'I've sworn a vow of celibacy, so keep it business, young lady.' He led her back down, asking Jack to brief her, and to show our guest around. Jimmy went down to his parents at the old house, not returning till late, the gossip all around the house by then.

Secret weapons

Jimmy grabbed me one evening and told me to pack a bag, just me. Sixteen hours later we landed in Nairobi, picked up by Cosy and a team of Pathfinders, and driven directly to the large farm north of the orphanage.

The place bustled with kids in blue, the crops looking to be well attended, if not lovingly over-attended. We parked up, Cosy leading us on through thick trees to a part of the farm I had not visited. Two Pathfinders stood protecting a sturdy gate in a high fence, their presence a puzzle. They saluted and greeted us, a few words exchanged. Inside the highly protected carrot patch I frowned at the fence, Cosy leading us on. At the next gate we again found a high fence, this time guarded by armed Chinese soldiers. Now I was right confused. I practised my Chinese, which was pretty good these days, and they let us through. We approached a large colonial house with bars on the ground floor windows, surrounded by neatly tended gardens and lawns. Through the main door we again passed Pathfinders, this time in civilian clothes, and found a busy hallway, busy with kids of all ages – from twelve to eighteen in my estimation.

A girl, appearing to be around sixteen, approach Jimmy with a huge smile. She greeted him – in Chinese, followed quickly by Russian and French. Conscious of the fact that my mouth was open, I closed it and faced Jimmy. He simply smiled back and led me on, leading me to a computer room, a handful of kids sat behind the screens.

A twelve-year-old child looked up at me. ‘Paul Holton. Any more crazy helicopter stunts?’ the local boy asked in a posh English accent.

‘Er ... no, unfortunately,’ I answered, now seeing what the child was viewing, a screen of algebraic formulas that were way beyond me.

Jimmy led me to the next room, a play area dominated by a large roulette table.

‘Aren’t they a bit young for gambling?’ I asked.

Jimmy called two youths across, a boy and a girl. As he placed his finger on various squares, and groups of squares, they gave the odds of winning – whether with a single zero wheel or an American double zero wheel.

‘OK,’ I said. ‘They’re very smart.’

‘They’re all Mensa rated, IQs off the scale.’

‘That’s nice. So why the security?’

‘Why do you think, dumb fuck?’

He hadn’t called me that for a while, so I must have missed something. ‘They’ve ... had the blood?’

He nodded. ‘One in three hundred has a genetic aberration, so we’ve got twelve kids here. When they’re ready, I’ll put them to work solving problems.’

‘Like...?’

‘Things like ... electric cars, aircraft engines, computer software, and even political modelling. But what else do you think they could lend their talents to?’

I gave it some thought. And shrugged.

‘The blood?’

‘Ah, they can reverse engineer it,’ I realised.

‘And more, much more.’

‘In the Congo, there’re twenty thousand kids getting injections. So ... that would be –’

‘A lot of smart kids,’ Jimmy finished off, my maths a bit slow. ‘Harvested like ripe tomatoes, put to use solving the world’s problems.’

‘The Chinese obviously know, who else?’ I asked.

‘Just them. No one else for now.’

‘Is that ... wise?’

‘If the Chinese are involved I can control the projects. The kids won’t develop nuclear weapons – or trade the stock markets.’ I found myself nodding, Jimmy adding, ‘Not a word to anyone, not even Helen.’ He held his stare on me.

Defensively, I said, ‘There are many things I haven’t told her, and won’t.’

‘This is my secret weapon, our best hope.’

‘You think they could find a solution to 2025?’ I puzzled.

‘It’s a hope, but at least there is a hope. And I had some good news this week.’

‘Good news?’ I repeated. He wouldn’t answer.

We greeted all of the kids, conversing in a few languages. I even sat and played a computer game with one of the students. A middle aged English teacher turned up in a white lab coat, greeting Jimmy warmly and updating us on the kids’ remarkable progress. The two eldest youths were now tackling a mathematics degree by post, a home study course. Another had passed a chemistry degree, his age inflated for the official records. The precocious thirteen year old was putting me to shame with my HND from Kingston Polytechnic.

‘Is there one of these in the Congo?’ I asked.

‘No, they’ll come here when they’re spotted,’ Jimmy explained. ‘Too soon yet, it takes five or six years at least to spot them.’

The teacher put in, ‘The girl, Kako, is the best student. She’s coming up to sixteen, and digests encyclopaedias; the other students like to ask questions about places and people around the world. I gave her a one thousand-question test and she got them *all* right. She even spots errors in the books, so we have fun writing to the publishers each week.’

‘And their mental well-being?’ I asked.

The man answered, ‘If they’ve got their pet projects they want nothing else in the world, no desire to be anywhere else. They exhibit autistic characteristics, in that they focus hard on just one area of study. None have a desire to travel outside of the safe confines they find here.’

Jimmy explained, ‘They grew up in the orphanage, they’ve known nothing else.’

He led me out of the house, and to a large workshop. Inside we found a wide array of tools and machines, benches of electronic components, and more computers. Two boys stood at benches making remote controlled toy cars. At Jimmy’s request they placed the toys down, racing them around the central walkway using radio remote control. Jimmy and I had a go, mine crashing. Still, it gave them something to put back together. Beyond the workshop we inspected a small laboratory, finding two students in white coats and protective glasses concocting something in beakers. The next building appeared to be simply a regular greenhouse, stuffed full of large plants, mostly tomatoes.

‘They’re experimenting with increasing yields,’ Jimmy explained. ‘The soil here, its from the Congo, some of the best soil in the world. So far they’ve grown tomatoes twice the normal size, melons weighing a tonne.’

I handled a ripe tomato. ‘How far advanced are they, against say ... students at MIT in America?’

‘Individually, on par. But collectively they’re much better. They’ve been raised to work in teams, and deliberately so. I’ll give them problems as a group, each tackling one aspect of it; division of labour.’

‘And world politics?’

‘Not a hope, I’m afraid. This lot will help fix foundation problems, helping to ease political problems in certain areas; slightly better electric car, slightly better food production. Science they can tackle, people they can’t.’

I stopped dead, a heavy frown taking hold of my face. ‘Helen!’ I turned to face Jimmy.

‘Unlikely. It’s not normally passed on. At best, you’d have a one in three thousand chance of your daughter being autistic.’

‘You said she has a future,’ I quickly got out.

‘Not as a mad scientist,’ he assured me with a grin.

We toured the main orphanage, greeting kids and teachers in neat military formations as they walked about, then sat with Anna and her staff, young Mary now toddling. I pinched the little lady away, holding her hands as she toddled around the courtyard in her nappies. Her English was not great, seemed they were teaching the girl Dutch and German; she understood “yah” and “nein”. With Mary sat on my lap, and sharpening pencils till they were an inch long, Anna briefed us on problems and progress. They made us lunch in the staff canteen, getting to meet some of the teachers, one an English graduate on an exchange visit. Little more than two hours after arriving we headed back to the airport, a quick catch-up with Rudd as we sat waiting our flight back.

Rudd produced a bank statement, stopping to stare at it, lifting the paper to his face. Facing Jimmy he said, ‘Someone has transferred two hundred and forty million pounds to the account!’

‘What?’ I gasped in a whisper. We both stared at Jimmy, and waited.

‘A ... foreign government wants to help out,’ he calmly explained.

‘Jesus,’ I let out. ‘That’s ... a lot of help.’

‘Keep it under wraps. And Rudd, I want a cut in spending here, not an expansion. Mawlini is costing too much, trim some of the activities – five or ten percent. Allocate more funds to RF UK.’

‘What is this money for?’ Rudd puzzled.

‘It’ll be used for a variety of things, but not for a while. Transfer twenty million to the Congo, the general fund, and earmark another thirty million to build smelting plants in the Congo. But I want the roads in the Congo treated as a priority, followed by an expansion of mining. Oh, the planned port in the north of Somalia, you can make a start on that. Then, I want an investment account set-up here for the excess money – stock markets. It may as well make some money whilst it’s sat there.’

We left Rudd looking stunned. My head was spinning as well, wondering if a particular government was trying to buy favour with us, and considering the implications. The French came to mind, but Jimmy said no.

New year

There was an outside chance that Helen would give birth on Christmas day or New Year, a month or so premature – which Jimmy assured us was normal for a mother-to-be injected with stems. The lads had a betting pool running, and even Michelle made a bet, Big Paul betting on a boy. We’d been visiting the Harley Street clinic run by Sykes and his mob, the doctors aware of Helen’s condition. We’d also had the benefit of calls to Anna in Kenya; she’d been through it without problem.

Anna had opted for a “C-Section” on Jimmy’s advice, oddly enough for the sake of the child. Helen was not averse to a “C-Section”, not least because the scar would be gone in a few days. I left the decision to her. On Jimmy’s advice, I also left the name to Helen, so long as it was not something exotic. But, after some

head scratching, she had gone and asked Jimmy what we called the child before. He took some persuading, but finally relented; our first daughter was previously called Michelle. We both liked the name, but wondered if the “M” Group Michelle could have ever had any influence previously. Helen liked the idea of the nickname “Shelly”. It was a done deal.

The Cubans had visited Mapley and inspected it at length, their first troop of fifty arriving a week after we had returned, keen to get started. With the other new recruits in attendance, the place was buzzing with activity. It was too cold for tents, but the barrack blocks just about housed everyone, some people on camp beds. The Cubans tackled Faulty Towers with vigour, the course now involving metal cutting with grinders and acetylene torches. They were worked hard twelve hours a day.

They found the Silo Stiffy dummies fascinating, Jimmy offering to send a few out to Cuba. The climbing wall was generally wet from the rain, but the recruits went up and down till their fingers were sore and their limbs hurt. Whilst they were training, a Cuban representative took up station in the HQ building, along with a French representative, Bob Davies advising the French on recruitment, facilities and training standards. As with the UK unit, the French had created a supplemental group for internal work, but there was no way the French could deploy in January, Jimmy hinting at an earthquake to attend. We had accepted an Indian representative before Christmas, who had stayed a week and gone home without explanation. A replacement arrived two weeks later.

Four weeks after landing at Mapley, the Cubans were packed off to Mawlini for an intense six-week course. Since most of them were military doctors our expectations were high of quick passes. With my dear lady wife-to-be taking it easy, Jimmy and I travelled over to see Bob Davies, Mac up for a quick visit. We met in Bob’s office with Mac, Coup and Doc Graham, Coup now here so often he had a desk and a room.

Jimmy began, ‘I’ve been thinking about the necessary stages of alert, from an earthquake happening somewhere, to us deploying. This is what I think we need, assuming that we grow considerably, and attend more disasters in the future. First, we

need an alarm system here, reaching into every area, and the dorms. So if there's an alert at night you can wake everyone up.'

'A loud alarm then,' Mac said with a smile.

I said, 'Unlike *your* place, the people here don't get that hammered on a Saturday night!'

'Some do,' Bob admitted. 'It's their free time, so we can't get involved.'

'So a loud alarm and tanoy,' Jimmy repeated. 'And the same for all bases worldwide. We'll then need a system of reaching people off base, out of hours. I have a bit of software that will send faxes and automated messages, even to a non-fax numbers: when you pick up the receiver a mechanical voice reads a message over and over till you hang up. Bob, I want that looked into quickly. Then there are pagers; all instructors and senior staff should have pagers.'

'We have them on the deployed Supplemental Group,' Doc Graham put in.

'We should buy in bulk, then link them to the software,' Jimmy suggested. 'Mac, down at your end I doubt they would work, so senior people should keep their satellite phones handy at all times. We then need software in here to help with a deployment. We may send, let's say, just the ten best people from each unit, or a lot from one unit and none from another. We need to be able to say it's an all-out panic, or selective, or regional. We also need a way of saying that someone is skilled enough, say a new recruit, to attend certain types of deployments. So if they haven't passed minefield or survival yet, they could still do jobs in Europe.'

He took a breath. 'Then, we need a grade of alert, and type of alert. How about this: first, Unit Standby. That means the unit is on six hours standby to move. Then, Ready Alert, which means thirty-minute standby to move, transport arranged. Next, Deploy, which is easy enough, but let's split that between a simple non-emergency deployment and an emergency. So if we issue Emergency Deployment it means get there any which way as fast as possible. Regular deployment would be the next available flight. And let's consider part-timers – as in Turkey - and supplemental groups. They would deploy for only certain types of emergency. So, someday, god forbid, if I said Full Emergency Recall, Full Emergency Deployment – that means everyone who

remember their own name gets called in. If they're tired or pissed, they can sleep on the plane.'

He stood. 'We'll leave it with you, but by tomorrow I want a simple set of phrases to describe each stage. Then we'll look at the software and pagers. Oh, we already have some units who've graded their rescuers by teams, so that they have a team on standby, say - Alpha Team, and so on down. Let's get that formalised, huh. We could always say Deploy Alpha Teams only.'

We stood and opened the door, finding a man stood there about to knock, his hand hovering. 'Mister Silo.'

'Roger, good, you're just in time. You can sit in on this meeting. Everyone, this is Roger, your new Communications Officer.' They stood. 'Roger is good at anything electrical, and the kind of software we need to co-ordinate people like us. Put him to work immediately.'

We left them to it.

Given Helen's condition, Po came to us for a quiet New Year at the house, many of the "M" Group off to see relatives and to visit their hometowns. We invited a few people up for a dinner and sedate New Year's Eve party, Helen about to burst and getting much sympathy. On January the tenth she said she had enough, the London doctors called. They met us at a private clinic East of Cardiff for a "C-Section" that took far less time than I would have anticipated. I paced up and down the corridor whilst Jimmy sat calmly reading a magazine, not at the bedside because Helen had not wished to be seen operated upon. I had argued the case, but did not push it. Little more than twenty minutes later I was handed a small bundle in a white blanket, asked to wait before going in to Helen. Sitting next to Jimmy, I examined my red and wrinkly daughter, a silly grin from ear to ear.

Jimmy had called my parents earlier in the day without me knowing, and I looked up to find them stood there with Big Paul and Karl. They sat next to me, my mum taking the baby.

'Michelle,' I informed them in a whisper.

Helen was wheeled out fifteen minutes later, looking well, and taken to a private room, a separate bed made up for me. Jimmy checked Helen was OK before leaving us, my parents remaining for an hour before heading back to the house. When

the baby cried, Helen tried breastfeeding, making me a little jealous. And I said as much. I don't know how long I just stared at her, but it must have been hours. With Helen sleeping, I sat watching my daughter breathe, having been warned by Helen not to just sit there watching the baby breathe.

The next day my parents came back to the hospital for an hour, and Helen was discharged that afternoon, Helen surprising the medical staff with how quickly she had recovered. Back at the house, Sharon went all maternal, her own kids now eleven and thirteen and a right pair of trouble makers. Everyone in the "M" Group took a peek, Michelle allowed to hold her namesake. Jimmy handed me a large pile of faxes, telegrams, and letters in a plastic bag, informing us that presents had been left in our house.

In the house we found my parents waiting, Sandra cooking, our home warm and inviting, the hallway stuffed full of gifts. With Helen breastfeeding again, I trawled through the cards, the telegrams from world leaders, the rude cards from the RF staff: yes, I did have lead in my pencil, and yes I did know who the father was. My mum helped to open gifts, many simply kitchen utilities, some ornaments, baby clothes, plus a few books on helicopters. It felt as if Christmas had been extended and, with my parents there, quite nostalgic. Helen brought the baby down and handed her to me clean and fed, the four of us sat around the lounge as Sandra placed down snacks. As I took in the scene, I realised how far I had come since meeting Jimmy. And no matter what dangers the world faced, for now this was my little world. I didn't care what the world outside was up to.

Sound recall

On January 13th a quake struck El Salvador. By strange coincidence, Russian, British, Australian and Chinese RF units had been training in Cuba, all sizeable teams. Jimmy called me over to the office. With me stood there waiting expectantly, he dialled Mapley.

‘Bob Davies,’ came from the speakerphone.

‘Bob, Jimmy, got a pen?’

‘Fire away.’

‘Earthquake, El Salvador: in reference to those teams in Cuba *only* ... sound Emergency Deployment. Copy that?’

Bob read it back.

‘Good luck.’ With that Jimmy said I could go.

The teams were ordered over immediately, flying the short distance in Hercules and Antonovs hired for the exercise.

That evening, somewhere in the Cuban Government buildings, Castro and his men watched Cuban rescuers, in white uniforms and Cuban arm patches, land and deploy. With Cuban rescuers on the ground, many Cuban citizens watched their TV screens with interest. An American audience also watched the events unfold, the flags of many countries represented, but none of them American. The new US President was busy getting ready for his inauguration, but he had caught the news as well. ‘Timing was everything,’ Jimmy had often said. Now, our rescuers in El Salvador were getting more TV minutes than the new President.

As I watched the news with Helen, both keenly attentive, I remarked, ‘Yanks won’t be pleased. It’s their backyard, and there’s a shit load of communists helping out.’

‘Why have you never started a unit in the States?’

‘Jimmy says the timing should be right. Besides, it’ll be expensive as hell; the insurance is a killer over there. If a rescuer dies, we pay out ten million to the next of kin.’

‘It’s too much - it would bankrupt us. Will you open one there eventually?’

‘Yes, but either state run or run from Kenya. If the rescuers are hired by Kenya they can’t really sue anyone. Jimmy says that in the future the relatives sue us loads of times.’

Helen and I were officially on holiday at the moment, but when you only sleep four hours a night there are a lot of hours in the day. After four days we started to drift back to the house, attending our paperwork with the baby in the pram. And Michelle was a good sleeper, sometimes woken-up just to be fed on time. If she did cry, Jimmy would lift her out. She’d always stop crying for him, usually for me, less often for Helen. We all agreed; the girl was a flirt.

With the teams back from El Salvador for little more than the one day, Jimmy sat watching a website as it registered a quake in India. It was 3am, and Helen and I sat with him and the baby in the office.

Jimmy lifted the phone and dialled Mapley, waking Bob Davies. 'Bob, Jimmy, wake-up, get to your desk, call me back.' When Bob called back, Jimmy said, 'Earthquake, Gujarat, India – a bad one. With reference to all trained and qualified rescuers - but no reservists except UK Supplemental - sound Full Recall worldwide and Full Deployment. And with UK Supplemental, leave the UK deployed teams where they are of course. I'm on my way.'

'We'll man the phones here,' Helen and I offered. 'We're bored not being involved.'

'Do whatever hours you wish to,' Jimmy offered, a wave at my sleeping daughter.

With Jimmy gone, we got the kettle on and woke Han, since he always wanted to be involved in deployments of Chinese rescuers. As Rescue Force mounted its biggest ever deployment, a truly international deployment, Michelle slept soundly through it in the office. Helen readied the press releases, the software faxing more than a hundred recipients.

Many aircraft *just happened* to be in the right place at the right time. An IL76 jet stood on the apron at Forward Base, the Congo team loaded quickly. It flew to Mawlini, picking up the command team and their tents, a second IL76 landing as doors were closed. In Cuba, a hired commercial 747SP was diverted from the Dominican Republic, soon on its way across the Atlantic. At RAF Lyneham, dated RAF VC10s and Tristar transports made ready.

Helen got a few hours sleep as I manned the office with Han, swapping roles at 7am, my daughter in the steady and regular routine of eating, sleeping, and then filling her nappies. By time I returned, at 10am, the "M" Group were pitching in, problems of flight plans, permissions and re-fuelling. Jack assisted Sharon with the mundane faxes and emails, filing them in the right places for us to check them later, bringing things to our attention if they were important. And our French liaison, Michelle, she drove herself to Mapley in her hire car, expressing the desire to see how a deployment worked, the French on the sidelines for

this one; their only involvement was to send tents out. And of all the teams deployed, the Indian's own team took longer to arrive at the epicentre than the Cubans.

That first day was frantic, trying to move over a thousand rescuers to India. I spent time on the phone offering cash to Indian companies to help move our people; regional aircraft, helicopters and buses. The larger aircraft, the 747s, had landed in Mumbai, the IL76s putting down on a small strip inside the affected region. Jimmy appeared on the news at 6pm, background shots of the map table and bustling command centre. He relayed the problems of Indian officials at Mumbai airport not making certain nations welcome and delaying deployments, despite Indian Government agreements in advance. The diplomatic phones lines would be red hot.

As the days wore on things settled down, Helen and I driving over to Mapley to see how things were progressing on the ground. The command centre still bustled, people unshaven and appearing tired. We found Jimmy in Coup's office with Michelle, our French liaison now tasked with buying food and supplies around India and moving them to the affected area, a mountain of papers and faxes under her nose; Jimmy had given her a ten million pound budget. Listening to her on the phone, I figured she was getting good rates. Two middle-aged French officials stepped in and greeted me briefly, handing Michelle faxes. Jimmy explained to me that Michelle had roped in the French Foreign Office, and their Ambassador to India – whether they liked it or not.

I returned to Bob Davies. Quietly, I mentioned, 'Michelle seems to be ... mucking in.'

He glanced past me, grinning. 'She's shit hot, very efficient – and aggressive with it. Not just a babe. Reminds me of your missus before you knocked her up.'

'I heard that!' came from Helen, stood behind me.

'She'll be after your job next,' Bob joked.

I turned and exchanged a look with Helen. To Bob I joked, 'Helen's irreplaceable.' But I had caught Helen's expression.

Driving back, Helen said little. Pulling into the house she suggested a part-time nanny, which I agreed to straight away; I knew exactly what was going through her mind.

In the office, Sharon said, 'Your new nanny is at the house,' as she left for the day.

Puzzled, and curious, we walked straight around, finding a girl waiting in our lounge. She was a little plump, with a cheerful round face.

Standing, she said, 'I'm Katie, but everyone calls me Cat. Jimmy hired me. My sister is, Sue, the masseur that visits sometimes. Sharon is my aunt.'

'Oh. Er ... and your background and qualifications,' I asked after shaking her hand.

'I'm a nurse, paediatrics, an SRN. When my contract finished Jimmy asked me to work here, better pay and close by. Did you... not know?'

'I did,' I lied. 'Wanted it to be surprise for Helen.'

Helen knew I was lying, but welcomed Cat to the household. Cat already had a room in the main house to use when it was necessary to stay over, and Sharon had briefed her thoroughly. There was nothing to do but to hand over our sleeping bundle. I led Helen outside.

'She was probably the nanny we had before,' Helen suggested.

'If Jimmy hired her ... definitely.' I stopped Helen outside the main house. 'Listen, what Bob said, it was just a joke.'

'I know,' she said, but I wasn't sure if she accepted her own words.

'Listen, you're going to me my wife, so houses and money forever. If you don't want to work ... you don't have to.'

'I couldn't just sit around.'

'Well, no, I appreciate that - this is no regular job.' I took a moment. 'Stand still.' I dialled Jimmy. 'Jimmy, what you got in store for Michelle?'

'Tell Helen she'll be my PA for many years, Michelle could never fill that role – nor ever be fully trusted. Relax.' He hung up.

'Michelle could never be fully trusted, so there.'

We both took a breath and walked in. Tackling the mundane paperwork, we took it in turns to pop back over to our house, simply finding our daughter sleeping for the most part. In the days that followed we settled into a routine, Cat arriving at 8am and leaving at 5pm each day, but eating with the gang in the

diner a few days a week. And when Helen and I wanted an evening out, Cat was always available.

Our first meal, at the end of the first week, was with Jimmy and Michelle oddly enough. Helen was a little defensive to start with, but when the topic turned to family, Michelle quite openly explained that she could not have children. After that, Helen warmed to her, the two of them getting on well. Michelle had been quite angered at the honey trap, not in on it, and had applied for a reassignment – assuming she was telling us the truth.

The next morning, Jimmy called an “M” Group meeting. And stunned us.

‘I have ... received a message. From where, I will not reveal. Ever. There is a solution to 2025.’ People stared at each other. ‘I don’t know what the solution is, but at least there is one. I would hope to get another message before then.’ He stood. ‘That’s all, so don’t ask stupid questions all day.’ He left us to it, and I was just as surprised as the rest.

‘A message from Magestic,’ Michelle assumed.

Han and Jack exchanged looks, getting up and walking out.

Keely nudged me outside. ‘They’ve sent a message back?’

‘Right now, your guess is as good as mine. But as far as I know, he can’t contact them or vice versa.’

‘They’ve found a way,’ Keely whispered. ‘And if they can find a way to get a message back, they may just be able to open some sort of portal?’

‘All speculation, mate. Still, it’s a good sign,’ I offered.

Keely nodded to himself. ‘We’ve ... er ... heard that the Israelis got a shit load of diamonds.’

That was news to me. ‘How much of a shit load?’

‘A billion dollars worth. At least. They Congo diamonds?’

I turned Keely by the shoulders and led him to Jimmy. ‘Our American cousin has heard something about Israeli diamonds.’

‘Congo diamonds,’ Jimmy said without lifting his head from his computer. ‘Israelis didn’t want them on the open market.’

‘Ah,’ Keely let out.

Now Jimmy lifted his head. ‘If it was relevant, I’d discuss it with you.’

Keely left us. ‘That where the two-forty million came from?’

Jimmy nodded. ‘Get started on the RF celebration bash, next Saturday, London Club.’

I sat with Helen, paper and pad, planning the Indian deployment celebrations. The senior staff from each team would be there, Ambassadors, the press, and UK politicians. We invited the most senior staff from the UK emergency services, Mackey and his people, and of course, the Mapley RF commanders, Bob now walking with crutches. And I had only recently found out that Bob had not been injected, Doc Adam convinced that he would recover without it.

Arriving at the bash we found the street partially closed off, police manning railings, armed police milling around. Dressed smartly, we all stepped down from the Range Rovers to a blizzard of camera flashes. I didn't know why, there were twenty of the buggers inside by invitation, plus TV crews.

Helen and I had left the baby behind with Cat, no longer worried about leaving her. Still, we'd called Cat just before reaching the club. Now we stepped through the VIP entrance, Helen lifting the train of her long back dress, and looking stunning. We walked through to the Red Room, finding a small crowd already stood around, some sat at tables. Around the outside of room stood dozens of easels displaying photographs from the deployment, tree diagrams, movement plans. From the balcony hung flags of all the nations involved, including France we noted. We greeted Mac and Coup at the bar.

Dunnow squeezed in, putting an arm around Helen's waist. 'God, love. What's a babe like you doing with him, huh?'

'Money,' Helen joked. 'And what do you earn?'

Dunnow was deflated as we all laughed at him. 'Yeah, but I'm a hard working hero type.'

'When I'm down on my luck, I'll call you,' Helen teased.

Jimmy straightened Dunnow's bow tie. 'Scruffy bloody Aussie.'

I turned to find Po and family walking over, not expecting them. Ling kissed me on the cheek, introducing herself to Helen, congratulations offered on the baby. With them chatting, and me a little nervous, I wound up our short fat Chinaman. Turning back I found Katie Joe now chatting to Helen and Ling, Jimmy smiling at me. I took my beer and wandered off. Upstairs, I found Han and the Chinese Ambassador, so stopped to practice my Chinese for a while, Sykes walking past with a few stiff in

suits, but no one I recognised. I sat with the McKinleys directors for ten minutes, catching up on the markets and the gossip, noticing Keely with a girl. Stood at the bar, ten minutes later, Helen appeared at my side.

‘Avoiding me?’

‘Not you ... per se.’

‘How many ex-girlfriends do you have at this bash?’ she teased.

‘Well, it’s early yet,’ I said, getting a dig in the ribs.

‘I’ve invited Kate Joe to the wedding.’

‘Isn’t that supposed to be bad luck or something?’

‘She’s dating an exec’ at Pineapple, been steady for six months. He could be the one.’

Jimmy stepped in, Helen grabbing him by the elbow and dragging him over.

‘Does Katie Joe marry the Pineapple exec?’ Helen asked.

He nodded. ‘She’ll sing at your wedding.’

Now it was my turn to smile at Jimmy, nodding towards the corner of the bar. He turned his head to find Liz.

‘We gave her a membership,’ he explained. ‘Would have looked odd otherwise.’

‘You’re not seeing anyone...’ Helen suggested.

‘How do you know,’ Jimmy posed.

Ten minutes later, with Liz having said hello, Michelle stepping in with another lady, both of them looking beautiful in the evening gowns. She introduced her sister to us, Jimmy grabbing the wandering pack of photographers. He called over Liz, told me to “sod off, short arse”, and posed with the four ladies. They snapped me with Helen, me with Jimmy, then Jimmy with our French ladies.

Michelle and Liz struck up a conversation in fluent French, Helen joining in.

‘How are you and Michelle *getting along* these days?’ I teased.

‘If someone sends you a ready cooked meal...’

I tutted. ‘But it’s good, you taking one for the team.’

He gave me one of his disappointed, fatherly looks. We drifted back down to the Red Room, greeting Bob Davies and the national representatives with their ambassadors, nudging people to tables as the singers readied themselves, the lights lowering.

We sat on a table near the front, twelve of us in total, three of our most famous singers belting out popular numbers for an hour as snacks were served. In a surprising move, Katie Joe's last number was introduced as having been dedicated to myself and Helen. We exchanged looks, both gobsmacked, people now staring our way. The song, 'Soul mates,' moved Helen to tears, leaving me embarrassed as I sat there not knowing what to say or do, Jimmy seemingly enjoying my discomfort.

With the lights back up, people wandered around and met those rescuers who had turned up in their whites. Jimmy made a fuss of the Cubans, but told the Indian Ambassador that any further problems and we would withdraw from India. In a surprise move, the Prime Minister put in an appearance, his Australian counterpart visiting the UK and dragged along to meet his team. We pressed the flesh, Michelle and her sister sticking close to Jimmy, certain to be noticed and reported. Since she was, after all, the French "M" Group representative; the other "M" Group nations would be asking questions on Monday morning. It was turning out to be a surprising evening.

We did not have long to wait for the questions to start, Sykes cornering me. 'Is it Silo-Holton policy, that when spies are sent you, you bed them?'

'Only if they're gorgeous,' I replied.

'This is not funny,' he quietly pressed. 'She's a trap.'

'And Jimmy could wind her up like a clock. He dated Liz for a year or so, and she never suspected a thing. When it comes to lying to women, he's the best.'

'The PM has already asked questions.'

'Well, tell the PM, that as far as I know, he hasn't done both sisters together yet.'

Sykes was not amused, trotting off.

I led Jimmy away from the Sri Lankan Ambassador. 'Sykes and the PM are on the warpath. They think you're enjoying yourself too much.'

'If I don't snuggle up to her and feed some disinformation, the French will make many attempts to spy on us. It's the lesser or two evils.'

'Be brave,' I told him, then headed off and explained it to Sykes. Peace reclaimed the evening, Helen only ringing home twice.

We stayed the night in the club, setting off early the next morning with Karl, Jimmy and Michelle not returning till 10am Monday morning. By then I had whispered into the ears of the “M” Group. The photographs of Jimmy with the girls made all the tabloids and glossy magazines, lots of speculation about him and Michelle. Since they were seen, and snapped, sightseeing around London on the Saturday and Sunday, everyone in the damn country knew. Saturday’s tabloids also seemed to have gained access to our bank accounts in Kenya, labelling us as having sent three hundred million to the charity this year alone – and we were only in February. I hoped the taxman didn’t read the papers. I rang Rudd, who suggested the board of trustees for the charity had discussed it openly. Jimmy was not too fussed, suggesting that it served our purposes, Helen releasing a press statement to say that others had contributed to the sum.

Hail to the Chief

With Harvey out of the White House, his former Vice President now sworn in, he came for a “private” visit a few weeks later, inviting himself. Guess his library building was not keeping his full attention. He called and asked for a chat, Jimmy asking him how many bodyguards he would have with him for the visit. When told the number, Jimmy said that only ten would be allowed in, take it or leave it. Harvey re-worked the security he was required to drag around, the UK police offering to cover our fence.

Harvey had flown into Heathrow on a private jet, an Agusta helicopter then bringing him over to us, his ride trailed by two RAF helicopters; some of his staff in one and an SAS security detail in the other. He landed on the lawn, the Augusta flying off to Cardiff airport to wait. The first RAF helicopter, a Puma, put down eight people, the other RAF helicopter circling for five minutes before it headed off to wherever they hung out. We greeted him on the lawn, his assistant and two bodyguards, soon

followed by another assistant and seven bodyguards – all lugging cases, yellow-clad British police in view around the grounds.

‘Nice house,’ he said, looking up. ‘Very nice.’

‘It eases the burden of what we do,’ I suggested, making him laugh.

I showed him his room – a corner suite, his bodyguards being allocated apartments, their senior man shown to the camera room, but already knowing the way. Settled in, Harvey toured the house before joining us in the lounge.

‘So, you get protection for the rest of your life, yeah?’ I puzzled.

‘Afraid so.’

‘What, even when you’re like ... ninety years old?’

‘They reduce with the years,’ he informed me with a smile, his assistant sat ready with pad and pen, bodyguards at the doorway.

‘So,’ Jimmy began. ‘What will you do next in your career?’

‘Not much I can do, or would be allowed to do.’

‘I’m going to create a new charity,’ Jimmy informed him, news to me. ‘The Organisation for International Co-operation and Development.’

‘Toficad?’ I questioned.

‘OICD,’ Jimmy corrected me. To Harvey he said, ‘And could do with someone with *diplomatic* credentials.’

‘Do I accept the post?’

‘You do,’ Jimmy carefully mouthed.

‘Then I accept. What’s the pay?’

‘Million dollars a year plus all costs and travel.’

‘And will involve...?’

‘Some *controversy* when you help to promote low carbon technology and electric cars, amongst other things. Strangely enough, I just happen to have some designs for some low carbon emission bits of kit.’ Jimmy reached under the coffee table and pulled out a thick file. ‘Reading material, ideas, suggestions. But your first job will be to meet all those involved in the student exchange programme, and to promote its awareness – nagging the various governments for cash.’

As I sat there I could picture 2015 and 2025, and Jimmy’s role in the key events. It struck me hard, as the formerly most

powerful man in the world sat taking Jimmy's directions, Jimmy now his de-facto boss.

'But that's enough about work, lets eat and have a few beers,' Jimmy suggested.

'Sounds good.'

'And it's poker night,' I put in. 'But your NSA guy is unbeatable.'

'Typical NSA, they probably run courses on it!' Harvey joked.

The "M" Group joined us around the dining table, dressed smartly, and we laughed and joked with Harvey like old mates.

In the morning, Jimmy's masseur turned up with a curvy mate. It seemed that she was called "Bouncy", but I must have heard that wrong. Harvey received an hour-long massage from Bouncy, people avoiding enquiring as to "how was it?" The Africans were in awe of him, Sharon not phased at all and taking his contact details for his salary. She told him to have expenses claims in within thirty days, or else! She also told the bodyguards to get out of "her" office, making me smile.

Bob Davies came over and spent an hour with our new employee, giving him a complete run down of Rescue Force operations worldwide. Over coffee I picked Harvey's brains about White House trivia; sleeping in late, having your mail re-directed, did you get a reference for your next employer – and who wrote it, was there a secret bunker and tunnel. Any death rays?

Forty million pounds from the Kenyan charity fund was diverted to OICD, Harvey tasked with improving computer education and Internet access for Africa, starting in Kenya. A fibre optic cable would extend from Suez, down the Somali coast and to Mombassa, thereafter inland across Kenya and Tanzania towards the Congo, permissions a foregone conclusion. Rudd had transferred the money, before noticing that the same amount of money was still in the account, eventually figuring out that the investments had done quite well; very well, in fact.

Two weeks after his first visit, Harvey was back, this time on a mission from the new President, Art Johnson. We met him with the full "M" Group, since it involved Magestic work.

Harvey began, 'Art would like to tax the rich, and Wall Street, without them knowing about it; put more money into Government projects. He could do that if stock trading information, plus currencies and ores, was made available.'

Jack, Ivan and Han could not object since they already got such information.

Ivan asked, 'What effect would that have on the global economy?'

'Not much,' Jimmy told him. He faced Harvey, 'How much does he want to take out of the economy?'

Harvey raised his arms and shrugged. 'It all helps.'

'He must have a figure in mind,' Jimmy pressed.

'Let's start simple,' Harvey suggested. 'And extra fifty billion a year.'

'From Wall Street, you can take as much as you like,' Jimmy suggested. 'That's your right. But currencies would affect some in this room. Ores are less of a problem, but if you buy a lot of ore futures you'll create a shortage. Now, how are you planning on getting around the legislation that prevents you from doing just this? Congress *will* see the audit.'

'Good question,' Harvey said with grin. 'We can't do it directly, certainly not in a large way. So we'd ask you to nudge up the investment funds of military and civil service medical insurers and pensions. We'd then lower our contributions, freeing up money. In addition to that, you'd assist the investments of nominated friendly states, and we'd lower aid packages. Finally, a few friendly construction corporations would get a boost from you, dropping their prices to us. And as for Senator Pederson and his *rapidly growing* medical insurance company, we're happy for that to expand greatly – we can lower some of our contributions. And none of this would be provable, since it's simply a matter of investments doing better than in previous years.'

'And what is it that you think I'll put on my Christmas list?' Jimmy posed.

Harvey upturned his palms, and waited.

Jimmy took out a piece of paper. 'First, I want greater pressure on the Pakistani Government to stop Arab fighters reaching Afghanistan. Second, I want the US to have no objections to the Chinese supplying weapons to Sri Lanka to end

the Tamil war, thereafter building Chinese commercial shipyards in Sri Lanka. Next, I want relations improved with Venezuela, no matter how much you dislike them. I want tighter regulation of the US mortgage market, and an expanded programme where you buy up abandoned houses, employing locals to fix them, then rent them out – state owned. I want the Mexican border buttoned up tight and more illegals repatriated. And finally, and most importantly, I want a big push to mend relations with Cuba.’

‘Cuba? Jeez.’

‘Let me put it this way: you have your list, I have mine.’ Jimmy handed over the sheet and sat back. ‘And with Cuba, keep in mind that over the next decade I’ll buy up some nice real estate. When Cuba and you eventually kiss and make-up it’ll be worth a fortune. And you *will* make-up eventually.’

Han asked, ‘Would Cuban hotels be a good investment?’

‘Yes,’ Jimmy told him, Michelle taking notes.

‘So how do we do this?’ Harvey asked.

‘Until I see in the news what I want to see, I’ll only help the military pension investments.’

‘Just how the hell do we *quantify* relations with Cuba?’ Harvey complained.

‘You can start by appointing me US special envoy to Cuba.’

A cat walked in, taking in the faces. Jimmy lifted it up, placing it on the arm of the sofa.

‘Sorry, Jimmy, that’s mine,’ Jack offered. ‘Don’t know how it got in.’

Jimmy stroked the cat’s head. ‘It’s OK. We have a baby, so a cat was inevitable. I’ll start worrying when Paul’s girl starts bringing bikers home.’

‘I’d have them shot at the gate,’ I suggested. ‘I’m not going to let her out till she’s thirty.’

Jimmy faced Harvey. ‘You have the list, and it’s not negotiable. Dinner at 6pm for all here, drinks afterward.’

A month later, Jimmy was appointed Special Envoy to Cuba, making a formal visit with representatives from Russia and China, a weighty group backing us up.

We began with tourism, offering to assist Russians holidaying in Cuba, Yuri and Marko wanting to buy up a few hotels. We

also wanted to buy, or build a few hotels ourselves, all good news to the Cubans. The French had made moves towards increasing tourism to the island, the cost of hotels rising already. By the end of that first hour-long meeting we had agreed to build another thirty hotels between us.

After lunch we agreed to increase the size of Rescue Force Cuba, almost doubling it, the Cubans accepting money from us. With the storms that often hit Central America, not to mention earthquakes or volcanoes, their RF teams were already kept very busy, a sizeable foreign contingent swelling their numbers; this was where the action was.

The next morning we got down to politics. Jimmy firmly suggested that he was not about to criticise their socialist system, something he admired for its efficiency, but that they should look at China and Russia, communist countries that now embraced capitalist ideas and offered growing economies. We indicated that there was movement from the Americans, and that we could promise progress if the Cuban rhetoric was toned down.

The question of reparations came up, reparations for US corporations and families who lost businesses and properties when the communists had seized power. Jimmy's solution was simple: allow those who had lost out to have land at no cost, to build hotels and bring in tourists. That way everyone benefited, and the Cubans would not have to shell out any cash. They were surprised, and we left it with them. I rang home to see how Helen and the baby were doing before we flew to the Dominican Republic, catching a flight to the US.

After a night in the New York apartment, we flew down to DC and met Senator Pedersen in his office. Jimmy began by saying he would assist the medical insurance company to grow by three fold, the good senator staring back wide-eyed, then asked for help with Cuba. It was a kind of "one goes with the other" sort of deal. That cake was iced with a mention of African oil for Pedersen's friend, Ted the oilman with the loud wife. We outlined the reparations deal, even suggesting we'd put some money on the table, before heading off for a TV interview.

Settled around the interviewers desk, our faces now dabbed with make-up, teeth cleaned, we went live.

'Mister Silo, you're best known for your charity work around Africa, more than a billion dollars spent —' We did not correct

him. ‘- and of course Rescue Force medical charity, but now this move into world politics. How did that come about?’

‘Being heavily involved with Rescue Force, I have always dealt with governments and politicians, trying to cut through the red tape to get my medics into certain countries. You’d be surprised how difficult it can be to help people in need.’

‘And now you have a rescue team in Cuba, with the backing of the Cuban Government.’

‘We’ll take help from anyone who wishes to give it.’

‘You have units in Russia, China and now Cuba.’

‘Yes, and they’re great to work with. I admire an ordered society, especially after the chaos of Africa.’

‘You have several orphanages in Africa, the largest has some twenty thousand children in it – run along military lines.’

‘Most people watching this show will have trouble with controlling two or three kids - try twenty thousand in one place!’

‘And why is it militarised?’

‘It’s not militarised - it’s regimented and disciplined. My philosophy is simple: they *will* study each day, they *will* be punished for misbehaving, and they *will* respect their teachers. In Kenya, the sixteen-year-olds in our orphanage have a higher educational standard than the whole of Africa, higher than the American average. A certificate of education from our orphanage just about guarantees a good job.’

‘And in the Congo, where you were awarded a Governorship, you run a tight ship, criticism from some groups.’

‘I don’t have the authority to set policy or laws, but I have influence. Where possible I have encouraged capital punishment and have brought back hanging.’

‘Hanging?’

‘Yes, hanging. When a man rapes and kills a ten-year-old girl, we hang the bastard. My only regret is that I’m not allowed to do it myself.’

The interviewer blinked. ‘And now you’ve been appointed US Special Envoy to Cuba.’

‘That is just because no one here has the guts to talk to the Cubans. It’s silly really, because for the past ten years, British and European tourists have enjoyed holidays in Cuba, the numbers growing all the time. We’ve bought a hotel down there, property prices appreciating by at least twenty-five percent a

year. If you Americans don't want to make a buck down there, we will. And Cuba offers some of the best beaches in the Caribbean.'

'You've recently met with the Cuban leadership.'

'Yes, and they want a solution, they've wanted one for the past twenty years. All you have to do is pick up the phone and stop talking to them like they're naughty children. But I seriously doubt there are any politicians here with big enough Cahonies to visit the place with me, except maybe Senator Pedersen.'

The interviewer blinked again. 'And ... what's on the table?'

'First, I think the Cubans are willing to discuss reparations for what American companies and individuals lost when the communists took over, a kind of land deal that I have put to them.'

'Land deal?'

'Land for hotels - very valuable land - islands with great scuba diving. I see no reason why anyone who lost out should not get something. And something is better than nothing.'

I put in, 'If the US wanted to take a first step, you could allow your tourists to visit the islands in the north. After all, we wouldn't want innocent and naïve American tourists to be converted to communism after a stroll through Havana.' Jimmy hid his grin.

'And what has President Johnson said about the Cuban position?'

'No much, unfortunately,' Jimmy replied. 'He wants a solution, so do they. But it's like getting back with you ex-wife for the sake of the kids. Damn hard! But if the States doesn't get a foothold in the Cuban economy, the Russians and Europeans will. By time your ready to kiss and make up it'll be too late, all the good business opportunities will have been taken by us. There're some folks out there hoping you don't open up trade yet.'

'Jimmy Silo, Paul Holton, thank you for being with us today.'

We were off air. Still, I got one sentence in. And we got plenty of column inches the next morning as we met Pedersen for breakfast with some of his Republican buddies.

'Ya don't pull no punches,' the first white haired man said.

'You want a job here?' the second joked.

Pedersen discreetly dropped into the conversation the fact that his buddies had oil and mining interests. Jimmy explained that the minerals and oil in the Congo were ten times bigger than anyone knew about. I think they call this “horse trading” down in Texas, where Pedersen hailed from. Jimmy was blunt and to the point, and in most countries this would have been illegal, if not immoral. Here, it seemed to be the norm.

We suggested that it would be in the national interest for a delegation of Republicans to visit Cuba in a month’s time, the men sure they could arrange it. Thereafter we’d talk about the Congo. It was no more complicated than that, or more difficult, a surprise for me; I had entered the world of American politics, where the dollar was king, horse-trading the norm.

Jimmy received a call from the White House after breakfast; we were summoned. Vans with blacked-out windows picked us from the hotel an hour later, whisking us the short distance to the White House. I was back in the Oval Office, admiring the carpet, the Chief of Staff the same guy we’d met with Harvey. At least they made me tea this time, President Johnson turning up a little late.

‘Sorry about that, a bit hectic still.’

‘Don’t appoint Decker,’ Jimmy told him.

‘No?’ Johnson queried, a glance at his Chief.

‘He’ll embarrass you. Badly.’

‘Oh. Well, thanks for that.’ He sat. ‘OK, that TV interview: what the hell was all that about?’

‘Stage play,’ Jimmy said. ‘You wouldn’t want me to appear to be a Democrat, would you?’

‘I think some are calling you Jimmy “hang ‘em high” Silo. Still, your ratings are good.’

‘We have ratings?’ I asked.

‘They poll everything here,’ the Chief explained. ‘You got a seventy-two percent approval rating, an older affluent demographic.’

‘If I understood any of that – I’d still think it weird.’

Johnson asked, ‘You met with a group of Republicans for breakfast?’

‘They’ll go to Cuba,’ Jimmy explained.

‘And were they ... induced?’

‘Of course,’ I said. ‘Good old fashioned horse trading.’

‘Are reparations a possibility?’ Johnson asked.

‘They are,’ Jimmy insisted. ‘And now your TV audience believes they’re missing out on business opportunities down there. Some will open bank accounts in the UK to buy property there.’

‘And the next step for Cuba?’

‘Let the Republicans take the lead for now, it’s a long process. But if you ease some restrictions it will help my hand. Allow US citizens to holiday there, as some already do in a round about way. Tourism is the one key factor: they’ve got the beaches, your people like cheap holidays. It’s no point you trying to change the regime, just work around them, deal with the people direct. And between now and 2015 *your ratings* in Central America drop to all time lows. That needs addressing. Now, if you make a big effort in Cuba this year I’ll give you an oilfield in the gulf, a big one, and address your ... shopping list.’

‘Why’s Cuba important?’ Johnson asked.

‘That ... you’ll discover just before it’s too late.’

‘Oil?’

‘They have oil,’ Jimmy agreed.

‘And...?’

‘And ... wait and see. Everything at the right time.’

Johnson took a moment. ‘Do I serve one or two terms?’

‘That’s a naughty question. If I answer that ... it may be seen as interference.’

‘Cut the crap. One or two?’ Johnno pressed.

‘You only just scraped in this time, you won’t next time.’

‘And with your kind assistance?’ Johnson risked. I could not believe what I was hearing.

‘Look at this way. Following you, a Republican gets into office, and does a lot of harm. But, that harm gets the next Democratic President in for two terms, and he does a lot of good.

If I help you get back in you’ll upset that pattern, and the idiot getting in after you serves two terms. So think about it. Cause ... and effect, and you’ve already used up one wish by being in that chair to start with.’

‘You interfered?’

‘Directly, a long time ago.’

‘Some might call that *interference*.’

‘Something about *gift horses* comes to mind,’ I put in.

Jimmy smiled. 'You will, however, have an important future after office, a significant role.'

'Not with Harvey?' Johnson baulked.

'No, more important than that role.'

'What about Israeli and the Palestinians?' Johnson asked.

'Nothing will ever change, so don't waste your time. Cats and dogs.'

'Russia?'

'Always a pain, but again – *deal with the people*. Let them visit New York in droves, buy apartments. Wine and dine their new middle class. By-pass the Government, leave *them* to me.'

'No problems there?'

'None. Right now they couldn't hold their own in a fight with Estonia, let alone you. But they have a shit load of gas and oil, and will get rich quickly. Get your corporations in there. But most importantly, get them over here. The key to the future is *corporate integration*; by 2015 it's a truly global economy.'

'And if it's not interference, the biggest domestic problems faced by the US in the years ahead.'

'That will be your successors battling with the oil industry. You'll resist electric cars too long, other countries ahead of you. You lose that race. And beyond 2010 you'll get used to ten percent unemployment, twenty percent by 2015 onwards. You can't compete with China, India or Brazil, they pay a third of the wages for skilled workers. Only after 2015 do Chinese wages start to hurt them, Indian wages never will.'

'And the solution?'

'Not sure I'm qualified to best judge that, even with knowledge of the future. There are ... many paths to take. For the most part your future Presidents just get angry at the world, blaming others. Your best bet is to nudge US corporations into Russia, India and definitely Africa – as you did in a way after the Second World War. You need joint projects with many nations, and you need to get back to making things and selling them abroad. If tractors don't do it any more, look to see what does. But no matter what you do, China, India and Brazil will grow and take your trade. They'll rise and you'll slip; not even I could alter that. Learn what every small businessman knows: if you can't sell more, cut your costs. Your core costs are oil, wages,

healthcare, and food. Look for the efficiencies before it's too late.'

At the airport, sat in the First Class lounge, I made a confession to Jimmy. 'I must admit, I'd rather be home with the family than here. Not sure my mind is on this.'

'I know. But you'll appreciate them more, and then you ... if you travel. Besides, I said you could take some time off...'

I nodded, taking in the other passengers. 'I can't say I have a lot of respect for this lot.'

'It's politics: you're not supposed to respect it, you're supposed to use it for your means – for good. Anyone who enjoyed this would be a serious concern. But don't judge Johnson too harshly, he's a good man, it's just the game he's in.'

'He cares more about the size of his arse than Katie Joe.'

Jimmy smiled. 'Washington is a game which, once started, is hard to give up. And it's all about the ratings. Often, the best way to get things done is to hold a TV interview, get good ratings, and then sell the ratings to whoever wants to buy them. The other way is good old fashioned dollars.'

I was glad to be back, wondering if the baby even recognised me. Helen showed me a chart that Cat had made, basically how long our daughter measured week by week since birth; baby Michelle was in the highest percentile. With Cat watching our rapidly growing child, we went and found Jimmy, acting like a pair of concerned parents. In his apartment we sat on the edge of sofa.

'The baby's in a high percentile,' I said.

'It's too soon, that happens normally sometimes. We need a year.'

'And if she has the blood?' Helen asked.

'She'll be tall till fifteen, then her height will freeze.'

'How tall?' I asked.

'Like Helen tall, not like me tall,' he said with a smile.

'Oh. And when would we know if she was heading that way?'

'Like I said, a year.'

'Any other side effects?' Helen asked.

'Same as you: lack of sleep, fit, immune.'

'How much lack of sleep, I mean – as a baby?'

‘She sleeps too much as it is, I doubt she has the blood, she’d roar more often. Best thing to do is just inject her and get it over with.’

‘Should we?’ Helen asked.

‘That’s you call, but if it was my kid – with a chance of getting Meningitis – then I’d inject the kid. And the first time the kid gets sick, you’ll inject her.’

‘We will?’ I asked.

‘If she got sick, and you didn’t inject her, and she died – just how would you feel, knowing you had the cure?’

It was a sobering moment. There was no answer to it.

‘We’d never forgive ourselves,’ I finally said.

‘First time she gets sick, inject her,’ Jimmy suggested. ‘But I think she’ll be fine either way. And don’t spend all night worrying about it.’

We headed off, and spent all night worrying about it. In the morning I put a call in to Anna, discovering that she had injected young Mary after a month. Since that time, she had noticed little difference, Mary sleeping a good ten hours a night. I called the London doctors the next day, the man due to visit soon anyway. He came with a very small needle, anticipating just such an occasion. He took a blood sample first, injecting the baby with a tiny drop of my blood.

‘As far as we know,’ he said, ‘the drug works the same way as a baby works – its growth pattern, so no particular changes really, just the immunology. But if I’m wrong, she’ll cry more and need more feeding.’

‘Thanks a lot,’ I quipped.

‘I injected my own granddaughter six months ago, and so far very little difference. We’ve all the stats from the orphanage as well, and the worst case was only ten percent growth acceleration. No particularly tall boys after all these years.’

‘Will she run a fever now?’ I asked.

‘No, that doesn’t happen in babies. Like I said, it’s trying to make her body do what her body is already doing; it’s most pronounced in adults. I’m staying over in the house tonight, I’ll check in on her in the morning. Don’t worry.’

‘Poor little mite,’ I said. ‘Big needle in her leg.’ We sat and worried.

Housing plans

We created a new Limited company, not a Plc, and sold the Chinese ten shares for a pound each. The nice men in Beijing then made a directors loan into the company, a cool one billion dollars. Actually, Po bought the shares and made the loan on their behalf, another two hundred million from his own family. It was a big number, but for what we planned on doing not nearly enough. Helen organised a one-page advert in The Times, inviting investors with more than twenty-five million to spend to attend.

A week later, three hundred people sat in the Red Room at the club, refreshments free. It was the least we could do. Jimmy took to the podium.

‘Ladies and gentlemen, my name is Jimmy Silo.’ He waited as people laughed, no one unaware as to who he was. ‘And we are here today to find people interested in investing in my property business. That new venture will be involved with several areas of the property market, here and abroad. It will involve the building of new properties, renovating old properties, rentals, apartments and hotels. Hotels would only be built in certain strategic locations, and only where I feel they will enjoy a good rate of appreciation. Holiday homes would only be bought where I feel the resort is not going to be a flash in the pan. At least forty percent of the company’s investments will be in the UK, thirty percent in the US – possibly more in time.

‘Now, the way we want this to work, is that those interested – that we have no objection to – would buy a single share in the Limited Company, followed by a directors loan in. That loan would attract interest on a pro-rata basis in line with how well company’s investments are doing, paid out at the end of a fixed two year period. In order to withdraw that loan we would need one years notice to unwind the investment. That’s two years fixed, one-year notice. My estimated return is twenty percent per year compound with no downside; money will never be invested into anything other than bricks and mortar. For those prepared to

make a five-year investment, we believe we can offer a better rate of return, and will pay out annual interest adjustment at our discretion, aiming at six percent.

‘You will all have the details in front of you. They list our solicitors, and McKinleys stockbrokers who are helping out. And before you ask, this venture *will not* be converted to a Plc.

‘Finally, and most important, all investors get a free membership here.’ People laughed. ‘OK, questions please.’

Jimmy fielded questions for fifteen minutes, many quite repetitive, most answered with a “no”. When done, Jimmy said, ‘Any investment houses, or anyone playing with more than a hundred million pounds, please come forwards for a chat now. Anyone wanting a shorter or longer term, please wait till called, those investing from twenty-five million upwards go see the nice men to the right of the bar for application forms.’

We formed the first group into a line, seats provided, then spoke to each party briefly in private. Some wanted to forego the annualised payment for a better return, others wanted a better annual payment; details were taken, terms agreed. One fund manager informed us with a grin that he handled US civil service pensions, a less than subtle hint. Jimmy told him he could have any terms he liked. Yuri and Marko had their brokers in the audience, the amount they wanted to invest limited – for now. By time the big players had finished, six billion pounds had been pledged, a big number. But in property terms, it represented two hundred thousand small abodes worldwide, terraced houses in the UK. Chuck in a few hotels, a thousand apartment blocks, and there was not much change left; it was a paper number.

Jimmy and I split up and wandered around meeting groups of investors, five London stock brokers that we knew grouping clients funds together to create a master fund, then investing it with us, a safe twenty percent a year. Many admitted to believing our returns would be higher. Little did they know that we were doing this to keep property prices down in the years ahead.

An hour and half after the meeting began we closed up, having a bite to eat in the diner before our second meeting; Rolf the architect plus several house-building companies, one general construction company from Swindon. We met upstairs in the computer room, refreshments offered before getting down to business.

Jimmy began, 'Rolf here, whose name is not Rolf, will be acting as liaison between ourselves, and yourselves, assuming that you wish to be a part of this. We have, today, created a new property business, and it has just under six billion pounds in it.' They blinked. 'We'll be looking to commission you to build houses and apartments on land we buy, the first part no more complicated than that. And it's easy work for you, because we're paying upfront for the construction, and you don't need to try and sell the property afterwards. The second part, possibly even the biggest part, will be the company buying run-down properties that meet a certain criteria, then doing them up for sale or rent. Rolf, I'll need you to find me twenty hard-working architects covering an area from Birmingham, south east to the coast, and including South Wales. They start as soon as you have them, their task to find run down properties with potential. We'd buy them, and start the renovation rental process straight away.'

He faced the construction company. 'I've selected your business and, provided you don't try it on, we'll spend a lot of money with you. We'll also force down material costs by buying in bulk upfront and storing them with you.'

'How many properties per year?' the man asked.

'Upwards of ten thousand.' That got his attention. 'I appreciate that you don't have the staff, so we'll make a few upfront payments to ease your cash flow and wages bill. You can grow ... as fast as you can grow.'

He faced the house building companies. 'Your role is easy enough, your cash flow a joy – we'll pay fifty percent up front with each commission.' He turned his head to Rolf. 'Your job will be to pick areas that show promise for the future - road links, schools and supermarkets - then find land at good rates; the skill comes in the location. We'll then want a mix of two-bed, three-bed and four-bed properties – no luxury retreats. For London, and urban areas, think four storey apartment blocks for the rentals market. Gentlemen, I want sample house designs and costs as soon as you're ready. Renovation guy, you'll have to quote each job and be audited by Rolf's company. OK, you lot, meet amongst yourselves, let's all meet at the house in ten days time, co-ordinate through Rolf – whose real name I've forgotten.'

Ten days later, on a cold Thursday night, the same guys assembled at the house, their co-directors in attendance. We examined sketches and diagrams, Jimmy tending towards “practical” rather than “fancy”, the renovation guy offering a ramp up process for us to look at. Helen and I looked at diagrams for apartments, making a few comments.

Rolf had started the process of recruiting architects, already a handful commissioned as self-employed surveyors. The first two properties were under offer, several bits of land under offer – Rolf explaining their location in relation to schools, road links and proposed supermarkets. We were making progress, the company already showing a good profit since we had traded some of the money through the DOW Jones futures markets; it was twenty million pounds ahead without having sold nor rented a property.

Jimmy then commissioned the construction of an entire holiday village in Croatia, causing a few raised eyebrows. He commissioned three large hotels, six bars and three hundred holiday homes, the Croatian authorities happy to lay the roads and promenade. In the Russian resort of Sochi we commission two hotels and two hundred holiday homes, another two hotels and a three hundred holiday homes in Bulgaria. In Tenerife, we commission a sixty-apartment block.

Across the Atlantic, we petitioned the Cuban Government for land to build four hotels, and in the US itself we hired a team to work with Rolf. They would find well-made stone houses and apartment blocks that needed a bit of work, to buy and renovate them and rent out. But most of all, we concentrated on the UK, where Jimmy knew what the markets would do, and when. When estate agents approached and offered up apartments in Dubai, Jimmy told them firmly to “fuck off”.

We landed back in Cuba a day ahead of the US politicians visit, staying at the same hotel in Havana and driving straight around the nearby RF unit. The base was now accessed through a high fence manned by soldiers, many brick buildings completed. Someone had been busy.

English, Russian and Chinese rescuers greeted us, the Cubans now issued whites to wear. From the tower roof the senior Cuban, who spoke perfect English, pointed out the training stations: the cave, the climbing wall, Faulty Towers, the assault course, the rapid water feature, the gym under construction; it was Mapley's twin brother. They even had Huey helicopters, a leased commercial Hercules sat on the apron.

Ratchet and Spanner stepped out to us, being warmly greeted; it had been a while. They showed us around, illustrating the strengths and weaknesses of the Cubans, what kit they needed. Ten land rovers had been imported from Kenya, more promised, the Cubans training on the British made vehicles to be compatible with other units. They also seemed to possess twenty of their own jeeps, for local use, RF Mawlini paying their fuel. We arranged to meet Ratchet and Spanner, plus their Cuban counterparts, that evening at our hotel for a meal.

The next morning we met the Cuban Government for talks before talks, the diplomacy delicate. Jimmy explained all of the various etiquettes of international negotiations, then ignored them and did his own thing. The Cubans were not thrilled about any discussion of reparations, since they blamed the US for everything apart from the weather, especially the state of their economy. Jimmy asked if they would table the reparations, but not do anything about them; it was a chip on the table. That got us over hurdle one. They were happy to sell land and increase tourism, and would sell to us at reasonable rates. But the sales were not sales, they were ninety-nine year leases, the state owning the land ultimately. Jimmy asked if they would do the same for certain US corporations that may help our political cause. They agreed in principle, but saw it as back to reparations.

Next, Jimmy surprised me. Could our Russian friends drill for oil in Cuban waters? They were a bit taken aback. Me too. Jimmy asked for a concession to drill at a few sites, suggesting it would not cost the Cubans anything, and may bring in good revenue. He then asked if we could drill for oil just outside

Cuban waters, with their assistance and blessing; outside of the twelve-mile limit, but inside of the two hundred mile zone. That puzzled our hosts, since we did not, technically, need their permission. They agreed the last part after a phone call, Jimmy pushing them on the first part, emphasising that they had nothing to lose. Over coffee the call came in: we could bring in a Russian oil company. It just so happened we had a Russian company in mind, and could they sink test drills around Havana itself? Oh, and they would arrive next week in force. Our hosts were perplexed, calling the Russian Ambassador. Yes, we did speak for the Russian Government and its principal oil companies in this matter.

Breaking for lunch, Jimmy explained that the Russians would be “lucky” in finding oil. He also explained that a letter from the Russian President should be reaching Castro right about now. After lunch, a few extra bodies were in on the meeting, a slight change in tone evident. Jimmy eased back towards simple reparations, at least the hint of them. If they were on the table, we would ask the UN to counterbalance such claims against the damage the embargo had done. Jimmy suggested that such a claim and counter claim would take ten years, but in the meantime the embargo could be tackled. We finally had an agreement in principal.

The next point was simple enough, if a bit out of context: could we open a large orphanage here, and fund it all ourselves? At first they were insulted, the UN itself acknowledging that Cuban orphanages were well funded and well run. We explained that it was our way of helping, we were not saying that the orphanage was needed. They agreed in principal, nothing to object about. Jimmy suggested a modest thousand kids to start with, and did they have land we could lease for it?

Doctors came next. Cuba had a lot of well-trained, but underpaid doctors. Could we employ a thousand of them for Africa? We’d pay the Cuba Government the equivalent of four times their monthly pay, and all their costs, a pay package that was still a tenth of a British doctor. Cuba would get the political benefit, and make some money. They made a call, the project approved, and we asked for the first two hundred to be readied for the Congo within six weeks. They would wear RF whites and work out of Forward Base.

Breaking for coffee, we stepped out, Jimmy lifting his satellite phone after a moment's hesitation. He called the White House, getting through to Art Johnson. 'Mister President, something I wanted to clarify, just in case I did not relay it well enough when we met. First, I've just got the Cubans to allow in a Russian oil company, and second ... they have enough oil to shift the balance of power in the region.' He listened. 'Did I not mention that? Never mind.' He hung up.

'Did you just kick him in the balls?'

'More like the throat,' Jimmy quipped. 'I wasn't going to do that for a while, I must be getting adventurous in my old age.'

Back in the meeting, we simply asked what steps could be taken to improve relations with the Americans, a whole host of silly ideas given to us, and rejected. Everything came down to the embargo, Jimmy explaining that the Russians, British and French were keen to improve trade in the near future. We did not get far and broke for the day, travelling around to the Chinese Embassy for a meal, the Russian Ambassador invited over.

Jimmy took a call from Art Johnson. It made him smile, so must have been good news of some description. Back at the table, Jimmy told the Chinese and Russians that it would help our cause if senior figures from their governments visited around four weeks from now. They promised to relay the messages.

The next morning we met the American delegation at the airport, four Republican senators, four Democrats, Pedersen in the group. A coach whisked us to the same building we had been using, cold and formal greetings swapped between the Cubans and Americans. Everyone settled around a large table, Jimmy kicking things off because he was, after all, the special envoy.

'Let me start by informing everyone here that I spoke to President Johnson last night, and as of next week America would like to offer two flights a day between Florida and Havana, visa restrictions applying of course. If Cuba is happy to co-operate, President Johnson wishes to make this first gesture of peace and goodwill.'

The Cuban side of the table exchanged looks, making formal noises of approval, heads bowing polite acknowledgements. Pedersen made a short speech, and managed to use a hundred words to say absolutely nothing, his colleagues repeating the move. Jimmy finally asked the Cubans if they would put

reparations on the table. They would, the American delegation could take that back. Jimmy then asked if the Cubans could tone down any anti-American rhetoric whilst talks continued, regardless of what American commentators said. They agreed. Thank god for small miracles, I thought.

Jimmy then introduced a few sweeteners, which I was not sure about. He explained that the French and British Governments would be sending medical supplies for Cuba's hospitals, a large consignment. In a way, it made the Americans at the table look bad. The American delegation entered into detail, small detail, of "maybe" deputy assistant ambassadors swapping between Havana and Washington. Sometime soon. I felt like shouting at them.

Jimmy halted proceedings, saying he wished to try and reach the White House. We stopped for coffee and cake. Returning, Jimmy announced that full Assistant Ambassadors would be welcome to swap within a month, the US expanding its team at the Swiss Embassy. Progress. And that was all we got done, the Americans leaving on the plane that had brought them, Pedersen thanked. We stayed another night, Cuban officials dining with us at our hotel. Somehow, they had got the impression we could get things done.

A week after we departed, a huge Russian contingent landed in Havana by boat, all the equipment needed to drill wells. They got to work. Two weeks after their mini-invasion of their communist allies, the Russian Deputy Prime Minister landed for a visit, closely followed by his Chinese counterpart a day later, a joint British-French delegation slipping in after them. The nice man in the White House could not have missed the attention Cuba was getting, and I'm sure he uttered a few words when the Russians struck a major oilfield, a very major oilfield.

In the deal we had struck with the Russians, they made significant upfront payments to the Cubans, twenty mainland wells sunk before offshore rigs arrived. The prospects for Cuba were good, the island soon to follow Russia as an oil rich nation, the White House moving as far, and as fast, as prudence would allow in order to mend relations.

Jimmy's next interview with a US news service was simple and blunt. 'The Cuban's have enough oil to make themselves the

richest nation in the Caribbean, if not all of South America. If American corporations don't get in there soon they'll lose a hell of an opportunity to the Russians and Europeans. You need to think about jobs and the economy first, regime change and politics second. You deal with Russia and China, so why not Cuba?'

As this was going on, the first Chinese oil well was sunk in the Congo, just ten miles south west of Forward Base. Strangely enough, they struck oil at the prescribed depth, work already underway for a small refinement plant. Yuri was also busy, a modestly sized smelting plant nearing completion. All it needed was a good source of cheap oil nearby.

All was progressing well enough with our projects, when news of Kimballa's death came through. We were in the cars, driving over to Mapley one morning.

'Did you know?' I asked Jimmy.

He nodded. 'The man was a liability anyway; his own people bumped him off. His son will take over – and do a better job.'

'Will it affect our project there?' I asked, concerned.

'No, no change.'

At Mapley we examined three new buildings, the first being a press centre next to the HQ building. It was a two-storey office block, two large rooms downstairs for giving press conferences, numerous small offices for reporters to use. Upstairs, two sets of video conferencing kit had been set-up, allowing someone to be interviewed for the TV news remotely. Helen was tasked with the press centre's upkeep and operation.

The next building was a similar size to the HQ building, but designed for NGOs to hang out in, free office space for any NGO that applied, the UN and the Red Cross already moved in. Others would drift in over the years.

The final building was another barrack block, this one for temporary visitors, recruits visiting for just a few weeks. That freed up the other barracks, those with separate rooms, for members of the Supplemental Group. This building was two-storey, but long and wide, twenty different rooms, each with ten beds in. As we poked around it, I considered that Mapley was going the same way as Mawlini.

In Bob's office, we discussed the Cuban doctors.

‘They RF sign-ups?’ Bob queried.

‘Not really,’ Jimmy explained. ‘More your ... flying doctors. They’ll wear whites and come under your remit, but they don’t need all the courses - they’ll work out of clinics. But, in the future, if they’ve done some of the courses, they could be seen as supplemental groups. There’s two hundred in the DRC, under our people there for now, so get involved. A hundred will go to Somalia, but most will help out around the Congo, especially at the mines.’

Driving toward the gate, we passed the first batch of French rescuers I had seen. Their base, near Toulouse, had everything Mapley offered, but they were required to pass the tests here to be signed up to RF International. If they wished to be part of the family, they’d have to stick to the family rules. Mapley also hosted teams from Ghana, India, and the latest addition, Namibia. Namibia was chosen for its excellent training grounds, its long stretches of desolate coastline now subject to teams on navigation exercises and survival courses.

Savagery

Jimmy handed me a task, a secret task. I was only to describe it as “trading funds”, even to Helen. The “M” Group were not to be informed, but Jimmy hinted that certain members knew about it. I was informed that I would be allocated a hundred million out of the property fund, then led up to my old apartment, where three new computers had been installed, each with a satellite link to accounts set-up by McKinleys’ directors, via Switzerland. They were real time, state of the art, the communications channels secure.

‘OK, I’m confused,’ I admitted. ‘Why the cloak and dagger?’

Jimmy gave me a sheet detailing what certain markets would do in the months ahead. ‘There are many very rich banks and brokers in the Gulf States, doing little with their money other than build useless marble edifices in the desert – and invest in Western property markets.’

‘Ah...’

‘And we’re going to bankrupt a few.’

‘What? You mad? What happened to discretion?’

‘It’s all secure,’ he assured me. ‘If they track back, it goes through a Swiss bank client account, then McKinleys. Besides, it’s not illegal, it’s just a private client trader having a bit of luck.’

‘How’ll you bankrupt them, they’ll offset trades in the market?’

‘No, some will act as principal.’

It was the process whereby brokers and banks acted as bookies. They did not take your trade and place it with many individuals in the marketplace, they took the opposite side of the action to your position. If you won, they lost. But they worked on the assumption that, overall, everyone loses; just like Vegas. My job was simple: find those acting as principal and break their balls, slowly building up positions till their eyes watered, then moving on to other brokers. We knew which brokers were international, so avoided them. This was about Gulf State and Saudi brokers and banks only.

I explained to Helen that I had more stock trading to do, much of it real-time, and that I would be behind the screens a fair bit. She handed me the carrycot, a subtle hint. If I was to be sat on my backside upstairs, I could make myself useful.

In the days that followed, Cat babysat out of the apartment a few days a week, Helen popping up each day for coffee and lunch. When trading the US or Asian markets in the evenings or early mornings, Helen would sit with me, picking up a little about trading, or we’d lay on the bed watching TV, my screens bleeping for attention when a sell trigger had been reached. Within seven days of making the first trade, my first account had been forcibly closed out. We had not lost anything as a result of it, but the bank behind the brokers was hurting badly; some pencil pusher in an air-conditioned office Kuwait would have to adjust his balance sheet by almost twenty million pounds.

With the money in the account, Jimmy asked the PM for a chat at the London apartment, Jimmy asking for a license to build a new prison. If the PM promised the building some suitable guests, we’d go ahead. It was done deal, the press all over this new Government-Private Sector partnership. After the

meeting, Helen and I lay on the bed in the old apartment, a large floor plan of the proposed new prison spread out. It was American in design, a star shape that allowed the five wings to be viewed by a central security desk, and could hold four thousand prisoners. This prison was due to be built north of Bristol, a second hinted at for South East London.

I continued to savage the brokers, often opening accounts with the smaller brokers just to destroy them. It did not sit well with me, but the brokers had the money to lose. One brokerage working out of Dubai folded inside a week after selling me stock options. We hadn't lost any money, but had not received a potential further sum they owed us. Jimmy would sit with me at least once a day, often playing with the baby. He even did the nappies once. One day he brought up a plan for a new pensioners complex, a "super retirement home", and something that the PM was already aware of. He explained the concept to Helen and me.

'You have a large number of pensioner flats, small flats that they sleep in, TV, mini-kitchen, etc. But they also have communal areas for TV, an internal courtyard like Po's hotel in Hong Kong. That courtyard has a café, plus a restaurant or two for evening meals – all included in the cost of living there. Because the restaurants are feeding large numbers it gets cheaper, an economy of scale. Outside the complex you have gardens and ponds. At the point where the access road meets the complex you have a doctors surgery and a pharmacy, open to the public, but aimed at the complex. That means that a large number of pensioners can be seen by the doctor doing his rounds, just like in a hospital, and saving money. There'll be a shop inside and regular orders can be delivered each day, even milk in the mornings. At the back of the complex there'll be a hall for church services and dancing.'

'Dancing?' Helen queried.

'Keep the pensioners active and healthy.'

'Could just inject them,' Helen suggested.

'Could do, but that would bankrupt the nation,' Jimmy pointed out. 'If all pensioners live to be a hundred and fifty it will bankrupt us. As we stand, by time we get to 2015 most pensions will be undervalued, people going hungry. People are already living longer, not enough young people working to pay their tax contributions.'

‘That going to be a problem?’ I asked.

‘A big problem,’ Jimmy emphasised. ‘Hence, cost saving ideas.’ He tapped the drawing. ‘The first one will be built just down the road, we’ve already got the planning permission. I’ll roll out twenty or thirty of them, but there’s no money in them.’

‘Hence the top up with the trading,’ I noted. ‘It’s almost as if you’re working to a plan.’

Working behind the screens gave me a new focus, and a new appreciation of the Helen. Many a day I would get home after a long thirty yard walk, and sigh loudly. Sometimes it would get me sympathy, sometimes a good massage after straining my eyes all day, Helen always quipping about the relationship between eye strain and the need for a massage.

One day I heard a helicopter land, walking to the window of the apartment. Yuri and Marko stepped down from the Agusta chopper. I set an automatic sell on the computer and walked downstairs, finding Po’s vehicle convoy pulling up. I practised my Chinese, soon followed by my Russian, finding Jimmy in the office finishing a call. In the lounge, we closed the door and sat.

Jimmy began, ‘Gentlemen, I have a favour to ask. In order to assist my operations in Cuba, I would like you to use some of the *good favour* you have accumulated, and jointly build a new university in Havana.’

They glanced at each other. ‘You have the plans?’ Yuri asked.

‘They’ll be ready soon, and I’d like you to journey to Cuba to meet the government there and make the offer, on behalf of all of us. Paul and I will contribute ten million, I’d ask for ten million from each of you.’

‘That’s a big university,’ Yuri noted. ‘In Cuba, it would cost a tenth of that!’

‘Yes, but we want it to be the biggest and best university in the region, with computers, and western teachers. Students would come from many countries to study there. The money is for a five year plan.’

They were all happy to be involved, and they would be all nominated as honouree chancellors, themselves and their families involved for many years to come. It was a done deal. Big Paul and Karl brought in three map boards, Han and Ivan joining us. Over the next hour we discussed each mining

concession, any problems or suggestions. Jimmy laid out plans for expansion, the routes through Tanzania and Kenya. In order to keep the Kenyans and Tanzanians happy he wanted small smelting plants in their countries, refining ore for shipment on the coast. All were in agreement.

Jimmy then mentioned that the UN, and certain human rights groups, were nosing around the Congo mines and smelting plants, suggesting that more hearts and minds was needed. He suggested that small schools be built near each Chinese and Russian installation, on a pro-rata basis per million tonnes extracted. On that basis, Yuri's mine should have a school big enough for two hundred kids, little more than ten thousand pounds to build at local rates. He would also need a clinic with three medics. Marko's mine would need a school for three hundred kids, a clinic with five medics. The Chinese would have to supply a great deal more, but Jimmy said to make use of the Cuban doctors for their philanthropic contributions. Po was then surprised, by being offered a small mining concession. He readily accepted, his corporation already heavily involved in shipping the ore back to China.

With the Chinese tonnage up to a trigger point, Jimmy said they should start work on the highway from Forward Base towards Kinshasa, a ten year project through mosquito infested jungle, and regions still controlled by warlords. We would be fighting our way through. And as for our region, we had pushed five hundred miles beyond our remit, the Kinshasa Government not fussed; they had more tax revenue pouring in than they knew what to do with.

With the meeting concluded, Jimmy surprised everyone by saying we'd all now make a surprise visit to Forward Base, a plane sat waiting. I quickly packed a bag, said goodbye to a disgruntled Helen, and set off for Heathrow in the cars, the Russians in the Augusta, Po back in his vehicle convoy. We met at Terminal Four, our flight not listed on the board, but taken through to a private lounge, our 747SP packed with supplies for the Congo. Passports were checked before boarding, the aircraft offering only sixty seats up front, the rest of the plane all cargo hold. Seven hours later we broke through the clouds over Forward Base, known to most as Kigeli after the nearest town.

Coming in to land, I was surprised by the changes, my last visit here made in the dark. What had been a green and lush valley now looked like a Russian suburb - all concrete! The building work staggered me; it was a city.

We touched down on a wet runway at sunset, taxiing around to the new terminal building. It wasn't much, and reminded me of Biera airport in Mozambique. Clambering down the high steps into drizzle, the officials were clearly not expecting us, guards saluting. They arranged a line of jeeps, whisking us first to the RF unit.

'Jimbo! Paul!' the Australian senior man offered. 'Welcome to the backwater.'

'Not any more,' I said. 'It's grown a bit.'

'It grows by a hundred yards a month,' the man informed us. 'Got the Cubans here now, hundreds of them.'

He gave us a tour of the RF facilities as we lost the light, meeting those staff that were not out on deployment, a few I recognised. One had flown with me in Mozambique.

After forty minutes with our RF unit, Chinese and Russians rescuers introduced to their countrymen, we booked into a new hotel, a far higher grade of finish than the RF hotel. Jimmy sent word that we'd hold a meeting with the senior administrators at 7pm, giving us time for a shower, and a bit to eat in the hotels plush restaurant. Yuri and Marko had already stayed at the hotel and now showed us around, the hotel even offering an indoor pool and sauna. At 7pm we drove around to the administrative buildings, and I did not recognise them. This complex was as large as the Cuban Government buildings, the main planning room impressive. It stretched out thirty yards square, huge maps pinned to the walls, a large central table with a map of the region ten feet square. Mining operations were denoted by small plastic models, also oil wells, hospitals, clinics, military bases, national flags placed on many items. If someone sneezed over the board, workers could end up in the wrong area.

The administrators gave a brief run down of main operations, current operations that mostly involved the ongoing battle of moving west. We told them about the highway project, and they illustrated where it would run, the best route given the terrain. There was much debate about a tunnel, since it would cost as much to go around a mountain as through it. Jimmy favoured

going around. He then surprised them by announcing a plan for a small hydroelectric dam, in fact ten of them around the region. The thinking was simple; a large dam could power a large region, but that would mean a lot of power cables going through the mountains and jungles. So they would be small, some just ten metres high and fifty metres wide, enough power to light a small town or a factory. Or a smelting plant, Han pointed out.

They showed us the latest tonnage and revenue figures, making my eyes widen. The diamond trade was not measured in tonnes, but dollars, an obscene amount of money generated, but one that we had capped in case the global price dropped. After a little persuasion, the Chinese and Russian Governments had agreed to buy up excess diamonds at a discount, and hold them with their national gold reserves.

We broke the meeting after an hour, thanking our staff, and headed for our evening meal at the hotel. We had only just settled when Hal stepped in.

‘Part-time workers here then?’ he asked.

I stood to greet him, dragging over a chair. ‘What you doing down here?’

‘Got some warlords in the west playing up.’

‘Aren’t you a bit old for this?’ I asked.

‘Still kick your arse, sonny!’

Hacker walked in smiling, grabbing a chair. ‘We’re honoured with ya visit to the backwater.’

‘Not such a backwater,’ I pointed out. ‘All mod cons!’

An hour later, the meal finished and a few beers downed, we sat reminiscing about Mozambique when one of the base officials came and found us, carrying a map.

‘Sir, we have reports of a Nigerian aircraft crashing, on our border with Zambia.’ He illustrated the position for Jimmy.

‘What type of aircraft?’ Jimmy asked, everyone now listening in.

‘A civilian 737, sir.’

We stood, Jimmy loudly ordering, ‘I want Rescue Force Congo to full emergency deployment. Move it!’ The man ran out, civilians in the restaurant now keenly attentive. Facing Hal, Jimmy said, ‘I want every Huey we have ready to go ten minutes ago!’ Hal and Hacker ran out.

Jimmy led everyone out and down to the foyer, ordering vehicles. He dialled Bob Davies on his satellite phone. 'Bob, a 737 has crashed in the jungle about four hundred miles southwest of Forward Base, which is where we are now. I've ordered the Congo team to emergency deployment, put Tanzania and Kenya on Unit Standby, and get me every Mi2 and Hercules we have in Kenya over here, and the Dash. Get me the best twenty people from Kenya. I'll call you back.'

I called Helen. 'Get everyone in the house to the office, a plane has crashed southwest of us, Rescue Force is going after it. Thanks, love.'

In the map room, flustered officials trotted back in. Jimmy barked, 'I want the Congo Rifles senior officers and the British instructors! Quickly.' A man lifted a phone. 'What aircraft do we have on the apron?'

They listed off two Antonovs, a commercial 737 and the 747SP.

Jimmy ordered, 'I want them all fuelled tonight, get me the pilots!' He pointed at the man who had informed us. 'Get me the flight plan of the downed aircraft, and last known position. And double check it.'

We closed in on the map, Jimmy placing a small model on the indicated area.

'There no roads,' Po pointed out.

'None at all,' Han added. 'Not within thirty miles.' Yuri and Marko had a nose at the map.

Jimmy called a man over. 'Tell us about this area.'

The man made a face. 'It is unexplored jungle, deep gorges and rivers, that's why there are no roads. And around it, many warlords.'

'Jesus,' I let out. 'Couldn't have picked a worse spot. We'll even have to fight our way in.'

With the aircraft's flight plan checked, we stretched out a piece of red string onto the map board, a kink in it where the last known position was indicated. It was in the middle of nowhere. For all we knew the place still had dinosaurs and cannibals. The RF senior staff appeared with radios and satellite phones, claiming a desk as their command centre. I showed them the crash site.

‘Jesus, it’ll take a week to reach it by foot from the nearest road!’

Jimmy tapped the map, one of our outposts. ‘What’s there?’

‘A clinic, a helo pad, twenty Rifles,’ they reported.

‘Alert them to expect the Hueys, set-up lights, send all the Hueys there now.’ Jimmy faced an official. ‘Send fuel trucks to this location for the helicopters.’

The pilots of the Antonovs and civil aircraft we led in, white shirts with gold bars on shoulder epaulets.

‘Gentlemen, I need your help. A commercial 737, Nigerian Airlines, has crashed four hundred miles south west of here – in the middle of nowhere. Two hours before dawn I’d like you to help with the search pattern, I’ll pay the fuel and time.’ They were all agreeable. ‘Go and get some food, plenty of sleep, back here at 4am.’

As the pilots stepped out, the Congo Rifles entered. Their senior officer was a local, his adjutant British. Six ex-SAS troopers trailed behind, some I knew. ‘Gentlemen, a Nigerian Airlines 737 has crashed in the jungle.’ He pointed out the spot. ‘Where are your nearest men?’

The adjutant pointed out the bases and outposts, none closer than a hundred miles.

‘Order them all to this village,’ Jimmy said, he finger on the village in question. ‘Fight your way in if you have to, seize the area. Get six of your Hueys ready for the morning, we’re sending fuel trucks to the outpost here.’ They noted the location, familiar with it. ‘Then replace the men you’ve moved with men from here, or other areas. Now, we’re going to need explosives to blow down large trees and to try to make a helicopter zone near the crash site. It’s jungle, so tall trees and no fields. Get the explosives onto a Huey tonight and get it going, we’ll update you after you get there.’

The adjutant dispatched the ex-SAS guys, grabbing a desk with his boss, phones lifted.

