

God is always at the center of every thing from an atom's nucleus to the center of the entire Universe itself.

The pulse surging reactionless drive Primal Point of Unity's silently oscillating Toroidal Pinch Centroid Nozzle is at the epicenter of the novel Flux Thruster Atom Pulsar.

IMPLODING CAVITY in a liquid irradiated with ultrasound is captured in a high-speed flash photomicrograph (above). The implosion heats the gases inside the cavity to 5,300 degrees Celsius. Since this cavity formed near a solid surface, the implosion is asymmetric, expelling a jet of liquid at roughly 400 kilometers per hour. Both the heat and the jet contribute to a unique chemical environment in the liquid. The diameter of the cavity is about 150 microns. The drawing (left) shows the stages of cavity implosion and the formation of the jet. The cavity is spherical at first and then shrinks rapidly. The jet develops opposite the solid surface and moves toward it.

Witness that the imploding water bubble is in the configuration of a spherical torus. Everything in the entire Universe is based upon the two cycle surge pump purification process consisting of implosion/explosion

The inestimable Sunflower Hologram Toroid Map
manufacturing blueprint construction diagram for the

The novel Flux Thruster Atom Pulsar

Shown are quantum positioned discrete numbers.

All numbers are created out of the decimal point which permanently continues to exert its influence and superimposed harmonics trinary dwell setting determining impact upon them. The pulse surging reactionless drive Primal Point of Unity is at the center of the decimal point which is the crucial entity behind the sustained existence of the rational numbers.

URANIUM HAS 92 PROTONS

GOLD HAS 79 PROTONS

The electron shell orbits around the nucleus are not haphazard, random and sloppy pathway trajectories as scribbled in the atoms above. They are when correctly graphically illustrated neat, precise, and self replicating logarithmic spiral Polarized Fractal Geometric Equations which follow along the perpetual motion bifilar Doubling Circuits.

All types of life forms receive the mysterious underpinning ley lines diamond grain crystal lattice structure reticulation pattern imprint energy grid dot matrix.

The Star Tablet

Forty days before the arrival of that officer at Chínig, the Báb collected all the documents and Tablets in His possession and, placing them, with His pen-case, His seals, and agate rings, in a coffer, entrusted them to the care of Mullá Báqir, one of the Letters of the Living. To him He also delivered a letter addressed to Mírzá Ahmad, His amanuensis, in which He enclosed the key to that coffer. He urged him to take the utmost care of that trust, emphasised the sacredness of its character, and bade him conceal its contents from anyone except Mírzá Ahmad.

Mullá Báqir departed forthwith for Qazvín. Within eighteen days he reached that town and was informed that Mírzá Ahmad had departed for Qum. He left immediately for that destination and arrived towards the middle of the month of Shá'bán.¹ I was then in Qum, together with a certain Sádiq-i-Tabrizí, whom Mírzá Ahmad had sent to fetch me from Zarand. I was living in the same house with Mírzá Ahmad, a house which he had hired in the Bágh-Panbín quarter. In those days Shaykh 'Azím, Siyyid Ismá'il, and a number of other companions likewise were dwelling with us. Mullá Báqir delivered the trust into the hands of Mírzá Ahmad, who, at the insistence of Shaykh 'Azím, opened it before us. We marvelled when we beheld, among the things which that coffer contained, a scroll of blue paper, of the most delicate texture, on which the Báb, in His own exquisite handwriting, which was a fine shikastih script, had penned, in the form of a pentacle, what numbered about five hundred verses, all consisting of derivatives from the word "Bahá."² That scroll was in a state of perfect preservation, was spotlessly clean, and gave the impression, at first sight, of being a printed rather than a written page. So fine and intricate was the penmanship that, viewed at a distance, the writing appeared as a single wash of ink on the paper. We were overcome with admiration as we gazed upon a masterpiece which no calligraphist, we believed, could rival. That scroll was replaced in the coffer and handed back to Mírzá Ahmad, who, on the very day he received it, proceeded to Tíhrán. Ere he departed, he informed us that all he could divulge of that letter was the injunction that the trust was to be delivered into the hands of Jináb-i-Bahá³ in Tíhrán.

Plate no. 3

¹ June 12-July 11, 1850 A.D.

² According to "A Traveller's Narrative" (p. 42), the Báb had produced no less than three hundred and sixty derivatives from the word "Bahá."

³ Title by which Bahá'u'lláh was designated in those days.

The most sacred of all historic religious masterpieces is
The Star Tablet of the unapproachable Most Great Name of God.

Ask someone to pick a number from 1 to 31 inclusive. Don't tell me the number, I will

The doubling of the music scale is also based upon thirds

Music

Another logarithmic scale is that of music. Each musical sound has a frequency, which is the number of vibrations per second. For instance, on a piano keyboard the note C above middle C has a classical standard frequency of 512 vibrations per second; this means that the piano string for this note vibrates 512 times per second. But this scale is also logarithmic with base 2, because the octaves for each note are found by doubling or halving the frequency.

