ISSUE 4.01

Master Lock introduced the **ProSeries®** product line in 1992 with Weather Tough® and High Security, iron shrouded, rekeyable padlocks. Intent on providing locksmiths with greater ease and flexibility, Master Lock designed the padlocks to use standard components across the line. Since then, **ProSeries®** has grown to include solid body padlocks in Brass, Steel and Aluminum to further satisfy corrosion, security and safety requirements. Most recently, Master Lock has added extensive interchangeable core and door hardware cylinder options to create maximum options for padlock integration into facility padlock and door lock systems. Today, **ProSeries®** is the only product line available for so many different applications, making Master Lock the source for complete commercial security.

# ProSeries® Rekeyables Service Procedure

All of the ProSeries® locks have a generic construction technology that allows for a uniform assembly and disassembly technique. Below is a step-by-step procedure for disassembling one of these padlocks (refer to diagram at right for parts and orientation). The only exceptions to this procedure will be the Door Hardware and IC versions of the lock.

- Use the key to unlock the shackle, A. (If the key is unavailable you will have to use another method to unlock the shackle).
- Use a 7/64" hexagonal wrench to remove the mounting screw located inside the toe side shackle hole.
- Holding the trap door, D, in place, lock the shackle, A, into the padlock body. (This relieves pressure on the extension, E).
- Remove the trap door, D, and the nut, F.
- Remove the cylinder, C.
- Remove the extension, E.
- Remove the locking ball bearings, B, and shackle, A.

The order may be reversed to reassemble the lock. A light application of assembly grease may be used to hold the ball bearings in place during assembly.

If the lock only needs to be rekeyed, it is not necessary to remove the extension, ball bearings, or shackle.

Two functions are available in the locks, NKR (Non Key Retaining) and NRK (Non Removable Key) and both functions are accomplished as a design feature of the extension.

The NKR, non key retaining, function extension used in the lock has a projection on one side. You should note the orientation of this projection when removing the extension so that you can easily reinstall it during the reassembly process. Extensions are supplied with different sizes and two different styles have been used in the ProSeries® locks. Consult the Extension section, page 17, of this manual for more detailed information.

The NRK, non removable key, function extension does not have a projection to help with orientation and you will have to rely on the position of the half-moon shaped actuator the tail of the cylinder contacts. Again, different sizes and styles are available for use in the ProSeries® locks, so consult the Extension section, page 17, of this manual for more detailed information.

See component parts list on page 5.

## ProSeries® 6230 Locks Service Procedure

The 6230 is a solid steel body lock using the ProSeries® standard ball bearing locking mechanism. Disassembling for servicing is similar to the rekeyables and may be accomplished by following the steps listed below (refer to diagram at right for parts and orientation).

- Use the key to unlock the shackle, A. (If the key is unavailable you will have to use another method to unlock the shackle).
- Use a 7/64" hexagonal wrench to remove the mounting screw located inside the toe side shackle hole.
- Holding the trap door, D, in place, lock the shackle, A, into the padlock body. (This relieves pressure on the extension.)
- Remove the trap door, D, and the nut, F.
- Remove the cylinder, C.
- Remove the extension, E.
- Remove the locking ball bearings, B, and shackle, A.

The order may be reversed to reassemble the lock. A light application of assembly grease may be used to hold the ball bearings in place during assembly.

If the lock only needs to be rekeyed, it is not necessary to remove the extension, ball bearings, or shackle.

Two functions are available in the locks, NKR (Non Key Retaining) and NRK (Non Removable Key) and both functions are accomplished as a design feature of the extension.

The NKR, non key retaining, function extension used in the lock has a projection on one side. You should note the orientation of this projection when removing the extension so that you can easily reinstall it during the reassembly process.

The NRK, non removable key, function extension does not have a projection to help with orientation and you will have to rely on the position of the half-moon shaped actuator that the tail of the cylinder contacts.

See component parts list on page 6.

## ProSeries® 6270 Locks Service Procedure

The 6270 is a solid steel body lock. Disassembling for servicing is unique for this version and may be accomplished by following the steps listed below (refer to the diagram at the right for parts and orientation).

- Loosen or remove the cylinder mounting screw on the back of the lock body with a 3/32" socket wrench.
- Use the key to unlock the shackle. (If key is unavailable you will have to use another method to unlock the shackle).
- Pull on the cylinder to remove it.
- For rekeying, loosen the set screw, (1.5 mm), inside the last pin chamber to allow 180° rotation of the plug.
- Align pin chambers in plug with service holes in the bottom of the shell to remove existing bottom pins and replace with new combination.
- Rotate plug to key pull position and tighten the set screw in the last pin chamber.
- To exchange the cylinder, remove the roll pin at the back of the plug, remove the shackle and install shackle on a new cylinder.

The order may be reversed to reassemble the lock.

This lock is available with the ProSeries® K6000 or K7000 key. The 700A keyway is available for keying alike to other brands of locks which may be found in the field.

See component parts list on page 6.

# ProSeries® Interchangeable Core Service Procedure

The ProSeries® Interchangeable Core locks employ a construction technology similar to that used in the Rekeyables. It also allows for a uniform assembly and disassembly technique. Below is the step by step procedure for disassembling this version of padlock (refer to diagram at right for parts and orientation). The only exceptions to this procedure will be the Rekeyables and Door Hardware versions of the lock.

- Use the control key to remove the IC cylinder, C. (If key is unavailable you will have to use another method).
- Remove the ring retainer.
- Remove the steel retainer plate.
- Remove the throw member.
- Remove the extension, E.
- Remove the locking ball bearings, B, and shackle, A.

The order may be reversed to reassemble the lock. A light application of assembly grease may be used to hold the ball bearings in place during assembly.

If the lock only needs to be rekeyed, it is not necessary to remove the ring retainer, retainer plate, extension, ball bearings, or shackle.

Two functions are available in the locks, NKR (Non Key Retaining) and NRK (Non Removable Key) and both functions are accomplished as a design feature of the extension.

The NKR, non key retaining, function extension used in the lock has a projection on one side. You should note the orientation of this projection when removing the extension so that you can easily reinstall it during the reassembly process. Extensions are supplied with different sizes and orientations, and two different styles have been used in the ProSeries® locks. Consult the Extension section, page 17, of this manual for more detailed information.

The NRK, non removable key, function extension does not have a projection to help with orientation and you will have to rely on the position of the half-moon shaped actuator the tail of the cylinder contacts. Again, different sizes and styles are available for use in the ProSeries® locks, so consult the Extension section, page 17, of this manual for more detailed information.

See component parts list on page 8.

# ProSeries® Door Hardware Service Procedure

The ProSeries® Door Hardware locks employ a construction technology similar to that used in the Rekeyables. It also allows for a uniform assembly and disassembly technique. Below is the step by step procedure for disassembling this version of padlock. The only exception to this procedure will be the IC version of the lock.

- Use the key to unlock the shackle, A. (If key is unavailable you will have to use another method to unlock the shackle).
- Use a 7/64" hexagonal wrench to remove the mounting screw located inside the toe side shackle hole.
- Holding the plug retainer, D, in place, lock the shackle, A, into the padlock body. (This relieves pressure on the extension.)
- Remove the cylinder adapter with the cylinder, C.
- Remove the driver if it did not come out with the cylinder adapter and the cylinder.
- Remove the extension, E.
- Remove the locking ball bearings, B, and shackle, A.

The order may be reversed to reassemble the lock. A light application of assembly grease may be used to hold the ball bearings in place during assembly.

If the lock only needs to be rekeyed, it is not necessary to remove the extension, ball bearings, or shackle.

Two functions are available in the locks, NKR (Non Key Retaining) and NRK (Non Removable Key) and both functions are accomplished as a design feature of the extension.

The NKR, non key retaining, function extension used in the lock has a projection on one side. You should note the orientation of this projection when removing the extension so that you can easily reinstall it during the reassembly process. Extensions are supplied with different sizes and two different styles have been used in the ProSeries® locks. Consult the Extension section, page 17, of this manual for more detailed information.

The NRK non removable key, function extension does not have a projection to help with orientation and you will have to rely on the position of the half-moon shaped actuator the tail of the cylinder contacts. Again, different sizes and styles are available for use in the ProSeries® locks, so consult the Extension section, page 17, of this manual for more detailed information.

See component parts list on page 10.

# Cylinders and Retainers

Master Lock Company makes seven basic cylinder sizes/types for use in our padlocks;

1. A small diameter cylinder for some of our laminated locks.
2. A four pin cylinder for our laminated locks.
3. A five pin cylinder for our laminated rekeyable locks
4. A six pin cylinder for our ProSeries® locks.
5. A cylinder for our number 19 lock.
6. Cylinders compatible with various door hardware locks made by others.
7. SFIC cylinders.

1. The small diameter cylinder is generally referred to as the number W7 cylinder and is used in various products where the available space is limited. This cylinder is used in the number 7 laminated padlock, the gun lock, etc., and is generally not accessible for rekeying. In those cases where it can be rekeyed, it uses the same pins used in the first four classes above. Those pins are available in our #291 pinning kit found on page 19. See page 14 for service procedures.