Jimmy turned to me. ‘Get hold of Keely at the house, see if there are weather satellite photo’s of the area.’

I made the call, Jimmy made coffee, discussing the options with our gang. Reports came in: Hercules lifted off from Mawlini, Mi2 from Tanzania, Dash-7 airborne, Antonovs refuelled. The RF Hueys had departed, heading southwest

through the night sky, soon followed by the Rifles' Hueys. I called Helen and dictated a press release, asking her to send it out to the usual outlets, but then to hit all the African outlets as well, Jack helping her.

Michelle called me back, having anticipated the need for a weather update: the storm from hell was approaching that area, which is probably why the plane had crashed in the first place.

'Jimmy,' I called. 'The storm from hell is closing in on that area.' We all stood and stared at each other for a moment.

Jimmy finally said, 'We'll have to try it anyway, get as close as we can. Walking in *is not* an option.'

We invited Po, Han and the Russians to return to the hotel and get some sleep, we'd crash out here. Han remained, since Chinese RF units here were involved, the others taking up their rooms but promising to be back in the morning. Keely's satellite images began emerging from the fax machine, weather maps and projections, the storm clearly visible. Luckily, the centre of the storm was moving south and past our area of interest, assuming that the plane was in that area.

At 4am Jimmy ordered ten members of the Rifles into each plane to act as spotters. The planes were dispatched; the Antonovs first, followed by the 737, finally the 747SP, the graduation one of speed; slow to faster. Each plane was given a slightly different heading and altitude, a different area to search. The 747 cargo would reach the target area at dawn, the others later. We paced up and down.

As the 747 reached its search area it relayed low cloud and poor weather - it had no choice but to move east and adopt a new search area for now. It had the range and fuel, and could stay over the search area all day long, so we were not concerned. The 737 was diverted, starting a search pattern east of its intended target. At least those areas were being eliminated.

The Antonovs arrived an hour after dawn and flew straight to their target areas, ignoring the storm and riding it out, the soldiers in the back a bit sick. An hour after starting their search pattern the Russian pilots spotted the wreck, its tail and rear fuselage intact. They reported a red tail with a white line, so we checked with the airline. Yes, it had a red tail with a white line. They fixed the position by GPS, all planes ordered back. They

also reported that it was a deep gorge, on a river bend. We fixed its position on the map, finding the gorge and river.

I straightened, 'They're in the worst part, of the worst area, of the poorest country in Africa. With a storm overhead! And that's if there *are* any survivors.'

Jimmy replayed the co-ordinates to our outpost, Hal complaining that the weather was too dangerous for a flight. We asked him to take off the minute he could.

The map room now bustled as the rescue plans were arranged, people coming and going, updates handed over. Yuri and Marko had mines to visit, people to see, and so Jimmy asked them not to waste their time here today, we'd meet up later. Po stuck close by, a handful of RF Hong Kong rescuers involved. Tubby wandered in with Sue, and I pointed out the position of the crash site. They were not optimistic, soon refuelled and about to transfer the RF Kenya staff to the outpost. I wished them well. Stood outside for a breather, I peered up at angry dark clouds, cursing the weather.

At the outpost, a few hours later, Hal and Hacker lifted off. Badly buffeted, the two Hueys fought their way southwest, often losing sight of each other, but fixing their positions by radio and landmark. With fifty miles of virgin jungle to cover, they followed valley contours, trying to stay as high as they could, but under the cloud layer. More than once they banked to avoid hitting the mountains, soon out of radio contact with the outpost.

Forty minutes later, and figuring they were close to the crash site, they followed the river they believed the aircraft to have crashed next to, fighting the wind all the way. The team in the back opened the doors to try and spot the wreckage, soon soaking wet as they stared down through cloud and mist at primordial jungle.

Around the next bend they passed a steep cliff on the left, the red tail spotted on the right. Hal slowed to a hover, Hacker climbing over Hal's Huey. They both turned about, the way they had come, and into the wind. There was no sign of life at the wreck site, a handful of bodies visible, the Huey hard to handle in the gorge. Hal estimated the clearance to be just about enough, but the wind buffeting too much for a safe winch of survivors; he'd have to risk landing if any survivors were to have a chance.

Hacker sounded his objections, loudly, but Hal went down anyway. For ten minutes Hal fought to hold the Huey steady, descending very slowly, his crew and team shouting clearances. But the lower he got, the less the effect of the wind.

Facing the prospect of landing right in the main debris field, maybe even on bodies, Hal continued down. At that moment, the very old lady he was flying decided she'd had enough abuse over the years, a connecting rod on the transmission popping. Warning lights flashed, alarms sounded, and the bird dropped onto its belly with a jolt, breaking the tail off. The tail rotor hit the debris field, tearing itself off and spinning around like a mad Catherine wheel.

From high above, Hacker could only watch, no radio contact coming back. White figures raced out of the Huey and dived clear, six in all. Everyone was accounted for. With the Huey's rotors winding down, they ran back and grabbed backpacks and emergency supplies, stripping anything useful from the Huey in case it caught fire. With a green flare fired, to show they were all OK, Hacker pulled up and began the arduous trek back alone.

An hour later we got the news, Hal's Huey blocking the only place to set down. Only then did Hal remember his satellite phone, calling Mawlini for Jimmy's number before calling Jimmy directly.

'Hal, what the fuck was that?' Jimmy asked, people closing in.

'Any landing you walk away from...' Hal shouted over the roar of the storm.

'You planning on paying for that Huey?'

'You can bill me, if we get out of here.'

'Any survivors?'

'Five: various states of injury. I think four might make it. Drop us supplies, extra IV drips, and stretchers, food and heaters.'

'The weather has deteriorated, so you'll have to wait till the morning. Have you searched the area?'

'Near impossible, it's a death trap just to move around. If the weather is better in the morning we'll go out again. We're camped in the tail section. Hal out.'

Jimmy announced to the room, 'Five survivors.'

I closed in. ‘Did Hal bend one of our Hueys?’

‘Broke the tail clean off. Anyway, issue the following press release: veteran pilot Hal *deliberately* crashed his helicopter into the jungle to land the medics, etc.’

Shaking my head, I rang Helen.

At the crash sight, our team battled against the odds to save the injured, whilst also battling the raging storm. Their backpacks possessed basic rations, enough for two or three days, and small cooking heaters, now being employed to make hot sugary tea for the injured, our rescuers trying to get fluids back into them. With night approaching, not that the available illumination was great now, Hal scrambled over razor sharp debris and to the Huey, stumbling over a headless corpse. In the back of the broken helicopter he opened a storage locker and pulled out a one-man yellow dinghy pack, not much bigger than a football. Back at the 737’s tail section he pulled the chord, the dinghy hissing into life and flapping in the wind. Dragging it in sideways, Hal jammed it between seats, blocking the opening and affording those inside some shelter from the wind and driving rain. With his toolkit retrieved, Hal removed the last row of seats, further blocking the opening with them whilst making space for the injured. They had a shelter and clinic for the night, but a hell of a draft.

Hal was up before dawn; he had been injected with stems in hospital in Nairobi. He had found many bottles in the aircraft’s small galley and now siphoned-off aviation fuel. Small Avian water bottles were filled and transported back. Away from the tail section, Hal collected chairs, stacking them up, broken branches placed on top; a beacon for the other helicopters when lit. He fetched water from the nearby raging river, soon plenty stored ready, albeit a little brown in colour.

An hour after dawn, staring at leaden sky, his face wet from the rain, Hal could swear he heard a helicopter. He shouted to the others, who emerged and looked up, before lighting the beacon, a liberal amount of aviation fuel making it roar.

A green army Huey was a surprise. The small parachutes were also a surprise, more than a dozen of them drifting down and snagging on trees. He grabbed the closest one. Explosives!

‘They’re explosives!’ he shouted. ‘Be careful!’

A white RF backpack came tumbling down, no parachute, and slamming into the debris. It was stuffed full of blankets, one sheet of tarpaulin. In the centre of the pack, wrapped in the blankets, four IV packs lay unbroken. Two more packs descended, thudding into the ground; more blankets and IV sets. And that was all, the Huey pulling away.

Back at the shelter, Hal collected his team. 'Right, we got blankets, IV, some tarpaulin. You lot use that, I've got some trees to blow down.'

Hal spent fifteen minutes scrambling over the debris to retrieve all of the explosive packs, placing them in the Huey. With the first block of plastic and detonator in hand, he studied the steep hillside, and the trees. Blowing them down without killing himself, or anyone here, would be the trick. After five minutes study it came down to two tall trees preventing another helicopter landing or winching. Fetching rope from the Huey he set off, sliding down a steep gully and across to the other side, up the tree's exposed roots. At about the height he figured he would set the charge he found a convenient hole in the trunk, dreading just what may be lurking inside. Hanging onto the wet and slimy roots, his hands muddled, he fixed the detonator. It looked like a standard five-minute fuse. Before snapping the fuse to start it, he threw the rope around a nodule and back down to the gully. With one hand on the wet rope he snapped the fuse and tossed the explosives into the hole with a curse, soon sliding down uncontrolled. In the gully, up to his knees in water, he figured he'd not have time to scramble up the opposite bank. He turned and walked down the gully, finding an overhang after five yards and ducking in. He waited, hands over his ears.

A pressure wave passed over him, the modest blast registering afterwards and repeating twice off the curving cliff face over the river. Then nothing. He peered out as the tree slowly considered its options, finally opting for a slow and graceful bending, its high canopy now covering the nose section of the plane and its debris. He retrieved the rope, now dangling in front of him, and set off again, soaked right through, his whites now brown.

Thirty minutes later he again slid down the rope, too wet to control his descent, and reclaimed his shelter in the gully. This tree, however, wanted to show off. Its trunk splintered, and it danced sideways, landing above the gully on the debris side,

remaining upright for a moment before falling on top of the first tree. It took Hal ten minutes to scramble over and under branches and back to the tail section, every inch of him soaked and muddied. At the tail he heard another Huey, and stood wondering if his efforts had been enough.

Whoever was in the white RF Huey, they floated slowly past, turned into the wind and then lowered to twenty metres, their rotor signature resonating off the cliff. A door opened, a stretcher spinning as it lowered.

‘Get the injured out!’ He grabbed the dinghy and tore it out of place.

With three injured stretchered up, the Huey pulled away, a second dropping into place. The next two injured were sent up, the recipient Huey pulling away. The third Huey dropped into place, but instead of sending down winches, rescuers came down with their packs.

‘You’re to stay here,’ the man reported. ‘Search for any survivors walking off, then gather the bodies.’

Hal turned to his team and shrugged, four more rescuers descending, followed by tents and supplies being lowered, together with almost fifty body bags. The next Huey winched down four members of the Rifles, armed and kitted out, the sound of helicopters soon just a distant echo as the rain and wind recovered the valley. Standing there, Hal considered that he had never felt better. Or fitter. ‘OK, people, let’s get organised!’

‘Injured at the outpost,’ I reported. ‘Dash landed on a road, they’re heading directly to Lagos, Nigeria, being treated on-route.’

‘Good. And our people?’ Jimmy asked.

‘They’re fine. But the Rifles are busy shooting up the local warlord.’

‘Contact our book writer. Got another chapter for him I think.’

With the search underway, normality resumed to a degree, and we got back to the commercial reason for being down here. We marshalled the gang, a large party of bodyguards, and headed for the oilfields.

In a small building that acted as an office for the drilling operation, we met the Chinese workers. With Han and Po close by, Jimmy suggested that they strike a second well, his finger on the map. Han had the authority and told them to arrange it, to order the extra equipment from China.

Addressing the group, Jimmy said, 'The problem ... is that we're a very long way from the coast. We're also a long way from a large market. Now, the African economy is growing, but it's already fed by Nigerian oil - we would not make a lot of money by trying to transport the oil, or to sell it. If a pipeline was considered, it would cost a billion dollars at least, the best route being through Tanzania.

'So the solution, is to stick to those products that are valuable enough to be transported by road or rail. Now, if ... the Tanzanian railway could be fixed to a good standard, then it may carry ore and crude oil in the future. That's something that should be considered. The simplest option is that which we're already seeing - to refine locally and to sell to ourselves locally, for the cheap transport of the ore. And, as the area and the country grows its industrial base, that internal market will increase in value: we can sell oil to the French mines. We can also sell oil to Uganda, Rwanda, Kenya and Tanzania. It is not a huge market, but it is a market.

'I suggest that we put together a working group, with the Tanzanians and Rwandan authorities, to review road and rail links. Year by year, we should spend some revenue on the rail link, thinking about long trains full of oil. But, in the short-term, let's increase the oil production here to match refinery limits, then use the petrol locally. Once that stage is ready, we'll issue another ten mining areas to you, the aim being to have the fuel supply ready before the large dumper trucks arrive. That stage should be six months. Han, if you can be ready to begin new areas in six months.'

We toured the nearby refinery, asking about production levels, before dropping in on a mine on the way back, listening to gripes about equipment and the local unskilled labour market. Back at Forward Base we met with a French administrator, the man a representative of the French Government, and listened to his concerns and needs, helping where we could, a French consortium now mining a sizeable area.

The next morning, our visit here dragging on longer than planned, the Rwandan Government came over, polite enquiries made about the plane crash. Jimmy began by asking that they take back more Hutu refugees, and offering crude oil and petrol as incentive. They offered to consider it. Jimmy offered to force all the Hutus back across the border in one go. The Rwandans modified their approach. They would take five thousand a month, the oil deal, and some money from us for each person accepted back. We thanked them, telling them that when oil refinement was increased, we would sell them cheap petrol. We'd also offer some money towards improving their road and rail links. It was a done deal: we were paying them to take back their own citizens!

Next came representatives of Seirra Leone, their country suffering at the hands of guerrillas, not least those sponsored by Liberia. Jimmy was blunt: invite us in, offer us mining and oil exploration rights, and we'll kill everyone holding a gun - or spitting on the pavement. We'd start with two-dozen attack helicopters, five hundred soldiers of the famous Rifles. There was nothing in the deal not to like, a paper signed and handed over there and then. We handed them a Swiss bank draft for twenty-five million pounds: "towards their orphanages".

With the Seirra Leone delegation packed off, the gang asked about the move.

'Sierra Leone has ore and oil,' Jimmy said with a grin. 'But first, we need to sweep the small nation, then use the guerrillas as an excuse to destroy Liberia. If we don't, Liberia will send guerrillas to attack our mines there.'

Orders were signed for the squadron of Mi24s to be dispatched to the coast, along with the Cobras, twenty army Hueys and five hundred members of the Kenyan Rifles. War, had been declared. After lunch, with the 747SP sat fuelled and waiting, representatives of the Zambian Government arrived, an hour late landing. We quickly settled them in the same meeting room.

Jimmy began with, 'We would like to help you with the MLF problem that still plagues your northern border, our southern border.'

'How ... exactly?' they wearily enquired. The last time we had just invaded their territory.

‘We would like to offer to raise a small brigade of Zambian Rifles, and pay for it. They could then be used to quell any problems with the MLF. They would be under your control, but we would pay them, equip them and train them, as we have done with the Kenyan Rifles. Their base would be near the border so that they can patrol that area. That way you have fewer problems with guerrilla fighters, and so do we. We will then, when the security situation is better, build schools and hospitals for you. Your northern region would be as peaceful as the Congo has become.’

They liked the idea, and the sweeteners, offering to get back to us as soon as they could, then cheekily asked for investment capital in a few projects.

‘Security first,’ Jimmy insisted. ‘We would not invest in a country if it was dangerous for our staff.’

I was glad to board our plane and take off, soon above the clouds and in the brilliant sunshine. Not having slept much in the past few days, I dozed off, Jimmy discussing Sierra Leone and Zambia with the gang. Yes, Zambia had mining potential, and Liberia; Jimmy was out to dig up the whole of Africa.

Po headed home from London, so to Yuri and Marko. On the drive to Wales, Po and Jimmy were scheming in detail, so I just switched off. At the house, Jimmy told me to meet him at 9am for a war council. Helen opened the door to our house and I lifted her up, squeezing her tightly.

‘I missed you,’ I whispered into her ear. I stepped in and closed in on my daughter, finding her awake and giggling. Lifting her out of the cot, I tickled her feet, eliciting shrill laughter. ‘And I missed you even more.’

Helen sat. ‘All sorted?’

‘The rescuers found five,’ I said.

‘One died, but they found a small girl in the jungle.’

‘A girl?’

‘Three years old, her parents dead.’

‘Christ, she must have been wandering around for ... three or four days.’

‘Hal found her. And they airlifted most of the bodies out, the transport officials were airlifted in.’

I found myself nodding, then took in my own daughter's face.
'If anything ever happened to her...'

'It won't, Jimmy would say,' Helen softly insisted.

'It's not guaranteed, not since he's altered the time line.
Hence that car bomb.'

'Well, let's not think about that now, huh. Some food?'

'Lots of food. Then the three of us can take a bath.'

More to follow... this is not the end.

Magestic

Geoff Wolak. October, 2009.

Part 5

War council

The “M” Group gathered in a lounge, the topic Sierra Leone.

Jimmy sat back and crossed his legs. ‘Gentlemen – and lady, the government of Sierra Leone has asked us to assist with their counter-insurgency, and we have readily agreed. As we speak, our attack helicopters are boarding a Russian aircraft carrier off the coast of Africa, for a short sail to Sierra Leone, the advance guard of the Kenyan Rifles already *in country*. We’ve been allocated an old army base with a runway nearby. Our aim is simple: to rid the country of insurgents, then to assist the country to develop roads, schools, hospitals ... and its mining activities to pay for it all. We’ll then look at Liberia, the cause of much trouble in the region.’

‘*Look at ... Liberia?*’ Keely questioned.

‘*Look at ... cross-border raids,*’ Jimmy clarified.

‘We have long-dated relations with Liberia,’ Keely noted. ‘Should we not be involved?’

‘American boots on Africa soil is not a good idea,’ Jimmy suggested. ‘Nor is an American peace keeping force. The Africans need to fix themselves – with my help.’

‘You’ll raise a Rifles unit in Seirra Leone?’ Jack asked.

‘Of course. They can then police themselves. All they need is for their mining profits to go to the government in order prosper, and hopefully the money won’t end up in Swiss bank accounts. They have a chance at good future.’

‘Do *they* have oil?’ Keely testily asked.

‘Yes, offshore. And, when it’s pumped, it should sail across to America or up to Europe. That would be ... the most efficient use for it.’

‘How much oil?’ Keely pressed.

‘Not as much as Cuba, and not as much a Liberia, but enough to make them a small rich nation.’

‘Liberia has a lot of oil?’ Keely queried.

‘Yes. And nothing short of a complete sweep of the entire country would make it safe to dock oil ships there.’

‘And after that sweep?’ Keely pressed.

‘The new government could sell its oil to anyone it wants, I won’t interfere.’

Big Paul stepped in and handed Jimmy a note before withdrawing.

‘I bomb has gone off in Equatorial Guinea, West Africa, the President and all his cabinet – have been killed.’ He put the note away. ‘I guess they’ll need a new President.’

‘Do *they* have much oil?’ Keely baulked.

‘Yes, a very great deal of oil. Perhaps Uncle Sam could get involved there.’

‘Will *you* get involved there?’ Michelle asked.

‘Not for many years,’ Jimmy replied. ‘So, Sierra Leone. It’s a one-year campaign, longer to train their military. Does anyone have any questions?’

I asked, ‘How long before the mines make a buck?’

‘At least a year.’

‘So we pay up-front for everything,’ I noted.

‘Not quite, there are good diamond mines in the north and east, the locals willing to sell wholesale.’

Michelle asked, ‘The Kenyan Rifles will not remain?’

‘Only for training, most withdrawn within a year.’

‘And Liberia?’ she asked.

‘A difficult political situation – they won’t be asking us in. We’ll need a UN remit to attack.’

‘UN?’ Keely questioned.

‘The guerrillas in Liberia are attacking several neighbouring states, it should not be difficult.’

‘Art Johnson won’t be pleased,’ Keely suggested, getting a look from Han.

‘If your dear president wishes to send troops, he’s welcome to do so. It will save me a few quid.’

‘And after Liberia,’ Michelle cheekily nudged.

‘Darfur, in the south west of Sudan. A civil war will break out, the Sudanese Government attempting to drive black Africans out in favour of Muslims. And, before anyone asks, we already know that Southern Sudan has a shit load of oil.’

‘And Zambia?’ Jack asked.

‘Good question. First, we’ll need to defeat the MLF guerrillas, then help the country grow its economy. On its border with the Congo are a lot of minerals. If we don’t defeat the MLF they’ll attack at will for decades to come.’

Keely asked, ‘When will Congo oil hit the open markets?’

‘Not for many years - if at all. It will mostly be used to assist mining operations there.’

‘Bombs have gone off at Iraqi oil terminals,’ Keely put in. ‘Who’s behind it?’

‘Some Iranian, some Saudi.’

‘Saudi?’ Keely challenged.

‘They don’t want the oil flowing,’ Jimmy pointed out. ‘If Iraq, Iran, and the West African states got up to speed, the Saudis would be ... most displeased. Oil prices would drop, the US and European economies boosted, more goods bought from China. The Russians also have an interest in keeping oil prices high, but they’re not setting off bombs.’

A day later Hal called, asking for a favour.

‘You broke our Huey!’ I complained. ‘What fucking favour, *old man*?’

‘I want to adopt the girl I found, she’s now an orphan, no relatives at all.’

‘Oh,’ I stumbled. ‘I’ll ... get back to you.’ I went and found Jimmy in the canteen, sat now with Jack. ‘Hal wants to adopt the kid he found, little girl – no relatives.’

Jimmy nodded. ‘I’ll make a call. Tell him she would have to be placed at Ebede, not in the Congo. He could visit if he’s based in Kenya.’

I called Hal back and explained it. He wasn’t completely happy, but understood that he moved around a bit. Given his dodgy occupation – attack helicopter pilot, the courts would never give him custody.’

Jimmy called Anna and she formally asked for the child to attend Ebede orphanage and school.

Sat back down with Jack and Jimmy, Jimmy raised a finger as if about to say something, then just stared out of focus.

‘What?’ I asked.

‘You’ve had no challenge to that Saudi account?’

‘No. Maybe they don’t reconcile till the end of the month.’

‘Today’s ... the twelfth,’ Jimmy noted. ‘Jack, ask Sykes to ask the PM if he’d like to take some money off the Saudis.’

With a curious expression – a smile and a frown, Jack stepped out. An hour later Jack came and found me in the apartment, a sheet of paper in his hand. ‘That’s the account, routed through

Switzerland to London - hard to track. There's sixty million in there. Jimmy said to tell you to make their eyes water.'

I took the paper, entering the account details and passwords into my system.

Jack pulled up a chair. 'So what's this about?'

'Looks like this Saudi trading account is not checked every day, so anyone doing well may not get noticed till the end of the month.'

'You're doing ... nothing illegal,' Jack puzzled. 'So why—'

'If you do well, they close your account, unless they're placing your trades in the market. This lot are not offsetting by the look of it.'

'Which means...?'

'Any money we make comes from their back pocket.'

'Ah. That'll hurt.'

I chose a stock that I knew would spike upwards today, checking my watch. I called up its chart, already a small price rise ahead of a noon news release. I bought Call Options, the confirmation note emailed to me, the bottom line indicating that they were "acting as principal". So I bought more, followed by twenty million pounds worth of stock. When the acknowledgement came through I bought more Call Options, several batches of odd numbers.

Jack sat checking his watch as noon approached, the news flashing up on my Reuters screen as Helen stepped in. With a finger on the screen, Jack read the detail, the stock skyrocketing.

'Ouch!' Jack said, Helen closing in, the baby on the bed.

'What's ouch?' Helen whispered.

'I just took ten million off a Saudi bank, small deal just to break the ice. They sold me stock without having it, probably, so now they'll scrabbling around to find it, and forcing the price higher.'

'You'll sell now?' Jack asked.

'Nope, that would let them off the hook. I'll wait five days. They'll have to get the stock to deliver it.'

Jack became a regular behind the screens as I busted up several brokers, but he never knew what I was up to. I knew of a few Europeans acting as principal, and pushed three of them to close my account, taking millions off them. By the end of the

month the UK Government's sixty million stood at ninety-four, the Saudi account closed down. Sykes rang to thank me, the civil service pension for the MOD now looking a lot healthier.

Jimmy told me to change the account numbers, and to take more risks, calling me a "risk averse slacker". Cursing under my breath, I moved money around, checking the upcoming trades. On a wet Monday, and telling Helen I had a busy twelve hours ahead, we settled into the apartment. I had an eye on the FTSE, another of the DOW, a third on the Nikkei; a three-eyed financial monster who now figured that the three markets would lag a bit, the Saudis not paying attention.

With some determination and aggression, and confident key tapping, I started to open modest trades, building up positions. I even threw in a few spoilers - trades I knew would lose money or go sideways. Anyone checking the account would consider me to be opening balanced positions, so long as they could not add up. When the DOW opened I added to the positions, even though they were now slipping a bit. The computer must have thought I was crazy. By 8pm the baby was fed, changed and sleeping. We even found time for a bit of mummy and daddy time.

At midnight, just the Nikkei remained open and I adjusted positions, making the largest trades whilst assuming the Saudi brokers were off for a bite to eat. With nothing to do till 8am, we headed back over to the house. At 7.45am we were both back and sat watching the screens. The FTSE opened down eight points, dipped to be down twenty - enough to cost me millions - then rallied, soon up fifty, up eighty points by 4pm. I closed out the FTSE and DOW trades, an automatic sell on the Nikkei trades - whichever way they went.

I went and found Jimmy in the diner. Glancing over my shoulder I said, 'I just took a sixty-eight million from a Saudi broker. If they're not off-loading, it'll hurt.'

He handed me a sheet. 'That's Yuri's account. Go murder the futures markets, but through regular brokers.'

I scanned the paper. 'If I type something in wrong, he'll lose a lot ... and kill us.'

'Then don't type something in wrong.'

I got started, and over the next month made Yuri, or the Russian Government, just over a billion dollars, most of the trades made in the Asian futures markets. I hoped we were on a

commission. I tried teaching the baby to trade, but her typing was terrible. And she dribbled on the keyboard. Helen, on the other hand, got a book from Jimmy without me knowing about it and studied hard, soon able to make useful comments, even to check screens.

One day two mini-buses turned up, Big Paul driving one, Karl another. They offered two seats behind the driver, then four seats facing each other as on a train, even a table to use. The windows were tinted, curtains pinned back. Jimmy explained to Helen and me, sitting now in the table seats, that they had been reinforced, making them safer for motorway use. They would be used for airport runs. 'Cool,' I said.

Sierra Leone

Hal, the would-be adoptive father, went off to war, hopefully realising just how unsuitable he was for the whole parenting thing. Hacker went with him, Ratchet and Spanner, and many senior staff from around the globe. Sierra Leone was action central, so they wanted to be in at the start.

They landed at the designated airstrip, pitched tents, set-up security patrols of Kenyan Rifles, and got to work. A tented clinic rose just outside the dilapidated fence, open for trade to anyone passing and in need of a doctor. A second tent rose at the army base just up the road, a surgical unit ready for casualties. Five white RF Hueys landed in bellies of IL76 transports, their rotors detached. Ten green Hueys joined them, the Mi24's and Cobras having been at the base for a week already. With more IL76s flying in with ammunition, the attack units were made ready.

Setting up a base and converting an airfield was something that our facilitators could write a manual for. They fixed the fence, got their supplies organised from local farms and shops, then hired every local building firm they could find to raise buildings, both at the army base and the airfield. The UN still housed eight thousand troops in the area, left over from the larger

UN force that helped to end the long civil war, but the soldiers in blue helmets stuck to their bases or their fixed patrol routes around the capital, Freetown. One of the first things our lads did was to fly up to the UN base and drop in for tea and a chat. They explained what they were planning on doing – in general terms, and asked for a UN co-ordinator at our base, just to be sure that we didn't injure any UN peacekeepers. The next thing our people attempted was to fly over those parts of the country that hosted rebels, in our white Hueys, dropping leaflets over every village and town. Those leaflets, in many dialects and languages, demanded that all armed gangs should surrender their weapons and accept food from us. Two RF Hueys were shot at with fifty calibre machine guns, so I guess we got their reply to our message. Either that or they couldn't read, using our leaflets to wipe their bums.

Jimmy provided the commanders on the ground a very accurate map of where "satellite intel" showed the bad guys. In a bold move, and a quick move, we set-up roadblocks at every road junction from the capital to the northern border, cutting the small country in half. The first groups of gunmen had read the leaflets, but chose to ignore them, getting themselves shot-up on sight. That produced the response we wanted: more gunmen headed for the roadblocks, hungry Cobras circling nearby, Hueys with chain guns on standby. When pitched battles began, the helicopters decimated the gunmen quickly.

In a move approved by the Sierra Leone Government, we threw a ring around the capital, roadblocks on every junction, an RF white tent at many crossroads to attract passing trade; free medical care, even a few babies delivered. It was our stock in trade, and we were good at it. With that phase complete, a second batch of a hundred RF medics landed, another three hundred Rifles, some Tanzanian. The roadblocks moved outwards, more RF tents pitched as part of the hearts and minds campaign.

In Freetown itself, a hundred Cuban medics arrived, adopting the main hospital and offering an excess of medical supplies, and the best of equipment, as part of the package. Tents were set-up outside the main hospital buildings, locals treated for anything they needed, a whole new maternity ward created. We even had a dozen dentists on hand. Through the main port we shipped bags

of rice and wheat, handing them out free; people would wake to find a 2kg bag on their doorstep. In a move that Jimmy organised, that I thought was counter-productive, tens of thousands of corrugated metal sheets were imported. Trucks drove around after midnight and left one or two sheets outside every shanty shack; a new roof, or wall for the inhabitants. A separate set of trucks dropped new plastic buckets filled with household goodies; pots, pans, cutlery, towels, soap.

Coup flew in a month after the first RF units had cut ground and organised a meeting of NGOs already in the country. His message was a simple one: what do you need? We offered ships full of wheat, unlimited medical supplies, even money. No one had anything to complain about, but they still managed to complain about our presence. Apparently, according to some, the country would be better off if left alone.

The airport received a new fence and a lick of paint, as did the government buildings, a ship full of concrete arriving from Po. The cement bags were transported to all the builders in the city, simply handed over to the perplexed locals, the excess stored at a government warehouse. Timber arrived from Ghana, not that there were a lack of suitable trees here, but this wood had been cut into suitable planks and boards, again just dumped outside shacks or handed to builders.

Outside of Freetown an old army base was appropriated, its officers and NCOs kept on and paid an incentive. The fence was repaired, the buildings touched up and painted, the armoury secured, an RF medical tent set-up. Instructors from the Rifles, plus our British instructors, set-up home, placing adverts for new recruits: regular wages, food, shelter and three cooked meals a day. The take-up was not great because of years of civil war - they knew what it was to fight in the jungle. But a hundred eighteen-year-olds signed up, medicals – and injections - given. The Sierra Leone Rifles had been born, new uniforms flown in, new boots, new weapons and plenty of ammunition. The Sierra Leone Army, what it was, got forcefully told to join us by their government. We took our pick of the men and NCOs.

The main pockets of gunmen had no intention of surrendering to us – or anyone else, they were enjoying their diamond-funded drug habits too much. So the ex-SAS guys and the Pathfinders did what they were good at, and snuck about with GPS position

finders and night sights, their M4s fitted with silencers. When concentrations of gunmen were spotted, air strikes would be called in, the Mi24s thundering in at dawn and blasting the insurgents in their beds. Such an attack would typically be followed by Hal's Cobras picking off jeeps or attacking individual buildings, the Rifles landing nearby and mopping up. It was a huge mismatch of firepower. Day by day, mile after mile of jungle was cleared as the war moved north.

As for funding, we spent twenty-six million in the first six weeks alone, all appropriately misappropriated from the Congo mine revenue fund. Mining equipment was unloading on the dock before we had even secured the mines, plus enough road building material to reach to the mining areas. Trucks started to be off-loaded. And all the while Liberia watched with interest, as did the nice man in the White House. As a result of our activities we got an invite for coffee.

Being the sort of people we were, we flew to Cuba instead, to the dedication of the new University, the first building just about complete. The campus had a long way to go, but politicians liked ceremonies. Just to show Art Johnson how much we cared, senior Chinese, Russian, British and French politicians attended the dedication, in town for a trade fare. Po, Yuri, Marko and ourselves were all made honouree chancellors and we gave interviews about the importance of education, co-operation and international peace. It was just an unfortunate co-incidence that this first block would be for budding Cuban oil engineers.

Making like Prince Charles, we inspected an old factory building that was now being converted to our orphanage, before dragging the international media out to the RF base. Footage was shot of us observing training sessions, in particular at Faulty Towers el Cuba, the collapsed building a carbon copy of that at Mapley – albeit surrounded by pleasant palm trees. After lunch we met with Cuban officials, but they had a new attitude, a less helpful one: who cares about America, we have oil now. Jimmy explained that the embargo would still hurt the economy, and that we were making diplomatic progress. Even with the oil revenue, he argued, it would take ten years at least to revamp the Cuban economy and industrial base. And the Americans could put pressure on others not to deal with Cuba. I left feeling that the oil strike should have been delayed by a year, Jimmy

explaining that it could not come soon enough, a hint at the 2015 conflict between the US and Venezuela. ‘Pieces on a chess board,’ he had remarked.

After a relaxing two days at our first hotel – making many calls home, we flew off to the Dominican Republic and on to New York. Staying a night at the apartment, we met with Oliver at Pineapple’s plush Fifth Ave offices, taking him and his wife out that evening – the companies same hired guards in tow. The following day we made a familiar journey down to Washington, booked in again to the Hilton on Massachusetts Ave. The black vans picked us up, our visit that of official Special Envoys.

‘How are you’re ratings?’ I asked the Chief of Staff, shaking his hand across the nice blue carpet in the oval office.

‘Never as good as you’d like.’

‘And ours?’ I toyed as I sat.

‘Not many people like your associations, old habits die hard.’

Jimmy lifted his face to the man. ‘You know why I like the Chinese system. Because when future disasters hit, they’re authoritarian regime copes well with them. You ... crumble on day one.’

The Chief stared back, the door opening and Johnson stepping in with the Joint Chiefs, quite a crowd; much braid and brass displayed - as well as cold and unfriendly stares.

I faced the guy in the blue Air Force uniform. ‘You the guy who hides the UFOs at Area 51?’

‘You tell us,’ he countered with a cheeky grin. The men settled.

‘I hope you don’t mind the group, Jimmy, but we have some... questions.’

‘Fire away,’ Jimmy said, easing back.

‘I have a list,’ Johnson joked. ‘First, Liberia. We ... obviously have historical ties, and emotional ties – and you’re planning on invading.’

‘As I told your representative, if you want to do it - knock yourselves out, it’ll save me a lot of money.’

Johnson eased back. ‘And in the grand scheme of things, what part does Liberia play?’

‘Well, once it’s free of insurgents and tin-pot dictators, and a peaceful little backwater, there’s the issue of its off-shore oil.’

‘How much oil?’ Johnson asked.

‘If you were to take Sierra Leone, Liberia, Nigeria, Cameroon and Guinea – together they have more oil than the Arabian Gulf.’ The Joint Chiefs exchanged looks. Jimmy added, ‘And those nations would sell it to you cheaper than the Saudis. Less of a shipping route as well. And, in 2025, oil suddenly becomes... extremely hard to come by. When there’s fighting in the Middle East, West Africa will be ... *available*.’

‘So what you’re saying ... is that we’re in the wrong damn place.’

‘You can be in more places than just the one. But if you don’t embrace West Africa soon it will cost you dearly in years to come.’

‘Then we should consider military bases in that region,’ a General suggested.

‘No. In the Middle East, you have people that you’ve pissed off, people that the Israelis have pissed off, and you have functioning governments that don’t like you - lots of them. In Africa, no one hates you, and you have no enemies at a government level, you have twenty bandits with rusty AK47s terrorising oil workers. You will never need to defend your interests at the government level. You need only let me sweep the area, then get your corporations in there. You’ll never enjoy a target worthy of an expensive jet bomber.’

‘Anything you need - like a new broom?’ Johnson joked.

‘No, it’s all under control.’

‘OK, let’s talk about Cuba,’ Johnson suggested. ‘What will they do?’

‘Right now, they think they’re clever because of the oil. They have yet to learn how difficult it will be to modernise their economy after all the damage you guys have done. It’ll take them ten years just to get into second gear.’

‘Any threat there?’ a General asked.

‘Lots,’ Jimmy emphasised. ‘If you miss the opportunity to kiss and make up they’ll use their oil revenue to buy the latest Migs, missiles and boats. If you screw this up, you’ll have a very rich and well-armed adversary on your doorstep. And that’s just the military problem. When the neighbouring states start getting more dependent on them for oil than *others*, they’ll exert political influence in the region. They’ll deliberately give petrol to countries - if those countries agree to piss *you* off. In a

nutshell, the kid you've been bullying for forty years just won the lottery.'

'And the solution?' Johnson asked.

'Kiss and make up, and buy their oil – all of it if you can. Before it's too late. You need the oil, they desire colour TV. If you're tough with them, you get no oil ... and a war.'

'And their military capability ... by 2015?' a General asked.

'Enough to hurt in a conventional war, three hundred of the latest Migs, plus all the surface to air missiles they could want. If you nuke them, every South American state would turn against you – and the rest of the civilised world.'

'We are ... making small steps,' Johnson admitted.

'The guy that follows you will reverse them, so why not make some big steps.'

'And Venezuela?' a man asked.

'Run by a nutter, who will always be a nutter, no matter what you do. If ... and it's a big if, you get Cuban oil flowing sufficiently, Venezuela gets sidelined, their economy suffers, the people change their leader. They need oil above \$50 a barrel. Cuban and West African oil could dent that.'

Johnson made notes. 'We could squeeze them.'

'Which would also squeeze Canadian sand oil a bit,' I put in. 'They also need it above \$50 a barrel.'

'I wasn't elected to run Canada,' Johnson quipped, making notes. 'How soon could African oil flow?'

'Soon enough to aid your cause. You could send rigs to Sierra Leone next week.'

'And Guinea needs a new government and a lick of paint,' I put in.

'Any clues about that?' a man knowingly asked.

Jimmy replied, '*Whoever* arranged it used American mercenaries. Would be awkward if *that* got out.'

The man who had asked the question cocked an indignant eyebrow.

'We've started to help your guys in Northern Somalia,' an Admiral stated. 'That urgent?'

'No,' Jimmy emphasised. 'That's for 2025 mostly, some trouble with Yemen around 2012 threatening the Suez Canal. You'll need a good dockyard there.'

The Air Force chief glanced at Johnson, then asked, ‘Principal military threat in the years ahead?’

‘There isn’t one. Russia is on its arse, China needs you to buy things, North Korea will sabre rattle for the next hundred years. Your first main war will be in the Caribbean, when a certain future President goes for Venezuela and Cuba, or either one. You biggest national threat is your own banking industry. In 2008, 2014, 2020, there’ll be crashes in the markets, each one worse than the last – all caused by bankers wanting to make more and more profit. You’ll be plunged into a deep recession for no reason other than greed and stupidity, at a time when your economy is doing well. It will give rise to neo-conservatives, hence the attacks on Venezuela, and ultimately China. If you want to save tens of thousands of American servicemen’s lives - shoot greedy bankers.’

‘And what about Afghanistan?’ a man nudged.

‘I have a solution, leave it to me. *Don’t* ... invade. If you do you’ll set the region ablaze.’

‘And Al-Qa’eda?’ the same man pressed. ‘We’ve intercepted several attacks.’

‘And you’ll keep intercepting them,’ Jimmy emphasised. ‘Right now they think god is against them, or that you’re better than you actually are.’

‘We can’t ignore them just because you’re informing us of their planned attacks!’ a General protested. ‘If we miss one...’

‘Try *not* to miss one, and keep in mind that American boots on the ground Afghanistan will make Vietnam look like a quick victory. If you go in ... you’ll never leave. Leave it to me.

‘If you want to busy yourselves with something useful, consider 2025, a conflict in the Middle East, not much oil from the region – and how you’ll adapt. The solution is not a military one, because your military is driven by your economy. Think hydroelectric, nuclear power, electric cars, home grown food. Think ... war in Europe, the Middle East and Africa, isolation of the Americas. It might just be you and the South Americans, and a nice big ocean to keep the bad guys at bay. Oh, and if you don’t pull your fingers out, 2025 will see fifty-one percent of the US population being Hispanic. By time you get to 2015 you may see fighting on the streets, public schools teaching in Spanish

only. Al-Qa'eda, gentlemen, are the least of your worries. You lot, are set to implode, not be attacked.'

We took a mini-breather as a coffee tray was wheeled in. They even had biscuits.

Over coffee, Johnson admitted, 'This lot have a room with fifty people in it, studying every move you make.' The Air Force General seemed a little ill at ease with the revelation.

'Really?' I asked. 'What've they concluded so far?'

The head of the Air Force reluctantly explained, 'So far, the one consistency – is a lack of consistency. Fifty different people with fifty different takes on who and what you, and Magestic, are.'

The Admiral said, 'I blindly favour the US astronaut theory, it helps me sleep.'

Another man said, 'We got a bunch of people who swear blind that you got onto a plane in Africa ten minutes after you landed in London.'

'Now that would be good, no more boring flights,' I approved.

'And they can't figure the blood,' the Admiral admitted. 'Best they can come up with is that it was developed for long-term space flight. For hibernation.'

'They'd be mostly right', Jimmy told the man, causing a reaction. 'Hibernation causes cell damage, which needs continuous replacement.' They considered that. 'But I think you'll find, that the medics of the decades ahead will take one very nasty retro virus, and alter it so that it does more good than harm. They'll not understand the science, just make use of its delivery system.'

A man said, 'We have people claiming you've been to Afghanistan four times, but we can't even prove you've been there once. And as for the Rifles in Africa, every Army general is jealous as hell as to how they do so much, with so few numbers.'

'You know what the biggest controversy is,' Johnson put in with a smile, holding a coffee cup now. 'Your house.'

'The house?' I asked. 'What, they think it's a bit ostentatious?'

'No, they can't understand why the house is so well protected, yet you two use public transport, planes, and risk your lives on a regular basis, getting right to the front line of battles in Africa.'

The house is more secure than this place, built to withstand direct assault, yet as soon as you step outside the gate you're exposed. It's a puzzle. So they think there something, or someone, at the house that needs protecting – maybe a damn time machine!'

'You're people have been all over it,' I reminded them.

'So why so secure?' a man asked.

'To protect the "M" Group from interference,' Jimmy suggested. 'Their presence is a puzzle for the UK press, so we keep them under wraps.'

'I don't accept that,' a man quietly stated.

'Think of it this way,' Jimmy began. 'If they came and went on a regular basis, it would attract far more attention. And ... from whom?'

They glanced at each other. 'Other governments?'

Jimmy nodded. 'It's a secret that should be kept secret as long as possible. But, as we sit here, the Germans are asking the French what goes on, so too other nations not part of the club. In years to come the "M" Group itself will be the subject of direct attacks, even bomb attacks.'

I didn't like the sound of that, at all.

'Other governments – jealous – will attack the group,' Johnson realised. 'Makes sense, they're at a great disadvantage.'

'And the French liaison?' a man posed with a smirk.

'He took one for the team,' I suggested, making them laugh.

Hiding a grin, Jimmy said, 'If I had not satisfied her ... *curiosity*, they would have made several dangerous attempts to get close. And will do so in the future when they get impatient with the delightful Michelle.'

'It's a dirty job, but someone has to do it,' I helpfully added, getting a look from Jimmy.

The Admiral said, 'You know the one thing that has the brain boys most puzzled? You pair risking your lives so much. Some of them think that you're the astronauts, or that you're the real Magestic, then agree that such a person would not take so many risks – not with the future of the world at stake. Every week some guy makes a presentation to prove that you, Mister Silo, are the real Magestic. Then they prove otherwise and go back to square one.'

'A waste of good brain power,' Jimmy suggested.

‘Coming back to Liberia,’ Johnson put in. ‘We should, at least, play a role.’

‘It’s a tricky one for you, since we’re there to remove the token government. In the future that will be known as *regime change*. There is, of course, a lot that you can do, it’s just that I would recommend that you don’t – for your sakes. Try ... and keep your image, in the mind of the Africans, a good one. The best thing you can do is to help me secure a UN resolution to move in after the rebels. After that, I would have asked you to build a naval base and airbase there, a staging area for the 2025 conflict – where you should assume that all Mediterranean bases are compromised quickly, all of North Africa unsafe, The Brotherhood attacking south into Africa.’

The generals looked sceptical. ‘You’re saying, that in 2025 – with all the technological advances of our military by then – that we lose the Middle East and the Mediterranean to a bunch of terrorists.’

Jimmy put down his coffee. ‘Let me illustrate the scenario for you: a hundred thousand suicide bombers wearing explosive vests under their clothes; men, women and even children. They mingle with refugees. At your checkpoint they blow themselves up ten yards from your gate, killing your gate staff. In the confusion, a dozen of them run through to your next check point. Some are shot, one blows himself up, knocking down your men. Others run forwards, blowing themselves up as soon as they are within ten yards. And so on, and so on, through the towns and cities. Pretty soon you can’t allow anyone to approach within a hundred yards of your soldiers, making it kinda hard to be there and interact with those you’re supposed to be protecting. What about local officials and local soldiers? They approach, and blow up. Soon, you can’t deal with anyone.

‘Then they’ll go around you, and advance. Across North Africa, into Europe with its densely populated streets, dressed like locals. They’ll blow up power lines, water works, government buildings, anything that represents technology - since their aim is a return to the Stone Age. You can’t use tanks, or planes, or ships, because it’s a counter-insurgency campaign like you’ve never seen before. Every attack creates panic and chaos, and more refugees, the Brotherhood infiltrating the

refugees. Boats blow up at sea, others are rammed into your naval vessels.'

'Jesus,' a man let out.

'So, coming back to what I mentioned early, you have two nice large oceans to cut yourselves off. You could easily sink every boat they send. Problem will be them attacking Russia, with a view to getting at Russian nuclear missiles. China will lose half its land, Russia the Southern Islamic Republics.'

'And Israel?' a man asked.

'They'll shoot so many suicide bombers on their borders it will create a health risk, then a plague. They'll be surrounded and cut off, their nuclear weapons useless, their aircraft useless. It's about hand to hand, not technology. So, over the next twenty years you'll be busy designing high-tech kit to beat the Russians and Chinese, when what you'll actually need is more men with boots and rifles.'

They collectively blew out.

'I'll give you some hints and clues, for your war games. You can cut off the Suez, cutting off Africa from the Middle East. You have the Bosphorous straights to use, the Black Sea. You have India as a buffer in the east. You will have no choice but to try and contain, not to occupy. Think ... contagion and isolation.'

'Abandon Israel?'

'Think Alamo,' Jimmy emphasised. 'You could re-supply by ship, and hold onto the land as a bridgehead, but what of the Israeli people and their economy? It would just be a large base under constant attack, the Brotherhood dropping all their dead bodies into the Jordan upstream. Holding Israel will cost you twenty thousand men a year, at a time when you're losing fifty thousand a year to the insurgents, three times as many wounded.'

'We couldn't sustain those losses,' they baulked.

'Hence the isolationism,' Jimmy responded. 'Besides, the folks back home won't give a shit about the casualties, they'll be keen for you to stop the Brotherhood reaching New York. Instead of learning difficult lessons at the time, you should make a choice ahead of time.'

'The way it would pan out,' Johnson began, 'would be the pull back to the Suez, then a pull back to the Atlantic – political

pressure to reduce casualties at any cost, that cost being Europe. And when Europe's ablaze ... why hang onto it?

'So it's best not to go through that process at all. Draw a line somewhere, cut off a limb.'

'The Israelis know that?' a man asked.

'Yes, and they'll dither till it's too late,' Jimmy emphasised.

'Is there enough oil outside of the Middle East?' a man asked.

'Yes, and I know where it is.'

'So isolationism could work,' another man suggested.

'What? And give up the future of the planet?' the Admiral baulked. 'Blanket nukes would have an effect, also chemical warfare. I'd rather lose the deserts than Europe!'

'The Israelis might not like that approach,' Jimmy suggested. 'Remember where they sit.'

'You declared that you received a message, that there's a solution,' a man challenged.

'Yes, but I don't know what it is. I'm was kinda hoping to get another message, a thick document detailing the fix would be nice.'

'There's no simple solution to the scenario,' Johnson insisted. 'Only degrees of containment – terrible, or less terrible.'

Jimmy nodded. 'I can see no solution other than containment or isolationism, and it occupies a lot of my time. And we still have to get to 2025, through several conflicts and economic crashes. You may reach that point being dirt poor.'

I said, 'So get those fifty idiots in the room thinking about a solution, not how often my daughter takes a dump.'

Back at Heathrow, the mini-bus was waiting with a Range Rover tail car. We battled through the traffic to the old apartment, Helen, Cat and the baby already there, the food on. An evening at the club was planned, Cat babysitting.

The next morning we headed to the Foreign Office, and our Congo team, now twenty strong. We also continued to receive the assistance of twelve Foreign Office staff, so the main room buzzed as we entered.

'Morning everyone,' Jimmy loudly called. People grabbed chairs and sat, Jimmy producing a page. 'OK, we won't keep you too long. First, the Congo Development Corporation is making too much money – a nice position to be in. As a rule, I want no

more than twenty percent of annual income kept back, the rest spent on the projects.’ A chorus of whispers broke out. ‘From now on I want five percent of profit to be offered to any NGO that wants a few quid. Provided that the money ends up in the region, I don’t care about the NGO. Appoint someone as chief *money-give-away-person*. I’d guess that they would be both very popular, and very busy.’

The senior man raised his hand. ‘Jimmy, the corporation made six hundred million in the past nine months alone - is all to go on building up just *that* region?’

Jimmy held his hands wide. ‘As opposed to Kinshasa? They get their cut, what they do with it is up to them. Our aim is to create a shining beacon of efficiency in Central Africa. Then ... we’ll look at Kinshasa.’

They exchanged looks.

‘Next, I want more building materials brought in from Kenya and Tanzania. And let’s get every skilled builder we can find in Western DRC up to the region to work on projects. But, let’s keep migrant workers out; we’re there to fix the Congo, not the world. OK, those small hydroelectric dams, get a move on please, we need a test case to have a look at. Buy British or German turbines ready, use the money and get the power cables down there.

‘OK, next: food production. I want large areas cleared, state run farms expanded – bring in specialists from around Africa or the world. I want to grow twice as much as the region needs, and soon. Collaborate with our farms in Kenya - buy seeds. And let’s go out and buy cattle from the neighbouring states, large cattle ranches set-up.

‘Now, as you will have seen from Sierra Leone, we can get cheap corrugated metal sheets, so someone order-up a shit load for the region, for the shanty towns. And those buckets that come from Hong Kong, the ones filled with household goodies, let’s get a million and dish them out. And more mosquito nets as well. Overall, my main interests in the short-term are the dams. Kindly make that your priority. OK, questions?’

‘What are we doing on regional air services?’

‘Hire a Dash-7 or two, stick them at Forward Base and radiate outwards. Subsidise them a little and, when passenger numbers increase, go for larger aircraft. Between the mines and Forward

Base, hire some commercial S61s, or Super Pumas. But feel free to cut a new dirt runway anywhere you like.'

'There's a stretch of river heading west. If it was damned and flooded, with three lock gates, it would reach three hundred miles.'

'For boat transport, or ore transport?' I asked.

'Both,' the man said.

'I want an advanced feasibility study done right away,' Jimmy suggested. 'Would it flood a few villages?'

'Lots of them, but mostly small hamlets. It could join the main waterway.'

'The villagers would need compensating. Besides, that's a twelve hundred mile trip down to Kinshasa.'

'Are we extending the rail line from Tanzania through Burundi and to the south of our region?' a man asked.

'That's a Chinese project for next year, leave it to them.'

'Tourism?' a man asked.

'Yes, but not for a year or two. Before then I want to look at an international airport west of Goma.'

'We've started clearing the ground for a two runway airport, the runways long enough to handle anything. Just hope we have the passengers.'

'It'll be a UN hub as well, and it'll fill up with engineers coming and going,' Jimmy explained. 'But to start, three hundred people a week – no queuing at check-in! I want ILS, long distance radar, the works. We'll offer the tower services to other airlines transiting Africa.'

'We've appointed a French company to build it.'

'Then tell them to get a move on, please,' Jimmy lightly suggested. 'OK, schools and colleges – where are we?'

'Mostly primary schools going up, not many suitable sixteen year olds.'

'That will change in a few years. Then we'll want a University and Technical College. The orphanages OK?'

'Standards are rising all the time,' a man happily reported. 'They're pushed hard, just like Ebede. We've added a farming college next to it, thirteen year olds and above. We've also got a vocational mining programme going. In time they'll be able to learn to drive trucks, diggers, operate machinery. A home grown labour market.'

‘Teach them how to make roads and bridges as well!’ Jimmy suggested with a smile.

‘We’re laying a hundred miles a week,’ they offered. ‘Making tar at the oil refinery as well now.’

‘Just another thirty thousand miles of road to go,’ I thought out loud. ‘Can we drag in some Kenyan road gangs?’

‘Could do,’ they answered.

Jimmy lifted his eyebrows and nodded. ‘Push it all along.’

‘Congo Rifles?’ a man asked.

‘Congo Rifles ... what?’ Jimmy asked.

‘They’re four and a half thousand strong, so what level you aiming at?’

‘Over ten thousand,’ Jimmy replied. ‘They’ll be used like police officers. And they’ll replace the Chinese.’

‘Cadet scheme at the orphanage?’ a man asked.

‘Yes. Plus any sixteen-year-old not gainfully employed; two-year courses. Oh, while I think of it, that new airport would be a good cargo hub, so let’s think about building transit sheds nearby, then apartments, and office blocks. I’m thinking that, in years to come, the road from the airport to Goma would be a new city all by itself.’

We got into small detail, the questions lasting thirty minutes before we got out of there. I managed a quick lunch with Helen, then got dragged to the new Somali Embassy, part paid for by us, certainly renovated by us.

General Abdi, Defence Minister, greeted us with the Somali Ambassador to the UK. ‘How are you, my friends?’

‘Well,’ Jimmy said. ‘Just back from the Congo.’

‘I have read much about it,’ Abdi said as he gestured us to seats. ‘You will make a paradise out of a jungle.’

‘And what of Mogadishu?’ Jimmy asked.

‘We build, we repair, we clean. Soon to have a city worthy of visitors.’

‘And the northern territories?’ Jimmy asked.

‘No more warlords worth my attention,’ Abdi lamented. ‘I miss being the soldier under your guidance. I would go back and start again.’

‘I know that feeling,’ Jimmy quipped, exchanging a look with me. ‘How is oil revenue?’

‘Increasing,’ the Ambassador put in. ‘Three oil rigs are now present off our coast.’

‘And what do you do with the revenue?’ Jimmy cheekily enquired.

The Ambassador hesitated, noticed by Abdi.

‘We have no secrets from Jimmy,’ Abdi nudged. Facing Jimmy, he said, ‘We are building our nation, modernising.’

‘Some of you ... are putting money in Swiss banks for when you retire,’ Jimmy stated. I blinked. Jimmy took out a series of photographs and handed them to Abdi. ‘What need do you have for cash deposits in Swiss banks?’

Abdi studied the pictures. ‘This is the Junior Finance Minister. Excuse me, please.’ He stepped to the table and made a call, the Ambassador seemingly most put out as voices were raised. Returning, Abdi said, ‘This man will be arrested and questioned.’

‘Perhaps the money should go to your people, not on western prostitutes, drugs and gambling,’ Jimmy suggested.

‘It is a great sin, he will pay dearly,’ Abdi insisted.

‘It would be necessary to retrieve the money *before* anything happened to this man. The Swiss will not co-operate with you; you will need the identity, the account numbers and the passwords.’

‘You serve us well, Jimmy,’ Abdi acknowledged.

‘If you wish it of me, I will keep an eye on your people abroad.’

‘I wish it, yes.’

‘Now, I understand the Saudis have opened an Embassy in Mogadishu.’

‘Yes, they wish many joint projects,’ the Ambassador explains.

‘That is good for Somali,’ Jimmy noted. ‘But what do they expect in return?’

‘They wish only to assist their neighbour,’ the Ambassador suggested.

‘I believe they wish you to join OPEC, and sell only through them – at *their* prices,’ Jimmy pointed out. ‘Not so much assistance, as an arm around your shoulder.’ Jimmy faced Abdi. ‘When a woman gets into your bed, you must see if she has large breasts – or large teeth.’

Abdi laughed at the analogy. ‘You think our Saudi friends wish to tame us?’

‘I think you should be wary of gifts from anyone other than myself. And when you need advice, you need only call. Now, down to business: I think your neighbours to the north may be... troublesome in the years ahead. The Somali Rifles now stand at six thousand soldiers, so I will send money – fifty million pounds – towards an increase up to twenty thousand soldiers in the years ahead. More jeeps, and more helicopters, and tanks from China. You should be in a position where you can defend yourself.’

‘I had missed you, Jimmy,’ Abdi admitted with a smile. ‘It is good that we shall build the army further.’

‘And soon some military aircraft, so look for some pilots. I will help you to start an airline, Somali Airways, and arrange aircraft on lease from Europe. Now, if you are happy, I will send to you my Chinese friends to drill for oil. If lucky, you will have more money – perhaps best used through my people.’

‘We will take your counsel,’ Abdi offered, the Ambassador forcing an awkward smile.

With that we left them, Rudd transferring the money from the Mawlini account to the Kenya Rifles and into an old account for the Somali rifles. The recruitment process would start again.

In the months that followed I settled into some serious trading, Helen showing off her knowledge from time to time. We set-up a computer in the house so that we could call up screens, Jimmy warning me not to trade from there: it was an area to be kept tightly under lock and key, and he became a real pain about it. At 10pm each day we could equally be heard chatting about the baby, or the close on the Dow Jones.

January 2002

Shelley’s first birthday came around quickly, and I wondered where the year had gone, Helen and I still not settled on a wedding date. Jimmy had suggested April in Kenya, at the golf complex, and it was a serious candidate. Jack had taken to

studying the stock markets, which meant that Han had copied so that he understood what we were talking about. Some days, around the diner, the conversation was all trading, Big Paul asking for a posting to Seirra Leone.

On the 3rd of January a minor domestic war broke out. Big Paul's lad, thirteen now, had shot Jack's cat with an air rifle. Jack had slapped the lad hard. Now the parties were in the diner, sat facing Jimmy and me.

Jimmy began by addressing big Paul, 'Remove the air rifle today, never to return – nor anything like it.' He faced the lad's mother. 'You, madam, will pay the vet bills. And the next time your lad does something like that on my property you'll be kicked off the same day, because we both know you're soft with him. Your partner here will be allowed to continue working for me, but you'll be gone – never to return. Now, is there any part of that which I have failed to make clear?'

She shook her head.

Jimmy faced the lad. 'Do you want move back to Ross-on-Wye? Do you want to see your mum lose her job, maybe your parents live in separate houses?' The lad became tearful. Jimmy continued, 'We have a lot of security around here because important people visit. As such, it is important that no one messes about, or you may set-off the alarms, or get shot at. You either look at living here as a privilege, the kind that your friends don't get, or you move away.'

With his head down, and not saying anything, Big Paul led his family out, Jimmy apologising to Jack. In the camera room, Ricky was told to keep an eye on the lad in future.

When Big Paul returned, he asked, 'Do we stay together, Jill and me?'

'It will never be easy, you will move out once or twice. It is... a rocky road. And no, I won't advise you.'

January 17th neared, a volcano about to erupt in the Congo, in the famous Rift Valley north of Goma. Jimmy reported to the team at the Foreign Office that a seismologist on the ground had issued a warning, and they were to take immediate, and large-scale, steps. Forward Base was alerted, soldiers and medics moved closer to Goma on the 15th. At Mapley, we practised a

few alert procedures, the communications officer sat behind a computer screen.

Jimmy ordered, 'For RF UK and UK Supplemental, overseas-available, send the following: standby, standby.'

A message appeared on Bob's screen, followed by an alarm that sounded like a break for school dinners. Someone unseen announced, 'Rescue Force UK – standby stations for overseas deployment. Supplemental Group – standby for overseas deployment.'

Bob's pager went off, the message checked. Apart from a spelling mistake, it was the right message.

Doc Graham stepped in, 'Yep, got it by email, fax *and* pager.'

Jimmy turned his head. 'Go pack a bag, you're in overall charge of the deployment on the ground.'

'About bloody time.' Doc Graham headed out.

Jimmy ordered, 'In regard to RF Kenya, Tanzania, Ghana, Russia, China, Hong Kong, Israel and Australia: standby, standby.' The message was sent, soon calls coming in. Jimmy modified the message. 'For China, issue standby of sixty people only. For Hong Kong make it forty.'

The parameters were altered, second messages sent out.

On the 16th we were back at Mapley, the volcano now reported to be growling and rumbling. Jimmy ordered, 'For units on standby, issue deployment orders. For Kenya, Tanzania and Ghana, issue Full Deployment.'

Mac was on the phone an hour later, reporting planes in the air, other units faxing in lists and numbers of people deployed. Forward base would be busy. Helen issued the press releases and we made the news, the baby with Cat upstairs in an apartment.

On the 17th the volcano blew, ash clouds drifting towards nearby towns and causing a massive evacuation. RF units had been deployed right around the mountain in a circle, but none closer than ten miles. Some had a spectacular view, followed by a quick dash to get the hell out of the way as day turned to night. Almost half a million people were displaced, massive tented cities put up across a wide area, a RF group of tents in each. Injuries from the volcano were mostly ash inhalation, eye-sores, or people getting trampled. Much of the time, the RF staff simply helped to evacuate the elderly, or sick people from local

hospices, some mad helicopter dashes made to rescue people cut off or left behind.

Helen, Jimmy and I gave interviews in turn in the new press centre, even to overseas news stations via the new video conferencing system. The UK press occupied the offices for a day, soon heading off; it was not that big a story. On the ground, however, it was a logistical nightmare. We were attempting to feed and house a third of a million people for a few weeks. Grain had been stacked ahead of time, the tents ready on the ground, but it was still a huge undertaking. Some camps had fifty RF staff to ten thousand people, the Rifles keeping order.

After two busy weeks the British and French Supplemental groups were ordered back, the remainder staying on for another week as the locals drifted back to their houses. RF Russia, Hong Kong and China got the recall message after three weeks, the African units mopping up. By week four even they were heading back. All in all, it was a well-run operation, a post mortem done at HQ Mapley, the only hiccup being Tubby's desire to fly right through the volcano's ash whilst getting very lost, minor damage to the Dash-7's paintwork. He would never live it down; I wouldn't let him.

With the deployment wound down, Jimmy popped over to the house one evening, a surprise since he rarely dropped in. He picked up the baby, asking us to sit. 'We need to talk about your return to work,' he said to Helen.

'Return to work? I am ... working.'

'You're helping out, you're not being a full time PA, not the role I anticipated for you when you signed on.'

'Oh. So, what changes are you looking for?' Helen puzzled, a glance my way.

'You'd spend more time at my side, and travel more – UK and abroad. And no, we'd not take the baby into the First Class cabin on a 747.' Helen and I exchanged looks. 'I've given you a year,' Jimmy emphasised. 'Now you can play PA, or I'll get another one and you can play at housewife.' He tickled the baby, making her shriek.

'How much travel?' Helen asked.

'Wrong question,' Jimmy said without looking up. 'Try again.'

I urged her with my eyes.

‘I’m ... ready and available for whatever you need?’ Helen stated.

‘Better,’ Jimmy said. ‘Now, give some thought to spending time away from the sprog, to using the brain that we both know you have. Tomorrow you get a laptop with a secure link to the computer server back here, to take with you when we travel. You’ll also get a sophisticated pager. And there will be times, many times, when it’s just us ... your dear husband holding the fort here. And holding the baby, no doubt.’

With Jimmy gone, we sat and thought about it. It was no great hardship for Helen, we both trusted Cat, and Helen was keen to work. She most definitely did not like the “housewife” label, but like any mother of a young child she did not want too many long trips away. We got up in the morning assuming that Helen was back to being Jimmy’s PA.

In the office Helen received the new laptop, a few hours instruction on various programmes, then found a shorthand dictation teacher stood in the doorway. Helen was already trained in shorthand, but had not used it since joining the household. Lessons began in earnest. The next morning Helen was ready to adopt the new role, some areas an overlap with what she had been previously tackling. She drove off with Jimmy to meet Rolf, taking notes at the meeting. On the way back Jimmy dictated a few letters, Helen practising her touch typing on the laptop as the minibus negotiated slow traffic on the M4 motorway.

‘Hard day at the office, love?’ I asked as she entered the house.

‘It’s just like working for my old boss,’ she said with a shrug, handing me the property business summaries.

As she showered I read the detail, Cat feeding the baby. We had bought over a thousand properties, most now renovated and rented out. Twelve apartment blocks were under construction, none taller than five storeys; we were high-rise averse. The overseas properties were progressing, all just about on schedule. The first super-sized OAP centre was nearing completion, a second patch of land purchased.

When Helen came down, now in a tracksuit, she said, 'Jimmy had a go at Rolf. They're behind on the UK purchases, so they're getting estate agents involved as well as surveyors.'

'Are the builders and decorators flat out?'

'No, that's the problem. The criteria will be sent to estate agents in the areas we're interested in, to by-pass the surveyors. We need another thousand properties by June to be on track because the Chinese will put more money in. There's an estate agent in Bournemouth doing a good job, so Jimmy has asked them to find three hundred properties in their area, by-passing Rolf, another estate agents in Cornwall. So, what did *you* do today?'

'I made a few trades, then took the baby around the ponds for an hour.'

She punched my knee. 'You're not supposed to say things like that.'

Rob the dog handler knocked on the door. 'Sorry to disturb you Paul, but have you got yourself a cat?'

'No, why?'

'Twice now I've seen one around your house.'

'It Jack's?'

'No, this one is a tabby.'

'Oh. Must be a stray. Guess it'll wander off eventually.' I went and asked Helen if she was feeding the cat. Then we asked the animal's namesake, Cat.

'I've seen a cat, but I thought it was Jack's. I gave it some food. Little tabby.'

'Nearest neighbours are a long way off,' Helen noted. 'Now that you've fed it the cat will hang around.'

'We could catch it, dump it up the road,' I suggested.

Then there it was, on the kitchen window, crying.

Helen opened the window and lifted it in, placing it on the floor. 'We could get the security guys to dump it up the road.'

Our daughter made her mind up, crawling quickly towards it as the young cat wandered into the lounge sniffing the carpet. We sat and exchanged looks, our daughter chasing the animal around the room. Frustrated with her lack of speed, our daughter amazed us by lifting up on her feet bum first, and toddling after the animal. Helen shrieked, and I grabbed the video camera, soon

recording the first steps. Once up, Shelly would not settle for anything less than running across the room.

When she stumbled, Helen moving closer, I said, 'No, watch.'

Shelly got straight back up without any tears and toddled after the nervous cat. We had been wondering about her lack of toddling, but obviously she was saving it all up for one giant leap forwards. Now that she was up there was no stopping her, we'd have to put gates on doorframes and the stairs.

Later, we took her over to the house, Shelly toddling around the "M" Group, Han always happy to play with her. Holding her fingers, he took her for long trots along the corridor and back.

'I think you've bred a marathon runner,' Keely said.

'She'll have a bad habit of climbing trees around ten years old,' Jimmy informed us. 'A tomboy till thirteen – like her mum.'

'I was terrible,' Helen admitted. 'I cut my hair short and got into fights with boys – my parents even getting me a psychiatrist.'

French Michelle admitted, 'I set fire to a barn at twelve, my grandfather's. I then ran to the local river, three miles, and pretended that I had been there all day.'

Shelly's toddling was a milestone, much filmed by us, everyone amazed by the sudden transformation from rug rat to sprinter. Now the problem was keeping her in the pram; she wanted out.

The following week we travelled over to Mapley together, a new employee to greet. Dug was an expert in earthquakes and volcanoes, a seismologist-vulcanologist. When I asked about nicknames, his wife called him Crusty, after the earth's crust he was always studying. Either that, or she meant something else. Crusty, the earthquake man, was on board. We introduced him to the team, asking him to arrange lecturers for all recruits, plus a written test. After an hour, sat chatting with a cup of tea, Crusty admitted to experimenting with earthquake prediction software. I got the feeling that he would have some successes in the future.

Security breach

One March evening Jimmy took the call that he had dreaded. The secret school for the autistic Ebeye children, hidden in the farm, had been penetrated. There had been a shoot-out, a guard killed, others wounded. Someone had gone to great lengths to find out what went on inside.

Jimmy ordered a hundred of the Rifles to surround the farm and the secret school, and woke Han and me.

‘Pack a bag,’ he told me. ‘Just you.’

I always had a bag ready these days, and Helen came across to the office with me.

Jimmy told her, ‘Go online, book Paul and me open tickets to Mombassa, or Nairobi.’

With Helen tackling that, Jimmy explained the security breach. It could only be at government level. Han stepped in, his bag packed.

Jimmy told him, ‘Fly to Shanghai immediately, ready the college. Before you go, send a plane for the children as we planned.’

Han hurried out, getting into a Range Rover for the trip to Gatwick. Helen found us tickets on the first flight out in the morning, 7am.

Keely appeared in the doorway of the office, odd for him to be about at 1am, but he had been injected and did not sleep much. ‘You’re up late. Another earthquake?’

Jimmy stepped to him. ‘There’s been a security problem in Africa, Mister Donnelly. If I find a connection to your government then your life will be in danger. If you know something, say so now ... or don’t be here when I get back.’

Shocked, Keely glanced at Helen and me. ‘If ... the CIA was up to something they wouldn’t tell me, that’s for sure. And the NSA don’t go overseas. What’s ... happened?’

‘We’ll discuss that when I return,’ Jimmy threatened. ‘In the meantime, try and find out if the CIA are in Kenya - shooting my people.’

Leaving Keely looking stunned, we drove off to Gatwick. I managed to catch two hours sleep on the way. Touching down at Nairobi, we had more of an escort than usual, the Defence

Minister waiting, not least because he had a dead soldier to explain.

In the jeep, Jimmy said, 'I have scientists at the farm, working on crop yields. We've spent millions of pounds on the science behind it, hoping to make some breakthroughs.'

'And somebody wanted to get access to it?' the Minister puzzled.

'I don't know. Maybe someone saw the security I had there, and figured it was something valuable – maybe the cash we keep at the orphanage. They would have been stupid to break in with guns just for the science.'

'This science ... it would be very valuable?'

'If it works, very valuable.'

I wasn't sure if the Minister was convinced, but he could never have guessed the real reason. We dropped him off and headed towards Mombassa and the farm. Cosy met us there, the Chinese soldiers now removed.

'Did the children see or hear anything?' Jimmy asked him as we walk through the gates.

'They heard it, sure, but it was dark. Today they are curious, but not afraid.'

'Get me some buses with tinted windows,' Jimmy told Cosy. 'Food and water for a long flight.'

'You'll take them?' Cosy questioned.

'They're in danger here. I have no choice.'

Inside the house we called together all of the children.

Jimmy heaved a big breath. 'Children, we've arranged a treat for you, a flight in an aeroplane.' They did not look pleased.

'Who *does not* want a flight in the plane?'

A few raised hands. One asked, 'What model of aircraft?'

'A 747SP.'

'They're very reliable,' the kid acknowledged, the English professor stepping in.

The eldest boy asked, 'Has this flight anything to do with the shooting last night?'

Jimmy hesitated, taking in the faces. 'Yes. The question is ... do you trust me?'

'I do,' the elder boy keenly stated. 'I've read everything about you, all the books, all the newspapers.'

‘Do you think you could persuade the others to take the flight, if we shared a great secret?’

Several of the kids expressed a keen desire to know the secret. Jimmy selected the five eldest children, and led them to a side room with the professor, Cosy and me, the younger children vocally protesting the secrecy – and being left out.

After settling the attentive youths, Jimmy began, ‘You are all autistic, of a kind. You know what that is?’ They nodded. ‘And you are autistic because you were injected with my blood as babies. You know *why* you were injected?’

Cosy said, ‘You all had the AIDS disease when you arrived at the orphanage. I was there when you came in.’

‘We are not symptomatic,’ a girl challenged.

‘You are completely cured,’ Cosy stated. ‘Not only that, you are now immune to all diseases, and you’ll live to be a hundred and fifty or more.’ He pointed at the girl. ‘Where is your scar from where you burnt yourself the other week?’ She examined her hand. ‘Is that normal?’

The youths exchanged looks.

‘You were injected with my blood, and my blood has abnormal qualities, kept secret.’

‘Jimmy is ... special,’ Cosy stated.

‘The Americans, Russians and Chinese leaders all talk to you,’ the girl noted. ‘Is that because of the blood?’

Jimmy lifted his head to Cosy. Cosy stated, ‘You remember Mary, who founded this orphanage?’ They did. ‘In the Second World War Jimmy saved her life.’ They puzzled that. ‘He is more than a hundred years old.’

The professor was surprised by that, but obviously knew some of the detail.

Jimmy explained, ‘I injected you to save your lives. But, one in three hundred children injected will go on to develop autistic characteristics, high IQ, which is why you are all here and not with the others. You are special, and as you grow older you will become a lot smarter. I have you here to help me to fix things, to fix Africa. If others knew about you, they might want you to help them invent other things, maybe even weapons.’

‘Will we stay together ... if we go?’

‘Yes,’ Jimmy said with an encouraging smile. ‘Which is why I want you to persuade the others. If not, I’ll drug them and take them anyway ... for their safety.’

A boy lifted his head towards the professor. ‘Will you be coming with us?’

‘Yes he will,’ Jimmy cut in with. ‘To a new house with unlimited facilities, and great safety.’ Jimmy stood, gesturing the youths back to the main group. Facing the professor he said, ‘Get a needle and syringe, please.’

With the needle handed over, Jimmy said, ‘Take off your jacket, roll up your sleeve.’

The professor glanced at me, hesitating before doing as asked. ‘I’ll ... live a long time?’

‘A hundred a fifty, in perfect health,’ Jimmy assured him.

Cosy extracted the blood and injected the professor. ‘You’ll run a fever for a day or so and your pee will smell. After that, eat protein and exercise.’

The professor stepped into the main hall, rolling down his sleeve. I could hear the kids asking if he had been injected, realising that their tutor was now “one of them”. We sat for half an hour as the kids debated the issue, being able to hear some of it. I think the clincher was the elder youths and the professor saying that they were going anyway, the youngest not wanting to be left behind. When Jimmy joined the debate he informed them that all of their personal possession would be transported, and their study projects. Everything. That clinched it, they would now come with us.

Cosy arranged for an empty coach to drive to Nairobi under heavy guard, then handed us pistols, the kids stating the make and model of the pistols, how many rounds they carried, muzzle velocity, the works. At 1am we boarded another coach with basic effects and clothes for the kids, and no escort for the short drive to the airfield.

Driving through the black night I was nervous, wondering who was out there. I was also angry that this had come about, determined that someone would get their arse kicked. At the airfield, a Chinese 747SP stood being attended, having landed under false pretences: a minor fault. The gate guards halted the bus, the children hiding themselves. Jimmy stepped down, the guards stiffening and saluting. He exchanged a few sentences in

a local dialect, then discussed the plane, saying it was Rescue Force supplies for Mawlini, and we'd save some time by getting a ride up there. He gave them a hundred dollars each, the guards very happy and saluting again as he boarded.

We drove straight around to the steps of the plane, just the one local attending a generator. The kids poured out, lugging their cases up the steps and inside, the plane's engines starting immediately.

Jimmy approached the bus driver, handing him ten thousand dollars. 'You were never here, you saw nothing.' Wide-eyed, the man thanked Jimmy, driving off into the night.

We lugged our own cases up the steps, the door closing, the generator unplugged. The professor settled the kids, checking their seatbelts as Jimmy ordered the plane to take off, regardless of tower permission; he would sort it. We taxied around the small apron and to the runway, powered up and accelerated down the runway. Lifting the nose, the pilots were told to head for Mawlini. After a hundred miles we turned hard right and North East, over Somalia and soon over ocean, enough fuel to reach Shanghai since the cargo was simply the kids and three adults.

Eleven hours later we landed at a military airstrip outside of Shanghai, Han meeting us in a coach. We loaded the curious kids and their cases, a short drive to a military complex with high fences and numerous guards, soon negotiating an inner cordon. The coach navigated around high trees, seemingly placed to hide the facility within, and we opened to pleasant gardens, finding many ponds and waterfalls, footpaths and swings. Halting, I got my first glimpse of the new college, the house designed and built to resemble that of the old colonial house at the farm.

Jimmy addressed the kids, 'Grab you cases and then follow me.'

In the foyer of the large house, which looked more like a hotel on the inside, a reception desk housed two Chinese ladies on the right, both fluent English speakers.

Jimmy ordered, 'Put your cases down here, we'll come back for them. First, a tour.' He led the group off, and I was just as curious as the kids.

The first room was a lecture theatre, heads poked inside. The second room was a canteen, several sofas with coffee tables off

to one side, room for fifty people at least. Opposite the canteen sat the computer room, a variety of the latest computers, perhaps forty in total. Through that room we walked, a set of glass double-doors revealing a library and study area, all the books seemingly in English. Back in the foyer we climbed wide stairs to the first floor, the first room being a TV lounge, but with many individual compartments. I figured that each kid could watch a separate channel, and puzzled it. Next came a games room, making me smile. They had everything a teenager could want; pool table, arcade games, chessboards and computer games. Through that room the kids trailed behind, now chatting amongst themselves, their initial shock gone as we entered a dormitory area. The first room offered three sets of bunk beds, the second three single beds and plenty of shelving, the other rooms similar. Across a landing to another door we found individual rooms, similar in many ways to the rooms at Mapley.

When I turned around we only had three kids left on the organised tour, Jimmy smiling widely.

‘Let’s leave them to it,’ he said. We returned to the lower level, kids running up the stairs with their cases, laying claim to rooms. We sat in the canteen with Han and the professor. Jimmy explained, ‘Right now, back at the farm, Cosy is removing all traces of the kids. Their possessions are probably already on another flight, the house being stripped. He’ll move in Zimbabwean farming students, claiming that the security breach was about them.’

Two kids burst in and grabbed trays, pointing at what they wanted, the Chinese ladies behind the counters serving them.

‘Kids are kids,’ the professor said. ‘They’ll adapt quickly.’

Han asked, ‘Do you know who was behind the breach?’

Jimmy shook his head. ‘It could be one of three. I’ll investigate. But, now that this lot are here I’ll bring the other kids here direct.’

‘There are more?’ the professor puzzled.

‘We have an orphanage with twenty thousand kids in the Congo,’ I informed him. ‘And this lot could probably work out how many brain-trusts that will produce.’

‘Another fifty,’ Jimmy suggested. ‘Oh, labs around the back, and a bunker underneath us full of goodies.’

‘Should he not know the truth?’ Han suggested, meaning the professor.

‘Now that he’s been injected, yes,’ Jimmy agreed.

Han informed the curious professor, ‘Mister Silo is a time traveller.’ I enjoyed the look on the professor’s face. Han added, ‘His mission is to prevent a series of future wars and conflicts, as well as plagues and other problems.’

‘The kids!’ the man realised.

Han softly explained, ‘They will, hopefully, help to assist in research projects that may assist the safe development of this planet.’

‘My god!’ the professor whispered.

Jimmy glanced at Han, addressing the professor. ‘I apologise, but you, sir, are a prisoner in a nice cell. *You will* ... help me use the kids to save this planet. Hopefully, around 2010 you’ll be released, most of the work being completed by then. If you stick it till then, I’ll put a few million pounds in your pocket. Since you’ll live a very long time, the money will help.’

‘I would have stayed anyway, I knew there was something special going on.’

‘What did Jimmy first tell you?’ I asked.

‘Just that he had a genetic aberration in his blood, and that it caused autism in some. Then he offered a lot of money. But it’s not about the money. I’ve worked with autistic kids all my adult life, but some of this lot are off the scale. Not only that, you can converse with these kids, give them projects without temper tantrums.’

‘Your first project is a hybrid electric car. Concentrate on the battery science, it’s the key.’

‘Time travel, huh. Now that would be an interesting project!’

‘And one that you are banned from discussing,’ Jimmy insisted.

The rest of the kids piled in, the canteen soon bustling. Jimmy and I had a plane to catch, a plane back to Kenya and home from there, a long trip. If we flew straight back to London it would look odd, very odd. On the plane I asked about the American unit that monitored us, figuring they may put this all together.

We landed back at Mombassa, right into some awkward questions about the unscheduled flight. Jimmy explained that, en-route up to Mawlini, he got an urgent message from Hong

Kong and diverted the plane – all his fault. We left the officials in Mombassa wondering about what to do, and fearing upsetting us. We checked the farm with Cosy, the Zimbabwean students in place, and drove to Nairobi, using our open tickets to catch a flight home without further incident. At the house, Han was already back, Jimmy calling Keely outside.

‘Well?’ he demanded.

Keely took a moment, finally handing over a sheet of paper with three names on. ‘What’ll you do?’

‘They killed and wounded Kenyans,’ Jimmy reminded Keely. ‘Where are they now?’

‘Stateside.’

‘I want the President’s highest representative here. Tomorrow. If not, I’ll take a large chunk of change out of the American economy and give it to Cuba, enough to make his fucking eyes water!’

Art Johnon’s National Security Advisor, Shoneberger, arrived the next afternoon, his visit kept secret. The “M” Group met, but had not been fully briefed, certainly not on the children.

In the lounge, Jimmy explained, ‘A few days ago a facility of mine in Kenya was penetrated by three CIA agents.’ He handed over the names. ‘They killed one Kenyan guard, wounding two others.’

Han piped up with, ‘My Government wishes an explanation for this.’

‘As do we,’ Jack echoed, Michelle and Ivan adding their voices of complaint.

Shoneberger took a moment, clearly angered, but at who was not clear. ‘The President has taken steps to investigate the matter.’

Jimmy held his hands wide. And waited.

‘We’ll let you know what we find.’

‘And until then all bets are off, no co-operation between us. If that means terrorist attacks go ahead, then it’s on your head. And every day you delay I’ll take a chunk of change out of Wall Street and make a charitable donation to Cuba. So don’t take too fucking long.’

‘Is it appropriate ... for you to threaten us?’

‘Is it appropriate for you to spy on me, to kill and wound my staff? Men with families?’ Jimmy pointed at Keely. ‘You have your man here, and he can ask any question he likes. Why shoot dead my people?’

‘The move was not sanctioned, it was the CIA ... freelancing. Our administration apologises. But ... but the CIA have been trying to convince the President that there was something going on there.’

‘There was, and there is *something going on* at many facilities I have, all so sensitive I can’t risk them getting out – not even to you!’

‘I thought we had transparency.’

‘If I tell *your administration* things, you’re out of office in two years and some other idiot takes over, not being bound to keep their traps shut. If you had a more secure system of government I could tell you more. As it stands, the next guy in the White House is a right arsehole. You want him to know everything? The first thing he’ll do is to try and have me arrested, tortured for information! Don’t forget, numb nuts – I know the future.’

Shoneberger took a moment. ‘I’ve been asked ... to ask what was going on there?’

Calmer, Jimmy stated, ‘Genetically modified crops, the Chinese helping me.’

Shoneberger glanced at Han. ‘For what purpose?’

‘If it works, it will feed Africa. A controversial subject.’

‘Why ... controversial?’

‘Why do you think?’ Shoneberger shrugged, Jimmy adding, ‘Feeding Africa would cause a population explosion and migration problem. In years to come we’ll disagree on African policy; I’ll feed them, you *and others* won’t want me to. Contact your Ambassador in Kenya, send him to the farm today, examine the research, I’ll arrange access.’

‘The tomatoes are huge,’ I put in. ‘Marrows weighing three hundred pounds. It’s part of a secret project in the Congo.’

‘With the blood, and the food, the population growth would be unsustainable,’ Jack noted. ‘So I guess it will cause a lot of problems in the future.’ He faced our visitor. ‘But, knowing Jimmy’s fondness for Africans, he’ll try and feed them all.’

Jimmy wagged a warning finger. 'I think, maybe, I should try and get the Republicans on board. I should make a donation.' He turned his head to me. 'How much do you think is appropriate?'

'Got to be at least two-hundred and fifty million to make it worthwhile, especially if they're going to be difficult in years to come.'