The frequency of each C note can be expressed as some power of 2. Thus, the musical scale is logarithmic, with base two. On a piano keyboard, the lower frequencies are spread out at the left and the higher frequencies are compressed at the right.

The entire musical scale, not only the C's, is logarithmic in the same way. The table shows the frequencies of all tones in this system. Notice that for every note, raising an octave doubles the frequency.

To sound a note an octave higher, it is necessary to double the number of vibrations per second. That is, the next higher C has a frequency of 1024. On the other hand, to sound a note an octave lower, it is necessary to halve the frequency. Thus, middle C has only 256 vibrations per second, and the C below that, 128 vibrations per second.

The harmonious major sixth interval is given by two notes that have a ratio approximately equal to ϕ .

Modern Hungarian pianist and composer Béla Bartok made extensive use of the 'Sectio Aurea' (Golden Section) in his music, often using it at the climax of a piece or at the beginning of a recapitulation.

$$\begin{array}{l} C = 256 \text{ cycles/second} \\ E = 162 \text{ cycles/second} \\ A = 432 \text{ cycles/second} \end{array} \left[\begin{array}{l} \frac{332}{222} = 1.58 \\ \frac{729}{432} = 1.68 \end{array} \right]$$

The no quantum limit threshold barriers macro size scale level

The novel spherical torus Flux Thruster Atom Pulsar electrical venturi space-time implosion field generator coil harnesses the unseen Eternal Aetheron Flux Monopole Emanations and instantly reacting dual magnetic field flows on the no quantum limit threshold barriers macro size scale level. THE DIRECT-TIE BETWEEN DISCRETE NUMBERS AND NUCLEAR ENERGY SPIN ANGLE WAVE FORMS

The star is a logarithmic spiral

The Y axis is in numerical quadrature with every fourth number equal to multiples of four and five. The end number is counted twice when counting in a straight line.

The X axis is in numerical quadrature with every fourth number equal to multiples of one and eight. The end number is counted twice when counting in a straight line.

The Z axis is in numerical quadrature with every fourth number equal to multiples of two and seven. The end number is counted twice when counting in a straight line.

PRINCIPLES OF CROSS ADDITION

All numbers when added together in a horizontal row will total a discrete number.
 Examples: 16 (1 + 6) = 7; 32 (3 + 2) = 5; 64 (6 + 4) = 10 (1 + 0) = 1; 128 (1 + 2 + 8) = 11 (1 + 1) = 2; 256 (2 + 5 + 6) = 13 (1 + 3) = 4; 512 (5 + 1 + 2) = 8

Standard Multiplication Table:

Discrete numbers are the mysterious underpinning cartographic ley lines of the entire Universe. Even when there are many digits in a number it will still correspond to a single specific location point. No matter how big the number is there is still never more than one positioned denoted by it.

DIVIDING BY SEVEN

Repeating decimal series of numbers are not endless and do have a discrete number single digit fundamental physical property value characteristic quality. The amazing polar number set member opposite of seven is two. To find the correct cross addition sum result answer of any number when dividing by seven add the left side of the decimal point with the cross addition sum result answer on the right side of the decimal point.

Example:

$$\begin{aligned} 8 \div 7 &= 1 + ? \\ .142857 \dots &= 4 \\ 1 + 4 &= 5 \\ 8 \div 7 &= 5 \end{aligned}$$

$$1 \div 7 = .142857 \dots = 4$$

$$2 \div 7 = .285714 \dots = 8$$

$$3 \div 7 = .428571 \dots = 3$$

$$4 \div 7 = .571428 \dots = 7$$

$$5 \div 7 = .714285 \dots = 2$$

$$6 \div 7 = .857142 \dots = 6$$

$$7 \div 7 = 1$$

$$8 \div 7 = 1.142857 \dots = 5$$

$$9 \div 7 = 1.285714 \dots = 9$$

partial proof of theorem:

$$\begin{aligned} 7 \times 4 &= 28; (2 + 8) = 10; (1 + 0) = 1 \\ 7 \times 8 &= 56; (5 + 6) = 11; (1 + 1) = 2 \\ 7 \times 3 &= 21; (2 + 1) = 3 \\ 7 \times 7 &= 49; (4 + 9) = 13; (1 + 3) = 4 \\ 7 \times 2 &= 14; (1 + 4) = 5 \\ 7 \times 6 &= 42; (4 + 2) = 6 \\ 7 \times 1 &= 7 \\ 7 \times 5 &= 35; (3 + 5) = 8 \\ 7 \times 9 &= 63; (6 + 3) = 9 \end{aligned}$$

DIVIDING BY TWO

The cross addition sum result answer of dividing by two is the multiplication series of five who's opposite polar number pair set member multiplication series is four when dividing by seven. The combined tables total the never changing number nine when added together.

$$1 \div 2 = 5$$

$$2 \div 2 = 1$$

$$3 \div 2 = 1.5 = 6$$

$$4 \div 2 = 2$$

$$5 \div 2 = 2.5 = 7$$

$$6 \div 2 = 3$$

$$7 \div 2 = 3.5 = 8$$

$$8 \div 2 = 4$$

$$9 \div 2 = 4.5 = 9$$

The hexagonal symmetry of snowflakes is created
from the Aetheron Flux Monopole Spires polarization.