2. The four pin cylinder is generally referred to as the number W1 cylinder and is used in the number 1, 3, 5 laminated padlocks, and many other products. In many cases it is not accessible for rekeying, but when it can be rekeyed you may use our #291 pinning kit. Servicing procedures may be found on page 14.

3. The five pin cylinder is generally known as our number W27 cylinder and is found in our laminated rekeyable locks such as the number 21, 24, 25, and 27. It may be rekeyed using our #291 pinning kit shown on page 19.

There are times when you may want to use a four pin cylinder in a lock designed for the five pin cylinder because of keyway compatibility. That can be accomplished by using the 27-0334 plug extension which adapts the four pin cylinder to the five pin length.

4. The six pin cylinder is referred to by two different part numbers, depending on the number of pin chambers that are pinned. When pinned with only five pins, it is called the W6000 and if all six pins are used it is called the W7000. This cylinder is found in our ProSeries® products and may also be rekeyed using our #291 pinning kit.

Effective mid-2001, Master Lock Company will implement a new six pin cylinder and key. The cylinder will change from a crimp to an E-clip which reflects tighter tolerances between the plug and shell. The new key has a radiused blade bottom. This running change should have no effect on key operation from old to new cylinder types.

You can use two of the 27-0334 plug adapters to install a four pin cylinder where a six pin one would normally be required. It isn't possible to install a five pin cylinder where a six pin is required. See page 14 for keyways and part numbers.

# Cylinders and Retainers *continued*

5. The W19 cylinder is only used in the number 19 lock and it is not really accessible for rekeying without drilling the rivets. This cylinder uses .125" diameter pins and a .025" increment. The shell is crimped on both sides and does not allow the service technique typical on the old style W1 cylinder. The only option available for rekeying would be to use the holes on the bottom of the shell to remove pins from the plug and replace them with new ones.

6. The door hardware cylinders are rekeyable using standard .115" diameter pins. The plug is mounted to the shell with a ring retainer, and use of a follower is recommended for rekeying. In order to mount the cylinders in the lock, a cylinder retainer plug is placed over the bible of the cylinder. The retainer plug has a threaded hole used to mount it to the lock via the toe side shackle hole and the socket screw. This cylinder also requires a special driver to be placed between the cylinder tail and the lock extension in order to function. The listing below allows construction of a correct cylinder part number when ordering from Master Lock.

6 – six

\* indicates a composite keyway

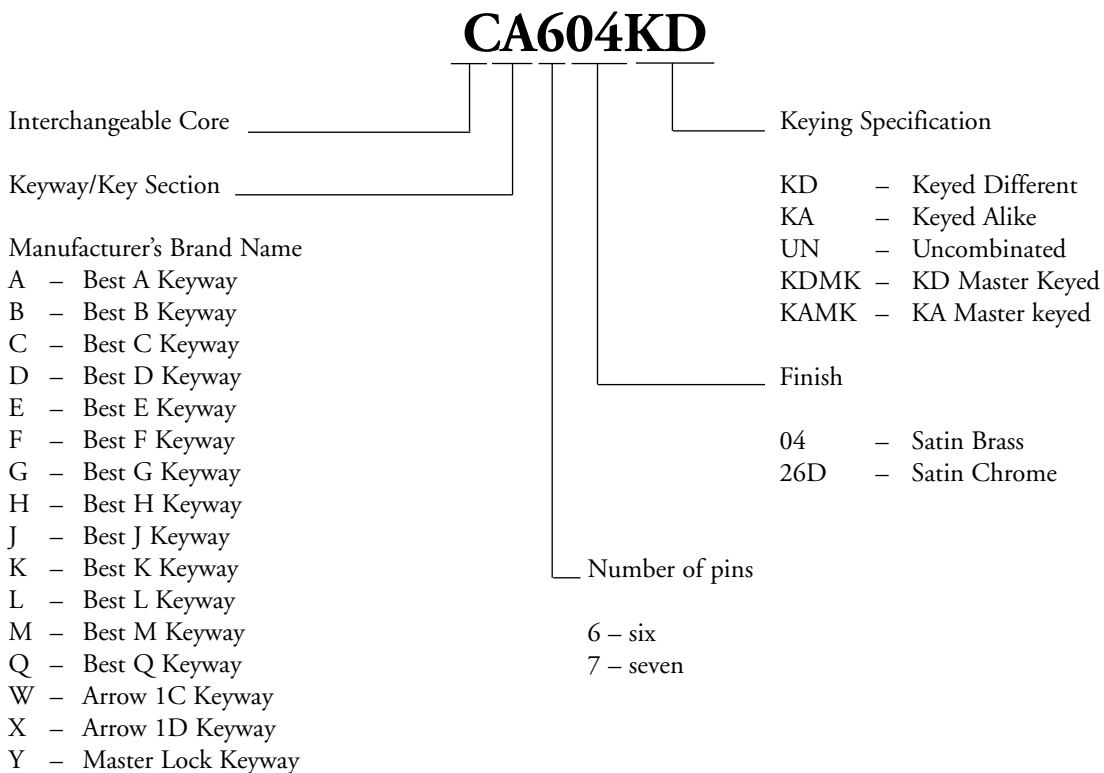

## Cylinders and Retainers *continued*

7. The Interchangeable Core cylinders are constructed to the SFIC standards that you encounter with many other brands. Keying uses the same techniques employed for those cylinders.

Master Lock offers IC cylinders keyed to existing key systems if you are able to supply the combinations for the operating key, the TMK, and the Control key. Master Lock also has the ability to recreate your entire key system, including all potential expansion, if you can supply bitting combinations of all keys that have been used.

At present, Master Lock offers IC cylinders compatible with the A2 and A4 format from the factory. If you are equipped for pinning SFIC cylinders, you can key the cylinders into an existing A3 system without difficulty. The listing below allows construction of a correct IC cylinder part number when ordering from Master Lock.

# Cylinder Service Procedure

All ProSeries® locks are supplied with a six pin length cylinder for uniform keying capability. The ProSeries® cylinder may be combined with 4, 5, or 6 pins to accommodate existing key codes.

## CYLINDER

Pin chambers in this cylinder are drilled from the shell into the bible. Care should be exercised to avoid turning the plug 180° because, at that point, the bottom pins will align with the service holes on the bottom of the shell and could be lost.

1. The plug is held in the shell via a crimp in the end of the shell.  
This crimp prevents removal of the plug from the shell unless you have a Master Lock plug follower with a flat on it.
2. The bottom of the plug is undercut at the keyway to allow it to bypass the crimp. The Master Lock plug follower is designed to fit the end of the plug and automatically align with the crimp in the shell.
3. To remove the plug, turn it 90° counterclockwise and, with the special plug follower, push the plug from the shell.

Once you have changed the pinning combination, insert the plug into the shell.

Effective mid-2001, the crimp retainer is replaced with a new design E-clip. To service the new cylinder type, remove the E-clip and then follow step 3 above. This running change replacement will eliminate the crimped retainer for the plug in all ProSeries® 6000 and 7000 keyway cylinders. This new design cylinder will also be supplied with a new key design. The new keys will have radiused blade bottoms and the section stamping will include a suffix “B” for ease of identification (see page 15).

Rekeyable Cylinders					
No. of Pins	Keyway	Part Number by Cylinder Length			Keying
		4 Pin	5 Pin	6 Pin	
4	K1	295W1*	295W1*	296W1	KD
5	K15	N/A	295W15	296W15	KD
5	K17	N/A	295W17	296W17	KD
5	K27	N/A	295W27	296W27	KD
5	K81	N/A	295W81	296W81	KD
5	K600A	N/A	295W600	296W600A	KD
6	K700A	N/A	N/A	296W700A	KD
5	K6000	N/A	295W6000	296W6000	KD
6	K7000	N/A	N/A	296W7000	KD

\* Includes plug extension for 4 pin cylinder

NOTE: For KA or MK'd, insert that specification in front of the 'W' in the above part number.

For Zero Bitted, use suffix 'KZ' with above part number

# Keys and Keyways

Master Lock uses a wide range of keys and keyways. Below illustrates the relationship of keys to keyways and the corresponding part numbers.

## Four Pin

## Five Pin

## Five Pin

## Six Pin

# Keying

Master Lock keys are coded from bow to tip and with a few exceptions, the increment used is .0155". Master Lock keys will be encountered with two types of stamping on them. Both direct and blind codes are stamped on the keys for different products. In the 291 pin kit you will find the 290-0371 slip gauge for decoding keys. For ProSeries® products, use the top slot in the gauge. Insert the key in the slot at the large end perpendicular to the gauge. Once inserted, pull the key toward the smaller end of the slot until it stops. The number stamped on the gauge directly below where the key stops is the cut depth for that cut position on the key. Repeat the process for each cut position on the key to determine the actual combination of the key.