Shoneberger left without even so much as a cup of tea. By time his plane landed the New York Times had news of alleged CIA involvement in the assassination of the Guinea President, several African nations up in arms, as well as the UN. Kenya had issued international arrest warrants for the three CIA agents that had broken into the farm in Kenya – naming them only as "US citizens", the US news somehow matching their names to the CIA. The American news was full of it, Art Johnson now under pressure. The next morning the New York Post opened with a very detailed story about CIA involvement with a failed military coup of the Venezuelan President. Los Angeles TV stations were also investigating an old story about ex-President Harvey – and how much Art Johnson knew at the time. News was also running the story of Jimmy making a hundred million pound tourist development loan to Cuba.

Ex-President Harvey flew into London and we met him with the UK Prime Minister, Jimmy insisting that the head of the CIA must go, or we'll ramp things up. Leaving the meeting, I realised we had just threatened the US President, shouting at the previous incumbent.

There was a time, as a kid, when I was in awe of parents, they could fix anything. Then, growing into a young man, I believed our political leaders knew what they were doing, and were honourable people. Now I knew differently. They were just people, only worse; their policies were set by their popularity. Katie Joe would have found the job of being a politician an easy transformation. Driving through the streets of London, I remembered what Jimmy had said: how would you react if you met a President? At the time I would have been terrified. Now I had nothing but contempt for them all.

Driving back, Jimmy called Senator Pederson, some sharp horse-trading conducted, oil and mining concessions offered.

Harvey flew straight back to the States, another revelation about the CIA being released that evening, Pedersen and his

gang calling for the head of the CIA to go – as well as Art Johnson. Johnson had no choice; he sacked the head of the CIA and ordered an investigation, several lower grade CIA managers suspended. The story ran for a few days, eventually fizzling out, Art Johnson inviting his special envoy to the White House.

Three days later we were again on the blue carpet of the oval office. So far, the US press had not linked us to the incident in Kenya.

I shook the hand of the Chief of Staff. ‘So, how’re your ratings?’ I testily asked.

‘Not good,’ he admitted, being reserved.

Johnson stepped in five minutes later, as we sat having a coffee. We didn’t bother to get up, the move – or lack of movement – noticed. He sat opposite us, straightening his tie, and I could not figure out if he was angry, afraid or resolute. He took a moment to compose himself. ‘I’d assume that it was you who leaked the details of the CIA activities to the press.’

‘And you’d be right,’ I told him.

He heaved a sigh. ‘This was all one great ... mistake; I can see that now. They should have asked you about the facility, not snuck around – and certainly not shot anyone. For that, we apologise. And your *demonstration* has registered where it should.’

‘Payback is a bitch, huh,’ I said.

‘I would like to ask ... that terrorist and disaster warnings be resumed,’ Johnson humbly requested.

‘They will be,’ Jimmy confirmed.

‘Can we ... move on from this?’ Johnson asked, his hands wide.

‘We can,’ Jimmy confirmed.

‘We’ve got the Joint Chiefs assembled in the Situation Room as you requested.’

‘We did?’ I puzzled, Jimmy confirming to me with a nod.

Ten minutes later we were led to the Situation Room, Johnson not in on this meeting, the military brass sat waiting, a variety of uniform colours, much braid and brass displayed. It was a frosty reception.

‘God bless all here,’ I joked. ‘Who’s round is it?’

Jimmy took off his jacket, placing it over a chair. ‘Gentlemen, your dear President has agreed, finally, to this treasonous

meeting, a meeting *without* his presence, although I'm sure he'll get a full report.' He patrolled around the table. 'The CIA made a mistake, one that you should learn from. If you have a question, come and ask me. If you kill innocent people, men with families, there will be a penalty.' He stopped. 'And just think what that penalty would be if you harmed someone I cared about.' He let them think about it. 'If Paul and I were killed – by you, detailed documents would be sent to Russia and China, potentially putting the US at a massive disadvantage in the decades ahead. If you lot don't understand the nice way of doing things, we can do it the hard way.'

He let them think about it. 'Now, let's be realistic. You sit there with your arms folded –' a man unfolded his arms. '- sour-faced and sceptical, because the only the way that this would work to your satisfaction is if I was tied to a chair in a cell, only answering to you, helping to make the US of A as great as you'd like it.'

'You forgot the shackles and hot poker,' a man said without looking up.

'Don't worry, the next guy in the oval office will have the hot poker ready.' Jimmy patrolled the group. 'Your job ... is to defend the US. Well, your job is to try and advance your own careers and play with models on a board, to invent threats from time to time to justify your salaries.' A few angered faces looked up. 'My job, is to try and save the planet. Although the US is part of that planet, my job is not to save the US at the expense of all other nations.'

'What you *learn-ed* gentlemen don't realise yet, is that in the future the planet becomes very globalised, both a blessing and a curse. Corporations grow and become truly international, crossing all borders. In the future, it is those corporations that hold the power, not the politicians, and they do a good job of preventing wars – because no matter what country is involved in a conflict *they* have a financial stake in it. Those corporations are huge, stakes in China, Russia and the US. So the Chances of a conflict between the US and those nations are extremely limited; if you fire off a nuke you hurt your markets and shareholders. Beyond 2015, the chances of a global conflict are extremely remote, the military downsized. To some, that would be seen as a good thing.'

‘Not to this lot,’ I suggested.

‘No, not to this lot, because they judge their own self worth, their own pride, on the prowess and abilities of the shiny toys. And war is good for them, it proves that the toys works, it justifies their salaries – even with a lot of casualties.’

‘That’s crap,’ the Admiral stated. ‘You paint us as war-mongers.’

‘Ah, now raise your hands all those who wish to see a system of world government where the US takes third place behind China and Russia.’ No one raised a hand. ‘By time you get to 2025 that’s exactly the situation you’ll be in, gentlemen, fewer shiny toys to play with at a time when we’ll all be fearing the worst.’

‘Knowing the 2025 problems, we’d never disarm,’ a man scoffed.

‘Who pays for the military?’ Jimmy waited, his hands held wide. ‘The taxpayer. And when there’s been no war for a decade or two, certainly not a successful one, and the peace campaigners get ahead, and the economy is struggling – the world dominated by super corporations - what view will the taxpayers take on the military?’

‘You’re saying we’ll be ill-equipped to fend off the Brotherhood?’

‘Not really, because as you already know, General, shiny toys won’t be much use against them. Your navy will keep your shores safe, but jet fighters and tanks will be useless.’

‘How many troops will we have at the time?’

‘More than enough, just not in the format you think. You see, between now and then, a bright spark over here will keep a careful eye on that troublemaker, Jimmy Silo, and learn from his example. From his examples on how to fight wars in far off parts, cheaply, effectively, and without any US or UK casualties.’

‘The Rifles?’ they puzzled.

The Admiral said, ‘They’re low paid, injected with the blood, they know their own terrain, speak the language – and the folks back home don’t give a shit if they take casualties. So ... when we’re having our budgets cut by the politicians, we’ll use proxy soldiers. A throwaway army.’

A chorus of whispers broke out, quite a debate. I had not realised they'd go that route, but it made perfect sense. Jimmy smiled smugly towards me, helping himself to a water as they debated the matter.

Finally, he called order. 'Gentlemen, there *are* some advantages to having someone like me around - you get a route map to the future. Now, let's talk about the arseholes in the CIA. They, like you, have a budget that they'd like to see maintained, or even increased. Problem is, with me around, you don't need them so much. They feel ... threatened, useless, less important in the grand scheme of things. They feel like they need to be justifying their salaries. And, in the years ahead, they will make a point of trying to discredit me. Every time they do I'll strike back – because I am only human, with human emotions. Every time I strike back it will hurt the US, we may even see US casualties. We will, definitely, see me withdrawing my services. If that happens at a time when someone is trying to sneak a nuke into New York, it could go badly for you.'

'Will someone try and sneak a nuke into New York?'

'Yes,' Jimmy affirmed. 'But, because I have business interests there, I would be foolish to let it go off. You see how this global corporation thing works? I'm British, but I don't want anything to happen to New York because of my business interests there. Some day very soon, the Russians and the Chinese will also think like that, so too the Cubans and others.'

'You'd never let a bomb go off,' a man said. 'Not even a small one.'

'You think you know me?' Jimmy asked the man directly, holding his gaze. 'Let's hope you're right. Just don't say that I'd never bring down a US President, I'd make a liar of you.'

'You'd bring down a government?'

'Not a government, a President,' Jimmy corrected the man. 'And that brings us nicely onto the next matter. Some things are certain, such as future economic crisis –'

'If we know about it, why can't it be avoided?'

'For the same reason the CIA are sneaking about: because you're political paymasters are too stupid to listen to me. They hear the words, but they don't believe them. Besides, someone else will be in office by then – it's not their problem. So you'll suffer an economic problem, several in fact. And then, a certain

future President will suggest that, given the size of your military – with all its shiny toys – that something could be done before the US loses its place at the top. He'll try, at least, to persuade you to attack Venezuela, and China. Both campaigns will be disasters. You'll also be urged to invade Afghanistan, a disaster waiting to happen.'

'So what are you suggesting - that we shouldn't follow orders?'

'No, I'm assuming that you are smarter than that, that you could present plans that have far higher costs and casualties than you think, and that you think about your exit strategy before your invasion strategy. You need to say to the President: yes, we can invade and win the war quickly, but then what? Are we there for regime change, or nation building? Are we there to build schools and change the politics? And what about the attrition casualties, daily roadside bombs in some far off hellhole? And what happens when you leave? Do they go back to being a nuisance state, or do you patrol the streets forever? Vietnam was easy to get into, but where was the exit strategy? Your biggest problem in the future will be quick victories, followed by a lot of people sat around thinking of an exit strategy, soon realising that there isn't one. You'll withdraw in poor order, the communist nutters taking back their country and declaring victory.

'Now, in the years ahead, some of you will approach retirement close to crisis points. As such, you could accidentally go public and condemn the plans.' They glanced at each other, wide-eyed. 'What you would have to balance up, is if your reputations and remaining few months in office are worth the lives of tens of thousands of soldiers. Who here thinks that the seat they occupy is worth a thousand dead soldiers?'

No one raised a hand.

'Give it some thought gentlemen, treasonous thought. Would you sacrifice the end year of your career to prevent bloodshed, or ... are you more interested in moving pieces around on a battle board, regardless of the casualties.' Jimmy sipped a fresh coffee.

'You're asking us to try and influence policy!'

'No, I'm asking you to think beyond the battle. I'm asking you to make proper plans, and to not let the politicians ask you for just a way in. You need a re-construction plan, a civil order plan, and an exit strategy. Otherwise, once the battle has been

won and the incumbent is happy with his ratings, you'll be picking up the pieces as the man in the White House moves on to things that he finds more interesting.

'You'll probably be involved in a war within five years of now, a quick initial victory followed by heavy daily losses, the folks back home losing interest, followed by an exit-strategy that looks like you lost – when you actually won the battle. But if the aim, the political aim, was to remove the regime, and they come back a year after you leave – what will you have achieved? You'll have dead American soldiers ... and for what? To teach them a lesson? Don't do it again! The Vietcong didn't harm the reputation of the US and its military, public opinion did that. When you go to war, gentlemen, keep one eye on the enemy, two on the politicians, and three on public opinion. Ask yourselves: what value was the quick military victory if the nutters get back into power, the folks back home blaming you?

'Consider this: next week, the President calls you in and says you should invade Venezuela and remove the government, go make a plan. What I would expect is that you say to the President: what comes after the invasion, sir, we holding onto it? What about the exit strategy? And, if the President suggests that you think about that at some later point, that you dig your heels in, that you ask: how many years will we occupy it, sir? And after we leave, then what? Is the mission to destroy their government? Is to grab their oil – which it will be. I'd expect, gentlemen, that you present a plan that spells out the cost of holding onto the territory for five years: five thousand dead a year, twenty thousand wounded a year will be your actual figures. And then, when you leave, an even more hard line government takes over.' He stopped patrolling. 'So why the fuck did you get in there in the first place? You may argue, quite correctly, that it's not your concern. Now, how many of you, able to go back in time, would say to the then President Johnson: Vietnam, great idea, sir, leave it to us. We'll show those commies!

'You're in a unique position, in that you have the benefit of hindsight – in advance. Venezuela will make Vietnam look like a walk in the park. Afghanistan will set Pakistan ablaze, leading to a war between India and Pakistan – a nuclear exchange and the rise of the Brotherhood from the refugees. Attacking China will

result in a nuclear exchange and you'll lose California.' He stopped again. 'You get many warnings from me about terrorist actions, plane crashes, and you believe them all, and you act upon them all. But when I tell you about the big mistakes you're about to make, you just sit there looking dumb.'

They glanced at each in silence for a moment, Jimmy suggesting a coffee break.

A man asked, 'What *was* at that secret facility in Kenya?'

'A bunch of clever people, many Chinese, experimenting with genetically modified crops under my guidance.'

'Why so secret?'

'Why not?' I asked. 'Do we want the public to know what we get up to?'

'That facility, gentlemen, is one of dozens, all projects that have some relevance to the future, none of them a threat to you, or of interest. Many of those projects involve future technology, items that would be hard to explain at this date. Many are involved with alternate energy and, before you ask, the arseholes in your oil industry *will* try and block their design and use it to line their own pockets – till it's too late and there is no oil. Then the lights go out.'

'We've got GM crops here, out in the open. Why the big secrecy?'

'Because the world is not yet ready for maize that grows at a foot a day, reaching twelve feet tall.'

'Shit...' someone let out.

'And that flight you took to China?'

'All the research has been handed over to the Chinese.' That stirred them. 'Because I know that they can keep it under wraps.'

'You trust them more than us?'

'Yes, much more.' They didn't seem to like that, Jimmy adding, 'They wish to survive and prosper, you wish to lead and to dominate. There is a subtle difference. You want what's best for *you*, I want what's best for ... Africa, Asia, South America. And, in the future, the conflicts we'll have – you and me - will all come down to that premise: how many African lives is an American life worth? A hundred? A thousand? One? Are African lives worth less because they're not educated or cultured, not productive in the world? My students at the orphanage are passing degrees, on par with American students. All they needed

was a chance. Always keep in mind, gentlemen, that to me, the survival of the planet is important, not America, or Russia, or Britain. Now, who wants to tell me why I'm in the Congo developing its infrastructure?'

'To stop the Brotherhood moving south?'

'I could do that with an army, why an elaborate infrastructure?' They puzzled it. Jimmy explained, 'After 2015 the Congo will have a GDP as large as the rest of Africa combined, busily buying American goods. Beyond 2015 Africa is an important market for American goods, because by then they'll have a few dollars, a house and a car, and a desire for a larger TV set. And it will all be down to me.' He took a moment. 'You're welcome.'

We left them to think about things. Back at the hotel I opened the door to my room to find Helen and the baby.

'I don't have a woman in here, babes,' I quipped, giving her a hug.

'Jimmy sent for us, Cat next door, flight to Los Angeles.'

'Oh. Fair enough. Get your clothes off.'

'No time, hotrod, flight in an hour or so. I packed for you.'

'I'll have a quick wash.'

We were on the plane to LA in two hours, the flight delayed, and staying at a plush mansion that Po owned, his family using it sometimes. It came with ten Chinese servants.

I cornered Jimmy. 'OK, what we here for, what's the big secret?'

'I have a bit part in a Star Trek episode.'

I stood and stared at him.

'I play the part of a time traveller, a name similar to Magestic.'

I continued staring at him.

'In a few weeks the CIA will release details, claiming I'm me.'

'Ah, and with the show shot they'd look like twats.'

'Hopefully. Celebrity charity bash tonight, TV interview first.'

The doorbell went and I answered it, wondering how they got past the security. I found Oliver Standish and his wife, cases in

hand. 'Five dollars to carry your bags,' I told them, holding the door.

'Is the baby with you?' Oliver's wife asked. I nodded. 'Dying to see her.'

Half an hour later we sat around the pool drinking, Cat sat in the shallow end of the pool with Shelly, our daughter shrieking with delight. When Cat sharply called our names we all stood, Shelly performing a fast and confident doggy paddle across the pool, Cat her behind ready.

I asked Helen, 'Has Cat been giving her lessons at the house?'

'I don't think so. Cat! Does she swim at the house?'

'No!'

We all sat. 'She was the same with walking,' I said. 'Once up, no stopping her.'

'You taking her on the show later?' Oliver joked.

'No,' I said.

'Yes,' Jimmy said.

'Yes?' Helen queried.

'They're expecting her,' Jimmy suggested. 'Feed her first, she'll be fine. Really.'

Two hours later we sat on a sofa facing the interviewer, Shelly giggly and adorable, the audience loving her. They asked about the upcoming wedding, when we had finalised it, followed by Pineapple records and our stars, some about Africa and Rescue Force, nothing controversial. Jimmy mentioned the Star Trek role, the time traveller. Cat took Shelly home with the security detail, and we enjoyed the black tie charity gala.

The next morning Pineapple's New York lawyers called. An LA paper was running a story that Shelly was Jimmy's kid, Jimmy expecting the move. We issued a writ straight away, Jimmy holding a press conference, making jokes about the situation.

Within an hour, three of the best LA labs had taken blood from the four of us. Jimmy headed off to the studio, to dress up like an alien and say a few lines, whilst we sat around the pool. Jimmy returned to the studio the next day, another eight-hour session in make-up. By time he had returned our lawyers had held a press conference, releasing the results of the three respected labs: Shelly was not Jimmy's. We invited in a TV crew

and they filmed us enjoying ourselves around the pool. The paper's owners offered to settle out of court, but we were having none of it; we wanted fifty million dollars in damages.

A week later Jimmy had finished filming, the offer from the paper rising. Then Jimmy suggested he would accept stock, the paper readily agreeing. The lawyers sorted the deal quickly, twenty million dollars of stock signed over.

Sat in the lawyer's office, Jimmy, Helen and I signed to say that we were settling. Having done so, Jimmy said to the papers sub-editor, 'Oh, by the way, I bought some of your shares a month ago.'

'Yeah?' the man puzzled. 'How ... many?'

'With these, enough to launch a bid.'

The lawyers began salivating: they could handle that for us.

Standing, Jimmy gave the lawyers the go ahead. Facing the sub-editor, he said, 'I guess there may be some job losses. Tell me, do you wish to stay on, and get a pay rise?' The man just stared back. 'Where did the story about us come from - *employee?*'

The man took in our faces. 'Britain, we bought it from a man supposedly working in your intelligence services.'

'We'll need all the details, in this office, inside the hour,' Jimmy insisted.

Oliver stepped in. 'You were after me, Jimmy?'

'Yes, I'm taking control of this gentleman's paper. So, from now on ... all stars give interviews to it first. You'll be on the board, after you've opened some offices down here.'

Oliver shook the man's hand. 'Welcome to the Silo team.'

I smiled so widely I must have looked like an idiot.

Jimmy faced Helen with a grin, 'Issue a press release around the States, Miss Money Penny.'

A lawyer said, 'I thought that was just a joke name in the Bond movies.' We all stared at him.

On the flight back Shelly was restless, so I took her for a walk. It was late, the lights low, not many people awake. In Business Class, people recognised me, smiling widely at Shelly. Coming back around the other side of Business Class I got tapped on the arm. Turning, I recognised a man from McKinleys, stopping to chat in a whisper, lifting Shelly for his wife to see her. The

stewardesses made a great fuss of Shelly, and I eventually climbed to the bar, where Jimmy accepted her off me; she always settled for Jimmy. With the flight crew coming out in turns, we talked flying – and crazy helicopter stunts.

At Heathrow, in the mini-bus, Big Paul reported, ‘They arrested that guy, Sykes has him.’

‘For a while back there I thought we’d nudged him to say it,’ I admitted.

‘No need,’ Jimmy sighed. ‘There’ll be plenty of those in the future.’

Back in the UK, our solicitors suggested we had a very good case against a handful of UK papers that had not only repeated the allegations of Shelly’s parentage, but embellished upon the accusations as well. We gave the vultures the go ahead, writs issued.

It was just odd timing that the three-monthly event at the club, “Snappers and Scribblers”, was due. That Thursday the club was full of reporters and photographers, including many of those we were suing. I even bought one a drink, telling him what I was going to buy with the money I took of his paper.

None wanted to settle out of court, so we’d have to fight them, which was the course that Jimmy preferred.

Re-organising

When we got back to the house, Jimmy called a Rescue Force “Shura” at Mapley; a meeting of elders. Mac, Doc Hoskins and a few others came up from Mawlini, the senior staff from Tanzania, DRC, Ghana and Namibia and all other RF units. Po and Hancock from Hong Kong turned up, Han always interested in the operations, Hal and Hacker lending their weight of experience. There were a lot of familiar faces at the HQ building, much hugging and greeting, nothing getting done for the first two hours. After lunch in the canteen, Jimmy called everyone to the lecture theatre, the only room that could hold us all. Helen and I sat off to one side, Helen taking notes.

‘OK, settle down people, you’re not in Mawlini now,’ Jimmy called, people laughing. ‘Hands up those who have had volcano training from Crusty?’ Half raised their arms. ‘Let’s make that all of you, and soon.’ He faced Crusty. ‘Split yourself into three and get around them all.

‘OK, when I was in American, in California, I spoke to a man about wildfires. Since then I’ve been thinking that maybe we should attend wildfires in some regions: Southern France suffers from them, Greece, and Australia. To that end, I want some sort of wildfire training and plan of operation. Bob, add it to your list. I would guess that we could offer helicopter rescue, jeep rescue and medical care for people suffering from smoke inhalation, a lot like the Goma volcano deployment.

‘OK, next. I’ve allocated funds for Sir Lanka, India and Sumatra for an expansion of their teams with a view to offering non-emergency village medicine, a bit like the flying doctors. We already get involved with that in Africa, so let’s think about it in the countries I mentioned.

‘Next, as a direct result of our actions in Sierra Leone, we shall now create a unit there, so ask around for anyone who wants to head it up. Unfortunately, doctors and nurses are thin on the ground there. That mission will also be about village medicine as much as anything else.

‘OK, Congo. We’re pushing west, into areas that haven’t seen a doctor since Doctor Livingstone.’ They laughed. ‘I want any spare bodies in your units that are not gainfully employed or training to be sent to the front line there. We can absorb as many people as you can send, so let’s use it as a good training ground. There are plenty of gunshot wounds, and lots of nice tropical diseases.

‘OK, annual national games this year they will be held in Mawlini in September. Mac, close the bar a week before.’ They laughed at him. ‘This year, contestants will be limited to fifteen people. That’s fifteen only, or the base will run out of beer. Oh, while I think of it, we need ten volunteers for Ghana, for remote village medicine. Bob, over to you.’

Bob Davies hobbled out, still using his crutches for some support. He went through a long list of things, some question and answer time, Jimmy then calling up Coup and the training

standards guy. When they were done, Jimmy took the floor again.

‘OK, we’re here to think about the direction of Rescue Force, and get some input from you. So if you think you know what direction we should be going, or have a question about that direction, raise you hands.’

Jimmy pointed at the first man, and worked around the room, suggestions made and taken on board, some points disagreed with, some points refused because of money. Then Mac raised the question of Cambodia and Vietnam, and their mine clearance efforts.

Jimmy faced Hal. ‘Did you leave some ordnance behind?’ People laughed.

‘A lot!’ Hal confirmed.

‘Yes, Mac, it’s a good idea, mine clearance with our medics behind them – just in case. Bob, talk with the UN and the countries directly, let’s think about a training centre over there, one in each country, funded by us.’

Hal asked, ‘We won’t be flying over Vietnam in a large formations of Huey’s, will we?’ Everyone laughed.

‘No,’ Jimmy quipped. ‘That would scare them a little. Po, Han, I’d like you helping on that project; it’s your backyard. Right, I’ll be making a little more money available for the training budget in certain areas. First: jungle training in the Congo, a crashed helicopter scenario – headed up by Hal.’ They laughed at him. ‘Second: long range navigation by jeep and foot, Namibia, plus survival training.’

Doc Graham raised a hand. ‘What we doing about the Supplemental Group? Some people want a second year.’

‘Their bosses have to authorise it. If they quit their jobs, sign them up, but under no circumstances been seen to tempt them away. I don’t want the Prime Minister whinging.’

‘What about numbers?’ Doc Graham added.

‘Again, it’s down to the PM. Write him a nice letter.’

‘He’s agreed the Civil Emergency Unit Training,’ Doc Graham informed us.

‘Yes? Oh, in that case get started on it straight away. I’ll buy some more land, the area over the road. I think it’s almost as big as this place. They’ll want short courses spread throughout the year, some compacted twelve week courses.’

‘What is that unit?’ Mac asked.

‘For the British Government, just like the Supplemental Group; in the case of a national disaster they’d be called up. Think of like part-time Supplementals.’

Doc Graham said, ‘They’ll train on the weekends, so think of them as Sunday Supplementals!’ The group laughed.

‘Have you been making good use of the place in Scotland?’ Jimmy asked.

Coup said, ‘It’s busy through the summer, partly in the winter. The Army and Marines make use of it as well.’

Finishing up, we arranged to meet at a hotel in Swindon at 7pm for a meal, a few families attending. The next morning a display of new equipment was organised, various suppliers demonstrating equipment to us – and hoping to sell the items, followed by an NGO session, the NGO’s meeting us and discussing joint ventures, even requesting some training for their NGO staff. We met in the lecture hall at 4pm for another question and answer session before the group broke and headed back to their home nations.

Oil and sand

At about the same time that we had asked the Somali Government to allow a Chinese oil company into Somalia, Jimmy had discretely asked the Kenyan Government the same questions – but would they keep it quiet for now. I think they agreed before the confirmation fax had arrived with them. The Chinese crew had sunk a well just across the border from Mawlini, and struck oil, the find kept secret for now.

A week after the Mapley Shura we flew down to Nairobi with the gang and Shelly, and enjoyed five days on the beach. And on this trip Big Paul brought his other half and teenage boy, their first time away with us. Flying up to Mawlini, all now suitably tanned, we took a ride in our newly delivered Dash-7, a commercial pilot flying it. The usual mix of UN and NGO staff were aboard, a sprinkling of RF staff, all making a fuss of Shelly. Booked into the RF hotel, we left Helen by the pool and took Big

Paul and his lad up in a Huey, Jimmy letting Big Paul fly us to impress the lad. Five miles across the border I had to look twice as we circled an oil well.

‘Is that ... is that an oil well?’

‘Yep,’ Jimmy replied. ‘Chinese.’

‘That’s damned close to the border,’ I said. ‘Any oil this side?’

‘Let’s go have a look,’ Jimmy said, directing the Huey back across the border and to a place just six miles north of Mawlini.

On the horizon I could see an oil derrick standing proud, quite a small camp around it. Closing in I could see a fence, many small wooden huts similar to those we often used. Jimmy asked Big Paul to land nearby, and we blew up a sand storm. Winding down, we walked across to a Rifles jeep that had driven out to meet us, their colleagues guarding the helicopter as we drove to the well site.

Stepping down from the jeep I pointed at the discoloured sand. ‘What the fuck’s that?’

‘Oil,’ Jimmy stated. ‘Why’d you think I put the base so close all those years ago, Dumb Fuck.’ Big Paul and his lad stood staring up at the tall derrick.

‘How much oil?’ I asked.

‘Enough. More than enough.’ Jimmy led us into a hut, meeting a British engineer with a Scottish accent.

‘Jimmy, you missed it by a few days,’ the man said as he stood and shook our hands.

‘Missed what?’ I asked.

‘The discovery. The oil!’

‘How much is down there?’ I asked.

‘It’s a good pressure, so enough to make you very rich. Sorry, I forgot, you’re already very rich.’

Jimmy explained to me, ‘I funded the site myself, this is our oil to sell, taxes back to the Kenyan Government.’

‘They don’t know yet,’ the man said with a grin.

Jimmy lifted his satellite phone. ‘Rudd, Jimmy. Issue a press release: we’ve struck oil north of Mawlini. Thanks.’

‘That’ll make the news, first oil found in Kenya,’ the man stated with a smile.

‘Shit...’ I let out.

Jimmy playfully told the man, 'Get a move on, get it pumping and to the coastal refinery. You're in for a bonus.'

Back at Mawlini, we entered Mac's office, Jimmy sounding the alarm for a few seconds. He lifted the tanoy microphone. 'All staff, all staff, this is Jimmy Silo. A few weeks ago I arranged for an exploratory oil well to be sunk just a few miles north of the base. A few days ago they struck oil, so the drinks are on me.'

'Fucking 'el,' Mac said. 'Oil? That you're oil?'

'Yes,' I said. 'Help to pay your bar bill!'

'Be oil workers flying in now?' Mac grumbled.

'Lots of them, hopefully,' Jimmy replied. 'I want our Hercules running trips for them from Nairobi, but charge them a reasonable fee. It can bring kit up as well, helping to pay the Hercules fuel. Have a medic or nurse team of two people up there on shifts, in case of injuries. Rudd will build another hotel and bar, outside the fence, for the oil workers. We don't won't those hard drinking ruffnecks in here, our ladies may hurt them.'

Laughing, we stepped out into the heat, driving around to the Rifles base for a visit, Big Paul and his lad on the shooting range. I was amazed by how far the base had come along, many more buildings visible now, the camp just as busy as ever. Signs on the buildings denoted different groups, specialities, training centres: 3 Group, 16 Section, Bravo Company, HQ Company. We drove into the helicopter compound, the signs displaying "2nd Air Combat Wing, 1st Training Wing, Mechanical Support wing." A dozen hangars formed a long high wall and we drove along the apron in front of them, a variety of aircraft sat around or being worked on; Hueys, Cobras, Pumas. At the pilot's lounge we stopped, taking off our sunglasses and stepping in.

'Jimmy! Paul!' came an American accent, one of Hal's buddies, the Kenyan Pilots all standing. Greetings exchanged, we accepted cold fantas and sat, catching up on operations and gossip. The helicopter wing was busy in Sierra Leone and the Congo, plenty to do. At least these days they had enough pilots. They reported a Huey downed in Sierra Leone, minor wounds only, another down in the Congo in a storm. Given the number of Hueys we had sat around we were not concerned; we were amazed that the old Hueys kept going.

‘I’ve got a batch of spares coming in,’ Jimmy informed them. ‘But these are brand new, from the manufacturers, I worked a deal: we get a good price, they use us for advertising.’

‘We received another shipment of avgas from the States,’ the American pilot informed us.

Jimmy and I exchanged looks. ‘That’s ... nice of the White House,’ I commented, puzzling the move.

The celebrations began around 4pm, people finishing early and heading to the rooftop bar. With Cat minding Shelly by the pool, the rest of us enjoyed a cold beer in the heat, talking of the oil strike. An hour later, with the bar filling up, various government ministers started to call, Jimmy suggesting a groundbreaking ceremony at noon the next day. We drank till late, the Kenyan RF gang as boozy as ever, many carried out and put to bed.

The next morning we kicked people up and out of bed, we even sounded the alarm. At eleven o’clock a snaking line of white jeeps drove out the gates followed by another twenty jeeps from the Rifles, the base warned that the President may be inspecting. As the convoy was leaving, the President flew in aboard one our Dash-7’s, a bus ready to take his party to the oil well. A second bus would ferry the press, landing now in a second Dash.

Outside of the oil well’s fence, we lined up the jeeps either side of the access road, making an avenue. What Rescue Force and the Rifles had to do with the oil well beat me, but we laid on a show anyway. Everyone was stood in a line by their jeeps as the President’s coach pulled in, the oil managers stood waiting. Being a politician, the President waited on his coach till the attending press set-up ready at the compound gates. Now being filmed, he stepped down, greeted by Jimmy, Helen and me, and introduced to the site manager. He peered up at the tall derrick and the surrounding machinery, asking questions of capacity and timescales. Jimmy informed him that we would now sink another three wells nearby, and that the first crude should reach the refinement plant near Mombassa in a week or two.

It was all great news to the Kenyans, and I’m sure they figured their economy would be significantly boosted by this small find. Still, Jimmy suggested that they would be boosted by a hundred million a year to start with. The Energy Minister

handed Jimmy a document, Jimmy later explaining that it gave us the right to sink a well wherever we damn well pleased, even on the front lawn of the Presidential Palace.

We drove back to Mawlini behind the President, a quick tour made of the base, people introduced, the Rifles turning out in force and being inspected from the back of a jeep. He took time to stop and talk to the British military instructors before inspecting the education block and its complement of British teachers. At the UN hotel the Somali Government were waiting in the rooftop bar, the Kenyan delegation led that way. The two groups greeted each other, tables and fanta shades arranged, cold drinks of fruit juice dispensed.

The reason for the meeting was simple: could Somali crude from across the border travel down Kenyan roads to Mombassa and be refined, the petrol returning to Somalia. A document was signed, the Kenyans obviously better off from the deal. A second document was duly signed, on training co-operation between the Kenya Rifles and their Somali counterparts. That concluded the President's visit. Little more than thirty minutes after his plane had climbed over the rooftop bar, a second Dash landed, this time bringing Han and a Chinese delegation. We met in the restaurant downstairs, the room affording us some token privacy.

Jimmy laid out a map for us to study. With a finger in Mawlini, we discussed the oil capacities and reserves, the same for the Chinese run oil well across the border. The aim was simple, and a direct parallel to the Congo: oil to be used locally to aid the ore extraction and transportation process. Revenue from the crude sales would also be used to improve roads, consideration given to a rail track across Somali and to the coast, the shortest route. Jimmy then tapped the map, the northern region of the DRC, where a great deal of oil could be found. The problem was one of distance. We even considered shipping it across Southern Sudan, where they already had a good oil infrastructure.

Han explained that the Chinese would visit the oil well across the border, and that they would then fly over the region and onto the Congo to study the roads north from Forward Base towards the mentioned oil fields. After insisting that he greet Shelly, Han flew off. With news of the oil strike settling in people's mind,

several senior staff came and cheekily asked for extra bits and pieces, “fuck right off” used a few times.

The next morning, Tubby flew us down to the safari lodge. I sat right seat most of the way, needing the practise, whilst looking out for ash clouds from nearby volcanoes. At the main lodge we booked in, Shelly introduced to some very small Cheetah cubs, but she just pulled their fluffy manes sharply. We gave the cubs a respite after five minutes. I carried my daughter to the roof and showed her the views. Turning, I met Katie Joe and her mum.

‘Jean. Katie,’ I stumbled. Jean took Shelly. ‘You, er, here with the fiancé?’

She showed me her hand, and ring finger. ‘We did a quicky on holiday in Bali, save the fuss. You need to read the papers more.’

Helen stepped up and gave Katie a big hug, inspecting the ring and chatting. I slipped away and found Jimmy and Big Paul in bar.

‘Katie Joe and her mum are upstairs,’ I reported, lifting my eyebrows.

‘She’s fine, nothing to worry about. Like I said, she’ll sing at your wedding next week.’

I sat, frowning hard. ‘Next ... week?’ Big Paul laughed.

‘Helen will suggest it tomorrow, *don’t* ... disappoint her!’

I shrugged and held my hands wide. ‘What about the planning? The guests?’

‘Will be flown down, relax.’

‘We haven’t bought rings!’ I whispered.

Jimmy handed over two gold rings in a translucent packet, already engraved. ‘It would be *wise* to make it believe that you organised the rings and their engravings.’

I pocketed the rings, and blew out. ‘Bloody hell.’

‘There are a lot of people packed and ready, so don’t disappoint them.’

‘Pipe and slippers next, mate,’ Big Paul helpfully mentioned.

I stared out over the savannah. ‘Oh, well.’

‘That’s the spirit,’ Jimmy encouraged. ‘But, you know, be a bit more enthusiastic with Helen, she has a hell of right hook.’

I downed a beer before taking a walk around the lodge, bravely climbing the stairs to Helen and Katie, a false smile

offered. I met Katie's husband, an executive that worked for us at Pineapple. Grabbing beers, we walked to a quiet spot.

'So, how's married life?' I asked him.

'Fine, apart from her travel. I have some responsibilities for her concerts, so I go on some of the trips.'

'Where you living?'

'Wimbledon, nice big house my parents left me. At today's prices it would be over a million.'

'Much of a commute in?'

'No, I hop on the tube.'

'I used to do that every day, working at McKinleys, me and Jimmy.'

'You've come a long way. And now oil in Kenya. Will that boost their economy?'

'Not by much, it's not a major find. But it all helps.'

'I was reading somewhere that you account for twenty percent of *all* their tourism.'

'It's beaches and safaris, so not a massive industry.'

'Four hundred people a week here; we had a look at the large hotel. A bit busy for us, this place is just about right.'

'Jean any better in the heat?' I knowingly enquired.

He gave me a look, glancing over his shoulder. 'She suffers it to be with us.'

Jimmy walked out as we returned to their table. Sitting, Jimmy pulled Katie onto his lap. 'Mike, how much for an hour of fun with your wench?' Katie slapped his arm.

'I was about to say you couldn't afford her, but in your case... I'm sure you could.'

Jimmy faced Jean. 'You any better in the heat?'

'I have cold showers a few times a day,' Jean admitted.

The next day we organised a combined safari-picnic, a table of food pitched on a flat expanse in lion country, Shelly held on a firm leash and looking cute in her large hat, many photographs taken.

Back at the lodge, and with Shelly asleep, Helen and I lay on the bed, both tired from the heat. 'Why don't we get married down here?' Helen asked.

'OK.'

She took a moment, then lifted up onto an elbow. 'I mean, here this week.'

‘Oh, you ... er ... must have read my mind.’ I produced the rings.

She stared at them. ‘Did Jimmy tell you I’d suggest it here?’

‘Jimmy? What the fuck does he know about anything, eh? It’s not like there’s five hundred people at check-in as we speak.’

‘What!’ she whispered with a smile.

‘Golf complex, five days, wedding of Mister and Mrs Holton. RSVP.’

‘My god, he’s invited them all?’

‘No, he’s waiting for us two to decide if we want to tie the knot down here. Then ... he’ll invite them all down, all five hundred of them.’

‘Well I ... want to ... if you want to.’

‘I do. And ... *I do*. And apparently, Katie is supposed to sing.’

Two hours later, with the rooftop bar full of guests sat eating – and swiping away flies, I stood on my chair. ‘Ladies and gentlemen, your attention please, we have an announcement to make. After putting up living with me, and the pains of childbirth, my long suffering fiancé, Helen, has finally agreed to marry me, at the golf complex in five days time.’

The groups cheered and applauded sedately, a camera flashing. I eased back down to find a reporter and photographer closing in, many snaps taken, quotes written down; Jimmy had organised them. A few people wandered past to offer their congratulations, Jimmy organising free champagne for each table. Right on queue, Katie offered to sing at the ceremony, and afterwards at the reception.

At Mapley, our communications office launched a new computer program, invites issued to a great many people, faxes sent out. Jimmy had laid on two extra 747s, so no one should have a problem with tickets, sixty seats reserved for the press. Jimmy had also reserved all the rooms at the hotels in advance; it would be just the wedding party.

The next day we packed and headed off to Nairobi, a few suits to hire, a dress to find, Jimmy giving Helen a list of suitable shops. That evening we stayed at the usual Nairobi hotel, giving a TV interview about the wedding, and the oil – and odd mix. Arriving at the golf complex we found it empty and quiet, Pathfinders diligently searching each room, explosives sniffer dogs doing the rounds. We booked in, Katie Joe and her group

allocated rooms. Rudd and Cosy turned up and sat going through the small detail with Jimmy, Helen and I banned from knowing. The “M” Group from the house turned up that evening, Michelle in a separate room to Jimmy in case the press got hold of it.

Han flew in from the Congo the next day, along with our senior staff from the corporation and RF DRC. Coup arrived with his assistant to help out, followed by Mac and the Old Dogs, Hal and Hacker, Doc Hoskins and other senior staff. From the UK, Bob Davies, Doc Graham and Hildy arrived with all of the national RF liaisons, quite a crowd. Helen and I were told to stay in our rooms, even to eat there.

The next day was rehearsal day in the huge marquee, Jimmy organising with Sharon - over from the UK. We had already received a set of vows by Jimmy, short and to the point. Dressed casual, we attended the “walk-through”, an actual Bishop conducting both the real and practice services. Standing at the head of the seats, we turned and took in the vast marquee and its neat rows of empty seats.

‘That’s a lot of people,’ I said.

‘And TV cameras,’ Helen noted.

‘They’re not live, we have editorial rights – apparently,’ I explained.

‘Who’s in the front row?’

‘Politicians, apparently.’

‘Which ones?’ Helen puzzled.

‘It’s a surprise, but probably the Kenyan President or Prime Minister.’

Returning to the hotel, our ever-present security in tow, we spotted my parents and dragged them to a quiet corner for a ten-minute chat. Back in our suite, we closed the door on the bustle and sat with Cat and Shelly, ordering in lunch. When a knock came on the door, I found the British Prime Minister and his wife stood there. I held the door and invited them in, arranging chairs. They stayed and chatted for ten minutes, Shelly clambering all over them and pulling at their noses.

Jimmy popped in an hour later as we remained imprisoned in our suite, the three of us sitting on the balcony and observing the fuss below. Everything was sorted for the wedding the next day and the weather should hold, chances of a shower tonight. Then he asked if we were going to take a honeymoon. Neither of us

were that fussed, but Jimmy suggested the Seychelles, him and Michelle coming along with Big Paul and his family to act as babysitters. We took Jimmy's advice, Jimmy then firmly ordering me to move my stuff to another room; it would be bad luck to see Helen before the ceremony. Whinging about the superstition of that, I packed and moved, Katie Joe now assisting Helen with the dress. I found myself sat in a room by myself, my suit hung up, my shoes shined, the rings checked a dozen times. I watched a little TV, ordered food and drink, and sat staring at the wall a few times, Jimmy eventually returning.

'Nervous?' he asked.

'Bored,' I said. 'Stuck in here.'

'Soon be over, then you can call her "the misses" and she can call you "hubby".'

I don't remember much about the wedding, I think due to amount of alcohol I drank. What images I do have of it came from the video and from the very large photograph album.

Jimmy checked me over in the morning, since he was the self imposed Best Man. He led me down with an escort of Pathfinders in smart suits, maybe to stop me from running away. In the marquee, I walked down the isle with Jimmy, checking I still had the rings, and past almost five hundred people. I remember recognising a few of the faces. Stood waiting with Jimmy, I caught some of the people on the front row: the British Prime Minister, The Kenyan President, President Kimballa Jnr, my parents. I clocked the TV cameras, all three of them, then broke with tradition a bit as I watched Helen walk down the isle, Katie Joe singing from somewhere unseen; I'd never seen a lovelier sight.

I did, apparently, get the vows right, and did not drop the rings. I remembered the rice and confetti, my mum in a big hat, and what seemed like a million photographers on the grass. They snapped us at length, then with Jimmy and my parents, then the Prime Minister, the Kenyan Ministers. I saw Sykes and Jack at one point before standing with the Rescue Force staff, Sharon and her husband; we must have been there an hour. The reception was in the same marquee, tables brought in, Jimmy making a long speech, which saved me saying too much. After the meal, and the cake cutting, we did the rounds, meeting and

greeting everyone. And that process went on and on, and I drank more and more, not remembering being put to bed.

The next morning I felt a little rough, despite the blood, and Helen and I ordered in a huge breakfast, taking it easy. Jimmy knocked around noon, asking if we could do the rounds and thank people. There was, apparently, a mountain of gifts here, and back at the house, and Jimmy handed us a list of who gave what.

After a shower, and leaving Shelly with Cat, we patrolled the rooftop bar and thanked people. We found Po and his family, but I did not remember them from the wedding. Our gift from them was an apartment in Hong Kong. Hancock from RF Hong Kong was there, Ratchet, Spanner and Dunnow asking about having the wedding after the kid was born, and being suitably rude. We greeted a relaxed looking Prime Minister, thanking him for the gift, wandering down to the beach hotel to repeat the process, adding a third session at the second hotel.

That evening we packed our bags, leaving early from Mombassa for the Seychelles. Reality kind of kicked back in as we got there, and the next few days were quiet, plenty of time just spent lying around or swimming. Two bodyguards kept their distance, but besides that we rarely saw the others. Towards the end of the week we met up with them for meals, back to normality and starting to miss the work. And we when arrived back it was into a storm, a media storm.

Exposed

As anticipated, a former CIA officer went public and claimed that he had the story of the century: Jimmy Silo from England was a time traveller advising the White House. At the house, Sharon was behaving a little odd, saying little, everyone else making a joke of it in the presence of non “M” Group staff. Jimmy drove over to Mapley and to the communications centre, offering interviews to anyone who wanted them. The first interview was for the ABC network in America.

‘Mister Silo,’ they asked. ‘What do you make of these very strange claims by a former CIA agent?’

‘I think he read the script from my recent filming of a Star Trek episode, and persuaded a few idiots in the media to part with some money.’

‘Star Trek?’

‘A month ago I had a role on a Star Trek episode, playing an alien time traveller called Magico. Now some nut, or a reporter, thinks it’s real. Guess the guy must be from Los Angeles.’

‘Will you be taking legal action?’

‘I don’t know if I could, it’s not such a bad label really. If I could go back in time it would probably be to the 1970s, to the height of disco in New York. There’s also a few actresses I wouldn’t mind meeting before they were famous.’

‘And what of the claim that you advise the White House?’

‘Oh, if I could influence the White House I’d definitely force them to bring back disco.’

‘Any predictions for the future?’

‘I’m predicting that Art Johnson will finally get a bill through the Senate, but that he’ll be so surprised by it he spontaneously explodes, the carpet in the oval office needing to be sent out for a good clean.’

‘I don’t think anyone over here would believe such an outlandish prediction as Art Johnson getting a bill passed!’ the reporter joked.

Back at the house, the “M” Group met to discuss the event, Jimmy calm about it.

Keely informed us, ‘They’ve arrested the guy, possession of restricted materials, but are obviously saying that the stuff about Jimmy is a fake. Art Johnson made a joke of it, suggesting that he had been told that he would win a second term, and that everyone should vote for him.’

‘After 2005, exposure will be a problem, coming to a head around 2009,’ Jimmy explained.

There was nothing more that we could do other than wait, and judge the fallout. In the meantime, we decided to keep a low profile by organising a “time traveller’s ball” at the club, the Red Room hosting groups from the seventies. We even advertised it across the tabloids. The US tabloids ran the CIA story, and according to the White House our ratings actually went up, but

that was down to the wedding photographs more than anything else.

The following week came the second wave of attack, a claim that we had a hand in the deaths of four CIA agents in Kenya, Potomo and his gang. This was more of a worry for me. But no sooner had those allegations surfaced, this time our lawyers in the States issuing writs, than the Tanzania Government issued details of Potomo and his mates being involved in child sex trafficking. A former CIA agent, working in Africa at the time, then came forwards in the States and made the same claim about Potomo, very damaging for the CIA – and Art Johnson. They both got the same message at the same time: if they threw mud, we'd throw some right back.

A few people actually believed that Jimmy had killed the men for their child sex activities, especially around Africa. And they applauded him for it. In an odd move of solidarity, the French Government said that it had investigated Potomo's links to child sex rings in Africa many years earlier. Everyone forgot the claims about us, the story overshadowed by the sex allegations, Art Johnson on the defensive.

In the office the next day, Sharon asked Jimmy if he would kill men involved in such a child sex ring. He answered "yes" without any hesitation, Sharon not commenting further, just getting on with her work. A kind of normality returned, but Sharon had changed a little. She was not stupid, she had run the office a long time and she could see the power Jimmy wielded, strange at the best of times, downright weird the rest of the time. Then a home grown problem surfaced, one that angered me greatly.

A local family had written to us many times, but our mail was intercepted and checked for bombs, further checked for junk mail – so we did not see the junk mail; begging letters would never get to us. This family had, apparently, written to us about their little girl without any luck. Now they had gone public, claiming that we had ignored their letters and would let their daughter die. The local papers ran the story, then the local Welsh TV station, Jimmy issuing writs against them all for damages. The tabloids picked up the story, but were careful how they worded it, staying just inside the line. Jimmy drove up to London straight away and gave an interview to the BBC, which started bad and got worse.

‘Mister Silo, why have you ignored this families plight?’

‘You should have checked very carefully with you legal department before asking me that question, I will be suing the BBC for damages.’

The interviewer blinked, before composing himself and touching his earpiece.

Jimmy continued, ‘Let me make something clear to you: I have given more than a million pounds to the children’s hospital in Cardiff. If they wish to pass a hundred and thirty-two thousand onto this family then that’s their choice – they know more about the case than I do. And *no one* in this country has given more to charity than me. Those white helicopters you see flying around, they’re all paid for out of my back pocket, millions each year. I will not be told where I should spend my money, nor will I get involved in individual cases.’ He said to the interviewer, ‘In the UK’s top five hundred richest people – where do I sit?’

The man said he did not know. ‘I’m at three hundred and sixty. So why are you trying to harm my reputation when there are three hundred richer people above me?’

The interview was cut short, a minute of static screen before the normal news programme continued, and as if nothing had happened. Our solicitors had the writ against the BBC ready in record time and handed in. The next day the tabloids were full of the story, a debate about whether we should or should not help the family. And it dragged on and on, the family getting plenty of coverage, and plenty of sympathy. After all, why did we not just give them the money? Jimmy dug his heels in, challenging the family to a live televised debate, a very odd move, and one that I objected to – very loudly.

Jimmy went live in a Cardiff studio, the interviewer careful in his choice of words. ‘Mister Silovich, you’ve volunteered to be here today, and to discuss this matter with the Lewis family. May I ask, first of all, how much you have given to the children’s hospital in Cardiff?’

‘Including Medical Genetics, more than a million pounds.’

‘And no stipulation on how that should be spent?’

‘None, it’s up to them. I have, today, spoken to the children’s hospital, and they say that the Lewis family were advised that their daughter’s condition was not operable – and that they

would not fund further operations. That's the NHS speaking for the taxpayers of this country, and it's their choice, not mine.'

'Mrs Lewis, why do think Mister Silovich should pay for you child's operation, when the NHS says a further operation is pointless?'

'We've spoken to a French surgical team, and they think there's hope for our Lucy, and we'll not give up on her.'

'But why pursue Mister Silovich?'

'He's very rich, and always giving money to charity, but charity begins at home, here in Wales, not in Africa.'

Sat at the house watching the TV, I eased up. 'Fucker!' I cursed at Jimmy. 'He knew.'

Jimmy reached into his pocket, and produced a cheque. 'This is a cheque for two hundred thousand pounds. If I spent this in Africa, on vaccinations, I could save one life with every two pounds I spend: a vaccine is just two pounds. So that could be a hundred thousand African babies saved, or your daughter – who the doctors tell me will never lead a normal life. What *do you* ... think I should so with it?'

'Well ... I think you should spend it in Wales.'

'Are Welsh babies more important than African babies?' Jimmy asked the woman.

'Well, aye, because they're closer like, family like.'

'And does the fact that I come from Wales mean that I should spend my money here before Africa?'

'Well ... yes.'

'Is that because babies in Africa are black?' Jimmy asked her directly. I was on my feet again. She did not answer. 'Is it not true that you have a conviction for a racially motivated slander of your *black* African neighbours?'

The woman did not answer, the programme cut. When Jimmy returned I shouted at him, wanting to know just what the fuck he was doing.

He calmly answered, 'That's just the first of many. In the future people will sue us for not helping their particular charities or kids. And if we did, we'd have to help them all, bankrupting ourselves.'

The next morning I drove out early and grabbed all the papers, sat reading them with Helen over breakfast. For the most part the

coverage was balanced in our favour, several tabloids displaying a set of weighing scales: African babies versus one white baby. Many ran with the woman's racist tendencies and our African work, but some were still critical of us, which angered me greatly.

When the phone went, it was Oliver Standish from Los Angeles. 'Paul, Oliver, I couldn't reach Jimmy.'

'What's up?'

'What's up? Fucking media going crazy over here.'

'About what?'

'The interview Jimmy gave, that cheque and the woman.'

'Shit. What they saying?'

'They loved it! Huge debate, you got more air-minutes than anything else, some news slots gave you fifteen minutes out of thirty. There's no one over here that wouldn't recognise Jimmy now. You got more coverage than the President, you shadowed his latest speech.'

'I'll let Jimmy know, thanks.'

It was a strange turn. We put the TV on and found CNN, sat watching for half an hour before Cat turned up.

I found Jimmy in the office. 'You seen the American news?'

'Yes,' he calmly replied. He lifted a fax for me to read.

'The African Union ... wants to vote on making you ... a Hero of Africa recipient.' I lowered it. 'Well, at least someone appreciates us.'

Sharon lifted her head from a file. 'They've name a school after him in Kenya.'

Jimmy stood, 'Pack a bag. States. Sharon, tickets for today please.'

When we touched down at JFK it was getting dark, Oliver arranging security and a van. We slipped out of the airport unmolested by the press, but went straight around to a TV studio; they had been nagging Oliver all day. In a cheeky move, they wanted to put us on live instead of our employee, ex-President Harvey. Jimmy insisted that the three of us go on together and, after the make-up chair, we all walked out together and received a warm welcome from the audience, making me wonder if we shouldn't live over here.

The interviewer began with, 'So, Paul, how come ex-President Harvey was not invited to the wedding?'

'He was,' I said. 'So long as he ditched the security.'

'I couldn't make the date anyway,' Harvey put in with a smile.

'It was a spur of the moment thing?' the interviewer asked.

'Yes, we decided when we were over there, then invited who we could.'

'Now, Jimmy, these crazy claims by a former CIA agent.'

Harvey cut in, 'I was President when the agents went missing, and Jimmy was never a candidate. First I knew about this ... was this week.'

'And now you work for Jimmy's foundation,' the interviewer stated. 'Did the White House check-out Jimmy before you accepted that post.'

'Of course they did, and these allegations are ridiculous. Jimmy is all about saving lives and helping people.'

The interviewer asked Jimmy, with a smile, 'And the time travel stuff? Could you demonstrate that for us in the studio tonight?'

'Sure. You're going to be discovered in a hot tub with two young sisters...'

The audience laughed, the interviewer biting his bottom lip and holding up crossed fingers. The interview said, 'I agree about the 1970s and disco in New York.'

'Hey, I was there!' Harvey said with a smile. 'Great era.'

'And this woman in England giving you all the grief, how did that come about?'

'All rich people and celebs receive letters asking for money, you can't avoid it. If you give to one, you'll never hear the end of it. So I give money to the hospitals and they decide how it should be spent. But this one woman, with convictions for racism, went to the press and pretended that her sick daughter was somehow my fault. But she picked me because I give a lot to Africa, and she hates Africans.'

'What percentage do you give away?'

'Close to ninety-five percent,' Jimmy answered.

'Wow,' the interviewer said. 'You put the rest of us to shame.'

‘Charity is individual. No one should be pressured into choosing how they spend their money.’

‘And you give money to the Veterans Association over here.’

‘Yes, a couple of million to the Vietnam Vets, it’s a subject close to my heart.’

‘How so?’

‘I feel they got a raw deal from the American people.’ He wagged a finger. ‘Soldiers don’t make wars - politicians make wars. The way they were treated after Vietnam is a national shame, and one you still haven’t sorted. You sent them over there, then criticised them when they came back. And how many ended up living on the streets? And how many are still on the streets?’

‘You don’t think the government did enough for them?’

‘No, you need a day when Vietnam Vets could march and be cheered. They didn’t start that war, and they shouldn’t live with the damn guilt. And what message are you sending to today’s troops? Get involved with a war that the folks back home don’t like – you get shunned when you return? Not a very good recruitment poster, is it.’

‘It’s a deep subject, and one that we’ll be wrestling with for some time yet I suspect. Let’s talk about Africa and your work there. What’s your take on the problems in Africa?’

‘There’s only one thing you need to keep in mind: Africa has enough minerals, and enough oil, to make it the world’s richest continent. All it needs is a helping hand. But at the moment, some mining corporations favour the conflicts in Africa because they can mine the ores cheaply. The western world has been raping Africa for a long time, but I’ve put a stop to that. My corporation in the Congo produces a billion dollars a year, and it all goes back into local infrastructure: roads, schools, and orphanages. I take nothing out.’

‘Are you entitled to take that money?’

‘Yes, that’s the agreement I have with the Congo Government. That’s my money.’

‘You leave a billion dollars a year ... for local projects, and you could pay yourself that?’

Harvey said, ‘That’s just the Congo. His other projects in other countries are the same: all the profits stay local.’

‘We just discovered oil in Kenya,’ I put in. ‘The revenue will go towards road projects to start with.’

‘And the money from the very successful hotels and safari parks you run?’

‘It all stays in Kenya,’ I said. ‘We don’t take a penny out.’

‘And how many kids do you now have in orphanages?’

‘Over thirty thousand,’ Jimmy answered.

‘Thirty ... thousand ... kids? What’s it like trying to get them to brush their teeth and get to bed?’ The audience laughed.

‘We have a loudspeaker system,’ I suggested.

The interviewer pointed at Harvey, covering his mouth in pretend secrecy. ‘Is he a good worker?’

‘His expenses come in late,’ Jimmy said.

‘And his secretary, Sharon, shouts at me,’ Harvey said with a smile.

‘So, Jimmy, how did you feel when you hired a new secretary, and Paul here makes her pregnant - then marries her?’

‘I gave him a written warning, and told him not to do it again.’

The interviewer faced me. ‘You got the boss’s secretary pregnant!’

‘It was a wet Monday, nothing on the TV,’ I said with a shrug, the audience laughing.

‘And your wife is still Jimmy’s secretary, going on business trips with you. How does that work? I mean, if Jimmy shouts at your wife?’

‘He wouldn’t, she has a mean right hook.’ The audience laughed. ‘But seriously, we all work hard and believe in what we’re doing, so there’s no egos or conflicts. The fight is out there, not at home or in the office.’

The next day our ratings were excellent; we could have got elected to Congress. We toured the Pineapple offices, meeting a number of very freaky singers with tattoos, catching an evening flight out.

In the mini-bus, driving down the motorway at 9am, Jimmy said, ‘I’ve been thinking about something. We’ll need the Republicans on board, helping to counterbalance the next US President and, in years to come, super-sized corporations are the norm – even necessary and a good thing. So ... so if we built up

a company around the Congo corporation, tied in Kenya, Somalia and others like Sierra Leone, it would be huge.'

'And very influential?'

'Yes, the bigger the better for influence in the States.'

'Why the change in strategy?' I probed.

'Well,' he sighed. 'There has to be an easier way of handling the next problem, a hard line US president, invasion of Afghanistan, clashes with us. But that I can deal with. What I've been thinking about is 2025. What we've been doing in Central Africa provides a counter-balance to the Brotherhood. But ... but what if they could do more than just sit and take it?'

'How? It'll take decades just to get the Congo sorted.'

'Decades with plan "A",' Jimmy emphasised. 'But if the process could be accelerated...'

'They'd be well positioned to fend off the Brotherhood,' I noted.

'And what if they went further?'

'Further? Attacking north?' I gave it some thought. 'Would save the West having to get involved in the southern regions of the Middle East, or North Africa.'

'The West could hold the Northern Mediterranean. That would save them half a million troops.'

'So how would you change your plans?'

'I'd have to speed up the development of Africa, whilst tying in the Americans. But, if we created a super corporation - involved in mining and oil - it would extract more oil and ore, more money for the governments of Africa, but less money for us - we'd have to pay out dividends. Our cut would go on roads and schools, as now, the money paid to the various local governments probably being squandered.'

'Ending up in Swiss banks.'

'Then we'd have to sell no more than forty percent of the stock, getting a few other companies tied in. But I'd like a lot of other companies tied in, especially American.'

'What about what we did with the property company?' I posed.

'Not sure we could do that for oil and ore, I'd have to check.' He lifted his phone. 'Sharon? I want a meeting later today at the house: solicitor, accountant. And ask the solicitor to find a few

experts on the oil and ore industry, plus a solicitor expert in international company law.'

In the house, I found Shelly asleep and Cat sat reading a novel. After a quick shower and change I joined Jimmy in the office, a mountain of paperwork to go through.

At the big meeting, at 3pm, Jimmy began. 'I want to start a new company in Africa, involved in oil and ore, and tying in a large number of investors, but ... but we wish to retain full control, never losing it. We also want a structure that is *acceptable* to overseas investors.'

'What's wrong with a majority share of a Plc?' they asked.

'We could lose control some day,' I countered.

Everything pointed towards a Plc, an international listing, as the best way to get many companies involved, but there was the risk that the biggest block could take over. The solution seemed to be the sale of non-voting stock on the open markets; but that would simply raise money at the outset. We wanted a dozen large corporations tied in.

They debated the issue for fifteen minutes, agreeing that a floatation would be better offered later, than sooner. The main purpose was to tie in US companies, but we could not label it as that. We also wanted the maximum cash for infrastructure projects.

After much scribbling on a notepad, Jimmy said, 'How about this: we create a limited company for now, with us retaining twenty percent, our Hong Kong associates fifteen percent, our Russian associates ten percent, five percent to the UK Government and the rest available to be sold by us at convenient times, principally to those US companies that we wish to tie in. That means that we would always have the largest influential block, twenty percent. I would then *sell* blocks to those US and European firms we wanted involved.'

Our solicitor cautioned, 'You may be criticised if the Congo corporation *allocates* concessions to your own company.'

'Our cut goes to charity, so I think we'll be OK,' Jimmy suggested. 'OK, gentlemen, you have a go. Take that company we created to mine the Kenyan oil and restructure it. Start recruiting, I want a management structure quickly, experts in oil and minerals. Find us some London offices, plenty of room for

growth. I want a major pow-wow in four weeks, I'll organise the investors.'

We sent them off rubbing their hands and salivating. Jimmy informed Han and Ivan, asking them for discreet investment. We called Pedersen and informed him of the planned launch, asking him to arrange a meeting in Washington in five weeks time, but only of Republican Senators or Congressman, making it his deal, and his deal alone.

Four weeks later we held the big pow-wow in London, in the bare offices rented for the new company, a Chief Executive and management team hired, very highly paid for a company with no furniture save a few seats. They understood it would grow quickly, our reputation enough to make them keenly interested in working for us. The UK Government sent down a man from The Treasury and we gave them five percent of the shares. Yuri and Marko transferred a hundred million pounds, to make the deal look respectable, Po's company paying in two hundred million pounds, the money all ours technically. We made a director's loan of it back into the company. The Russians sent two members of staff, so too the Chinese, Jimmy asking the new CEO that he open a small office in Moscow, one in Beijing, and one in Washington within six weeks. As for Kenya and the Congo, Jimmy wanted offices inside of two weeks, the recruitment target for the Congo being a hundred staff in two months, our facilitators down there helping out.

The new gang posed for the press, the launch of CAR, Central Africa Resources Ltd. The floatation to the public was delayed, many keenly awaiting it, not least McKinleys, who would handle any floatation.

We flew over the Atlantic to the second part of the meeting, the important part, a week later, meeting Pedersen in Washington, Art Johnson most keen for a meeting with us afterwards. Pedersen had been belle of the ball, holding the invites to the meeting. I think a little horse-trading had gone on. Either that, or large herds of horses were being traded. He had assembled thirty men, including twelve senators, ten congressmen, and a few friends. Jimmy, Helen and I greeted the group, re-acquainting ourselves with Ted; the oilman with a loud wife and big hair.

After fifteen minutes of polite chitchat, Jimmy called order. ‘Gentlemen, *and* politicians.’ They laughed. ‘You’re here today because I have a long-standing relationship with Chuck Pedersen, and he assures me that you are the right people for this deal. This new venture that we’ve started, will capitalise on one fact: the Africans love me.’ They laughed again. ‘And they like to give me oil and ore concessions, already worth a lot of money.’

‘Now, this small company will grow very quickly, not least because I get to say who drills in the Congo. This is about being in on the ground floor, in at the start. But it’s not money we’re looking for, so much as partnerships with companies that can bring something to the table. We will not, initially, sell to individuals, only to oil or ore companies. We will then look to allocate those companies concessions whilst the main company is being built up. And, when we have a good working relationship with those companies, there is the matter of other concessions around Africa, maybe Cuba and other places.’

They asked questions, and Jimmy expanded upon a few things, but the premise was simple. And they knew we held the concessions. Jimmy singled out Ted’s firm first and offered five percent of the shares for a hundred million dollars, a bargain, a handshake given. Two other companies were called out, the same deal offered. That left those smaller companies that wished to be a part of the deal, two signing up for three and two percent accordingly. A brash Senator, with a family mining interest, then bought ten percent for two hundred million dollars. That left twenty percent, Jimmy asking the men to talk to their boards. Pedersen brought out the champagne and we spoke of Africa, and Art Johnson’s chances of getting a bill passed.

From our hotel on Massachusetts Ave, the blacked out vans whisked around to the White House, a familiar journey, but the first for Helen. The Chief of Staff welcomed us again.

‘How’re our ratings?’ I asked him, the man expecting just that line.

‘We’re just hoping your not running for office.’

Art Johnson stepped in a minute later, greeting Helen and asking about the wedding, and Shelly. He cheekily asked for a photograph, and we posed together, the four of us. Sat on the sofas, he began with, ‘So, how goes the new corporation?’

‘Sold most of the stock,’ Jimmy informed him.

‘And ... in years to come...?’

‘The corporation will have a great deal of influence in many places,’ Jimmy informed him. ‘And before you ask, yes ... we are trying to influence US lawmakers, in particular Republican ones.’

‘You’ve taken over a newspaper as well,’ Johnson noted.

‘First of many,’ Jimmy told him. ‘You see, the problem is this: we could tell you what the future holds, and how to fix it, or we can try and fix it ourselves knowing all the while that you won’t listen to us.’

‘I listen, and I act,’ Johnson insisted.

‘You, sir, are not the problem,’ Jimmy suggested. ‘Those that follow you ... are the problem.’

‘Hence you bedding the Republicans.’

‘It was just oral,’ I put in, getting a look from Helen.

‘There are a great many unhappy people around here for the attacks on the CIA,’ Johnson broached.

‘Wait till I get going,’ Jimmy threatened. ‘They mess with us, we’ll mess with them, it’s as simple as that. You push, we push back.’

‘Which is odd really, since we’re here to help save your arses,’ I put in.

‘The Government, and Washington, is an octopus with many legs,’ Johnson tried to explain away. ‘Hence my *inability* to get bills passed.’

Jimmy asked to see the head of the Joint Chiefs if possible. Ten minutes later the Admiral stepped in and sat.

Jimmy began, ‘I was thinking the other day, about 2025. What if ... a sub-Saharan African army did more than just hold its own against the Brotherhood.’

‘More ... how?’

‘Taking North Africa west of Suez ... and holding it,’ Jimmy suggested, the Admiral shocked.

‘Take and hold that entire region?’

‘Its sparsely populated, wide open spaces that are easy to cut lines into, and hold,’ Jimmy suggested. ‘Think about it. In the meantime, I’m going to proceed on the assumption that it’s a good idea, at the very least an extra piece on the chessboard. If sub-Saharan troops take North Africa, it will free up a lot of soldiers from other nations.’

‘It would,’ the Admiral admitted, a glance at Johnson. ‘And if that army was big enough, a footprint around Yemen and Oman would box-in the insurgents.’

‘First I have to develop the Congo, then raise the army,’ Jimmy said. ‘Hence my new corporation.’ He faced Johnson. ‘We’re going to ramp things up a bit. So anything you can do to help industrial development in the region will help.’

Back in the UK, Jimmy went into overdrive, keen to get the new company pushed along. First thing in the morning, last thing at night, he could be found in the office making plans; it was consuming him. And for at least four hours of the day I was helping with those plans.

Through the DRC corporation we allocated ourselves concessions, then appointed companies within the group to mine the areas or sink oil wells. Pedersen, and Ted the oil man, were granted oil-drilling rights to an area in Northern Congo straight away, a Chinese firm allocated oil rights near the existing finds south of Forward Base. APAC, the mining company taken over by Yuri and backed by the Russian Government, were granted wider areas under license. By using proxy companies we received a fraction of the revenue, but at least the areas were being developed; in order to reach the areas in questions the licensed companies would have to improve the roads. There was also the corporation’s rule on local development, each concession meaning a certain number of schools or hospitals had to be built. Our existing corporation itself also made more money; CAR Ltd would be paying its taxes, split with Kinshasa.

With the first international airport nowhere nearing completion, we took the odd move of commissioning five regional airports from the same French company, some of the budget for road projects allocated towards them.

Po came over for a business meeting with his partners, meeting us at the club in London, in the computer room. We had a shopping list: fertilizer, seeds, agricultural tools, cheap second hand cars and motorbikes, radios, TVs and a long list of cheap household items. In return, we’d offer oil or mining concessions. Po’s family were already shipping ore, and had a part-stake in a mining concern in Papua New Guinea. They agreed to increase the stake, after which they would be receiving a mining

concession in the Congo or Somalia. They also got a gentle nudge towards getting their own small oil exploration and drilling company, easy enough considering that the Chinese Government would loan them whatever they wanted.

Reading from a long list, we ordered goods from Po's family, everything from detergent and clothes pegs, to plastic sheeting and buckets, blankets and umbrellas, many villages in the Congo having next to nothing. They gave us a good deal on radios, and we bought a hundred thousand of them, Forward Base now offering its own radio station. The buckets filled with goodies were always popular around Africa, many a housewife happy to find one dumped on her doorstep overnight.

After the business was over, and we were sat around chatting, Jimmy mentioned that we would open another three orphanages in the Congo, each with a capacity for ten thousand children. We were not just trying to be kind and helpful, we were recruiting the soldiers of the future.

After the meeting, and before joining them later for food, we drove around to the Foreign Office to meet Sykes and the PM. We explained the ramp up, and the reasons why, then asked for more help in the Congo, a few more facilitators working on the projects, offering to get British goods into the region when it expands. Jimmy asked for cattle farmers, rather "cattle farming tutors", and help with hydroelectric projects. The PM was happy to help, not least because the UK taxpayer had a five percent share.

Tsunami

One sunny September day, sat in Bob Davies' office in Mapley, Crusty the earthquake man suggested that we look at the tsunami warning system.

'What's that?' Jimmy asked, pretending he didn't know.

'It's a warning system in the Pacific, early warning of tidal waves. Where there's an oceanic or coastal earthquake there can be a tidal wave.'

‘We have units in Sumatra, India and Sri Lanka, so why not set-up a system there, and test it,’ Jimmy suggested. ‘We’re not in the Pacific yet.’

‘I’ll put together some ideas,’ Crusty suggested. ‘What ... er... what budget would I have?’

‘What would it cost?’ I asked.

‘Well, to set-up a software warning system is easy enough, just the staff to load the details,’ Crusty explained. ‘Then, like here, when there’s an earthquake we send out emails and faxes to every coastal region, local government, TV and radio, hotels and schools. There’s also the question of an air-raid siren type of warning system.’

‘That sounds expensive,’ I said. ‘Stringing out sirens around a thousand miles of coastline.

‘How about just towns and villagers, or put them on the roofs of police stations and hospitals,’ Crusty added.

Jimmy nodded. ‘As for the first part, go ahead and get involved, running the operation out of here, couple of staff local to each country loading the database – after their governments agree to it. Then, lets think about an education process, TV campaigns, so that people know what we’re talking about. Arrange some wandering tutors to go to each school and give a talk. Then, starting with Sumatra, sirens on police stations to start with. Bob, give him a good budget. Oh, what’s that island north of New Zealand that gets a lot of earthquakes?’

‘Samoa?’ Crusty asked.

‘Yeah, them. Bob, start a small unit there, twenty people, plus part-timers.’

‘New Zealand sent us a letter,’ Bob Explained. ‘They want their own unit, jealous of the Aussies.’

‘Fine, get someone on it, but see how much funding they’re willing to put in,’ Jimmy said. He turned his gaze toward me. ‘Get Helen to fix us a trip, New Zealand and Samoa, around Christmas, we’ll do Hong Kong afterwards.’

A long time after making friends with the President of Zimbabwe, and after numerous truckloads of medicines were “misplaced”, and with us having a growing reputation around Africa, the Zimbabwe authorities finally offered us the tourist concession on Victoria Falls. We offered to fly down and meet at the famous falls, to hold a press conference and ceremony. We also offered to put pressure on the British Government to ease their punitive sanctions against Zimbabwe.

With the news of the concession making the headlines, we came in for some criticism from the UK press. In response, Jimmy pointed at the hardship that the people of Zimbabwe were suffering. We flew down to Nairobi, swapping flights for Lusaka, the capital of Zambia, for two reasons: first, to talk again with the Zambian Government about mining and development, and second to discuss the burgeoning Zambian Rifles. We also could not fly direct to Harare without upsetting a few in Downing Street.

Lusaka was not exactly the garden city of Southern Africa, a hot a dusty place with terrible traffic; it made Nairobi look civilised. We stayed the night in a reasonable hotel, only for rich “white folk” visiting, and met the Government in the morning, a polite two-hour talk about the Rifles and mining. They kindly provided us an escort after lunch, and we journeyed southwest to the tourist town of Livingstone, a few press vans in tow. Booked into a nice boutique lodge on the Zambian side of the border, we glimpsed the famous falls before sunset by helicopter.

The next morning we confirmed the arrangements with our contact in the Zimbabwean Government and crossed the border with a line of tourist coaches, across a bridge used for bungee jumping. Pulling into a large lodge in its own grounds, we were stopped by the Presidential security and checked, even frisked. We were, thankfully, machinegun free, and passed under a wooden arch and inside to the cool interior, meeting the manager of the lodge that we hoped to fill with tourists. Sat waiting in the bar was our host, surrounded by his cronies and a few army officers looking a bit warm in their thick tunics. Without standing to greet us, he waved us over and welcomed us, drinks ordered. He asked about Rescue Force, the orphanages and the Congo, and we made polite conversation. Getting down to

business, we explained that we were confident that we could boost numbers, on condition that most of the tourists book through our tour operators, those we used for Kenya. We would also offer split-location trips from Kenya and Tanzania. It was a done deal, the document signed and handed over, a promise of a quick progress from us, and a further meeting in a month from them.

What I did not realise at the time was that the Zimbabwean delegation had flown into Livingstone Airport, the only airport nearby. Or that for the past four years a team had been casing the joint, infiltrating it and bribing both technicians and refuelling truck operators – just in case either was needed. Now that team was in action, the President's plane the object of their interest. As we sat enjoying a cold beer, in the bar of the hotel we had stayed the night in, the President's plane lifted off and headed east towards Harare. If the doctored fuel had not caused the plane to falter, the small explosive device in the fuel tank would have.

Jimmy checked his watch. 'Be prepared for a mild shock, and don't react.'

'What?' I puzzled.

'I think the President's plane may have ... met some trouble.'

I eased upright, remembering what Jimmy had said about dispatching the guy. I just did not realise it would happen so soon, or in this manner. It was a mild shock, but at least we were on the Zambian side of the border. A reporter came and found us an hour later, asking us if we had heard, and would we like to comment.

Jimmy said, 'If his plane went down, it was probably tampered with.'

That was the only comment we were prepared to make, packing up quickly and being escorted back to Lusaka. At the airport we were besieged by the local press, Jimmy now holding a mini press conference in the concourse.

'Africa has lost a man who fought for the rights of blacks over white colonialists. If for nothing else, he deserves recognition for that. We don't know the cause of the crash yet, but I suspect that the plane may have been tampered with. The matter should be thoroughly investigated.'

Boarding a flight for Nairobi, I was glad when they shut the doors, even happier when we touched down safely in Kenya, air

disasters on my mind. Jimmy repeated the speech at Nairobi airport, the Pathfinders blanketing us and whisking us away to our hotel. That evening, the Zambian police would find two airport workers dead; they'd never talk about what they did. The Kenyan TV news was full of the story, some hint of blame aimed at London. But the one group they could not have blamed was us two, not after getting the tourist concession. In London, we exited the airport without being spotted, whisked away to a quiet lane near Windsor and a meeting with Sykes on the way home.

'I had kind of forgotten about him,' Sykes admitted. 'That was till his plane when chasing rabbits.'

'Faulty maintenance; can't get the parts with all the sanctions,' Jimmy suggested, Sykes shooting him a look.

'And what, pray tell, do you see as the future of Zimbabwe now?'

'I see myself helping to reform them as much as I've done in the Congo, starting with tourism, then mining. It will be a little unsettled over there for a few weeks, but should calm down. And his own people won't investigate the crash, they're damn glad he's gone.'

'Who'll take over?' Sykes asked.

'His Defence Minister. Followed by some political upheaval, and the MDC getting a foothold. Give it time. Oh, his Defence Minister may have had some links to the airport workers, so relax, no one blaming you. Well, no one who matters.'

'A well executed manoeuvre,' Sykes applauded. 'You're in the wrong trade.'

'My dear Mister Sykes, I've been in your trade – and better at it – since long before you were born. And talking of which, we need to think of British instructors training soldiers of the Northern Alliance in Afghanistan, as they did during the Russian occupation. We also need to smuggle some munitions in, some Mi24s.'

'Pakistan will notice, and the Russians would never co-operate.'

'Not normally, no. But it's me, remember, and the Russians owe me a few quid. So ask the PM. We've two years before the guy in the White House thinks about invading Afghanistan.'

'Will he?'

Jimmy forced a breath. 'I have enough dirt on him to wreck his career now, but we need him to screw up and help the next Democratic leader in. Problem is ... a war in Afghanistan; hard to avoid unless the Taliban take a kicking.'

'What will you do?' Sykes asked, Jimmy staring out of the window.

'Let's meet with the PM and go through the options, soon. You arrange it.'

Sykes stepped out, and into his own vehicle.

Getting home, I hugged Helen tightly before lifting Shelly up onto me as we sat. Very glad to be back, I didn't tell Helen what had happened – what we had done, but I wanted to. I wanted to tell someone what we had done; what Jimmy had done. He had downed a plane with thirty people on board, for the greater good. Somehow I could not see it. Fixing Zimbabwe was a small part of fixing Africa, which may or may not have had an effect on 2025.

It wasn't the first time we'd killed people, far from it. Potomo and his men had been a shock at the time, but we risked exposure, a direct threat to the mission. This was different. This was a detail in the corner of a page, no threat to us. I was mad at Jimmy, but needed to talk, and so went and sought out Jack, finding him in a lounge by himself.

'Got a minute?'

'Sure,' he said, putting down his file.

I eased back and took a breath. 'How do you feel ... about taking a life?'

'Not something I've ever been involved with, not directly. But, in the past few years, I have helped Jimmy to target some people – which I know disappeared.'

'Does it bother you?'

He studied me for a moment. 'Some, yes. If not, I'd be like Sykes. He could shoot someone without a second thought. So could Jimmy I reckon. They have ... a clarity of purpose that I lack.'

'You're on the team, a trusted member...' I posed.

'Well, yes. But if the question is ... could I kill someone that threatened the project, then I'd say *I hope so*. In some ways I feel very sorry for Jimmy, for all he's seen and been through. In other

ways, it has changed him – of course it has.’ He crossed his legs. ‘One evening, sat here, he told me about Canada after the war. I couldn’t have done it; I would have taken my own life. But he struggled through, knee deep in dead bodies every day, some he cared about. Considering what he went through – and we don’t know the half of it – he’s very well balanced and calm. And compassionate still.’

I stared out of the lounge door.

Jack added, ‘Paul, what would you do to save Shelly’s life?’

I stared back for a moment. ‘Anything.’

‘And if someone broke into you house with a knife?’

‘Yeah, I kill them, I don’t doubt that,’ I admitted.

‘And 2025, if Jimmy can’t get it sorted? How many people, Paul? How many would perish? What you feel for Shelly, he feels for us. And as for *Zimbabwe*, how many people died unnecessarily because of the idiots in power? How many will now live if Jimmy gets their economy turned around? How many has he already saved in Africa?’

‘I just wish ... that there was another way.’

‘There isn’t, and according to Jimmy it will get a lot worse in the years ahead. You have a great lifestyle and a perfect family, but I don’t envy you. We’re in a war, Paul, a real war. And the only thing that’s going to give your girl a chance of a future ... is the big guy ... and his *clarity of purpose*.’

A few days later the Zambian authorities pointed a finger towards the Zimbabwean Defence Minister; we were in the clear and I felt a little better, if only in the practical detail of not being blamed. We organised tourist flights direct between Nairobi and Livingstone and advertised them heavily through all of our usual outlets, subsidising tickets to members of the club, McKinleys, or investors in the businesses. The lodges on the Zimbabwean side of the Zambezi started to fill up. The former parliament speaker in Harare took over as interim president, elections called for within six months. In an unrelated move, at least I hoped it was unrelated, several high-ranking army officers were killed in car bombs, several others shot dead, something of a bloodletting.

With tourism at the front of our minds, Jimmy called in the owners and directors of African Express, the company we put

our Kenyan hotel business through. It was a lovely day when they arrived; Helen, Shelly and I sat having a picnic outside. We packed up and walked inside, Cat taking Shelly as we welcomed our guests and showed them to a lounge, two men and two women, a pair of husband and wife teams.

Jimmy began with, 'We're looking to increase our tourism footprint in Africa by quite a lot, and to subsidise a few flights. As such, we've toyed with the idea of creating our own travel company.' Their faces betrayed their fear and trepidation; we were their biggest customers by far. 'But before we look at that possibility, we thought we'd talk to you first. How do you feel about selling us some shares in your business?'

The husband and wife teams glanced at each other. 'How many shares?' a man asked.

'Fifty one percent,' Jimmy answered. 'That would give us control but, as with Pineapple, we would not get involved on a daily basis.'

'We'd ... be selling out,' the other man timidly stated.

'No, you'd be junior partners to us. And, out of respect for what you've already done to help us, we're making you this offer. Forty-nine percent of a very large amount is better than losing all of our business, because we're not going to put ourselves in the situation where we're dependent on you – without influence at board level. That's just being prudent.'

'What ... plans would you have for the company?' the first man asked.

'A massive increase in turnover; I want a thousand people a week heading south to Africa within a year, followed by increases year after year: Kenya, Gambia, Tanzania, and the Congo Rift Valley. I aim to hire two 747s every week and pack them out.'

'It's a good deal,' I encouraged. 'You get guaranteed throughput. And ... you get our overdraft facility to help with expansion. The alternate ... is that we work around you because we're certainly not going to subsidise flights – to help Africa – and have someone else benefit from it.'

Jimmy eased forwards. 'Fifty-one percent of your shares are worth only four hundred thousand pounds, we've checked; and without us - *a lot* less. We'll offer you a million for them, and

guaranteed employment for six years. We'll also leave you alone to get on with it, just monthly meetings.'

'Guys,' I said. 'There are distinct advantages to being partners with us pair of troublemakers.'

'You're not leaving us much choice,' they grumbled.

'Sometimes,' Jimmy began, 'the easiest, and best choices, are those that are made for you.'

They asked innocent questions for ten minutes, matters of practicality, before Jimmy suggested they take a walk around the grounds, insisting we'd need a decision today. In the end they had no choice, they would go bust if we switched our business away from them. Back inside, they agreed the deal, but they did not look pleased. The papers had already been drawn up, a man from our accountants down for the signing. He had been hidden away till now. We handed over two separate cheques, a third cheque for another million - a director's loan into the company, then asked them to open a small office at Forward Base, the DRC, as well as in Berlin and Moscow. Without me knowing about it, Jimmy had bought several lodges in the DRC, mostly around the rift valley and its unstable volcano. He now asked them to add the lodges to the advertising literature, flights into Forward Base for now. Totalling up the lodges, I realised they could handle five hundred people a week. With the Victoria Falls business, we would be moving a lot of bodies south, Jimmy explaining that direct flights from Russia would begin soon.

Other lodges in the DRC, now under consideration, totalled two thousand people, Jimmy explaining that our property business would be buying them. Rudd had also put in offers for two more lodges around the Serengeti and one more beach hotel, boosting Kenyan and Tanzanian tourism if we could fill them all.

After our visitors had departed, Jimmy grabbed Keely and myself for a chat. Sat in the lounge, he eased back and crossed his legs. 'As you know, the next US President is a handful - he'll want to go into Afghanistan, which is ... inevitable. I have a solution or two for dealing with Afghanistan, whether he goes in or not, but ... in an ideal world it would suit us better if he was *restrained*.'

'You said that you wanted the next guy in - and doing a bad job - to help the next Democrat,' Keely puzzled.

‘Yes, but ... but I’ve altered a few things in recent years. You see, there’s getting to 2025 in good shape, or ... there’s *getting ahead*.’

‘Like an African army not only holding its own, but fighting back,’ Keely noted. ‘Our best estimates say that Africa could not develop quick enough.’

‘You may be right,’ Jimmy admitted. ‘But it all helps.’

‘So what’s the question about the next guy?’ Keely pressed.