1. Photomicrographs of typical natural snow crystals, showing almost perfect hexagonal symmetry in their habit. The crystals are, in each case, approximately 2 mm in diameter (Magono & Lee, 1966).

A sample case in point of everything consisting of Aetheron Flux Monopole Spires is this unidentified creature which has the star shaped configuration along with the centroid nozzle that allows it to travel at speeds faster than the space shuttle or this sliced in half pear with the five pointed star at the epicenter.

The Plankton Stalkers

Plankton, plankton everywhere but not a patch of it to see" has been the lament of some oceanographers. These mite-size plants and animals form the basis of the marine food web, but little is known about their density or distribution—in particular, whether plankton occurs in small patches and clumps that allow marine organisms, including zooplankton, to graze on it.

A system called a video plankton recorder, or VPR, may help oceanographers answer those questions. Developed by researchers at Woods Hole Oceanographic Institution, the technology promises to revolutionize the study of plankton. "Even humans hanging out of a submarine can't see things as clearly as the VPR can," comments Peter H. Wiebe, chairman of the biology department at Woods Hole.

By towing the VPR behind a research vessel, scientists can view their subject matter in its natural environment. The device, invented by biologists Cabell S. Davis and Scott M. Gallager, consists of a red strobe light that is synchronized with the shutters of four video cameras, each set to a different high magnification. The strobe flashes 60 times a second, permitting the tracking of rapidly moving creatures. The VPR can record animals ranging in size from less than one millimeter to one centimeter, Davis says.

This view of plankton is not available from other technologies. Nets smear samples as well as picking up and mixing together creatures from different levels of the water column. Nets also obscure densities: everything caught becomes one messy mass. Even a more refined net system

that is opened and closed electronically—called a moeness, or the "moeiness lonster"—destroys fragile animals. Higher-tech systems also have shortcomings. Optical particle counters do not produce pictures. And for now at least, acoustic systems indicate density, but not composition.

In its few trial runs, VPR has already surprised investigators. Davis was able to see the orientation of zooplankton, information lost in nets. And "we saw lots of organisms we couldn't identify," Davis notes. Of particular significance was the observation of planktonic micropatches. The existence of such small clusters has been hypothesized, but "these data show that microscale patchiness does, in fact, exist in the ocean," Davis reports.

One drawback to the VPR, Wiebe says, is that only small amounts of water are sampled. And, Davis adds, creatures are not caught, so they cannot be examined later. Davis and Gallager ultimately intend to preserve everything they photograph in a trap. Although their initial attempts to do so failed, they revealed a fascinating fact about zooplankton.

When Davis tested the equipment, he found that zooplankton easily avoided the trap. "The dexterity of these bugs was truly amazing," Davis describes. Imagine you have shrunk to one millimeter, he explains. A nozzle measuring 60 feet across comes at you at 2,000 miles an hour. When it is 60 feet away, you accelerate from a dead stop to more than 2,000 miles an hour in the opposite direction, in one sixtieth of a second. Creatures do not avoid the VPR, however. Says Davis, "I really think we have a 'Stealth' plankton recorder."

The inestimable Sunflower Hologram Toroid Map

The novel spherical torus Flux Thruster Atom Pulsar electrical venturi space-time implosion field generator coil exterior surface reference as viewed from the horizontal plane graphically illustrating the positive and negative polarity sign symbol diamond quantum tile astrophysical shape shifters with only one sixth of them ever being activated at any one given instance.

There are more pyramids which are named Bā' than any other name. The reason why the name Bā' is so recurrent in Egyptology is because the Bā' means the soul which they believed would descend upon them after their death.

IN ENERGY TRANSFORMATION EVERYTHING
STARTS FROM THE CENTER OUTWARDS

Double Delight

When the United States declared the rose its national flower, no particular variety was named. If one had been singled out, Double Delight would surely have been a contender for its colors if nothing else. Two thirds of the flag are all we're likely to get, there being no blue roses.

The inestimable Sunflower Hologram Toroid Map

The maximum compression exists at the pulse surging reactionless drive Primal Point of Unity and the maximum expansion exists at the horizontal equatorial transition line point of inflexion which are extreme opposites of one another.

The inestimable Sunflower Hologram Toroid Map

The unseen Eternal Aetheron Flux Monopole Emanations are the transparent 'Z' axis traveling through the center of the diamond quantum tile astrophysical shape shifters.

The inestimable Sunflower Hologram Toroid Map

The diamond quantum tile astrophysical shape shifters are elastic with their configuration changing from small to large to small again. The volumetric proportions change from:

this. . .

The maximum expansion of a diamond quantum tile astrophysical shape shifter at the horizontal equatorial transition line point of inflexion.

to this,

The contracting diamond quantum tile astrophysical shape shifter nearing the Primal Point of Unity.