The cylinder being rekeyed may be set to an existing key combination or it may be zero-bitted. In either case, follow the plug out of the shell and discard the existing pins from the plug. If the cylinder was Master Keyed, also remove any master pins that may have been retained in the shell. For the combination decoded, select the appropriate length pin from the 291 pinning kit, and install in the appropriate pin chamber of the plug. Once all pins have been installed, insert the plug into the shell and check for smoothness of operation. If you note roughness in the operation, check the key to be sure it has been produced to the bitting specifications on page 20.

## MASTER KEYING

Most keying system software offers the option of providing a pinning chart. It is advisable to use that option. If the option is not available, the following example illustrates the procedure required to determine the pinning of a master keyed cylinder.

With the example master key combination of 047345 at right, and the change key combination of 405253, the first step is to figure out the bottom pins that you must install in the cylinder, then the required master pins must be determined.

Bottom pins must be selected to allow operation of the shallowest cut per position in the cylinder for either key. By comparing the two combinations, select the shallowest cut for each cut position from either key. In our example we have highlighted the shallowest cut depth, and you can see that our bottom pins for the cylinder will be 005243. The master pin sizes are determined by subtracting the shallowest cut depth from the deepest cut depth for each pin position in the lock. As noted in the example, the difference is 442112.

From this process, we know that in the first pin chamber we must have a number zero bottom pin and a number 4 master pin for both keys to operate. The illustration at the right shows the pinning for the master keyed cylinder example. Depending upon the size of your key system, you may or may not require master pinning in all of the pin chambers.

If you find that some cylinders require master pins in different pin chambers or if different cylinders require different quantities of pin chambers to have master pins, question the design of the system before proceeding. Having master pins in different pin chambers may indicate that the system utilizes a Rotating Constant Method of progression, which should be verified. Having different quantities of master pins in different cylinders usually indicates faulty key system design, and you should recommend that the system be replaced.

# ProSeries® Extensions, Retainers and Drivers

## EXTENSIONS

As noted in the exploded views, all ProSeries® locks use an extension mechanism that causes the ball bearings to lock or unlock the shackle. Typically, ProSeries® locks are supplied with a non key retaining function extension. There are five different variations of this extension you may encounter as shown here.

The 2 right extensions are the original position used in the Weather Tough®, Shrouded, Solid Body Aluminum, and Solid Body Brass locks. The 2 left extensions are the version used in all Solid Body Steel locks. The middle extension is used in the 6230.

The differences are in size and/or the location of the projection on the spring washer. Its position is critical to operation of the lock. The two positions you will encounter for that projection are shown at the right.

There are three different extensions used for the NRK, (Non Removable Key), function and they are shown at the right. Care should be taken to position them correctly within the lock during assembly. Consult the component parts listings in this manual to determine the actual part numbers for the extensions.

## RETAINERS

There are three different types of retainers used in ProSeries® locks. A ring retainer can be found in the IC lock. It is a standard size and is used to position a retainer plate for the throw member. In the door hardware locks, a Retainer Plug (PN. 298-0629) is used to position the door hardware cylinder. A trap door, screw, and nut (not pictured) are used to position the cylinder in the other version locks, see the component parts listings for specific part numbers of particular locks.

## DRIVERS

The door hardware locks require a driver to allow the door hardware cylinder to drive the extension. There are four driver types available and they are shown on the right. Shown is the distinctive feature of the driver that engages the cylinder.

Positioning the driver on the cylinder should always be done to ensure that the orientation of the driver forms the assembly profile at the right.

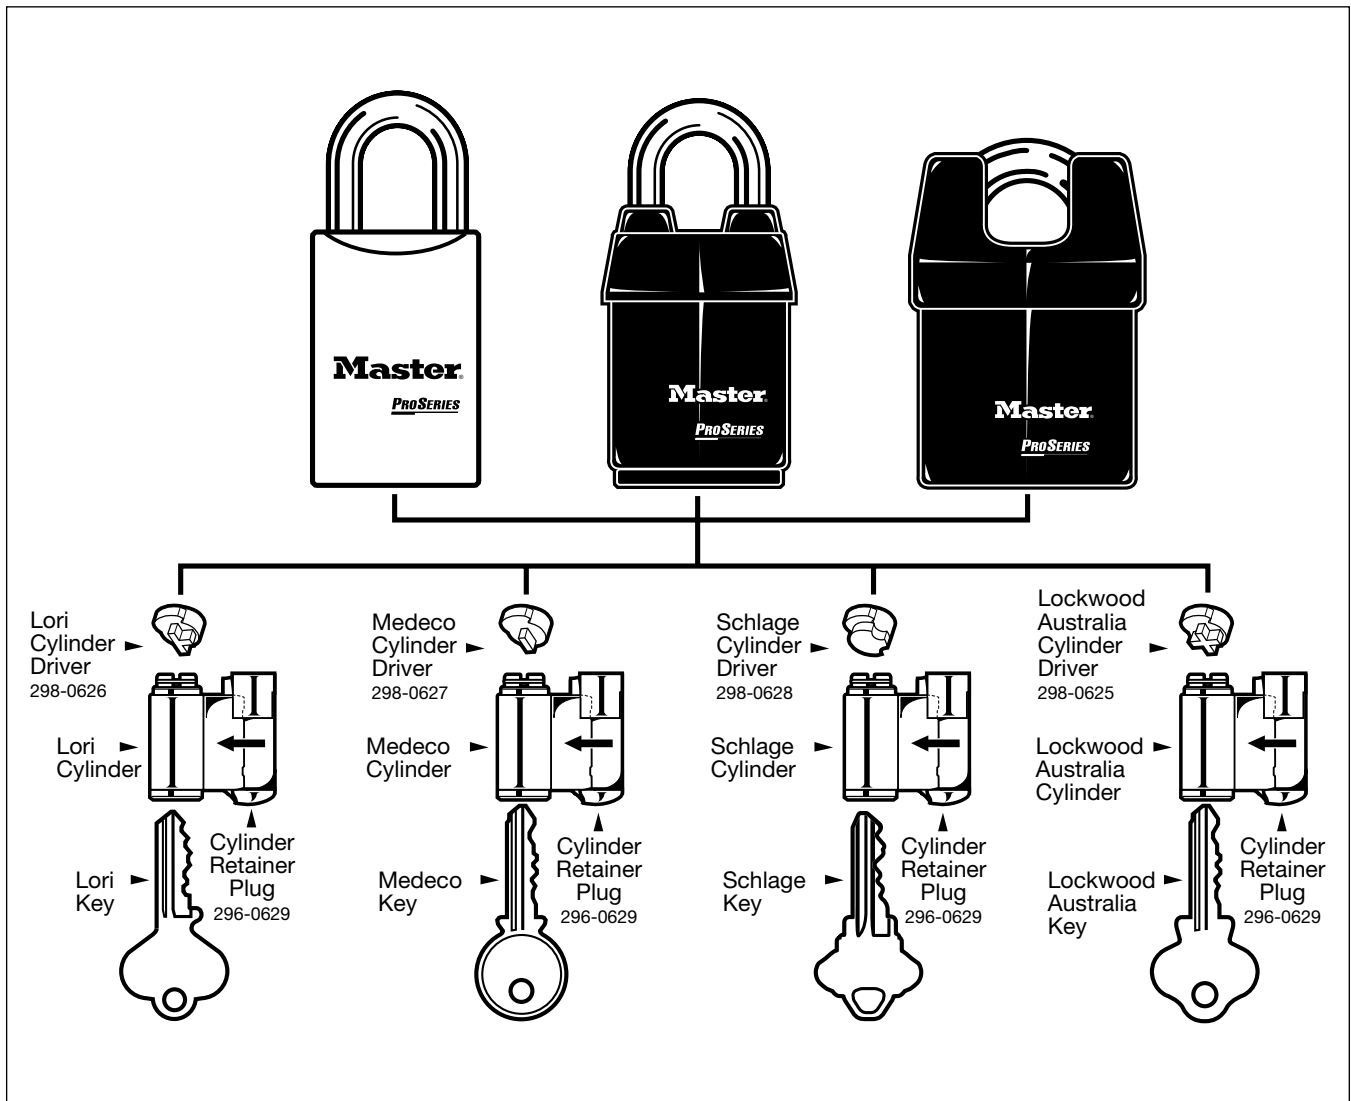

## ProSeries® Extensions, Retainers and Drivers *continued*

The Lori cylinders are available from Master Lock as part of the lock assembly and will be supplied with the 298-0626 driver. If you are using a Medeco 20-20000 or 20W20000 cylinder you should use a number 298-0627 driver. For all Schlage cylinders and the ASSA 65611 cylinder you can use a 298-0628 driver. The number 298-0625 driver is used to adapt an Australian Lockwood cylinder.

Medeco also offers a cylinder that can be used without a driver. Use a 51-0600 or a 51W0600 cylinder for that option, but realize that it will not be adaptable to a door hardware lockset.

# Tools

All of the tools required to service Master locks are included in the 291 pinning kit, or they may be ordered separately. Below you will find the part numbers of each tool next to the illustration of it.

Master Lock offers some specific service tools for the SFIC cylinders which may be ordered separately.