‘The question ... is one of *could we do better*? Could we do more than just bump heads and let him make mistakes.’

‘You have dirt on him,’ I put in.

‘You do?’ Keely asked. ‘How much?’

‘Enough to send him to prison for life,’ Jimmy said, his eyebrows lifted.

‘And screw up the US political system to boot, and our reputation abroad. You’d really have a serving US President arrested? Jesus, even the people that like you would turn against you!’

‘If it stops the war ... yes,’ Jimmy affirmed.

‘There has to be a middle road,’ Keely insisted. ‘Why not just hint you have the dirt?’

‘That could just piss him off,’ Jimmy suggested. ‘He may figure that *removing* me might help him.’

‘Then trip him up now, two years ahead of the next election,’ Keely suggested.

‘The alternative candidate is no better, and if I trip *him* up, we get an unknown. And *they* are very dangerous.’

Keely eased back, ‘Then ... you meet him after he’s nominated, *soon* after, and let him know that you know – but that you want to help him.’

‘A little horse trading,’ I suggested. ‘He’s a politician.’

‘And how would Art Johnson see that?’ Jimmy knowingly asked.

‘He’d not be happy, but you can channel money through the oil companies, Johnson may not link it,’ Keely suggested.

‘Perhaps,’ Jimmy agreed. ‘It all comes down to that meeting. I might just spook him, because he’s not “M” Group.’

‘What happens when he gets his Magestic briefing?’ Keely asked.

‘He freaks out, then tries to control me.’

‘The solution, would be to get him a Magestic briefing when he’s nominated,’ Keely suggested. ‘Beside, I don’t think Johnson will run.’

‘No?’ I asked.

‘No,’ Jimmy confirmed. ‘Why run, when I say he’ll lose.’

Jimmy suggested, ‘So Johnson can’t object to the briefing. Then you meet to this next guy and chat ... and squeeze his balls. At the end of the day the fella’s got no choice.’

‘If the CIA found out that I had blackmailed a US President?’ Jimmy posed, his hands wide.

‘They may try and use it against you, yes,’ Keely admitted. ‘And if it came out ... be bad for you. When you chat to the candidate, do so alone.’

‘Can I rely on your discretion, Mister Donnelly?’ Jimmy asked.

‘You tell me, you know what I do in the future.’

‘Still, I like to give people choices,’ Jimmy said with a smile. He reached into his pocket and pulled out a rough diamond the size of a large peanut. He handed it over. ‘Bury it somewhere, for when you retire.’

Chad

With Jimmy describing the upcoming conflict in Darfur, due to kick off next year, we called a meeting in Mapley with all of the senior staff, many up from Mawlini. After the usual hour of greetings, mock insults and chitchat, we settled into the lecture theatre, a slide of Central Africa displayed on a large white screen.

Jimmy began with, ‘Chad is suffering from a small Sudanese refugee problem, nothing serious at the moment, but the tensions in the Darfur region could increase the numbers. Chad is a very poor nation, and the border with Darfur is lawless to some extent. My sources tell me that the conflict in Sudan could escalate, and soon. I don’t have a strong desire to send our

people into Darfur, but we should *at least* set-up camps on the border and deal with the humanitarian fall out. After all, it's on our doorstep.'

Mac asked, 'Jimmy, we going in as Rescue Force ... or we going to fucking invade?'

'This is a humanitarian mission –'

'So was Somalia to start with,' Mac pointed out. 'And we invaded!'

'Sudan is not Somalia; they have a large and efficient army, an air force, and close links to my Chinese friends. So no ... no military aspect to this. And as for Somalia, look how that turned out.'

Mac pressed, 'We providing security for our people?'

'If it becomes necessary; then yes, of course. Bob, put together a team, send someone to Chad and ask for permission to operate along their border, make a security assessment. If the Rifles are necessary, ask for permission to use them, get the Kenyan Government involved. I'll talk with the Sudanese via my Chinese friends to see about permission to operate *inside* their border. In the meantime, let's start collecting all the information we have on the border region and the troubles inside. Mac, find us a base with a runway nearby, maybe even inside Darfur.'

'A base inside the border?' Bob questioned. 'Will we be in the thick of the fighting?'

'We've operated in war zones before,' Jimmy pointed out. 'But here, we'd have bases on the Chad border, popping over for humanitarian and rescue missions.'

'What about the Southern Sudan authorities?' Coup asked.

'Yes, contact them and ask is we can put teams on their border with Darfur.'

'When?' Coup questioned.

'Straight away,' Jimmy said. 'We need information, eyes-on information.'

'If the Chinese are dealing with the Sudanese Government, could they not spearhead this?' Coup asked.

'They will have a role because, as you said, the Khartoum Government won't want to upset them. Now, let's take a break and make some calls. Bob, call you old contacts and get an opinion on the situation. Mac, Coup, find out what you can about

the region and bases, talk to the Red Cross and others. Let's meet back here in thirty minutes and make some plans.'

With the gang on the phones, we toured the base and met members of the Supplemental Group, sitting in the pilot's lounge as they diligently awaited an emergency somewhere on the UK's motorways.

'So, what you up to?' I asked.

'We've been running a study. The lady doctors average two point five cups of coffee before they need a pee, the men three point one cups, but Nick is the odd one out because he can go five cups before a pee.'

'Guys,' I said. 'Your spending too long in here.'

Back in the lecture theatre, Bob said, 'There's already fifty thousand refugees on the border, and the word is that it will get a lot worse – and quickly.'

Mac said, 'There's as many as that again in Southern Sudan. Seems like the Arabs are trying to push the blacks out. There's one big camp already set-up, UN in there.'

'Bob, ask Doc Hoskins to dispatch twenty people, tents and supplies to the Southern Sudan camp straight away, a second team for the camp in Chad. They can make on-the-ground assessments. Then let's get some international teams in there; Hong Kong and China.'

Mac put in, 'My contact says there could be half a million people on the move if the fighting hots up.'

Jimmy gave it some thought. 'Bob, ready all the tents we have in Africa, do an inventory, get some more if necessary. I'll sanction a good budget on this if the numbers are going to grow.'

I asked Coup, 'How many Kenyan and Tanzania nurses on the reserve list?'

'Two hundred plus.'

'Well,' Jimmy said with a sigh. 'Is Darfur going to go tits up, that's the question? Do we ready ourselves now ... or wait?'

'Wait till they're desperate?' Bob scoffed. 'There're already enough people in the camps to justify our participation.'

Jimmy took a moment. 'Show of hands, please: those in favour of a substantive ramp up now ... *just in case*?'

I raised my hand, followed by Mac, Coup and Bob, Doc Graham, a few others not seeing the need just yet.

‘OK,’ Jimmy said. ‘Bob, use our communications set-up: thirty from Hong Kong, fifty from China, another hundred from somewhere – but not Supplementals. Coup, hire those nurses - I’ll call Rudd and sanction the budget. Bob, tents. Let’s meet in the map room in an hour, someone find a map of the area.’

Jimmy called Rudd and transferred fifty million pounds to RF Mawlini for the operation. In the map room we studied the area, Mac pointing out a lonesome airstrip on the border. A meeting was then called of all RF representatives, in the command centre, the UN and Red Cross invited over, the brief given, RF teams asked for – but for long term placements, at least eight weeks at a time. Jimmy asked for a plan of action by the morning, and we left them with some midnight oil to burn.

The next morning they presented a call-up plan, a deployment plan, a long-term plan for the camps involving many Africa nurses. The total deployment would be almost three hundred RF staff for a year at least, thirty jeeps, six Hueys, weekly re-supply by Hercules from Mawlini. It was an expensive operation. Jimmy signed it off and gave the go ahead, the deployments issued by email and fax, Helen issuing a press release.

Leaving the command centre, I recognised a face, a young lady doctor. ‘You look familiar.’

‘We met at a hotel in Kenya, years ago. I was on holiday with my parents. It was when your people parachuted from a Dash-7... and when your bodyguards shot dead two assassins.’

‘Ah, I remember. So, you joined up.’

‘You left an impression,’ she said with a coy smile.

‘How long have you been here?’

‘Ten weeks, we finish here soon. I can drive a truck, and I’ve callous on my fingers from climbing the damn wall.’

‘There’s a big deployment to Sudan, maybe you’ll be on it.’

‘I’ll ask about it, I’m off to Mawlini next week.’

Jimmy closed in. ‘Cassie.’

‘You remembered my name,’ she said, very impressed.

‘I always remember a pretty face. You off to the Sudan?’ Jimmy asked her.

‘I just heard about it, so maybe.’

We left her with a huge smile. Driving off, Jimmy said, ‘She has a good future. Well, it’s good for Rescue Force advertising

anyway. I've just put her on a course to meet her future husband.'

Arriving back, Sharon said there was a fax from the White House.

Jimmy nodded, none too concerned. 'Book us flights to the States for tomorrow, three of us.'

In Washington, the next day, we met with Senator Pedersen and his gang, now partners in our oil business, and discussed mines and oil. The conversation was then steered towards Liberia.

'I'm trying to persuade Art Johnson to get involved in Liberia, West Africa; it has a lot of oil. Problem is, the warring factions. If I persuade him to send in the troops, be nice gentlemen and back him would you.'

Back at the hotel, the blacked out vans turned up in the car park and transported us the short distance around to the White House, the place now appearing a lot smaller than my first visit. We received tea and biscuits as we waited, soon joined by the Chief of Staff, a minute later by the President, the Chairman of the Joint Chiefs and three generals. We stood and greeted them.

Sitting again, Art Johnson said, 'Thanks for popping over, we know you're a busy man. And now a major deployment of Rescue Force to Darfur. Is that area going to implode?'

'Yes,' Jimmy affirmed. 'Two million refugees, lots of TV minutes in a year's time.'

'Is it something we should be involved with?'

'Not if don't want to upset the Muslim world,' Jimmy said. 'It's a minor civil war, no clear aggressors, but the Muslim forces will get backing from Sudan, jet bombers attacking civilians.'

'We'll keep an eye on it. Anyway, we've decided we should be more involved in West Africa. We'd like you to hold off on any plans you have for Liberia, we're going to take an interest. Save you some money – as you said the last time. Besides, we founded the nation, we should help.'

Jimmy opened his case and handed over a thick document: How to deal with Liberia. 'That's a blow by blow account of what you should do, what you should avoid, and how it will turn out.'

Johnson skimmed through the detailed document. ‘You ... anticipated we’d make that move,’ he said in a resigned tone, the generals glancing at each other.

‘Will you use your own troops, or raise an army?’ Jimmy posed.

‘Raise an army,’ the Admiral stated. ‘Get some practice of using proxy armies.’

Jimmy opened his case and handed over a second document, even thicker than the first. ‘That’s everything you’ll need on raising an African infantry regiment. You’ll find some very specific requirements in there, some differences to western soldiers.’

‘Should have figured that,’ the Admiral wistfully stated, flicking pages of the document.

‘What’ll I do after retirement?’ the Air Force general joked.

‘Spend some time with the daughter you don’t know you have,’ Jimmy said with a straight face, holding his gaze on the man.

Everyone stopped. ‘What?’ the Air Force General asked.

Jimmy took a photograph and handed it over. ‘She’s studying in New York, and you’d best retire soon – like tomorrow – or it will get out eventually. Better to make the choice, than have it made for you.’

The man stared hard at the photograph, pocketed it and stood. ‘If you’ll excuse me, Mister President, I hereby tend my resignation before ... before I cause any embarrassment to the service.’ He stepped to the door and out, people calling his name.

‘What the hell was that all about?’ Johnson loudly asked.

‘He made a mistake twenty-four years ago, and it would have hit the headlines next year. Better he resigns now, with dignity and praise. No one will go after a *former* general.’

‘Is there a security matter here?’ the Admiral asked.

‘Not really,’ Jimmy replied. ‘The Russians sent a honey trap to him, but he didn’t declare the affair. That was his only mistake.’

‘And the daughter you mentioned?’ Johnson pressed.

‘A nice young Ukrainian girl, now studying at NYU. And no, she was not about to blackmail him, she just wants to meet him.’

‘Jesus,’ the Admiral let out.

I asked the Admiral, ‘Did you ever...?’

‘No, unfortunately; guess they never thought I was important enough.’

‘The daughter will stay in the States, and he’ll look after her,’ Jimmy put in. ‘I do like happy endings. So, Liberia: if you try and work with the existing regime you’ll get nowhere, *and* you *will* find yourselves being tainted by the association. Any money you give them will disappear quickly, maybe ten percent being spent on the projects you want the money to go to. If you remove the regime it will set every African government against you, because they’re all corrupt, and don’t want big bullies like you kicking them out of power just because they’re corrupt.’

‘So what do you recommend?’ Johnson asked.

‘First, you need an excuse to go in; such as more conflict internally, and with their neighbours. Then, if the regime was... blown up by rivals, you’d be playing the good guys and riding in to help.’

‘Not sure I like the sound of that,’ the Admiral stated.

‘How would *you* do it?’ I asked him.

‘We would work with the existing government, calling for free and fair elections.’

‘Free and fair elections? In Africa?’ I repeated. ‘Good luck with that. Tell us how it works out for you.’

The Admiral gave me a look.

‘You’re saying we’ll come undone if we go in,’ Johnson noted.

‘It’s a minefield,’ Jimmy suggested. ‘Literally. You’ll be damned if you do, and damned if you take a half measure. If you work with the existing cronies they’ll taint you. Remove them and you’ll pay the price. There is a path of least resistance to your aims, which is to allow me to assist you. You can then ride in on a white charger and save the day, looking good around Africa.’

Helen’s pager went. ‘Sorry.’ She checked it quickly. ‘A bomb’s gone off in ... Liberia of all places.’ She glanced at Jimmy from under her eyebrows, the generals stiffening. ‘The President and his staff are all believed to have been killed. Fighting has broken out on the streets of the capital.’

‘Anyone got a white charger?’ I testily asked.

Johnson eased forwards. ‘And what will history record as the *cause* ... of that blast?’

‘A disaffected army general will be blamed, who will now take over... and start executing aid workers. Including American aid workers.’

Johnson glanced at his generals, forcing a breath. ‘Gentlemen, I don’t think we can just standby as our brothers in Liberia are calling out to us for assistance.’

‘No, sir,’ they agreed.

Johnson ordered, ‘I want the Navy off the coast, airborne troops flown in straight away. I’ll handle the State Department.’

‘And I ... will get Africa on your side,’ Jimmy offered. ‘As well as Senator Pedersen and his friends. And, if you desire a UN resolution, I can arrange that as well.’

‘It’s not a bad idea,’ Johnson admitted. ‘Will the Russians and Chinese back us?’

‘Yes. And the British and French,’ Jimmy confirmed. ‘I’ve already spoken to them. And, before you even set foot in the jungle, we’ll hammer the bad guys into submission for you.’

‘That the operation we launched yesterday?’ I asked Jimmy.

He nodded. ‘Anything else we can do for you, gentlemen?’

The generals smiled, shaking their heads.

Hal had been back and forth to Sierra Leone, now back with the Cobra squadron and pounding rebel bases just across the Liberian border. They had been given a list of targets, a long list, and were working through it, airborne raids by the rifles to mop up. But three days after our meeting with Johnson, Hal had a mission well inside Liberia, a rebel base in the north just within fuel range.

He took off at dawn with four other Cobras and six support Hueys, one white RF Huey providing medical cover, Ratchet at the controls, Dr Jane Hicks in the back. Having struck the rebel base, Hal’s old lady suffered a simple mechanical fault, but she picked a bad spot; Hal went down into dense jungle, losing his props on the way. Fortunately, he hit water, he and his gunner getting out and waving up at the circling Hueys. Ratchet hovered over the downed Cobra, but found the trees too high for the winch. Seeing an immediate and practical solution, Hal and his gunner started climbing up a tall tree, Ratchet sending all but one other Huey back to base, not least because they were low on fuel.

Ten minutes later, Ratchet had a choice to make: to wait for the men below to reach the treetop, or to leave them. He could wait another ten minutes, then set down at the border crossing, getting a fuel truck sent out. As it stood, he would not make the base with his current fuel status. He remained overhead.

Hal and his gunner made it to a high branch, the winch lowered. In a daring move, and a dangerous move, Hal grabbed the winch, got himself inside, linked his arms around his gunner and jumped off the branch. They were winched up, grabbed in the doorway and pulled inside with huge smiles. Ratchet nosed down and headed back. He had gone two miles when fifty calibre rounds penetrated the Huey, killing the co-pilot and a rescuer in the back. With alarms sounding, warning lights flashing, the Huey lost power and nosed down into the dense jungle.

In New York, Jimmy glanced at his watch. The satellite phone trilled a few seconds later. Jimmy listened. 'OK, keep me posted.' He glanced out of the window, then turned to face us as we sat eating the apartment. 'Hal has crashed into the jungle.'

'He alright?' Helen asked.

'He was winched up, by Ratchet actually, but Ratchet's bird was shot down. We got a mayday signal from them; two dead, two wounded. They're down and running, rebels in the area. Paul, get yourself on a plane to Sierra Leone, probably need to fly into Ghana.' I stood. 'Helen, prepare a press release, I'll get what other details we can. We're staying here, we can use the US Navy to locate Hal.'

'No stupid stunts!' was the last thing I heard from Helen as I grabbed the security detail and headed towards the airport.

Helen released the details of the rescue to all US press agencies, reminding them of the books that Hal had been made famous by. The same detail was, oddly enough, sent to all the veteran associations. Jimmy was up to something. And as I headed to the airport I wondered why he was staying put.

Later that day, as I flew across the Atlantic, Jimmy and Helen headed to Washington, to be seen to be asking Art Johnson for help from the US Navy. As they left their aircraft in DC, Jimmy gave a quick statement to a lone TV crew, briefing them of the situation in Liberia and the planned rescue of Hal the veteran. By time he reached the White House, Associated Press, Reuters and

CNN had the story, the story receiving prime time viewing at 6pm.

A surprised Art Johnson welcomed Jimmy and Helen back into the White House.

‘Need your help, Mister President,’ Jimmy began. He relayed the story of what had happened, making a formal request for assistance if there was an aircraft carrier nearby. There was, it had been dispatched days ago and was due to be part of the Liberian operation. The US Navy were notified, the aircraft carrier put on alert, jet fighters scrambled to scout the area. Ratchet possessed a radio and a satellite phone, so it was just a case of them using the radio at the right time, since the satellite phone could not be zeroed in on.

6pm in Washington, it was midnight in Liberia, Hal and the survivors hunkered down in a hollow, covered in mud and soaked through; and completely lost. The sound of fast jets caused them to scratch their heads, because the Liberians did not have any, not least any that worked these days. They tried the radio, Hal knowing the standard emergency frequency.

‘Downed Cobra pilot to fast jet overhead: copy, over?’

‘Navy E3 to downed Cobra pilot, confirm lead pilot name.’

‘Navy E3, this is Hal.’ Hal and Ratchet exchanged looks through the dark.

Navy E3 to Hal, we have your position, extraction at dawn. How are the neighbours?’

‘Hal to E3, neighbours are close, and unfriendly to anything that flies, over.’

‘E3 out.’

The sound of tree frogs reclaimed the dark, the odd gunshot report in the distance; the rebels were shooting at shadows. If they got too close Hal and his gunner had their pistols, what good they would be. Soaking wet, cold and hungry, they huddled for warmth, Doc Hicks treating the wounded, her backpack the only one retrieved from the Huey before the rebels opened fire, causing the survivors to run. Now their jungle training would be put to the test.

Sat against the tree, Hal rubbed his hands in the mud and over Dr Hicks back, making her white jacket brown. ‘How many accidents have you had now?’

‘This is number ... four. You?’

‘I lost count a long time ago,’ Hal whispered.

In Washington, Jimmy gave a lengthy – and passionate – interview, hanging around the studio and giving updates till 10pm.

An hour before dawn a hell of a storm blew up, Hal staring up through the canopy. ‘Be unlikely to come for us in this.’

Dr Hicks stood shivering, Hal rubbing her arms, and took in the swaying branches. ‘Best share out the rations now, we’ll be here a while.’

‘Stay here, I’ll scout around a bit, we could be near a road ... or a rebel base.’ He trudged off, soon knee deep in water as the wind howled through the trees, the rain taking the mud off Dr Hicks white jacket and cleaning it.

With the dark night surrendering to a grey dawn, Dr Hicks was worried, Ratchet reassuring her of Hal’s abilities. When they heard a noise above the wind they hid, the Kenyan gunner readying his pistol. Hal’s image solidified through the raindrops, carrying something over his shoulder. He dumped a wild pig at Dr Hick’s feet.

‘You killed a pig!’ she said above the roar of the storm.

‘I shot it. No fucker going to hear it in this storm.’

‘Did you find anything?’

‘I did a complete circle, and nothing – just jungle. There’s a stream heading north west, we could follow that.’

‘Should we not stay here?’ Ratchet challenged.

‘With this storm, the rebels may give up for a while. But if this lasts a few days, no helicopter is coming for us. That means more rebels moving in for their prize.’

‘Prize?’ Dr Hicks questioned, rain pelting her in the face.

‘Ransom. Anyway, let’s eat,’ Hal suggested.

‘Should we risk making a fire?’ Dr Hicks questioned.

‘In this storm, they could be the other side of this fucking tree and not find us!’

Hal hung up the pig, bled it and carved pieces off, holding them over the small fire they had made, soon offering charred ham to the survivors, much needed protein. With their stomachs full, they made the decision to move out, and not wait for

company. The two wounded needed helping along, shivering as they progressed. In the streambed, the group found a stable footing, and it could not have made them any wetter than they already were. By nightfall, Hal figured they had covered at least a mile or two. And, walking down the stream, the rebels would not find their trail.

Ratchet eased off the backpack, Dr Hick's backpack. She foraged around inside, pulling out a bright orange emergency sleeping bag, basically a large and sturdy plastic bag the size of a normal sleeping bag. With a knife, she slit one side and the base, making several holes. Grabbing thin vines, she wound them through the holes, soon erecting a shelter just big enough for the six of them to sit under. Hal broke branches and placed wet leaves on the muddy forest floor: their bedding for the night. From Dr Hick's pack he pulled out a leg of the pig, soon roasting pieces over a small fire. The meat did not go far, but it helped.

'Haven't heard any aircraft,' Ratchet noted.

'Not in this storm,' Hal agreed.

Ratchet took out his satellite phone, turned it on and struggled to see the battery levels. 'My battery is low.'

'Mine too,' Hal admitted. 'I forgot to charge it. Pointless in this weather anyway. Save it.'

Ratchet put his phone away, lifting a giant millipede and tossing it away. 'Not exactly camouflaged, are we?'

'If they're close enough to see this ... we're dead or captured,' Hal insisted.

An hour later Hal woke with a start, nudging Dr Hicks.

'What is it?' she asked.

Hal composed himself. 'Sorry. I was dreaming.'

'What about?'

'I was in a filthy stinking jungle after a helicopter crash in Vietnam, being hunted by guerrillas.'

Ratchet could be heard laughing, soon followed by Dr Hicks.

'Haven't you had enough of this?' she asked above the sound of the storm.

I was in Seirra Leone by this time, at the forward helicopter base, and feeling pretty useless. There was little more to do other than check the same weather reports over and over. I called Helen, and assured her I was OK, and nowhere near a helicopter. She

informed me of Jimmy's news conferences, one of which was with President Johnson.

The survivors suffered a second cold and wet night, the combined effect of their wet clothes, a lack of food and a lack of decent sleep starting to have an effect. In the morning, no one much felt like moving, the rain continuing.

Hal had to do something, or they were in trouble. He stood and cut down the shelter, getting incredulous looks from the group. 'Sit there losing body heat and you'll die. We need to move.' He helped them up one by one, soon taking point as they again tackled the stream.

An hour later, with the storm easing off a little, Hal thought he could smell smoke or cooking. He grabbed his gunner, and they both checked their pistols. They moved forwards together, the rest of the group hidden in the undergrowth. The wind was coming from direct ahead, so that had to be where the cooking was coming from, maybe a house or a farm. Finding a clearing, they eased down and crawled ten yards, lifting their heads over a tree root to find a hut, its chimney betraying the cooking activities within. Hal put a finger to his lips, gesturing for his buddy to crawl around behind the hut. With the Kenyan gunner soon becoming just an image of a bum in motion, Hal rubbed mud across his face for added camouflage.

A man stepped out of the hut, ran across to a large tree and took a pee, running quickly back inside. The AK47 the man wore labelled him as rebel, not farmer. Hal eased upright and around the tree he had been sheltered behind, stepping slowly to the hut, no windows on the side that he now approached. With his back to the wooden wall, he signalled his gunner up, the man stepping quickly across. Hal pointed to a nearby trench, the gunner running and diving into it, his pistol trained on the hut's front door. Stepping slowly and quietly, the storm masking any sounds, Hal stepped around to the rear of the hut, finding a wooden slat propped open. Peering through he could see three men sat around a cooking pot and jabbering away. He need only kill two of them. He turned his head to the right, picking out a thick tree root. Turning back, he stretched out a leg towards the root. At little more than six feet away from the earnest cookery

students, he pointed, aimed, and fired twice, ducking quickly behind the root.

Nothing happened for ten seconds. Then a burst of fire came through the hut wall and into the tree that Hal now sheltered behind, a second burst sounding as if it was aimed out of the front door. Hal eased up his pistol, his hands and finally his face over the tree root, trying to see through the rain. He waited, squinting as water irritated his eyes. A good three minutes later, two shots sounded, too quiet to be AK47, they were pistol shots.

Hal held a flat hand to the corner of his mouth. 'Did you get him?' he shouted.

'Yes!' came back.

'Stay there!' Hal moved forwards, and to the edge of the hut, again peering inside. He could see two bodies, one now with his clothing alight. Moving around to the front he could see another man face down in the mud. They were three for three. In the doorway he poked his head inside, the small hut offering nowhere for a man to hide. He stepped inside and grabbed an AK47, checking it quickly. Emerging, he said, 'Get the others down here!'

The gunner trudged off. Hal slung the AK, lifting the second from the mud and shaking it before slinging it over his head. He grabbed the dead rebel by the wrists and dragged him towards the stream, dumping the body into undergrowth. He tackled the second man, his clothes smouldering, and gave the first body some company. As he dragged the third man out the gang appeared, Dr Hicks aghast at his handiwork.

'Get inside, get warmed up!' Hal shouted over the roar of the storm. With branches covering the bodies, Hal returned to the hut, giving Ratchet his AK, cleaning and checking the second rifle. Finding a suitably waterproof poncho, Hal threw it over his head and readied his weapon. 'You got two hours before we swap. Eat the food, warm up, dry your clothes.' He stepped out. Across from the hut, and in view of the trail that led up to it, he stood against a tree and focused on the dark green foliage for any unwelcome company, figuring that no one would come till the storm eased off. Three hours later, not two, Ratchet stepped out of the hut in a green poncho, AK ready, Hal waving him over.

'Stand here, watch that trail. If the rain stops, warn me.' Inside, Hal eased off the poncho, accepting a bowl of warm stew

from his gunner. Sitting on a bunk, he could now see could clothes hung up and drying, even a bra, the wounded sleeping peacefully.

Dr Hicks said, 'We got pot and cocaine if you want some?' She lifted the drugs that the previous occupants had been planning on using.

'Been a while since I smoked pot. I think the last time was ... in a wet steamy jungle, after a helicopter crash, with guerrillas armed with AK47s hunting us.'

Dr Hicks laughed. 'About time you fucking retired, Hal.'

'Never. I'll die with my boots on, not in some old folks home.'

The rain did not ease off all day, Ratchet toughing out a four-hour stretch before being relieved by the Kenyan gunner. Everyone got some sleep.

An hour before dawn Hal was awake, stoking the fire before he realised the rain had stopped. Grabbing the AK, he stepped out and sloshed through the mud to Ratchet, now on his second tour of sentry watch. 'I'm going to get everyone up, make a move at dawn. Stay there.'

Back inside the hut, Hal nudged people awake. The last of the stew was apportioned to the gang, mostly to the wounded. Cold and aching limbs were stretched, people stepping out in turn for a morning pee. The walking wounded were issued ponchos, Dr Hicks putting on a green jumper a few sizes too big for her, a few hats pilfered. Hal looked the ragbag patrol over, leading them away from the easy to navigate trail, and back into the stream, everyone soon up to the knees in cold water and complaining.

As the day warmed up, the weather improving, the patrol slowly plodded along. When the stream grew too deep, they struggled up a muddy bank and followed the stream's course from an ill-defined animal trail, till they could hear the rush of water. Breaking through the dense foliage, they could see large boulders exposed in a fast flowing, but shallow and wide river.

'They can get a Huey in there,' Hal said. 'Come on.'

Ratchet lifted the radio and turned it on. 'Any air mobile, this is downed Rescue Force crew.' Nothing. He repeated the message several times.

Hal took out his satellite phone and turned it on. He dialled the RF emergency number and placed it to his ear. All he got was low-battery bleeps. 'It's dead.'

Ratchet tried his. 'What position do I give?'

'Found miles north west of previous, river bend, rocks,' Hal instructed.

Ratchet hit the green button and waited. 'Hello?' came a woman's voice. 'This is Ratchet in Liberia, we're four miles north west of previous position, river bend, rocks in river. Got that?'

'Yes, I got that.' The bleeps started.

'She said she got it,' Ratchet reported, turning off the phone.

'Hide yourselves,' Hal ordered. 'At least two hours to reach us.' They sat down and settled in.

Stateside, the TV news channels were in a frenzy for fresh information. When the rescue co-ordinators were given the press went into overdrive, relaying the launch of the helicopters. I was getting more information from Helen, now watching CNN in Washington, than from our people on the ground. I relayed the good news. I was also sorely tempted to jump into a Huey and rush over there. I'd be divorced afterwards, but we'd have Hal back.

Thirty minutes after our troop of survivors had settled themselves in the muddy undergrowth, jets screamed overhead.

Ratchet tried the radio. 'Lost sheep to Shepard. Anyone on?'

'Lost sheep, please give a reference.'

'Turn around; you went straight over us. Bend in the river, big rocks, over.' The jets could be heard approaching again. 'Keep coming ... keep coming ... overhead!'

Back in the states, the news now reported that US jets had located the survivors. It was happening live, Jimmy making sure of that.

An hour after the jets had fixed the survivor's position, helicopters could be heard, spirits lifted on the ground.

Ratchet turned the radio on. 'Lost sheep to Shepard, we can hear you. No visual.'

‘Roger that. Standby.’

Hal led the survivors out, ponchos and green jumpers discarded, rifles made ready. Coming up the river bend, two American helicopters could be seen, stalking in low. Dressed suitably in white, Dr Hicks stepped out across the rocks and waved; they could not have missed her. Flaring, the first Naval Seahawk slowed and descended, its crew leaning out of the doors and relaying instructions to the pilots about clearance and height. With two wheels on a large flat rock, crewmen waved the survivors over. Hal’s gunner discarded his rifle into the water and boarded, followed by the two wounded, Dr Hicks and Ratchet, just Hal left on the rocks.

The pilot waved and pointed upstream. Hal turned to find two gunmen on the riverbank, too far away to do any damage unless they were the marksmen from hell. In a move worthy of Hollywood, he aimed and fired, scaring them off before jumping aboard the helicopter, his AK47 tossed out.

I was already on my way south in a Huey, heading to the main airport. An hour after being picked up, I expected the survivors to be dumped at the airport, or maybe the hospital full of Cubans. But no, the US Navy was having none of that, they were welcoming Hal aboard the aircraft carrier to a heroes welcome, the US news still in a frenzy. Jimmy and Art Johnson held a press conference, Johnson loving the positive attention, for a change.

I spent the night in Freetown, Hal and the survivors getting the best of care aboard the aircraft carrier, Jimmy and Helen on a plane to the UK. The next day the US Navy flew the survivors across to Freetown, our two wounded handed to the Cubans, the rest getting another heroes welcome, a great many RF staff at the airport, plus the Rifles, and even more reporters. Rudd had been busy, flying Kenyan, Tanzanian and DRC reporters to Freetown and paying their hotel bills. We even had a BBC crew.

I gave several interviews before Hal arrived, being filmed hugging him and the others. We gave an extended interview stood in the airport, before moving to a quiet room for a joint interview with BBC and CNN. I don’t know about the others, but I was exhausted at the end of it. We arranged rooms for the three of them in Freetown’s best hotel, explaining that they were now officially on leave for two weeks and ordered back to the UK

with me; Jimmy was going to milk the episode for all it was worth.

Arriving back at the house with Hal and Dr Hicks, I left them to attend my family, finding Helen sat reading a movie script.

‘Jimmy’s going to fund the film of Hal’s time with Rescue Force. He’s written the whole thing himself.’

With Shelly asleep, Helen cooking, I flicked through the script, wondering who would play me. And Helen. And Jimmy. Later, we carried Shelly across to the house and joined the festivities in the lounge, Hal, Ratchet and Dr Hicks relaying their tales, Bob Davies and Doc Graham over from Mapley. Our daughter was a flirt, and never happier than in a room of grown-ups spoiling her. She favoured the men, especially Jimmy and Han, and ignored Michelle.

Keely reported that Johnson was very happy with Liberia, the American press behind him; he had finally done something popular. ‘Tell me about this movie,’ he said to Jimmy.

‘Script around here somewhere,’ Jimmy informed Keely.

‘Who’s going to play Hal?’ Helen asked.

‘Play me?’ Hal queried.

Jimmy explained, ‘I’ve written a script about your adventures with Rescue Force, prior to this episode, but I guess it could be added in. You’re going to be even more famous.’

‘A film? About ... me?’ Hal questioned.

‘It’s not just about you, it’ll help to promote Rescue Force, but its main thread is you joining up, then your accidents and adventures, a lot about Scorpion Base. I’m going to fund it so that I have some editorial control.’

‘This be a cinema movie?’ Hal asked.

‘No, TV movie,’ Jimmy suggested. ‘But around Africa it will be shown in the cinemas I guess. Probably straight to video, shown on prime time TV in the States.’

‘Dr Hicks is in it,’ I joked. ‘She falls out of helicopters a lot.’ We laughed.

‘Am I in it?’ she queried.

‘Yes, bit parts,’ Jimmy confirmed. ‘But I’ve been thinking of a larger role for you, if you don’t mind.’

‘Ya didn’t ask me if I don’t mind,’ Hal pointed out.

‘Don’t want to be famous?’ I asked him. ‘You might get laid after all these years.’

Helen glared at me, Hal waving a threatening finger toward me.

Jimmy explained, ‘Legally, we don’t need you permission, but you can sue us afterwards if we portray you in a poor light. Read the script, then decide.’ He faced Dr Hicks, adopting a serious, fatherly expression. ‘Your life has not been a bed of roses. Would you want that out there?’

‘It’s in the bloody book already,’ she said with a sigh. ‘Besides, since it all came out I don’t dwell on it anymore. Africa has given me bigger things to worry about. Like Hal’s flying.’ We laughed.

‘What’s wrong with my flying?’ Hal protested. ‘We crashed due to mechanical faults.’

‘And that time in Mozambique when you said we were on fire, and told me to jump into the swamp, then flew off!’

Hal smiled. ‘Ah, well that was because you were being a pain in the arse.’

‘You flew under power lines just to make a point!’

‘They probably had no power anyway,’ he countered, making us laugh.

We chatted into the night, many drinks downed, Shelly fast asleep on Jimmy by 9pm. The next day, Hal sat quietly and read the script, getting half way through by our planned evening meal. He had no objections, nor corrections, and even seemed quite moved by it. Jimmy explained that Dr Hicks would be written in, the movie culminating with the recent crash.

Hal and Dr Hicks were sent off to London to offer interviews to anyone who wanted one, spending a few nights at the club. In the meantime, we watched the American deployment in Liberia with some interest, not least because they were following Jimmy’s route map. Our friends in Africa had applauded the US “assistance” in Liberia, a UN Security Council resolution passed granting the US the right to stabilise the country. Relations with the US military had never been better, the only wrinkle being the condition Jimmy imposed: British and French warships joined the US Navy and assisted in what small way they could, setting up field hospitals in two locations.

New year

Looking forward to a beach holiday, we flew off to Australia in early December, Cat and Shelly in tow, and enjoyed a week in Sydney. We did the tourist bit and saw the sights, the iconic opera house and famous landmark bridge, but mostly just lounged around the hotel pool in the day and ate at the best restaurants at night. The Aussies knew who we were, very proud of their own Rescue Force unit, Dunnnow something of a minor celebrity “down under”.

Tanned now, a long flight north took us to Cairns and the RF unit, an inspection they had been expecting since glimpsing our faces in their society papers. Dunnnow showed us around the Spartan base, not much to see since most training was conducted off base and most of the staff were deployed either around Australia or overseas. Out of forty staff, just eight were in residence, some in Chad already, one team in Sierra Leone. We caught up on the gossip, problems and gripes, Jimmy then informing Dunnnow that they had a budget now for up to eighty staff, a doubling of the unit size, two extra Hueys arriving within days.

Back in Sydney, we made plans to travel to New Zealand to officially open their RF unit, then on to Samoa to inaugurate their RF unit, finally heading up to Hong Kong. But the next day Dunnnow rang us, an eye on a large bush fire near Canberra: most Aussie RF units were abroad, and could they be recalled? Jimmy called Mapley HQ and ordered all Australian units to Canberra unless they were new recruits in training. We watched the bush fire on the TV News, Jimmy informing us that it would get out of control. He called the fire chief for the Canberra area and asked if Rescue Force could help, and not just the Australian unit, the man more than happy to receive our assistance since they were stretched, fires now spreading over a wide area.

Helen power up her laptop and emailed Mapley HQ. The NZ unit were to fly over with their jeeps, experienced staff only. British and French Supplemental units were to mass deploy,

Mawlini being ordered to use the large IL76 aircraft to fly jeeps over; six per aircraft, twenty-four requested. Other vehicles could be hired locally.

The New Zealand trip was postponed, not least because they were coming over to us, and we journeyed to Australia's capital, Canberra, by road, enjoying some of the countryside and beaches en route as part of a two-day journey. By time we booked into our hotel in Canberra the news was reporting the mass deployment of RF units. With Australia being a signatory to the RF charter we did not need permission to bring units into Australia or transit through, but now arranged to meet the emergency planning teams and the Prime Minister for formal permissions.

They showed us around the control centre, the Prime Minister touring the facility with us, then offered cold drinks in a lounge as we informally discussed their particular needs. Those needs were to backup the small town medical centres in the path of the fire, and to assist with evacuations – those residents leaving it to the last minute to abandon their homes. The first Aussie units had returned from Africa, more on the way, some flying down their jeeps from Cairns courtesy of Australian Air Force Hercules aircraft. Jimmy suggested that the international RF units might cause people to ask questions, such as why use foreign rescuers instead of your own. So we arranged a TV interview that evening.

Jimmy said to the interviewer, 'In each and every major deployment of Rescue Force there has been an Australian unit at the front, or an Australian pilot at the controls of our helicopters. You have helped us, so now we're going to return the favour by bringing over rescuers from several nations. That doesn't mean that your own emergency services cannot cope, it means we'd like to lend a hand to those who have helped us so much in the past.'

It did the trick with the Australian public, the French and British Supplementals landing in force at the airport that evening and being filmed by the TV News. An army base was made ready, barrack rooms organised, supplies bought locally. The jeeps started to arrive the next day, an Australian put in charge of each vehicle, the vehicle's crew made up of English, French or New Zealand rescuers. And overall deployment control was

given to the local fire chief, the head of RF Australia working under him, the national group leaders under them. With the army base in a good position, west of the fires, teams were sent out the next day. We toured the base that evening, finding that our people had treated a dozen locals for smoke inhalation, some for minor burns, and two suspected heart attacks. They now made plans for a mass evacuation of a small hospital, our distinctive white jeeps already a regular feature on the news.

Having remained for three days, the daily routines of the rescue teams now settled, we flew directly to Hong Kong, re-arranging the trips to Samoa and New Zealand for the New Year. Po picked us up in the Rollers, a security detail provided, and we booked into his hotel, Shelly soon swimming across the pool. When I picked her up and threw her across the pool she loved it, coming back for more, Helen and I getting looks from other guests by throwing our daughter across the pool to each other. Bored of that, Helen and I sat, Shelly climbing out off the water by herself, running and jumping with a shriek. When Jimmy turned up in the pool with an unknown leggy beauty we exchanged looks, agreeing not to mention French Michelle. Shelly swam straight to Jimmy, inspecting the new face with him. When Jimmy launched Shelly across the pool his new date was horrified, our daughter soon swimming back to him and wanting more. I grabbed her away, giving Jimmy some time to be with his new woman, whoever she was.

The leggy babe joined Jimmy for a meal with Po and us, but sat too far away from me to interrogate. By the end of the night Helen and I were dying to find out who she was, were they at it, and did Michelle have a gun back at the house. Sharing a car to the casino, I asked Po if he knew. The useless bugger just shrugged. At the casino I decided to find out.

‘Jimmy is too rude to introduce us, so I’m Paul.’

‘Not ... good English,’ she came back with.

‘Anya is from Croatia,’ Jimmy explained. ‘So unless you speak some Serbo-Croat it will be a hard conversation.’

He neglected to tell me she spoke German and Russian. I reported back to Helen, none of us knowing where the hell Anya came from. Ling eventually turned up, greeting Anya as if they knew each other. We cornered Ling.

‘Who’s the woman?’ I asked.

‘She’s a model. Jimmy saw her picture in a magazine and made contact, inviting her here,’ Ling reported.

Helen and I exchanged looks; it was not like Jimmy. There had to be an angle, someone Anya knew, or was related to. We spent an hour scratching our heads, the mystery woman driving us nuts.

At the bar, with Anya powdering her nose, I closed in on Jimmy. ‘OK, the suspense is killing us. Who is she, and what’s the connection?’

Jimmy smiled. ‘In ten years or so she will have a role to play.’

‘I knew it!’ I explained it to Helen and we both relaxed, making up scenarios for her, some very bizarre.

Doc Graham turned up the next day, which was odd, because he was supposed to be in Canberra.

‘Doc Graham?’ Jimmy asked.

‘You ... sent for me?’

‘I ... sent for you before I left Canberra.’

‘What?’ He took in our faces.

‘You turned left at Singapore,’ I said. ‘Should have gone right.’

Jimmy shook his head. ‘Now that you’re here, do a review of the Rescue Force branch on my authority. Make it thorough, then get on a plane for Oz. Oh, while in Oz, use emergency funds to help the displaced people, make a big show of what a nice chap I am. In the meantime, book-in, grab a shower, join us later.’

‘I’m going to buy you an atlas,’ I told him.

Muttering under his breath, Doc Graham booked in.

The next day, with Doc Graham inspecting the local RF unit, we flew to Shanghai for a quick visit to the brain trust kids, just Jimmy and myself. Our 737 landed at the military strip again, and we were whisked away in a coach to the military compound that encircled the kid’s college. In the foyer of the college we met Han.

‘They all settled in?’ I asked.

‘They have adjusted very well,’ Han reported as he led us on. ‘None have requested a return to Kenya.’

‘No family there, that’s why,’ I commented. ‘The only family they know are the other kids.’

We entered the computer room, a few faces turning up to us, many just ignoring us, the various computer screens holding the attention of the kids.

I glanced at one screen, a schematic of a car displayed. 'Electric car?' I knowingly enquired.

'I dedicate three hours a day to the project,' the young lad informed us. 'My area of interest is the primary shell, dynamics and safety.'

'It would go a lot faster if it had furry dice hanging from the mirror and flames painted on the side,' I told the lad, making him laugh.

Han reported, 'The project is being mirrored by a team in Beijing, but the youth here have already outsmarted our team.'

Jimmy led us away from the studious kids. 'Han, I have a project for you. Inject some of the kid's blood into ordinary pigs, wait four weeks, then extract the pig blood and inject into soldiers and monitor the results for both endurance and immunity to disease.'

'The DNA of a pig is, I believe, ninety-eight percent compatible with that of a human,' Han noted. 'Does the pig's physiology ... *filter* the blood?'

'This would be no fun if I told you everything, now would it?' Jimmy teased.

We toured the remaining rooms, taking time to speak with as many kids as we could, asking if they needed anything. They had a few weird requests that we agreed to help with, some Han would facilitate. Overall, they seemed interested only in their own little worlds and their small circle of friends. We gathered the senior students - the elder students - and sat having a coffee for thirty minutes. Their only gripe was one of workload; they were not pressured enough and desired more projects. Jimmy explained the importance of the electric car, but offered a tougher project or two if they made good progress on that. We left them feeling wanted, needed, and appreciated.

Only on the way out did we finally bump into the professor, the man rushing up from the labs in the basement. 'Sorry, critical experiment with battery acid.'

'How's it going?' I asked him.

'Making good progress,' the professor enthused.

‘Make good enough progress and I’ll give you some tougher projects,’ Jimmy offered before we departed.

Han accompanied us back to Hong Kong, staying a night at the hotel, Shelly happy to see him. If she could have stopped calling him “Ham” that would have been great. Still, she called Jimmy “Jilly”, which we did not try and correct.

The next day we reclaimed the 737 and took Helen, Shelly and Big Paul up to Beijing. Another coach transfer delivered us to the same concrete buildings that we had first visited, but now I felt like an honoured guest and not one of the condemned. At first the government stiffbs did not know how to treat Helen and Shelly, glancing at the boss before making suitable noises and offering fingers for Shelly to grip. Helen decided to be bold and get it over with in one go. She approached the Defence Minister and presented Shelly. It took the man a few seconds to melt the hard façade. He grabbed a large piece of paper, coloured marker pens and placed them down for Shelly on a side table, Helen watching our daughter as she keenly scribbled over the paper.

Jimmy stood at the white boards, for thirty minutes of questions, mostly about small detail, before getting to the main point, the alterations of his plans that had upset the detailed Chinese time line. He said to the group, ‘It was always my intention to develop the sub-Saharan states so that they could defend themselves from the Brotherhood. But let’s not kid ourselves: the real reason was to absorb and contain the Brotherhood with the lives of African soldiers.’ He let them think about it for a few seconds. ‘But what if we developed Africa beyond that point? What if ... they could push north? What if they could grab and hold the Suez for us, freeing up Western soldiers?’

He attended a map board and described scenarios, the Chinese making comments.

‘They will take heavy casualties,’ the Defence Minister noted.

‘And what casualties will they take if they defend their borders for ten years?’ Jimmy posed, people exchanging looks.

‘Could they be ready in time?’ a man asked.

Jimmy took a moment. ‘They could with your help. And I can accelerate the discovery of oilfields; some relevant to Africa, some relevant to you. But first, let’s talk of India: when the Brotherhood attack east, India acts as a buffer for you. If we say

that North Africa and Suez is down to me, and the African armies, then your armies need only worry about your western border, and supporting India. The Russians can worry about their Southern Caucuses, Europe draws a line at the Bosphorous, and America defends Israel, the Mediterranean and the Indian Ocean. If American forces *do not* have to hold North Africa then they have a lot of extra men and resources.'

The Defence Minister posed, 'And if an Africa army landed in South West Pakistan and held that area...?'

'They would absorb The Brotherhood by taking a lot of casualties,' Jimmy noted.

'Would you hold back using them?' the Minister asked.

'No,' Jimmy replied. 'Because if they fail ... the Brotherhood take Africa and kill their families, then destroy the planet. So no, I won't hold back when the fight comes.'

'So ... if Africa developed enough, they could do a lot more than hold their own borders,' the Minister stated. 'And now America is raising a local army in Liberia.'

'Yes, with my guidance – where they take the advice, that is.'

'Then we should look at a similar approach?'

'No,' Jimmy adamantly stated. 'My proxy army ... is your proxy army. If you support me ... then I will grow the army. But we must be careful. If they grow strong, and their political leaders get greedy, they may cause local wars in Africa. It is a slow and deliberate process.'

'Then what should we do towards the aim of a large African army for 2025?' the Minister asked.

'Help me with infrastructure; roads, and railways, hydroelectric projects, some coal-fired power stations, schools and hospitals. For the African army to be capable of attacking north it must be able to feed itself for many years. And that is down to an industrial base. In the short-term, we need only try and accelerate our plans for the Congo, everything else will follow.' Jimmy paused. 'I want you to consider what additional help you will give the Congo if I give you an oilfield in the India Ocean, one that is so big OPEC will be unhappy for you to access it.'

'How big an oilfield?' they pressed.

‘Larger than the find in Cuba.’ A flurry of whispered conversations broke out, Jimmy adding, ‘But there will be a political price I’ll be asking for. And that is Iran.’

‘Iran?’

‘Yes. They’ll try and develop nuclear weapons before 2013, leading to an American military strike.’

‘We will need to discuss that,’ the Minister stated.

‘The oil discovery will mean that you don’t need Iranian oil,’ Jimmy pointed out, letting them think about it.

‘And Liberian oil?’ they asked.

‘Will boost the US economy, which means they buy more goods from you,’ Jimmy answered with a shrug.

‘And the Indian Ocean oil field?’ a man asked.

‘Almost as big as the entire West African field.’

We left them to think about things, flying back to Hong Kong and an ever-curious Po, who did not know why we were so popular with the People’s Republic. The news awaiting us from Bob Davies was that the wildfires were still spreading like wildfire, Doc Graham reporting that our people were flat out busy. We sanctioned extra bodies from the UK and Kenya, but only “white” rescuers from Kenya, not wishing the rural Australians any opportunity to show any prejudice towards black Africans. RF Israel was asked for a volunteer team, and RF Hong Kong complained that they were not being included, but we explained the racial issues of Orientals rescuing people in rural Australia.

Helen and I inspected the apartment Po had bought us as a wedding gift, staff from Pineapple now using it for a holiday, before enjoying a day shopping. Christmas eve was spent at the hotel, Rudd and Cosy and their families flying in that morning. Christmas day was spent at Po’s home, a strange house built into the side of a mountain and spread over six floors. Ling was now pregnant, but unmarried, her sister married with two kids already. Hancock from the RF unit popped over for lunch, still unhappy at not deploying to Australia.

The next day, with the wildfires still a problem, Jimmy altered New Year; we were all going to spend it in Sidney, Australia, Po invited along. Everyone packed up Boxing Day, and we all hopped onto the same 747 southbound the next day, managing to find a hotel with rooms. In reality, Jimmy had pre-booked a

block of rooms, but we had to maintain the public façade of being mere mortals. Big Paul's family were already waiting at the hotel, as were Ricky and Rob from the house - they were off shark fishing; "man fishing" as they put it to Helen.

Our arrival back made the Australian news, and on the second day we flew over to Canberra to meet Doc Graham, getting a firsthand assessment. A third of our staff were acting as paramedics to the fire fighters, the rest busily evacuating homeowners - who always hung on to the last minute before fleeing. A few locals had now been killed, many burnt, a few of ours suffering burns and smoke inhalation injuries. The number of homes destroyed was also rising rapidly, Doc Graham busy arranging temporary rented homes and issuing grants from us; we were becoming popular "down under".

Back in Sydney, Jimmy invited Mac and the senior Kenyan staff over for New Year, a bit of a working holiday since they could pop to Canberra and help out as well. Without me knowing it, Hal had been on a mission to California, to round up experienced fire fighters; he landed with a team of sixty, kit and all, Jimmy only mentioning it when they arrived. Hal and Hacker joined us for New Year, both itching to get into Hueys and help out, but both ordered to stand down by Jimmy.

Hal had not only been in California to recruit the fire fighters, he had spoken to a film director about the script Jimmy had written. When he mentioned that we would be funding it - as well as supplying all the extras and helicopters for free - it was a done deal; location scouts were on their way to Kenya. Hacker would also feature in the movie. They had not known each other in Vietnam, but had served in the same unit, so Jimmy had been a bit creative with the script.

New Year's Eve was spent at a restaurant in Sydney, the roof garden of the building offering a view of the Sydney Harbour Bridge and its famous firework display. New Year's Day was odd in the fact that we were swimming on Bondi beach, calling people back in chilly England and winding them up about how warm it was; I was applying suntan cream on New Year's Day. Not even Kenya was this warm in January.

Mac and the guys soon headed over to Canberra to help out, and to chat to old friends. The local Australian helicopter pilots had all read the books, making our aging and veteran pilots very

welcome. Keen now to move on, Helen fired up her laptop and made plans to get us to New Zealand and Samoa, the New Zealand team rotated out before New Year. We had also rotated out a number of British and French Supplementals that had families, and were unhappy to be away for the Christmas duration. They were in a minority, many opting to stay put and help out.

We left Australia having achieved what we wanted to achieve: everyone in Australia now knew our faces and Rescue Force was both popular and respected. Landing back at the house, Jimmy handed Helen a pregnancy kit. I stopped and stared at her, and she looked back a little sheepish.

‘Jimmy said it was time,’ she offered, deflecting any criticism of my lack of input, other the obvious biological input.

Jimmy sat and checked his emails. ‘You can’t have just the one child, and we all know you’ve discussed that, so be happy. It will all work out fine.’

‘Another daughter,’ Helen informed me. ‘Lucy.’

I wasn’t quite sure what I felt as I stood there. I should have been mad at Helen and Jimmy for conspiring, but the thought of another Shelly was secretly delighting me. ‘I wanted a boy,’ I said as I sat behind my computer.

‘You did?’ Helen puzzled.

‘No, he did not,’ Jimmy said without looking around.

‘Best go pee on the stick, Dearest,’ I told Helen.

She came back five minutes later, smiling widely.

‘So ... Lucy then,’ I let out with a sigh. ‘Best do some work to cover the cost. Kids aren’t cheap, you know!’

‘I think you’ll cope,’ Jimmy mentioned.

The next day a fish tank arrived, since Jimmy said it coincided with Helen’s pregnancy. We scratched our heads about that all day, having been told to stay out of the lounge. Finally, we were summoned. And what a tank! Ten foot long, four foot tall on a strong metal stand, the top was over Jimmy’s head. Along with the “M” Group we stood and stared, since it seemed empty.

‘You need some goldfish,’ I suggested.

Jimmy ordered the curtains pulled, the lights turned off. We closed in, our eyes adjusting to the dark. Small flickers of light caught our attention, becoming brighter, soon distinct patterns of

fluorescent jellyfish, and quite beautiful: red, blue and white flashes of light streaking along the jellyfish. I lifted up Shelly and she fell silent, staring through the glass at the display of light and colour.

Whispering, Jimmy said, 'What do you think she'll be when she grows up?'

Helen and I exchanged looks. 'A ... biologist?' Helen asked.

'A marine biologist,' Jimmy informed us.

We studied the jellyfish with renewed interest, our daughter staring in silent appreciation of the spectacle, others closing in for a better look.

Countdown

On January 12th, Jimmy said it was time to begin the countdown.

I stood rigid and worried for a moment. 'Count ... down?'

'To a major quake in 2004.'

'Oh. How ... major?'

'Three hundred thousand dead.'

'Ah. That major. So, where is it?' I asked.

'Sumatra.'

'Straight forward enough,' I suggested.

'It's offshore, causing a tidal wave that spreads out and slams into about three thousand miles of coastline.'

'Ah,' I loudly let out. We'd be a bit stretched.'

'And we risk being exposed.'

'By putting our people in there first,' I surmised. 'Can we use Crusty and his software?'

'Yes, but it will still seem ... odd, to the world. There'll be a lot of questions afterwards.'

'Where does the wave hit?' I puzzled, thinking what country had a coastline that big.

'Sumatra, Thailand, Bangladesh, India and Sri Lanka,' Jimmy listed off. 'It'll even touch Kenya and East Africa.'

'Any damage in Kenya?' I asked. We had a beach hotel – on the beach!

‘Some, a five foot wave, a bit damp afterwards. Crusty will have to join “M” Group first, or he won’t play ball. And that means soon. We’ll need a few minor successes in the old earthquake-prediction game before 2004.’ He lifted a sheet for me to read. ‘We’ll discuss it at the first formal “M” Group meeting for world leaders.’

‘African Industrial Development Conference?’ I read aloud.

‘It’s in Paris, in three weeks. We’ll hold the “M” Group meet afterwards, and showcase Africa at the same time. CAR Ltd organised it just before Christmas, I’ve notified the “M” Group nations I want a formal meeting.’ He lifted a second sheet.

‘Cuban Industry Fair?’

‘It’s four weeks later, in Cuba, just to give the Yanks a nudge. Remind them of the opportunities, now that oil is flowing.’

Crusty came to the house for “a chat”, but walked into an “M” Group meeting, Sykes in attendance. Crusty took in all the faces, puzzling the meeting, not least because Big Paul had his jacket off and shoulder holster visible.

‘Come in, Dug,’ Jimmy urged, gesturing our earthquake expert to a seat. ‘There are some things we need to discuss, but first I need you to sign a disclaimer, otherwise known as the Official Secrets Act.’

Sykes presented Crusty with a series of forms to sign, handing him a pen.

‘And what has this ... to do with me?’ Crusty asked.

‘As you know, I work closely with many of the world’s governments, and some areas of that work we’d now like you more involved with. It also comes with more money for you personally, and a bigger budget for your software and tsunami warning system.’

‘Oh. Er ...’

‘And if you don’t sign we sack you, or shoot you. Or both,’ Jimmy added.

Crusty decided to sign all the documents and hand them back to Sykes.

‘So, let’s start at the beginning,’ Jimmy said. ‘There exists a very powerful clairvoyant called Magestic, but not one of the fake Magestic psychics you find at Blackpool Pier. This Magestic predicts many things with pin-point accuracy, which is

why many of the world's governments listen to him.' Jimmy gestured around the room. 'Deputy Direct Sykes of MI6, Keely of the NSA, Han of the Chinese Government, Jack from the UK Government, David from Israel, Michelle from France, Ivan from Russia. And in case you're wondering, I make a lot of money from the stock markets because I get told what stocks will rise and fall.'

'Bloody hell,' Crusty let out. 'This clairvoyant ... he's on the level?'

'He ... predicts earthquakes, and other disasters.'

Crusty stared back, wide-eyed. 'Rescue Force! Always in the right place at the right time.'

'Exactly,' Jimmy stated. 'But we have a problem. In the years ahead there are going to be some very large earthquakes, a lot of damage and death, and we're going to help. The problem is... how do we evacuate a place without revealing our sources?'

Crusty smiled. 'With earthquake prediction software that's been rigged in advance.'

'Well done,' Jimmy offered. 'For the next few years I'm going to tell you when earthquakes will appear —'

'And I'll massage the data,' Crusty said, nodding. 'Going to have every scientist on the planet pouring over the data.'

'Which is why we'll keep it secret and secure,' Jimmy suggested. 'You may need a bodyguard at some point.'

'When's the next major quake?'

'Christmas, 2004, a sub-ocean quake off Sumatra —'

'There've been plenty of those throughout history,' Crusty put in.

'This one will create a tsunami that slams into eight countries, killing three hundred thousand. Unless...'

'We convinced the world we're right, and evacuate the beaches,' Crusty finished off.

'You will, unfortunately, be closely monitored from now on, your phone tapped, your movements noted,' Jimmy explained. 'Nothing to worry about, it's just that we very much need you to assist us with this project.'

'If it saves lives, I'm in,' Crusty said with some conviction.

'Good man,' Jimmy responded. 'Now, get to work on that software, and your budget for the tsunami education and warning system will be dramatically increased next week.'

The French President was reportedly delighted to be hosting the first formal “M” Group meeting, and more than happy to assist with the African Conference as well. Security would be a nightmare, what with Art Johnson coming over, the Russian President and the Chinese Premier. But that was down to the French, and not our headache. We booked rooms in a top hotel, three whole floors of rooms. Staying with us would be the executives from CAR Ltd, all of them, our facilitators from the corporation in the Congo and our people at the Foreign Office in London, plus senior Rescue Force staff. Rescue Force had nothing to do with the conference, but it was a chance to showcase the group and boast of successes, not least the recent Australian deployment.

We flew from Bristol Airport to Paris, less than an hour, and were met by a small fleet of mini-buses courtesy of the French Government, then stop-started through Paris traffic to the hotel. Booked in, we knocked on doors and greeted our people, each given a mini-briefing on what we wished to achieve in the next few days; people to meet and nudge, some to drop hints with, some to wind-up. Dining at the restaurant downstairs that evening, I recognised a face at almost every table. All our enemies needed was just the one bomb and we’d all be gone. And this being France, I was nervous.

Shelly always behaved well at meal times, since she would let nothing get in the way of stuffing her face till she burst. The hotel staff found a high chair for her and she munched away, listening to the grown-ups talk about the upcoming events. Rudd and Cosy had travelled up for the show, since they were heavily involved in the Kenyan aspects of CAR Ltd, and both tickled Shelly from behind as they passed. Cosy even stopped to help feed her, a process that simply involved putting food within a yard of Shelly and watching it magically disappear. We checked that no spoons were missing afterwards.

The first day of the show, held at a purpose built conference centre, was for politicians only, and the various groups and their bodyguards now toured the stands. The CAR stand was by far the largest, some twenty of our people stood ready to take questions, or to illustrate answers by pointing at the colourful charts and displays behind them. Our Congo team stood in front

of a large map of Eastern Congo, many photographs depicting all of our good work. The Russian mining and oil companies that we partnered had stands, Yuri and Marko stood with their teams. The Chinese Government had a large stand, hoping to get some business from the conference, as did French and British mining companies. British Aerospace and Airbus had stands, as did a variety of European manufacturers that had wished to attend.

We toured the various displays, the walkways jammed with groups of African leaders, the various world leaders well blanketed by their security as they toured around. We stopped to greet all of the Africa leaders, even those we had not met previously, and stood in a corner for ten minutes with Art Johnson and his team, coffee in plastic cups and French doughnuts. He was keen to meet with the leaders of Sierra Leone, Liberia and Nigeria, but expressed a wish to avoid the new government of Guinea, making me smile. The Chinese were busy trying to do business with countries they did not have a presence in, and they also wanted to meet with the leaders of Sierra Leone and Liberia. The Rescue Force stand received plenty of attention, information packs handed out to those Africa nations that did not yet have their own units. Mac, Coup, Bob Davies and Doc Graham stood in their white jackets with six members of RF UK, plus another six from the French RF unit.

‘Mac, you’ve shaved,’ I said as we neared.

‘Had a bath and washed the sand out as well,’ he retorted.

‘Any business?’

‘Aye, they all want a fucking unit,’ Mac grumbled. ‘Why wouldn’t they.’

Bob said, ‘New Zealand got wind that you doubled the size of the Australian unit. They’re whinging.’

‘Let them whinge,’ I said. ‘When we’re ready ... we’re ready. Besides, Jimmy said the next one would be Papua New Guinea.’

‘Papua?’ Bob questioned. ‘I suppose, they get earthquakes.’

‘How’s Darfur?’ I asked Bob.

‘Getting worse, those camps are growing,’ he reported. ‘We’ve pulled people from all over, got two hundred up there, more on the way.’

Jimmy approached. ‘Bob, while I think of, I’ve sanctioned an increase in the Sumatra unit.’

‘How much of an increase?’ Bob queried.

‘Up to two hundred bodies.’

‘Two hundred?’ Bob repeated. ‘That’s more than double.’

‘They’re cheap,’ I mentioned.

‘How about New Zealand?’ Bob asked. ‘They’re not happy.’

‘How many bodies does their government fund?’ Jimmy asked.

‘They fund twenty, we fund twelve.’

‘Tell them we’ll match their funding if they wish to go to forty and above. And send them all to Darfur, show them what it’s really all about.’

After lunch, the various African leaders continued to wander around the trade stands, whilst the “M” Group countries met upstairs in a private room. The explosives sniffer dogs had been around, the room checked for bugs. Jimmy walked in as if he owned the place, everyone waiting his attendance around a large circular table. He adjusted a set of white boards and maps, and faced the group as I smiled towards some of the “M” Group members who lived at the house.

All of the people I had met were now in attendance, odd to see the “M” Group members from the house sat behind their political paymasters. Art Johnson’s team was the biggest, an Admiral and General sat near.

‘First of all, can we all consider just who ... we have brought with us, and whether or not they are security cleared for this meeting?’

The leaders glanced around at their translators and assistants. No one volunteered to leave.

Jimmy pointed at a man to the right of French President. ‘In years to come he will breach security. I’m afraid he cannot be here today, Mister President.’ He waited.

The French President seemed most put out, but sent the man out after a few seconds thought.

‘Thank you, Mister President. Welcome to you all, this first official “M” Group meeting of world leaders. I hope that it is harmonious and productive. First, since we are all here, I would like to discuss an earthquake. I have started to make plans to attend an earthquake, but such actions will risk exposure to some degree, certainly a lot of publicity.

‘Around Christmas 2004 there will be a large earthquake off the coast of Sumatra, not uncommon for that region. That

earthquake will create a Tsunami, a tidal wave that will strike Indonesia, Thailand, Bangladesh, India and Sri Lanka, causing a lot of damage and a great loss of life. Rescue Force will be deployed *before* the quake, because getting their twelve hours later will achieve little. I will also be issuing a public warning.'

People glanced at each other.

'Between now and that date we shall make known that we have computer software that accurately predicts earthquakes, and – as you can imagine – that software will have many successes between now and that date, giving us credibility.'

'Why risk exposure?' Art Johnson asked.

'Simple. Three hundred thousand dead, two million homeless.' He waited.

'The project ... is more important,' Art Johnson suggested. From the looks on various leaders faces, he had support.

'True. But I will not sit by and watch these people die, nor the millions that will die for various reasons between now and 2025. There is no point in saving humanity ... if we lose our humanity along the way.' He let them think about it. 'And after this earthquake, there will be others, some in populated areas in Western cities, some in China. Millions will die. If we send in Rescue Force afterwards, millions will still die. What say the Chinese Government?'

The translator said, 'We will not stand by whilst millions of our citizens die needlessly.'

'And, knowing that a major America city will be destroyed, killing millions, what say the Americans?'

Art Johnson took a moment. 'We'd want to evacuate ahead of time, of course.'

'Such an *evacuation* ... would only be possible if our predictive software was trusted. Since both China and America have a lot to lose, I will proceed with the project. Do the other nations have a problem with that?'

The leaders glanced at each other, no one raising a voice.

'OK, let's consider Africa ... and its role in 2025.' Jimmy drew up the scenario of a Middle East falling apart economically, politically, and then the rise of the Brotherhood. He then illustrated various sub-Saharan armies holding the line and moving north, holding Suez, and even invading Western Pakistan. A line was drawn on the map where he expected Russia

to hold its southern border, the same for China, the Europeans holding the Bosphorous Straits, the Americans patrolling the oceans.

Art Johnson raised a finger. 'There's no mention of US land forces?'

'If the Africans did not hold North Africa, then your land armies would have to, right up to the Israeli border. If they're not needed, then it is down to you where they would be.'

The Russians and Chinese asked where the Americans would be, an academic question without the Americans knowing the circumstances at the time.

Art Johnson said, 'They'd be where most of the fighting was.'

Jimmy explained, 'That would be one of two places: either the Israeli border, or Greece.'

Sykes raised a finger, Jimmy gesturing towards him as he sat behind the British PM. 'The Greek Army would not last five minutes. Nor would the Bulgarians or Romanians, nor Montenegro or Cyprus.'

'A good point; there is no strong military power in that area. But don't overlook the civilian population. Consider Malta.' He attended a map. 'It would fall very quickly if North Africa was lost. But what if you landed a thousand troops, but with fifty thousand rifles, plenty of ammunition? The Maltese population are not going to sit by and be slaughtered; they'll fight back with vigour. And, if the civilian population of Sicily and Southern Italy, and Greece, we so armed ... they would fight. Not only that, they would absorb the Brotherhood's fighters.'

'And take heavy civilian casualties,' the British PM noted.

'And what casualties will they take after the Brotherhood impose Sharia Law?' Jimmy posed, his hands wide. 'Half would be killed in the first six months. In any future conflict of this nature you must consider an armed civilian response, possibly some training beforehand.'

'And what of Israel?' Ben Ares asked. 'How many soldiers to defend our borders?'

'More than you'd have alone,' Jimmy remarked. 'But, if the Kenyan Rifles set-up a kill-zone in the deserts, no insurgents would get through. Of course, the Kenya Government might expect some ... remuneration for their efforts.'

'No doubt,' Ben Ares quipped.

‘One way to deal with the Brotherhood, is to play to their weaknesses. They want to attack Israelis and Americans. So, if you set-up bases in the desert they’ll come to you in droves, like flies to a fluorescent light. If such bases, American bases, were set-up in areas of flat desert you could absorb and kill a large number of them, slowing up any advance into Europe and elsewhere. And, by 2025, you’ll have technology to use such as automated lasers; they’ll blind anyone approaching. The problem will be one of economy and cohesion. We are all here today, getting along well, but that will not be the case in the future. There will be problems that prevent American, Russian and Chinese leaders sitting around the table together. That will not prevent you from defending your borders, but you will lose effectiveness by not working together. Then there are a number of economic problems to face. So, ladies and gentlemen, tactics for 2025 are only valid if we get there with some money to spend, and talking to each other.

‘One point that you can *all* agree on, is Africa. If you help the economies of the African nations, I will raise an army and try and take North Africa. That will benefit you all, whether you like each other or not. And I’m confident that by 2025 I could offer you an army of three hundred thousand men, all trained to the same standards as the Kenya Rifles.’

‘We have been studying the Kenya Rifles,’ the French translator said for his boss. ‘They would hold their own against five soldiers of any nation represented here. An army of three hundred thousand would do a lot more than just hold the line!’

‘You sound almost ... cautious,’ Jimmy noted. ‘Rest assured that the Africans will never consider invading anyone, but may war with each other. To that end, I know where the flash points are in the future, and my corporations are creating important links between nations to prevent any single African army being a threat to its neighbours. And such an army will not have tanks and aircraft, nor ships. They are infantry.

‘Now, whilst we are on Africa, there will be significant oil discoveries in years ahead that will help to keep oil prices low for us all. But ... OPEC will try and get involved, to our detriment. If oil is sold outside of OPEC, and not necessarily in dollars, it will be cheaper ... and not subject to political control. Saudi Arabia will be a problem when oil starts to flow.’

The French asked, 'Will OPEC drop the dollar?'

'Yes, before 2025,' Jimmy answered. 'It depends on a few factors, but most likely around 2019.'

'And the effect on the American economy?' Art Johnson asked.

'Would be terrible ... without advance knowledge,' Jimmy suggested. 'But, since such a move would also harm many of the people around this table ... I think we'll come up with some plans ahead of time. Such as ... keeping African oil in dollars.'

'Would that be enough?' Art Johnson asked.

'By time we get to 2025 Saudi oil is well past its peak, Iraq oil going strong, so too Iranian, but African oil will equal Gulf oil. The Gulf will not be in trouble in 2025, but well past its peak. And there will be some countries oil free.'

'Oil free?' our PM asked.

'Sweden and Norway will be oil free by then,' Jimmy explained. 'They'll use hydroelectricity and electric cars. France will go all-nuclear, making good use of electric cars, and sell electricity to many other nations. China will be mostly oil free by that time. The main oil consumers will be the US, South America, India and Asia.'

'We don't move away from oil?' Art Johnson puzzled.

'No, because those that follow you are too stupid. America will suffer the consequences. Your great savoir, in the decades ahead, will be China.'

Art Johnson exchanged a look with the Chinese Premier.

The French President had been making notes. 'We sell electricity? To who?'

'To the UK, Holland and Belgium, Germany,' Jimmy listed off. 'Many countries.' The French President seemed pleased with the news, almost proud. Jimmy asked him, 'I would like France to assist with commercial air traffic to the Congo, direct flights from Paris once a week or more. I am also opening up the area for tourism, the Rift Valley north of Goma. Russian and British workers can fly to Paris and change flights for the Congo, sometimes flying direct.'

'OK, let's talk about Cuba. There'll be a trade conference in Cuba in four weeks time, similar to this one. I hope all here, except the US of course, will send senior representatives and your industrialists. Cuba has a lot of oil, and there will be many

lucrative contracts in the years ahead. Whether US companies are involved or not ... is entirely down to the US. Some American corporations will be involved indirectly via my company, CAR Ltd. I would like the Russians and Chinese to help ensure that my company gets some concessions in Cuba, which will then give our partner US companies some exposure in Cuba – helping towards a peace between America and Cuba.’

‘And if there is no progress?’ Art Johnson asked.

‘Then you’ll lose out on good trade opportunities, and Cuba will end up rich – and hostile. The opportunity is there to normalise relations, a costly mistake if missed.’

‘We are making progress,’ Johnson insisted.

‘Perhaps ex-President Harvey could visit,’ Jimmy suggested. ‘The first former US President to do so.’

‘We’ll ... discuss that,’ Johnson hesitantly offered.

‘On the subject of the Caribbean, I would like Russia and China to keep in mind that Venezuela is run by a nutcase, and will end up as a poor and war-torn nation ... unless assisted. It’s President cannot, and should not, be supported by anyone. The chaos in that country is achieving nothing for the world, or the advancement of the world. And, in years to come, they will deliberately provoke a US President, leading to a war if we are not careful, a costly war for America. That is to be avoided, due to the damage it does to the American economy, and to the dollar. It is the key trigger event that takes OPEC away from the dollar.’

People started making notes.

The French President unhelpfully put in, ‘If OPEC switches, it will be the end for America.’

‘Not the end,’ Jimmy quickly got in, ‘but a serious economic crisis, mass unemployment, and the rise of right wing elements in American politics.’

‘Can a switch be avoided?’ the UK Prime Minister asked.

‘With a great deal of hard work, yes,’ Jimmy replied. ‘But that *hard work* would mean a significant shift in US fiscal policy, something that is unlikely to be palatable to any US President in the future. Which leads us to the current economic crisis.’

‘What crisis?’ Art Johnson asked.

‘The one boiling slowly away in western house prices. Between now and 2007, house prices will rise due to a booming

world economy, and the more they rise the more investors will buy additional properties. From 2005 onwards, US and European bankers will invest heavily in the property and mortgage market, in particular in the mortgages for poor people. Chinese investments into those banks will fuel the rises, causing a peak and a snap-back, leading to a severe economic crisis. The money markets will freeze and need bailing out, so much so that the US deficit reaches a dangerously high level. That crisis *will* be avoided, not least because Russian and Chinese investors are already aware of it, and I am taking direct steps to help counter its effects. In Europe, the British and French Governments must do all they can to regulate the investment branches of their banks, and keep capital reserves high. They should also avoid investing in Icelandic banks, putting that country on a lower credit rating if Iceland continues to invest heavily in the US sub-prime mortgage market – starting now.

‘The US will suffer when the crisis hits, but those affected the worst will be Greece, Spain and Portugal in Europe, plus Iceland. In the UK, six principal banks will go bust and need government bailouts.’

‘We’re confident that *will not* happen,’ the UK Prime Minister insisted. ‘We are keeping a very careful eye on it.’

Jimmy nodded, ‘Unfortunately, there is only so much I can do to affect the US markets, so it will be down to the Chinese to avoid investing in the US mortgage market to stem the crisis.’

‘We are taking steps,’ Johnson insisted. ‘No nation should be cautious about investing in the US markets.’

Jimmy countered with, ‘Between now and 2006, all nations should be cautious of US property investments.’

The Chinese Premier said, ‘We will take Mister Silo’s advice on the matter.’ The Russians echoed that sentiment, clearly annoying Art Johnson.

Jimmy explained, ‘The economic crisis of 2008 is far worse than what you may perceive as lost investments between now and then. But, the Chinese should have no problem with investing in business property, or quality housing projects, up till mid 2005. A point, sir, at which *you* may be out of office.’

He took a sip of water. ‘OK, next ... India. Between now and 2009, a number of terrorist attacks will take place in India, organised by Pakistani Taliban fighters and other Pakistani

groups. Those attacks will bring the two nations close to war. I would like the US and the UK to assist India with developing a dedicated counter-terrorism force, the details of which I will supply soon. I would then like China to appoint me as mediator to the Indians over disputed border regions. I will require China to be the big man, and to concede to the Indians a few miles of border. Thereafter, we need to see China ease tensions with India, improve trade and co-operation, towards the goal of supporting India – should it be attacked by the Brotherhood. China needs to keep in mind that India is the buffer between the Middle East and its own territory: the better India does in the fight, the less China has to do.

‘OK, Sri Lanka. The Chinese will assist the Sri Lankan Government in their fight against the Tamils. No one ... should criticize that action. The Chinese will then build a port in Southern Sri Lanka. I would like that port extended so that it could facilitate a US naval fleet.’

Jimmy illustrated a map of the Indian Ocean. He drew a line from Sri Lanka to Kenya, then from Sri Lanka to Australia. ‘Those lines, are the lines that the US Navy has to maintain in order to prevent the Brotherhood spreading themselves around Asia. The Key port is Sri Lanka, the only one that can be trusted in a time of crisis.’

The Chairman of the Joint Chiefs, the Admiral that we had met, asked, ‘What about the port in Somalia?’

‘That port is useful, but you can’t take on supplies there,’ Jimmy explained. ‘Not even water. In years to come a new port will be built in Kenya, also by the Chinese, and that would be an important forward base.’

The meeting dragged on for another thirty minutes, becoming a question and answer session, before we broke for the day. But breaking for the day simply meant that we travelled around to the embassies of each nation and had a private chat with the respective leaders. We left Art Johnson at the US Embassy to the last, arriving at 8pm. With him were his team; his Chief of Staff, his National Security Advisor and the Admiral.

‘Not sure I like our dirty laundry aired in public,’ he began with.

‘You don’t have to attend these things,’ Jimmy countered. ‘And if there are some subjects you want kept quiet, let me

know. Besides that, be happy that all those nations are talking, not fighting.'

'You're holding back countries from investing with us,' he complained.

'Get your house in order, and I'll reverse that,' Jimmy said with a false smile.

'So if I asked you for a detailed plan on *how* to avoid the crisis, *and* get the investment, you could give us that?'

'I could.' Jimmy took out a thin document and handed it over.

'This my homework?' Art Johnson asked.

'It is. And you need only stop fraudulent mortgages.'

'Fraudulent?' the Admiral repeated.

'Yes, fraudulent. At the moment, people have to prove income and possess a good credit rating to get a mortgage. In years to come your unscrupulous American mortgage re-sellers will grant mortgages to anyone who can sign their own name. That leads to a spike in prices, followed by millions of defaults. All you need to do, to avoid the crisis, is to apply the same standards that mortgage brokers applied ten years ago. Simple.'

'That whole crisis ... is caused by that?' the Admiral asked.

'Yes, just that. And last week the Chinese signed off on building many low-cost homes in the States, a massive investment. Those homes will, however, be rentals and not sold. That building project should help to keep prices to a suitable level. If you then do your *homework*, we'll be fine.'

'So, in effect, you're working around the administration,' Johnson noted.

'That is how things are done in your country, isn't it?' Jimmy teased. 'Free enterprise and all that.'

Johnson smiled, shaking his head. 'That medical insurance company is doing well, saving us a lot of money. The way it's growing it should be number three in less than ten years.'

'Taxing the rich,' I said.

'Taxing the rich?' the Admiral repeated.

'It takes money out of Wall Street,' Jimmy explained. 'Away from short-term investors, who have the money to lose. It'll also be involved in some low-cost property building.'

'Quite ... *socialist*, for Senator Pedersen,' Johnson noted.

'Yeah, but he hides it well,' Jimmy said. 'Oh, we'll need him inside the "M" Group next year.'

‘We will?’

‘Yes, got some projects for him, and we’ll need his help with your replacement.’

‘You don’t feel like helping me stay on?’ Johnson teased.

‘Three Democrat terms? The voters are tired, that’s all. It’s not you or anything you’ve done, just a desire for change that will swing the next election.’

Back at the hotel, after our meal, Cosy came and found us. ‘Got a minute?’

Jimmy gestured him to a chair.

‘The first batch of nurse students will graduate in a few weeks, they’re in a work placement at various hospitals at the moment. Some have applied for jobs in Kenya, but they’re unlikely to find work, even with an Ebede qualification.’

‘Not many nursing jobs?’ I asked, Cosy shaking his head.

Jimmy told him, ‘Any that wish to work in a hospital should be helped and encouraged. Anyone wanting to work in a hospital or clinic in the Congo – that’s fine. The rest can be offered work in Rescue Force, I want none of them out of work.’

‘There’re are sixty of them,’ Cosy warned us.

‘That’s OK, we’ll make use of them,’ Jimmy suggested. ‘What Rescue Force foundation work have they done?’

‘Jeep driving, fitness, map reading, self defence,’ Cosy listed.

‘Be a quick work-up period at Mawlini,’ I realised.

‘Warn Mac they’ll be coming his way,’ Jimmy told Cosy.

‘What about the boys?’ I asked Cosy.

‘There are ten boys in the nursing class, the other seventy will complete their military apprenticeships at the same time. Twenty have been selected for Officer Training, a few sponsored for degrees by the Army.’

‘If any wish to pursue a degree course ... we’ll sponsor them,’ Jimmy suggested. ‘Especially studies in oil, geology and business.’

‘The rest go straight into the Rifles?’ I asked.

‘To the Junior Leaders course,’ Cosy explained. ‘It’s separate to main body. Many go on to officer training or helicopters.’

‘Good,’ I commended.

‘Next years sixth form starters number three hundred,’ Cosy warned us.

‘Expand the college,’ Jimmy said. ‘Whatever it takes. How’s that cadet movement?’

‘The Army Cadets have four hundred, aged from thirteen to sixteen. The Rescue Force cadets have two hundred.’

‘Increase the Rescue Force cadets, please,’ Jimmy ordered.

The trade show started properly the next day, African ministers and businessmen touring the stands with invited guests, plus the trade media and those people who wanted to visit, people with business interests in the sub-Saharan region. The halls bustled with activity, the staff on the stands kept busy. We put in an appearance, meeting several groups that we were interested in awarding contracts to in the DRC. Many cups of coffee were downed, many bagels chewed. We did not get back to the hotel till 4pm and I felt exhausted, mentally exhausted, flopping onto the bed, Shelly jumping onto me. Helen and I managed to have a quiet evening, food in our room, and simply sat on the bed watching cable TV.

The next morning we packed early, Helen and Shelly sent back to the house, Jimmy, myself, and many of the CAR staff off to Africa. CAR had booked a 747SP as normal, the plane stuffed with goodies for the region. Travelling with us were senior staff from the French company that had built the international airport, this being our first flight into it; the new airport had only opened a week ago. I made them laugh by warning about a smooth landing, and was their tarmac any good?

I glimpsed the now dormant volcano north of Goma as we descended, and we did manage to touch down smoothly. Stepping down from the plane, I glanced up at the tall and impressive control tower, the controllers inside offering a service to neighbouring Uganda and Rwanda, plus aircraft transiting our airspace. The terminal was impressive, if not way too large for the passenger numbers now scuffing the shiny floor, hairy oil workers in boots. We found Passport Control to be smooth and efficient, the officers well presented.

With our luggage dumped in a secure room we began a tour with the French builders and the airport manager, the man also French. I stepped through the scanners, setting them off, before adjusting my metallic content till they stopped bleeping. They seemed about right. The baggage carousel was switched on and

observed for five minutes before we tried a meal in the departures lounge, just a handful of passengers present. The restaurant offered its patrons a pleasant view of the runway, the full size of the place now dawning on me. Across the runway, I could see maintenance sheds, awaiting an airline or two to park their planes, next to them cargo sheds, finally a high fence with armed guards patrolling. The airport even had a permanent detachment of twenty Congo Rifles - just in case.

In the basement of the control tower we stood behind operators attending orange radar screens, transiting aircraft being advised of other traffic, one Huey passing nearby and being directed away from the airfield's control zone. From the glass tower I could appreciate the entire span of our new airfield, and the size of the undertaking; three miles long by two miles wide. A hotel sat inside the gates, used by transit workers and our staff, alongside a standalone restaurant and a bar. All we needed were some passengers.

I spoke too soon, a German Airbus coming in to land, stuffed full of tourists bound for the new lodges along the rift valley, the flight subsidised by us. It landed smoothly, taxied around and was met by the stairs, passengers soon stepping down to a purpose designed apron coach, the Germans dumped at Arrivals.

'Tomorrow we've got a flight from London,' Jimmy mentioned. 'More tourists, some workers; six international flights a week at the moment, five to Kinshasa, plus a couple of UN flights.'

'Keeps the place ticking over,' I commented.

With our 747SP refuelled, we boarded with the French party, a quick one-hour flight to the second airfield that they were involved with, this one incomplete. We circled the field to let them know we would land, and touched down without permission, taxiing around to a half built terminal. With little ground support save steps, the engines would have to idle, the monstrous engines whining as we stepped down. The workers picked us up in a coach and transported our party around to an unfinished tower. In the breezy tower, glass free, the French pointed out things of interest, displaying a map of the regional "airport-to-be".