# Terminology

When making a definition of a term, the following rules were applied to the term:

1. Is the term listed in a standard dictionary?
2. Is the definition there the same meaning used in our industry?

A standard pocket dictionary can be obtained easily and on short notice from a variety of stores that have a pocket book display. If the answer to either of the questions above is no, then the definition of the term may be found here.

A definition must meet the following rules:

1. It must describe the subject of the term without graphics.
2. It must describe ONLY the subject of the term.
3. The term should not be used in the definition.

If you have a technical objection to any definition, please bring it to the attention of a member of the LIST Council for review.

Used by permission. Copyright © 1989, 1990, 1995, 1996, 1997 LIST Council

## -A-

**actuator** n. a device, usually connected to a cylinder, which, when activated, may cause a lock mechanism to operate

**ADA** abb. Americans with Disabilities Act

**adjustable mortise cylinder** n. any mortise cylinder whose length can be adjusted for a better fit in doors of varying thickness

**all-section key blank** n. the key section which enters all keyways of a multiplex key system

**ALOA** abb. Associated Locksmiths of America, Inc.

**associated change key** n. a change key which is related directly to particular master key(s) through the use of constant cuts

**associated master key** n. a master key which has particular change keys related directly to its combination through the use of constant cuts

**ASTM** abb. American Society for Testing and Materials

**auxiliary lock** n. any lock installed in addition to the primary lockset

## -B-

**ball locking** adj. a method of locking a padlock shackle into its case using ball bearing(s) as the bolt(s)

**battery eliminator** n. an electric device designed to provide energy to equipment normally requiring batteries for operation

**bible** n. that portion of the cylinder shell which normally houses the pin chambers, especially those of a key-in-knob cylinder or certain rim cylinders

**bicycle padlock** n. a padlock with sufficient shackle clearance to secure a bicycle

**bi-directional cylinder** n. a cylinder which may be operated in a clockwise and counterclockwise direction by a single key

**binary cut key** n. a key whose combination only allows for two possibilities in each biting position: cut/no cut

**binary type cylinder or lock** n. a cylinder or lock whose combination only allows for two biting possibilities in each biting position

**bit** n. the part of the key which serves as the blade, usually for use in a warded or lever tumbler lock v. to cut a key

**bit key** n. a key with one or more projecting bits

**bitting** n. 1. the number(s) which represent(s) the dimensions of the key 2. the actual cut(s) or combination of a key

**bitting depth** n. the depth of a cut which is made into the blade of a key

**bitting list** n. a listing of all the key combinations used within a system. The combinations are usually arranged in order of the blind code, direct code, and/or key symbol.

**bitting position** n. the location of a key cut

**blade** n. the portion of a key which may contain the cuts and/or millings

**blank** adj. uncut, see also "key blank"

**blind code** n. a designation, unrelated to the bitting, assigned to a particular key combination for future reference when additional keys or cylinders may be needed

**block master key** n. the one pin master key for all combinations listed as a block in the standard progression format

**BMK** abb. block master key

**bolt** n. any movable projection which blocks the movement of one object relative to another

**bottom of blade** n. the portion of the blade opposite the cut edge of a single bitted key

**bottom pin** n. usually a cylindrical shaped tumbler which may be conical, ball shaped or chisel pointed on the end which makes contact with the key

**bow** n. the portion of the key which serves as a grip or handle

**bow stop** n. a type of stop located near the key bow

**box of wards** n. a complete unit of intricate wards installed in or on a lock case

**bridge ward** n. a center ward attached to the interior of a lock by means of a bracket

**broach** n. a tool used to cut the keyway into the cylinder plug v. to cut the keyway into a cylinder plug with a broach

**build-up dimension** n. 1. the distance between two different shear lines, as expressed in units of the manufacturer's increment or as an actual measurement 2. the dimension of the build-up pin required in a particular chamber, which will allow one key to operate at the plug shear line and a different key to operate at a different shear line

**build-up pin** n. the additional element of a pin stack required to allow operation at different shear lines in a cylinder

**by-pass tool** n. a device that neutralizes the security of a locking device, or its application hardware, often taking advantage of a design weakness

## -C-

**cam** n. 1. a lock or cylinder component which transfers the rotational motion of a key or cylinder plug to the bolt works of a lock 2. the bolt of a cam lock

**cam lock** n. a complete locking assembly in the form of a cylinder whose cam is the actual locking bolt

**cap** n. 1. a spring cover for a single pin chamber 2. a part which may serve as a plug retainer and/or a holder for the tailpiece v. to install a cap

# Terminology

**capping block** n. a holding fixture for certain interchangeable cores which aids in the installation of the caps

**case** n. the housing or body of a lock

**case ward** n. any ward directly attached to or projecting from a lock case

**chamber** n. any cavity in a cylinder plug and/or shell which houses the tumblers

**change key** n. a key which operates only one cylinder or one group of keyed alike cylinders in a keying system, see also "reset key" definition 1

**changeable bit key** n. a key which can be recombined by exchanging and/or rearranging portions of its bit or blade

**Chubb shackle** n. a hinged shackle with a pierced hole for the bolt in its movable end

**CK** abb. 1. change key 2. control key

**clevis** n. a device to permanently attach a chain to a padlock

**clipper** n. a hand held key biting punch, often incorporating a triggerlike handle

**closed gated** adj. pertaining to a lever tumbler whose gate is pierced into the body of the tumbler. The lever(s) surround the fence in both the locked and unlocked positions.

**clutch** n. that part of a profile cylinder which transfers rotational motion from the inside or outside element to a common cam or actuator

**CML** abb. the title "Certified Master Locksmith" as awarded by ALOA

**code** n. a designation assigned to a particular key combination for reference when additional keys or cylinders may be needed. See also, "blind code", "direct code", and "key symbol"

**code key** n. a key cut to a specific code rather than duplicated from a pattern key. It may or may not conform to the lock manufacturer's specifications

**code original key** n. a code key which conforms to the lock manufacturer's specifications

**combine** v. to set a combination in a lock, cylinder, or key

**combination** n. the group of numbers which represent the biting of a key and/or the tumblers of a lock or cylinder

**compensate drivers** v. to select longer or shorter top pins, depending on the length of the rest of the pin stack, in order to achieve a uniform pin stack height

**complementary keyway** n. usually a disc tumbler keyway used in master keying. It accepts keys of different sections whose blades contact different bearing surfaces of the tumblers.

**composite keyway** n. a keyway which has been enlarged to accept more than one key section, often key sections of more than one manufacturer

**compound bitted key** n. a key with at least one compound cut

**compound cut** n. a biting which has another biting dimension within its dimensions

**constant cut** n. any biting(s) which are identical in corresponding positions from one key to another in a keying system. They usually serve to group these keys together within a given level of keying, and/or link them with keys of other levels. See also "rotating constant"

**construction core** n. an interchangeable or removable core designed for use during the construction phase of a building. The cores are normally keyed alike and, upon completion of construction, they are to be replaced by the permanent system's cores.

**control chamber** n. in an interchangeable or removable core, any chamber which has a control shear line, which is different from the operating shear line

**control cut** n. any biting which operates the retaining device of an interchangeable or removable core

**control key** n. 1. a key whose only purpose is to remove and/or install an interchangeable or removable core 2. a bypass key used to operate and/or reset some combination type locks 3. a key which allows disassembly of some removable cylinder locks

**control lug** n. that part of an interchangeable or removable core-retaining device which locks the core into its housing

**control shear line** n. the shear line which allows operation of the control lug of an interchangeable or removable core

**control sleeve** n. the part of an interchangeable or removable core retaining device which surrounds the plug

**controlled cross keying** a condition in which two or more different keys of the same level of keying and under the same higher level key(s) operate one cylinder by design; e.g., XAA1 operated by AA2 (but not XAA1 operated by AB1)  
Note: This condition could severely limit the security of the cylinder and the maximum expansion of the system when (1) more than a few of these different keys operate a cylinder, or (2) more than a few differently cross keyed cylinders per system are required.

**core** n. a complete unit, often with a "figure eight" shape, which usually consists of the plug, shell, tumblers, springs, plug retainer and spring cover(s). It is primarily used in removable and interchangeable core cylinders and locks.

**CPL** abb. the title "Certified Professional Locksmith" as awarded by ALOA

**CRL** abb. the title "Certified Registered Locksmith" as awarded by ALOA

**cross keying** n. the deliberate process of combining a cylinder (usually in a master key system) to two or more different keys which would not normally be expected to operate it together. See also "controlled cross keying" and "uncontrolled cross keying."