Back aboard the 747, we flew south to a third airfield, but this time just circled it to get a view. We landed at Forward base two

hours later, the sun down and night claiming the sky. The facilities at Forward Base were as good as our new airport and we all booked into the hotel. The chitchat at the meal that night was of aircraft, airfields and interesting facts about Charles de Gaul airport in Paris, which these guys built. At least the new terminals they built, since I figured that the original had been there a while.

In the morning we said goodbye to the French and spent the day with our corporation managers, the detail of many projects poured over, money moved around from one project to another depending on their level of priority. The Congo Rifles were still growing, as was our new police force. That police force operated along the same lines as the Rifles; we paid and fed them, trained and equipped them and ultimately influenced them. They had been named as National Police, to differentiate them from their local counterparts, who could only be trusted to direct traffic. Their weapon training was on par with the Rifles, and they took no crap, one of their roles being to monitor local police officers – and to arrest them if necessary. They had their own distinctive jeeps and travelled in groups of at least four. According to the reports in front of us there were now four hundred of them.

The orphanages now reported over fifty thousand kids, but that figure was distorted by the fact that we offered day schooling to locals. Since the kids got three meals a day, locals were onto a good thing by getting their kids in. Feeding those kids was down to the Farms Manager, the man controlling the clearing of forests near the orphanages and the planting of crops, the local farmers given seeds and machinery, but made to sell the produce back at a reasonable rate. There were also dozens of state farms, some of them huge, and within a year we aimed to be net exporters of food.

At 3pm we visited the RF unit, greeting old friends and familiar faces, dining with them that evening and catching up on all the gossip. The rooftop bar had not changed much, the waiters remembering us. The following day was again all paperwork, this time with CAR Ltd and the partner companies, Russian and Chinese. We poked at maps and discussed mining and oil for hours, tightening security where it was needed or requested. A few roads needed to take priority, two bridges needing to be built quickly to save long road journeys. When the hungry industrial

machine had been satisfied, Jimmy ordered revenue directed toward Darfur, two field hospitals of Cubans to be set-up.

Our final meeting regarded Zambia. The Zambian Rifles unit had been launched and was coming along, a few clinics had been built over there, some roads repaired, their RF unit recruiting its first thirty staff. Jimmy was happy enough with the progress so far, agreeing a budget increase for the Rifles now that we could see some tangible progress.

Arriving at the apron, Tubby stood with folded arms, tapping his foot. 'Nice of you to grace us poor humble pilots with your presence.'

'Fuck off,' I told him with a smile. 'And get to the gym, fat bastard.'

'Charming,' Tubby said. 'We be needing parachutes for this trip?'

'No,' Jimmy said with a smile.

Our dated pilot flew us to Kigoma Airfield in our dated Dash-7, a quick hour flight skirting around Burundi airspace. And Rwandan airspace! We landed in the dark, met by a jeep for the very short journey to the RF hotel, now used mostly by the UN. Having booked in and dumped our luggage, we climbed stairs to the rooftop bar and peered down at the floodlit airfield. Nothing seemed different. RF staff called out to us and we joined them at their tables for food, joking the night away under the stars.

Since we had met most of the RF staff the night before, we skipped an inspection of the unit in the morning and took a jeep the short distance to our hotel up the road. The road seemed cleaner somehow, more shops and businesses dotted along it. The hotel manager welcomed us and offered cool drinks in the bar, nothing in particular to report; year on year it plodded along and just about broke even.

Driving through the bustling ferry port area we turned south, taking the lakeside road down to the old refugee camp, now home to a company of Tanzanian Rifles, six green Hueys sat idle. The senior officer welcomed us, the men turning out for inspection, the base having been warned of our arrival the night before. We played like royalty and inspected the lines, talking to the men and the officers at length, trying to make them all feel needed. The officers mess was now a stone building, not the tent I had first seen, and they made us lunch, informing us about day-

to-day operations along the border, and their on-going battle with smugglers of all sorts along the lake. It seemed that an interesting day around here involved chasing pig smugglers in a Huey.

Tubby flew us over to Nairobi that evening, landing late and booking into our usual hotel, and with our usual compliment of Pathfinder bodyguards. A message was waiting for us: CAR and Tanzanian officials arriving in the morning. Rudd and Cosy were back in Kenya from Paris, and met us early, a quick chat about local matters before the main meeting, to be held in a function room of the hotel.

Since discovering oil in Kenya, the Tanzania Government had been encouraging us to sink wells in their country - the risk and cost all ours, of course. Jimmy had resisted so far, wishing them keener on the idea, and more generous on concessions. Our visitors arrived on time, the CAR senior staff welcoming the guests and bringing them in to us. I knew most of Tanzanians from previous meetings, and they all remembered me as I helped to arrange chairs for them.

Settled, they quickly got to the topic of oil exploration. Problem was, they did not have two pennies to rub together. Jimmy was in devious mode, and took thirty minutes to torture them, finally agreeing on offshore test wells, but only if we had a guaranteed concession if oil was struck. That was not a problem, the relevant documents having been brought along, the Tanzanians keen that CAR have rights to all of Tanzania's oil, if there was any. CAR signed, we signed, and the Tanzanians signed, our Kenyan solicitor witnessing and signing. Champagne was brought out, an optimistic gesture.

Then, in an odd move, Jimmy informed our guests that a Chinese rig on its way to Somalia could be diverted to Tanzania. CAR were dumfounded by the move, not least because we knew where the oil was in Somalia. Jimmy reassured them that he would smooth it with the Chinese, and that we had not yet got a CAR concession for Somalia anyway. The Tanzanians left happy, Jimmy telling CAR where he wanted the test drilling to take place, the southern end of Zanzibar Island. Since the rig belong to the Chinese company that we partnered it was not a problem, it was all in the family, the Chinese on their way to Zanzibar anyway.

We thanked everyone for their efforts, Cosy driving us to the airport, where Tubby waited to whisk us up to Mawlini. I made sure our pilot was suitably insulted as we boarded, and took right seat from Sue. Approaching Mawlini, we circled low and slow, Tubby pointing out a new barrack block for nurses in the RF compound, followed by the hotel at the top of the base for oil workers, a new terminal building to handle civilian flights – paid ticket flights – and finally a small town being constructed north of the base for oil workers and families. A little out of practice, I landed us smoothly enough, getting a dollar from Tubby; pocket money for “being a good boy”. It was not like I had ever been rude to him.

Mac picked us up in a jeep, grumbling already about all the extra work, the construction and the extra nurses coming his way. We passed a group of New Zealanders, trainees sweating in the midday heat, their work-up before Darfur. After a cold beer, and a whinge from Mac, the senior staff assembled in the lecture hall, Doc Graham down to take charge of Darfur, virtually all of the regular UK rescuers now assigned to Darfur. We greeted everyone collectively, sitting as Doc Graham gave a presentation on the situation.

It was bad, getting worse, and believed to be about to get much worse. Short and sweet, I considered. We told him about the two Cuban field hospitals, agreed to let him pull in Cuban regulars, and suggested that budget was not a problem. Doc Graham was told to deal with the issues, we’d worry about the money. Mawlini was designated regional command centre for the Darfur operation, the small airstrip in Darfur we had chosen to be named as Forward Base, no permissions from the Sudanese yet. A helicopter-refuelling base had been created in Southern Sudan and already manned by the Rifles, fuel trucks ready. All was set for a minor invasion, and a major operation.

Ten small camps had been set-up along the border with Chad, consisting of white RF tents and detachments of Kenyan Rifles. They already had refugees flocking to them, and Jimmy suggested that they would now grow quickly, food convoys being arranged, not least from our people in the DRC. Looking at the overhead slide for deployment stats, I could see that this would be our biggest deployment to date; we would be stretched.

Taking a break from the meeting, and downing a cold beer, Jimmy said that this would be the making of Cassie, the lady doctor we had met all those years ago in Nairobi. She'd meet her husband, but would also make the movie screen. He also mentioned that we'd lose some people.

'This going to get out of hand?' I asked.

He glumly nodded. 'Big time.'

Back in the meeting we agreed to just about everything Doc Graham asked for, agreeing for him to pull people off other assignments. The new Kenyan and Tanzania nurses would boost numbers, two hundred and fifty of them ready to deploy. Still, it was not a big number for a million refugees, and more than twenty camps.

Back in the damp British weather, at the house, Jimmy turned the lights on in the basement, setting up a command centre for the Darfur operation. When Keely brought down satellite photographs of the area I knew it was serious; we were about to go to war again.

Cassie

Twenty-six year old Doc Cassie landed in Chad with a bump, her Huey blowing up a sandstorm. With the rotors winding down, the engine whining as it lost power, she stepped out with her head down, dragging her two heavy backpacks; her personal kit and her extended-stay RF pack. She took one look at the camp she had seen from the air and wondered what the hell she had let herself in for. She struggled to get her rucksack on before grabbing her second pack, walking towards a waiting jeep and kicking up sand with her boots as she progressed. She noted a broken down bared-wire fence, the bleached bones of a dead animal, and a scorpion, and little else. Sitting down on the jeep's tail, she offloaded her backpack, already sweating. The guys helped to push her pack inside and she grabbed a seat behind the driver, correctly recognising him as Kenyan Rifles as issuing a

Kenyan greeting. She got back a toothy smile in the mirror. Five minutes of bumping along ill-defined tracks delivered her to a large green tent behind a large white tent, faded “UN” initials stencilled onto them.

A large and muscular nurse in a t-shirt greeted her. ‘Ladies: in this tent. Put your kit on a bunk then report to the front of the white tent. And get a bloody hat on!’

Cassie dumped her kit on an available bed, trying not to wake the sleeping occupants. At the front of the white tent she met her team, its team leader checking they were present and correct. Since he only had four to worry about, it was not a difficult task.

With a Huey roaring past, the same nurse appeared. ‘I’m Nurse Sheldon, but they call me “Butch”.’ Cassie resisted a smile. ‘This is Triage Tent One, initial drop off point for wounded or sick. Follow me.’ She turned on a heel. At the next tent she labelled it as Triage Tent Two, then Three; so far, it was not complicated.

‘The accommodation tents for the staff who work these tents are right behind them. You’re newcomers, so you get fuck all sleep for a while. We have a policy of burning out newcomers.’ Cassie blinked. ‘OK, behind the accommodation tents are regular staff tents, be quiet around them or you’ll get a boot up your arse.’ She led the team through. ‘Ablutions hut and ... facilities,’ she said with a dismissive wave. ‘They’re not very private, but who cares. When you are tired as you will be - you’ll not give a shit when you leave a shit.’

The smell hit the group.

‘Yep, it smells, so don’t forget to cover your waste with sand; it then gets burnt with oil. We have locals who do that, plus RF staff who screw up.’ Butch led the team to the left. ‘Food tent: the most important place in the camp. Eat often, even if you’re sick with the shits, keep hydrated or you’ll drop.’

She led the team up a small rise of sand. Standing at the top, the team looked out over a vast expanse of tents and makeshift shelters, most of them blue plastic sheets with “UN” labelling.

Cassie put a hand over her eyes and squinted at the tents, the camp stretching out to the horizon in all directions. ‘How many people are there here?’

‘Sixty thousand, we recon.’

‘And how many of us?’

‘Forty. You work it out. But there’s a UN centre on the far side, Red Cross, and food shipments come in regular from base. You do what you can, and you don’t let it get to you.’

Butch led the team back to the tents, leaving them at Triage Tent One. ‘Get to work, you’re on day shift, which is hot; 8am to 7pm. Lunch is whenever you get a break.’

Cassie and her team stepped inside, to a stink of rotting flesh, the sounds of crying kids and adults in pain.

‘You just arrived?’ a middle aged man asked.

‘Yes,’ Cassie answered.

‘OK, stand outside and make assessments of the newcomers. Turn away the minor wounds or treat them there, get your packs. If it’s life threatening – shout!’

Having retrieved her pack and opened it ready, Cassie sat behind a wobbly trestle table with her team, some shade afforded by the tent. For thirty minutes they waited in the heat, swatting flies, before a dilapidated coach pulled up. A woman stepped down, carrying a newborn, the umbilical still attached and visible. Cassie swallowed.

The same man stepped out from the tent. ‘Lay out a blanket, attend her off to one side. This aint London, love.’

Cassie assisted the woman, whose face remained hidden behind a purple veil. It was a shock, the lack of basic hygiene or medical care. Ten minutes later, satisfied that she had done what she could, Cassie grabbed a man with an infected gunshot wound. She led him inside. ‘Gunshot wound!’ They took him off her. Back outside, Cassie found a man with a deep laceration, and decided to stitch it herself, right there in the sand on her knees, wondering what her previous registrar in St. Barts, London, would have made of it.

At 7pm her team was relieved, Cassie heading straight for her bunk. Butch intercepted her. ‘Eat first, drink, then sleep! Never ... put you head down hungry or thirsty, you’ll wake up feeling like shit and be no use to anyone.’

With what energy she had left, Cassie stomped through the sand to the food tent, finding it bustling with life.

At the counter they said, ‘Heaters packed in.’ The woman gave her three tins of meat, a bottle of water and two cans of lager. Cassie cocked an eyebrow at the lager, before sitting in a free space.

‘New here, love?’ came and Australian accent; Dunnnow.

‘Yes, boss,’ she said, noting the rank insignia on the shoulder.

‘Call me Dunnnow.’

‘Ah, the infamous helicopter pilot. I read the books.’

‘Don’t believe a word of it,’ he said with a smile. ‘I’ve never crashed a Huey, just landed hard a few times.’

‘You a Brit?’ came an American accent, the man sat opposite. He appeared to be around thirty, tanned and unshaven, yet attractive.

‘Yes, I’m Cassie. I didn’t now there was an American unit.’

‘There isn’t yet, I volunteered to join the Kenyan unit. I’m Anton Schapp from New York.’

‘Swiss parentage?’ Cassie asked.

‘You’re good,’ Anton commended. ‘My Grandparents were Swiss. Any specialities?’

‘I can put a peanut on my nose and eat it,’ Cassie offered, making those sat closest laugh.

Two hours later, Anton walked Cassie the short distance to her tent; he was next door. ‘Get rest when you can around here, every minute counts.’

Cassie saluted her new friend, soon fast asleep. In the morning she woke to find a mosquito tent over her.

Sitting up, a woman told her, ‘Don’t forget your mossie tent, or you’ll be bitten to fuck.’

‘Thanks. It was my first day.’

‘Welcome to hell, doc. Wash what you can, stuff your face, drink some water and get to it.’

Cassie grabbed her boots from where she had hung them up, standard RF practice. She looked inside, then checked again with her hand, finally putting them on when certain there was nothing unwelcome making a happy home inside. The second day was even harder than the first, a solid twelve-hour shift with a ten-minute break for lunch. In the mess tent she found the cookers working, a hot meal appreciated. If she could have identified what it was, that would have been a bonus. She sat with her team, but close enough to Anton and Dunnnow to chat.

Six days later she woke to find that she had a day off, and enjoyed a leisurely breakfast, getting to know some of the other doctors. She even had time to make a cup of tea, her first one. Back at the accommodation tents she found a hidden square

walled by tents, a group of nurses sunbathing, several topless, a male doctor sat chatting to one. 'Very Swedish,' she muttered, deciding to catch some sun, down to her bra and knickers.

An hour later someone tapped her foot. 'Fancy a ride?' Anton asked, the nurses making rude noises.

'That's a bit forwards,' Cassie joked.

Anton smiled widely. 'In a helicopter.'

'Ah,' the nurses collectively let out.

Cassie lifted up onto her elbows. 'And where is this helicopter ... heading?'

'Local town; supply hunting, some shopping, cold beer.'

'Cold beer, eh?' Cassie repeated as she stood, dusting off sand and pulling on her trousers. She carefully checked her boots again, and stamped them on, pulling a t-shirt over her head. 'OK, I'm ready. How'd I look?'

'Rough,' Anton said.

'Charming. Typical bloody Yank.'

Ten minutes later, Dunnnow blew up a dust storm and lifted off, soon cheekily setting down on a football pitch in the local town. With two Kenyan Rifles minding the Huey, Dunnnow led the group to the town's café, cold beers ordered. After a cold drink the group split, Dunnnow and two doctors off hunting for fresh fruit and working batteries.

'Fancy a proper shower?' Anton asked.

'First you offer me a ride, now a shower,' Cassie teased. 'Don't I get dinner?'

'Not around here,' Anton said, laughing. He stood, 'Come on, I'll show you pleasures like you've not had for ... a week or so.'

Stood in a hotel room with a wobbly ceiling fan, and gesturing towards the bathroom, Anton said, 'You first, I'll order us some fruit.'

Cassie stepped into the bathroom, enjoying a cold shower a few minutes later, washing out seven days of grime. Back in bra and pants, a towel around her midsection, she thumbed Anton towards the bathroom. 'Wash it, Yank.'

Anton stepped past her. 'Don't eat all the good fruit, it cost ten dollars.'

'You know how to spoil a girl.' She sat, grabbing a melon and cutting it open, savouring the juices.

Ten minutes later Anton appeared in just his trousers, his physique impressing Cassie as she munched and slurped melon. 'Is it tasty?' he asked her.

'A bit, yes,' Cassie responded with a teasing look. 'This is all very forwards - you know that. And you're a New Yorker, which means you're a bit ... you know, *pushy*.'

'It's nice to be in the position where I still feel human, still able date a girl. It's ... been a while.'

'No conquests at Mawlini, that hotbed of alcohol and sexual intrigue?'

'I don't like girls with muscles,' Anton said, grabbing some melon. 'I like women who are slim, petite, and with a cool Brit accent.'

'Careful, you may turn my head. Besides, I haven't asked you the relevant questions.'

'Such as...?'

'You well paid?'

'Nope.'

'Secure job?'

'Nope, downright dangerous.'

'Good working hours and holidays?'

'No, they're terrible. How am I doing?'

'Not good, I'm afraid. Are you great in bed?'

'Not had a lot of practise. I'd need a book or video to get it right.'

Cassie glanced over her shoulder at the bed. 'You reckon it's clean?'

'No, but cleaner than where we're at now.'

'Will they gossip at the base?' Cassie teased.

'Definitely. You'll be known as the whore of Triage Tent One.'

'Oh, that's nurse Denton; she's done all the doctors there. I'd have to make do with second place, I suppose.'

'Then I'm hoping you remember what goes where.'

She leant in. 'I have medical training,' she whispered.

Anton from New York, and Cassie from Brighton on the south coast of England, became an item, sitting together for meals. Everyone knew, and no one cared, they had their own daily battles to get through. Once a week they would try and catch a

flight to the town; twelve dollars for the room, ten dollars on fruit, twenty dollars on the black market for a pack of condoms.

Four weeks into her tour, Cassie got a five-day break at Mawlini with her team, a Huey flight to the nearest airstrip, then a three-hour ride in the Dash-7. Anton had used up a favour or two and swapped shifts around, accompanying Cassie back. And for the next five short days they lounged around the pool, drank heavily and ate well, catching up on much needed sleep, a few days spent in bed, food ordered in from the rooftop bar.

Cassie had only been back on the front line three days when an incident occurred. She had treated a thirteen-year-old girl for a serious vaginal infection, but noted the cut marks. Using an interpreter, she quizzed the family, the father not willing to talk with a “female”. Cassie soon realised that the father had sold the daughter into marriage, not uncommon for the region, but had to take her back when the would-be forty-year-old suitor was unable to get his marital rights of a cold night. The father had then tried a common approach in the region, that of a little DIY surgery with a rusty razor.

When the father finally admitted his actions, by no means illegal in Africa, she kicked him swiftly in the balls, then the face, knocking the man out. She was packed up and put on a Huey within an hour. Back in Mawlini, she had a night to stew over things before a disciplinary hearing. Anton used up another favour and got through to the barracks, a nurse fetching Cassie. It was a brief chat, Cassie doubting her suitability for Darfur.

In the morning Jimmy rang Doc Graham. ‘You got some problems with Cassie I hear.’

‘How the hell did you know that?’

‘I hear things. So?’

‘Yeah, she beat the crap out of a local,’ Doc Graham explained.

‘Why?’

‘Like a lot of fathers up there, he did a bit of DIY female circumcision, or something like that.’

‘What do you have planned for her?’ Jimmy asked.

‘It’s a serious matter. If it reached the press we’d have a problem. I don’t approve of it anymore than anyone else, but it’s their country.’

‘True. Send her on a ten day jungle survival course in the Congo, then back to Darfur.’

‘That’s all?’ Doc Graham challenged.

‘You’ve seen her scorecard; we need her more than she needs us. So that’s all.’

‘Are you taking away my right to discipline those under me?’ Doc Graham pressed.

‘No, I just want the good staff kept in. Teach her, convert her, and lead her ... rather than risking her leaving. And how many times have I challenged your decisions to date ... on matters like this?’

‘Well ... none, really.’

‘Then do as I ask, and *next time* you can ask me if I’m interfering. Bye.’

Doc Graham sat Cassie down and told her how disappointed he was, how much he disagreed with female circumcision, but that it was a serious matter. She was sentenced to ten days jungle survival, starting immediately, after which she would go back to Darfur.’

Cassie apologised for her actions, and said she would do better in the future. Anton called again, and she explained that she would enjoy ten days of rain whilst he suffered in the heat of the desert. She was not bothered by the course at all, and quite looking forward to the challenge. She had attended the Greenhouse in Swindon, and therefore did not need to attend this type of field survival course within three years of joining. Flying off to Forward Base in the DRC, she realised that she could lose Anton, and that was the worry. As for Rescue Force, she had enjoyed the hard basic training greatly and wished to stick at it, but Darfur was hell. The long flight afforded her time to think things through, not least what her parents would say if she left.

At Forward Base, Cassie checked her email at the RF unit, a note from Jimmy Silo himself: “Hope you stick at it. Personally, I would have killed the man, but we can’t judge other people’s traditions ... too much. PS. You’re a dirty stop out, girl!” Cassie smiled widely before deleting the message.

After an arduous seven-hour jeep drive in the dark, bumping along uneven tracks, Cassie and the new recruits arrived at the training ground. Stood up to their knees in mud at the side of the track, the driver said, “I left my cigarettes back at base, I’ll be

back.” He drove off, leaving the group with no leader as the dawn light fought its way through the high trees.

‘What, no instructors?’ a woman complained.

‘It’s a test,’ Cassie pointed out. ‘OK, first things first: running water. I suggest we backup along the track till we find some, then make a camp in sight of the road, leaving a marker on the road. He may not be back for days, so we need shelter – because it *will* rain – and possibly some local food, which we’ll have to catch.’

‘Sounds like a plan,’ a male doctor approved, a giant of a man at six foot five. He led the way in the dawn half-light.

Three days later the instructors arrived, Cassie having organised a dry and efficient campsite. They were most impressed. She had even caught a wild deer and a pig. For the next two days they taught the recruits the best ways to set traps, jungle map-reading, tracking animals, jungle pathways, and how to identify a few edible plants. That led on to jungle medicine; which plants and mosses could be used to cover wounds. They made a number of stretchers from branches and vines and lugged each other around through the forest.

On one particular day they walked two miles to a river and found a small waterfall, all being ordered to jump over, which they found great fun. Downriver, they fashioned ropes from vines and practised rescuing each other. They had to sleep rough that night, little more than their packs and some plastic sheeting, the next day spent fishing by line, spear and improvised nets. When Cassie grabbed a snapping turtle she was told to put it back. Not deterred by that, she swam down and speared a giant catfish, three people needed to haul it to the bank; they ate well that night, joined by the Kenyan Rifles that had been watching them all along. They had never been in any danger, the Rifles sometimes within yards of them and not noticed.

For Cassie, it seemed to end too soon, and she realised that she would seriously miss fun like this if she got kicked out. The return Forward Base meant hot showers and decent food, and time to reflect, soon on a direct flight back to Darfur. Arriving at 7pm, she dumped her bag and entered the mess tent.

‘Here comes trouble!’ someone shouted, cat calls and wolf whistles issued.

She gave a regal bow, and joined her team and Anton. ‘Miss me?’

‘Where you been?’ they asked.

‘Didn’t they tell you? Ten days punishment: a jungle survival course in the Congo. And it rained ... every day.’

‘Lucky bitch,’ a nurse said.

‘Wet, damp, cool, glorious rain,’ she teased, getting bread rolls thrown at her. ‘What’s new here?’

‘Camp has got a lot bigger,’ they reported, ‘but more of us. Another thirty, plus twenty Kenyan nurses.’

Anton explained, ‘Those nurses walk around and do the births, pre- and post-natal. Saves us time.’

The next day Cassie reclaimed the front of Triage Tent One.

Spies

Landing at Mawlini, the base seemed quiet, at least the areas I could see. Mac picked us up and drove us around to the lecture theatre, where Coup and Doc Graham waited for us, four new faces sat in whites two rows behind everyone else.

‘OK, listen up,’ Jimmy began as Mac took a seat. ‘The four gentlemen in whites are ex-SAS troopers.’ Doc Graham glanced around at them. ‘They are in whites because they’re in disguise. This meeting is off the radar, no mention to anyone, or you’ll feel my boot up you arses. These men will be going into Darfur to collect evidence of the fighting, and the killing - by Sudanese Government troops. If they get caught they’ll claim they’re with us, and the Sudanese won’t shoot them as spies. To that ends, you will give them the manual, put them through all of the courses very quickly, get them up to speed on practices, lingo and bad habits. They must be able to pass for some of ours.’

Mac told them, ‘Start drinking heavily.’

‘I think they already have that down,’ Jimmy told Mac. ‘You’ve got four weeks to make them fit it, then add their cover names to the books, fabricate dates, make sure they know all the characters ... and what they look like.’

‘Tubby is the fat pilot,’ I told them. ‘Doc Adam is the loud Christian black guy with six girlfriends!’

Jimmy explained, ‘As far as our people are concerns, these gentlemen are all ex-Army medics, which – technically – they are.’

‘We got all the Pathfinders on the Sudanese border,’ Mac noted. ‘We expecting trouble?’

‘Where we can we’ll get evidence of the slaughter and the ethnic cleansing, and get the UN beating up the Sudanese. I’m also trying to volunteer various African armies as peacekeepers, but so far the outside world is not aware of the problem, not to any degree anyway. The lads behind you will take a few pictures. I’ve also asked a few reporters to come down and embed themselves, to get the conflict better known around the world. We’ll be organising a meeting of African leaders in Nairobi in a few months.’

Coup asked, ‘Can’t we just take a pop at the Janjaween? You invaded Somalia, why not give these guys something to think about.’

Mac did not agree.

‘Mac’s right, the Janjaween have the entire Sudanese Army behind them. That includes tanks and modern jet fighters. Now, for those of you who are not stupid, you will – eventually – have figured out that I’m arranging arms shipments to the rebel fighters, plus food and fuel. So if you see suspicious consignments, that’s because they *are* suspicious.’

The long walk

As Jimmy and I landed at Mawlini, Cassie was adjusting to her new role as part of a Huey team. Anton was not happy, despite the fact that he had also transferred to Hueys; they were going over the border and dropping supplies to the needy, often bringing out wounded aid workers. The Sudanese backed fighters took shots at them and the Sudanese Government said they were not welcome. There were squadrons of Kenyan Rifles on the border if things got out of hand, but each flight was a risk

in itself. Nightly arguments of “risk-taking” between Cassie and Anton led to pleasant “make-up” time behind the tents.

With a report of an attack on aid workers reaching Cassie’s flight, two Hueys took off at 9am on a hot Darfur morning, disappearing through the sandstorms and heading due east. It was a sixty-mile trip, fuel enough on the Hueys. Cassie and her mate sat on the floor, feet out the door and safety rope employed, and enjoyed the breeze and the view as they raced across parched earth. Camel herders were waved at, interesting features pointed out. They passed a few green valleys and climbed as hills and ridges were crossed. The features below gave the impression of river valleys, but each riverbed was dry. Still, green vegetation persisted around the dry riverbeds.

Approaching the pick-up point, radio contact was made with the aid workers, who informed the Huey crew that fighting had caused the wounded to be bussed north, twenty miles. The Huey changed direction and began covering green savannah, Cassie pointing out a lonesome herd of four elephants, a rare sight this far north.

Cassie’s ride suddenly banked hard left, dropped like a stone and banked hard right, throwing her around. The Huey levelled off, Cassie staring at the backs of the crew for a clue as to what might be wrong. A MIG fighter passing at little more than a hundred yards labelled the problem well enough. As Cassie watched the plane in horror, glad that it was turning away, the bright flash registered out of the corner of her eye, a searing burning pain in her leg causing her to scream unheard and grab for it. The Huey began to spin out of control, pinning Cassie flat to the cabin floor. She struggled to get up, rolling onto her side. Feeling herself being pulled out of the open door feet first, she grabbed her rucksack. A bang followed a jolt. She found herself outside of the Huey, holding onto her rucksack straps, watching in horror as the Huey span and descended, the tail clearly missing.

She had no concept of where the ground was, she just knew that they would hit hard, and she hung on. What happened next took her breath away: the rucksack slipped under the rope. Images flashed through her mind of falling thousands of feet to her death, not registering that they were at little more than a hundred feet when they had been hit. With her eyes closed, and

expecting the worst, she slammed into the flat top of an Acacia tree; a thorny tree favoured by the elephants that were now mostly missing from these parts. Her bodyweight broke a branch, and the branch helped to break her fall. With the thorns tearing flesh on her face and hands, she tumbled down to a hard landing, still gripping her backpack.

The second Huey had ducked into a valley, the missile aimed at it missing. It flew at just six feet above the ground, the pilots now eye-level with the Acacia trees. Rising over a crest, they came upon the burning Huey, no sign of any life nearby. They doubled back around and flew past slowly at little more than ten yards away, the dead crew clearly visible – and alight, burning bodies visible in the back, the fuel tanks roaring. They checked the immediate area, certain that no one had got out in time, and headed back at low level.

Doc Graham took the message, then came and found us in the rooftop bar. He stopped at our table. ‘A Huey has been shot down in Darfur. No survivors.’

We stood. ‘Are you sure there were no survivors?’ Jimmy pressed.

‘Hit by a missile, burst into flames, crashed and burnt,’ Doc Graham reported. People within earshot stood.

‘A missile?’ I queried.

‘Sudanese jet fighters,’ Doc Graham reported.

Jimmy gestured him towards the door and we headed quickly for Mac’s office. Inside, Jimmy met Mac’s angered stare. He said, ‘I want a Huey to go in at night, check the downed bird for survivors, bring the bodies out. Do it tonight, then suspend flights inside Darfur.’ He faced me. ‘Call Helen: I want everyone in the world to know about this.’ Facing Doc Graham, he said, ‘I want the crew list. Names.’

‘That young lady doctor, Cassie ... was on board,’ Doc Graham reported.

Jimmy stared out of the open door, taking a moment. ‘Inform Bob Davies. Tell him to send a general broadcast about it. I need to make some calls.’ Jimmy stepped out and called Rudd, asking him to contact all African TV stations with the story, and to contact the various governments, asking them to condemn the Sudanese.

Back inside, Coup asked Jimmy, 'We pulling back the mercy flights? If we do that ... then they win!'

Jimmy grabbed a cold water and sat. 'And what would you do?'

'Go in at night and fetch people.'

'Low level night flying ... is just as dangerous as dodging missiles,' Jimmy said without looking up.

Mac sat on the side of a desk. 'So we sit around the edges and pick up the pieces?'

Jimmy lifted his head. 'You want to take on the Sudanese Army?'

Mac looked away, frustrated. Turning back, he said, 'You must know a few people with surface to air missiles.'

'Sure. Then what?'

'If they lose a couple of aircraft they'll fuck off and stay out the area.'

Jimmy glanced at me. 'And if they decided to send in a tank battalion?'

'Last time I checked, we had a few dozen anti-tank helicopters sat around,' Mac sarcastically stated. 'And the Rifles will make sawdust out of 'em.'

'Let's think about this with cool heads, not when we've lost people. Let's not start a war that will kill more people than we've just lost. Six are dead, losing another sixty *just to make a point* ... is not wise.'

Cassie opened her eyes. In front of her an ant laboured along with part of a leaf. She stared at it for a whole minute. Lifting her head the pain registered, her memories resurfacing. Turning her head side on she could see the smouldering helicopter, an urge to get up and get to it. Problem was, she could not remember where she put her arms. She had to make a conscious decision to force her arm to move, finally getting a hand in front of her face, the skin torn from the tree's thorns. Her other hand came forwards, similarly scribed with bloody cuts. Only then did she register that she lay face down on top of her rucksack. Lowering her head, the dark red and black bloodstains registered, a stark contrast to the white of the fabric. She pushed her hands into the sand and lifted up onto her knees, her shoulders complaining. Bringing a knee forwards, she balanced herself and lifted upright, a hand to her

nose. A lump of stringy blood and mucus came away in her hand, Cassie now realising that the blood on the rucksack was from her nose. She felt the ridgeline: not broken.

Looking herself over she figured nothing was broken, nothing important anyway; she moved her arms in and out like a demented robot. They worked; pivotal joints and rotator cuffs functioning. Standing was a different matter. Her legs seemed to want to co-operate, but she fell over twice. Middle ear damage, she self diagnosed. Grabbing a branch, she lifted up and made a three-point stable platform. Despite feeling giddy, she advanced towards the smoking wreck; stick, left foot, right foot, stick.

At five yards she halted, noting the burnt and blackened bodies: pilot, co-pilot, and three in the back. They were all accounted for. With acrid smoke filling her nostrils, tears welling up, she turned and surveyed the pleasant green savannah. ‘Get a grip, girl.’

She knew from her briefings that most of the wild animals here had been hunted to extinction long ago. She would have to very unlucky to chance across a lion or hyena. Lifting her head, she figured on two hours of daylight remaining, and considered her options. Staying close to the Huey would be the normal procedure, but there may be government troops or Janjaween nearby. And, given the jet fighters, would they send a rescue? All of her options, she realised, came down to her two legs. She bent and flexed her knees, ignoring the pain, then imitated dancing “the twist”. If she ignored the pain, which might pass - she hoped, she had full motion available. Tossing away the branch, she gritted her teeth and walked forwards, gaining speed and balance as she neared her rucksack. Turning at the base of the tree, she headed back to the Huey, picking up the pace, each movement of her legs easing the pain and increasing the available range of motion.

Returning to her rucksack, she pulled out her water bottle and downed a few swigs. She dropped the bottle onto the rucksack and walked around the tree, soon walking around the smouldering Huey in a wide circle. That led her back to the tree, and to decision time. Her legs worked well enough, she had no trauma or significant blood loss. The middle ear disruption would pass, her nose bleed was not serious. She put a hand over her eyes and stared west, the prospect of a sixty-mile walk to the

border facing her. Hell, she had walked that far in basic training, she realised. It was four days marching, seven allowing for rough terrain. So the problem would be food and water.

She again faced the Huey, and made a choice. Walking forwards, she reached into the back of the Huey and dragged out a charred backpack. Opening its lower pouches she found a water bottle and numerous tins of meat intact; warm, but intact. Dried biscuits in their wrappers fell out. Leaning over the remains of her friend and colleague, she pulled the second rucksack out. Ten minutes later she figured she had enough supplies for the trip, the personal supplies of four people, designed for two days each.

From her own backpack she pulled out her spare boots and tossed them away, so too bra, panties and a towel. A spare jacket was not much use, but the nights were chilly. She tossed it away. The compass was checked, a plastic sleeping bag kept, the basic first aid kit retained, the larger kit thrown away; she'd not be delivering any babies anytime soon! Spare batteries were chucked, but they caused her to take a sharp breath. As fast as she could she raced to the Huey, struggling to open the co-pilot's door. Eventually smashing out the already-cracked and blackened glass, she taped the co-pilot's chest pockets, finding a lump, a lump shaped like a satellite phone. Pulling it out her spirits sunk, the face plastic melted. She tried in vain to switch it on before throwing it over her shoulder. Running around to the pilot's side, she eased his body back and checked his pockets, finding them empty.

She stood back a step and cursed, fists on hips. 'OK, what am I forgetting? Think, you stupid bitch, think!'

After a minute staring at the wreck, she clambered into the back and reached under the pilot's seat, finding a first aid kit in a metal box. Under the co-pilot's seat she found another metal box, this one Velcro-fastened to the floor. She lifted the Velcro strips and opened the tin, finding a pistol. With a small "thank you" to a god she did not believe in, she tucked it inside her jacket.

Standing back from the Huey, she again tried to remember her basic training. She knew where the life vests were, spare oil and a toolkit for the helicopter, and blankets. Besides that, were there any other compartments? Satellite phone, pistol, first aid. No, that was it. Retrieving her rucksack, she eased it on, wincing, the

extra food and water weighing it down. Still, it would get lighter day by day. Turning, she stared at the wreck, wondering if she was doing the right thing. And did they even know where the Huey went down?

‘Sixty miles, I can do this. One foot in front of the other.’

Facing the setting sun, navigation easy enough, she put one foot in front of the other.

At 1am the report came in, all of us sat in Mac’s office and awaiting news of the rescue mission: five bodies, kit has been ransacked, possibly one survivor, but captured by local fighters.

‘Well was there a survivor or not?’ Jimmy barked. ‘Get back to them, find out. I want a Kenyan Rifles bird there just before dawn, looking for tracks.’

Mac ordered the Rifles’ mission launched.

Cassie had reached a dry riverbed at sundown and decided to keep going, the valley she was in heading west. She had fixed the moon as the sun had set, and the clear night sky offered up the distinctive Orion constellation for a southerly reference point.

The pistol had proved a challenge. She managed to release the magazine, but then had to backup and bend down to get it back. Blowing sand off it, she managed to re-load the pistol, then pointed ahead and pulled the trigger. Nothing had happened. She knocked the safety switch off, that was easy enough, but still nothing. Remembering all the movies she had watched over the years, she finally struggled to pull the slide back and release it. Pointing ahead again, she fired a round, pleased with the achievement. Clicking the safety back on, she kept the pistol inside her jacket, just in case.

The riverbed was surprisingly flat, if a little soft to plod along, and snaked west, the light coloured sand easy to follow in the moonlight. The occasional animal noise could be heard on the breeze, and at one point she thought she might have heard a helicopter. At dawn, she found a wide savannah ahead of her, crossing now a little used track. Tired, but resolute, she plodded on, finally deciding to save water by sleeping through the heat of the day. Selecting a suitable Acacia tree, one that was both easy to climb, and seemed to offer a suitable nesting branch, she dumped her rucksack and climbed up. Selecting a suitable

branch, and getting comfortable, a hissing sound caused her to lift her head. Across the tree, crouched on a branch, a young Leopard snarled at her.

‘I have a gun!’ she told it. ‘Besides, you’re too small for a punch up. Come back when you’re big enough, because I’m knackered, and I’m not moving.’ She closed her eyes and lay back. ‘Just hope your mums’ not around here.’ Remembering her small silver digital camera, she took it out, zoomed in on the cub and took a snap.

Three hours later, a jet roaring past caused Cassie to open an eye and lift up onto her elbows. The cub was still there, still staring, but seemed drowsy itself; so far, no sign of mum. Needing a drink, Cassie climbed down, the cub hissing. Rationing her water, she took just a few small gulps before moving the rucksack into the shade of the tree’s trunk, grabbing a tin of meat. Climbing back up, she opened the tin, spooning a small amount out and placing it within reach of the cub. Back on her own branch, she quickly downed the tinned corned beef. Lying back, with a hand behind her head, she observed the cub take a whole thirty minutes to approach the meat, sniffing it at length before wolfing it down.

‘You’re welcome.’ Cassie eased back and closed her eyes as the temperature rose.

Lying there, the day hot, but offering up a pleasant breeze, she stared through the branches at the clear blue sky – and considered just how beautiful it was. If this was death, it was not so bad. Not so bad at all.

Rested, Cassie eased up and stretched as cat-like as her unhappy companion across the tree. ‘No sign of mum yet?’ Considering if the cub looked old enough to be independent, or if farmers had killed the mother, she climbed down. Checking the horizon in all directions, Cassie heard the cub land. It darted away a few yards and circled around, sniffing the ground.

‘It’s called cupboard love: I feed you, you pretend you like me.’

After five minutes of picking large blackened lumps from her aching nose, Cassie felt sorry for the leopard. She opened a tin and spooned its contents onto a flatten tree root. After a swig of water, another snap taken of the cub, she sat in front of her rucksack, did up the straps, and turned on her side, easing up the

tree with the added weight. Three hours to sun down, Cassie took a breath and put one foot in front of the other.

After a hundred yards the cub ran past on a parallel course, soon falling into step. 'So much for instinct, little one. If you were clever, you'd run away now.'

The cub was not listening. It kept its distance, but tagged along to the source of food, Cassie taking the occasional snap of it whilst photographing the savannah, a record for anyone finding her – should she not make it back. They plodded on together, the cub occasionally flopping down ahead of her, but getting up and catching up after she had passed. Nearing dusk Cassie spotted wild goats, but figured she could never have got close enough to shoot one with a pistol. And, for the moment, food supplies were fine. With a beautifully surreal orange sunset ahead of her, Cassie plodded on.

The cub stopped and jumped to the side, hissing at something directly ahead. Cassie stopped and took out the pistol, approaching the long grass carefully. Noting where the cub was looking, she could see the tail of a snake, and skirted around it. 'Useful bugger, you are,' she told the cub.

A mile further on the cub again stopped, focussed on the tree line ahead. It backed up, and ran around behind Cassie. Taking out the pistol, Cassie decided to skirt the trees, walking to a small rise and up it. The other side of the rise, another dry riverbed headed in the roughly the right direction. Stood on the rise, and looking back, Cassie could now see large animals amongst the trees, but couldn't determine what they were. Losing the daylight rapidly, she decided to feed the lonesome cub before trying to lose it. Dumping her rucksack on a tree stump, she spooned out a tin for the cub, wondering if that was the exact wrong thing to be doing. With the cub stalking the meat, she lifted her pack and picked up the pace, reaching the riverbed and turning west. The sand was hard and she managed to hike along at a good pace. With no sight, nor sound, of the cub, and head down, she plodded quickly along with determination.

An hour after dark she could smell smoke. It stopped her dead. Smoke could mean farmers, hunters or rebels. It was fifty-fifty if they would help her, or shoot her. Stepping quietly, she advanced with caution, sniffing the air as diligently as the cub had done. Around a bend in the river she could now see a

flickering light in the distance. With no choice, she broke left and walked up the gentle valley side and through sparse trees, soon cresting a round rise and down the other side, turning right to get back on track for a westerly direction. The report of a distant shot inspired her to pick up the pace, soon at a brisk walk and perspiring, the sweat on her brow registering in the cool evening air. Feeling fit, and confident, Cassie walked all night in a westerly direction.

At Mawlini, the reports were still confusing. The kit had been ransacked, no tracks approaching but one track leaving, heading west. We poured over maps of the area, and scratched our heads as to who had survived, and which way would they walk. The border seemed logical, but not as logical as any one of a hundred UN or NGO stations in the area. We sent messages to all NGOs in the region to watch out for a survivor – conveniently dressed all in white. Besides that, there was little more we could do other than pace up and down, Jimmy plotting and scheming with the Rifles officers.

Cassie met the dawn with a shock. She had thought the village deserted, but nearing it she could see bodies; the Janjaween had paid a visit. Stepping cautiously through the huts, she could see charred bodies in each, parents and children alike. Determined to make a record of it, she snapped the bodies with the digital camera. The village well lifted her spirits, but peering down it revealed several sets of feet. She turned west as the sun put in an appearance on the horizon behind her, and plodded on.

In the distance, through the heat haze, she wondered if she was hallucinating. As she progressed across a parched brown patch of what appeared to have been crops at some point, a donkey came into view, complete with backpack and a dangling rope. It lifted its head and stared at her as she approached. Walking right up to it, the grey donkey did not budge, stood firmly rooted to the spot. She stroked its neck. ‘All alone?’

In the backpacks she found straw, handing some to the animal. It was munched quickly. Taking out her water bottle, Cassie dampened the next handful of straw and fed the hungry animal. With half the straw gone, Cassie lifted the donkey’s tether and led it west a hundred yards, the donkey happy to plod

along. Halting, Cassie lifted off her rucksack and placed it on the donkey, careful to keep one hand on the tether, one of her rucksack. She tied the rucksack to the backpack and took a step back, gripping the tether tightly. The sedate donkey did not become a bucking bronco. 'OK, ass, follow my ass.'

With the tether tied around her wrist, Cassie walked on, the world's gravity suddenly seeming a lot less. She kept up a good pace, stopping every hour to feed the donkey, not a clue as to what was appropriate or not. Finding a lush green patch of vegetation she led the animal forwards and allowed it to select what it liked, green shoots pulled up. She snapped it with the camera. Spotting the dust trail of jeeps in the distance, Cassie turned north around a ridge dotted with Acacia trees. At the top of the ridge, and well hidden, she stared out at the dust cloud. Whoever it was seemed to be on course for the village, maybe the people who had killed them. And the jeeps did not look like UN. She turned, leading her ass onwards, wishing to find a suitable place to sleep.

A tight gorge looked suitable and she led the donkey along a narrow path, through bushes and past large boulders. Easing between two large grey rocks she stopped. And began crying. There, nestled between large overhanging rocks, lay a strip of crystal clear water. The air hung still and warm, not a sound disturbing the scene. After a whole minute of just staring, she led the donkey to the water and let it drink, testing the water herself and finding it cold and pure; spring water. She quickly gulped down what little warm water remained in her bottles and re-filled them. Tethering the donkey in the shade, she stripped off and eased into the cool water, kneeling on a flat rock and splashing refreshingly cool water over herself. Clean of baked-on blood, and cooling down, she clambered naked up a smooth rock, into a pleasant breeze that acted as a hairdryer. For five miles in any direction she could see savannah, and nothing else. Back in the gorge, she washed her clothes and laid them out on a rock to dry in the sun. Placing down the plastic sleeping bag in the shade, she lay naked in the humid and still air, soon asleep.

As dusk fell, Cassie sat eating from a tin, thinking about what course of action to take. Staying here and hanging out a sign for aircraft was an option, but she risked being spotted by the

Government backed forces. There was no food here, no fish; she could survive five days if she took it easy on the tinned meat, simply eating and sleeping all day.

She stood. It was time to go. Retrieving a plastic bag from her kit, she filled it with water and placed it amongst the donkey's straw. With the gorge photographed, she took several gulps of spring water, filled her bottles to the rims, allowed the donkey a last drink and set off into the setting sun, another beautiful orange sunset being laid on for her tonight.

The flat savannah gave way to ridges and valleys after a few hours, so she followed those running on a southwesterly course, soon kicking up dust in dried riverbeds. Her faithful companion plodded along without complaint, woman and beast in harmony. At dawn she stopped to feed the donkey, splashing water onto the straw first. Climbing a ridge, she stood and stared into the grey images created by the struggling dawn light. A village. It was on the right course, but hard to move around since it was backed by a steep ridge. It could be avoided with a southerly course. With an hour to full sun-up, Cassie picked up the pace, hoping to pass before the cock crowed.

Nearing the village, and moving south, she could now see bodies on the road. She stopped. 'They're home,' she told the donkey, 'but they won't wake from their sleep.'

A dog barked, causing Cassie to move off at the trot, leading the co-operative donkey onwards. Past the village, and now sweating, Cassie glanced over her shoulder, a dog trotting along behind her. She stopped and turned, touching the pistol in her jacket. The dog trotted up, sniffing and whimpering as it reached her. Kneeling, she held out a hand, the dog licking it, its tail thrashing quickly back and forth. 'All alone, little one?' She retrieved a tin, the donkey not at all phased by the small pooch. Using her fingers, she fed the dog a suitable chunk of corned beef. Standing, she said, 'You're no leopard, but your nose and ears are better than mine. Welcome to the team, this is my ass.'

Now three, they plodded onwards, the rising sun behind them. Cassie kept an eye on her shadow as she progressed, keen to keep it in front of her, her own dark outline pointing her west. After a mile she happened across an isolated farm, its roof burnt off, the smell of burning hanging around. Checking the horizon, Cassie edge forwards. She snapped the image as she approached,

snapping the family as they lay in line in the dirt, the youngest just a baby. A cry caught her attention and she ran towards it. Inside a pen she found a young goat. Untying the animal, she lifted it out. With one saddlebag empty now of straw, the kid fitted perfectly inside. Cassie pulled free some of the string used to fasten the make-do saddlebags. She tied the goat to the donkey's harness. 'Sorry, little one, but you're tomorrow's lunch.' Leading the donkey onwards, the dog following, she commented, 'No such thing as a free ride.'

As the day heated up, Cassie needed to find shelter, and to rest. All the good ridges, those that may offer up some shelter, were to the north, the south and west flat. And being caught out in the open was the problem. She figured that she had come at least fifteen miles, maybe twenty, but the carnage at the last village dispelled any ideas that she was nearing the border, or safety. She turned north, to the edge of the hills, a hot hour's slog to reach a gully. An isolated tree offered protection from being viewed from above, the gully walls from being viewed from the ground. The land in the immediate vicinity did not look used; there were no paths or litter. Tethering the donkey, and letting down the kid to feed whilst tethered to the tree, she fed the dog on tinned meat, pouring water onto her hand for it to lick off. Fed and watered, she lay down with the dog in the shade, the poor pooch panting in the midday heat. With a hand on the animal, she dosed off.

Two hours later a bark awoke her. She grabbed the dog and closed its mouth for a moment before rushing up the ridge and peering over. Lying down like a sniper, she crawled over the rise and peered out. Nothing. She lifted up, put a hand over her eye and scanned the horizon. 'What is it, stupid dog?'

Back in the gully she slumped down, needing more sleep, the dog now focused on the head of the gully. Lying there, Cassie watched the head of camel become a body, then a line of camels. In no particular hurry, the large animals plodded slowly towards her. Thoughts of capturing one and riding it out crossed her mind, soon followed by thoughts of falling off and breaking her neck. She snapped them with the camera. With no particular regard, the camels plodded slowly past Cassie, all watching her from under giant eyelashes, Cassie holding the dog firm. Like

slow moving ships, they eased past, depositing dung nearby. 'Thanks for that!' Cassie offered them as they moved away.

Back on the trail, the sun low, Cassie had no choice but to head southwesterly, the ridges becoming angry small cliffs with sharp edges. If someone spotted her she could run and climb up them, but she'd have the leave her travelling companions behind.

Unknown to her, events fifty miles east had been unfolding at a pace. Spread out along a ridge in eastern Darfur, the Kenyan Pathfinders had waited, camouflaged and invisible. The first fly to approach the spider's web had been a Government Mi8 helicopter, ferrying weapons to the Janjaween. As it crossed the ridge a missile streaked upwards, impacting and exploding within two seconds, the Mi8 plunging into the ground and bursting into flames. Two hours later, a small propeller driven reconnaissance aircraft flew slowly towards the ridge, possibly looking for the missing Mi8. A missile streaked up and impacted front on, the small aircraft spinning earthwards out of control, its wreck creating a small bush fire.

The next day a dated Russian Mig was shot down, followed by a second Mi8. When a flight of six Migs were scattered by three missiles, one finding its mark, the Khartoum Government realised that the rebels had surface to air missiles. The Pathfinders had disappeared back across the border, moving at night without being spotted. The Sudanese then acted in the way that Jimmy had anticipated, they sent tanks and infantry in, a week after promising the African Union that there were no Sudanese soldiers in the area. The remaining pathfinders, hidden on ridges, photographed the advancing army, the digital images uploaded to a satellite and sent to the African press. The Sudanese had just moved a chess piece in response to Jimmy's first move. Unfortunately for the man in Khartoum, Jimmy knew his every move.

The anticipated response was a mass movement of refugees west and south, the camps swelling. But this migration was different in that we had all the world's media filming it, the story making the nightly news. Our ex-SAS troopers, disguised as RF medics, were busy filming the Janjiween slaughtering villagers, some very graphic images making it out.

At Mawlini, we watched the crisis grow, and accelerate in ferocity, Jimmy suggesting that it was best that three years of conflict be played out in a just a few months. The size of the RF presence was increased, RF Hong Kong deploying en-mass, a Chinese unit now being stationed in Southern Sudan. Tents were being shipped out every day by Hercules aircraft, plastic sheets by the tonne, plus wheat and grain.

Following the downing of our helicopter, the Sudanese President had been astonished by the level of complaint, and its ferocity, not least the complaints issued by the Chinese and Russians. With Jimmy pointing at oil off Zanzibar, the Chinese were less inclined to worry about Sudanese oil. The screws were turned. The Kenyans, naturally, kicked out the Sudanese Ambassador, as did the Tanzanians.

And whilst all that was happening, General Abdi flew over to Mawlini to meet us, at his request. We greeted his team in the downstairs restaurant of the UN hotel.

‘We have not expelled the Sudanese Ambassador, as you requested,’ Abdi stated.

‘This is not your fight, my friend,’ Jimmy told him. ‘You need good political and economic relationships with Sudan, your important neighbour.’

‘Always thinking of what is best for us, old friend,’ Abdi responded with. ‘But if you are in this fight, it would be rude for me not to offer to assist.’

‘And your assistance is appreciated, if only diplomatic.’

‘We are applying what pressure we can,’ Abdi assured us. ‘They were greatly mistaken to shoot down a Rescue Force helicopter. And now, many of their own aircraft are being shot down. A very great accomplishment for the ... ill-equipped fighters in Darfur.’

‘Indeed,’ Jimmy said with a hint of smile.

‘We are ready to assist if called upon,’ Abdi insisted.

‘When you look in the mirror,’ Jimmy asked him, ‘what do you see? A black African, a Muslim African, or an Arab?’

‘We do not see ourselves as Arabs, we are black Africans; Muslim black Africans, as are many of those being pushed out of Darfur.’

‘And some Christian,’ Jimmy added.

‘As are our Kenyan brothers.’

Jimmy took a moment. 'If we accepted your help, it would not be in your long term interests – in your relationship with Sudan.'

Abdi shrugged. 'We have our own oil, minerals, and we grow stronger year by year. Maybe they will need us more than we need them!'

Jimmy smiled. 'A good approach. When the time is right, and your forces can help, I will call upon you. But first, we must try and solve this problem through the African Union.'

'I think, Jimmy, that you favour the direct approach more than sitting and talking with old men.'

'Timing ... is everything,' Jimmy told our guest. 'It's all in the timing.'

Cassie hand fed the kid, realising that it was a bad idea; it would make killing it more difficult. Still, she planned on reaching help before that day came. She plodded on with her travelling companions, the dog alerting her to any sounds beyond her normal acoustic range, and any strange smells in the soil.

The night became a boring slog, little of interest to note, the occasional animal calls of little interest now. Dawn offered grey light over the barren landscape, her compass suggesting that the unhelpful ridges were forcing her southwest. Millions of years of erosion had schemed against her. Still, camp was southwest, and so was Anton. A chill went through her: what if his helicopter had been shot down? She forced the image away and plodded onwards, figuring she may travel by day in future if she could find enough water.

A sound caused her to turn, the damned dog ahead of her and in a gully. She cursed it as focused on a lone jeep approaching, a white Toyota pickup bumping along the track. Fortunately, the track was rough enough for her to run away whilst the jeep slowly approached. She scanned the ridgeline, picking out a crevice. She could make it, but Dobbin the mule would have to be abandoned. In the matter of just a few seconds she had heard the jeep, spun, untied her rucksack and thrown it on, now rushing towards the crevice. The dog finally barked. 'Now you see it, ya useful mutt!'

She made the base of the ridge at the crevice and started to climb, hands on the edges, boots wedged against rocks. At the top, panting now, she turned, the jeep stopping next to the

faithful donkey, who just stood there. The dog tucked itself between her legs and peered out at the visitors as Cassie took out the pistol.

Two men stepped down from the jeep, locals, the second man armed with an AK47. That did not label him as a Janjaween, but it did label him as dangerous. Cassie dropped her backpack, certain they could catch up with her if they wished to. They inspected the donkey and the goat with toothy smiles before walking towards the ridge, Cassie making herself visible at the top. The second man checked his AK47, not the actions of a would-be rescuer. At the base of the ridge they stopped, little more than thirty yards below her, beckoning her down. When that failed to move her, they raised their voices, angrily waving her down. When that failed, the second man raised the AK47 and fired a warning shot into the rocks, Cassie ducking down.

She glanced over her shoulder at the terrain, certain they could catch her unless she ditched her backpack; her food and water. She'd have to stand and fight, with just the one chance of success: they thought her unarmed, probably a UN nurse. The sounds of displaced rocks permeated the air as the men climbed up to her, Cassie moving unseen to one side and staying low. The first man reached the crest with his head down, concentrating on holding on and not falling backwards. He did not even notice Cassie. The second man appeared, the AK47 now strung around his back so that he could climb. Whoever these two were, they were not the brightest pupils in the class.

Cassie leant over, took careful aim at the head of the second man and shot him dead, putting around through the stomach of the first man as his buddy rolled down the rocks. With the dog barking at the wounded man, Cassie lifted up and rushed forwards, the pistol to the man's face, a round fired. 'Never do half a job,' she whispered to the limp and lifeless body.

Scrambling down the rocks, she retrieved the AK47, wondering if she could figure out how to fire the damn thing. In the back of the jeep she found straw and building materials, some plastic pipes. Sitting in the driver's seat, the key in the ignition, she started it up, noting a quarter tank of petrol. 'Enough for thirty or forty miles, boys.'

With the engine running, the door open, the dog jumped in. Cassie stood and stared at the donkey and the goat for many

seconds, finally letting the kid go before un-harnessing the donkey. Free of its backpack and harness, the donkey just stood and stared. Cassie snapped a shot of it, one of the ridge and the bodies, another of the jeep before climbing in and slamming the door. With a final look back at the donkey through the jeep window, she found the clutch and gears, and pulled off, not a clue where she was going. After suffering a mile on the bumpy track, she found herself on a half-decent tarmac road. Problem was, it ran north to south. South was better than north, but not by much. She pulled off and put her foot down, soon cruising at fifty miles per hour and smiling widely, the countryside shooting past.

At Mawlini, that morning, Jimmy suggested that we fly up to Chad and encourage the staff. Tubby flew us north with Doc Graham and a planeload of scheduled staff replacements. We landed in Southern Sudan, and spent the day at the largest camp, flying onto Chad at the end of the day. Accommodation was rough, just tents in the desert with the rescuers, but the cold cans of lager they offered us were much appreciated. We sat in the mess tent after sundown, chatting to the staff, and even to Anton. At the time I had no idea who he was, just that he was keen for news about Cassie. The bodies had all been identified and flown out, Cassie's missing, everyone certain that she survived and walked off, as much of a hope as anything.

Sat there in the mess tent, Jimmy checking his watch, screams and cries went up from someone unseen, someone else bursting into the tent.

‘She’s back! Cassie’s back!’

Everyone poured out, bumping shoulders in the mad scramble through the tent, no respect for the two of us in the mad dash. We all ran after the others, everyone heading towards the heliport, surprised to find Cassie slowly driving towards us in the jeep, arm and face out of the window, smiling and waving, a dog leaning out of the opposite window. She pulled up when her headlights illustrated us.

Easing out, people firing hundreds of questions at her whilst patting her on the back, she said, ‘Reporting for duty, boss.’

‘You’re late,’ Jimmy told her.

Anton squeezed past, holding Cassie by the shoulders and looking her over.

'I'm fine, I'm fine,' Cassie got out before having the breath squeezed out of her by Anton, the dog at her feet, its tail wagging excitedly at all the strangers.

'What the hell happened?' Anton asked.

'Missile took down the Huey, fired from a Mig. I went out the door and landed in a tree.'

'You fell out?' Anton queried, everyone keenly attentive.

'More like spun out. When I came too the bird was burnt, everyone ... dead, which I guess you know. So I started walking west. Anyway, are the cookers working? I'm starved!'

We led them back inside. Jimmy said, 'Cassie, you've got some time off due. We'll take you back with us.' He lifted his satellite phone and dialled Cassie's parents.

Cassie held the phone to her ear. 'Mum?' She held the phone away from her ear as her mother screamed. 'Calm down! I'm fine! I'm back with Rescue Force.' The call reduced her to tears, the phone finally handed back.

A press photographer squeezed in, Jimmy waving him over. 'OK everyone, kneel down, sit down and line up,' Jimmy ordered. 'Let's get this moment frozen in time.'

Everyone squeezed together as several shots were snapped.

Anton asked Jimmy, 'Any chance of moving some holidays around?'

Jimmy turned to Cassie, then back to Anton. 'You get two weeks leave from next year brought forwards. You can fly back with us to the UK.' To Cassie he said, 'Now, get some food inside you young lady, you look thin.'

'Apparently, my boyfriend likes them slim,' she replied, her eyes still moist. 'Oh,' she grabbed the camera. 'I kept a photo diary. There're images of villages wiped out.'

Jimmy took the camera. 'I'll make sure the images get to the news papers.'

Within ten minutes every news outlet in the world new about Cassie's walk to freedom, Jimmy playing it up a little in the press. I felt a book coming on.

We flew Cassie and Anton out early the next morning, a quick chance to shower and change at Goma International Airport, a press conference organised for the African press, Rudd flying

them in. Cassie gave details of the helicopter incident, Jimmy and I sat either side for support. She detailed some of the walk she made, mentioning the leopard cub in the tree, the donkey and the dog. She then went into detail about the burnt out villages that she had found along the way, whole families being killed. The press then moved their attention to Jimmy, who was ready for them and in speech mode, criticising the Sudanese Government at length, urging the UN and the African Union to get involved – before it's too late. Our hired 747SP took us north in comfort, Cassie sleeping a lot of the way, snuggled up to Anton the remainder of the time.

'This pan out as you expected it?' I asked Jimmy, out of earshot of anyone else.

'There are always variables. But, overall, as I expected.'

'We get a book out of this?'

'Definitely. Publicity is our lifeblood and, for the projects ahead of us, essential. Publicity ... is power and influence, more so that money, and certainly more than political office. Between now and 2005 we need to conquer America, and the way to do that is to appeal to the people directly.'

'Hollywood ... directly?' I nudged.

'Yes. And in years to come, social media.'

'What the fuck's that?'

'You'll see. It's as revolutionary as the internet itself.'

Before we landed, Jimmy told Cassie that her parents would be at the airport, bags packed. They were all invited to the house, not least because of the small army of reporters camped outside Cassie's parent's house. We slipped out of a side entrance, into two coaches, and headed off, Cassie's reunion with her parents witnessed only by Anton.

At the house they were allocated the best rooms whilst I hugged my wife, getting plenty of ear bashing for the long trip away. I took off my jacket and sat on the floor with Shelly, soon colouring-in the Telly-Tubbies. I was reasonably sure that one of them was not green with red stripes, but who cared. Jimmy made a fuss of Cassie's parents, showing them around the grounds as Anton and Cassie strolled hand-in-hand.

Then next morning, over breakfast, Jimmy got around to the book, copies of the photographs from the camera laid out for

Anton and Cassie's parents to view. 'Cassie, when you're up to it, I'd like you to write down your experiences, we'll turn it into a book quickly, a Rescue Force book.'

'Me? Write a whole book?'

'Start with diary notes, then flesh them out. All you need to do is describe in great detail what happened, hour by hour. We'll do the rest and detail the rescue operation, and your poor parent's time spent worrying. It's important to get the book out there, because it highlights what's going on in Darfur. And I'll make sure it goes right around the world.'

'Don't they take years to publish?' Cassie queried.

'Not for me they don't,' Jimmy emphasised. 'You'll get help with it, professional help. It will take less time than you think, a matter of weeks. It's also good advertising for Rescue Force. Some young lady doctor will read the book, as you did with our other books, and some day think about joining up.'

Cassie's parents encouraged her to put pen to paper.

'OK, I'll start with a diary outline.'

'Leave nothing out, not even Anton,' Jimmy suggested.

'Oh, there's some things I think we should leave out,' Cassie joked, a glance toward Anton.

'Your romance will be an important part of the book – a human interest story,' Jimmy told her. 'Then there's the UK press, who'll be annoyed if we delay any longer.'

'When do you think I should talk to them?' Cassie asked, a glance at her parents.

'Do a combined press-conference later today, get it over with,' Jimmy suggested. 'Then hang around for an hour and answer questions.'

'Here?' they asked.

'No, we'll drive over to Mapley, the press can drive down from London.'

They were all in agreement, following Jimmy's lead. He made a call to Helen and she fired off the faxes and emails: 4pm, press conference, all welcome, food and drinks afterwards. At the news conference, copies of the photographs were given out, hard copies and on CD, Cassie sat on the podium with Anton, her parents and Jimmy. It dragged on a bit. We mingled with the press afterwards, making sure everyone had what they wanted, Jimmy very keen that Sudan stayed in the news week after week.

He was plotting something, but he first needed the publicity. Around Africa, Rudd was busy, Sudan kept at the fore in many countries, the stories evolving into its simple core truth: Arabs were trying to push black Africans out of Sudan.

Three days later, and with Cassie sat behind a computer at the house, Anton helping, we flew off to Nairobi for an emergency meeting of African Union members. Helen and Shelly accompanied us, or I would have been divorced by my return. This meeting was unusual in that only certain countries were invited, those of the Sub-Saharan nations, none of the Arab countries – who protested at length the legitimacy of such a meeting.

For the first day of the meeting we skirted around the edges, meeting various governments in private and scheming. The Tanzanians were revelling in their oil discovery, and we could do no wrong in their eyes. At the end of the first day they voted on allowing us to speak the next day, an almost unanimous approval. In the morning, Jimmy took the microphone, a long applause given just for him being him.

‘I thank all of you for allowing me this opportunity to address this body, regarding the situation in Darfur. What started as an internal matter has widened into something bigger, and more sinister. We now have a million refugees in Chad, Southern Sudan and other countries, a great burden on those nations. I am doing what I can to support those countries financially, and to assist the refugees. But let’s not dress this up: this is Arab against black, the Sudanese Arabs desiring to remove blacks from Darfur. The Khartoum Government has long denied that it supports either side, but we can all now see the evidence: there are no Arabs in the refugee camps!’

The audience applauded.

‘The Khartoum Government has sided with the Janjaween, and armed them, the evidence is clear. They have also sent fighter jets to shoot down our medical helicopters, a criminal act. The Sudanese then complain that their aircraft have been shot down over Darfur, aircraft that they said were never in Darfur to start with. I guess the Sudanese aircraft shot down were ghosts. Now we see tanks and infantry entering Darfur, on the premise that they are there to restore order, the order of Arabs burning the

villages of blacks, having first killed men, women and children – even livestock.

‘We do not say that Darfur should be independent of Khartoum, we just want the fighting to stop, and for the refugees to return to their homes without fear. I call upon the African Union to create a peacekeeping force with the assistance of the UN, and for Sudan to allow the peacekeepers in.’

He stood down to great applause. Sat off to the side, we listened to various governments echo Jimmy’s words: Kenya, Somalia, the DRC, Ghana, Seirra Leone, Zambia, Mozambique, even Zimbabwe. What the outside world did not realise, was that we had offered to fund the peacekeepers within certain nations. Since we were already funding the Rifles in those nations, it was no extra cost to us.

The meeting broke that evening, the delegates having voted in favour of a peacekeeping force. Even without the Arab countries, they had enough votes. The UN was asked to form a peacekeeping force, which would take the form of an official request for troops.

In the east of Darfur, meanwhile, the tank columns were not having much luck, some cheeky bastards planting anti-tank mines everywhere the tanks went, tracks blown off every mile; it was as if someone knew their movements. Infantry trucks and jeeps triggering mines fared badly, the casualties mounting quickly, and without so much as a shot being fired at their unseen enemy.

That evening Jimmy took a call: a column of Sudanese tanks was heading south towards the border with Southern Sudan – and the refugee camps. When I heard the words “Cobra standby” I was worried.

‘A column of Sudanese tanks are heading south,’ Jimmy informed me after the call.

‘And we’ll attack??’

‘No, we’ll defend the border if necessary,’ Jimmy insisted.

‘And will it be?’ I pressed.

‘Yes, because the tank commander can’t read a map. And ... the other routes are mined.’

‘You’re herding them!’

‘I’m not, the rebels are.’

At 1am we were still sat in the rooftop bar, Cat minding Shelly in our room, the hotel awash with bodyguards and police. Jimmy's phone went.

After listening, he told me, 'That tank commander has crossed the border, and at night. He's following a tarmac road to avoid bombs. And, as we sit here, the authorities there are requesting the kind assistance of the Kenya helicopters nearby.'

'What choppers?' I asked.

'Twelve Cobras, six Mi24s.'

'And the outcome?'

'Thirty tanks destroyed, twenty support vehicles,' Jimmy calmly stated. 'All inside the border. Just.'

'Southern Sudan has never fully broken away from the rest of Sudan,' I puzzled, Helen agreeing.

'No, but they're semi-autonomous, and oil rich. They'll be independent in a few years.'

We woke to the news that Sudan had invaded Southern Sudan, the attack repulsed by Kenyan attack helicopters. There just happened to be TV crews nearby, filming the aftermath - and the clearly marked border. The African nations protested the attack at length, the Sudanese President scratching his head as to who ordered the incursion; plus the loss of his tank regiment. His position was now in jeopardy.

Jimmy held a press conference and condemned the attack, an attack that was labelled as the chasing of refugees into the camps. 'Who attacks refugee camps with tanks?' Even the Arab states were annoyed at the move. Having achieved our aims, that of stirring up a hornet's nest, we flew back, commercial flights now diverting around Darfur, and Sudanese, airspace.

In the house we found Cassie typing away, already a detailed outline of the document, Anton helping. Her parents had stayed for four days, the most they had seen of their daughter in years, the press hoards having now dissipated.

'How much time off do I get?' Cassie asked us.

'As far as I'm concerned, that book is RF work,' Jimmy told her. 'Keep at it. Anton returns next week, and I've ordered him off of Hueys for now.'

'You have?' Anton challenged.

‘Yes, because Cassie’s been sick in the mornings,’ Jimmy told him, walking off.

I smiled widely at him, tapping him on the shoulder.

Cassie faced Anton. ‘It’s probably a bug.’

‘Are you late?’

‘Two weeks.’

‘That could be malnutrition,’ he offered.

‘I’m kind of hopping it’s not.’

They stood and stared for many seconds.

Anton closed in and hugged her, kissing her forehead. ‘If we had jobs in a hospital somewhere...’

‘I know. But there are always Rescue Force desk jobs, and hospitals.’

‘You’d come to New York?’

‘Love to. That an invite, or ... an invite?’

‘I don’t know, my head’s spinning,’ Anton admitted.

‘You can’t just knock-up a poor helpless English girl and run away, Yank.’

Anton laughed. ‘You? Helpless?’

Cookie’s wife, Sandra brought in a pregnancy tester, handing it over without saying anything.

‘Best go pee,’ Cassie suggested.

Ten minutes later she rang her parents with the news, before the happy couple approached Jimmy and me. They sat opposite us in the diner.

‘So, what happens now?’ Cassie asked.

‘I could get you a medical book,’ I offered.

‘Career wise.’

‘I’ve paid some money into your account, compensation for your ordeal,’ Jimmy informed her. ‘As for your career, that’s up to you. You can stay in Rescue Force, picking your assignments, or doing a desk job. Maybe a teaching job.’

‘What do you think you’ll *want* to do?’ I asked.

‘Anton’s invited me to visit New York,’ she explained.

‘We’re flying there in a few days, you can come with us,’ Jimmy suggested. He faced Anton. ‘You’ve got family there?’

‘Yes: mum, dad – second wife, two brothers – both orthodontists, younger sister in college.’

‘Christmas must be fun,’ I suggested.

Jimmy asked Cassie, 'Do you want a temporary release from Rescue Force?'

'The truth? If I wasn't pregnant I'd want to go straight back to Darfur. This ... changes things.'

'Of course,' Jimmy agreed. 'But our door will remain open for you. Tell your parents to pack a bag, they should meet Anton's parents.'

Anton agreed, and suggested it would all be a shock, his parents not approving of him joining Rescue Force.

With the happy couple gone, I asked, 'What are the parents like?'

'Oh ... billionaire media moguls ... I think.'

I laughed loudly. Standing, I said, 'You are such a sneaky bastard.'

The gang flew over to New York first class, Cassie's parents sleeping most of the way, the mother not a good flyer. We stayed at the apartment, Anton, Cassie, and her parents off to a big house in the Hamptons – and a big shock at how rich Anton's parents were.

The next day they called us and invited us over, Pineapple's security driving us out to them. It was a nice house, and large, but nothing compared to our monstrous palace. Dressed in Tuxedos for dinner, Helen looking stunning in a little black number, we met the father, Ted, on the steps. He reminded me off a character in Dynasty, Blake something...

'Nice house,' I offered.

'I've heard yours is ... not bad.' We shook, Ted greeting Helen. 'And you're the famous Jimmy Silo.'

'How's the TNC takeover going?' Jimmy asked Ted as they shook.

'How the hell did you know that? It's secret!'

'I'm a man of resources,' Jimmy informed our stunned host.

We stepped inside and met Anton and Cassie, both dressed smartly, and Cassie's parents, finally being introduced to the brothers - a clear family resemblance.

The first brother told me, 'I read up on your dummy in New Scientist.'

'I trained on it,' Anton put in.

'Damn thing creeps me out,' I said.

We settled down to dinner, Ted and Jimmy all business and politics, the brothers eyeing Helen's cleavage, Anton and Cassie in their own little world, her parents looking a little lost. At one point the father asked about newspapers in Africa.

'I could put your papers into ten countries,' Jimmy offered, very matter of fact. I could see the father's grey matter working away. 'In fact, our region in the Congo has no paper. We were thinking of doing our own.'

'I've heard a lot about the area, it's growing very quickly. You've built a few airports there?'

'Five.'

'Five?'

'It's a region six times bigger than Texas. But if I was going to create a paper I'd call it African Times, and have it sold across Kenya, Somali, the Congo, Sierra Leone, Tanzania – right across the central region.'

'You'd get licences?'

Anton laughed. 'Jimmy doesn't ask for licences, dad, he tells the African leaders what he wants – and they do it.'

'I have ... some influence,' Jimmy emphasized.

'Any experience of the newspaper business,' Ted asked.

'None at all. Perhaps you like to help?'

'And the funding?'

'I'd fund it all myself, I don't like bank loans,' Jimmy said.

'A pan-African paper like that could cost two hundred million dollars to set up.'

'That's what I make in a month,' Jimmy informed our host. 'So if you want to run it, I'll fund it.'

'That's a hell of a deal ... to be discussing at the dinner table,' Ted stated, everyone now focused on him.

'Not really, I did my research on you before we flew out. The deal's yours if you want it.'

'And you can get the licences?' Ted pressed.

'Already had a word to that effect, but only nine countries so far.'

'Only nine,' Ted sarcastically repeated. 'It's a start, I suppose.'

Jimmy took out a sheet. 'Those are details of my lawyers here, they've been briefed – encase you decide to contact them.'

Ted read the detail of the page. 'You always go out loaded?'

‘Research and timing ... are the keys to success,’ Jimmy said. ‘Research ... and timing.’

After dinner we stood chatting in the lounge, drinks in hands. Helen spoke with Cassie’s parents whilst I deflected the odontologists from my wife’s cleavage.

Ted stuck to Jimmy. ‘You act almost as if you’re Cassie’s father. This deal is a hell of a dowry.’

‘As a member of Rescue Force ... I care for her, yes. But if she had not got together with Anton then you, sir, would not have appeared on my radar. And what you have to keep in mind is this: Cassie is writing a book about her ordeal, but also of her romance with your fine son. The publishers are fighting over themselves as to who gets it, and I’m in talks with all the major Hollywood studios as to who will make the romance story, which I’m sure will be of great interest to you and your dear lady wife when it’s shown in cinemas all of the world. Of course, it needs a happy ending. Be unfortunate if the story ended with Anton’s father not approving of the heroine of the piece.’

Ted stared back, wide eyed. ‘Dear God. You’ve backed me into a corner, tied my hands and stuck a gun to my head!’

‘And don’t forget the rather large bribe,’ Jimmy said with a grin.’

Ted stared across at his son. ‘I’d best go give me son a nudge in the right direction.’

The African Times had been born, offices and printing presses already standing by. And Jimmy had an input to the layout from the get go. The front page would cover international news, plus important stories from around Africa. The following pages would then each be national, one page for each country, the major stories, covering at least eight pages. There would follow a business section, a technology section, and oil and ore section, entertainment and adverts, the last few pages dedicated to sport.

The editors were hired, and given firm guidelines about not criticising any of the tin pot dictators that may read the paper. Quotes attacking the various leaders were OK, but the paper itself would never criticise anyone openly. It was neutral; our brand of heavily biased neutral.

Cassie and Anton flew back to Mawlini after a week, now engaged. Anton went back to Darfur, Cassie given a desk job and training role, plus plenty of time off to finish the book.

Crusty

Poor old Crusty, the earthquake man, had been given a poison pill in his assignment. He had made two earthquake predictions, both panning out, but had also claimed to have made a dozen more previously. The academic community immediately called foul, since the data had not been presented ahead of the various quakes. Crusty then claimed that he had warned both Rescue Force and the Chinese Government of the predictions. Much to annoyance of the academic community, we then issued a statement saying that we had received the warnings in advance. The Chinese followed suit, and soon Crusty had a hundred angry scientists wanting to see all of his data.

Since the software was proprietary, and may have some commercial applications some day, he declined. That caused more of an outcry, but we stood by him. After all, he was entitled to recoup the cost of his efforts in researching the science behind the software. He was interviewed several times, always being careful to mention that he was on our payroll – if anyone had a problem. His software was hailed as a major breakthrough by the tabloids, and found support from many “M” Group governments, the world’s academics about to explode with fury and frustration.

As promised, Jimmy supplied a bodyguard for Crusty and his family, not least because numerous eminent scientists, far better than Crusty, wanted him dead. They even created their own working group to try and debunk the software. Problem was, they could not even get along with each other, let alone formulate a coherent plan of action against Crusty. They did, however, spend hundreds of hours coming up with the slur: “Crusty the Clown”, a character off the Simpsons cartoon show. And that was just about all they managed to agree upon. Our strength, was in their lack of unity.

Zanzibar

The local town council on the island Zanzibar did not seem happy with the oil find. At least, they were not happy with the money going to Tanzania. They were part of the country, not far off shore, but considered themselves somewhat detached and independent. They were also more devoutly Muslim than their mainland counterparts, some criticisms issued of the money being made. I don't know where that left Saudi Arabia, the Gulf States, and Iran, but these particular Mullahs were not in favour of oil.

In reality, they just wanted more money for themselves, so we swamped the small town councils with gifts and money for projects, religious sensitivities aside. They adopted the Vegas Mormon approach to things, and helped the oil industry – whilst condemning the avarice at Friday prayers. Bank balances, and souls, were soothed in equal measure.

A third and forth rig soon turned up, one from CAR and one Chinese, work beginning on an onshore terminal and berth for oil tankers. No sooner had the foundations been cut by the Tanzanian President than various religious schools on the islands received money from Saudi Arabia, the offer of religious tutors following the “oil generated evil western concept of cash”. We were ready, a quiet word with the Tanzanians, who became worried that fanatics on the island would disrupt the oil. An army brigade, of Tanzanian Rifles, set up shop on the island, near the oil terminal, the Tanzanians having a quiet word with the town councils: screw with us and we'll dump you all in the fucking ocean! The councils did, however, get extra money for various projects.

OPEC then approached the Tanzanian Government, and dangled various infrastructure projects ahead of a chat about the new oil find. OPEC wanted to survey the area, and for Tanzania to consider joining it if their oil was plentiful enough. The Americans were keen for them to join OPEC, since it meant

more oil dollars floating around the world – hot off The Treasuries printing press! We had spoken to the Tanzanians first, and reminded them of the concession they signed. OPEC was afforded plenty of time, a few cups of tea, followed by non-committal noises and promises of further meetings.

The Chinese then dumped a huge project onto the Tanzanians, a new port facility and extended railroad into the Congo – provided they did not court OPEC. A prominent Saudi then sent us an invitation to visit that was worded along the lines of “we could squeeze you in for a few minutes, and you’d be lucky and grateful!” Funnily enough, we declined, telling them that the dates clashed with a holiday to Israel – just to be rude. It would not be the end of OPEC’s interest in us.

Liberia

The small country of Sierra Leone had been sorted very quickly, the main gangs dead and buried, literally, a few left rotting in the jungle. The RF presence had been wound down with the end of major operations, and the start of the Darfur ramp-up. The Cubans remained in Freetown, flying the flag for us.

Hal and his buddies had pounded the rebels in Liberia before his fateful mission, and now the Americans were landing at Monrovia Airport and setting up bases inland. The new, and unelected President of Liberia, an Army Major, saw the American helicopters overhead and thought better of it, heading inland to start what could have become a guerrilla resistance to the “Yankee invaders”. Unknown to him, our people were watching and waiting, and as he rallied his troops and drove them north one night, his column was strafed at length by our Cobras and Hueys, the good Major killed, his soldiers scattering. That left yet another vacuum in the Presidential Palace, something that the building and its staff were quiet used to. An exiled politician, with about as much claim to the job as my mum, had been living in the States, and now sat behind the Presidential desk, cocaine and gold-enamelled pistols still in the drawers. He did now, however, have a US Army pistol pointing right at his temple. To

aid any discomfort from the barrel, he had a large budget for aid and reconstruction.

The US Marines secured the airport, then the port. As far as Liberia went, that was most of it bar some nasty mosquito infested swamps and jungle. Whoever controlled Monrovia, controlled the country. America had deep pockets, and now made use of its fiscal strength by bringing in a ship full of goodies, starting with wheat, which was distributed freely to Monrovia's poor. That was followed by a delivery of our special buckets, those filled with household goodies, and each housewife in the small capital received one. Seemed like the Yankee Invaders were not so bad after all. Corrugated sheets turned up overnight, and all idle teens and men were given work cleaning up the capital. It was not great pay, but it was pay – and regular.

Signs went up asking people to sell old weapons to the US Army, and to collect rewards for information about gunmen. Rusted old AK47s were soon being handed over, gunmen turned in for a few dollars.

Outside of Monrovia, the Marines left the clearance operation to the Kenyan Rifles, whom the new Interim President had called in and sanctioned. Anyone holding a weapon was shot dead on sight. Roadblocks were set up, searches made, harsh and immediate sentences carried out at the roadside. In the area run by the gangs, the Rifles hid and waited, picking off anyone with a weapon, sometimes calling in air strikes. With a thousand Kenya Rifles in-country, the gunmen were soon as endangered as the scarce local wildlife.

But as Darfur heated up, we reduced the numbers of Kenyans in favour of Congolese Rifles, who took to their work with fervour, soon a high body count that was unseen by the world's press. Liberia was not a large country, and when most of the gang areas had been swept, the Rifles pulled out and left the Americans a more peaceful countryside, having provided a function that no American officer – nor President – could have ever sanctioned.

War in the desert

The months dragged on, and Darfur seemed to be getting worse, not better. The camps were not getting any smaller, the atrocities mounting. But as the body count was rising, so too was the publicity around Africa; we made sure of that. We wanted the sub-Saharan nations on our side before moving, but if anything, we were in danger of going to far, permanently harming relations between Sudan and its southern neighbours. That was not the aim. The aim was secret, even to me, and Jimmy said that the time was right in June.

With advance permission and co-operation from the various governments, the Rifles were mobilised in force and sent to Chad and Southern Sudan, along with most of the helicopters we could muster. Following the ill-fated tank patrol, Sudanese heavy armour had been pulled back to the northern and eastern edges of Darfur. Looking at the dispositions on a battle board in the basement of the house, we seemed to be greatly outnumbered. Jimmy said that it did not matter; victory over Sudan was not the aim.

When I noticed our troop dispositions, I queried some of the flags. Nigeria, Ghana and Somalia were listed. They joined Kenya, Tanzania, the DRC and Zambia. Nigeria and Ghana did not have Rifles units, so these must have been regular soldiers. Jimmy was not being very forthcoming, adding a flag for Zimbabwe to the board. We even had a unit of fifty soldiers from Mozambique. With Jimmy informing me that the operation would begin in a few hours, I checked my paperwork and warned Helen. She was not happy at being left out, so we called Cat back to the house and settled into the basement with many others, curious members of the "M" Group stood observing. I spotted Kenyan Army uniforms, British officers, and a few spy types.

Jimmy checked his watch then addressed the Kenyan officer. 'Launch Insert Alpha.'