**cruciform** adj. of or pertaining to a key section or keyway which usually resembles a plus sign (+) or the letter "X"

**cut** v. to make cuts into a key blade, see also "key cut(s)"

**cut edge** n. the portion of the key blade which contains the cuts

**cut key** n. a key which has been bitted or combined

**cut root** n. the bottom of a key cut

**cut root shape** n. the shape of the bottom of a key cut. It may have a flat or radius of a specific dimension, or be a perfect "V"

**cutter** n. the part of a key machine which makes the cuts into the key blank

**cylinder** n. a complete operating unit which usually consists of the plug shell, tumblers, springs, plug retainer, a cam/tailpiece or other actuating device, and all other necessary operating parts

**cylinder blank** n. a dummy cylinder which has a solid face and no operating parts

**cylinder collar** n. a plate or ring installed under the head of a cylinder to improve appearance and/or security

**cylinder guard** n. a protective cylinder mounting device

**cylinder key** n. a broad generic term including virtually all pin and disc tumbler keys

## -D-

**deadbolt** n. a bolt, which requires a deliberate action to extend, and which resists end pressure in the unlocking direction when fully extended

**deadlock** n. a lock which incorporates a deadbolt

# Terminology

**deadlocking** adj. pertaining to any feature which, when fully engaged, resists attempts to move the latch or bolt in the unlocking direction through direct pressure

**declining step key** n. a key whose cuts are progressively deeper from bow to tip

**decode** v. to determine a key combination by physical measurement of a key and/or cylinder parts

**decoder gauge** n. a measuring device which helps determine the combination of a lock or cylinder without removing the tumblers

**depth key set** n. a set of keys used to make a code original key on a key duplicating machine to a lock manufacturer's given set of key biting specifications. Each key is cut with the correct spacing to one depth only in all biting positions, with one key for each depth.

**derived series** n. a series of blind codes and bittings which are directly related to those of another biting list

**direct code** n. a designation assigned to a particular key which includes the actual combination of the key

**disc tumbler** n. 1. a flat tumbler which must be drawn into the cylinder plug by the proper key so that none of its extremities extends into the shell  
2. a flat, usually rectangular tumbler with a gate which must be aligned with a sidebar by the proper key

**double-acting lever tumbler** n. one that must be lifted a precise amount, neither too little nor too much to allow movement of a bolt

**double bitted key** n. a key bitted on two opposite surfaces

**double pin** v. to place more than one master pin in a single pin chamber

**drilled key** n. a type of bit key with a hole drilled into the shank from the tip

**driver spring** n. a spring placed on top of the pin stack to exert pressure on the pin tumblers

**drop** n. a pivoting or swinging dust cover, see also "increment"

**dummy cylinder** n. a non-functional facsimile of a rim or mortise cylinder used for appearance only, usually to conceal a cylinder hole

**duplicate** v. to copy, see also "duplicate key"

**duplicate key** n. any key reproduced from a pattern key

**dustproof cylinder** n. a cylinder designed to prevent foreign matter from entering either end of the keyway

## -E-

**effective plug diameter** n. the dimension obtained by adding the root depth of a key cut to the length of its corresponding bottom pin which establishes a perfect shear line. This will not necessarily be the same as the actual plug diameter.

**ejector hole** n. a hole found on the bottom of certain interchangeable cores under each pin chamber. It provides a path for the ejector pin.

**ejector pin** n. a tool used to drive all the elements of a pin chamber out of certain interchangeable cores

**electrified lockset** n. a lock which is controlled electrically

**end ward** n. a ward which prevents complete insertion and/or rotation of an incorrect key by forming an obstruction to the end of the key

**end ward cut** n. any cut made into a key to bypass an end ward

## -F-

**factory original key** n. the out key furnished by the lock manufacturer for a lock or cylinder

**fail-safe** adj. a feature of a security device designed to release, for safety purposes, during a power loss

**fence** n. 1. a projection on a lock bolt which prevents movement of the bolt unless it can enter gates of properly aligned tumblers, see also "sidebar"  
2. any locking element other than a sidebar or shackle designed to enter a tumbler's gate

**file cabinet lock** n. 1. any lock used on a file cabinet  
2. a plunger lock cylinder for a gang lock normally used in a file cabinet

**finish** n. a material, coloring and/or texturing specification

**first generation duplicate** n. a key which was duplicated using a factory original key or a code original key as a pattern

**first key** n. any key produced without the use of a pattern key

**five column progression** n. a process wherein key bittings are obtained by using the cut possibilities in five columns of the key biting array

**five pin master key** n. a master key for all combinations obtained by progressing five biting positions

**flat type key** n. a key which is completely flat on both sides, usually used for warded or lever tumbler locks

**flexible head mortise cylinder** n. an adjustable mortise cylinder which can be extended against spring pressure to a slightly longer length

**foot** n. the cam portion of the trunnion assembly in some lever tumbler locks

**four column progression** n. a process wherein key bittings are obtained by using the cut possibilities in four columns of the key biting array

**four pin master key** n. a master key for all combinations obtained by progressing four biting positions

**frangible shackle** n. a padlock shackle designed to be broken easily

**frangible shackle padlock** n. a padlock equipped with an easily broken shackle

## -G-

**gate** n. a notch cut into the edge of a tumbler to accept a fence or sidebar

**GGGMK** abb. great great grand master key

**GGGMK'D** abb. great great grand master keyed

**GGM** abb. great grand master key

**GGMK** abb. great grand master key

**GGMK'D** abb. great grand master keyed

**GM** abb. grand master key

**GMK'D** abb. grand master keyed

**graduated drivers** n. a set of top pins of different lengths. Usage is based on the height of the rest of the pin stack, in order to achieve a uniform pin stack height. See also "compensate drivers"

**grand master key** n. the key which operates two or more separate groups of locks, which are each operated by a different master key

**grand master key system** n. a master key system which has exactly three levels of keying

**grand master keyed** adj. of or pertaining to a lock or cylinder which is or is to be keyed into a grand master key system

**great grand master key** n. the key which operates two or more separate groups of locks which are each operated by a different grand master key

**great grand master key system** n. a master key system which has exactly four levels of keying

**great grand master keyed** adj. of or pertaining to a lock or cylinder which is or is to be keyed into a great grand master key system

**great great grand master key** n. the key which operates two or more separate groups of locks which are each operated by different great grand master keys

# Terminology

**great great grand master key system** n. a master key system which has five or more levels of keying

**great great grand master keyed** adj. of or pertaining to a lock or cylinder which is or is to be keyed into a great great grand master key system

**guide** n. 1. that part of a key machine which follows the cuts of a pattern key or template during duplication 2. that part of a flat key lever lock which connects the nose to the foot and supports the key blade

## -H-

**hand change** adj. pertaining to a combination lock in which the wheels must be removed in order to change the combination

**handed** adj. pertaining to hardware which is manufactured only for application on doors with a specific orientation

**hardware schedule** n. a listing of the door hardware used on a particular job it includes the types of hardware, manufacturers, locations, finishes, and sizes. It should include a keying schedule specifying how each locking device is to be keyed.

**hasp** n. a hinged metal strap designed to be passed over a staple and secured in place

**heel & toe locking** n. describes a padlock which has locking dogs at both the heel and toe of the shackle

**heel (of a padlock shackle)** n. the part of a padlock shackle which is retained in the case when in the unlocked position

**HGM** abb. horizontal group master key

**high security cylinder** n. a cylinder which offers a greater degree of resistance to any or all of the following: picking, impressioning, key duplication, drilling or other forms of forcible entry

**high security key** n. a key for a high security cylinder

**hinged shackle** n. a shackle whose heel is permanently mounted to the padlock case in a manner which allows the shackle to pivot to open

**Hobbs shackle** n. a hinged shackle with a notch for the bolt in its movable end

**holding fixture** n. a device which holds cylinder plugs, cylinders, housings, and/or cores to facilitate the installation of tumblers, springs and/or spring covers

**hollow driver** n. a top pin hollowed out on one end to receive the spring, typically used in cylinders with extremely limited clearance in the pin chambers

**hook bolt** n. a lock bolt shaped in the general outline of a hook. Normally used on sliding doors or where spreading of the frame and door is a possible attack.

**horizontal group master key** n. the two pin master key for all combinations listed in all blocks in a line across the page in the standard progression format

**horn** n. in a non-cylinder lock, the housing which surrounds the nose and extends through the door or drawer

**horn plate** n. the cover of a lever tumbler lock case to which the horn is attached

**housing** n. that part of a locking device which is designed to hold a core

**hub** n. a lock component, which redirects rotational motion from a spindle or shaft to linear movement of a latch or bolt

## -I-

**IC** abb. interchangeable core

**impression** n. the mark made by a tumbler on its key cut v. to fit a key by the impression technique

**impression technique** n. a means of fitting a key directly to a locked cylinder by manipulating a blank in the keyway and cutting the blank where the tumblers have made marks

**incidental master key** n. a key cut to an unplanned shear line created when the cylinder is combined to the top master key and a change key

**increment** n. a usually uniform increase or decrease in the successive depths of a key cut which must be matched by a corresponding change in the tumblers

**index (of a combination lock dial)** n. the mark outside the dial ring of a combination lock used as a reference point

**individual key** n. an operating key for a lock or cylinder which is not part of a keying system, see also "change key" definition 1

**interchangeable core** n. a key removable core which can be used in all or most of the core manufacturer's product line. No tools (other than the control key) are required for removal of the core.

## -K-

**k** sym. symbol for "keys" used after a numerical designation of the quantity of the keys requested to be supplied with the cylinders; e.g., 1k, 2k, 3k, etc. it is usually found in hardware/keying schedules.

**KA** abb. keyed alike

**KA1, KA2, etc.** symbol which indicates that all cylinders so designated are or are to be operated by the same key(s). The numerical designation indicates the keyed alike group or set.

**KA/2, KA/3, etc.** symbol used to indicate the quantity of locks or cylinders in keyed alike groups. These groups are usually formed from a larger quantity; e.g., 30 cylinders KA/2.

**KBA** abb. key biting array

**KD** abb. keyed different

**key** n. a properly combined device which is, or most closely resembles, the device specifically intended by the lock manufacturer to operate the corresponding lock

**key biting array** n. a matrix (graphic) display of all possible bittings for change keys and master keys as related to the top master key

**key biting punch** n. a manually operated device which stamps or punches the cuts into the key blade, rather than grinding or milling them

**key biting specifications** n. pl. the technical data required to bit a given (family of) key blank(s) to the lock manufacturer's dimensions

**key blank** n. any material manufactured to the proper size and configuration which allows its entry into the keyway of a specific locking device. A key blank has not yet been combined or cut.

**key change** adj. referring to a lock in which the combination can be changed through the use of a special key or tool without disassembling the lock

**key changeable** adj. of or pertaining to a lock or cylinder which can be recombined without disassembly, by the use of a key. The use of a tool may also be required.

**key coding machine** n. a key machine designed for the production of code keys. It may or may not also serve as a duplicating machine.

**key control** n. 1. any method or procedure which limits unauthorized acquisition of a key and/or controls distribution of authorized keys 2. a systematic organization of keys and key records

**key cut(s)** n. the portion of the key blade which remains after being cut and which aligns the tumbler(s)

**key cut profile** n. the shape of a key cut, including the cut angle and the out root shape

**key duplicating machine** n. a key machine which is designed to make copies from a pattern key

**key gauge** n. a usually flat device with a cutaway portion indexed with a given set of depth or spacing specifications. It is used to help determine the combination of a key.

**key-in-knob cylinder** n. a cylinder used in a key-in-knob lockset

**key interchange** n. an undesirable condition, usually in a master key system, whereby a key unintentionally operates a cylinder or lock

# Terminology

**key machine** n. any machine designed to cut keys. See also "key coding machine" and "key duplicating machine."

**key manipulation** n. manipulation of an incorrect key in order to operate a lock or cylinder

**key milling** n. the grooves machined into the length of the key blade to allow its entry into the keyway

**key override** n. a provision allowing interruption or circumvention of normal operation of a combination lock or electrical device adj. of or pertaining to such a provision, as in "key override cylinder"

**key override cylinder** n. a lock cylinder installed in a device to provide a key override function

**key pull(s)** n. a lock specification which indicates by quantity and orientation the position(s) in which a key may be withdrawn

**key pull position** n. any position, of the cylinder plug at which the key can be removed

**key records** n. pl. records which typically include some or all of the following: bitting list, key bitting array, key system schematic, end user, number of keys/cylinders issued, names of persons to whom keys were issued, hardware/keying schedule

**Key Records Department** n. the department which is responsible for generating and issuing all lock and key combinations and maintaining records of them

**key retaining** adj. 1. of or pertaining to a lock which must be locked before its key can be removed. 2. of or pertaining to a cylinder or lock which may prevent removal of a key without the use of an additional key and/or tool

**key section** n. the exact cross sectional configuration of a key blade as viewed from the bow toward the tip

**key symbol** n. a designation used for a key combination in the standard key coding system, e.g., A, AA, AA1, etc.

**key system schematic** n. a drawing with blocks utilizing keying symbols, usually illustrating the hierarchy of all keys within a master key system. It indicates the structure and total expansion of the system.

**keyed** adj. 1. combined 2. having provision for operation by key

**keyed alike** adj. of or pertaining to two or more locks or cylinders which have or are to have the same combination. They may or may not be part of a keying system.

**keyed different** adj. of or pertaining to a group of locks or cylinders, each of which is or is to be combined differently from the others. They may or may not be part of a keying system.

**keyed random** adj. of or pertaining to a cylinder or group of cylinders selected from a limited inventory of different key changes. Duplicate bittings may occur.

**keyhole** n. the opening through which a non-cylinder key must pass to enter a lock

**keying** n. any specification for how a cylinder or group of cylinders are or are to be combined in order to control access

**keying conference** n. a meeting of the end user and the keying system supplier at which the keying and levels of keying, including future expansion, are determined and specified

**keying kit** n. a compartmented container which holds an assortment of tumblers, springs and/or other parts

**keying schedule** n. a detailed specification of the keying system listing how all cylinders are to be keyed and the quantities, markings, and shipping instructions of all keys and/or cylinders to be provided

**keying symbol** n. a designation used for a lock or cylinder combination in the standard key coding system; e.g., AA1, XAA1, XIX, etc.

**keyway** n. 1. the opening in a lock or cylinder which is shaped to accept key bit or blade of a proper configuration 2. the exact cross sectional configuration of a keyway as viewed from the front. It is not necessarily the same as the key section.

**keyway ward** n. a ward which prevents entry of an incorrect key into a cylinder or lock

**KR** abb. 1. keyed random 2. key retaining

**KWY** abb. keyway

## -L-

**laminated padlock** n. a padlock whose case is constructed of separate plates usually riveted together

**layout tray** n. a compartmented container used to organize cylinder parts during keying or servicing

**levels of keying** n. pl. the divisions of a master key system into hierarchies of access, as shown in the following tables. Note: the standard key coding system has been expanded to include key symbols for systems of more than four levels of keying.

TWO LEVEL SYSTEM			
Level of Keying	Key Name	ABB.	Key Symbol
Level II	master key	MK	AA
Level I	change key	CK	1AA, 2AA, etc.

THREE LEVEL SYSTEM			
Level of Keying	Key Name	ABB.	Key Symbol
Level III	grand master key	GMK	A
Level II	master key	MK	AA, AB, etc.
Level I	change key	CK	AA1, AA2, etc.

FOUR LEVEL SYSTEM			
Level of Keying	Key Name	ABB.	Key Symbol
Level IV	great grand master key	GGMK	GGMK
Level III	grand master key	GMK	A, B, etc.
Level II	master key	MK	AA, AB, etc.
Level I	change key	CK	AA1, AA2, etc.

FIVE LEVEL SYSTEM			
Level of Keying	Key Name	ABB.	Key Symbol
Level V	great great grand master key	GGGMK	GGGMK
Level IV	great grand master key	GGMK	A, B, etc.
Level III	grand master key	GMK	AA, AB, etc.
Level II	master key	MK	AAA, AAB, etc.
Level I	change key	CK	AAA1, AAA2, etc.

SIX LEVEL SYSTEM			
Level of Keying	Key Name	ABB.	Key Symbol
Level VI	great great grand master key	GGGMK	GGGMK
Level V	great grand master key	GGMK	A, B, etc.
Level IV	grand master key	GMK	AA, AB, etc.
Level III	master key	MK	AAA, AAB, etc.
Level II	sub-master key	SMK	AAAA, AAAB, etc.
Level I	change key	CK	AAAA1, AAAA2, etc.

# Terminology

**lever pack** n. a set of lever tumblers

**lever tumbler** n. a flat, spring-loaded tumbler which usually pivots on a post. It contains a gate which must be aligned with a fence to allow movement of the bolt.

**loading tool** n. a tool which aids installation of cylinder components into the cylinder shell

**lock** n. any device which prevents access or use by requiring special knowledge or equipment

**lock service package** n. a kit offered by the manufacturer or distributor of a product, which contains what he deems required to properly service the product

**locker lock** n. a cabinet lock designed specifically for use on lockers

**lockout** n. any situation in which the normal operation of a lock or cylinder is prevented

**lockout key** n. a key made in two pieces. One piece is trapped in the keyway by the tumblers when inserted and blocks entry of any regular key. The second piece is used to remove the first piece.

**locksmith** n. a person with the knowledge and ability to select, install, service and bypass all the components of an electrical or mechanical lock

## -M-

**MACS** abb. maximum adjacent cut specification

**manipulation key** n. any key other than a correct key which can be variably positioned and/or manipulated in a keyway to operate a lock or cylinder

**master disc** n. a special disc tumbler with multiple gates to receive a sidebar, see also "master pin" definition 1, see also "stepped tumbler".

**master key** n. a key which operates all the master keyed locks or cylinders in a group, each lock or cylinder usually operated by its own change key v. to combine a group of locks or cylinders such that each is operated by its own change key as well as by a master key for the entire group

**master key changes** n. the number of different usable change keys available under a given master key

**master key system** n. 1. any keying arrangement which has two or more levels of keying 2. a keying arrangement which has exactly two levels of keying

**master keyed** adj. of or pertaining to a cylinder or group of cylinders which are or are to be combined so that all may be operated by their own change key(s) and by additional key(s) known as master key(s)

**master keyed only** adj. of or pertaining to a lock or cylinder which is or is to be combined only to a master key

**master lever** n. a lever tumbler which can align some or all other levers in its lock so that their gates are at the fence. It is typically used in locker locks.