The man made a call. This night insert, by Huey, was a reinforcement of the Rifles already dug in and hidden around the region. For the past two weeks the Rifles had been feeding back intel' about the Janjaween, an accurate picture of their movements, bases and identities. We even had people outside the Darfur region, all passively watching, but never being seen. That intel' was now being illustrated on a large map, many small toys

indicating movements. It was good job Shelly was not here, she would have had them away, some eaten.

An hour later reports came back, various insert teams now landed, some turned back due to mechanical faults.

Jimmy checked his watch again, so I pointed at the large clock on the wall. 'Begin Operation Wake-up Call.'

The same Kenyan officer made another call. What he was initiating was the remote detonation of almost four hundred individually placed explosives, many now near vehicles, some alongside compounds or houses. Each had a radio receiver, and the nice men in an American AWACS now boosted the signal and let rip. Ground reports soon flooded in of explosions heard or seen. Upwards of a thousand members of the Janjaween were dead, that many again wounded, the rest just rudely woken up.

Fifteen minutes later, the nice people in the AWACS sent the second signal. Explosives that had been strategically placed to catch the curious, those curious about the first bomb, detonated. Upwards of five thousand Janjaween were now injured, which just about covered half of those actively involved in ethnic cleansing operations.

Jimmy ordered, 'Eyes on, twenty-four hours.' People started to stream out, some to a room next door fitted with camp beds.

'That it?' I asked.

'We'll now observe for a day,' Jimmy explained. 'Our strength, is in small numbers of inserts, observing at length, and doing little – and only then when sure.'

We went upstairs for a cup of tea and some cake in the diner before heading off to bed.

The next morning, the Khartoum Government began receiving reports of an all out invasion of Darfur, presumably by the Rifles. Sudanese television showed mass casualties streaming towards Khartoum for some decent medical treatment in the capital. Confused, and with poor intel', the Sudanese Army mobilised. After all, there was nothing else they could do. Their jets and helicopters flew over Darfur, not reporting so much as a stray camel, let alone a large-scale attack; no jeeps, no tanks, no nothing. Migs screamed over the region all day, and reported nothing upon their return. By nightfall, and with the Army on its way south, the President was scratching his head.

The mass deployment, of infantry and armour, halted at the border and took up positions as Jimmy ordered “Operation Desert Storm”, which he said was poignant, but I didn’t understand why.

All the next day the Sudanese Army sent probing convoys and aircraft into Darfur, glimpsing only burnt-out villages and lone camels. Nothing was reported, causing much frustration back at Army HQ. The soldiers bedded down for the night. They did, unfortunately, bed down where Jimmy expected they would. The nice people in the AWACS returned, and sent another signal, to explosives that been buried many weeks ago. The Sudanese soldiers, sat about the campfire and complaining that a soldiers lot was not a happy lot, got blown up en-mass.

Dawn threw a grey light over death and misery for the regular soldiers, a mass evacuation organised, some ten percent of their number killed or injured. All the stops were pulled out, more units mobilised and sent to Darfur, passing the wounded as they headed to the region. The nature and timing of the explosions were a cause of great concern, and greater confusion. No incoming rounds had been heard, no enemy soldiers seen, no helicopters or planes. The desert had just exploded in twelve places at the same time – right where their columns had halted for the night.

Jimmy ordered the Rifles to form up and move twenty miles into Darfur, toward pre-planned positions, under the cover of darkness. At dawn, we made sure – through the media – that their presence, and their position, was known. As per Jimmy’s plans, no jeep was closer than a hundred yards to another, and all soldiers had dug slit trenches. It was noon when they figured out why, Migs coming in to strafe them. A lot of ordnance was expending by the Migs, but only two soldiers were killed, a few wounded.

As darkness fell our RF Hueys fetched the wounded, taking them to a field hospital that Jimmy called “The Melting Pot”. He would not explain why, he just smiled, so I called him names.

The next day our troops advanced another ten miles, their previous positions being taken by second line replacements. The Migs came in again, killing three and wounding a handful. Again they were flown out. With such a clear provocation, the Sudanese finally put a foot on the gas and moved into Darfur in

force. They formed a wide line, and faced-off against our troops, a gap of some ten miles between the two sides. Our troops moved again that night, to their final positions, and dug in, being re-supplied by helicopter.

At dawn the Sudanese advanced towards our positions, running into mines five miles short of our lads, some of their vehicles destroyed. Tanks had tracks blown off. As they advanced on our positions they soon figured out that our lads had chosen their spots well. It was as if some forethought had gone into the positions. The Sudanese had no choice but to bunch up in natural funnels, where they ran into more mines. By the end of the day, only five of our positions were engaging the enemy, the rest were still facing each other at some distance. All that night our positions were probed, but not too seriously, our casualties light considering the amount of expensive ordnance lobbed towards our positions.

Unfortunately, a company of Somali Rifles got bored with the standoff and burst out, engaging the Sudanese at point blank range. It meant heavy casualties on the Sudanese side, but also many casualties on our side, some from friendly fire. They were ordered back.

The next day became something of a sniper duel, in that we had the snipers and they didn't. Their supply lines were clogged, being hampered by the Pathfinders, and we were re-supplying at night. As dusk fell that third night, our helicopters went up with simple instructions: keep them awake. They approached from the west, our positions illustrated by red and green lights that could only been seen from the west. The pilots knew that as soon as they flew over those lights they could fire at anything that moved. All night long the helicopters pounded the well-defined Sudanese positions, the Sudanese unaware that our forward positions were being abandoned.

At dawn, the Sudanese were hurting, and tired, but bravely attacked in force, finding just mines and booby traps. They lost hundreds of men, morale now an issue. Jimmy called the "M" Group countries, and they petitioned the UN, all pressing for a ceasefire and pullback. The African nations involved all agreed to the ceasefire, so did the weary Sudanese. They had sent thirty thousand soldiers to face three thousand, and took a beating.

Several days of talks resulted in the Sudanese pulling out of Darfur, our troops pulling back to the border immediately. We packed a bag and flew to Washington to update Art Johnson.

In the situation room, the Chairman of the Joint Chiefs asked, 'How many men did you have on the front line?'

'Less than three thousand,' Jimmy calmly stated.

'Against thirty thousand, and tanks and planes?'

Jimmy shrugged. 'Good planning.'

To incredulous stares, we sat.

Art Johnson started with, 'I guess you're going to tell us what the big picture is, and what part this small war plays in it.'

Jimmy pointed towards the Admiral. 'You're a smart man. Why don't you tell me what it was all about.'

'Been trying to figure that for a few days; lot of effort just to stem a refugee crisis. And you said Sudan does not sponsor terrorism or The Brotherhood.'

Jimmy took a set of enlarged photographs out off his briefcase, handing them over. 'Tell me what you see.'

The Admiral, and others, glanced at the pictures. 'These are your troops, the Rifles.'

'Shoulder badges,' Jimmy nudged, gesturing the Admiral on with a wave of his hand.

'These are your Rifles ... from many countries.'

'Keep going.'

'These are your Rifles ... from many countries ... fighting together?'

'And when was the last time they did that?' Jimmy asked.

The man glanced at each other.

'Never,' Jimmy answered. 'So, for the first time in African history, seven countries fought shoulder to shoulder. Seven sub-Saharan Christian countries, fought shoulder to shoulder, against a common Muslim enemy.'

'By god, it was a dry run!' the Admiral stated.

'A dry run for 2025,' Art Johnson put in, many small conversations breaking out.

After a minute, Jimmy added, 'Plus one additional benefit. Four men, injured, sat in our medical tent together for three days. They made friends. A Kenyan, a Tanzanian, a Nigerian and a man from the Congo. And, in just about fifteen years time, they'll all be in positions of power in those countries.'

‘Blood brothers, born in battle,’ a General said. ‘You’ve knitted them together.’

Art Johnson started laughing, shaking his head, soon followed by the others.

‘You’re welcome,’ Jimmy offered them with a smirk.

We spoke about Liberia, that was going well, and the mood was a good one for a change. I felt quite relaxed. And, with the group in a good mood, Jimmy suggested Senator Pedersen should be converted: get it over with. The group discussed it for five minutes, no major objections raised since Jimmy indicated that Pedersen was a “player”. The good Senator was invited over that evening; 5pm.

Entering the Oval Office, Pedersen was surprised to find us there, and in the company of several of the Joint Chiefs.

Art Johnson welcomed his adversary, then began with, ‘Senator, we’ve invited you here because we wish you to be *involved* ... with a few matters, matters of national security. Do I have your assurance that what we discuss will not get out ... to anyone?’

Pedersen glanced at us. ‘I guess it involves Africa, since Jimmy and Paul are here. Yes, of course I agree.’

‘Then we will need to you to sign these documents to that effect first, please,’ Art Johnson explained.

Pedersen stood, and signed four forms. ‘Project Magestic?’

‘We’ll come to that,’ Johnson said. ‘First, I’d like to make it clear that what we will now discuss is classified Top Secret, and that any disclosure would mean a prison term for certain.’

Pedersen took a moment. ‘I’m a patriot Art, you don’t need to read the book to me.’

Jimmy put in, ‘We know you’re a patriot, it’s why you’re here, and why I’ve been dealing with you all along.’

‘May I ask, Jimmy, why you have such a high level of clearance?’ Pedersen broached.

‘Because Project Magestic is about ... Paul, me and others.’

‘About you?’ Pedersen queried.

Jimmy held up a hand. ‘Let me say two things first. To second what Art said about security, this is the single most important conversation you’ll ever have. A security breach would be serious for you. And second - and I have to say this and mean it,

Chuck - should you breach security I would do *everything* ... within my power to harm you.' He let Pedersen think about it.

'OK, ya'll got me worried.'

Jimmy faced Johnson, who gestured Jimmy on. 'There exists a very powerful clairvoyant, codename Magestic. I'm his right hand man, Paul assists me.'

'Clairvoyant? This fella wouldn't be good with the stock markets, would he?'

'He'd be one hundred percent accurate,' Jimmy confirmed. 'He'd also be accurate with plane crashes, terrorist attacks, wars, elections, earthquakes and erupting volcanoes ... and major events decades ahead that will just about wipe out mankind.'

'Jesus,' Pedersen let out.

'He also knows where all the best oil finds are,' Jimmy added with a grin.

'Which'd just about make the fella the richest man on the planet!'

'He's not interested in money, he's interested in saving the planet,' Jimmy suggested. 'We're facing a global war, where most people on the planet may die, hence the Top Secret nature of things here today.'

'We're planning ahead,' the Admiral put in.

'And my medical insurance company?' Pedersen puzzled.

'Has a small role to play in a large game.'

'That why I'm here?'

'No. You're here because you have a future, a predicted future, one I knew about a long time ago.'

Pedersen faced Johnson, but pointed at Jimmy. 'Fella just about bribed me to enter politics.'

'He knew,' Art Johnson said with a shrug.

'We need your help on the hill,' Jimmy said. 'We need you, possibly some others, to know what's ahead, and to help us plan for it.'

'And the stuff you're doing in Cuba?'

'They have enough oil to strategically alter the region,' Jimmy stated. 'You can make friends, or come out fighting.'

Pedersen nodded to himself. 'I trusted you before I signed those papers, Jimmy. Might have been a little money in there, but I seen what ya'll up to around the world.'

‘I know. And I’ll soon need your help with the Republican Presidential candidate.’

‘He’ll get in?’

‘Yes. I have dirt, but ... there may be a better way of dealing with him.’

‘Dealing ... with him?’

‘He’ll do a lot of harm,’ Jimmy explained. ‘Even knowing what the future holds. He’ll see me as an ... opportunity, not a route map. If he makes a mistake, you go to war. And lose.’

‘You aint never been wrong so far, Jimmy,’ Pedersen admitted with a sigh. ‘I was starting to think you got insider information.’

‘I do,’ Jimmy admitted with a false smile. He eased forwards. ‘This is serious, Chuck. We’re talking global war, billions of lives. Directions need to be taken now, some serious planning ahead.’

Pedersen took in the faces. ‘I’m on the team. Wad’ya need?’

‘For now: an hour or two of your time, for a full briefing on the next twenty years. We can do that downstairs.’

Pedersen was driven out two hours later, looking pale and worried, making me concerned for him. And he now had a new perspective, one that would keep him awake all night.

We pulled our troops out of Darfur, and arranged numerous parades through many capital cities, with representatives of each nation parading through the other’s capitals, something else that had never been done before. Rudd oiled palms, and the news coverage was great, that of a united Africa. We then placed Rifles from many nations into each other camps, more so than in the past. Members of the Congo Rifles were based at Mawlini, together with Tanzanians.

A month after the Darfur conflict officially ended, but with the refugee crisis still getting worse, we set about organising the first annual Rifles competition at Mawlini. A hundred of the best men came from each nation and competed against each other in their teams: shooting, running, jeep driving and maintenance, ordnance skills, the assault course, a written test. It was all good humoured, carefully staged and carefully monitored, much drinking after hours. We were careful not to have a road race that

could be timed and monitored, since their record breaking times would have been hard to explain. These men had all been injected, and could run like the wind.

The Kenyans won this first event, the Kenyan President being joined by the Tanzanian President to award medals and thank the participants. It was one of the first stories for the African Times, launched in nine countries. A front-page picture displayed soldiers from each participating nation, and their national flags, under a banner of “United Africa”. We had our mouthpiece, and we were not about to be quiet.

Apartments

After much nudging from the Kenyan Government, we began to tackle a number of farms that had defaulted on their taxes, plus a few safari estates. We grabbed two estates straight away, simply paying their taxes, and built lodges, adding them to the brochure. Near the existing super-farm, we took over small farms and made them outposts of their larger brother, managed from there since they were all within twenty miles. All in, the acreage of suitable farmland increased by a third, and it cost less than a hundred thousand pounds.

Meanwhile, at Goma International Airport, our flagship airport that lacked passengers, Jimmy had built a block of decent apartments, ten stories high and in their own grounds, complete with pool and parkland. It looked very nice. With photograph in hand I went and found him, and asked him if he was crazy!

‘The block will be grabbed by companies that have workers and managers in the area. It was cheap to build, reasonable for people to buy or rent. The airport manager and his staff have rented there, several mines have bought there already, and some of the richer locals from Goma have bought. It’s all sold bar one.’

‘Oh.’

He dug out another photo. ‘Apartment block two, down the road.’ Then he showed me a sketch, making my eyes widen. He explained, ‘The future of Goma City.’

‘It looks like New York!’

‘It’s a good investment for the property business. The apartments cost ten thousand pounds to build, twenty to sell. In the long term, they’ll be worth much more.’

He showed me a second sketch, this time of a large square apartment block, shops on the ground floor. ‘For rental, for workers: two hundred apartments. It’s on the road to Goma. From there it has bus links to the closest mines, the smelting plant and the oil wells. We’ve got a half decent bus service running now. I’ve just agreed to a college near it, a school, kindergarten, public swimming pool, parks.’

‘Home from home – in the jungle.’

‘It’s where the jobs are. There’s also enough food, cheap fuel, and plenty of land that costs nothing.’

‘It’s also close to the airport, so any enquiring journalist will see it on approach,’ I noted.

‘You’re not stupid, are you?’

‘What about the roads, they’re taking ages?’ I pressed.

‘I’ve ordered concrete made locally, lots of it. We’ll use concrete for now, tarmac them over later.’

‘What’ll ore lorries do to concrete?’

‘Crack it, but it’ll be good for a few years. By then we’ll have tarmac over it. I’ve bought up all the spare concrete from Rwanda and Uganda, which should have an effect. We’re using concrete for a few bridges: cheap, but effective. I’m also paying Rwanda and Uganda to improve their road links to us, plus a decent motorway through Burundi to Tanzania.’

‘What’s the corporation making at the moment?’

‘In pounds: one point three billion annually. Plus ... extras.’

‘CAR?’ I asked.

‘An extra four hundred million a year in it. Plus more if OPEC don’t go to war with Tanzania over Zanzibar island.’

‘They noticed the reports have they?’ I asked with a grin.

‘Right now they think the deposits are a quarter size of Saudi deposits.’

‘And...?’

‘And think what they’ll be like when they realise the deposits are as big!’

‘They visiting tomorrow?’

‘Yes, the President himself. So shine your shoes.’

The next day I was grinning as we met the Tanzanian delegation at the front of the house. I knew what was coming, and I always enjoyed shocking people. Unfortunately, the old boy didn't look like he could take too many shocks. We allocated rooms for them, our guests amazed by the house, and the quality of their rooms. We made them lunch, and sat about the dining room table chatting about things of little consequence.

After lunch we retired to a lounge and lifted our note pads. Their delegation had ten members. Opposite them sat Jimmy and me, Helen and Han, plus our Chief Executive from CAR.

'First of all,' Jimmy began, 'I would like to say that we are happy to increase the size of the Tanzania Rifles from two thousand five hundred to five thousand – if you are happy.'

Silly question, I thought. They were more than happy, a document signed for their honorary Colonel in Chief.

'Next, we would like to increase the number of oil rigs off Zanzibar Island, moving some to the north.'

Another silly question; the old boy had the pen in his hand before Jimmy had finished.

'Next, and in recognition of the revenue we expect from the oil in the next four years, we are paying you one billion pounds *upfront*.' Jimmy handed over a cheque with a lot of zeros.

I wondered if the old boy would make it through the day as his team leant in and peered at the cheque. The old boy pocketed the cheque, leaving me hoping he would not put his clothes through the wash before he banked it.

'Next, the Chinese Government have consider the request you made for a development loan. They have agreed a loan of three billion dollars, at zero percent interest.' They stared back as Han laid out a form to sign. The old boy duly signed, so too his ministers, witnessed by us and Han. Jimmy added, 'The money will be transferred to you within a week.' He poured the old guy a glass of water.

'Next, we'd like to discuss the Zanzibar oilfield. We feel ... that OPEC countries, especially Saudi Arabia, may be a problem in the future when they realise the size of the oilfield.'

'Size of it?' they puzzled.

‘We believe, from our recent surveys, that the oilfield could be half as big as the Saudi oilfield, making it one of the world’s largest oilfields.’

Now I was sure the old boy would keel over. They took a while to digest it.

‘One of the world’s ... biggest oilfields?’ the old boy questioned.

‘Making Tanzania as rich as ... Dubai and Kuwait put together,’ Jimmy suggested. ‘You, sir, will see your country grow to be very ... very rich. As such, we’ve borrowed some inshore patrol boats from the Chinese, and they’ll be delivered to you soon to patrol the oil rigs – to keep your investment safe.’

The old boy had a new swagger about him that afternoon as he wandered around the house and grounds; he was walking on air. As such, Jimmy, being the sneaky bastard that he was, brought in the UK Prime Minister for a business meeting with the Tanzanians. We sat again in the lounge and had tea, the PM soon offering oil equipment, oil experts, help with building terminals and a local refinement plant on the mainland. The old boy, his head spinning, signed up straight away, the costs offset against future oil revenue. It would all be done for no upfront cash, a deal worth over a billion for British companies.

Meanwhile, Crusty was in China. His software had predicted a modest quake, and RF China and Hong Kong were on full alert and deployed, along with British and French groups. The academic community watched in a state of shock as Crusty gave interviews to Chinese TV, making his pinpoint prediction.

On the day in question nothing happened, so they waited. The next day, at noon, the ground shook, buildings tumbled, people were injured and killed. And the academic community turned red with anger, its old men pulling out what little hair they had left. Crusty, and his two ex-SAS bodyguards, toured the Pacific region, making friends and promoting his software.

A month later he made a prediction of a minor quake in Sumatra, the authorities taking a mixed approach to it. We mobilised the local RF unit and sent over the Aussies and the Kiwis, who sat around for two days after the quake should have struck. It hit on the third day, minor damage, a few fires, some people trapped. We had several TV crews in place, the pictures

streaming back to western news programmes. Crusty was becoming a celebrity, his increasing popularity judged by the number of death threats he received. Since the threats were all spelt correctly, and sometimes penned in Latin, we did not take them seriously.

His budget for a tsunami warning system was increased, and he toured those regions subject to earthquakes, granting money for air-raid style sirens attached to police stations, hospitals, schools, and government buildings. He also produced a cartoon, which was dubbed into ten languages and regional dialects. It depicted kids playing on the beach when the water suddenly went out, rushing in and killing those kids that did not run inland. Every school received a copy. They also received posters for their walls: when the water goes out quickly, run! Twenty-five thousand posters went out, in a variety of languages.

The road to Damascus conversion

US Presidential races started a good year or two before the election itself, something I found odd. Well, I found most US politics odd, but this early start seemed even more odd. UK politicians began kissing babies and lying to the public little more than two months prior to an election, not two years.

But Hardon Chase, Republican candidate, was getting in there early, eighteen months or less to the elections. His opponent, in the Democratic Camp, was considered weak. Even by Jimmy, who avoided the pretender to the throne.

The day we landed in New York, the news broke about the death of a Republican Congressman in China, stabbed by a man who was then shot dead by Chinese police. The incident occurred at a hotel, the dead assailant from a remote region, and with an odd list of gripes, plus time spent behind bars for assault and mental health issues. The news was full of it, but it was an open and shut case, the Chinese very apologetic about the incident. The dead man was, however, known to me, and the Chinese. He would have gone on to be principal architect behind

the plan to attack China in 2015. None of the briefings that Jimmy had given had ever listed the names of future leaders; they had always been given numbers. No one in the “M” Group had a clue that this man would have gone on to be President some day.

We did the rounds in New York, a visit to Pineapple, photographs with the stars, a TV interview. The next morning we flew down to DC, to meet with Haddon Chase at the White House. He had received his Magestic security brief yesterday, a four-hour briefing, and so was fully prepped for us before we arrived. He met us in the Oval Office – for effect, but without Art Johnson present. For company we just had the Admiral; the Chairman of the Joint Chiefs. Chase shook Jimmy’s hand with a keen expression that said, ‘This is an opportunity.’

We sat and squared off to each other. Jimmy took a long time before saying, ‘So, how did you find the briefing?’

‘Still wondering why I was given the briefing in the first place. They were not so ... forthcoming.’

‘You were briefed about someone who can predict the future with pinpoint accuracy ... and you’re a presidential candidate.’

Chase’s eyes widened. ‘You saying I win?’

‘You win. And then go on to do a bad job as President.’

‘How I do ... is none of your concern. You’re not even American.’

The Admiral piped up with, ‘I’d suggest caution ... when talking to Mister Silo. He is ... more capable than you realise. And he knows what you’re thinking before you do.’

Chase took a moment, an indignant glance at the Admiral. ‘It’s the will of the American people who gets in. Then, as such, I will be the legally elected President. And since I know how close you are to the Russians and the Chinese, let alone the Cubans, you’ll not be welcome in the White House.’

I handed Jimmy ten dollars, the Admiral hiding a smile.

‘What?’ Chase asked. ‘You bet I’d say that?’

‘I bet, that you’d be just as difficult as I predicted,’ Jimmy calmly explained. ‘So tell me, how much of yesterday’s briefing did you believe?’

‘Well, the military believe it.’

The Admiral put in, 'We've had more than five hundred predictions over fifteen years, none wrong. We've averted terrorist attacks, plane crashes, you name it.'

'I'll make my judgements when I sit at that desk,' Chase said, thumbing over his shoulder.

'You believe our prediction then?' I asked. 'That you'll get there.'

He took a moment. 'I'll get there with or without you.'

'You'll get there if I let you get there,' Jimmy told him, the now Admiral seemingly uneasy.

'That a threat?' Chase asked.

'The thing about knowing the future, is that you know what will happen. I knew, in the summer of 1983, that you would be President. I knew, and so I was at the cabin on the lake, collecting evidence to use against you.'

Chase looked horrified, trying to hide his reaction in front of the Admiral.

Jimmy continued, 'I've had twenty years to collect, and even to fabricate, evidence. And, unfortunately for you, all of the witnesses gave written and videotaped evidence, and then very recently met with less-than-discreet accidents. The accidents, which occurred as you were nominated for Republican candidate, would be linked back to some CIA gentlemen. So, if anyone was to investigate the matter, it would appear as if the CIA had silenced all of the witnesses. If such an investigation were to take place after you entered office, it would look ... odd.'

'I'm gong to pretend I didn't hear that,' the Admiral stated.

Chase poured himself a glass of water and loosened his tie. He took several sips of water, composing himself. 'I guess there's a *reason* why I'm not in prison right now.'

'The reason is this: I wanted to sit and face you, to see if there was a spark of humanity in you. To see if you could be the man you'd like to be.'

Chase took another sip. 'You saying there's a way out for me?'

'You may end up President. It depends on the next ten minutes.'

Chase stared back, now just a wreck, not a confident and brash presidential candidate. ‘If I get in ... you’ll have a hold over me.’

‘I have a hold over the current incumbent, and did over the last one. I did not use that hold, that’s not how I like to do things.’

‘I can vouch for that,’ the Admiral stated. ‘We’ve had no pressure or threats, nor any asking for money. And if Jimmy wanted to, he could easily be the world’s richest man.’

‘So what do you want?’ Chase asked.

‘I want you to be the most successful president in the history of the States. I want them to build statues of you and name schools after you.’

Chase sat staring back, his eyes widening. ‘You’d ... help me?’

‘What do you think I’m here for?’ Jimmy posed, his hands wide. ‘Why do you think I was chosen for this task?’

Chase glanced at the Admiral, at me, and back to Jimmy. He shrugged and held up his hands. For a presidential candidate, a slick operator, he was a bit slow.

‘My job, is to help the world fix a long list of problems, and to get it ready for a calamity that strikes in 2025. I can advise you every step of the way about all the pitfalls, but I will not interfere in internal politics, nor party politics. If you ask me a question about a foreign government, I’ll answer it. You get the benefit of foresight. In the minefield of politics, you get a map that shows you the way through.’

‘And in return?’

‘And in return ... nothing. I’m here to help, not to ask for things.’

‘You make yourself a lot of money,’ Chase noted.

‘Ninety percent goes to charity. The more I make, the more I can support various charities.’ Jimmy waited.

‘If you’re just there to advise the President, why the blackmail?’

‘Some presidents, and residential candidates, are too stupid to listen to good advice. My advice, is not the ... take it or leave it kind. If I tell you that a quake will strike - then you act, you don’t take it under advisement. My advice, is to be acted upon,

or it will be withdrawn. And, where I see you doing something to the detriment of another nation, I'll advise them as well.'

'Like the Russians and Chinese.'

'Very much so. They ... listen.'

'You talk with their leaders?' Chase puzzled.

'All the time; they already know every aggressive move you'll make in the years ahead. Should you ignore my advice, and make those aggressive moves, they'll be ready for you ahead of time.'

'You're playing God!'

'And you, sir, may end up making decisions that cost thousands of American servicemen their lives. As President, that's your right. It's my right to stop you, and send you to prison.'

Chase took another sip of water. 'I ... made a mistake a long time ago. Since then ... since then I've tried to do a good job.'

'I know, I've been following your career with some interest. Your record is not a bad one, and I don't think you're a bad person. We just need to find the real you, the one that looks at end of his life, then turns back along the path he has trodden, and asks: did I do a good job? Could I have done better? Did I need to start that war? What I'd like you to do, is to consider what you may think on your deathbed, about what you did in your life. And what you may do as President. Will you look back and be proud? Will they name schools after you?

'As it stands, my knowledge of the future suggests that you'll leave office with the lowest approval rating since records began. You'll make Nixon look like a great man.'

I asked, 'If you know that you'll be so unpopular, why run? You're just beating yourself up for four years? And the pay aint great!'

'Being President is a ... calling,' Chase suggested.

'They're calling you an arsehole,' I helpfully put in. 'You won't be doing the after dinner speech bit after leaving office. So why bother? Want your name in the history books? Is that it? Hardon Chase, number forty-four, what an arsehole.'

'It's a good point,' Jimmy agreed. 'We know you'll be very unpopular at the end. So why go ahead with it?'

Chase eased back, taking off his tie. 'If I got in, and took your direction, it would compromise my integrity – and my right to choose. Not sure I could do that.'

'That's the first sensible thing you've said,' Jimmy stated. 'And a good point.' He faced the Admiral. 'How does Art Johnson do it?'

'He takes what you say, then we discuss it, do some research, and then he chooses a course of action.'

'Have I, in any way, taken away his right to choose?'

'No.'

We all faced Chase. And waited.

'And if you don't like the choices I make?' Chase posed.

'I'll try and counter balance them of course, especially if I know that they are very bad choices. But when you do make a choice, I'll explain exactly what the consequences will be, and in great deal. If you still decide to go ahead, knowing that you'll fail, then you have no right to be in the big chair. If I tell you that ... New Orleans floods, and you do nothing, I'll make it hurt, I'll make it hurt a lot. But it's still your choice to ignore my advice.'

'Why would I ignore a warning about a flood?'

'Why would you ignore any of my advice?' Jimmy countered with.

'Let's play ... Presidents and advisors,' I said. 'Here's a scenario for you, Mr President. Cuba had just discovered oil, and we're telling you they have enough to alter regional politics and make themselves very rich. What do you do?' We waited.

'I'd need more information,' Chase timidly admitted.

'OK,' I said. 'Choice number one: you ignore them. They develop their oilfields, get rich, buy lots of Migs and modern weaponry, and start offering cheap oil to Central American countries if they'll spit in your eye. Choice two: you kiss and make up, buy their oil, sell them TV sets, and try and gently steer them towards democracy.' We waited, the Admiral seemingly keen on the answer himself.

'There's a third choice,' Jimmy put in. 'You attack Cuba, steal their oil. Unfortunately, every South American country turns against you, along with Russia and China and ... well, most everybody. You fight a long war, you lose a lot of people, and the Democrat that replaces you pulls the troops back. What have you achieved? And when you look back on your life, what will

you think of your screw-up? What kind of chapter will it be in your memoirs?’

‘And the answer?’ Chase asked.

‘Is to do what’s in the best long-term economic interest of this country,’ Jimmy stated.

‘Kiss and make up, buy oil and sell them goods,’ Chase repeated, his head lowered. Lifting his head, he said, ‘Chuck Pedersen has business interests with you guys, and you’re in Cuba. You courting votes?’

‘I have twelve of your Senators willing to either assist you, or block you.’

‘To stop me from making bad choices,’ Chase wistfully stated

‘Minefield. Map,’ I put in. ‘Your choice. But it’s not just you crossing the minefield. There’re a few others there with you: two hundred million odd.’

‘You could just get rid of me with what you know, support another candidate,’ Chase posed.

‘I will always try, as far as I can, not to interfere in your domestic politics. I had intended dropping you in it, but I thought I’d talk to you first.’

Chase stood and walked to the window, then took a long moment to stare at Art Johnson’s chair. ‘I do want to be President, but I don’t want to be an unpopular president. I don’t want to regret it; I’ve met too many former presidents, and had nothing but pity and contempt for them. I don’t want to join that group.’

‘Then make a choice,’ Jimmy nudged.

Chase stepped back across to us and sat. ‘I won’t be bullied, nor have my hand forced by anyone, but I will listen to what you have to say and try and follow the route map. That’s the deal, take it ... or throw me to the press.’

Jimmy stood. ‘I’ll take it.’ He offered a hand, and they shook, surprising me. I would have thrown him to the wolves. Jimmy invited him to Africa and London, to do some electioneering. I guessed we were going to endorse the candidate. But I kept my fingers crossed.

Water babies

Jimmy walked into the house, a week after getting back from the States, and lifted up Shelly. 'I'm pinching the kid for some swimming, join us in half an hour.'

With Shelly gone we puzzled the odd move, since Jimmy had not taken Shelly swimming before.

'He's probably got some lady to impress over there, wanting to come off as all paternal.'

I rang and checked. No lady visitor. We had a cup of tea, scratched our heads, and changed into swimming costumes, throwing tracksuits on over them. We arrived early, twenty minutes after Jimmy had suggested we join him.

At the pool entrance we could not see anyone, then noticed bubbles.

'There's a diver in the pool,' I commented, and we walked along the edge, peering down. And we stopped dead.

'Oh my god!' Helen gasped.

Exchanging looks, we tore off the tracksuits, placed on our goggles and dived in. There, alongside Jimmy, was Shelly, swimming along with a air tank the size of a pop bottle, tiny pink flippers and a small mask and mouthpiece. Seeing us, Jimmy turned her around and she swam towards us, our daughter breathing naturally and blowing out air. As she passed us she waved, but kept going, finning along at quite some speed. After five minutes of observing her, Jimmy lifted her up and onto the steps, easing her mask off. Shelly spat out her mouthpiece and coughed a little, smiling widely.

'You had it made for her?' I asked.

'What every budding marine biologist needs.'

'She's two and a half!' Helen said, but with a smile.

'Scooby-do div-div,' Shelly told us.

'Scuba diving, yes,' we agreed.

Jimmy eased off his equipment and gave it to me. 'Have fun. But keep her out of the pond, eh? And out the jellyfish tank. Given half the chance, she'd be in there!'

Five minutes later I was back underwater, Shelly swimming up and down without any fear. She even found her lost hair band.

Mogadishu

We landed at Mogadishu International Airport on a British Airways flight, the airport quite busy these days. It appeared clean and efficient. We were met off the steps and nudged into a black Mercedes, part of an escorted convoy, and soon speeding out of the gates. The roads seemed well maintained, and the houses all appeared bullet-hole free and painted.

It wasn't a long drive to the Presidential Palace, and we pulled up to find a long line of smartly dressed Somali Rifles. They stamped to attention after orders barked by a sergeant. Playing like royalty, we spoke to a few and enquired about the Sudan, most having been deployed there. Inside the palace we were led along white-marbled floors and walls, cool after the outside heat, and into a reception room where the President and his staff awaited us. I noticed that the photographer was from the African Times. He snapped us shaking hands with the President, General Abdi and a few others.

We sat and talked about the Rifles, the Sudanese problem, and oil exploration; a full hour. On Jimmy's request, we had a guided tour of the city by Abdi, to see how it had come along. I had nothing to compare it to, just photographs, but Jimmy said he knew what it should have been like. The city centre and port bustled, and from where we stopped we could see the harbour full of ships, more anchored outside. We dropped in on the main hospital, finding it as good as anything Africa had to offer. Next came a RF clinic on the edge of a poor area, time taken to speak to everyone there and get their input on conditions. Those conditions were improving day-by-day, month-by-month.

As we drove around we could see a great deal of building work still going on. It was not an attractive city, certainly nothing in the way of colonial structures or gleaming office blocks. What it was, however, was relatively safe. Police and soldiers stood on every street corner, and the crime rate was low.

On the outskirts of the city, we popped into the Rifles base and spent a full two hours greeting soldiers and chatting away. We even visited their clinic, chatting to some of the wounded from Sudan, many of whom had never been injected with the

blood. Pulling into a nice westernised hotel, Jimmy said it was ours, finished recently and paid for by the property business. Abdi followed us in and we sat and had coffee, inconveniencing the guests with Abdi's bodyguards.

'I hear some bombs have gone off,' Jimmy said.

'Yes,' Abdi admitted. 'A dissident group from the north.'

'My information says that they are al-Qa'eda: Saudi nationals and religious extremists.'

I pricked up my ears.

'You are well informed, Jimmy,' Abdi admitted. 'But they are small.'

'I hear that they are growing, and trying to disrupt your country because you do business with the west.'

Abdi took a moment. 'That is ... most disturbing. Do you know where I may find these people?'

'They're scattered far and wide, but their headquarters are in Afghanistan. They have training camps there.'

'Afghanistan? I must research this country. Why do they support these men?'

'The country is split in half, north and south. In the north are the Northern Alliance, who fight against the Taliban in the south. The Taliban were funded by the Saudi Government after the Russians left that country, so that they would not be communist, but Muslim. Now, the Taliban accept the help of Islamic fighters, Arab fighters, in their war against the Northern Alliance.'

'The Northern Alliance, they are not Muslim?'

'They are Muslim, but with different values to the Taliban.'

'What do they want with us?' Abdi puzzled.

'They wish to harm the west, and anyone doing business with the west. They want Somali to be an Islamic state with Sharia law.'

'We are Islamic, and we have Sharia law,' Abdi puzzled.

'Yes, but you do not make them your leaders,' Jimmy explained. 'They are Saudi; they feel you should bow down to their ... greater closeness to the source of Islam. They see you as children to be guided.'

'I will kill any of them that sets foot here,' Abdi insisted. 'We will rule our own land, not the Saudis.'

'You need to secure the northern waterways, Yemen is but a short boat ride,' Jimmy suggested.

‘It will be done.’

At the hotel, I asked for clarification.

Jimmy took a moment. ‘I just put Somali on a collision course with al-Qa’eda.’

‘Why?’

‘Because they’re the only black-African Muslim state that could be used as a buffer.’

‘So al-Qa’eda won’t get a foothold here.’

‘Correct.’

There was another reason, but I did not realise it at the time.

Part 6

Lucy

The autumn chill brought the birth of our second daughter, Lucy; we used the name Jimmy had suggested. She was a month premature, another “C” Section at a private clinic. Sykes’ Government doctors performed the operation in London, save us having to try and explain to regular doctors why Helen had no scar from the first “C” Section.

Lucy popped out with little fuss, and I soon stood there with a little red bundle, marvelling at how much hair she had. Sitting with Jimmy and my parents in the corridor, Shelly was very puzzled as to what it was. We had to explain that it was not another cat for the house, the last moggy eventually getting fed up with Shelly pulling its tail and hitting the road. Still, for the first few days Shelly said ‘puss puss’ at her sister.

Back at the house, two days later, everyone made a fuss, even Keely, and Cat moved into our house for a few weeks. There was no major crisis on the horizon and so we took it easy, Helen completely recovered in little more than four days. During that period, when Shelly had a strop on, we’d dump her with Uncle Jimmy, who she always behaved for, or we’d give her to Han. Unlike most people in the house, Han would get down on the floor and play with Shelly, an undignified position for a stiff Chinese diplomat. Without our permission, and a little annoying, Jimmy bought Shelly a pink bike with stabilisers, complete with a pink helmet, and let her tear up and down the long corridors in the house, chipping wood and paint as she went. He also bought her a small yellow dinghy for the pool and it occupied our daughter’s attention for hours when we wanted some peace. Finally, a month after the birth of Lucy, Jimmy arranged a nursery teacher, someone Sharon knew. The lady had her own three-year-old girl, and the two girls would spend hours a day colouring or finger painting. Helen went back to work part-time, which was probably what Jimmy was after all along.

Zimbabwe

Attempts at reconciliation between the ruling party, Zanu PF, and the opposition MDC were short lived, soon rioting on the streets of Harare. Jimmy suggested that the time was right, and then informed me that I was sworn to secrecy; not even Helen was allowed to know what would happen next. When I knew what was about to happen next I was horrified, and voiced my opinion. Jimmy gave me the talk about surgeons and arms, but I was still horrified. I then got the talk about killing ten to save a thousand. What Jimmy had planned was murder; a few hundred lives now to save thousands later. We ended the conversation without agreeing, and Jimmy said that this next year coming would offer up a high body count.

The Zanu PF party headquarters, a tall office block in central Harare, caught fire on the next Monday morning, the fire starting on the ground floor. Unfortunately, most of the party workers were in it at the time, and few survived. A few days later, at a hotel retreat in the country, the ruling party met to make plans and to discuss the election of a new leader, beyond the current interim president – who no one really liked. As they assembled in the hotel grounds, in a spacious marquee, a bomb – buried under the grass many months earlier – received the correct radio signal. The party's senior members perished, along with their wives, the ladies sat at the time in colourful dresses and big hats. Zimbabwe was making the news again.

A few days before the explosion, the Army's Commander had called the interim president "corrupt", which was rich considering what we knew about the commander. After the explosion, fingers were pointed, but not at the interim president, who all agreed could not blow up a paper bag. In traditional African style, the Army's top brass met a few days later to plot a coup. They had downed little more than just their first cup of tea when the room that they were in exploded. None survived.

The interim president had a nephew who was an Army Major and, after the explosion, few officers of higher rank left to consult with. He promoted the major to a general and appointed him head of the Army at just thirty-eight. Calm was restored. And the major, he had studied in Kenya, in Mombassa, working part time at a beach hotel to make extra money. Jimmy showed

me a picture and I recognised the guy; I'd taken him scuba diving a very long time ago.

The new head of the army contacted the Kenyan Rifles and asked for Pathfinder bodyguards, twelve of them, for both himself and the President. Permission had been granted immediately by the Rifles' Colonel in Chief, who had then asked to visit. We packed our bags, I said goodbye to the baby, and we flew direct to Harare from Frankfurt.

At the airport we were afforded honoured visitor status, a car whisking us out of a side entrance and straight around to the Presidential Palace, the Interim President waiting with his nephew. The President was a quietly spoken and unassuming man, and watched with great curiosity the reaction of his new head of the Army, Solomon Beke. Solomon greeted Jimmy like a long lost relative, explaining to the president about his studies in Kenya, his part-time work and the kindness we had displayed towards him. We sat and enjoyed a refreshing tea, making small talk. Jimmy explained that the bodyguards would not cost them anything, and that the men's neutrality and loyalty was assured.

'I miss the beach in Kenya some days,' Solomon admitted. 'Here we have no beaches.'

'You are welcome to visit the new hotel any time you like, as my guests.'

'I followed the crisis in Darfur with some interest, Mister Silo,' the President stated. 'They say you spend a lot of your own money on these things.'

'Yes, Mister President. Darfur cost me three hundred million pounds.'

At the time, that was about ten times the entire GDP of Zimbabwe.

The President digested the numbers. 'And how goes the tourist area?'

'We are sending as many people as we can down to you. I believe they are operating at around eighty-percent capacity, which is good – given the problems here.'

'Indeed,' the President admitted. And I'd have to admit that I quite liked the old guy.

'I have a proposition for you, Mister President,' Jimmy said. 'How would like your own Rifles Brigade?'

Solomon could hardly contain himself.

‘You would pay for them, as you do elsewhere?’ the President queried.

‘Yes, we would pay for them. We will equip and train them, but they will be loyal to you. In return, we may ask for them in situations like Darfur. And we thank you for those soldiers that you did send to us.’

‘They were not allowed near to any danger,’ the President noted, eyeing Jimmy carefully.

‘They were there for African solidarity. The aim ... was one of unity; political unity and military unity.’

‘I will be happy to see your newspaper sold here,’ the President suggested. ‘It is, perhaps, the only unbiased paper in Africa.’

‘We’ll begin circulation straight away,’ Jimmy offered. ‘What of the Rifles?’

‘We will be happy of your assistance,’ the President suggested. ‘But the recruits must be young men, no one who has yet developed a taste for corruption.’

‘Yes,’ Jimmy agreed. ‘Young men with ... fresh minds, and good hearts. And Kenyan instructors. But may I make a suggestion. How about we train them in Kenya and the Congo, and then give them back to you when they are fine young soldiers? Say, one year away?’

‘An excellent idea,’ Solomon agreed.

Jimmy added, ‘You need only assist us with recruitment, the rest will be down to us. We’ll hand you back a thousand good men.’

‘A thousand?’ the President repeated.

‘No point in a smaller group, and some will drop out, wishing their mother’s skirts,’ Jimmy suggested.

‘Your are ... abnormally generous,’ the President noted.

‘No, I have my own selfish reasons. I aim to unify all African armies some day.’

‘I did not think you a dreamer, Mister Silo.’

Jimmy smiled widely. ‘We all need our dreams.’

‘Indeed. And mine is of a peaceful Zimbabwe.’

‘I can help with money and resources,’ Jimmy responded. ‘Starting with a few schools, and a rather large orphanage.’

‘Your orphanages are legendary around Africa. How many will this one total?’

‘Let’s start with twenty thousand ... and work up, shall we?’

‘You may build as many orphanages as you like, but food supply is a problem.’

‘If I have your permission, then the orphanages would grow their own food with the help of our staff from Kenya. We would then look at helping your farms, if you are willing to sell farm land to me.’

‘If you were to buy such land, would not your *white countrymen* have a problem with just whose land it used to be?’ the President posed.

‘I will make contact with the former owners and offer them a settlement.’

‘You will be buying it twice!’

‘I am kind of hoping that you will be ... *generous* in your pricing.’

The old boy smiled. ‘Indeed it should be generous, if it feeds the people.’

Solomon escorted us back to the airport and we sat chatting for an hour. He wanted to visit again Kenya and the beach hotel, but dare not leave for fear of what might happen whilst he was gone. We promised to send recruitment staff, and he promised every assistance to find young men. Given the employment scene in Zimbabwe, it would not be difficult.

Before we boarded the flight, Jimmy rang Mac. ‘Mac, Jimmy. How’s Camp Delta coming along?’

‘Almost there, couple of weeks. It’s a big spread, so who’s gunna be in it?’

‘The new Zimbabwean Rifles.’

‘Zimbabwe? You fucking mad?’

‘All fresh faced teenagers, no prior experience, blank sheets of paper.’

‘Oh. Aye, that might work.’

‘There’ll start arriving in three weeks, so make sure the water pipes work and the canteen is ready.’

‘Kenyan Army says they got some more tanks.’

‘Yes, another twenty. And I got thirty for Somalia, and twenty for Tanzania. It’s not much, but it all helps.’

‘Rumour has it the Somali Rifles are ramping up?’

‘Yes, towards twenty thousand men. Keep the Ethiopians off their turf.’

‘Jimmy, is there wuz going ta be a big campaign somewhere... you’d tell us well in advance, wouldn’t ya?’

‘Mac, you’re always the first to know,’ Jimmy teased.

‘Like fuck. Didn’t know about what ya had planned for Darfur till the last minute.’

‘It’s called ... secrecy. Sometimes, I don’t even tell myself what I’m planning.’

Noodles

We’d been back for a whole day when Jimmy opened up the basement command room. I was worried as soon as I was told, Helen and me rushing over. On the table lay a map of Northern Somali and Yemen.

‘Oh my god. Suez,’ I let out.

‘You’re not wrong,’ Jimmy checked his watch.

‘There are eight fucking clocks on the wall!’

‘Six.’

I stopped to count them. ‘There’re six clocks on the wall!’

‘Yes, now shut up and listen. I’ve just tipped off Abdi about al-Qa’eda operatives crossing from Yemen. He’s sent men north to the coast.’

Han stepped in. ‘Good afternoon, Paul. How is Lucy?’

‘Fine, thanks’.

Han faced Jimmy. ‘The boats will arrive soon.’

‘Boats?’ I queried.

‘The Somalis have bought four inshore patrol boats from the Chinese, and they’re just about to be delivered to the harbour being built by the US Navy.’ He tapped the map. ‘Here.’

‘Is it ready?’

‘Some of it is. The patrol boats will be fuelled by the US Navy and sent out with Somali crews to patrol the area.’

‘And these Somali crews...?’ I posed.

‘Have about as much seamanship as your daughter in her little yellow dinghy – if not less.’

‘So ... how are they going to find the bad boys?’

Keely stepped in, dumping reports onto the map. 'The US Navy will put crews aboard.'

'So ... let me see if I have this right. Chinese made inshore patrol boats – with all the instructions written in Chinese – plus Somalis with no sea legs, and gung-ho Americans.'

'Have faith,' Jimmy suggested.

'Have faith? They're likely to shoot each other!'

Han put in, 'The Chinese crews are not armed for this venture.'

'Ours will be armed to the teeth,' Keely quipped.

'You trying to start a war?' I asked Jimmy.

'They have a common purpose,' Jimmy responded, showing me a picture of one of the craft. Ninety feet long, they had a crew of twenty and a single fifty-calibre mounting forward.

A fax churned out of a machine, Han checking it. 'They have arrived, and are being fuelled. Their escort cruiser is returning.'

'This should be good,' I said, grabbing a seat.

The US Navy boarded the craft, along with four members of the Somali Rifles that could speak to anyone apprehended, presumably in Arabic. The four inshore craft set off on a prescribed patrol route, Jimmy suggesting that small launches would cross from Yemen in a few hours. We paced up and down.

Two hours into a dull patrol, the US Navy hands aboard the Chinese craft were hungry, breaking open ration packs. The Chinese stared at the meagre American rations and scratched their heads. Where the Americans just being unsociable? They decided not to enquire, and got the stoves on, the galley soon full of the smell of cooking, and making the US Navy a little jealous. Thirty minutes later, the Chinese sat with their meal, noodles tonight. Being the polite individuals they were, they offered to share. The Navy deckhands required no prompting, and tucked into tasty noodles; rice, beef and black bean sauce.

In the basement, Keely put small grey models of ships onto the map board.

'What are they?' I asked.

'Five destroyers.'

'Destroyers? With bloody great radars up bloody great towers?'

‘Yep.’

‘So why aren’t they searching for the bad boys?’

‘They are,’ Keely said with a grin.

‘So why the patrol boats?’ I puzzled.

‘Try and figure it out.’

I stared at the map board, not figuring it out. The bloody great task force, with its huge destroyers, tracked the small launches every inch of the way. They then directed the nearest patrol boat onto an intercept course, and right up to the launches, who immediately opened fire. The Somalis returned fire and killed every last one of the occupants on the launches, taking several hours to fish up the bodies for identification. Back ashore, a lone wandering TV crew, a thousand miles from anywhere, filmed the Somalis offloading the bodies. The story made the news in Somalia, Yemen and the wider Middle East.

And the US Navy, full of tasty noodles with black bean sauce, had been taken off the patrol craft earlier. There was only one group that would get blame for the intercept, and that was the legitimate Somali Government. I finally had it figured out.

Upstairs, I checked a few faxes and decided to call it a day, laughter catching my attention. I popped my head out of the office to catch a glimpse of Jimmy with Anya, the Serbo-Croat speaking lady, climbing the stairs with Michelle the other side of Jimmy. As they climbed, Jimmy had a hand on both arses. I ducked back in before they saw me, my mouth opening. ‘The dirty bugger.’

I rushed around to Helen. ‘I’ve just seen Jimmy going up the stairs with Anya and Michelle together, a hand on each arse!’

‘Ah, I heard a rumour.’

‘What? And you didn’t think to tell me?’

‘Ah, not jealous are we?’

‘No,’ I protested, less than convincingly. ‘It’s just that...’

‘What? Just that you’re married now. With kids.’

‘No, no, I didn’t mean that.’

‘Then what?’ Helen teased.

‘Well, we don’t get to gossip much about the big guy.’

‘I’ve thought about what he’d be like in bed,’ Helen admitted.

‘What?’ I demanded.

‘He’s over a hundred, been around. Must have picked up a few tricks.’

I stared, my mouth opening. 'Uh, excuse me ... wife! You think about what he's like in bed?'

'Not in that way, just curious.'

'Not in that way? What other way is there?'

'I'd like to watch what they do.'

'You can't say that. You're married with two kids! Married to me.'

'And I wouldn't change a thing,' she said soothingly, a hand on my cheek. 'But I'd still like to see them at it. Wouldn't you?'

'No. I have no desire to see his hairy arse going up and down!' I said defensively.

'But you wouldn't kick Anya and Michelle out of bed ... either.'

'Well, no'.

'What do you mean ... no?'

'Don't start that, wench. I only have eyes for you.'

Helen looked away. 'I wonder if they'll use toys.'

'Christ...' I whispered. I shook my head. 'Bet he don't even like sex.'

'No?' Helen puzzled.

'No, he knows how it'll turn out.'

The silver screen

Everyone had been co-operating with the studio making the movie about Hal's time with Rescue Force. At Mawlini, people had been tripping over themselves to be helpful, as well as hoping to be extras. The director had been afforded as many Hueys as he desired, as much fuel, and as many big bangs in the desert that he needed. Progress was rapid.

With most of the editing complete, we flew down to Mawlini to play ourselves. They filmed us nagging Hal to hang around, Hal teaching me flight manoeuvres, then three scenes at Scorpion Base. But since we had built all over the base they had to get in just certain angles and had to avoid the new buildings - with all mod cons.

I shouted at Hal for volunteering the mission and came over as caring. The two final scenes of Hal and were shot at studios north of London, indoor shots, water sprayed onto our faces to simulate sweat. The film was ready. Jimmy and I reviewed it, happy with the outcome, and the director was tipped a bonus. No one apart from Jimmy figured it would be worthy of the cinema, but the director said he'd try it anyway. And even Jimmy pretended that he was in favour of just TV syndication.

It opened in the States, mostly in small towns, and received a modest attendance, getting good reviews, not least because it was a true story, current and topical. The director then moved it to the larger towns and it received an even better audience, the pollsters pointing towards an older generation, veterans plus servicemen. All told, it covered the costs twice over, but that was not the point. Millions around the world were now seeing Rescue Force as a sexy and exciting occupation – despite the crappy pay.

Cassie had finished her book, and Jimmy had edited it in just a weekend, a professional editor then taking over before handing it back to Cassie for a sign off. It hit the bookshops in record time, launched first in the States, and plugged heavily by Anton's father through his media empire – a wedding planned. We bought twenty thousand copies and shipped them around the world, most to Africa, where they enjoyed a good love story. And the guy who directed Hal's film, he got to work with hardly a rest from the last project.

Doc Graham called a few days later, our recruitment applications through the roof. Mac also called, complaining about "Yanks" just flying in and wanting to sign up. Jimmy allowed four to sign up straight away, recognising their names, turning away a few others. One of those signing up, a man from Denver, had a future, Jimmy hinting that it was a milestone passed, another box ticked.

Sat in the diner, chatting about American recruits to RF Kenya, Keely stepped in and sat.

'Joint Chiefs would like to put a team of observers at Mawlini, to observe the new Zimbabwean recruits.'

Jimmy responded with, 'The building for them will be ready in two weeks, I'll meet your team down there and brief them.'

Smiling widely, shaking his head, Keely lifted up and left us.

‘They snooping?’ I asked.

‘Not really, they can see the potential of the proxy armies, so they’re making plans.’

Two weeks later we landed at Mawlini, a direct flight aboard a hired 747SP stuffed full of oil equipment and great big hairy oil workers in boots, none of whom wanted my autograph.

At the base, we had just enough time to dump our bags before being whisked around to the new US Army building, positioned just inside Camp Delta. That camp offered no recruits yet, but a lot of builders finishing things off. The American’s building was solid concrete, square, and looked big enough to house maybe twenty people, plus some offices. Oddly enough, it offered no windows on the ground floor. There was no sign over the door, but the Stars and Stripes were already up and fluttering in the breeze. We stepped inside with Mac and Coup, finding many men in uniform moving boxes.

‘Where’s your CO?’ Jimmy asked the first man.

‘I’ll fetch him. Who’re you, sir?’

‘I’m your landlord.’

The man fetched the CO, a Major with shortly cropped silver hair. ‘Mister Silo. I’ve heard a hell of lot about you.’ They shook.

‘It’s all true,’ I said as we shook.

Jimmy said, ‘Why don’t we get the briefing over quickly, then we can have a cold beer. How about you get all of your men to the roof and save me having to repeat myself.’

The major shouted for everyone to down tools and follow us up the roof. We found a small corner bar, a barbeque set, and many tables and chairs with Fanta shades.

Jimmy waved the men into a line. ‘OK. My name is Jimmy Silo, and I own and run this airfield – as you probably already know. You’re here ... as my guests, to observe the Rifles, in particular the fledgling Zimbabwean Rifles, who will occupy Camp Delta in a week or two. They will be taught by instructors from the Kenyan Rifles, and by the British soldiers here, who are nearly all ex-SAS – our special forces and similar to your Delta Force. In fact, your Delta Force was modelled on them.

He pointed. ‘That is Camp Delta.’ He pointed the other way. ‘That is the Kenyan Rifles compound, although they have bases

elsewhere in Kenya and training grounds in other countries – which you are welcome to visit. Beyond that compound is the helicopter compound, where you’ll find some very familiar Hueys and Cobras – most of which are older than you are. You’ll also find some dated American pilots, who have no intention of showing you young bloods any respect at all. They’re not officers, but around here the Kenyans salute them out of respect for what they’ve done. Anyone seen the film about Hal Becker?’

They all raised their hands.

‘He’s here, and he’s grumpy if you don’t buy him a cold beer.’

They laughed.

Jimmy pointed at the RF compound. ‘That is the Kenyan Rescue Force compound, but it also doubles up as an international training centre for new recruits to Rescue Force. It’s also known as the “pussy compound”.’ They laughed. ‘Nurses are plentiful! Also some nice lady doctors. But let me warn you now: they’re all fit, tough, and undergo martial arts training. Kiss them off and it *will* hurt. One or two are built like Sherman tanks and will drink you under the table, carry you home over their shoulders, and ravage you all night long.’

‘He aint joking,’ Mac put in.

‘If you like Kenyan nurses, fine, they’ll like you. They’ll also like a little money and a promise of marriage. Be ... careful. Now, the local town is just about off limits, apart from driving through and buying things. If you stop to drink in a bar there you’ll be drugged, robbed and stabbed. And that’s just the women!’ They laughed again. ‘If you shag one of the local prostitutes you’ll pick up diseases that medical science has not yet identified. Let me make this clear: if you drink or shag in the town I’ll have you shipped out.’

He let them think about it. Pointing the other way he said, ‘That’s the UN hotel. Some nice UN ladies in there who’re not martial arts trained. They are, however, very prejudiced to military types; in uniform you have no chance. Tell them you’re an admin clerk or an English teacher here, or no nooky. Beyond the UN area is the main airfield, and at the top end are UN storage warehouses. Beyond the UN sheds, outside of the base, is a public hotel for oil workers. Their bar is to be avoided unless you like a good punch-up. Over the road from the main gate is

the public clinic, full of refugees, and behind it is what's left of a Somali refugee camp.

'Now, out in the desert are live firing ranges, mortar ranges, helicopter target ranges; we'll provide you with a map. You're thirty miles from the Somali border, which is very quiet these days. But a word about Somalis. If you insult the men it's a fight to the death. If you insult their women it's a fight to the death. If you look at their women, or make a comment, it's a fight to the death. Disrespect their religion and it's a fight to the death. Clear? If I find anyone here disrespecting them you're out the door.

'Now, let's talk about the Rifles, those *black* soldiers, and your attitude towards them. The Rifles have a hell of a reputation because they're pushed hard twelve hours a day, and each and every one of them is trained to your Green Beret standards. They *are not* infantry. They get up at 5am and run twenty miles every morning, often with backpacks.'

'Twenty miles a day?' someone queried.

'Every fucking morning,' Mac confirmed.

'They're all fitter than you, that I would bet my life on. They're also trained to fight hand to hand, to kill quickly and efficiently, and they've had training on every weapon the world has to offer: M16, AK47, and a dozen other rifles. They're all trained snipers, they're checked out on mortars, they can maintain and drive a jeep. Their annual allowance for ammunition is four thousand rounds per man and they will all fire off at least a hundred rounds a week on the range, every week.

'In the compound, you will see sergeants. Most of them got to be sergeants after they were tested in battle. Most of the sergeants here have spent months under fire in the desert and the jungle, and they have all killed dozens of men. Some of the sergeants here have seen action every year for the past twelve years; Somalia, the Congo, Sierra Leone, Zambia, and Darfur. They have confirmed kills in the hundreds. Personal ... confirmed kills. When you fine gentlemen are attempting to give them sage advice about how to be good soldiers, just keep that in mind. Their experience ... is a hundred times yours.

'Now, the soldiers here have no concept of white on black racism. Call them a nigger and they'll puzzle what the word it

means. If you insult them in a racist manner they'll simply be confused by it. But because you're white folk, they'll respect you a great deal from the get go, often saluting you by mistake. And the penalty for attacking a white person is often a hanging, so they won't be starting any trouble. You, gentlemen, need to be careful that you don't accidentally get them involved in anything that they should not be involved with, because the penalty to them is severe.

'Now, my hotels on the beach are available to you at a subsidised rate, and you can often find a few babes down there. Forget Nairobi and Mombassa, and don't wander around looking like American Servicemen. I also have safari lodges that you can stay at, and there are always groups of Rifles off to the Congo - so you can tag along. You can even join in a few deployments or exercises. Before we get you some cold beers, any questions? No? Right, officers and senior NCOs, follow us.'

Moscow

We flew into Moscow for a quick visit, Yuri picking us up at the airport. It took a whole five minutes for Irina to ask if Jimmy was seeing other women.

'Many,' Jimmy replied. 'Sometimes several together.'

'Three or four,' I helpfully added.

Irina pretended to be annoyed, but just ended up looking curious and turned on, Yuri laughing at her. We spent a quiet evening at a restaurant, no one recognising us, and met the Russian Government the next day. Jimmy tipped them off about action in Chechnya and Moscow bomb attacks, and we moved onto discussing the mines and oil, and finally Cuba. That brought us to a puzzling proposition from Jimmy. He asked if he could open a couple of coffee shops in Moscow, and I puzzled it as much as our hosts. They had no objections, Jimmy saying that he also wanted to buy some farmland and improve Russian agricultural output. They liked the idea of that and offered to supply state farmland and good rates, Jimmy asking for a lot of

hectares. It was a project for next month. For now, he was focused on coffee shops.

Away from the meeting, Jimmy told Yuri and Marko that he would use CAR for the coffee shops. Somehow, Central Africa Resources coffee shops in Russia seemed a bit odd. He handed over a document, outlining what he wanted done, and Yuri got to work.

A month later we returned, the weather cold, collars done up. The first four coffee shops were ready. They were all painted a uniform green and had a distinctive logo, wrapped around “Moloko” – the Russian word for milk. And yes, they served hot milk with all sorts of things added, or sprinkled on top. They opened with little fanfare, and attracted shoppers during the day and youngsters at night. They offered a few computers for internet access, a TV in the corner playing the state news, and free newspapers. Prices were reasonable, tourists finding them cheap.

Happy with the four shops, Jimmy asked them to create twenty more inside the month, using the exact same basic model and layout. Certain that there was a buck to be made – somewhere - they got to work. They appointed a national manager and created a centralised store where they could buy in bulk and feed the coffee shops. And Jimmy, he simply said that he was giving something back. No one believed him, the “M” Group poker night alive with wild speculation.

We grabbed the farmland, without viewing the frozen soil, and hired a farm manager. We gave him a big budget for western farm equipment and he flew to Germany to buy second hand machinery. He also hired half a dozen British farming experts. Fortunately, Jimmy was forthcoming about the farmland, saying that if farmed properly Russia could produce half of Europe’s food, if not more. It was a big number.

A month later we returned, now very damn cold, January snow on the ground. We inspected three of the near-identical coffee shops, the warehouse, and then spoke to the national manager and his growing staff. Given that there were now ten shops, the cost savings were starting to force a wedge into profitability. Jimmy reported that he was happy, and to go ahead and open another thirty in Moscow, twenty in St. Petersburg, and then to roll out twenty a month in towns and cities around

Russian till he said to stop. Yuri and Marko were curious, but not afraid of big numbers. The national manager, however, was terrified. He was asked to hire ten deputies, and to create regional managers.

Before we left, Yuri did his sums and fed his computer. If we bought in bulk and sold through the coffee shops, and the number tipped over a thousand, we could clear five million pounds a month in profit. I was starting to think that it was just about profit, but all the way back to London I was puzzling it. They were just coffee shops, their individual profits small. There was something else, something I was not picking up on. I knew Jimmy well enough: there was a far-reaching meaning behind everything he did. But what hell was it?

An American in Africa

Hardon Chase, presidential candidate, took time out from making false promises and flew into London, driving down to the house with his bodyguards. He was very impressed by our hotel-come-house and allocated a corner suite. He knew about the household “M” Group, but still found it fascinating that we opened our home to the national representatives.

We enjoyed a meal and a chat, Chase meeting the “M” Group members over dinner, and the three of us had a private chat afterwards. The next evening we all drove to Heathrow as planned, where a hired 747SP sat waiting, as full as ever with hairy oil workers, our politician flanked by four bodyguards. Goma International Airport came into view just after dawn, Chase viewing our creation from the air, plus the apartments and the construction work. He was most impressed with our airport, our group boarding a Dash for the short flight to Forward Base. That Dash flew low and slow over Forward Base, the Congo Rifles Base and other compounds, Chase quite shocked – if not disturbed - at the scale of it.

At Forward Base we were soon in the corporation offices and poring over maps and statistics, Chase taking it all in. The

figures made him sit up and take notice, not least the projected reserves of minerals and oil.

Jimmy laid out a map of Africa for him. He tapped it as he illustrated various places, and their significance. 'West Africa: as much untapped oil as the Gulf. The DRC: a quarter of that. Tanzania: as much again. The Gulf: OPEC controlled petrol dollars. In 2017 they drop the dollar, America has a coronary - a potentially fatal fiscal coronary. Africa has more oil, and could be non-OPEC potentially, under my influence in many places. OPEC, dollar, Africa.' He tapped the map. 'OPEC, dollar, Africa,' he repeated with emphasis.

'You're planning ahead ... to prop us up!'

'You're welcome, Mister President.'

'Why?' Chase posed.

'Why not? You fall - you take many with you, in particular the western banking system and stock markets. I'm not doing it ... *for you* ... I'm doing for everyone. Always keep that in mind: cause and effect.'

Chase studied the map. 'An OPEC switch would be a disaster. This could help.'

'Along with Cuban oil. Perhaps you should try and keep Cuba out of OPEC,' Jimmy teased. 'There are also oilfields in the Mexican Gulf that I know of that will make your eyes water.'

'Could it counter-balance OPEC?'

Jimmy made a face and shrugged. 'Not without some damage. The only way to be sure, is to attack OPEC bit by bit as the years roll on. And to start planning for it ... yesterday.'

A long hour's drive took us to our super-sized orphanage, twenty thousand clean and well-fed kids marching about in groups, neat parallel lines maintained with military proficiency. And all in blue! We drove down the main avenue to the very end, Chase staggered by the size of the undertaking.

In the camp's clinic we met Anna and Cosy, since they had some influence and control over the orphanages here. They had a room full of sickly kids waiting for us. Jimmy took off his jacket, making the bodyguards wait outside, Chase puzzling that move. Anna extracted blood and began injecting the kids, Chase observing with a frown; he had not been briefed on the blood.

'What the hell are you doing?'

Jimmy explained, 'Mister Magestic developed a few drugs, using future know-how, and we were injected. We can pass on the benefits by direct blood transfer, so the kids will be cured.'

'Cured of what?'

'Everything. AIDS, TB, Cancer, you name it.'

'There's a cure?' Chase whispered.

'Of a sort, but it will be kept under wraps for now.'

'Why?' Chase demanded.

'Population explosion, for one.'

Chase considered that. 'Well, yes, here in Africa it could be a problem.'

'They would live to be a hundred and fifty,' Jimmy explained. 'Doubling the population every eighteen to twenty years. Soon - famine and war.'

'You have a cure ... for AIDS?'

'Yes. Plus Cancer, dementia, and diabetes. You name it, we have it.'

'Why aren't our scientists working on it?'

'They are, and have been for many years. Unfortunately, neither they, nor us, understand it - and cannot reproduce it. So unless you intend injecting sick Americans with our blood it will stay hidden for a few years yet.'

'There's also a downside,' I put in.

'Downside?'

'Yes. An increased appetite, rapid weight-gain if people eat junk food. Your population would all go to thirty stones in a week, but none getting a heart attack.'

'They're heading that way now,' Chase admitted with a sigh. 'Medicare is becoming Fattycare.'

'So you see why *you* ... will not be mentioning it,' Jimmy told him.

Chase agreed with a nod.

We shoved him aboard the 747SP and headed towards Kenya, landing in Nairobi at dusk and booking into the usual hotel, security tight but discreet. Chase was tired, and went to bed early. In the morning, after a quick breakfast, Jimmy suggested a walk, the first time ever down here and making me puzzle the move. The bugger was up to something.

Jimmy led us out, asking for just four Pathfinders, Chase's own bodyguard detail not happy bunnies with the unscheduled

walkabout. Fact was, down here no one had a clue who he was. We strolled past another hotel, someone taking a snap of us. At the next corner two police officers stopped and saluted.

‘They salute you around here?’ Chase puzzled.

‘They’re just being polite,’ Jimmy suggested, getting a curious look from Chase. On the next block we entered an indoor shopping centre, busy with Kenyan housewives seeking bargains, as well as size eighteen floral dresses. As we progressed, Jimmy acted as a kind of magnet, people ahead of us being pushed invisibly to the sides and around us, not a word said to anyone. They just moved. And half way in I realised that the magnet was scooping up bodies as he went; we had a crowd following us.

A child ran out and Jimmy grabbed the girl, lifting her up and asking her in a local dialect where her mother was. He reunited child and mother and chatted for a minute, the crowd quietly observing. Pressing on, the Red Sea of Kenyan housewives parted. Outside of one shop, two men approached, issuing Kenyan calls, “Honoured Colonel!” They stamped and saluted; off-duty Rifles. Jimmy shook their hands and exchanged a few sentences in the local dialect. We pressed, very slowly, onwards.

A group of German tourists were greeted, and yes, they were at one of our lodges, Jimmy exchanging many sentences in German. The husband snapped Jimmy with his wife. And I noticed the balcony, a solid line of faces now staring down at us. I spotted a group of Russian tourists on my side and engaged them in reasonable Russian. They were, again, at one of our lodges.

Making it to the end of the shopping centre we opened to an enclosed courtyard, a café laid out with many seats under the shade of a large tree. The crowd was still behind us, some of those previously seated jumping up and peering our way. I spotted an oddly dressed elderly couple that appeared to be on a safari – in the middle of the concrete jungle.

‘Hardon Chase!’ came an American accent. They trotted over. ‘And Jimmy Silo! My God, what ya’ll doing here.’

‘Fact finding trip on Africa,’ Chase explained, shaking their hands. I looked around for a baby for him to kiss.

‘We’re from Colorado.’

‘I was born there,’ Chase informed them.

‘We know. We know where you went to school,’ they excitedly got out.

‘Are you here on safari?’ Jimmy asked.

‘Yes, well we were, but we lost our passports and some travellers cheques, so we we’re all having a time with the Embassy.’

I hid a smile. Bingo!

‘I think I could help with that,’ Chase offered.

‘Let’s get you out of here,’ Jimmy suggested, and led the couple towards the exit, the crowds parting and encircling the magnet that was Jimmy Silo. By time we reached the road a fleet of four jeeps were waiting, somehow by magic. I smiled and shook my head as we boarded.

At the Embassy they recognised Chase, and let us through the tight security, Chase soon kicking the cage of the Ambassador on behalf of the couple. The temporary passports were nudged along, Jimmy saying that he could get the couple on a flight that afternoon, First Class to London, and then the States. By time we reached the airport a pair of tickets had magically appeared at check-in, passport control waving our guests through, salutes given. And it just happened that a wandering TV crew filmed the whole damn thing, Chase making a statement.

Jimmy invited the TV crew along, Canadians, and they accompanied us to the Presidential Palace, Jimmy calling ahead to let them know we were coming. Not to ask if we could visit, just to tell them to put the kettle on. By strange co-incidence, the Tanzanian President was visiting, the meeting about to start. The Kenyan politicians welcomed us like family, so to the Tanzanians, and we settled about a table.

Jimmy began with, ‘Gentlemen ... and politicians, this is Hardon Chase, most likely the next President of the United States.’

The Kenyans and Tanzanians sat upright; US Presidents did not, very often, visit Africa. And for forty minutes Chase listened to their concerns for the region, their needs and gripes, and suggested a closer working relationship, especially regarding Tanzanian oil. Chase promised that when he became President he would make his first overseas visit here, a bold move, almost unprecedented. And Jimmy jokingly suggested that he would hold him to it. Or else. The three of us knew that Jimmy meant it.

The two African Presidents, and Chase, gave a ten-minute interview to the TV crew. Lots of words were used, little said; they were all electioneering.

Leaving the African politicians to chat, we returned to the hotel, packed, and boarded a flight to Mawlini. Flying in low in the Dash, Chase was again staggered by the base, the various compounds being described for him by Jimmy. Someone must have tipped off the base, because the American observers were waiting, jeeps and salutes for Chase. Our VIP didn't even know that there were American servicemen stationed here. They took us around to their building, more salutes given, and we climbed to the rooftop bar, now with a Hawaiian theme and quite cosy. The Major in charge pointed out the various compounds as Jimmy and I sat with cold beers, the two men eventually joining us.

'So what's your remit here?' Chase asked the Major.

'Observers, sir,' the man answered, sounding guarded.

'Proxy armies,' Jimmy stated. 'I make good use of African soldiers. They're fit, strong and excellent soldiers – but cost very little. Also, when they get killed or wounded, the folks back home don't give a shit. If, at some future juncture the US deems it suitable, they could copy my example when needing to fight wars in far off places.'

'That what's going on in Liberia?'

Jimmy nodded, taking a sip. 'Using my blueprint. Behind you we have the beginnings of the Zimbabwean Rifles, all starting from scratch and being trained *our way*.'

'And when they're trained?' Chase posed.

'Would be happy to deploy where I send them, even overseas,' Jimmy explained. 'So, if there was a conflict in ... say, the Middle East, they could go in. They cost a lot less than GIs and, as I said, the voting public back home don't get to watch their bodies returning home draped in the Stars and Stripes.'

The Major said, 'Loyal, cheap, expendable.'

The future President sat back, his grey matter firing up. He now knew about African ore and oil, but also its military potential.

Before we flew off we met Rudd, allocating an additional forty million to the Somali Rifles, and Big Paul flew in with a

bunch of twelve ex-SAS soldiers. They were also heading towards Somalia, and I was concerned.

Back at the house, a few days later, we lost Jimmy for an hour, finding him in the basement. I was concerned immediately and stepped down. On the battle board he had an elaborate miniature model laid out, small model soldiers and vehicles. I recognised the terrain and buildings. I also recognised the national flags. Pointing at the model, I just stared, a question in my look.

‘It has to be done.’

‘And the casualties?’

‘Modest, considering the action. Modest on our side, that is.’

‘When?’

‘Within the year.’

‘Who knows about this?’ I pressed.

‘No one, for now. They need ... plausible deniability.’

‘Jesus,’ I blew out. I returned to my family, and hugged them.

Tsunami

Crusty’s notoriety had increased, as had his bodyguard detail. He had predicted another minor quake in China, the TV crews all over it, and followed up with a minor quake east of Papua New Guinea, the action recorded live. The world’s academics, seismologists and vulcanologists, were still furious, but also curious and jealous: the evidence spoke for itself.

What happened next justified Crusty’s extra pay, and his expensive bodyguard detail. In June, Crusty predicted a future major quake off the west coast of Sumatra, a quake which would result in massive loss of life in Indonesia, and one which would probably cause a tsunami that would affect many countries in the region. The academic community were stunned into silence for a day, then rubbed their hands at the chance to discredit our Crusty.

The press went into overdrive in the region, some elements of the Indonesian Government considering having Crusty bumped

off, others praising him. His prediction was for January 2005, plenty of time to plan ahead, and we began playing a very dangerous game, the “M” Group countries nervous.

We called a meeting at Mapley of all senior staff and all national directors, finding accommodation for them in the nearby hotels. After a morning of greetings, hugs, rude comments and a lot of winding up, they settled into the lecture theatre after lunch. The difference this time was that of a TV crew in the corner, our own video guy off to one side, everyone puzzling their presence. The quality of the language used improved as people noticed the cameras, posh accents adopted by the doctors.

Jimmy and I stepped in a few minutes later. ‘Welcome,’ Jimmy began. ‘I guess this is first time that all of the various national directors have been in one place at the same time, so I hope your various body-clocks have adjusted. We’ve decided to combine an annual meeting of senior staff with a discussion on the ... unprecedented prediction of an upcoming earthquake that Douglas has made. Right, normal Rescue Force matters will be discussed in two days time, as well as down the pub later.’ They laughed.

‘As you all know, our man – known affectionately as Crusty – has a clever bit of computer software, and some science behind it that baffles the likes of me, and has had some great success with his predictions, which makes our lives easier. We’ve attended a handful of earthquakes where we managed to get there *before* the quake struck – a great advantage. We can be sure that we saved lives, not just from being close at hand, but from scaring the crap out of the local population first.’ They laughed. ‘When you tell someone a quake will demolish their house the next day ... they sit up and pay attention.

‘On that, I’d best mention that we are being sued by an island in the Pacific. We sent an aircraft with three distinctive white jeeps for an exercise, a joint Australian and New Zealand exercise. The locals, seeing out distinctive white jeeps, fully believed that the local volcano would explode, and that their island would sink into the sea. They evacuated in a panic.’ People tried, and failed, not to laugh. ‘There is a lesson to be learnt from that, so I expect – Bob – that we advertise our presence better in future.

‘OK, the Sumatra quake. Crusty is predicting a major quake, possibly the biggest for a decade or two, and a massive loss of life. By that, he means hundreds of thousand, perhaps millions.’

The room fell silent.

‘In order to deploy ahead of time we would need to make some plans, and such a deployment would be very expensive. We estimate it would cost twenty-five times more than the last ten deployments combined.’

A gasp went around the room, whispered conversations breaking out.

‘So you can see why we’re here to discuss it, and we’re seeking your input.’

‘Is that budget available?’ Doc Graham asked.

‘I will make a special budget available for this operation.’

‘And what effect will that have on training and deployments for the future?’ Bob asked.

‘I aim to increase your budgets twenty percent this year, cutting them ten percent for two years after.’

More whispered conversations broke out.

‘This deployment may be to the detriment of training budgets,’ Jimmy admitted. ‘But what price are we putting on the lives of the people involved? Are we willing to go on one large deployment, to save a lot of lives, and then limit other operations afterwards?’

‘What if he’s wrong!’

‘Then, we’ll have wasted a third of the deployment budget for a large training exercise. As in previous situations like this, I’m now going to give the floor over to various speakers. Anyone with a strong objection, or strongly in favour, can speak. If you are undecided, then wait till tomorrow.’ He sat, calling up Bob Davies.

Bob took a moment. ‘It all comes down to the accuracy of Crusty’s prediction. What we’re saying, if Crusty is correct, is that we save ten lives now instead of one a year for ten years to come. The problem is ... what if there’s a major quake somewhere else in a year’s time, maybe a built-up area.’ A whispered debate broke out. Bob added, ‘So far Crusty has been correct, but his data and his predictions only cover the past two years or so – not long in Earth geology. Still, a million lives is not a risk I would wish to take. I’d rather have our people sat

around doing nothing in Sumatra. Hell, they can always do a little village medicine while they're waiting.'

Jimmy stood, standing next to Bob and addressing the group. 'Crusty is predicting an offshore quake, a repeat of one that happened in Sumatra some time ago. That resulted in a tidal wave a hundred feet high. Crusty is suggesting that the tidal wave created would slam into Sri Lanka, India, Bangladesh, and Thailand. Not just Sumatra.'

'How the hell we going to cover all them?' Mac loudly asked.

'With a lot of money, and a full mobilisation,' Jimmy answered.

'How many would deploy?' Bob asked.

'Everyone,' Jimmy said with a shrug. 'People dragged off all other projects.'

A chorus of indignant whispers echoed around the room.

Jimmy called down the representatives of Indonesia, India and Sri Lanka, lining them up at the front facing the group. Jimmy said, 'Try and imagine a wall of water slamming into their heavily populated coastlines, and tell them it's not worth it.'

No one said anything for many seconds.

Jimmy added, 'Their coastlines are populated by millions living in shacks, many on the beaches themselves. What chance will they have?' He asked the three representatives to sit down.

'Why not just warn those countries?' a man asked.

'We will. But most will be ineffectual in clearing their beaches, especially in outlying areas. They'll then have a problem with regional hospitals being overloaded. So we could just tip them off, or we could attend regional hospitals, or deploy in groups to assist the wounded village by village – which is what we're good at. No other group can do that. No other group can get to the remote areas, treat the wounded and survive. So even if the countries involved issue a warning – will people listen? And what if Crusty is a day out.'

'He always is!' came back.

'So if they issue a warning and nothing happens, it's Cry Wolf - and the people drift back to their shacks. But the debate here ... is one of how much we get involved. We could send a few, or a lot. If we send a lot it will affect future year's budgets.'

We left them to the debate, knowing fully that the real debate would take place over a few drinks later. We toured the airfield

and observed various displays, taking time to sit with the police aero-med teams. At 5pm we sat in Bob Davies' office with Mac and Doc Graham.

'It's a big fucking risk,' Mac grumbled. 'And if we mass deploy – and no quake, we look like idiots!'

Jimmy blew out. 'We could always put our people in regional holding areas, away from the press; close at hand, but not driving up and down the local tourist strip. Plus all second line staff at the end of an eight hour flight, sat ready on the tarmac.'

'Could have 747s at Mawlini,' Doc Graham suggested. 'Sri Lanka is six hours or less in a 747.'

'If the runway there is still in one piece after the quake,' I pointed out.

Bob said, 'There's got to be a cheaper solution, a mixture of on-the-ground, regional bases and planes stood ready.'

'Those planes will cost me the same if they go or just sit on the apron,' Jimmy explained. 'We pay no matter what - when we hire them. Might just save a bit on fuel.'

'Moving the Hueys will cost,' I pointed out. 'IL76 transports, a dozen of them, and days in advance.'

'They're the problem,' Jimmy agreed. 'And our people are no good without their jeeps, which could go by ship, couple of days sail from Kenya.'

'I'll put a team and a plan together, a variety of options, and price them all up,' Bob said.

'Could you do that in a month?' Jimmy asked.

'With some help, yes.'

'You'll have the help. We'll have another meeting in a month. In the meantime, work out some basic plans for tomorrow, give the delegates three choices and let them vote on it.'

Thanking them, we left them to it and drove home.

On the way I said, 'We need a ship offshore, that we can move around and deploy people and helicopters from.'

Jimmy nodded absently.

I wagged a finger. 'We need a fucking aircraft carrier!'

'Have you got one tucked away?'

'I don't, but we know a few people who do.'

The next day Bob Davies presented three options. Option "A" would involve a mass deployment. Option "B" would see

deployments ahead of time to assist in village medicine, regional centres created where staff sat around playing cards, and reserves sat waiting at their home bases, aircraft ready. Option “C” involved just regional centres, our staff basically hidden away, plus secondary teams sat near aircraft in home countries.

They voted for option “B”, as being the best compromise. Bob put together a team from various national representatives and would hurry to cost it up, and to plan the logistics in great detail. A team of twenty were allocated the job, and they’d be pushed. Next came the hard part.

We drove up to London to see the Prime Minister. After explaining what we wanted, he stared back, asking, ‘Are you mad?’

‘The alternate, Prime Minister, is that British tourists get killed. If, at a later date, they pointed towards the warnings given - by us to you – they may wish to sue. Or argue criminal culpability.’

‘Jesus...’

‘It’ll turn out OK,’ Jimmy assured the PM.

‘You never told me this before. I can see why now! But if you warn off British tourists from those countries at Christmas, then those countries will want your head. It’ll be a busy time of year for them.’

‘All we need is a warning, to cover your governmental arses,’ Jimmy explained. ‘You issue the warning, however gentle you want it to be, that covers you.’

‘The publicity! You’ll have every news crew in the world at your gate.’

‘It’s a big gate. Now, I’m going to talk to the various Ambassadors, and I’ll need your backing as to the accuracy of the earthquake software.’

‘We can only offer a backing based on the results, not on the data, since there isn’t any. We can offer no more than that.’

‘It’ll be enough. And I’ll need to borrow the Navy.’

‘The Navy?’

‘One of those helicopter carriers that the Royal Marines use,’ I said.

‘You’ll get some good publicity from it,’ Jimmy suggested.

‘It’ll take months just to sail there!’

‘Make it look like a natural deployment, then divert it at the last minute to us. We’ll fly our helicopters off it, use it for re-supply.’

The PM made a face, suggesting he’d co-operate.

‘And then I’d like a few Hercules, and your Tristars.’

‘That all?’ the PM quipped.

‘Sat at RAF Brize Norton and ready to take bodies and kit over there, something you would do anyway – after the quake strikes.’

‘We’ll be ready.’

‘December 26th,’ I informed him.

‘Oh, great. They’ll love that – working over Christmas!’

Next came the really hard part. We met the Sri Lankan Ambassador at his embassy, and sat talking about their RF unit for ten minutes. Then we dropped the bombshell.

‘Mister Ambassador, we have an expert on earthquakes who predicts them with his clever software.’

‘I have read about it,’ the Ambassador commented with a polite smile.

‘Well, he’s predicting a major earthquake in Sumatra in January, one that will be very severe, a great loss of life.’

‘You want our Rescue Force unit?’

‘No, and we can deploy them without your input, Mister Ambassador. No, the earthquake is predicted to be off the coast of Sumatra, which is common for the region. But because it is offshore, it may well produce a tidal wave -’ The Ambassador’s face dropped. ‘- and we think that the tidal created may affect your eastern coastline.’

‘Affect it how?’