**master pin** n. 1. usually a cylindrical shaped tumbler, flat on both ends, placed between the top and bottom pin to create an additional shear line 2. a pin tumbler with multiple gates to accept a sidebar

**master wafer** n. a ward used in certain binary type disc tumbler key-in-knob locks, see also "master pin" definition 1, see also "stepped tumbler"

**matrix format master keying** n. a method of generating combinations and assigning key symbols in a master key system through the use of a matrix

**maximum adjacent cut specification** n. the maximum allowable difference between adjacent cut depths

**meter lock** n. 1. a padlock whose shackle consists of a single removable post, designed for locking utility meters or valves. 2. any of several small devices specifically designed to lock utility meters or valves and which require either a key or special wrench for removal.

**mis-cut** adj. of or pertaining to a key which has been cut incorrectly n. a mis-cut key

**MK** abb. master key

**MK'd** abb. master keyed

**MK'd only** abb. master keyed only

**mogul cylinder** n. a very large pin tumbler cylinder whose pins, springs, key, etc. are also proportionally increased in size. It is frequently used in prison locks.

**mortise cylinder** n. a threaded cylinder typically used in mortise locks of American manufacture

**multi-section key blank** n. a key section which enters more than one, but not all keyways in a multiplex key system

**multiple gating** n. a means of master keying by providing a tumbler with more than one gate

**multiplex key blank** n. any key blank which is part of a multiplex key system

**multiplex key system** n. 1. a series of different key sections which may be used to expand a master key system by repeating bittings on additional key sections. The keys of one key section will not enter the keyway of another key section. This type of system always includes another key section which will enter more than one, or all of the keyways. 2. a keying system which uses such keyways and key sections

**mushroom pin** n. a pin tumbler, usually a top pin, which resembles a mushroom. It is typically used to increase pick resistance

## -N-

**NCK** sym. symbol for "no change key," primarily used in hardware schedules

**neck (of a key)** n. 1. the portion of a bit key between the shoulder and the bit(s) 2. the portion of a cylinder key between the shoulder and the bow

**negative locking** n. locking achieved solely by spring pressure or gravity which prevents a key cut too deeply from operating a lock or cylinder

**NKR** abb. non key retaining

**NMK** sym. symbol which means "not master keyed" and is suffixed in parentheses to the regular key symbol. It indicates that the cylinder is not to be operated by the master key(s) specified in the regular key symbol; e.g., AB6(NMK).

**non-fail safe** adj. a feature of a security device designed to remain engaged, for security purposes, during a power loss

**non key retaining** adj. of or pertaining to a lock whose key can be removed in both the locked and unlocked positions

**non-original key blank** n. any key blank other than an original

**non removable key** adj. a key which has one or more cuts on it which trap the key in the lock upon insertion

**nose** n. the part of a non-cylinder lock which contains the keyway and rotates within a horn

**NRK** abb. non removable key

**NRP** abb. non removable pin

## -O-

**odometer method** n. a means of progressing key bittings using a progression sequence of right to left.

**one bitted** adj. of or pertaining to a cylinder which is or is to be combined to keys cut to the manufacturer's reference number one biting

**one column progression** n. a process wherein key bittings are obtained by using the cut possibilities in one column of the key biting array

**one pin master key** n. a master key for all combinations obtained by progressing only one biting position

**open gated** adj. pertaining to a lever tumbler whose gate is in the edge of the tumbler

**opening index** n. the index or mark to which a combination is dialed in order to effect an opening

**operating key** n. any key which will properly operate a lock or cylinder to lock or unlock the lock mechanism and is not a control key or reset key, see also "change key"

# Terminology

**operating shear line** n. any shear line which allows normal operation of a cylinder or lock

**original key blank** n. a key blank supplied by the lock manufacturer to fit that manufacturer's specific product

## -P-

**pack** n. the set of tumblers in a lever tumbler or combination lock

**padlock** n. a detachable and portable lock with a shackle which locks into its case

**page master key** n. the three-pin master key for all combinations listed on a page in the standard progression format

**paracentric** adj. 1. of or pertaining to a keyway with one or more wards on each side projecting beyond the vertical center line of the keyway to hinder picking  
2. of or pertaining to a key blank made to enter such a keyway

**pattern key** n. 1. an original key kept on file to use in a key-duplicating machine when additional keys are required  
2. any key which is used in a key-duplicating machine to create a duplicate key

**personal identification number** n. a series of numbers and/or letters associated with a particular individual as a means of identification

**pick** n. a tool or instrument, other than the specifically designed key, made for the purpose of manipulating tumblers in a lock or cylinder into the locked or unlocked position through the keyway, without obvious damage. v. to manipulate tumblers in a keyed lock mechanism through the keyway, without obvious damage, by means other than the specifically designed key

**pick key** n. a type of manipulation key, cut or modified to operate a lock or cylinder

**pin** v. to install pin tumblers into a cylinder and/or cylinder plug, see also "pin tumbler"

**PIN** abb. personal identification number

**pin chamber** n. the corresponding hole drilled into the cylinder shell and/or plug to accept the pin(s) and spring

**pin kit** n. a type of keying kit for a pin tumbler mechanism

**pin stack** n. all the tumblers in a given pin chamber, see also "pin stack height"

**pin stack height** n. the measurement of a pin stack, often expressed in units of the lock manufacturer's increment or as an actual dimension

**pin tray** n. see "layout tray"

**pin tumbler** n. usually a cylindrical shaped tumbler. Three types are normally used: bottom pin, master pin and top pin.

**pin tweezers** n. pl. a tool used in handling tumblers and springs

**pinning block** n. a holding fixture which assists in the loading of tumblers into a cylinder or cylinder plug

**pinning chart** n. a numerical diagram which indicates the sizes and order of installation of the various pins into a cylinder. The sizes are usually indicated by a manufacturer's reference number which equals the quantity of increments a tumbler represents.

**plug** n. the part of a cylinder which contains the keyway, with tumbler chambers usually corresponding to those in the cylinder shell

**plug follower** n. a tool used to allow removal of the cylinder plug while retaining the top pins, springs, and/or other components within the shell

**plug holder** n. a holding fixture which assists in the loading of tumblers into a cylinder plug

**plug retainer** n. the cylinder component which secures the plug in the shell

**positive locking** n. the condition brought about when a key cut which is too high forces its tumbler into the locking position. This type of locking does not rely on gravity or spring pressure.

**post (of a key)** n. the portion of a bit key between the tip and the shoulder, to which the bit(s) is attached

**practical key changes** n. pl. the total number of usable different combinations available for a specific cylinder or lock mechanism

**privacy key** n. a key which operates an SKD cylinder, see also "emergency key"

**profile cylinder** n. a cylinder with a usually uniform cross section, which slides into place and usually is held by a mounting screw. It is typically used in mortise locks of non-U.S. manufacture.

**progress** v. to select possible key bittings, usually in numerical order, from the key biting array

**progression** n. a logical sequence of selecting possible key bittings, usually in numerical order from the key biting array

**progression column** n. a listing of the key biting possibilities available in one biting position as displayed in a column of the key biting array

**progression list** n. a biting list of change keys and master keys arranged in sequence of progression

**progressive** n. any biting position which is progressed rather than held constant

**proprietary** adj. of or pertaining to a keyway and key section assigned exclusively to one end user by the lock manufacturer. It may also be protected by law from duplication.

## -R-

**radiused blade bottom** n. the bottom of a key blade which has been radiused to conform to the curvature of the cylinder plug it is designed to enter

**random master keying** n. any undesirable process used to master key which uses unrelated keys to create a system

**rap** v. 1. to unlock a plug from its shell by striking sharp blows to the spring side of the cylinder while applying tension to the plug  
2. to unlock a padlock shackle from its case by striking sharp blows to the sides in order to disengage the locking dogs

**ratchet lock** n. any lock which incorporates a ratchet device allowing locking in more than one position

**read** v. to decode a lock combination visually without disassembly of the lock or cylinder

**recombine** v. to change the combination of a lock, cylinder or key

**recore** v. to rekey by installing a different core

**register groove** n. the reference point on the key blade from which some manufacturers index the biting depths

**rekey** v. to change the existing combination of a cylinder or lock

**removable cylinder** n. a cylinder which can be removed from a locking device by a key and/or tool

**removable shackle** adj. referring to a type of padlock which is unlocked by removing the shackle from the case

**repin** v. to replace pin tumblers, with or without changing the existing combination

**restricted** adj. of or pertaining to a keyway and corresponding key blank whose sale and/or distribution is limited by the lock manufacturer in order to reduce unauthorized key proliferation

**retainer** n. a component which is clipped or staked in place to maintain the working relationship of other components

**RH** abb. right hand

**RHR** abb. right hand reverse bevel

**rim cylinder** n. a cylinder typically used with surface applied locks and attached with a back plate and machine screws. It has a tailpiece to actuate the lock mechanism.

# Terminology

**rim lock** n. a lock or latch typically mounted on the surface of a door or drawer

**RL** abb. The title "Registered Locksmith" as awarded by ALOA

**RM** abb. row master key

**root depth** n. the dimension from the bottom of a cut on a key to the bottom of the blade

**rotating constant** n. one or more cut(s) in a key of any level which remain constant throughout all levels and are identical to the top master key cuts in their corresponding positions. The positions where the top master key cuts are held constant may be moved, always in a logical sequence.

**rotating constant method** n. a method used to progress key bittings in a master key system, wherein at least one cut in each key is identical to the corresponding cut in the top master key. The identical cut(s) is moved to different locations in a logical sequence until each possible planned position has been used.

**row master key** n. the one-pin master key for all combinations listed on the same line across a page in the standard progression format

## -S-

**S/A** abb. sub-assembled

**Scandinavian padlock** n. a cast case padlock with an elliptical cross section. The locking mechanism is a set of rotating disc tumblers, which engage notches in the cast shackle and may be rotated by the angled cuts cast on the key.

**screen door lock** n. a lock designed for the thin stiles typically found on screen and storm doors

**second generation duplicate** n. a key reproduced from a first generation duplicate

**security collar** n. a protective cylinder collar, see also "cylinder guard"

**selective key system** n. a key system in which every key has the capability of being a master key. It is normally used for applications requiring a limited number of keys and extensive cross keying.

**selective master key** n. an unassociated master key which can be made to operate any specific lock(s) in the entire system in addition to the regular master key(s) and/or change key(s) for the cylinder without creating key interchange

**sequence of progression** n. the order in which biting positions are progressed to obtain change key combinations

**seven column progression** n. a process wherein key bittings are obtained by using the cut possibilities in seven columns of the key biting array

**seven pin master key** n. a master key for all combinations obtained by progressing seven biting positions

**shackle** n. 1. the part of a padlock, which passes through an opening in an object or fits around an object and is ultimately locked into the case  
2. the portion of a restraint which fits around the wrist, ankle, neck, waist or thumb

**shackle retaining pin** n. a pin which keeps an unlocked shackle heel in the case

**shackle spring** n. a spring which pushes the shackle into the open position when the padlock is unlocked

**shear line** n. a location in a cylinder at which specific tumbler surfaces must be aligned, removing obstruction(s) which prevented the plug from moving

**shell** n. the part of the cylinder which surrounds the plug and which usually contains tumbler chambers corresponding to those in the plug

**shim** n. a thin piece of material used to unlock the cylinder plug from the shell by separating the pin tumblers at the shear line, one at a time v. to unlock a cylinder plug from its shell by using a shim

**shoulder** n. any key stop other than a tip stop, see also "bow stop"

**shove knife** n. a tool used with a set-up plug which pushes the springs and pin tumblers into the cylinder shell

**shrouded shackle** n. a shackle which is protected from cutting or tampering by design or by the use of secondary shields

**sidebar** n. a cylinder component which enters gate(s) in tumbler(s) to allow plug rotation

**sidebar lock** n. a lock mechanism which incorporates a sidebar

**simplex key section** n. a single independent key section which cannot be used in a multiplex key system

**single-acting lever tumbler** n. a lever tumbler which must be moved a minimum distance to allow travel of a bolt, but cannot be moved so far as to restrict travel of the bolt

**single key section** n. an individual key section which can be used in a multiplex key system

**single step progression** n. a progression using a one increment difference between bittings of a given position

**six column progression** n. a process wherein key bittings are obtained by using the cut possibilities in six columns of the key biting array

**six pin master key** n. a master key for all combinations obtained by progressing six biting positions

**SKD** sym. symbol for "single keyed", normally followed by a numerical designation in the standard key coding system; e.g., SKD1, SKD2, etc. It indicates that a cylinder or lock is not master keyed but is part of the keying system

**SMK** abb. sub-master key

**spacing** n. the dimensions from the stop to the center of the first cut and/or to the centers of successive cuts

**spindle** n. a component which transfers rotary motion from outside a lock or latch case to an inner mechanism

**split pin master keying** n. a method of master keying a pin tumbler cylinder by installing master pins into one or more pin chambers

**spool pin** n. usually a top pin which resembles a spool, typically used to increase pick resistance

**spring cover** n. a device for sealing one or more pin chambers

**spring seat** n. the point at which a spring is anchored, located or attached and at which (from which) it exerts force

**standard key coding system** n. an industry standard and uniform method of designating all keys and/or cylinders in a master key system. The designation automatically indicates the exact function and keying level of each key and/or cylinder in the system, usually without further explanation.

**standard progression format** n. a systematic method of listing and relating all change key combinations to all master key combinations in a master key system. The listing is divided into segments known as blocks, horizontal groups, vertical groups, rows, and pages, for levels of control.

**stepped tumbler** n. a special (usually disc) tumbler used in master keying. It has multiple bearing surfaces for blades of different key sections.

**stop (of a key)** n. the part of a key from which all cuts are indexed and which determines how far the key enters the keyway

**sub-master key** n. the master key level immediately below the master key in a system of six or more levels of keying

**substitution code** n. a code whose individual characters are converted to individual key cuts or combination numbers by means of a reference table

## -T-

**T-handle** n. a T-shaped handle assembly which may be lockable

**tailpiece** n. an actuator attached to the rear of the cylinder, parallel to the plug, typically used on rim, key-in-knob or special application cylinders

# Terminology

**theoretical key changes** n. pl. the total possible number of different combinations available for a specific cylinder or lock mechanism

**three column progression** n. a process wherein key bittings are obtained by using the cut possibilities in three columns of the key bitting array

**three pin master key** n. a master key for all combinations obtained by progressing three bitting positions

**three point latch** n. a self-latching device designed to latch a door at the top, bottom and edge

**throw member** n. an intermediate actuator which engages the rear of the plug to transfer motion to a cam, tailpiece or other actuator

**tip** n. the portion of the key which enters the keyway first

**tip stop** n. a type of stop located at or near the tip of the key

**TMK** abb. top master key

**toe (of a shackle)** n. that part of the shackle, which may be removed from the padlock body

**tolerance** n. the deviation allowed from a given dimension

**top master key** n. the highest level master key in a master key system

**top of blade** n. the bitted edge of a single bitted key

**top pin** n. usually a cylindrical shaped tumbler, usually flat on both ends and installed directly under the spring in the pin stack

**total position progression** n. a process used to obtain key bittings in a master key system wherein bittings of change keys differ from those of the top master key in all bitting positions

**try-out key** n. a manipulation key which is usually part of a set, used for a specific series, keyway, and/or brand of lock

**tubular key** n. a key with a tubular blade. The key cuts are made into the end of the blade, around its circumference.

**tubular key cylinder** n. a cylinder whose tumblers are arranged in a circle and which is operated by a tubular key

**tumbler** n. a movable obstruction of varying size and configuration in a lock or cylinder which makes direct contact with the key or another tumbler and prevents an incorrect key or torque device from activating the lock or other mechanism

**tumbler spring** n. any spring which acts directly on a tumbler

**two column progression** n. a process wherein key bittings are obtained by using the cut possibilities in two columns of the key bitting array

**two pin master key** n. a master key for all combinations obtained by progressing two bitting positions

**two-step progression** n. a progression using a two increment difference between bittings of a given position

## -U-

**UL** abb. Underwriters Laboratories

**UL listed** adj. listed in a directory as having passed specific Underwriters Laboratories testing

**unassociated change key** n. a change key which is not related directly to a particular master key through the use of certain constant cuts

**unassociated master key** n. a master key which does not have change keys related to its combination through the use of constant cuts

**uncombined** adj. 1. of or pertaining to a cylinder which is or is to be supplied without keys, tumblers and springs 2. of or pertaining to a lock, cylinder or key in which the combination has not been set

**uncontrolled cross keying** n. a condition in which two or more different keys under different higher level keys operate one cylinder by design; e.g., XAA1 operated by AB, AB1. Note: This condition severely limits the security of the cylinder and the maximum expansion of the system, and often leads to key interchange.

**unidirectional cylinder** n. a cylinder whose key can turn in only one direction from the key pull position

## -V-

**vertical group master key** n. the two-pin master key for all combinations listed in all blocks in a line down a page in the standard progression format

**VGM** abb. vertical group master key

**visual key control** n. a specification that all keys and the visible portion of the front of all lock cylinders be stamped with standard keying symbols

**VKC** abb. visual key control

## -W-

**ward** n. a usually stationary obstruction in a lock or cylinder which prevents the entry and/or operation of an incorrect key

**ward cut** n. a modification of a key which allows it to bypass a ward

**warded** adj. having one or more wards

## -X-

**X** sym. symbol used in hardware schedules to indicate a cross-keyed condition for a particular cylinder; e.g., XAA2, XIX (but not AX7)

## -Z-

**zero bitted** adj. of or pertaining to a cylinder which is or is to be combined to keys cut to the manufacturer's reference number "0" bitting