‘Our earthquake expert suggests that a tidal wave, maybe a hundred feet high, may slam into your coastline ... killing everyone up to a mile or two inland. That was the result of a similar earthquake a hundred years ago.’

The Ambassador put his teacup down with a clatter. ‘Do you know what you are saying?’

‘Our prediction software has the backing of many governments, including China and Britain, even America. Besides, we may be wrong, it may never happen. We just wish to plan ahead in January.’

‘Plan ahead ... how?’

‘A warning to tourists –’

‘Out of the question. It’s one of our busiest times.’

‘Mister Ambassador, if we issued a public warning and you ignored it, and many died, then you and your government may face the anger of your own people.’

The Ambassador did not like that one bit, but controlled himself.

Jimmy added, ‘There’s also the question of compensation for western tourists, should they be hurt. We’ll be issuing a warning worldwide and if you ignore it there will be ... problems and claims.’

I eased up. ‘May I ask, Mister Ambassador, what is more important to you: tourist dollars, or the lives of a hundred thousand of your people?’

‘How dare you! This meeting is ended.’

And that was that. For a change, Jimmy failed with his diplomacy, but did not seem too bothered. We travelled around to the second meeting, with the Indian Ambassador, and did not fare much better. He did not throw us out, but also did not see the need to do anything until such an earthquake struck.

‘You’d have six hours,’ I pointed out, but he still did not see it.

The next day we visited the Indonesian Ambassador, who received us warmly and listened at length. ‘Tell us exactly what you need, and we will provide it.’

We modified our approach.

The Chinese President was due to visit Sri Lanka, so we flew over to Beijing for a chat, then flew down to Colombo with him, meeting the Sri Lankan President. The Chinese dangled some large carrots, then suggested that they consider what we had to say. We repeated our concerns for the earthquake in January, and asked for a speed-up with the early warning system. Since we were paying for it all, what could they object to? We also made sure Crusty’s cartoons were viewed in each school.

Our TV interview was toned down, since we feared not getting out of the country. We explained the earthquake software, the possible tidal wave, and the January date. Little more.

Before leaving Sir Lanka, we bought two hotels in the south, which puzzled me greatly in the timing. Not to mention the bloody positioning!

Autumn

Bob Davies had received extra funds, and all junior staff began receiving extra training. Fitness was pushed, and earthquake response was at the fore, many deployments made from Mawlini to the fake village and back. Recruitment was up anyway, and so we accepted more keen beginners than normal, Mawlini buzzing.

The only dampener on the horizon was Somalia, suffering at the hands of al-Qa'eda in the north. They had also suffered two car bombs in Mogadishu itself, a setback after all the progress the city had been making. Abdi flew up to see us, counter terrorism advice sought. We met in secret in the basement, sat about the map table, Abdi and one of his trusted officers.

Abdi began with, 'We need to deal with al-Qa'eda. But they cross our long borders and we cannot find them, or stop them.'

'We could get you more boats for patrols in the north,' Jimmy offered.

'They come across from Eritrea and Ethiopia,' Abdi admitted, sounding downbeat. 'We have offered large rewards for information, but still they set-off bombs.'

'I'm afraid I have very little information about their activities in your country. They train in Afghanistan, then journey through Pakistan to the coast. After that, we don't know where they go.'

'The Iranians shelter them?' Abdi asked.

'No, the Iranians are enemies with the Taliban. In the southeast of Iran the tribal leaders align themselves to the Pushtan, not to the Tehran Government. The Iranians fight with these men, and lose twenty soldiers a year killed from drug smugglers on their borders. If you ask the Iranians, they may help you with information.'

Abdi eased back, thinking. 'The Iranians, they are enemies to the Taliban,' he noted. 'And the Taliban host al-Qa'eda.'

‘It can do no harm to talk with the Iranians,’ Jimmy pushed. ‘The enemy of my enemy is my friend.’

‘You are wise, Jimmy,’ Abdi said with a smile. ‘But is there no solution other than catching flies on the meat?’

‘Do you wish to strike at their hearts?’ Jimmy asked.

‘I wish to cut out their hearts and eat them!’ Abdi angrily stated.

‘When dealing with such matters a cool head is always the best.’

‘Day by day we suffer,’ Abdi complained.

‘A great cause of concern for me also, my friend. I wish to see your country do well.’

‘No one in my land doubts that, old friend.’

‘There may be a ... solution of sorts. Well, not a solution, but a way of striking back at them. It would be dangerous and foolish, casualties high.’

‘Fools and heroes,’ Abdi said with a smile. ‘Fools on the attack, heroes made of those that survive.’

Jimmy smiled. ‘Yes. But what are you prepared to sacrifice to strike back at them?’

‘I am prepared to risk myself, and do so happily for my people.’

Jimmy took a moment, nodding to himself. ‘If the Iranians were to co-operate with you, they may allow you a small force to enter Afghanistan. That force could reach the al-Qa’eda camps with good luck, and a miracle!’

‘We saw the miracle in Darfur, my friend. If you plan such a move, it will have the luck of Scottish.’

‘Luck of the Irish,’ I corrected him. ‘Luck of the Irish.’

‘I have been studying your history of England. You did much, but were only a small country.’

‘A lot of time thinking, before doing,’ Jimmy suggested.

‘Will you help us?’

‘The Iranians must never know that I am assisting you. If they do, they will not help. This must be a Muslim fight only.’

‘We will make it so.’

Jimmy eased up, and found a large sheet of paper, just about five foot square, and laid it out on the map table, coffee mugs used to hold its corners down. Jimmy then drew a map of Kandahar airport and town. I swallowed.

An hour later Abdi and his colleague were as excited as my daughter at Christmas. It was hard to contain their enthusiasm.

‘First things first,’ Jimmy said, straightening. ‘You must go and talk to the Iranians. Fly to Tehran and ask only for information about Al-Qa’eda, nothing more. But, if the opportunity arises, offer them help with the patrol of the border with Afghanistan, saying that if it hurts the Taliban you are happy to help. Go and see the Iranian Ambassador in London tomorrow, then fly to Tehran and petition the Revolutionary Guard for a meeting. And Abdi - be very secretive about this. Come back in four weeks if you have any assistance from the Iranians. In the meantime, I will make some plans.’

Abdi left us with a skip in his step, and I needed a walk around the grounds to clear my head. If this went wrong...

The next day we sent twenty Somali pilots to a small Russian town with an airfield, not far from the Antonov factory itself. They began intensive training, bonuses in pockets. They could spend it at our coffee shop; the town already had one.

In a secret meeting with Han, we made plans to ship further arms to the Northern Alliance in Afghanistan, but the timing had to be right. Han knew what Jimmy was up to, and had more faith than I did.

In another secretive move, we flew down to Mawlini direct and across to Scorpion Base, where the Pathfinders were training the Somalis in earnest. Tubby let us off, and parked up to be refuelled as I marvelled at the base’s transformation. Scorpion Base? More like Beverly Hills these days. In the Officers Mess we met Kenyan Pathfinders and Somali officers and chatted at length. We then grabbed a Major, Ngomo, and led him to a quiet spot.

The man was a legend in the Kenyan Rifles, and a hero to the men, a man who had worked his way up through the ranks and had seen action in every campaign the Rifles had been involved with. Ngomo had been recruited just six months after the first Rifles, his service a long one.

‘What we are about to discuss is secret,’ Jimmy began with. ‘No one must know, not even you own politicians.’

Ngomo nodded conspiratorially.

‘There may be an operation launched by the Somalis at the end of the year. It will be overseas, against an enemy of Somalia, not an enemy of Kenya. The operation will be very risky, very difficult technically, and with high casualties if it goes wrong. It will be a difficult battle unless planned properly and timed well. Those going on the mission, if killed, would not be acknowledged. We would say that their plane cashed into the sea.’

Ngomo blinked.

‘If people knew that Kenyans fought in this battle they may wish to strike back against Kenya, and we cannot allow that.’

Ngomo nodded in agreement.

‘If Kenyans go on the mission, they will be fighting and dying for Somalia, not for Kenya.’

Ngomo eased back. ‘Do you say that the mission - that it is a just cause, sir?’

‘Very much so.’

‘I do not believe that any of the men would need more than that, sir,’ Ngomo said with some conviction. ‘Nor would I. If you ask, we go.’

‘Major, I want you to plan an ... exercise for me. Assume that an ... airfield in Eritrea needs to be seized and held for a few days; insert by air, re-supply by air, extraction by air. Find a disused airfield and practice. But practice with five hundred men inserted. Assume your enemy has no tanks or planes, but RPG, AK47, Dushka, some rockets, no helicopters. I’ll send our Hercules and hire some other planes for you in a few weeks. A great many blank rounds will be arriving shortly.’

‘And the aim of the insert, sir?’ Ngomo puzzled. ‘We won’t be holding the airfield?’

‘The aim, would be a punch on the nose, maximum enemy casualties.’ He handed the Major a sheet of paper. ‘That’s a sketch of an airfield scenario to work to. You have an unlimited budget. And next month you’ll take delivery of more 81mm mortars, and M82 sniper rifles, plus more anti-personnel mines.’

‘Should I put two and two together, sir?’ Ngomo asked with a hint of a grin.

‘You should, but quietly.’

Ngomo eased back. ‘This mission, if it happens, will be volunteer only, sir?’

‘Yes. And you must keep in mind that it will be very difficult. You *will* lose people.’

‘Then, sir, we’d best make sure that the plan is ... as perfect as Darfur.’

Jimmy and Ngomo exchanged smiles.

Outside, we accepted a lift in an open-top jeep, driving through the dust and the heat to a firing range a few miles away. We were greeted by a number of ex-SAS troopers, who pointed to the sand. I could hear the reports of outgoing rounds, but could not see the snipers. I had to walk closer, till I eventually recognised a pair of sand coloured boots. The sniper waved. Walking back, I was startled by a patch of sand just lifting up and saying hello, dust falling off the man’s camouflage netting.

At the jeep, I asked sunburnt, and hot looking troopers how the recruits were doing.

They wiped their brows with sleeves. ‘They get far more practice than their western counterparts, and a lot more ammo to play with. All round, they’re fucking excellent.’

Jimmy asked, ‘How many Somali Pathfinders?’

‘At least two hundred who would hold up against the Kenyans. We’ve had them in the jungle, and they love it. Some of these boys aint never seen rain!’

We laughed.

‘They all checked out on mortars?’ I asked.

‘Yeah, they get a lot of practice.’

‘And mine clearance?’

‘Yeah, one of the first things they do.’

‘They’ll be some new kit arriving for you soon, Russian instructors,’ Jimmy explained. ‘Short range rockets.’

Abdi had met with a keen and attentive Iranian Ambassador in London, and then been invited to Tehran as an honoured diplomatic guest. In Tehran, the Iranian leadership listen to the complaints of the Somalis, and their plea for information about al-Qa’eda. A second meeting was scheduled, for two weeks later, the Iranians sensing an opportunity, and not just the chance to get into the good books of the Somalis.

Two weeks later Abdi returned to Tehran, flying direct from Mogadishu on a chartered flight. After much small talk, promises

of intelligence material to be handed over, Abdi asked about the border with Afghanistan and the opium trade. The Iranians now had the chance to whinge about their own problems, not least a high casualty rate amongst its police and soldiers on the border. Abdi was bold, and offered five or ten thousand soldiers for the border, since it will hurt the Afghan drug traffics, so in turn the Taliban. Neither Jimmy, nor the Iranians, had corrected Abdi on that assumption, or the fact that the Taliban had been busy trying to stamp out the drugs trade, which was down to independent warlords, mostly from the north. The Iranians now seriously considered the offer, since the Somalis could take the casualties, not them. Still, it would be unseemly for a poor country like Somalia to be helping out the Iranians. They suggested that if the Somalis wished to interdict the drug traffickers that they could do so across the border, on Afghan soil.

Abdi agreed with that statement, but mentioned re-supply, and asked when they could get permission to cross Iranian airspace. The Iranians again went away to think about things, another meeting arranged for three weeks time.

This time, Abdi had a proposal for them, a strike at Kandahar, after which the Iranians could deny granting them permission, thinking the aircraft UN flights from Dohar or Dubai. The Iranians were surprised. An airborne assault on Kandahar? It was brazen, but they liked the idea. After all, all they would have to do is to mistake the identity of a few aircraft. And the Taliban would lose face. Abdi had a provisional go ahead, telling his Iranian hosts that he would make plans for an attack in a few month's time.

Abdi and his staff came to the house a month later, with Major Ngomo and his staff, and we opened one of the rooms on the basement. The map board of that room now offered a scale model of the Kandahar area, tiny models detailing the features with great accuracy.

Jimmy welcomed Ngomo. 'How goes the airfield *exercise*?'

'We have made two attacks, sir, and learn from each.'

'Add to it a parachute insert, a distraction.'

'I will, sir.'

They collected around the table and viewed the model, accurate in every detail. Ngomo took compass bearings,

approach paths and distances. He measured off four hundred metres and marked it on a small pointing stick, then marked the model where the four hundred yard point ran around the airport walls; the killing zone.

Jimmy then organised a slide show, images of the airfield taken from the ground, finally handing over enlarged versions of the black and white images. A new face stepping in and introduced himself as a member of the Rifles who had been in Kandahar for the past three months, clearing mines. He gave a thirty-minute briefing on the airfield, the dispositions of the Taliban fighters, and remaining mines. Fortunately, all the remaining mines were outside of the walls. The man then suggested that Rabbit would not be happy with his mine clearance skills. He had not so much been clearing mines, as moving them and attaching radio detonators to piles of them. He now detailed where they were on the model, a few nasty surprises for the unwary.

I thought back to when Jimmy had sent the mine clearance boys there in the first place, all those years ago, I thought he was being helpful to the Taliban. But they were clearing the airfield and mining the perimeter. I shook my head. And years before that we had adopted the mine clearance school. The symmetry was perfect; it was as if he was working to a plan.

Keely dropped in a file of A4 black and white satellite photographs and we poured over them, confirming the average number of men stationed at the airfield. From what I could remember there were no more than twenty.

Problems

The press had got hold of the earthquake warning and were interested, if not cynical to some measure. Still, they knew we'd jump all over them if they went too far. With the weather turning cold, and the desk diary turning to November, Jimmy gave a TV interview.

‘We’ve had a lot of success with our earthquake prediction software, and we regularly deploy Rescue Force when we think there may be a quake.’

‘And yet the academic community has poured cold water over the idea of predictive software? At the last international symposium of earthquake experts they voted by ninety-five percent that the software did not work.’

‘The results speak for themselves. Twelve predictions, twelve quakes, most attended by us. So they can carry on trying to discredit it, I’ll carry on saving lives. And that’s the difference between us, and those so-called academics. We save lives, they write books and play with themselves.’

That made it out unedited. At the house, everyone roared.

The interviewer composed himself. ‘And the latest prediction is of a massive earthquake.’

‘Yes, an undersea earthquake off Western Sumatra. The damage from the quake itself will be limited, but the chances of a tidal wave are good, and that tidal wave may spread out and hit Sri Lanka, India and Thailand, as well as Sumatra itself. I’m advising all tourists to avoid those countries over Christmas and New Year.’

He said it.

We talked about it, discussed it, and argued at length. Bless the big bastard - he said it, putting a hundred companies and a dozen countries on a collision course with us, and our solicitors. He would not risk the lives, so he said it. He damn well said it. I turned to Helen and exchanged a look.

The lounge fell silent, some staring at the floor, others breathing out loudly. In London, the Prime Minister sat ashen faced at the news, Sykes sat with his head in his hands.

The next day the media ran the story, the story of every travel company except our own threatening legal action. The Thai Government were not happy, and faxes came through from many sources, the machine running out of paper at more than one point. Jimmy went for a walk around the grounds, and I spent time with Lucy, Shelly oblivious to the storm brewing as she painted with her fingers.

The Russians and Chinese, true to form, advised their citizens not to travel to those countries. The French and British Governments stopped short of that, but acknowledged that the

predictions were very accurate, and that travellers should use caution in certain countries at certain dates. Art Johnson made no comment, few Americans typically visiting those countries over the holidays. Bookings from Europe plummeted, Jimmy pleased with the news.

Three days later the first sniff of legal action arrived. And thereafter, it kept coming. Our solicitors were frank: no earthquake and Jimmy would be bankrupted. Some of the legal action was pointed towards Rescue Force, so Jimmy had the solicitors direct it towards himself, since he had made the statement, not Rescue Force. The Kenyans, bless them, advised their citizens not to holiday in the affected countries, not that the Kenyans could have afforded trips to those countries. We told our solicitors to push back all claims to after New Year, at which point they would be academic. And the tabloids, they ran stories of people crying over ruined family holidays, money spent and now wasted. It made for good copy.

Everyone at Rescue Force, and the house, got over it quickly and got back to work. We had plans to make and two hurdles to cross, both of them major. Under the pretext of another meeting about African industrial development, the “M” Group countries met in Paris, a similar event to the previous. I took Shelly up the Eiffel Tower the day before the event started and she loved the view, a long time spent just staring down at the detail below.

We attended the trade show on the first morning and wandered around, CAR and our corporation attending again, as well as Rescue Force. After lunch we occupied the same room and welcomed all of the national leaders, Art Johnson winding down his time remaining in office, Hardon Chase awaiting the big chair. After ten minutes everyone settled.

‘Ladies and gentlemen, and politicians, welcome again,’ Jimmy began. ‘We are here, close to the end of this year, because we are close to a turning point. The events of the next two months will run the risk of exposure, and may be a turning point.

‘First, earthquakes and our software. The predictive software is essential, not so much for now, but for the future. If the Christmas earthquake was not warned about it would be just about three hundred thousand lives lost. In the future, you will be lucky to have an earthquake totalling less than a million dead,

and in populated areas. In the future, the Chinese and the Americans will suffer massive quakes, millions dead. I will not stand by while that happens, and I will not stand by now. We need the predictive software, even if the academic world disputes it. Otherwise, how will we evacuate say ... Athens.' He held his hands wide.

'There are many people taking legal action?' the French asked.

'Yes, but they won't have a case after Christmas. Mostly, they're British companies.'

'I have decided to make a statement about it. I will back you,' the French President offered. That left the UK Prime Minister in an awkward position.

'We will do what we can,' he lamely offered, and my look towards him made sure what I felt about it.

Jimmy said, 'I ask for all nations here - that have suitable surface vessels - to send some to the area, on any pretext you like.'

'Our aircraft carrier, the Charles de Gaul will be there,' the French offered.

'As will Ark Royal,' the Prime Minister countered with. I wondered if they'd get their dicks out and measure them.

'We have a group heading there from the Philippines,' Art Johnson added.

Jimmy pointed at him. 'If you can concentrate on Western Sumatra, the British and French will be off Sri Lanka. We'll need a lot of fuel for our Hueys. Russia, we'd like to hire as many IL76s as you have, plus AN12s.'

'They will be ready,' the Russians insisted.

'For the rest of it ... you need only act like caring nations, and win some political capital from the countries suffering. OK, Afghanistan. First of all, this is what would happen if Somali does not attack. The number of al-Qa'eda attacks against American interests will increase, and Art Johnson's successor, Hardon Chase, will invade. That will be a disaster.

'If Somali go ahead with their operation they'll strike a blow at the Taliban, making them think twice about hosting al-Qa'eda. If al-Qa'eda moves out of Afghanistan they will, to some degree, cause problems for Pakistan. That we can deal with, since our Americans friends will never invade Pakistan. Al-Qa'eda will

also wish to hit back at Somalia, and we'll create a killing ground in Northern Somalia, killing as many as we can over the years to come. All nations should then assist Pakistan to fight the Taliban and al-Qa'eda.'

'And the aim of the Somali action?' Art Johnson asked.

'To weaken the Taliban, first and foremost. They'll lose face and lose ground to the Northern Alliance. Second, to make them pay a heavy price for hosting al-Qa'eda. That will be made clear during peace talks afterwards. The Pakistanis have had some successes recently and the supply routes have been tightened up a bit.'

'And the Iranians will co-operate?' Art Johnson pressed.

'They think that they're being clever, using the Somalis to strike back at the Taliban. They're doing little more than turning a blind eye to a few UN flights, and will deny all involvement.'

The meeting dragged on for half an hour, some talk of Hardon Chase.

Countdown

A week before the Somali incursion into Afghanistan, I realised something. The earthquake would overshadow events unfolding in Afghanistan. With the "M" Group countries suppressing news as well, the Somali incursion might go unnoticed. Afghanistan rarely made the news anyway, so I had my fingers crossed. When I asked Jimmy if the timing was deliberate he just stared at me.

The air insert was the tricky part of the operation, but Jimmy had it all worked out in great detail. The aircraft would take off from Somalia and fly across Yemen and Southern Saudi Arabia, their flights logged as transport aircraft for Iran. When over Iranian airspace they would turn east and head to Kandahar. Since the airport possessed no functioning radar, and a lone air traffic controller, the Taliban would not see the aircraft till they landed. And then it would be too late. Hopefully.

Now, in Somalia, the pilots were practising steep approaches. They'd fly in at two thousand feet, then throttle back and stall, nose down to a steep angle, powering up and pulling back at the ground neared. If the Russian company that had leased the Somalis the aircraft had known what their aircraft were being used for...! One already sat on the apron at Scorpion Base, its undercarriage smashed; the Somali pilots landed like Dunnnow in a Huey. It would be reported as an accident after New Year.

Time was now split between the massive logistical challenge that was the tsunami deployment, and staring at the battle board in the basement. The Indian and Sri Lankan Government were still being less than helpful, the Thai Government down right hostile, not least because their beaches and brothels were missing a number of old European men. On December 21st, Jimmy revised the warning to that of December 27th, and issued a press statement to that effect, sending it to the press agencies of all European countries. He also went live on the BBC and urged all UK holidaymakers to stay away. More legal action was threatened, this time European.

Ignoring the pile of writs, we drove over to Mapley. In Bob Davies' office we met the planning team.

'All set?' I asked, no joy in my voice.

'Damned if we do, damned if we don't,' Bob wistfully answered.

Jimmy addressed the communications officer. 'Ready your software.' The man checked his computer screen. 'In reference to all Rescue Force units worldwide, all supplementals, reserves, former members on the reserve list and linked rescue NGOs – send the following message: standby for overseas deployment.'

The message went out, pagers bleeping and knocked off.

'Issue the following movement orders. Move the Cubans – and African units, to Mawlini, the Chinese to Sri Lanka, and the Russians to India. Move the British and French to India. Move the Aussies, Kiwis and the Samoa Group to Sumatra. Move the Kenyan unit to Sri Lanka. Move Hong Kong to India.'

The orders were dispatched, taking ten minutes.

'Move six Hueys from Mawlini by IL76 to Sri Lanka, with their pilots. Move six more Hueys from Mawlini to India, a final six to Sumatra. Move the Aussie Hueys to Sumatra. Action them to travel tomorrow.'

We received a call, informing us that the Prime Minister was about to make a statement about the deployment in Parliament. We all moved to a lounge with a TV, and sat waiting.

‘In relation to the planned mass-deployment of Rescue Force personnel, both British and foreign, we have decided to fully back that deployment. The Royal Air Force will be assisting in what capacity it can, and we have ships heading to the area. Despite the speculative nature of the deployment we have decided to assist Rescue Force, since they have given a great deal to the British people over the years. Jimmy Silo has made a decision to risk deploying on the chance that there will be an earthquake. I learnt long ago that Mister Silo does not take these things lightly, nor does he make hasty or foolish choices.’

‘Not too bad,’ I said. ‘Better late than never.’

Michelle rang half an hour later. Seemed like the French President was going public, to show how much they supported us, more than the UK Government. It made me smile.

Ivan and Han had nudged their governments, and they had faxed the Indians and Sri Lankans, asking them to co-operate with us: better safe than sorry, they urged.

In a move guaranteed to boost our standing, or write our epitaph, two-dozen camera crews were embedded with our units. Two US teams were stuck like glue to Hal as he got ready to deploy to Sumatra: where Hal went, a story followed. In an unusual move, the Germans offered direct assistance, and Jimmy accepted. Could they fly out tents, water and food to Sri Lanka? They could, and would, with some fervour. They were courting favour and we were happy to accept it.

Helen came over with Cat and the kids at 5pm and settled into an apartment, the presence of the apartments useful forethought on Jimmy’s part. We all worked to the early hours on logistics and problems, airports and permissions, trucks broken down and aircraft in the wrong place.

Then next morning Keely turned up.

‘What you doing here with us workers?’ I asked him.

He grabbed Jimmy and me, and we walked outside. ‘I’ve been *ordered* to assist you.’

‘By Art Johnson?’ I puzzled.

‘No.’

‘Oh,’ I realised. I made a face. ‘He won the damn election, he don’t need to be electioneering!’

‘He’s been beating up Art Johnson,’ Keely explained. ‘He wants the surface ships off Sumatra trebled, Air Force on standby. There are C5 Galaxy aircraft heading to some base in Gloucester.’

‘Fairfield,’ Jimmy put in. ‘Well, we may as well make use of them.’

Jimmy dialled the base commander at Brize Norton and cheekily asked for a liaison for the next week or so. The man was down to us inside the hour, not a long drive. Bob diverted trucks full of goodies to Fairfield and cancelled a commercial 747SP, saving us money; our Uncle Sam was helping out. Well, Chase was showing off his new power. But who cared, it was lives that mattered, not the size of Hardon Chase’s dick.

By 4pm a US Air Force officer had turned up, welcomed in, and joined Keely. Michelle turned up with a team of six French diplomats and facilitators. I was starting to feel all warm and glowy as I found them space and accommodation. Jimmy then called the local police and asked for six men and three patrol cars for the duration, already a few idle spectators at the gate instead of preparing for their family Christmas. He then stood down our motorway patrols and called in the Welsh and Scottish teams.

At 5pm we met with Mackey.

‘How many people could you get at maximum?’ Jimmy asked.

Mackey seemed apologetic. ‘It’s Christmas in a few days, Jimmy. I have a list, but...’

‘Get me the list of those not wishing to take part, names and home numbers. Now please.’

Mackey fetched the list, a computer printout. Facing me, Jimmy said, ‘Call Pineapple, get a few stars, and Katie Joe.’

I made the call. We then split the list between us.

‘That Robert? Jimmy Silo, down at Mapley. Was wondering if you’d join me in saving some lives. Good man, see you when you get here.’

Some were still refusing, due to family commitments, and we did not push it.

The next morning we put a keen and determined Katie Joe on the phones, along with some other very sexy singers. I invited in

a TV crew, and they filmed Katie Joe asking for rescuers to help. That did the trick, our trickle becoming more of a flood. At lunchtime Katie changed a nappy with Helen, the two sat gossiping for ages. Seemed Katie had just become pregnant herself.

23rd December

We had enough rescuers to justify a plane and sent them off with new equipment and supplies, and new jackets, reminding them that it was cold here but warm where they were headed. Boots and woolly hats would not be needed.

Hardon Chase then issued a call to all US citizens to evacuate Sumatra, Thailand coastal regions, Sri Lanka and Indian coastal areas. The heavyweights were moving. In Sumatra, families were starting to pack up and leave, especially near the coast. Seeing that the exodus had already starting, Jimmy ordered the RF teams already there to the coast to assist, and faxed the Indonesian Government, asking them to broadcast an evacuation of the coastal area. We got no response, unaware if they would or not.

We then brought forwards the expected earthquake date again, this time to the 26th; Boxing Day. All RF staff were updated. We also faxed the various governments, the TV screens now full of planes disgorging white lines of rescuers in various countries, thousands of them. But on the Indian coast it was business as usual for the locals as our jeeps drove to their dispersal positions. Fortunately, the rumour mill worked better than TV and radio in Indian coastal regions. Our RF staff explained why they were there, and people discreetly packed up and moved out. They told their friends, who told relatives and neighbours, and on the 24th many were on the move. The TV finally kicked into gear, reporting the exodus and suggesting that it was not necessary – all was well. Having viewed that news, and been reassured by the newscaster, everyone decided to pack up and get out. Roads were clogged and we were not popular with the Indian authorities.

And if there was no earthquake we'd be hunted down like dogs and killed. I secretly considered South America, and a beard and moustache.

Christmas Eve was a hive of activity at Mapley, and no one thought about Christmas, save one man with a Santa hat on. Shelly asked when Christmas was, and we told her it was a week away, not a day away. I had not slept well the on the 24th, and Jimmy had paced up and down all night. We both felt rough on Christmas Eve.

That evening, Jimmy insisted everyone take a break, and we held a mini-celebration in the canteen. People had a little to drink and plenty to eat, catching up on a few missed meals. Most went to bed early that night. In the morning we offered each other seasons greetings, but could not find the right mood. Trucks were still moving, aircraft were dispatched, and bottlenecks were still being dealt with.

The TV news showed empty beaches in Thailand and Sri Lanka, and we all realised how serious this was. If Jimmy was wrong we'd be finished. It turned my stomach. Various politicians in the affected countries were calling for us to be arrested, and getting plenty of air minutes. A dozen more TV crews turned up, from all over the world, and we were under the spotlight. To keep the hounds at bay, Jimmy gave an interview, competing with the Queen's traditional Christmas Day speech.

In the media centre, Jimmy arranged the cameras. 'The beaches of many countries are empty, hotel bookings down. That we don't regret. We obviously wish to assist the tourist trade in the affected countries, but first of all we wish to save the lives of the local people, many of whom have moved away from the coast already. If there is a chance, even a small chance, that a major quake will kill many – then we will act. I would rather be wrong than be viewing the dead on the news. The tourist trade has been affected, but if the quake strikes, then the tourist trade will be set back years. We are taking a gamble with dollars, not with people's lives.'

'How much of your own money has gone into this deployment?' a man asked.

'So far, four hundred million pounds.'

The man asking the question paused. 'And if there's no earthquake?'

‘A lot more in legal action. Thank you, that’s all for now.’

An hour later I caught the news, and the Queen’s speech. She finished with, ‘Our thoughts are with all those deployed overseas at this time of anguish and waiting. God speed Rescue Force.’

I stood, my mouth opening. I pointed at the TV set and faced Helen. ‘Did she just say that?’ Helen nodded. I went and told the gang, who took a moment to face each other, and to reflect.

That day was not easy, but I felt better; after all, the Queen was on our side. People came and went all day, a few flights in and out, a few people bussed up to Brize Norton. The US Air Force were busy flying tents and supplies into various countries, and busy being seen to do it, camera crews on the aircraft. And the world’s seismologists were hoping and praying that we would be proved wrong as they ate turkey and pulled crackers with their families.

A long way away, in Somalia, soldiers were handing over ID cards and any personal items, moving in lines towards waiting aircraft. My thoughts were with them as much as anyone else. The tension was mounting, and I felt terrible. I grabbed Jimmy and led him to the roof, braving the chill wind.

‘Some words of encouragement might help at this point, my guts are turning. This could all go badly wrong.’

‘It could. But look at this way: just how much are you prepared to do to save this planet?’

‘I’d hope, almost anything. But I’m not you. And right now I can’t think straight.’

‘Then you need that which kept early mariners going for centuries. You need hope, and some faith in what we’re doing.’

‘I have no doubts about what we’re doing,’ I said, and I meant it.

‘But you don’t have a hundred percent faith in what will happen tomorrow, in either zone of death and destruction.’

‘I don’t like sending the Rifles off to fight.’

‘That’s good. It shows you care, and that’s not a bad trait. Problem is, a surgeon needs to cut off an arm to save the body, and not hesitate or beat himself up over it. Focus on 2025, not on the people here and now. Focus on that, and fight with a determination to get there.’

‘The Somali inserts are going to take a beating,’ I reflected.

‘If it weakens al-Qa’eda ... I’d sacrifice them all.’

‘Yeah, well I’m not up to that, not yet.’

‘I know.’

I took in the airfield, and the grey sky. ‘Sure you picked the right assistant?’

‘Not always?’

‘What?’ I asked, turning to face him.

He laughed at my expression.

‘Fucker,’ I cursed.

‘Tomorrow will be better. It’s now our eleventh hour, but tomorrow is a fresh start.’

Downstairs, Crusty turned up with his bodyguards.

‘You better be right,’ several people uttered.

‘Merry Christmas to you too.’ Looking tired and drained, he fired up his laptop and opened a web page that displayed quakes, minor and major, then just sat and waited.

At 5pm Jimmy told people to get food and a few hours sleep, suggesting that Crusty’s prediction was for late tonight. Puzzling the accuracy, people got some rest. So did I, and I still felt terrible. At ten o’clock Jimmy checked his watch, a glance my way. Exhausted, people sat around saying little, the buzz and energy gone. It had been a hard few days. Now all they had to do was to wait. At ten thirty Jimmy checked his watch, stood up and stretched, standing next to the base alarm switch. I could see it in his look, but no one else could. Then the world changed forever. Every phone and fax machine came to life at the same time.

‘Earthquake!’ Crusty shouted. ‘A big one, off Sumatra!’

Jimmy threw the alarm switch, everyone jumping up. With the alarm off, Jimmy faced the communications officer. ‘Communications officer.’

‘Yes, sir,’ came back very polite and respectful.

‘Sound full emergency recall, full emergency deployment.’

The man typed furiously and sent the message. ‘Message gone.’

Pagers came to life and were knocked off without being viewed.

‘Helen,’ Jimmy calmly called over the bedlam. ‘Press releases please. Crusty, launch your software, warnings to governments first.’

Crusty typed away. ‘Sending signal to remote servers, messages ongoing, faxes outgoing.’

Jimmy faced me, and took a moment. 'We've spent fifteen years building up Rescue Force. We've ... done what could. Now we'll truly introduce Rescue Force to the world, our work almost done.'

A long way off, our sirens on police stations and hospitals started to wail. Tourist hotels received faxes: Tidal wave heading for you. Evacuate!

Jimmy excused himself and went for a long walk around the airfield. I helped out for an hour before turning the TV on, suddenly glued to the reports. The lounge offered three TV sets, all deliberately tuned into various news services, the sound turned-up only on the BBC at the moment.

In the morning the news again grabbed my attention, and held it, as it did for most people around the world. The images of the waves coming ashore astonished Helen and me as we sat watching them, Shelly oblivious to the remarkable events, Lucy asleep. It was one thing to predict the events, to know that they would happen, but to watch it rammed home the realism. And every image seemed to have a Rescue Force medic or helicopter in view, the teams now being referred to as "Jimmy Silo's" Rescue Force. Anyone watching the news would assume that we had a thousand helicopters and a million medics; they were everywhere. Camera crews had been embedded with teams and were now sending in reports of the waves, plus heroic rescues. On CNN they were showing an interview with Hal, making me smile. I figured, and hoped, the lawsuits would go away, and that the various governments would stop whinging now.

In the command centre I found thirty warm bodies all trying to talk at once. Checking a board, I noticed that Rescuers had landed in Thailand, in Phuket, despite the threats from the Thai Government.

Turning, I noticed the Prime Minister, now dressed casual. Well, it was a holiday. 'Courting votes?' I asked.

He cocked an indignant eyebrow. 'How's it going?'

I shrugged and held my hands wide. 'Your guess is as good as mine. We warned them, they evacuated by rumour, lives saved. Got no stats yet.'

Bob said, 'Still a lot dead. The wave reached inland in estuaries and up rivers, slamming into villages a few miles upstream. Many killed in Thailand – they didn't evacuate, and

Bandar Aceh has been levelled, whole town gone. They evacuated though. We'll be popular in Sumatra, they're hailing us as heroes already, and the Sri Lankans very happy with us.'

'Small miracles,' I said. 'Can't please everyone, but it would be nice to please some of the fuckers now and then.'

The Prime Minister nudged me outside. 'Queen has asked about Jimmy a few times. I think she knows.'

'Knows ... what? I puzzled.

'She's very well connected; old boys in the intelligence service keep her informed. So I think she may know.'

'She wished us luck Christmas Day.'

'She asked about an honour for Jimmy, but I told her he wouldn't accept one.'

'Why?'

'That's what he said: to deflect any honour.'

'Oh,' I puzzled, making a face.

'Anyway, you got every TV crew in the world at your gate. Best you say something.'

'Why don't we ... say something. Get you some votes, eh?'

'Cheeky bugger.'

We found Jimmy downstairs, dressed smarter than the rest of us.

'It's a holiday,' I said. 'You can lose the tie. We doing a few TV interviews?'

'Yes, get them over with.' He led us to the communications centre.

'Bloody hell,' I said, the words caught on camera. 'How silly are you lot,' I told the TV crews, twenty jammed into a space for perhaps eight.

Jimmy called order. 'We'll get through interviews faster if we have some semblance of order. I'll play like a Prime Minister and point to interviewers for questions. And yes, you can have more than one. And ... Merry Christmas.' He pointed at the first lady.

'Do you feel vindicated?'

'Let's not have silly or inappropriate questions, shall we. I do not feel vindicated, as you say, since this was not a game, nor a competition, nor about anyone's ego. This was about saving lives, and I don't care who gets the credit. Give our man Crusty a

golden crown and put him on a pedestal, it matters not. What matters, is what's happening in the Far East.' He pointed.

'How much did you spend, personally spend?'

'Again, not what we're about. But to answer your question, I will be asking the bank for a loan next week, because I'm now overdrawn. By time this deployment has finished it will have cost around seven hundred million pounds.'

'Have you emptied your bank account?'

'Yes. I'll be getting a letter in red from the bank manager.'

'Will this special software be available to everyone?'

'It is now: we get predictions and we tell you, and that saves you pushing the buttons.' He pointed again.

'How many rescuers were deployed?'

'The total is around six thousand, but we don't know what tally the reserves came up with.'

'Was Hal deployed?'

'Yes, he's in Sumatra, being pestered by American news crews and getting no work done.'

'How many nations sent rescuers?'

'I believe ... thirteen, many other nations helping out.'

'Who sent the most?'

'China.'

'Are you still being sued?'

Jimmy smiled. 'If I am, they'll have a hard time convincing a judge that we were wrong. Besides, I'm broke.'

'Paul, how come you're not out there?'

'I'd love to be out there. But I have two kids, and a wife with a mean right hook.' They laughed. 'If I went, I'd be divorced upon my return. Besides, who do you think does the paperwork around here?'

'Prime Minister, what was the British input?'

'We've worked very closely with the British contingent of Rescue Force all along, at this base, and provided RAF transports for rescuers to fly out the affected areas. We also have surface ships in the area, and an aircraft carrier flying Rescue Force helicopters into Sri Lanka.'

Jimmy put in, 'I would like to take this opportunity to thank the Prime Minister and the UK Government for all the support we've received, especially behind the scenes with diplomatic problems. The Prime Minister took a gamble by backing us, a

big gamble, and his support gave a lot of people around here the courage to do what we did. But what touched some people here more than anything was the message from the Queen. Small gestures like that go a long way.'

'What about the Americans?'

'I've been in almost daily contact with the new President, Hardon Chase. He's not in office for a few days yet, but has been working behind the scenes to get people in place. He also took a big risk and he moved half of the US Navy into place before the quake struck. The suffering in Sumatra has been greatly eased thanks to Hardon Chase kicking butt before he even takes office. As I saw in Kenya, he's a man of action. He can't stay up late drinking with the rest of us hard men, but he's OK – for a Yank.'

'Will you be flying out?'

'Hope so, but plenty to do here. Besides, the Thai Government might shoot me for taking tourists off their beaches. And may I take this opportunity to thank the German Government for their massive logistical support. They don't have a Rescue Force unit, but they helped out greatly. And Israel, they sent twenty people, their whole unit just about. And if the French Government is listening, I've been thinking about a welcome home parade for all the national rescuers in Paris, it's central.

'On a more serious note, I would like everyone - everyone in the world - to look at the images of the rescuers in action, and to look at the flags on their arms. Britain, Russia, China, Africa, even Cuba and America working together. You see ... there are some things that we all agree upon. There are some things that can bring nations together, instead of them shouting at each other in the United Nations chamber. Now, it's Christmas, so we have some food and drink for you in the canteen. No silly hats, but we have some sherry.'

Kandahar

As the sun set, Major Ngomo stepped out to the waiting Antonov; combat clothing, webbing, weapon slung. Across the tarmac sat seven other aircraft, quite a sight under the floodlights. With the roar of propellers in his ears, the smell of

aviation fuel, he turned with his adjutants and waved goodbye to Abdi. Boarding the plane, the door closed. He ordered the operation to begin.

His An12 taxied around, lined up on the runway and powered up, soon turning north through the dark night sky. Ngomo and his men settled into a tried and tested routine, all the men familiar with long flights. Ngomo opened his novel about the Napoleonic Wars and found his page, switching his brain off as his men spoke about family problems, models of cars and putting the world to right. In front of the Major, two men argued about the cost of speedboats, should they ever make enough money to own one. Smiling, he turned the page.

Eight hours later they entered Iranian airspace, labelling themselves as UN flights that had got lost en-route to Kandahar, and turned east, soon over Afghan territory. Ngomo peered down as the dawn arrived, now flying into the sun. The land below appeared sand coloured, a good omen; it looked just like Somalia. The mountain ridges below reminded him of the mountainous regions of North and Western Somalia, where they had been training extensively for the past six months. The men now referred to themselves as mountain goats. A few beards had been grown off the chin and into a point, and bleached white.

Ngomo's adjutant handed over two tins of meat; breakfast. Ngomo tucked in, the basic meal washed down with hot sugary tea.

Returning from the toilet, a man said, 'I just shat, and flushed, so al-Qa'eda has some shit already.' The men laughed.

'It freezes on the way down, sir,' a man told Ngomo.

'Freezes?'

'The shit and water, it freezes. Hits the ground like a bullet.'

'Then we may have already killed a goat herder by mistake,' Ngomo said with a grin.

Just over an hour later, Ngomo stood and stretched, using the toilet before he made himself ready. He tucked his beret away, and placed a blue cloth UN waistcoat over his webbing, a blue cap on his head. It would not hold up to any close inspection, but at twenty yards it would buy him and his men a few seconds of confusion. The pilots reported twenty minutes to landing.

Landing in the dark had been the first choice of insert, but Kandahar airfield lacked runway lights or available illumination.

In fact, Kandahar offered a runway, and that was it. So a brazen daylight insert had been opted for, the aircraft painted with huge UN letters on the tail. Since most of the UN flights were An12s, no one on the ground would suspect anything. Hopefully.

Ngomo got his team of ten men ready, blue UN waistcoats and caps, M4 assault rifles with silencers tucked away. With everyone peering intensely through the windows, wondering if they would live or die in the next few hours, the An12 touched down without permission, the lone air traffic controller getting back static. It was just another UN flight, just like any other day.

The plane taxied around to the apron, the pilots smiling and waving at ground controllers. All was normal. The aircraft halted where directed by a bored looking man who could hardly be bothered to wave the orange wands. Low steps were brought out as the engines wound down, a pilot stood in the open doorway, dressed like any other pilot in his white shirt with gold braid on his shoulders. With the steps in place he stood on the top and made himself visible for a minute. An official walked up the few stairs and the pilot shook the man's hand, gesturing him inside. As the official ducked in and lifted his head a silenced shot hit him in the chest, the pilot pushing him forwards. Ngomo waited ten seconds, then walked down the steps, blue UN hat and blue UN waistcoat, his men behind him. As he neared the waiting jeeps he counted twenty-six men in view. It would be interesting. Ten yards from the first man, Ngomo noticed the odd looks he was getting. He lifted his M4 and fired at a surprised individual, soon cutting down the four men in front of him. His men broke left and right, opening up on the other men, all running forwards and firing as they went, a great many rounds sprayed around. Ngomo sprinted past the jeeps and fired as he went, knocking down other men, soon to the terminal doorway. He burst through and fired as he went, at anyone and everyone that was not one of his group. Changing magazines, his back to the wall, he heard a long burst of fire. The game was up. He pulled two grenades and threw them into the terminal, secure in the knowledge that no innocent UN staff were about.

Two weeks before the insert, the UN had been alerted to the fact that Northern Alliance were about to launch a major attack, and so withdrew many of their staff. The Northern Alliance were also

rumoured to possess more Mi24 helicopters than they actually had, part of the Silo rumour mill. In reality, they had one helicopter that worked, and one that needed parts. It was all news to the Taliban, who scratched their heads at the UN withdrawal. The front lines were a long way off, and the Taliban were the ones advancing. So this alleged push south by the Northern Alliance had them confused. Still, they sent extra men north to bolster their positions. All that remained of the UN mission were two-dozen keen UN mine clearance workers; all Somalis who had arrived just a few weeks ago.

Then, yesterday, a report had come in of paratroopers landing in the west, something that had caused a lot of raised voices. Still, regional commanders in the west had been attacked and killed by someone. The reports arriving that evening were of men dressed as Iranian soldiers, sixty miles across the border into Afghanistan. Men had been dispatched from nearby areas, and from Kandahar itself.

Ngomo's grenades detonated, killing and wounding very surprised gunmen. He spun in with his adjutant and sprayed the room, running forwards and firing as he went, soon to the other end. Peering through a glass door he could see his men running off the plane, the ground handlers lying dead on the apron, orange wands no longer needed. He turned towards the gate. Circling around, and killing an innocent floor sweeper as he went, Ngomo came at the men on the gate side on, the men running towards the terminal. He and his adjutant dropped to their knees and fired carefully, two rounds for each man. Lifting up, they sprinted to the gate, firing from the hip as they progressed. At the gate they slammed their backs against a wall and threw grenades at the men outside.

Four Pathfinders in blue UN waistcoats reached the opposite gate buttress and fired. Ngomo nodded a signal, and they all spun into the gate, running and firing at startled men, soon knocking them down. Ahead of them lay a straight road flanked by fields, an unhindered view out towards the main road north/south that led to Kandahar, the town a few miles northwest. A lone Toyota pickup trundled towards them, possibly just an airport worker. To the sounds of machinegun fire behind them, Ngomo and his men fired at the driver and passenger, smashing the windscreen

and killing them both. Ngomo ordered the jeep recovered and brought inside.

From behind him, a large empty truck trundled forwards, soon blocking the gate once the Toyota was through. Overhead, the remaining aircraft circled, now ordered down as bodies were moved. Ngomo threw off his cap and waistcoat, placing his beret on as he strode towards the terminal. At the front of the terminal he asked for a casualty report. None so far, came back.

The second An12 landed, soon followed by a third, the first now being refuelled by the pilots themselves. Twenty minutes later Ngomo had just under five hundred men on the ground, each unit running to a pre-planned part of the perimeter and digging in, the unit commanders assembling around Ngomo. The final An12 unloaded just cargo, rations for the mission, a dozen large pallets that were pushed out. On the tarmac, the heavy pallets were pushed and nudged towards the terminal.

Ngomo lifted his satellite phone and sent a message: 'Fox in the chicken coup, chickens all dead, no casualties, transport leaving when ready. Out.'

They had done it, they had taken Kandahar airfield off the Taliban, a great loss of face for the old men that I had met – yoghurt and mint paste coming to mind when I heard the report.

With the aircraft taking off, Ngomo readied his wake-up call for those old men in the civic centre of Kandahar. A Russian rocket system was wheeled out, twenty tubes loaded with rockets. When ready, the operators stood and faced Ngomo, who waved a hand. The short-range rockets were launched towards the centre of Kandahar, soon raining down on unsuspecting citizens as they went about their business on this chill, but fine morning. Marketplaces erupted, buildings crumbled or caught fire, and the old men sat wondering if it was an earthquake. The blasts soon labelled the problem as something else, something far more sinister. Thought of the Northern Alliance came to mind, and the rumours of those Mi24 helicopters.

With buildings on fire, roads blocked, panic gripping the citizens, reports came back in. The Northern Alliance were nowhere near, they were hundreds of miles away, and no helicopters had been seen. But strange reports came from the area near the airport, sounds of gunfire. The airport was called on a landline, answered by a Somali.

‘We are the Somali Army, and we have taken the airport. We have come to fight al-Qa’eda, who make war on our lands. Thank you, and have a good day!’

Ngomo waited fifteen minutes, enough time for the crowds to gather and help the wounded, or to put out fires, and launched a second salvo. The old men of the Taliban leadership were debating the odd phone conversation with someone at the airport, when the building they were in shook. Outside, many were caught out in the open, the casualties mounting. The leadership dispatched as many men as they could to the airport, as expected.

Along the approach road to the airport jogged a group of Somalis in mine clearance gear, sweating and panting as they reached the gate.

‘What kept you?’ the men at the gate asked.

‘We stopped for breakfast!’ came back, the men puffing a little. Stripping off their mine clearance gear they squeezed past the lorry and found Ngomo.

‘Did you do a good job clearing the mines?’ Ngomo asked.

‘No, sir. We should all be flogged for the job we did.’

Ngomo smiled. ‘How safe is that approach road?’

‘It should be OK after ten, fifteen years of mine clearance, sir.’

‘Get your weapons and kit,’ Ngomo ordered with a grin.

Fifteen minutes later a column a mile long appeared on the north road, white Toyota pickups weighed down with armed men. Ngomo waited until they were three hundred yards away, and flicked a switch, a radio signal sent. A hundred and twenty mines detonated along the roadside, covering a length of six hundred metres. When the dust cloud cleared there were but a handful of men staggering around.

‘Open fire!’ Ngomo ordered, the men soon picked off and knocked down.

Back in the terminal, Ngomo set-up his HQ in a side room. On a desk he laid out a detailed map of the airfield and surrounding area. On it his adjutant marked in red the blocked road.

‘Make sure everyone gets something to eat in the next hour,’ Ngomo ordered. ‘It will be a long day, and they’ll come at sun down.’

A man stuck his head in. 'Sir, we found a few trucks, UN supplies inside. Wheat.'

'Excellent. Stick a few men on it, and start baking. Use it before the other rations.'

'Second truck has artificial limbs, sir. They're from Mister Silo.'

Ngomo and his men took a moment. 'Leave them somewhere safe. After today, I think they'll be needed in the town.'

A Captain took a radio signal. 'Sir, they are firing towards us from ... seven hundred yards.'

'Seven hundred? Idiots. Let the boys with M82 s find their range.'

On the terminal roof, painted white unfortunately, the snipers lugged up sandbags, creating four fire positions. They dumped their kitbags behind themselves, placed on ear defenders, issued chewing gum, and settled down. They zeroed-in on the road, observing for a minute the men with AK47s firing ineffectually toward them.

'Eight hundred,' a man said.

'Seven,' was a counter claim.

'Factor in our height.' They adjusted their sights, reducing the range for their elevation.

The first man said, 'White truck at the junction.' He fired, his colleagues observing the truck with their sights.

'Low,' they said in unison.

The first sniper adjusted his sights, and fired.

'Wheel!' they called.

A final adjustment was made, a round fired.

'Driver!' they laughed.

'And passenger!'

'Set seven twenty-five,' the first sniper suggested. 'No wind.'

They all made the adjustments, and fired at the men on the road. Startled individuals saw their friends cut down by fifty calibre rounds, gunmen knocked off their feet. The gunmen took cover, unaware of the power of the rifles they faced. Gunmen were hit in the face, a terrible mess made.

'Hit the jeeps,' a man called. 'Before they leave.'

Engines were targeted, Toyota pickups disabled. After twenty minutes the road was cleared of danger, the jeeps driving off, men running. The snipers halted, sat up, and issued more gum.

‘Road clear,’ was reported to Ngomo.

‘OK, put four spotters on the roof with binoculars. Rotate them every hour, eyes get tired from staring.’ He sat with his Somali counterpart, a Captain, a chocolate bar shared. ‘They have rockets.’

‘Take a day or so to move them,’ the man suggested, none too concerned. ‘Tonight they’ll try and sneak up.’

‘Question is – how long till the Arab fighters get here?’

With downtown Kandahar on fire, casualties filling the hospital, the convoy to the airport massacred, the old men called back their fighters from the north and west, but also called in their fighting brothers, the Arabs.

Sixty men had parachuted into the west, two hundred miles from their colleagues, the Iranians not appraised about that part of the plan. The group had landed, formed up and marched towards the nearest town. There, the lead men had donned Iranian uniforms, and shot up the town from a distance before leaving. The Iranian uniforms were discarded and buried, but Iranian berets were tossed onto the roads, where they could be found.

The column then began its long march to an isolated airstrip, where they aimed to be picked up in three days time.

At Kandahar airfield it was quiet; chilly for the Africans, but quiet. No one else had tried to tease the snipers, a few Taliban fighters taking up position south and north, in view, but at a thousand yards out. The Kenyans stamped their feet and jumped up and down to stay warm. The warm clothing they had brought was suitable, but remaining still for hours on end chilled them. Their unit commanders rotated them every two hours to keep them sharp.

In Kabul, a Chinese commercial transport landed, several tonnes of weapons and ammunition offloaded.

At sundown, hard to judge through the low cloud cover, Ngomo increased the number of snipers on the walls. They switched optical sights to thermal sights and made ready, each allocated an

arc of fire. An hour later, keenly awaited movement was finally spotted.

Along the north road, that led to Kandahar, jeeps pulled up, their headlights out. Fighters jumped down and walked to the west, along the course of a brisk stream, the water they were near very cold this time of year. They spread out and approached the airfield using a small wall for added cover.

At four hundred yards the snipers opened up, cutting down twenty of the men, wounding others. The fighters ducked behind the wall. Up on the roof of the terminal building, Ngomo scanned the men with a thermal sight for a minute. Seeing that the fighters were, unfortunately, exactly where he figured they would be, he flicked a switch and sent a radio signal. The culvert and wall exploded along a two hundred yard stretch. Those few stragglers that survived limped back to the road.

The second probe came an hour later, this time from the open spaces of the west. Foolishly, the drivers followed the track in the dark, their headlights out. The first Toyota hit an anti-tank mine and split in half. The column dismounted, several stepping onto anti-personnel mines. In disorder, the survivors ran away.

Back in Kandahar town, the old men could not believe, nor grasp the numbers of casualties. As such, they sent even more men to the airfield.

After an hour of calm in the dark, movement was again spotted. More jeeps pulled up behind the previously abandoned vehicles, the fighters stepping down and running forwards. They spread out and started crawling.

‘Finally,’ Ngomo commented. ‘Some men with brains. Try the mortars.’

The 81mm mortar crews were fed the co-ordinates. They adjusted their tubes, selected anti-personnel rounds, and lobed four rounds, the shells slamming into the ground between the fighters crawling forwards, several injured. Next, the mortar crews tried a starburst illumination shell, one fired. It lit up the area, exposing the men crawling. The snipers opened up, picking off several. When darkness reclaimed the battlefield, the snipers with thermal sights complained, at length. It took them a while to reacquire their targets. At three hundred yards they opened up, all of the fighters crawling forwards picked off.

Dawn brought a light drizzle and low clouds, reduced visibility across the killing fields. Ngomo surveyed the scene from the front gate, steaming coffee cup in hand. He stood wondering where the Arab fighters were.

At 2pm, the spotters reported seeing trucks, and men dressed in black. The newcomers were across the stream, and forming up.

‘Now we see,’ Ngomo told his adjutant. ‘Will these brave fools attack in daylight? Will their anger and determination get the better of them?’

The new batch of fighters disappeared behind houses and compounds, being glimpsed approaching the stream two hundred yards to the west of their drop-off point, now almost due north of the airfield. They crossed a pipe over the stream on their bellies, disappearing behind a low wall.

‘Sir, they are at the north approach,’ came a report.

‘They are not stupid,’ Ngomo noted. ‘Let them get across, count their numbers.’

Half an hour later, thirty-five fighters had crossed the pipe with some degree of professionalism. They spread out into three groups, men with long rifles seen in the group moving further west. The two other groups followed walls south, keeping themselves out of sight.

‘Mortars,’ Ngomo ordered.

The mortar crews checked their bearings and range, then lobed four rounds, hitting the banks of the stream next to the pipe. The compound next to the pipe took a direct hit, and started to issue smoke. A second volley of four rounds hit the concrete support of the pipe and demolished it, the pipe disappearing into the fast flowing water.

‘If they want out, they get cold,’ Ngomo noted. He lifted his radio controller for the mines his men had planted during the night, and flicked the switch. Twenty-four mines detonated, taking down most of the two walls that the fighters were behind, a huge plume of smoke and dust created. A minute later and another mine detonated, but this time from someone standing on it. Men could be seen retreating towards the third group. That group, armed with AKM sniper variants, opened up on the airfield walls, ineffectual at seven hundred yards. The snipers on

the roof opened up, their combined distance to their targets almost a thousand yards. The enemy snipers got the message.

RPGs were fired from behind a compound, none landing closer than a hundred yards to the airfield perimeter. Then a rocket landed, smack on the runway.

‘From the town,’ Ngomo suggested. ‘Blind shots. But still ... they could kill if they are lucky. Fire four rockets to the town.’

Some semblance of normality had returned to the town centre, people going about their business, as the four rockets rained down, scattering the crowds. The Taliban leadership now called in as many fighters as they could, even from Pakistan.

In the west, the parachute troop had settled about a road junction the night before and set-up traps. Dawn brought them a column of ten jeeps. The driver of the lead jeep was killed from five hundred yards, Somalis moving position – and giving away their position. The jeeps halted, the men pouring out, focused on the Somalis ahead. From the sides, the rest of the troop took their time and picked off each man, all killed in less than two minutes. They rushed down from their positions, grabbed headgear off the dead men, finished off a few wounded, and took possession of ten jeeps. The jeeps were turned around, and pointed towards Kandahar.

In the basement of the house I studied the battle board, then the white board that detailed the various actions. Five boxes had been ticked, all right on cue. Small red soldiers indicated the dead fighters, and were scattered over the model. Jimmy explained that a stealth night attack was next, Big Paul pointing out the probable approach routes.

As night fell, the Arab fighters moved into position, three separate groups. They figured that there could not be many men in the airfield, and so would split the fire. The main group crossed the stream using long ladders tied together side on, making a small bridge. Fifty crossed over. A further fifty walked around to the east, a further fifty trying again the low wall northeast, that area still littered with bodies.

This would be the most determined attack so far, and Ngomo checked his section leaders. But the snipers on the roof were

relaying the detail in real-time, there would be no surprises. They were then surprised by a rocket attack, a rocket landing on the roof and injuring one man. Four rockets had landed, no serious wounds inflicted. And the rockets kept coming, one every ten minutes. It made movement around the airfield interesting.

From the rooftop the snipers concentrated on the rocket launchers, spotting the flashes coming from a compound. They took a compass bearing, judged the distance, and radioed the mortar crews. A shell was lobbed; short and left. Settings were adjusted, another round lobbed. It hit the outside of the compound wall. Slight adjustments were duly made, four rounds lobbed. The compound disappeared in a cloud of dust, no more rockets forthcoming.

Meanwhile, the three groups of fighters were on their bellies and hidden from view, crawling forwards inch by inch across freezing cold ground. The group to the northwest reached to within four hundred yards unseen, and fired two RPGs over the perimeter wall. They exploded without injury caused, a futile gesture. The Somalis readied their own RPGs and fired down at the wall that the fighters hid behind, eleven rounds fired, the wall disintegrating. The fighters scattered. A starshell was lobbed their way, a dozen men picked off by snipers.

From the east, the next group followed a culvert, reaching an abandoned mud house and using it for cover. Allowing the men time to get inside and take-up position, Ngomo detonated the explosives inside and around the house, thirty fighters killed or wounded.

To the northeast, the fighters crawled along what was left of the low wall. In order to make them believe that they were making progress, the snipers fired over their heads, or into the ground. The fighters pressed on, reaching three hundred yards. That put their axis of approach right in the sites of a hidden machinegun, which now opened up, strafing the group from the front and killing the twelve leading men, injuring more. That route was abandoned.

But the Taliban were not without a few extra cards to play. From across the stream a mounted DSHK fifty-calibre machinegun opened up, rounds slamming into the airfield. The defenders had to duck, two men injured by ricochet. No sooner had the DSHK fired, it moved position by two hundred yards,

and fired again. So far, it was doing the most damage. From the northeast a second DSHK opened up, a hailstorm of rounds landing inside the perimeter. From the south, a third and fourth DSHK opened up, rounds now pinging off the terminal, and coming in from four different angles. The defenders had no choice but to get undercover. An unlucky shot killed the first Somali, hit in the head.

In the basement, the news was not good, Big Paul positioning four small cars to symbolise the mounted DSHK.

Ngomo had fetched the snipers off the roof before they got themselves killed, their old sandbags being torn-up by incoming rounds. For an hour the DSHK fired intermittently, but regularly, all the while Ngomo wondering about their ammunition levels.

The three groups of fighters, seeing an opportunity, had crawled forwards. After the first dozen had tripped mines, they realised that the approaches were all mined, and pulled back. All night the DSHK fired into the base, no way to know if they were achieving anything. An hour before dawn they fell silent. Ngomo put the M82 snipers on the roof with the spotters just before dawn. They stared hard through binoculars and spotted one of the mounted DSHK, at just about a thousand yards out. The four M82 snipers all aimed for the vehicle it was mounted on, and fired away, two rounds each. They were certain they hit the Toyota, and relayed the co-ordinates to the mortar crews. A round was lobbed towards it, landing short, but close. Four more went over the wall, the Toyota destroyed.

The one to the south was spotted easily, and ten rounds fired, the Toyota hit several times. Four mortar shells flew over their heads, the Toyota disappearing in a cloud of dust. The third and fourth DSHK could not be seen.

Ngomo now directed the mortars towards a bridge over the stream, some sixteen hundred yards out. They hit it after five shells had been lobbed, the bridge now out to vehicles. It was a good morning's work and Ngomo settled down to breakfast, secure in the knowledge that the planes would return that night.

A reporter in Kuwait had got hold of the story in Afghanistan. Actually, he had first reported that Iranian soldiers, possibly

chasing drug smugglers, had crossed fifty miles into Afghanistan. He had then been tipped off about the Somalis. He reported the Somalis as mercenaries acting for the Iranians against the Taliban, which was not too far from the truth. The Iranians denied it. Unfortunately, the left hand did not know what the right was doing, or had done, and a high-ranking Iranian accused the Somalis of an incursion into Afghanistan. The western media was focused on the tsunami and the amazing images coming out of the affected regions. The news of the incursion did not make it to a wide audience.

Another Iranian spokesman then accused the Somalis of breaching their airspace, an odd move considering that Somali was a long way off, and had no air force. There was then the matter of the large Iranian Air Force and their potent surface to air missiles. A third Iranian spokesman then suggested that the Somalis had entered Afghanistan under the pretext of being six UN flights. The reporters then asked how they knew it was six aircraft? They must have seen them?

Abdi was not much of a diplomat at the best of times. Without his President's say-so, he went on TV.

'The Iranians are dogs!' After that, it just got worse. 'They suggested to us that they help us fight the al-Qa'eda terrorists in Afghanistan, and allow in our soldiers. It was their plan. Now they are found out and want the world to think they did not have a hand in it. They have no honour, they are dogs!'

The outburst made Kenyan TV that evening. Rudd called the house, Sykes just happening to be with us and horrified at the turn of events. Jimmy told Rudd that he wanted the story all over Africa, and that the African Times should show an interest. Then the Prime Minister called, greatly concerned at the situation.

'It is necessary, and will be necessarily messy. From bad, it will go to worse, then much worse. But have faith.'

When Jimmy had finished the call, I said, 'They're cut off, no way out.'

Jimmy took a moment. 'I was once threatened by a group of men on a train. When I stood my ground they reminded me that there were ten of them. Yes, I said, but the isle is only big enough for one at a time. And I took off my jacket.'

Sykes nodded. 'A choke point. And a small unit can hold a choke point for a long time.'

Jimmy told me, 'They're Rifles, Kenyan and Somali; they have fighting in their blood. And in their blood – is my blood. Besides the obvious *physical* advantage, they're the best men the Rifles have to offer, most with ten years combat experience. And unlike their western counterparts, shooting at paper targets, that means killing - by gun or by hand. Each of those men is a qualified killer ... and they like it. They've had more training than ten of their Western counterparts, they're well armed, they have an excellent position, and they have a plan that I gave them. It's not the Rifles you should be concerned for.'

'You knew they'd get cut off,' I surmised.

'Who do you think tipped off the press?'

'You did?' Sykes puzzled. 'You dropped them in it!'

'Did I?' Jimmy posed. He waited.

'They're stuck,' I began. 'So they'll be even more aggressive. They have to fight their way out.'

'What did the Somali contingent do in Darfur, on the line?' he posed.

'They broke ranks and charged,' I said.

Sykes put in, 'So they'll go at the Taliban.'

'The Somalis told me they wanted to punch al-Qa'eda on the nose. Well, that punch should be a good one, because if al-Qa'eda is not ... *trimmed back*, the world goes to fuck. It's not Somali wanting to get back at them, it's a few other people that I knew - and buried. The blow about to be delivered is my blow, with as much power as I can get behind it. And no event of the past twenty years is as important, or as risky for the future of this planet. This is the heart of the fight, this is the real me. Rescue Force is what I do on my day off.'

The six An12's taking off from Dohar were refused access to Iranian airspace, and turned back, Ngomo receiving a call on his satellite phone. He was isolated in a foreign land, with no extraction coming, limited supplies, and a war on his hands. He called Abdi, and Abdi called Jimmy, who promised to try and arrange planes from China or Russia.

Ngomo called together his officers and NCOs. He took a moment to take in their faces, and their expectant looks. 'The Iranian Government had betrayed us. They are refusing to allow our planes for extraction.'

The officers and men glanced at each other.

‘I have spoken to Mister Jimmy Silo in England, and he will try and get Russian or Chinese aeroplanes here for us. Till he can do this, we stand and fight; we do the job we came to do and kill as many as we can. But I want all men on half rations till I say. And go easy with the ammunition. Make every round count. Please go and inform your men.’

Ten minutes later, the remaining two DSHK opened up intermittently, forcing everyone to keep their heads down, and to run the gauntlet when moving about the airfield. Another two men were hit and seriously wounded, the terminal building now hosting eight wounded men. Ngomo patrolled the line, finding the men in high spirits, despite their injuries.

Back in his office, Ngomo stared hard at the map of the airfield and surrounding area. Lifting his radio he said, ‘Fire one rocket every hour at the town.’ A single rocket flew outward, soon impacting a building in the town and reminding the Taliban leaders that they had not won this battle.

To the west, the Toyota convoy approached a crossroads, another convoy converging with them. The two convoys were soon on the same stretch of road, heading towards each other. The Taliban convoy’s lead vehicle slowed, a wave given. The Somali convoy did not stop, they sped up, opening fire at point blank range, a shower of outgoing fire hitting the unsuspecting Taliban fighters. Moving beyond the last vehicle, the Somalis swung around, driving through the sand and circling back, still firing. They halted, their soldiers jumping down and lying down, soon firing at those left alive in the Taliban convoy. It was a short battle. Running forwards, the Somalis finished off any and all survivors in the Taliban convoy, double checking bodies. Four of the jeeps were in reasonable condition and so were liberated, blood washed down. Fuel from the others was syphoned out, fuel cans pinched. The Somali column now consisted of fourteen vehicles. They continued towards to the east.

At the next town they noticed a concentration of fighters, and so turned off to circle the town, and ran straight into another convoy. The fighters in the town were suspicious, and opened fire from a good five hundred yards away. That made the approaching convoy halt, its fighters jumping down and taking

cover. It gave the Somalis no choice but to abandon their vehicles and seek cover. In their squads, eight men each, they split and circled mud walled compounds. There started a ten-hour battle, close quarters, and sometimes hand to hand.

Ngomo had studied the map all day, trying to figure out where the next attack would come from. He was certain that the DSHK would be used to keep their heads down, and that rockets would be fired. That would be his signal, the signal that the attack had begun. And he figured they would wait till nightfall.

Only the north offered approaching fighters any cover, the south and west was open country. He tapped the map with a finger. Calling the command team together he made his plan. It was not an ideal situation, but circumstance was driving this, not him. With his mind made up, he called Jimmy on the satellite phone.

‘Mister Silo, sir. Can we talk?’

‘Of course. How’re things your end?’

‘For the moment, it is OK, sir. But they pin us down with the Duska, and tonight they will come in force.’

‘Probably from the north.’

‘Yes, sir, I think this too. My idea is to go out and fight close, to cause many casualties and withdraw.’

‘It will make them think twice about attacking, yes. But be careful that you do not shoot each other. Create a distraction first, then move out very slowly just after dark. They will come an hour or two after dark. How are your supplies?’

‘Enough for three days, more on half rations.’

‘Then tomorrow night, if you have not heard from me, break out to the southwest and walk. I am trying to get you planes. I am also giving money to the fighters in the north to attack south. That will split their forces. I hope to have aircraft in two or three days, you will need to hold out till then. But I don’t think the aircraft can land where you are now, you will need to reach another base, and one without fighting.’

‘I understand, sir.’

‘Before you withdraw, set booby-traps, and fire off all excess ammunition.’

‘Yes, sir.’

‘And good luck.’

‘Thank you, sir.’

With the Kenyan press alerted to the presence of Kenyan soldiers in Afghanistan, the Kenyan President made a statement.

‘The al-Qa’eda terrorists from Afghanistan have been setting off bombs in Somalia, and have tried to set off bombs here in Kenya. We sent a small detail of the Rifles to assist our brothers in Somalia, to go and fight these terrorists who come from Afghanistan to attack Africa. The Iranian Government helped and assisted in this venture, but have now changed their minds. Our soldiers are trapped and cut off in Afghanistan. I will bring you more news when I have it.’

The result of that statement was predictable. Coming soon after the successes in Darfur, the various governments began offering troops to go and fight in Afghanistan, the African media now full of the story. Across North Africa and the Middle East, the Iranians were now feeling the heat for the error in judgement they had made by allowing the mission. Within hours of each other, two Iranian spokesmen made two distinctly different statements:

‘We would offer them safe passage out if they throw down their weapons at the border.’

‘They are mercenaries and invaders!’

We made sure that the African times ran both quotes on the front page.

At dusk, a group of forty Pathfinders and Somalis made ready. The teams selected were lightly armed, grenades and rifles, and nervous. They knew where they had planted mines, but were not a hundred percent sure.

With the men starting to move through holes in the walls, machineguns fired out towards the stream, and the compounds the other side. Mortars flew out towards those compounds, keeping down the heads of the people there. Stepping carefully, the Somalis crept out in their squads, soon stepping over bodies and body parts, some wounded still in place and groaning. Boots on necks silenced them. The ex-filtrate group reached the stream without incident, finding no fighters close by, mortars still landing ahead. Using the makeshift ladder-bridge, they crossed one by one, soon all across. The spotters, using their thermal

sights, saw the crossing and altered the mortar angles, a sporadic lobbing of mortars now two hundred yards beyond the stream.

One group split left, one to the right, the main body moving slowly up the centre, a course that would take them due north. The lead men all carried M4s with silencers, their AK47s slung. At the first compound they noticed a flickering light coming from the bottom of a set of stone steps, the sounds of men talking and the smell of food labelling the activities in the underground room as dinner. Two grenades were pulled and thrown down. Dinner was interrupted. From the smoke that escaped the stairs, two men staggered out, cut down with silenced rounds. No further sounds came from the room.

The group that had moved right, to the east, now approached a compound that had been hit by a mortar earlier, the damaged walls evident, and they caught glimpse of a DSHK on a Toyota. The Toyota was now being fixed, the other side of the compound wall, and hidden from view of the airfield. They encircled the compound, and took down the erstwhile mechanics with silenced rounds. Voices could be heard inside the compound, grenades, thrown in. They exploded with dull thuds. The Somalis moved inside, firing as they went, a handful of men wounded by the grenade being finished off. Back outside, a Somali had an idea. He slung his weapon, loaded the DSHK and checked it, his colleagues wondering what he was up to.

‘Push the car back!’ he whispered.

His colleagues pushed the Toyota back a few feet.

‘Stop. Good.’ With the DSHK pointed up at an angle of around twenty degrees, and facing the town, the man let rip.

In the town, fifty calibre rounds slammed into houses, cars and buses. The man’s colleagues looked at each other, then searched the compound for more ammunition, retrieving several belts and helping to feed them, soon hundreds of rounds covering the town.

The firing had a beneficial effect, many Taliban fighters coming out from compounds and from their hidden positions to see what was up, and getting themselves cut down. With their presence now known, the soldiers charged forwards, lobbing grenades into compounds, firing at shadowy figures. The confusion caused many fighters to emerge, only to be cut down in the crossfire.

Almost a mile from the airfield, the soldiers came across the main body of fighters getting ready, soon exchanging fire at close quarters. With the main compound identified, mortar fire was brought to bear, a densely packed compound trapping the fighters as they digested their evening meal. Fire co-ordinates were adjusted accordingly, and the force waiting to attack the airfield was decimated. Still outnumbered, the soldiers tucked themselves into dark corners and picked off the fighters, a battle that dragged on for two hours.

With ammunition low, the soldiers picked up AK47s from the floor and carried on, the withdrawal order given several times. Back at the ladder-bridge, the senior men counted their teams across, noting ten men missing. With everyone across, they blew whistles, searched around as long as they could, but had to pull back. They clambered across the make-do crossing covered by their men, and slowly retraced their steps, mindful of the mines.

Almost a mile further forwards a group of eight Somalis had lost sight of their mission, their orders and their discipline; the fighters were falling back, so they were going after them. With the fighters disorganised, and not knowing who was who, they were now being cut down from behind. When they did turn and fire they often hit their own people.

With the lights of Kandahar in sight, the team leader said, 'We will create a distraction for the others, we will be heroes.' They charged forwards through dark fields and soon found themselves running past houses in dark alleys. Reaching a brightly lit bazaar they opened fire, cutting down dozens of civilians. Charging on, they crossed a wide intersection, firing at cars and lorries as they went. At the other side of the intersection they ran unmolested along a straight road, no lights to give them away, and focused on bright lights nearby. Turning a corner they found a set of high gates, many guards stood around. Without slowing up they fired as they ran, cutting down the guards. Guards on the roof opened up, killing two of the soldiers. Through the strong metal gates that they found, they fired at groups of startled guards, a great loss of life inside the gates. Grenades were thrown over the gate.

Inside the gates, the old men of the Taliban were being ushered out of the back, a great shock to them all.

The soldiers grabbed magazines from the dead guards and ran to the right, the road opening to an intersection with several

shops and stalls. Shopkeepers were cut down, lorry drivers killed, taxis sprayed with rounds. From behind, guards opened up, killing another two soldiers. The final two soldiers, wounded now, turned right and ran forwards, throwing grenades as they went. They reached a brightly lit indoor bazaar and opened fire indiscriminately at spice merchants. Limping on, and losing blood, they rounded a corner to find fighters coming towards them. With a scream, the final two soldiers ran forwards, firing from the hip, killing many before being cut down. Kandahar was now in a state of shock. But that shock was nothing compared to what the old men in the leadership now felt.

Ngomo welcomed back his men, getting the report of ten missing, presumed dead. 'We have bought ourselves a day or two, with the lives of these brave men. Tend to the wounded.'

Unknown to Ngomo, the Northern Alliance were making use of the confusion, and the thinning of the lines, to attack south. It was something the old men of the Taliban would have to face in the morning.

A hundred miles to the west of Kandahar, the parachute troop were now driving east, but just forty of them, many of those carrying fresh wounds. The battle had lasted all day and into the night, the Somalis fighting in small groups, and killing anyone they came across. They had cleared the compounds and killed most all of fighters in both convoys, pursuing the stragglers into the town. There followed a massacre. With their blood up, their colleagues dead and wounded around them, the Somalis flipped. Now driving away in a column of Toyotas, they left behind more than six hundred dead; men, women and children.

The next morning, the Taliban leadership received reports of the carnage that had befallen Kandahar; some three hundred wounded, eighty civilians killed, three hundred and fifty fighters dead or wounded. And laid out in the courtyard were the bodies of just eight Somali soldiers. The town had been searched, as well as the area north of the airfield, and the evidence was there on the floor. Eight bodies. From the west, the reports were horrific, reports of whole towns and villages being wiped out, wild reports of tens of thousands of Somali soldiers converging

on Kandahar. And now the Northern Alliance were attacking in many places. Just to make a point, a lone rocket impacted a building not far away, the blast reverberating around the room.

The leadership now had a war on three fronts, and struggled to come to terms with how this had come about. Messages were sent to all fighters in other provinces of the invaders, a call to arms to defend the motherland. That was when Jimmy decided to turn the screws. He launched an operation that few were aware of, certainly not me. As the Taliban leadership argued about how to deal with the mess, explosions caught their attention, a dull rumbling sound resonating. The explosions got louder, the men thinking of evacuating to a cellar.

From the north, Mickey and Yuri opened up as they bore down on the town centre and the civic buildings. From behind them, three other Mi24s opened up, the townsfolk now in abject panic. The civic buildings were pockmarked, holes blown into roofs and walls as rockets rained down. And at the airfield, the soldiers stood up on the walls and stared wide eyed. The Mi24s radiated out from the town centre, firing at anything they noticed on the ground. In a line, they flew down the north-south road and strafed vehicles on it. Turning hard at the end of their run, they approached the airfield with a roar, setting down in a line on the runway, their engines soon winding down.

Ngomo and his senior staff met Mickey and Yuri on the apron.

‘This where the action is?’ Mickey asked, putting a cigarette on his lip.

Ngomo shook his hand. ‘Where did you come from?’

‘The Chinese had them, so flew them to the Northern Alliance. We snuck in on a UN flight a few days ago.’

‘We were planning on breaking out tonight.’

‘New orders: stay put. Should have some supplies tonight. So, got the kettle on, ‘av we?’

That evening, not long after dark, an An12 landed, its pallets pushed out quickly, the wounded removed. It took off to the south, but circled around to the north as it climbed.

In the pallets the soldiers found food, ammunition, mortars and rockets. One pallet contained ammunition for the Mi24s. Fuel for the Mi24s was not a problem, several fuel trucks lying

around the airfield. Ngomo took the rockets, had the tubes loaded, and fired a salvo of twenty-five rockets at the town – just to remind the Taliban that he was still there. To the south, he sent out two separate patrols and captured the DHSK, killing their operators. Back in the airfield, they moved the DHSK to the northern perimeter and fired towards the town intermittently. The good citizens of the town would not be getting much sleep this night.

An hour before dawn, Mickey and the Mi24s took off, and flew to their maximum range, pounding Jalabad at dawn, a rude awaking for the citizens there. On the way back they strafed Kandahar centre with what ammunition they had left, and landed in time for breakfast.

With radio contact made, the parachute troop coaxed their jeeps into the airfield. They had found no fighters nearby. The soldiers greeted and hugged each other, the wounded taken into the terminal.

At noon a jeep drove out from Kandahar with a white flag. It slowly crept along the approach road, and finally stopped a hundred yards out. The driver eased nervously out, waving his white flag, and walked forwards. He was searched at the gate and let through with an escort. Ngomo met the man in his office, but just sat and stared at him.

Speaking in Arabic, the man was translated by a Somali officer. ‘We wish to know who you are, and why you are here.’

‘That is simple, my friend,’ Ngomo began. ‘Al-Qa’eda makes war on Somalia, setting off bombs, killing women and children. You make war on us, so we are here to make war on you.’

The Afghan was a little puzzled. ‘We are not al-Qa’eda.’

‘They have their headquarters here, their bases, in the east. Don’t deny it, we know.’

‘There are Arab fighters here, yes, but we are not them.’

‘You are the Taliban?’ Ngomo pressed.

‘Yes.’

‘You are the government of the south, al-Qa’eda is in the south, so you support them.’

The Afghan made no comment, but asked a very odd question. ‘How long will you be here?’

Ngomo blinked, and glanced at his adjutant. He took a moment, sensing an opportunity. 'Till our reinforcements arrive from the north. We are only five hundred men here.'

'Reinforcements?'

'Yes, we have flown in five thousand men. More in the west.'

The white flag holder was stunned into silence for a few seconds. 'And what is your aim?'

'To kill you all, and take the country, of course.' Ngomo sent the man on his way. To his adjutant he said, 'They are worried.'

'Mickey says the Northern Alliance are moving south. And we are here, so distract them from their fight in the north. They are spread too thin.'

Ngomo rang Jimmy. 'Sir, the Taliban, they send a man with a white flag.'

'Do they offer terms?'

'No, they asked how long we would be here.'

'Oh. Well, nominate me as arbiter, and I'll talk terms for you. Abdi is here, at my house. Give them a satellite phone, please.'

'Very well, sir.'

Ngomo sent a man after the white flag holder, and gave him a satellite phone, telling the man to give it to the leadership, and wait a call.

When the phone rang at Taliban HQ, our Pushtan interpreter from the Foreign Office asked for the top man. He explained that Jimmy – the man who sends plastic legs – will act as arbiter for both sides, and were they happy with that? They were.

Jimmy began with, 'Have you suffered many casualties?'

'Many thousands, in many parts of Afghanistan; women and children massacred. Towns wiped out by these barbarians.'

'May I ask, why you support the al-Qa'eda attacks on Somalia?'

'We do not support such attacks.'

'Al-Qa'eda travels from your lands to set-off bombs in Somalia.'

'We have no control over this.'

'The Somalis wish that you remove al-Qa'eda from your lands. These are their terms for them leaving Afghanistan.'

'We could not remove al-Qa'eda without a fight,' the old man admitted.

‘There are thousands more Somalis in your country than you realise. Soon, fifty more helicopters. Perhaps you could just tell the Somalis where to find al-Qa’eda. After a year or two they may have killed them all.’

There was a long pause at the Taliban end.

‘This would not be acceptable to us.’

Jimmy explained, ‘The Somalis are brave and strong fighters without mercy. If you do not remove al-Qa’eda they will kill everyone they come across. And then the Northern Alliance will have your lands.’

Another long pause came. ‘The Somalis will not leave?’

‘No, they will stay, re-supplied by the Northern Alliance. Maybe a year. And I warned you before about Arab fighters who make war on the west. Without them, I could get you more money. That is better than fighting the Somalis every day for a year.’

‘We ask for a ceasefire while all tribal elders meet and discuss this.’

‘The Somalis are in agreement, but I cannot speak for the Northern Alliance. The Somalis will wait five days. Turn this phone off to save the battery, back on when you are ready. Bye.’

Ngomo received the news; a five-day truce. He assumed the worst, and started planning for the worst. At dusk that evening another An12 landed, its large pallets pushed out, twelve of them. When Ngomo read the cargo manifest his eyes widened.

New Year

The 27th had been hectic, but on the 28th we had nudged Bob Davies and others to give interviews, and Helen offered hourly updates of facts and figures, plus casualty reports amongst our rescuers. Most of those casualties were down to accidents, and not the wrath of Mother Nature. Jeeps had been involved in simple vehicle collisions, one had overturned, and a few rescuers attempting daring stunts to help trapped people, getting themselves injured in the process.

Sat with Helen in the apartment on the 29th, I picked up a copy of the African Times, available in the UK by subscription. On the page dedicated to the DRC, a picture of six hanged men caught my attention. They were new recruits, and just six months into training, who had gang-raped two women. In addition to the men who had been hanged, every other member of their platoon had been given fifty lashes, their sergeant busted down to corporal, and the officer in charge docked a month's pay. I did not mind the punishments, but to have it in the paper seemed to be doing our dirty laundry in public view.

I followed the story of the soldiers in Afghanistan, what the papers actually knew about it, and could see what Jimmy was up to. When he popped in to play with the girls I said, 'You're driving a wedge between Africa and Afghanistan. Probably a wedge between Africa and the Middle East.'

'Really?' he made a faced. 'Can't think why.' He ignored me and tickled Shelly.

I gave another interview and updated the tired hacks on events overseas. They got plenty of pictures from our people on the ground, streaming video across the internet, and diagrams from our staff. There was little more we could have done to assist the press.

When New Year's Eve came around we drove back to the house and made plans for a party, Po and others now visiting. We dragged Bob Davies and a few others over, but it would be mostly a family affair this year. We told Shelly that tomorrow was Christmas, and stuffed her presents around the tree. She was three. She was confused, but she'd get over it.

New Year was quiet compared to other years, and it would not have been seemly to enjoy New Year with a lavish party when so many of our people were overseas. We enjoyed a meal around the dining room table, some "M" Group members remaining for the holidays.

The next day Jimmy showed me our schedule for January.

'Are we trying to set a record for the most air miles, or what?' I asked.

'If you can see an alternate then I'm all ears, underling.'

I went and showed Helen the schedule, and she uttered a few rude words. But after an hour of writing over the schedule, we

could see little alternative; our kids would have to grow up without me.

On the 2nd of January we began to extract teams, starting with the reserves and linked NGO groups. We left doctors in local clinics and started to remove the less skilled personnel. NGOs were taking over, dealing with food and tents, and our lot were still searching – but not finding anyone now. Our rescuers returned to designated areas, formed up, ticked boxes on forms, and headed towards capitals and airports, sometimes in long jeep convoys,

The Sri Lankan Government turned out to welcome our people to the airport, crowds at the roadside throwing flowers. In India our people slipped out quietly, as they did in Thailand, but in Sumatra the Indonesian Government made a fuss, an impromptu visit from the Government to RF headquarters there.

We had considered a parade in each country that had sent a team, but that was a lot of countries, and a lot of air miles. I was starting to appreciate the suggested parade in Paris; we'd kill thirteen birds with the one stone. The French President had been delighted at the idea and was in overdrive with plans, being relayed now through Michelle. Jimmy suggested that the date should be worked around Hardon Chase, inaugurated on the 20th of January. A provisional date of January 28th was set, world leaders invited, an "M" Group meeting to be held afterwards.

On the 3rd of January we set off for Hong Kong. We'd start in the Far East and work back towards us. Po flew back with us, and his people had been instrumental in arranging a parade for the HK branch. With reserves, they totalled almost two hundred and eighty. We enjoyed a pleasant evening in Po's hotel, taking both girls swimming, albeit with bodyguards close by. And, with Jimmy and Cat babysitting, Helen and I first enjoyed an hour's massage, then a meal alone. Well, as alone as we could be with four bodyguards and everyone in the restaurant recognising us.

The parade the next day was a surprise; seemed that half of Hong Kong had turned out. The jeeps, freshly cleaned and gleaming, drove along slowly, our rescuers walking along behind, Hancock at the head of the column. We observed from the balcony of the Government buildings, Po dressed smart today, and then greeted the rescuers as they walked in, every single one given a handshake. I knew how Prince Charles felt.

They each received a medal from the Colony's Administrator, an envelope from Po containing free stays at his hotel, and even free cinema tickets.

We attended the reception that evening, a black tie gala and fundraiser, and I got used to people thanking us; all six million of the buggers. The next day we flew up to Beijing with the entire HK unit, a chartered flight, and went straight to a welcome home ceremony that dwarfed the Hong Kong parade. Seemed that the People's Government wanted to show off. Ushered onto a podium with the President himself, we waved at the rescuers as they drove and walked past, a few Hueys flying overhead. I wondered about the jet fighter flypast, not least because I had not seen them used for rescue work. Still, we got into the spirit of it. We helped award medals and thank the rescuers, my Chinese pretty good these days. I now not only had an appreciation for what Prince Charles went through, I felt sorry for the bugger, my hand numb.

The reception that night was typically sombre, a large room for people to mingle with senior rescuers and ask questions, a line of easels displaying photographs of Chinese Rescuers doing heroic deeds. Jimmy gave Chinese TV an interview and praised the Chinese rescuers no end, labelling them as the largest contributors. We spent the night in a modern Beijing hotel, and jumped on a commercial 747 heading to Sidney, Australia, the next day. We faxed Samoa, India and New Zealand to apologise; we were running to a tight schedule.

In Sydney we spent the evening chatting to the Prime Minister and other officials, attending yet another parade the next morning. Hueys flew overhead, and familiar line of white jeeps snaked along. At the reception I found Dunnow with his arm in plaster.

'Did you bend one of our Hueys?' I asked him.

'Naw, mate. Got back, got drunk, fell over.'

I shook my head. 'They don't need to know that.'

'I was photographed falling off a balcony.' He shrugged.

'I think they may forgive you, this time. How was the deployment?'

He turned serious. 'Morning of the tsunami, just at dawn, we were flying along the coast – saw it all. We were over Bandar Ache, and we knew that some people wouldn't leave. It was like

a kid's model, toy houses being swept away. We were picking bodies out of trees three miles inland.'

'At least we got the warning out,' I said with a sigh.

'I landed on a Yank aircraft carrier, bloody huge thing. They refuelled us, even did the windscreen. I had a nose inside the cockpit of an F14. Now that's a bird I'd like to fly.'

I nodded. 'My Augusta is nice. But it's not for sloppy drunken pilots like you!'

The next morning we flew up to Jakarta, giving an interview at the airport before travelling on in government coaches to our hotel, government minders close at hand. We gave a formal TV interview, travelling around to a studio, then attended yet another parade in the morning. At the reception we detailed support we'd be giving the government for the affected region; tents, supplies and doctors on rotation. That evening's gala was non-alcoholic, the food tasty though.

From Jakarta we flew across to Sri Lanka, basically to offer help with cleaning-up and reconstruction in a few areas. The bodyguards were ten deep, a coach laid on for us for the short trip into Colombo. The government were very happy with us, and we were welcomed as honoured guests, signing visitor's books at the Presidential Palace. The reception that evening was modest and sedate, the rich and powerful of Colombo society wanting to rub shoulders with us.

The parade the next day was that of four open-top buses. We were in the first with the government, the local rescuers in the trailing buses. We toured around the city and waved as the people came out and cheered. And it turned out that our two hotels were undamaged by the tsunami. I should have figured that. In a move to "assist" the Sri Lankan economy and recovery, we had people looking for damaged hotels to buy up on the cheap.

RF Kenya had been the last group to be withdrawn, and we had only missed them by two days. That evening, we jumped on a flight to Dubai, and changed for Kenya, arriving in Nairobi around noon, the Kenyan passengers on the flight all greeted, and all excited to be speaking to us. Many snaps were taken.

Approaching the arrivals hall we met two lines of soldiers funnelling us through, the crowds kept back – but waved to; the two honoured sons of Kenya were back. We emerged to a crowd

twenty deep and waved, soon boarding a coach, police cars leading us off with sirens wailing. At the Government Buildings we snuck in the back way, and to a meeting with the full Government Cabinet. They stood and welcomed us, everyone greeting us with huge smiles and handshakes. It took fifteen minutes to even get near a point where we could sit and settle.

‘Is everyone back safe?’ Jimmy asked.

‘All rescuers are accounted for,’ they informed us.

‘Good, good,’ Jimmy said. ‘Now we must talk of matters that are not pleasant.’ The mood changed. ‘I am in touch with the soldiers in Afghanistan. Tomorrow, the Taliban will meet to discuss terms, and what they will do about al-Qa’eda.’

‘Will the Chinese or Russians help our soldiers to leave?’

‘I don’t want them to leave,’ Jimmy informed them.

They puzzled that. ‘No?’

‘No, Mister President.’ He took a moment. ‘The Somalis did nothing to attract the attention of the al-Qa’eda fighters. Al-Qa’eda came and set off bombs in Somalia because they wanted to destabilise the country. If Somalia goes back to how it was they can create bases in the north, and launch attacks on Westerners, on tourist coaches and trains. If al-Qa’eda is allowed to succeed, they will bring Somalia to its knees. And what then for your border with Somali? What then will you do when the refugees come south seeking shelter? What will you do when Arab gunmen arrive on the border, and when they walk the streets of our beloved Nairobi?’

‘Gentlemen, we can fight al-Qa’eda in their back garden, or we can fight them here, in your gardens, where your children play. The fight in Somali was a tough one, but now your neighbour to the north is free and strong, and not a threat to you. They live and work as brothers in arms. Who here wishes to see them fall?’

He let them think about it. And what choice did they have.

‘No one wishes our soldiers home safe ... more than I do,’ Jimmy continued. ‘They are all like sons to me. But they signed up to fight for their country, to defend that country in its time of need. Now is that time of need. Our soldiers would rather fight and die in the cold of Afghanistan, then fight here – in the streets of Nairobi. A message has to be sent, a strong message. That

message must be a lesson, a very costly lesson: if we are attacked ... we will strike back.

‘Mister President, there are two hundred Kenyans and three hundred Somalis in Afghanistan, already twenty-five dead and ten wounded. But they have killed more than three thousand, wounding another three thousand. They have denied the Taliban the use of their airport, a great loss of face. They have food and supplies, and I have arranged that the enemies of the al-Qa’eda - the Northern Alliance - re-supply our soldiers. They can hold out a long time yet. And every day that they do, they send a message. What you must ask yourselves, gentlemen, is how many soldiers you will sacrifice to keep the streets of Nairobi free of bombs going off? I love the men of the Rifles like sons. And I will sacrifice all of them, to save Kenya.’

It was heady stuff, the Kenyans a bit shocked, but also certain that a destabilized Somali was a very bad thing for them. No one wanted to go backwards. We left them abruptly, to discuss the turn of events, and would meet the next day for the parade. At the hotel I found a woman in my room.

‘Didn’t I used to have a husband?’ Helen asked.

‘Jimmy lied, people with stems do get jet lagged.’ I hugged and kissed Helen, then flopped onto the bed. Shelly ran and jumped onto me. ‘God, when did you get so big?’

‘While you were away,’ Helen quipped as she lay down next to me.

‘My back is killing me,’ I said. ‘Damn plane seats. I’ve seen enough planes for a while.’

‘Did it all go OK?’

‘Yeah, as expected. We shook hands with every fucker in Rescue Force, all ten million of them. You know, the Chinese had jet fighters flying past.’

‘Making a spectacle of it.’

‘Can we swim?’ Shelly asked.

‘It’s only a small pool up on the roof. But I could do with cool swim.’

We grabbed our stuff and headed up, finding Jimmy sat with Rudd and Cosy. With Helen sunning herself, I cooled off in the water, Shelly collecting coins from the bottom of the pool. Towelled dry, I sat with the gang and made a seat wet, a cold beer appreciated. Seems that the President had gone on air and

rallied everyone to back the soldiers in Afghanistan, and to pray for them.

“We can fight the terrorists in their mountain bases, or we can wait till they walk down the streets of Nairobi,” the President had said. It sounded familiar.

Round two

On the second day of the agreed ceasefire, Ngomo stood on the roof and surveyed his battleground. Somehow, he did not see the Taliban letting them leave, or removing al-Qa’eda. He was certain that Mister Jimmy Silo in England could get planes for them, but Ngomo had a mission: to inflict casualties, and to make the Taliban sorry for hosting al-Qa’eda. And in his conversation today with Mister Silo, they had discussed many things, none of which involved pulling out. He’d also had a call from the President, a rousing call to fight on, something about fighting them here, or in Nairobi, and that all Africa was behind them.

As he stood there, stamping his feet in the cold wind, he could see jeeps coming out with white flags to collect the dead. He ordered his men to fire warning shots, and to move them back. His adjutant questioned that.

‘If the attackers see the bodies, and body parts, they will think twice. Also, if they wish to crawl on their bellies to us...’

‘The place needs a good wash down. It probably stinks over there.’

Ngomo had an idea. Earlier, the men had found a well, in it fast flowing water diverted from the stream. He now ordered a near empty fuel truck to have its final drops of fuel pumped to a second truck. It was then powered up and revved, its pumps used to suck up a tank full of water. With the truck blocking the gate removed, the fuel tanker trundle out, soon spraying water along the road. By time it had finished, a very wet and muddy stretch had been created.

‘It’s not enough,’ he told his adjutant.

That evening his men went out with digging tools, a large amount of explosives. For several hours they dug down next to what was left of the concrete foundations of the damaged bridge over the stream. A hole some six feet deep was carefully excavated. The explosives were placed at the bottom, plastic on top, then earth, the hole gently filled in.

The next morning at dawn, Ngomo stood on the roof with his detonator. He selected a four-digit number, and pressed the red button. A volcanic eruption of mud flew up, the blast heard two seconds later. He selected a second number and pressed the red button, the opposite set of foundations blasting skywards. But, more importantly, most of the concrete and mud ended up in the fast flowing stream. The bridge was gone, stopping people from crossing on foot, but that was not his aim. As he studied the aftermath through his binoculars he could see the water backing up quickly, soon spilling over the banks and spreading out. A thin film of water, little more than an inch deep, spread rapidly outwards, soon creating a damp patch the size of a football field on either side of the stream.

Through a culvert under the road he could now see brown water flowing out. It created a half-circle of moist ground that grew till its diameter topped two hundred yards. Across the road, Ngomo estimated that six football pitches were waterlogged. And in this weather, they would stay waterlogged for many days.

Ngomo's adjutant commented, 'If they want to approach, they will get muddy feet. And no one will be crawling on their bellies - that water is freezing. They will die.'

'We have denied them this area,' Ngomo happily stated. 'So, we must look to other areas, and other areas of attack.'

On the third day of ceasefire, the Taliban leaders left before dawn for a secret meeting in the east with the tribal leaders. But, more importantly, they would meet with the Arab fighters and the tribal leaders from across the border. They journeyed all day to a town north of Jalalabad. Meeting them were six thousand fighters, a mixture of Arabs and Pakistani Taliban fighters. They were none too keen on the weather this time of year, but the road south from Jalalabad was clear, and they would not be fighting in the mountains.

The size of the force meeting the leaders forced their hands. Trying to send them back off home would have been difficult. An hour was spent greeting old friends, and enquiring after absent friends, before everyone settled down and the Shura got underway. The opening speakers had just started to describe the situation when a shout rang out. The room they were in disintegrated a second later.

Mickey and Yuri banked away, the trailing three Mi24s roaring in and firing rockets at the compound, a hail of fire streaking up towards them. In little more than four minutes the Taliban leadership had been killed, their deputies and their guests. More than three hundred perished. The Mi24s returned to base, and reported to Ngomo only. Job done. They had not attacked the fighters on the ground; they wanted them tempted out to the airfield.

Ngomo put his hands on his hips and peered up at a clear sky, the day crisp and cold. 'Fire five rockets at the town. I'm breaking the ceasefire.'

Sixty miles to the east, young hotheads were rallying the fighters, the leadership all now dead. They mounted up and headed west as expected, all six thousand of them. With them they brought RPGs, short-range rockets, mortars and ten DHSK with plenty of ammunition. Two columns, both more than a mile long, headed towards Kandahar; one taking a northerly route, the other coming up from the south.

Ngomo warned his men that they would be attacked the next day. They were ready. They were dug in, warm and well fed. They had also been planning ahead; approaches had been mined.

Late that evening a DHSK opened up on them, unseen in the distance. Besides that, they saw no movement close by. At dawn, Ngomo was stood ready on the roof with his officers, the men focusing the binoculars on what looked like thousands of vehicles in the distance.

'They are marshalling were we expected them to,' Ngomo's adjutant suggested.

'They have little choice, given the terrain. And they are not army generals,' Ngomo pointed out. Lowering his binoculars he could see that large areas were still waterlogged. He turned to the west, raised his detonator control, punched in a number and pressed the red button. The bridge supports, of a bridge already

damaged, blew at the same time. Mud flew high into the air, the blast registering with them a second later. The concrete foundations fell into the stream, the water soon backing up and spilling over the banks. Soon a glistening reflection of the sky was created, the water spreading out rapidly. Within fifteen minutes a wafer thin lake the size of four football pitches was created, a shimmer blue lake whose depth was less than the image suggested.

A DHSK opened up, the men ducking into a sandbag position, well prepared ahead of time. Sitting on sandbag seats, they peered through slits with their binoculars. And they waited.

Half an hour later, Ngomo said, 'I think they are all grouped.'

'Yes, sir. They are stood around making plans.'

He eased out of the sandbag pillbox and straightened, thinking what a beautiful day it was for a second. He tapped in a four-digit number, looked to the west, and pressed the red button.

The group to the west had occupied an obvious position, an empty compound at about twelve hundred yards due west. Hundreds were already inside, forty jeeps around it, some men moving out as if to start a patrol. The C4 explosives placed in twelve positions blew, the anti-tank mines they were next to detonating. The compound disappeared, engulfed in smoke and mud. Ngomo did not hear the blast, he felt it, a slight wobble on his feet. When the smoke cleared, no movement was seen.

Ngomo turned south. A mile away, on the north-south main road, a large convoy had pulled off the road and to the only place they could park and form up, a clear area behind a small compound and a row of trees. The officers observed the group as the group clambered up onto their jeeps to see what had exploded. Ngomo punched in a number and sent the signal.

The line of explosions reminded him of the blasting that he saw at mines in the Congo. This blast pattern was, however, circular. The pressure wave wobbled him again, and he was certain that everyone in Afghanistan heard that one. Lifting his binoculars, he could see no movement, but more vehicles approaching from the south. He turned northeast. Across the blue lake that he had created a day before he could see a gathering of jeeps behind a large compound, at least a hundred in his estimation, perhaps more. He pushed the detonator switch and

watched an angry brown monster raise up, then fall back. The cloud created spread out four hundred yards in all directions.

Turning due north, he could see a snarl up at the road junction. He radioed down to the rocket crew and they fired a single rocket on the pre-planned bearing. It landed short and left. Adjustments were made, a second fired. That one hit a jeep, sending it into the air, two others destroyed. He ordered twenty-five fired, the rockets screaming outwards and pummelling the crossroads. They adjusted their aim a degree to the right and fired five additional rockets. Three degrees to the left they fired another salvo of five rockets, Ngomo happy with the mayhem caused. For good measure, they lobbed five at the town.

Two miles northeast, a convoy crawled around a bend and halted on a rise. They surveyed the damage with interest, then hastily set-up their own Russian rocket systems, three of them. A lorry pulled up, rockets soon being unloaded and stacked by a hundred men. Four hundred yards from the rise, two Somalis lay unseen at the end of a wire. They glanced at each other, pulled faces, and pressed the detonator button. A large quantity of C4 blew, sending the rockets, the lorries and jeeps, plus their operators, through the air.

Ngomo saw the smoke rise. He turned to the Mi24s and waved them up. Mickey lifted up, nosed down and stalked forwards. Banking right, he had the south road in his sights in seconds, a line of white Toyotas making for an easy target. He opened up and strafed the road at length, making two passes. Across the stream, he spotted a mounted DSHK and blasted away at it leaving the Toyota on fire. Turning east on the main highway he found trade straight away, many passes made as his colleagues found suitable targets in every quadrant. They could hardly fire without hitting a suitable target. Mickey returned and re-armed, ten men keenly waiting with their arms full, Mickey feeling like a Formula One driver. With a “thumbs up” from the men he lifted off again, his colleagues landing to be re-armed in turn.

He flew east along the highway, finding vehicles stretched along it, Yuri taking his time and not wanting to waste ammunition. The soft-skinned jeeps were shredded as they fled.

Four hours later, all of the Mi24 ammunition was gone, Mickey and Yuri on the ground, Mickey putting a cigarette on his bottom lip as he approached Ngomo.

‘Report,’ Ngomo ordered.

‘Got to be five thousand dead out there and a thousand jeeps damaged. No one’s coming to dinner tonight, it’s just us again.’

‘Good work, get some rest, some warm food.’

Aircraft engines could be heard. As part of their promised assistance in negotiations, the Pakistanis sent over a plane to observe. The plane, a small An24, had Pakistani officers with video cameras and still cameras, binoculars and human eyeballs. With Ngomo and his officers wondering who it was, the plane flew low and slow over the area several times, leaving to the east. The massacre had just been witnessed. Not only that, it had been filmed and photographed at length.

In Nairobi, sat at the bar, Jimmy remarked, ‘You don’t fight a terrorist war on their terms, you play to their weaknesses, their arrogance, and use their anger against them. In Somali we stayed out of the towns and used our advantage. In Afghanistan, we used the advantage of distance, and some careful forethought. They came out to us. History teaches ... for those who are paying attention.’

The Nairobi Rescue Force parade was huge, a jeep convoy a mile long and twenty Hueys overhead. The Rifles marched as well, to lend their support, and because it was an excuse to show some national pride.

We met the gang at the reception, catching up on stories of near misses and mishaps, and funny tales. Somehow, Ratchet managed to get a snake in his cockpit and nearly crashed. The US Navy thought he had lost control and would crash – into them. He slammed it down on to the deck and jumped out, trying to explain to the bewildered deck controllers it was a snake. The Marines were called, and used a fire extinguisher to freeze the damn thing, chucking it over the side. Ratchet came in for a little ribbing, a snake painted onto his bird overnight by the US Navy.

The next day, as we relaxed at the hotel, reports came in of the massacre at Kandahar, pictures on the wire. Jimmy called Rudd and made sure every news service in Africa was updated.

He then called the house and asked the “M” Group to run the story – everywhere. A special edition of the African Times was organised, an extra five pages on just this story. The propaganda machine was given a good kick.

Arriving in Dar es Salaam, the early edition was out. We met with the Tanzanian Government and discussed many things, mostly oil and business, then got around to the parade. During a break someone brought in the paper and we scanned the pages, many aerial photographs displayed of burnt out jeeps, bodies strewn around. The paper detailed four hundred members of the Somali and Kenyan Rifles at the airfield, ten thousand dead, and that number again wounded. It was an exaggeration, but not by much. Jimmy then sent a fax to the UN Security Council members and pleaded for an intervention to stop the bloodshed. They met that afternoon in emergency session, Afghanistan in the news right around the world.

The Tanzanian parade was modest, and we flew over to Forward Base that evening, spending the next day going through corporation business. We could have done with a week. Meanwhile, UN staff drove over from Pakistan and found a scene of carnage of biblical proportions, a health risk declared due to the rotting bodies. They weaved around the burnt out jeeps and down the airfield access road and into the base, welcomed with a hot meal and cup of tea from the well-stocked defenders. And Ngomo, he told them he had come for a year, so they’ll stay for a year. Or until al-Qa’eda agrees to stay out of Somalia. The UN staff were thanked for the visit, and sent on their way.

We held another parade in Kinshasa, a bit sick of the sight of Rescue Force by this time. Arriving back in the UK, I was welcomed by a pleasantly familiar chill wind. I filled my lungs. Back at the house we were warned we had two days rest only, a few rude words uttered. After lunch, I fell asleep on the sofa, the first time that I could ever remember doing that since being injected.

And in Kandahar, Ngomo fired a rocket at the town, just to make a point.

That evening he received re-supply, plenty more ammunition for the Mi24s, and a message from England. Before dawn the Mi24s lifted off and flew towards the border with Pakistan,

blowing bridges. Where they spotted narrow tarmac roads they blew holes into the road. Returning to the Kandahar region they followed all roads that led to the town and blew small bridges over culverts. The town was cut off. Refuelled, they set off to blow holes into the main road to Peshawar in Pakistan, a vital support route. It would be a tough winter in the Pushtan tribal regions.

The town's folk had already fled in droves, but now the remainder would have to walk out. With no re-supply of food or fuel, life in the town was becoming hell itself.

Stood on the roof, and thinking of the town's folk, Ngomo again considered the steam. His men had reported an offshoot and several pipes upstream. It seemed that the town water came from the pipes. That night he ordered the pipes blown, and at dawn he lifted his detonator and blew rubble into the path of the steam just below the offshoot, a wake-up call for the local population. Mickey flew over the town an hour later and reported pools of water in several places, a handful of streets flooded. The stream's barrier was soon worn-down by the force of the water, and the water level in the offshoot dropped, the town now without piped water. Ngomo fired a rocket and went down for a cup of tea. Walking around the front of the terminal he could now see some thirty Totoyas, recovered by the men at night. Besides the bullet holes and smashed windscreens, they worked.

His adjutant pointed at them. 'One careful owner.'

Back at the house, in the basement, I was looking at plans that made my stomach turn. 'It's mass murder I whispered.'

'Some things come with a price, some come with a high price, and some ... if allowed to, cost the earth.'

Ngomo sent the Mi24s up the next day, but this time to pound positions in the north, the positions that the Northern Alliance were feeding to us through various middlemen.

With the weather poor, the nights freezing, and snow on the ground in the high valleys, most of the fighters were tucked up warm in compounds, occasional sniper fire exchanged. When the weather was good, and the sun warming up the afternoons, the two sides might come out to exchange fire. Besides that, the

front lines were as static as trenches in the First World War. As in that war, attrition was a factor.

Warm and cosy in their compounds, the fighters sat about the fire, wondering what the distant rumble was. The Mi24s flew in, fired on the exact compounds they were required to hit, and flew back out again. Dozens of compounds were hit. The Northern Alliance then made half-hearted attacks which, given the retreat of the wounded Taliban, often just meant moving their bed roll from their compound to that vacated by their enemy. Blood could be cleaned up, holes patched, and the front was advanced a few hundred yards.

Casualties were high, and all on the Taliban side.

Party Season

Having travelled the world and pressed the flesh, and received and read a million faxes and telegrams, it was time to thank the UK rescuers and get ready for Paris. We organised a party at a large hotel in Edinburgh and flew up. Mackey, many of his instructors, and some three hundred men and women who had deployed were greeted and thanked, a free meal and a free bar. Groups were photographed, followed by everyone being photographed by a guy up a ladder.

Helen and I worked the room, and listened to the tales of damage done and heroic rescues, meeting the men's wives and girlfriends. Jimmy made a long speech and thanked everyone, a few mentions of particularly heroic rescues. By time we had finished everyone had met us and been thanked, many mentioning the personal calls they received from us, Katie Joe or other celebs. Some were apologetic for not wanting to deploy at the first call.

Back from Scotland, we planned a bash at the London club, Mackey and a few others attending that as well. On the Thursday we drove up to the club and booked in, running a function that night for NGOs, the UN, and those that had helped out with equipment or particular problems, the Prime Minister putting in an appearance and thanking the various groups.

The next day, the Friday, most all of the UK Rescue Force regulars and Supplementals turned up, along with the RAF personnel who had helped out, a contingent of US Airman from RAF Fairfield, Gloucester, plus the Ambassadors of the nations contributing and involved. The Prime Minister again put in an appearance, leaving me wondering if it was an election year. In the Red Room, large displays on easels detailed much of the work done by our teams. There was also a section of photographs taken by the rescuers themselves, now blown up and covering a wall to a height of some six feet.

I greeted Bob Davies and the HQ staff, all of the national representatives and many familiar faces. Thanking the RF teams, I was genuinely interested in what they had got up to. More funny stories emerged, and I was jealous at being left out, longing for dangerous flights in Hueys. I didn't tell Helen that when she enquired, I would not have dared.

War without end

Two weeks after the ceasefire had broken down, deliberately so, the Taliban and al-Qa'eda rallied as many fighters as they could, many fighters travelling down from the mountainous east, a difficult journey in the winter. With Keely's NSA satellite taking snaps of a particular junction, we had the advance warning. The Mi24s took off fully fuelled and fully armed, but flew to an isolated area and landed. And sat waiting. At Kandahhar, the poor beleaguered residents reported the helicopters flown off to the north, and not seen for a day or so.

The Mi24 was not just a gunship; it offered a cabin in the back where ten soldiers could be squeezed in. When Mickey had flown off he carried six soldiers in each helicopter, and enough mines to seriously worry him. If he crashed, it would be over quickly, the hole left behind a big one. Those soldiers were now moving under cover of darkness towards a distant road. They walked all night as it snowed, and hid during the day. The next evening they dug into the hard frozen soil and planted mines,

anti-tank and anti-personnel. Having planted the seeds of death and destruction, the men moved to a high ridge and dug in. They found a small cave and got a fire going, soon warming up as they waited.

The next day they observed lone jeeps driving along the road, but nothing worth firing at. But as the light faded, and the snow began, a massive column was spotted moving west. The leader of that column was not stupid, he was travelling at night, and then only when the weather was terrible. He also figured that to fly in this weather would have been crazy. He'd not met Mickey. The soldiers above the pass radioed the movement back to Mickey and the Mi24s wound up. Mickey and Yuri donned the night goggles provide by US military and their world turned a grey-green colour. Knowing exactly where they were going was an added benefit.

Little more than twenty minutes later the dull resonance of the approaching helicopters could be heard by the soldiers above the pass. They switched on red and green lights and placed them at such an angle that only the helicopters could see them. Approaching from the west, Mickey could see the lights, the headlights of the jeeps now distinct.

With the front of the convoy passing the mines, the soldiers threw a switch and blew a large hole in the road, taking out the first three jeeps. Trailing jeeps turned off the road and across the mines, soon splintering and rolling away. The convoy halted, men jumping down, but blinded by the driving snow. Then their predicament got worse; Mickey opened up. The Mi24s strafed the convoy front on, and kept going, following the convoy as it snaked back almost a mile. At the tail end of the grid locked convoy Mickey turned and made a second pass with his small squadron, as much as they dare in this weather. He set a compass bearing and flew off, knowing exactly the lay of the land on that heading. When his GPS system told him he was where he was supposed to be he radioed this buddies and set down, invisible in the storm.

At the convoy, jeeps and fighters intermittently set off mines. The road was blocked to the front, little room to turn around or back up, communication poor with the tail end of the convoy. From high above, the soldiers opened fire with their sniper rifles and thermal sights; single, well-aimed shots. The storm was so

bad that the men in the pass could hardly tell where the firing was coming from. Seeking shelter, they moved towards the rocks and set-off anti-personnel mines.

Dawn brought a clear and crisp day. The twenty-four soldiers got themselves ready, switched to optical sights and zeroed their weapons on live targets. Fire was returned, but the soldiers were well hidden, cloth over their muzzels to help hide the flashes. Inside an hour, close to a hundred fighters had been hit, vehicles abandoned and men scattering down the valley, some climbing up towards their unseen enemy. Those brave fighters climbing up tripped mines and claymores, being on the receiving end of grenades tossed down. One fighter got to within a few feet of a soldier, shot in the face with a pistol at less than ten feet.

Mickey had flown off at dawn, the weather better. After a very quick re-fuel and re-arm he lifted off again, soon back to the trapped convoy and strafing at length up and down the road. Several DSHK opened up, but were picked off, nowhere for them to hide. The remaining fighters scattered into the rocks, their vehicles destroyed or burning.

At 2pm, Mickey returned a third time and strafed the convoy, and the nearby rocks hiding the men. He then returned to the same spot that he had occupied the night before, and lit a cigarette. As dusk fell, the soldiers packed up and climbed down, sniper rifles slung, AK47s lifted. They crept through the charred Toyotas and dead fighters without incident, and adopted a reverse course, back towards Yuri. They reached him just before dawn and were back in time for breakfast.

‘They’ll have a long walk in the cold,’ Mickey informed Ngomo.

‘Good work,’ Ngomo commended before lobbing a rocket at the town. He sat in his office and studied the map. An hour before dark he called in his officers. It was time to make life for those people left in the town unbearable.

After dark, a hundred men crept quietly out across frozen ground and ice. They made it to the makeshift ladder bridge, but had brought their own. The first men across secured the area, the main body following. All across, they split into three groups and headed off in different directions. Approaching the edges of the town, they used their noses to decide which huts and compounds were in use. Grenades went over walls. When men broke out of

the compounds they were cut down. And that pattern continued into the town, cold and hungry townsfolk hearing the firing and fleeing north. Within an hour the soldiers were at the main road and tucked into walls. Passing vehicles were shot up till the roads were blocked, bodies lying in the streets.

Halting at the south side of the road, the soldiers waited in the shadows as fighters to the north rallied. Those fighters hid behind familiar walls and took up positions, exchanging fire with the soldiers for some two hours. That gave the soldiers that the fighters had not seen time to move around behind and spread out. That force, the main force, now moved south. They reached the fighter's positions, killing quietly with their silencers, and now picked off the fighters from behind. By dawn, the soldiers had no fighters left to shoot at, and set fire to the civic buildings, and other buildings that appeared to have a function other than a dwelling. They pulled back in the dawn's grey light and regrouped at the stream, teams counted off and checked as they crossed the water, little regard for fighters. Walking back into the airfield casually, they got the stoves on.

The Pakistani Red Cross was now putting a figure of twenty-five to thirty thousand on casualties, and they may have been right, the final tally would never be known. That evening Ngomo got a call: expect planes to take you out in two hours, get ready. He rallied the men and got them lined up ready for a quick departure. The rocket launcher and the mortars were moved to the far side of the airfield and wired to blow. Excess ammunition could not be destroyed, and so was left. Jimmy had told him not to wire the terminal with booby traps because the UN would land. Ngomo left his map of the area, the mines that they had laid clearly marked.

The first An12 landed from Kabul, mercenary pilots at the controls, and taxied around. With its ramp lowered a hundred soldiers ran on, the plane soon taking off again and heading north. With the next four planes loaded and dispatched, Ngomo and his officers approached the final aircraft, certain that no fighters were about to overrun the airfield. With his men on board, Ngomo pressed the red button on his detonator control and blew the abandoned weapons. Tossing the device over his shoulder, a look back at the terminal, he boarded the plane, the

ramp lifting. The Mi24s lifted off and returned to Kabul, where they would be handed to the Northern Alliance.

A long two days later the soldiers landed in Mogadishu, the whole city turning out for their return. The media filmed the arrival, and counted off the soldiers, four hundred and seventy returning. Abdi and the Somali President welcomed back the soldiers, but kept the fanfare down as Jimmy had requested.

A day later, in the officer's mess at Scorpion base, Ngomo opened his paperback, now almost to the end of the Napoleonic Wars. When Jimmy slipped in next to him, Ngomo lowered the book. 'Hello, sir,' Ngomo said with a smile.

'Did you punch them on the nose, my friend?'

'We did, sir. They will not forget.'

'And the world has more respect for what you can do. And ... fear. Unfortunately, the Somali Rifles are now seen as blood thirsty killers.'

'If I said otherwise, I would be a liar, sir.'

'I've sent five thousand Rifles to the north, to patrol the border. Al-Qa'eda will want its revenge some day soon.'

'They will not learn, sir?'

'No, my friend, they will not learn. You cannot educate the snake, you must kill it; over and over. But the Taliban will not wish to host al-Qa'eda after this, and few other countries will. When they leave Afghanistan they will travel to Yemen, and we will be ready.'

'Yemen will be easy to reach, sir.'

'Indeed it will.' Jimmy handed over a wad of dollars. 'Some day, when you no longer wish to be a soldier, but a politician, you will have my backing, and my money behind you.'

'That is good to know, sir. And will I also get ... tactical and timely information?'

'You certainly will.'

Paris

Jimmy arrived back from Africa in time for Paris, but only just. A quick wash and a bite to eat, and we were back out of the door.

We drove to Cardiff airport and boarded a flight to the French capital, a quick flight. No sooner had we climbed than we began our descent into Paris. They let us off first, the security tight, and whisked us to the same hotel, the same floors pre-booked and now stuffed full of RF staff. We bumped into Mac and Coup in the corridor.

‘What’s Mawlini like?’ I asked.

‘Quiet. Those that aint here is on holiday,’ Mac replied. ‘Should ‘av seen it when we deployed - two of us in the bar. We went and had a drink in the UN hotel for some company!’

‘I think we’ve booked every spare hotel room in Paris,’ I said. ‘Had to limit the Chinese to a hundred people.’

‘They say the Frogs is going to lay on a band and some soldiers,’ Mac cautioned.

‘It all adds to the spectacle. In China they had fighter jets overhead. Anyway, easy on the pop tonight.’

‘Yes, mum.’

In our room, we changed the baby and settled down, Shelly opening all of the cabinet draws and examining what she found. The hotel had kindly laid on a cot for Lucy and a small bed for Shelly. But lately, Shelly was often found in our bed, our eldest going through a period of nightmares. When the dreams got bad Jimmy would come over and sit on the sofa, Shelly asleep on him, and he would read a paperback all night. There was almost nothing he wouldn’t do for Shelly, Helen and I often wondering about our daughter’s future role in things. Considering the amount of time he afforded her, it must be something important.

We had paid for many of the teams to fly over to Paris, and paid their hotel rooms, and called all senior staff together that evening for a meal and a chat. And to check on the French plans for the parade, just in case. Those plans had been listed for us and seemed very thorough. Fortunately, the parade did not start till 11am, so the drunken arseholes we called Rescue Force Kenya would be up and smelling the coffee.

At dawn I peered out of the window and noted a clear sky. It should be a good day. Jimmy emphasised to me that the parade was important, a milestone, and that from here on things would change gear. He did not elaborate on that; gear up or gear down. We had an early coffee together, which finished with me still questioning what we had done in Afghanistan.

A car came for us at 9.30, and the three of us travelled around to the Presidential Palace for a coffee and a chat, a Rescue Force chat and not an “M” Group chat. We were then led down long corridors to a wide and high ceiling room that overlooked where the parade would pass. We’d be playing like royalty and waving off the balcony before meeting the rescuers later, Jimmy explaining that the TV spectacle was the main aim.

What we couldn’t glimpse from the balcony was being relayed to us on TV screens, and the crowds looked twenty deep, many with their own national flags. I saw an Australian flag on a lamppost, Kenyan and Tanzanian flags. Paris hosted many Africa and foreign students, and most of them now seemed to be on the streets, cheering for their national teams as if this was the Olympics.

Turning, I noticed Hardon Chase and Art Johnson walking in, behind them our own Prime Minister. I shook hands with the President and ex-President. ‘Didn’t sit on Air Force One together, did you?’

‘We did,’ Art Johnson confirmed. ‘I showed him around, his first time aboard.’

‘Family with you?’ Chase asked me.

‘Kids at the hotel, Helen on the balcony.’

‘All the politicians are in the room opposite,’ Chase informed me. ‘Like the UN in there.’

‘I best go network then.’ I eased past them and shook our Prime Minister’s hand, a brief smile before I greeted the Australian and New Zealand Premiers, thanking them for their contribution. The dusky gentlemen in the corner appeared Indian and Sri Lankan, vaguely familiar, but I recognised the Chinese Premier and practised my short vowels. That was followed by breaking into Russian, dabbling in German, then switching back to English for the Africans, the leaders of many nations here, even President Kimballa Jnr of the DRC.

‘You court the powerful of the world,’ Kimballa noted.

‘They need us to make themselves look good,’ I whispered, making him smile.

‘The road from Kinshasa is finished,’ he informed me. ‘We have buses now from Kinshasa to Goma.’

‘Not a pleasant trip.’

‘No, three days,’ Kimballa reported.

‘We should build small hotels on the route.’

‘You already have.’

‘Well, there you go. We do things now without even raising the phone.’

I recognised the Cuban flag on a lapel, but I did not recognise the face. Introducing myself, it turned out to be the Cuban Ambassador to France. I thanked him for all his teams, and his doctors in Africa, but he insisted that he was in our debt. Turned out that many South American and Caribbean countries were considering RF units based on the Cuban model, and he introduced me to the Ambassador from the Dominican Republic. I didn’t even know their team had deployed.

With the military band now passing, we moved out onto one of four available balconies, those politicians that wished to be seen waving to the crowds below. I stood next to Jimmy on one side, our own Prime Minister the other, Helen tucked in behind me. The band had passed, soon followed by the start of the RF groups in white, the national leader of each carrying a large flag on a pole. First came France, it was their country after all, followed by the RF teams in the sequence in which they had been created. Mac carried the Kenyan flag, giving the balconies a regal wave as he passed us. Cheeky bugger. After the African teams came Hong Kong, then the UK and China. The Cubans walked proudly past, Israel, Australia and New Zealand – leaving me wonder which was created first.

At the end of the teams came the UN, various NGOs and civilian rescuers that had attended, but an American flag caught my attention. I smiled widely as Hal came into view with the handful of American rescuers in white, plus the pilots, some of whom only flew Cobras. And I’m sure he saw me on the balcony.

‘Did we have any Cobras in Sri Lanka?’ I asked Jimmy, getting back a look.

Following Hal came another American flag, this time airmen, followed by sailors and marines, behind them British and French military teams, mostly navy. Jimmy had them all here, making a point, and milking the opportunity for everything it was worth.

After the parade had passed we all walked downstairs to meet the teams in the courtyard, thirty minutes spent wandering around and greeting people. Most of the politicians greeted their

own teams, all conveniently caught by the wall of TV cameras. Both the politicians, and us, drifted towards the long line of cameras and answered questions.

‘Paul, no more crazy helicopter stunts?’ a man asked, Helen at my side.

‘I need written permission these days.’

‘Are more countries signing up to Rescue Force?’

‘Yes, a few I think.’

‘Thirty-six,’ Helen helped me with.

After a formal state lunch, the “M” Group countries met for a meeting upstairs, the French very organised, and seemingly very pleased to have the honour to host the meetings.

With everyone settling, Jimmy began. ‘Ladies and gentlemen - and politicians, welcome to this “M” Group meeting. But first, let me thank all those who took part in the deployment to the Far East. We worked in concert, and we achieved a lot. Lives were saved *and* political image was greatly enhanced. On that note, there will be no major deployments for a while, teams can relax and then rebuild.

‘OK, Afghanistan: the main reason for this meeting. To recap, if no intervention had been made, either previously or in the latest military adventure, then al-Qa’eda and other Arab fighters would have collected in Afghanistan, sitting about the camp fire of an evening thinking of ways to attack the West.’

He pointed at Ben Ares, now the opposition leader in Israel. ‘And others. They would have also destabilized Pakistan. As a result of supplying the Northern Alliance with weapons – for which we all thank the Chinese – the Taliban have been kept in check. And this recent military adventure has done more than just keep them in check, it has knocked them back ten years or so. Many of their leaders are dead, their instructors and their best fighters. They have suffered around twenty-five thousand wounded or dead, a fact that will not be soon forgotten. And it was done with Muslim African soldiers, so no one can blame the West. Had our new President here, Hardon Chase, invaded, he would have lost a lot of soldiers in a campaign that would have dragged on fifteen years. And such an American invasion would have helped to unite Islamic fighters against the West.

‘In addition to those fighters killed in Afghanistan, many bridges and roads were damaged or blown, making food and fuel

supplies hard to move around during a cold winter. The suffering for the Taliban has not ended; it will be a very long and hard winter for them, many more will die.'

'Civilians?' the French President asked.

Jimmy took a moment. 'The Taliban allowed al-Qa'eda into their country, they provided them a base.' He wagged a finger. 'And they knew what al-Qa'eda was doing around the world. Some things come with a price, some a terrible price. If the Taliban had not been trimmed back, then that region would have gone on to produce the greatest threat to this planet in the future. That threat was not dealt with by American boots on the ground, but by the Northern Alliance, the Somalis – and we even managed to get the Iranians some blame. No one will be attacking the West in revenge.'

'Will al-Qa'eda attack Somalia?' the British Prime Minister asked.

'I'm counting on it. They'll move some of their bases to Yemen, and they will try and attack Somalia – who are making ready as we speak. I've deployed five thousand Rifles to the north of Somalia, and their purpose is to kill as many gunmen as they can. They are ... acting as a magnet to the fighters. And, whilst those fighters are busy in Somalia, they're not in London or New York.'

'The Chinese People thank and commend Mister Silo for such an effective strategy, brilliant in timing and audacity.'

Jimmy bowed his head.

Hardon Chase said, 'Our military is jealous as hell. Five hundred soldiers against ten or twenty times that much. Remarkable. But let me ask a question: if *we* had sent the soldiers, would they have got the timely intel' in the same manner?'

'A hard question to ask, since I would have done whatever I could to prevent you going in – for your own good. But, if you did embark on such an adventure I would have to weigh up the options. It would have been like a friend getting drunk and causing a fight. Do you help or not? I would hope that we never get into that situation, since forethought is plentiful around here.'

'Will al-Qa'eda re-group in Afghanistan?' Chase asked.

'Yes, and a few years from now I'll drop a few Somalis in to send another message. You see, al-Qa'eda is an idea, not a

person, nor place in time. It is the idea that the Muslims are pushed around and will fight back. In reality, the Muslims are oppressed by their own governments, yet some wish to strike back at the west for its support of Israel, and for helping to prop-up dictatorships – like the Saudis.'

'We get a lot of questions from the Saudis ... about you,' the British Prime Minister put in.

'Us as well,' Chase added. 'Perhaps you should talk to them.'

'The Saudis are far more dangerous than you realise, and they'll be a serious problem in the future. They'll fund terrorist groups that attack the oil interests of other countries, such as Tanzania. And they're currently funding terror groups in Iraq, because they don't wish to see Iraqi oil reach its full potential. They'll also go a long way to pressuring the West to keep up sanctions against Iran – again to reduce oil output. I will, soon enough, go head to head with them. Before 2025 they'll go to great lengths to try and kill me.'

The leaders glanced at each other.

Jimmy added, 'They'll lose revenue as I discover oil fields around the world, and they won't like it one bit. After 2017 they will probably drop the dollar – so don't go doing them any favours – and then in 2025 the Middle East stops producing oil. You need to keep that in mind. Saudi Arabia's days are numbered, and they will not go quietly. The Chinese, heavily involved in Tanzania, will suffer terror attacks in Zanzibar, the terrorists funded by Saudi Arabia. That will start next year.'

Chase said, 'We can't go accusing the Saudis – even if we know they're guilty!'

'No, you can't,' Jimmy agreed. 'You'll just have to pretend. It's like being married and cheating: you know, she knows, but no one says anything for the sake of the kids.'

A few smiles broke out.

'May I ask,' the French President began, 'how many terms Mister Chase will serve?'

Chase raised his eyebrows at the French President. Jimmy said, hiding a grin, 'He was only ever supposed to serve one short - and very painful - term. But, since the good President has agreed to co-operate with me, he may just go on to be the most successful president in history.'

‘Is that not interference in domestic matters?’ the French asked.

‘If it saves the planet, I don’t care. I would not normally get involved in domestic policy or party politics unless it’s necessary. And it’s necessary that America is on board for the next four years - there are some difficult problems ahead.’

‘The Germans keep asking about you,’ the French put in, the British Prime Minister seconding that.

‘I will meet with them soon. Who ... would like the credit for being seen to persuade me?’

The British Prime Minister graciously gestured towards the French, making the Americans smile.

‘Are you as short of money as the media says?’ Ben Ares asked.

‘Yes, but I have a good salary. The hole will fill in quickly enough. OK, next problem. House prices are rising, but are being kept in check to some degree, and China has tightened up its loan policy. May we ask if the Americans are tightening mortgage rules?’

‘It’s on my desk,’ Chase said defensively. ‘I just got into the White House, give me time to check the mail.’

‘You have two years,’ Jimmy informed him. ‘Time enough to open the mail, and avoid a crisis.’ Facing the French team, Jimmy said, ‘In years to come, when certain European countries struggle, large American banks will do a good job of making a lot of money by trashing Portugal, Spain and Greece. Unless steps are taken, those countries will leave the Euro.’

The French were shocked. ‘Leave the Euro? Pah!’

‘Perhaps, all of those here could take steps to rein-in large banks, and their activities. Unless altered, at one future date two large American banks fold ... and take the American economy with them.’ He faced Chase. ‘You should get the CIA to run a scenario: the banks will do more damage than any enemy attack could. And whilst we’re on America, and acknowledging that the incumbent has not been in the hot seat long, not enough is being done to strengthen the Mexican border or to repatriate illegal immigrants. It’s a disaster waiting to happen.’

‘That’s on my desk as well,’ Chase admitted.

I said to Chase, ‘And don’t forget your promise to visit Tanzania. It’ll keep the Saudis happy.’

‘I’ll be visiting Africa,’ Chase told us, making it sound like a threat. ‘Not least because I’d like to see American companies in the Congo.’

‘We’re ready when you are,’ Jimmy told him.

‘Got a new road from Kinshasa,’ I put in. ‘It only takes a week by bus.’

‘We’ll fly direct to Silo International Airport,’ Chase said with a smile.

Jimmy said, ‘I’ll be running direct flights from New York soon. Tourist flights, subsidised a bit.’

‘I will be holidaying there soon,’ the Russian President informed us. ‘Is the volcano quiet?’

‘Yes,’ Jimmy said with a smile. ‘Very quiet now. But I’m afraid you’ll have to put up with some German tourists.’

‘And if African GDP develops? Then what?’ Chase asked.

‘Then you all get to sell goods to African consumers,’ Jimmy explained. ‘After 2020 it’s a very important marketplace for you all.’

‘That on track?’ Chase asked.

‘More than on track, we’ve accelerated our plans. What of Liberia?’

‘Stable enough, from my briefings,’ Chase stated. ‘That small army is coming along as well. Some three thousand young men in it. First oil rig offshore as well.’

‘Well, let’s hope that the oil revenue benefits the people – and makes consumers out of them.’

‘If it doesn’t, then I’m sure I’ll get a nudge from you,’ Chase noted.

‘Indeed you will,’ Jimmy said with a dangerous smile. ‘Now, Guinea, West Africa. As you know, a tinpot dictator has taken over, a former army officer. I would like all of the nations here to try and pass a UN resolution that suggests he is not a legitimate leader, and that the African Union – and its armies – should remove him and hold free and fair elections.’

The various leaders exchanged looks.

Chase said, ‘By *armies* – you mean *your armies*.’

‘Indeed. But more than that, it would set a precedent in Africa, one whereby dictators could be selectively removed.’

‘They’re all crooked!’ Chase quipped. ‘Where would you end?’

‘We can’t stop African leaders from being crooked, but we can remove the worst of them and develop their countries. Remember: oil and consumers.’

I said, ‘Guinea is a small country. If a couple of thousand Rifles turn up they’ll run away!’

Jimmy slowly clapped, a message to the others, who all collectively realised at the same time. They made notes and promised a UN resolution.

Jimmy fielded questions for half an hour more and we wrapped it up, various groups holding meetings about trade and international relations. The RF teams met up in a hotel function room, bigger than the Red Room at our club, and we mingled, drinking and chatting till the small hours.

Back in my hotel I let out a sigh. ‘God, if I never shake anyone’s hand again it’ll be too damn soon.’

‘This is the last function,’ Helen said soothingly.

‘Where’s Shelly?’ I puzzled.

‘In with Jimmy; she had a dream about monsters, so he’s going to send them away for her.’

‘Monsters wouldn’t dare go near Jimmy.’ I took a moment. ‘You think she needs a shrink?’

‘Jimmy said that they’ll last a year or so. I used to get terrible nightmares, used to sleep in the wardrobe. It’s quite normal.’

‘She going to run to him instead of us?’ I said as I undressed.

‘Apparently yes, every time we shout at her. Good cop, bad cop. Anyway, parents can’t be friends; she’s lucky she has him. I was shipped off to boarding school.’ She took a moment. ‘I’ve never forgiven them for that.’

We eased into bed and cuddled up.

‘I was a good little boy, can’t really remember any problems at home.’

‘I left boarding school with *repressed anger* according to a psychiatrist I dated briefly. I was quite violent sometimes.’

‘Yeah, well according to Jimmy I’m not violent enough.’

Helen took a moment. ‘Could you order someone killed?’

‘I doubt it. I can order soldiers to shoot, and shoot back at people – I learnt that at Scorpion Base; I killed hundreds. But to send a spy off to top someone, someone with a bad future... well, I wouldn’t find it easy. And I wouldn’t have sent the Somalis to Afghanistan.’

‘And if Jimmy wasn’t around?’
‘I’d have to face it, and hope I could do it.’
At 5am I knocked quietly on Jimmy’s door. Inside, I found Shelly in the bed, Jimmy dressed and ready. ‘She OK?’ I whispered.
‘I told her a story, she went right off,’ he whispered.
‘Read her a story...?’
‘No, told her one ... about my past.’
‘And that didn’t give her more nightmares?’
He smiled, shaking his head.
‘Thanks anyway,’ I offered, deciding to leave Shelly slumbering in the giant bed.
‘To tell you truth, she helps me sleep.’
‘She does?’ I whispered.
‘When she cuddles up, and I tell her stories, it reminds me of... well, when I had a daughter of my own. A long ... long time ago.’
I knew who he was referring to. Well, I thought I did.

The long voyage

2035. I heard the submarine’s normally quiet manoeuvring planes clank. They were not loud, certainly nothing to worry about, but this damn sub was so quiet most of the time, with its nuclear power plant, that I often forgot we were under way and at a brisk thirty knots. Taking a breath, and issuing a sigh, I grabbed the keyboard, now hoarse from dictating, and deciding to record ‘The Long Voyage’. I had put down the story of Kandahar and felt that some aspects of Jimmy’s psyche needed explaining, so I thought back to Jimmy’s original life, that of 2012, and World War Three.

We were at the new house, not long after moving in, and I had not yet met Helen. Jimmy explained to me, ‘When the war got to the point that the Americans were thinking of re-taking the Gulf oil fields I got a bad feeling about where things were headed.

The economy was already fucked, the UK Government calling up Dad's Army – anyone who had served within the last hundred years – and the rest of us were being recruited into the Reserve Civil Defence Force, or Amateur Stasi as they soon became known.

‘Stasi?’ I queried.

‘Famous East German secret police. One day I was passing idiots in the street, the next they had a uniform and an armband and were telling me to *move along there*. And these idiots were seventeen-year-old ex-druggies with acne and gelled hair. Coming across people I knew was always a problem – had to hold my tongue because they had truncheons and guns, plus about six hours of intense training.

‘Several got caught raping girls at gunpoint, others caught looting, and they were all into the black market. It was all covered up of course; Government didn't want it in the papers. By then the “Paki Wars”, as they had been labelled by the lower elements, were mostly over bar the odd bomb or shooting. Half of the UK's Pakistanis were dead and the other half were in internment camps – along with the Indian population – plus anyone else unfortunate enough to have tan skin.’

‘How many died?’ I probed.

He made a face. ‘They said around a quarter million, mostly London and up north, where the worst of the fighting broke out. Not much trouble around South Wales, except the Somali population; they went off on one after the Americans bombed the hell out of what was left of Somalia. In fairness to the Yanks the Somalis did join The Brotherhood early on and attack south into Kenya.

‘The odd thing about the Pakistani uprising – predictable really – was that they spent a few months attacking Indians, then got bored of that and started attacking the police and army. Our police, poor sods, were trying to keep the two sides apart, just like in Northern Ireland, and ended up becoming the target of both sides.

‘For the first few months the UK economy was shaky, but holding in there. Then the Indians nuked Pakistan, and vice versa, and the world economy dropped like a stone, worse than the 1929 crash by a long way. So just as the tribal in-fighting here was heating up - the economy was shutting down, the

Asians being blamed for it by the tabloids. Outcome was inevitable: white folk without jobs went on the rampage to attack innocent Asians, usually getting the wrong race altogether and killing people from Singapore, or even South America. British skinheads never were that good with geography.' He turned his head and lifted his eyebrows.

'I was ... what ... forty eight, doing OK up to that point, working as freelance computer programmer. But when the economy *and* the security situation both blew up ... well, work dried up. No one was spending money, and half the middle classes were fucking off to Australia; anyone with money and sense was getting the hell out of Dodge City. Can't blame them, I would have done the same if I had had the money at the time. Bars were closing down; nightclubs, restaurants. No one was wasting money and everyone had bottled water and tinned food under the bed, pickaxe handle by the door.'

'Crime went up?' I knowingly asked.

His expression suggested that things were worse than he was describing. 'You barricaded your door at night and kept a knife in your pocket when you went out.'

He took a sip of a cooling tea. 'I sat doing fuck-all for a month, spent a lot of time with my mum. My dad died ... and that was hard; quick cremation and ashes handed back. *Here's your loved one, now fuck off quickly!* My brother lost his job as well at about the same time and my mum nagged me to move in with her. I knew that ... that if I moved in I would never move out again until she was dead. She was always dependant on me – when my father was old – and would be if I moved in.

'I did want to move in though, to save costs and to protect her. She had already suffered two attempted break-ins in a month, barbed wire around the back garden after that.' He sighed. 'And that was the start of the decline, here in the UK. I watched the news all day, sod all else to do, and I could see what was happening here ... and in the war. We'd already suffered months of news about the Asian rioting, people were pretty miserable. So I joined up.'

'Joined up?' I queried. 'What ... the Army?'

He nodded. 'Told them I was good with first aid and got assigned straight away to a Cardiff unit as medic; modest pay, plenty of black market goodies – which caused me a few

sleepless nights – but got me a pistol and rifle. When I went to Newport to visit my mum I made sure that I was in uniform, and armed, and stared hard at the local kids to let them know what would happen if they tried to break into my mum's place again. Even pointed my rifle at a few. Stuff like that ... no one would have given a shit if I had even shot one of them.

'I spent a year with that unit, trying hard not to be sent to the front – which for the Brits was Turkey by then. The Brotherhood took six months to organise themselves amongst the refugee camps around Basra, another six months to go on the rampage. I guess ... I guess you could say that ... *a year and a half* after the war between India and Pakistan we knew that *we* were at war - properly at war. The one good thing the rioting had achieved was to call up and train all the reserves. When Turkey became the front line the UK was already under de-facto martial law and mobilised, more so than other countries in Europe.'

He creased a cheek sarcastically. 'And we had the good old English Channel, which has been protecting us Limeys for hundreds of years.'

'How did that help?' I asked with a confused look.

'Suicide bombers got caught mostly trying to cross the Channel, ending up blowing themselves up amongst French police, poor sods. Calais police lost five hundred men in six months.'

'Why didn't you want to go and fight in Turkey?' I delicately probed. 'You went to Canada to join up.'

'Two very different sets of situations. First, I hated what the UK had become - the people, and just wanted to get away. It's not easy to understand, but think of it this way. I felt, along with everyone else, that the UK was screwed, along with Europe and the rest of the world. It was ... a lack of hope for the future that turned your stomach.'

'First the Pakistan-Indian war, then the rioting, then the economy and martial law, now the Brotherhood rampaging across the Middle East and setting off bombs all over the place, all over Europe and some in the UK. And things that I saw done by the Amateur Stasi ... well, I shot dead two of them without getting caught.'

'Jesus,' I blew out. 'How bad had things got?'

He gave me a look. Turning away he said, ‘Some of the stuff you could ignore, like a body search of teenage girls queuing for food. Other stuff, like rape and murder, you had to grin and bear it. Hardly anyone got prosecuted, not from within our ranks. I always played along, smiled and nodded when the dickheads boasted about what they had done, then dealt with them as best I could later. I was a good shot, a marksman, and I killed a guy on guard duty from five hundred yards. No one would have believed that it had been me since I was such a helpful fucker to everyone. And I was important too; everyone wanted the best medic when they went out on patrol or behind the lines in a riot.

‘So I hated the people ... ended up hating the cause, my own side and what we had become. To go and fight and die in Turkey would be to fight for the very same scumbags I was killing back here. One day ... one day an old guy in my unit said to me *you can't put the egg back together once it's broken*. He was referring to society, here in the UK, but also to the war and the Middle East. Then he blew his own brains out.

‘I knew what he meant ... and I felt the same way. I felt that I was washing the deck of the Titanic as it sank: *what the hell for?* Where was our future? Where was the hope? And everyone hated the politicians here; no one had any hope that they'd fix things. Nightly news was always about a *widening war* and *tougher times ahead*. Shit, they were tough enough already. Suicides were fifty a day in Cardiff. Old people died in their homes and no one noticed for months.

‘You know, I thought about suicide a lot during those times. Life was cheap, and no one would have noticed my absence except for my mum. She spent her days sobbing, and hoping that she'd die quietly in her sleep. I just couldn't take any more. One day I came across an old friend, a solicitor in his sixties – we used to go sailing together. He told me that he was taking his boat out in a few days and sailing down to the Cape Verde Islands, where he would end his days on a deserted island eating coconuts.’

He faced me and smiled. ‘And you know how I feel about deserted islands. I went round to see my mum, but I didn't have the heart to tell her I was going. I used up all my favours and got as much black market food as I could, such as tins of meat, and

gave them to her. I gave her an old pistol, unloaded, and told her to wave it toward burglars.'

He heaved an almighty sigh. 'Driving away that day was the hardest thing I've ever done. I left a poor, elderly ... defenceless woman to an uncertain fate. I left my mother behind.

'There was no way I could have got her onto the boat, or that she'd have survived such a journey. I drove to where the solicitor, Nigel, was living and told him I wanted to join him. He was delighted, since you need two people to sail a boat, even a small one; if you fall sleep you can run aground or go around in circles. He also knew I could probably pull a few strings and get us some kit, which I did. Day we were due to sail off I robbed several people at gunpoint, not giving a shit about getting caught, and pilfered a few weapons and rations from the army. We were well stocked.

'But trying to leave the lock gates the operators told us we had to register the journey with the police and wait for them to check us out. I had been hiding away in the galley in uniform, not wanting anyone to see me. I jumped up, up the ladder and into the control room. I stuck a pistol in the neck of the operator and told him that I was popping over to Southern Ireland for some black market stuff ... and that if he talked I'd burn him alive. Since it was quite plausible, unfortunately, about the nature of the trip, he let us out.

'I remember ... as the land started to fade in the distance the clouds broke and a shaft of light hit the area around the boat, bright like a summer's day. It was ... like being re-born. I told Nigel how bad I felt about leaving my mum behind, and he was understanding, but we both had a uncontrollable urge to get away from the UK.'

He faced me and made eye contact. 'That was the start of a nine month voyage. Shit, if I'd known at the start ... I may have had second thoughts about it. And I would have definitely had second thoughts if I had known about his snoring, the cramped beds and his damn cooking!'

We both chuckled.

'Is that the guy I met?' I asked.

Jimmy nodded. 'In Cardiff Bay. Crazy old bastard, but a great zest for life. He lifted my spirits on more than one occasion. And

I saved his life two dozen times as we sailed down to Tenerife - he fell overboard almost every day!’

‘Tenerife?’ I queried.

‘On the way to Cape Verde, needed to stop for supplies and fresh water. The weather was good; we were lucky. Very lucky. Bay of Biscay is a bitch at the best of times, and we crossed it in October! North of Tenerife we were becalmed for a few days, so caught up on some sunbathing, then arrived at night. I knew exactly the layout of the island and the location of the marina where Gareth had his boat: Solaner.’

‘*Our* Gareth, yeah?’ I suggested, meaning our IT manager.

Jimmy nodded. ‘He had divorced the missus and settled in Tenerife, living off his savings. Got his Yachtmaster certificate just as the troubles started. Of course, tourism down there died a death quickly, but he stayed. Sold his apartment and lived on his boat, along with a shit load of other Brits and Europeans getting away from it all. Frigging marina was packed. We motored slowly along with a torch looking at the names on the backs of the boats in their moorings and found his quickly. I stepped over and tied off as he came on deck, scared the crap out of him. He was, to say the least, completely fucking stunned to see me. And he had met Nigel before.

‘We broke open the booze we’d brought down with us and Gareth invited some of the other boat crews that he knew ... and we had a bit of a party, first time in probably two years that I had had a drink and a laugh.

‘The journey down had been both tough, but also a joy. I had to *learn the ropes* ... literally. I got seasick a lot, but just about got my sea legs when we neared the Canaries.’ He raised a pointed finger. ‘And we discovered how important sauces are on food. Day after day of corned beef is a drag if there’s nothing to put on it. And fish, cooked away which way you can think off, still tastes like fish.

‘Approaching Tenerife held its own risks. I was, after all, a deserter of sorts and there could have been NATO ships patrolling. As it turned out the population of Tenerife were up in arms because of the influx of Muslim refugees, coupled with mainland Spain abandoning them to secure the Straights of Gibraltar. By time we reached the sunny volcanic isle The Brotherhood had blown up most of the oil wells in the Middle

East. If the economy had not already been fucked it sure was now. Something like eighty percent of the world's oil supply had been cut off in just about two months.

‘Anyway, next morning we got a shock. Well, bad timing really. The local cops came along and said that all non-residents would have to leave within a week or be arrested. *And ...* that their boats would be impounded. Brits didn't like that, but what can you do? What we didn't fully appreciate at the time ... was how bleeding lucky we were. We were on boats, catching fish and buying cheap fruit off the locals – who were even poorer than we were by this time. What we also didn't know was that the Americans had put together an armada to secure the Saudi oil fields, something they're obliged to do by treaty, and now that armada of two hundred ships was about to enter the Arabian Gulf to invade the oil fields.

‘The Chinese and Russians had already warned against the Americans taking control of the oil fields, the Chinese firmly believing that they'd get no pigging oil – which was probably true.

‘Odd thing was ... what was going on around the Middle East ... was that the various governments were fighting hard to battle the growing Brotherhood. Apart from Somalia, and maybe Sudan, no other country was actively supporting the Brotherhood. And there was talk of Pakistani nukes ending up in the hands of the Brotherhood. It was one big powder keg waiting for a trigger. And those next four or five days were the worst the planet had seen so far as we listened in by radio.

‘On day one the Brotherhood had been superb in their planning and audacity. They sailed two cargo ships stuffed full of suicide bombers into the Russian naval base in Sebastopol in the Crimea and overran it quickly, literally within hours. They killed most of the Russian sailors and seized at least ten large destroyers. The West wanted to know if they were nuclear armed but the Russians wouldn't tell them. Next day a nuke goes off in Chechnya, Southern Russia, destroying a large Russian base. Everyone suspected it was a Pakistani nuke. Now everyone is *real* scared because they're sure that the Brotherhood has nukes, at least a couple. Israelis can't nuke anyone because the various Arab governments are on their side - fighting for their own survival.

‘So the Russians fire a nuke at Southern Pakistan – stupid thing to do really - but they had to show their people that they were fighting back, and there was nowhere else to hit. All they did was roast a lot of Red Cross workers. Meanwhile, the Yanks nuke the Russian surface fleet, now in the hands of The Brotherhood.

‘Jesus,’ I blew out.

‘Russians can’t do much because they’ve already threatened to do the very same thing if they can’t get back control of their ships. Fair to say that they were pissed at the Yanks. And the Chinese are threatening the Yanks about the oil, and sat listening to it on the radio we all expected the worst. A missile is fired – the next day – from Iran towards Oman, presumably towards the gathering US fleet; just a conventional long-range missile. No one believes that the Iranians have lost control of their missile bases and so Israel acts first and nukes Tehran, plus other principle cities and military sites, and their nuclear reactors. Russians and Chinese are not happy, *very* ... not happy. How are the Chinese going to get oil from Iran now?

‘Another conventional missile hits Israel this time, a lot of damage in downtown Tel Aviv. The Israelis had tracked the launch and fired another nuke into Iran. That causes all other Arab states to declare war on Israel – if only in name – since there was fuck-all they could actually do.

‘Anyway, on the last day another nuke goes off in Southern Russia, so the Russians fire a salvo at Pakistan again, just as the US fleet is steaming through the Straights. At the same time, more or less, several aircraft – it was later determined – not missiles, fly towards the fleet at low level and detonate several nukes close in to the fleet, roasting their chestnuts. Yanks think it was the Russians and go all out – full nuclear attack against Russian and China at the same time whilst Israel destroys every Middle East capital. In, what, the space of an hour ... something like a hundred million people die, more dying later from their burns. And me? I’m sat on a boat, getting a tan, eating fruit and fish...’ He took a reflective moment.

‘What happened to the boats? With the Tenerife police?’

‘Fair to say that the local coppers were just as despondent as us lot listening to it on the radio. The weekend deadline came and they didn’t move us on, but came back a few days later and

issued the same warning. Problem was, Gareth was planning on sailing back to the UK to see if his family was still alive. He took it hard, as you could image; three lads in their twenties and a couple of grandchildren. He figured he'd sail up the Bristol Channel, up the River Usk when the tide was right, moor up near the town bridge and walk to his old house – just a couple hundred yards from that bridge. Not a bad plan, and something I always regretted.'

'What?' I puzzled.

'That I talked him out of it. One of the larger boats had a short-wave radio geared up to a generator and we listened in to boat traffic around the UK, and people in West Wales and Cornwall who had radios. Cardiff had been nuked at least once, that was certain, but Newport was twelve miles away and people there could certainly still be alive. Thing about a nuke, is that it just destroys an area about a mile around. To destroy somewhere like London with a nuke you'd need ten or twenty of them. You know, it was only years later I found out that a stray nuke had hit Newport directly, killing everyone we knew in an instant. Back then I didn't know for sure.'

'He would have found no one alive...' I nudged.

'That's true, but he should have – at least – tried. By sailing off with us he died inside ... and felt like a coward. Which was how most of us felt ... if we were honest. Surviving World War Three has its own pain to bear in your soul ... and in your every waking moment: you're alive, they're all dead. Hell of a feeling.'

'I would have been working in London,' I mused. 'Probably would have been quick.'

Jimmy focused on me, a strange look, almost sad. 'You stayed with your family in London, even knowing what would happen. *You* ... could not do what I did the first time around.' He held his gaze on me. 'Try and image this: you're in Cornwall when London is nuked. What do you do? Try and get there, or get on a boat and fuck off?'

We stared at each other for a few seconds before I turned away.

'I ... I couldn't leave without knowing if they were alive or not,' I finally stated.

‘And that thing you’re feeling in your stomach right now ... that’s how I felt for the first hundred years. Give it some careful thought, because it’s a choice you may have to make again.’

Jimmy took a toilet break and we grabbed two pints of beer from the kitchen. Continuing, he said, ‘So we had a difficult choice to make, made easier by the local police wanting to get rid of us. Nigel was just about to continue his journey towards Cape Verde, so he was in no quandary at all. He was as upset as everyone else about what had happened, but was also resolute that he’d end his days on a small island, feet in the water and bum in the sand. Actually, he cheered us up with his determination.

‘I spent a lot of time with Gareth, trying to talk him out of what we all considered was a suicide trip. If he did make it back to the UK he would have to find his family, whilst hoping no one stole his conveniently parked boat, getting them and extra supplies on board and setting off again on another perilous journey. And then there was the question of his ex-wife. Surely his lads would not want to leave her behind, but even he was in two minds about taking her along.

‘And where would they go? They couldn’t come back down to Tenerife. So where? Caribbean? Would they be anymore welcome than Tenerife? Across to Canada? Around to Australia to his relatives there – a four-month voyage on limited supplies and a rather cosy boat? He could see it was futile and eventually agreed to sail south with us, the more boats the better in case of problems. I would sail with him. I thanked Nigel, told him that Gareth and myself might try for Australia and his family there.’

‘How did Nigel take it?’

‘Not a problem at all. Another boat had too many people and one stowed with Nigel. Perfect. So we set sail, about six boats at the same time, all roughly heading towards Cape Verde – two weeks due south in reasonable weather. Even had something of an ... air of optimism. Gareth was a pain to start with, telling me how to manage *his* boat, what not to do, etc. In fairness, it was his home, not just a boat. Sharing was not something he had done for a while and there was a bit of an atmosphere. Not so much between us, but about what had happened, his family, the world; two miserable bastards in a tin can getting by on four hour sleep rotations.

‘I spent a lot of time fishing, caught more than enough to eat. Even caught some tuna as we sailed along, most days not more than a handful of words spoken. One time we came close to an African refugee boat – guess they hadn’t heard about Europe going up in smoke. It looked like they were armed, but so was I, and I made a point of standing on deck with my rifle – UK Army issue no less! They looked us over and fucked off.

‘We kept in radio contact with the other boats and Nigel, losing sight sometimes. Then, on the fifth day, we got a garbled radio message, which I thought was Nigel’s voice. We couldn’t raise him and so turned toward his last known position. It took about an hour to get close enough to check his boat with the binoculars – UK Army issue again. There was no one on deck, which was unusual, and the twenty minutes it took us to close the distance didn’t reveal any movement. We radioed the other boats and they came in closer.

‘Boarding Nigel’s boat we found no one aboard, which shocked us. We radioed the other boats and, with me on Nigel’s boat, we backtracked the course he had taken to see if we could spot them in the water. Two hours of searching revealed nothing before sundown, after which we’d have no chance of finding him, the wind picking up. Through the night we could have gone right past him without seeing him. We did search a while into the night, wondering if he had his lifejacket on with a flashing water-light. They’re powered by contact with seawater, but only good for eight hours.

‘We didn’t find him or the other crewman ... and that lowered our spirits even more. We discussed sailing on with two boats, but figured one was safer with alternate people on watch.’

‘You abandoned his boat?’ I questioned.

‘No, one of the other boats came in and they put two crew on it, leaving two on the original. And off we sailed again. Ten days later we stopped at a small island at the north end of Cape Verde, finding it deserted, but with a jetty for mooring and some fruit trees and coconut trees. It was good to run ashore and we stretched our legs. I remember it rained like hell that first night, which was great -’

‘Why?’

‘Fresh water. We could see the storm clouds and so hung up a spare sail and collected enough water for all four boats to be

fully stocked.’ He took a moment to think back, and to reflect. ‘Nigel would have loved it.’ He faced me. ‘You see, simple decisions you take – left or right, forwards or backwards – they all have consequences.’

‘Yours more than most,’ I pointed out.

He nodded before sipping his beer. ‘So we sailed off after a few days, most boats heading for the main islands whilst me and Gareth decided to avoid people. We figured they’d be just as hungry as us, and not so happy to share.

‘We stopped at a few islands, every other day or so, but only if we thought they were unoccupied. One time we did find someone living there, a native, but the guys rusting machete was out trumped by my SA81 rifle. We made friends and showed him that we meant him no harm, and he cooked us a chicken, a relief after so much fish. He asked for a lift to the next island, since he was running out food and someone had nicked his canoe.

Jimmy smiled as he thought back. ‘Funny the things you remember. The fella jumped off a half mile from shore and swam in to the next island, bigger than the one he had been on. We managed to find fruit on many of the islands, and I shot two pigs on the last island before the end of the Cape Verde chain. Bacon for breakfast!

‘Sailing on, we figured we’d rather die than land on the wrong stretch of African shore, so we checked the supplies and headed towards the Cape. Fish kept us going, and we got rain water off the sails, but still needed to stop near Namibia – couldn’t tell you where exactly. I went ashore as Gareth kept the boat at full sail – just in case. I found a small cow, calf I guess you’d call it, and shot the damn thing. Just about lugged it to the dinghy, but the damn thing almost sank me. Bloody animal came back to life and started struggling, so I had to shoot it again at point blank range, right in the head. Still, it fed us well for many days, and we dried some meat and crudely salted it.

‘We did the same thing in sight of Table Mountain, South Africa, a green and lush area. I went ashore again, walked about for an hour and found an abandoned house with a decent vegetable patch. I pilfered as much as I could carry and went back a second time. Christ, we had carrots, green beans and potatoes that night! Bloody luxury! The things we take for

granted today ... God, you have no idea what some people go through.

‘Rounding the Cape, the wind was with us and we had an easy passage, but found an upturned yacht. We didn’t stop to investigate and tried to stay just out of sight of land. There would have been a time when we would have passed dozens of ships, but we saw nothing other than sail boats in the distance.’

‘No pigging oil, that’s why!’ I suggested.

‘And no one paying the crews to move their cargos. Whole damn world came to a grinding halt.’

He sipped his beer. ‘Beyond the Cape we hit a storm and almost capsized. That was a wake up call; we’d been lucky up to then. Solaner was a good boat, but not built for open ocean storm; we had to adjust the ballast position a few times to stabilise her. We sailed up the west of Madagascar and towards the lovely Seychelles – even more lovely with no pigging tourists cluttering up the place. Took us just over two weeks from the Cape, good going. Supplies were replenished in the usual way; me, my rifle, and my pilfering ways. North end of Madagascar I shot a calf and some baby goats.’

‘You’re kidding?’

He shot me a look. ‘Anyway, we had to go that route because we didn’t have the supplies to go straight across to Western Australia – four weeks on a bad day. Besides, Gareth’s brother lived in Darwin, *up the top end* as the Aussies say. Up to this point we only had ourselves for company plus the odd bit of radio chatter. But there was a lucky break and an odd few days ahead.

‘We had spotted this island – which we figured was part of the Seychelles - and had checked it out from a distance, finding a big hotel at the top of a nice bay. No people. So we sailed right around the island, taking a whole day of it. No signs of life. Next morning we docked at dawn, nice deepwater jetty, and I ran ashore with my rifle and pistol. I searched the hotel, empty, some nearby chalets on the beach, again empty, then went back to the boat. I told Gareth to wait out at sea and I went inland and up a small hill, a bleeding banana plantation of all things! From the top I could see all around – no ships and no signs of life. But I spotted what looked like a small village, or houses for the hotel staff. I snuck down, rifle prone, and checked it out. There was no

one about, but enough farm animals running around to feed a small army. I circled around the long way back and checked again, still finding nothing.

‘I signalled the boat back in and we took it in turns to sit on the hill with binoculars as we stocked up. Gareth caught chickens with his bare hands and throttled them, carrying them back past me; first time I had seen him really smile for a while. Then he trudged past with a cone of bananas as big as he was, finally a screaming piglet. ‘*Bacon for breakfast!*’ he screamed.

‘When it was his turn to sit on the hill I went back into the hotel. Apart from clean sheets – which I pinched – there was not much else of use for long sea voyages. A paraffin lamp and spare paraffin seemed useful, so I left that on the dock next to the boat, the piglet screaming from inside the boat.

‘Then I tried the kitchens, not finding much of use, before noticing a trap door. I lifted it, half expecting to find it full of dead bodies, but found the *real* kitchen storeroom. Booze, tinned food, champagne, powdered milk and teabags and jars of coffee – there was enough to reach Australia. I ran up to the hill, champagne bottle in hand and poured it over him. We checked the horizon, any other boat being at least three hours sailing time away, and raided the pantry. Poor old Solaner was weighed down with all the stuff we took. And we most definitely did not forget the sauces, many of which we’d never heard of.

‘We then had a lengthy debate about going straight for Australia, since we now had the supplies. That night we slept on the hill, four hourly rotations with hotel blankets wrapped around us. What you have to keep in mind is that we had been on two or four-hour rotations on watch for almost three months. When you’re sailing you don’t want to take the risk of pirates, especially not in the waters we were sailing through. So we were both permanently exhausted. You get used to it, but it’s still not eight hours of good kip.

‘When the sun came up we again diligently checked the horizon, and I allowed Gareth four hours sleep in one of the chalets. Actually, I gave him six hours because I wanted him to rest. When awake, he continued to check supplies, throwing out old stuff and loading more on board. And we killed and cooked as much as we could, trying to put some weight back on; we were both like skeletons after months at sea. He let me get seven

hours kip after I downed a bottle of champagne, then we figured we'd sail off, possibly stopping for more supplies around Indonesia if we needed to.

'But we knew that Indonesia was both densely populated *and* Muslim, so we charted a course well south of it. We set sail and had gone no more than ten miles when we spotted a sail on a course almost parallel to ours. It was a fast sailboat, a sporting racer, so we called it up on the radio. Turned out they were Germans who spoke reasonable English. They were heading towards Sri Lanka to re-supply, so we told them about the island and all the supplies, for which they were excited like kids at Christmas. We hadn't seen or spoken to anyone since the Verde Isles so we turned around and they followed us back, only a few hours, and we docked again, some of our old junk still on the jetty.

'German fella was sixty odd years old and his two grown up daughters were thirty-eight and thirty-six. They were no lookers, no make-up and weather worn faces like us, but we partied like it was 1999.'

I could not help smiling widely.

Jimmy continued, 'First, it was just great to see another human being and to have a chat, especially a fellow sailor to talk about boats. And the Germans? Jesus, they were so happy with the supplies they could not stop hugging us. We set-up a rota system on the hill - blanket, bottled water and binoculars - and then hit the booze. I was so pissed that first night I couldn't remember which girl I had shagged, not that it mattered, and they didn't care; we ended up shagging both of them in turns.

'We killed the fatted calf, downed five hundred quid champagne and ate like it was going out of fashion. We even swam and sunbathed, but the Germans did get their towels on the sun beds first.'

I laughed out loud at that.

'For a brief moment, as I came out of the surf one day, I saw them all lying on their sun beds and it could have been today. It was as if the war had never happened.'

'Where'd they come from?'

'Kenya ... of all places. They had hung around as long as they could, they had a farm and were pretty well off, but then the troubles started and the Somalis went on the rampage. They fled

to a tourist island, to their boat, but even that was soon under threat. They had sailed down towards the Cape before figuring that Australia was probably the best bet.

‘I tell you, when it was time to set sail we hugged each other and shed a tear like old friends. They were well stocked up, so were we, but their tub was a good ten knots faster than ours – no way we could have sailed together. They had the supplies to get to Australia’s west coast – just – and so did we. So they set off and literally ... sailed off into the sunset.’

‘Did you ever see them again?’ I wondered.

‘You’ll meet them in ... about eighteen months,’ he said with a grin.

I shook my head. ‘Weird ... time travel. And you know *exactly* when you’re going to bump into someone.’

‘It can be a source of amusement, making people feel really bad for not knowing you when you know everything about them.’

‘But ... they haven’t met you yet?’

‘Exactly. Great for winding people up! Consider your future wife -’

‘My what?’ I whispered as I sat upright.

‘What ... you didn’t think you’d ever marry?’

‘Well ... er ... yes, I suppose,’ I fumbled with. ‘You... you know who?’

‘Of course I know who, dummy!’

‘Don’t tell me. No, wait ... er ... should you tell me, you know, in case I ... you know ... react the wrong way?’

‘You’ll meet her in ... oh, couple of years time. So between now and then not too much *putting it about*.’

‘Is there ... you know ... a chance that I won’t meet her?’

‘No. None.’

‘How can you be so sure? She might not go into a particular club on a particular night,’ I pressed, not thinking too logically.

Jimmy grinned widely. ‘We’ll talk about your future wife, and two beautiful daughters, another time.’

‘Two ... two daughters?’ I stumbled with.

‘Yes, no football with the boys for you.’

I took a big gulp of my beer. ‘Bloody hell,’ I let out as I stared into my glass.

‘Don’t worry - you’ll do fine. And you’ll dump the two girls on me when you want to swan off ... which is just fine. I’m happy to baby sit your two girls anytime.’

‘We’re talking about them as if they’re actually here. So ... my wife –’

‘No. Now, shut up about her.’

‘Blonde, big tits?’ I toyed.

‘Blonde, reasonable tits, fit, very intelligent, drop dead gorgeous.’

I smiled the smile of a show-off. ‘Way-hey.’

After a quick snack Jimmy continued, ‘We sailed towards Australia and it wasn’t too bad, just a few nasty storms. Reaching the coastal waters of Australia was a relief, but also a let down as we were intercepted by the Australian Navy, who told us to *fuck off back to where we came from*.’

‘They wouldn’t let you in?’ I wondered.

‘No, place was already full of ex-pats with no jobs and no food. Many were leaving for South America, which had come off best and completely intact. The economies of South America had suffered, but they had bounced back and were trading amongst themselves quite nicely; oil from Venezuela, food from Brazil and machinery from Argentina. They did well, and later on fended off The Brotherhood. Mexico collapsed into civil war and strife, so too a few others, but overall the South Americas did well. It’s fair to say that Brazil became the world’s super-power. We told the Aussie sailors we had family here and they didn’t care – so had everyone else. Gareth even told them we had criminal records – if it would help.’

‘So what did you?’ I asked with a grin.

‘We sailed around the north and stopped at a few islands near Bali, finding large ex-pat boat communities. They filled us in on what had been happening around the world, and that’s where I learnt about the NATO resistance in Canada. Lots of Brits had sailed away from the UK after the nukes landed, most heading for Canada. UK Navy and Air Force headed that way as well, forces from around the world, and the Canadians seemed happy enough to have armed men on their soil. As for the boat refugees ... they gave them small plots of land, a spade and some seeds, and told them to get on with it. The refugees didn’t get state aid,

but land was a-plenty. The American Army, what was left, was just east of the Canadian Rockies, but Vancouver and Seattle were the headquarters - big naval presence.

‘You see, the war with the Brotherhood was still underway, despite the nuclear exchange, and The Brotherhood were not sitting on their hands. The Israelis were in a bind – no America to back them up. *Their* economy reduce to zero in a flash and many Israelis left by boat for America, some to Canada. The Brotherhood, meanwhile, had ten thousand suicide bombers surrounding Israel’s borders. For every ten the Israel’s stopped, one got through and killed twenty soldiers or more. It was a war of attrition that the Israelis soon realised they couldn’t win – they were losing too many people.

‘So after a pleasant week around Bali – swapping stories and spare parts – we set sail towards the Pacific, not least because of local pirates ... and we saw no future in that area. We sailed with two other boats of similar speed for about two weeks then came across a decent island community of all sorts; Brits, Americans, Europeans. We looked for the Germans and heard that they’d passed through; it cheered us to know that they were still alive.

‘This island, part of the Solomon chain, was deserted but for a handful of locals and was big enough to grow crops and raise livestock. There must have been thirty boats and their crews there, some transient, some staying permanently and setting down roots. All the boat crews liked each other – something about sailors. If you were capable of sailing around the world you were not an arsehole or troublemaker.

‘As in Bali, we swapped stories and spare parts, did a little fishing, helped dig some fields for our supper. Even considered stopping there, but news about Indonesian Brothers attacking The Philippines was a shock – we were not too far away. So a bunch of us, the transients, set sail for islands that were further east, well into the Pacific, and towards the Marshall Islands.

‘It was a beautiful place, but not so much on the cultivatable land, and all the good land was occupied. Got some lukewarm welcomes, some downright hostile. Shot one local who came at us. We found plenty of small deserted islands, caught plenty of fish, found coconuts and some animals left behind.’

‘Not enough to sustain a community,’ I figured.

Jimmy shook his head. ‘That was when I persuaded Garth to head for Canada – and some semblance of a western style of life; cities, comfortable beds ... and snow in winter sounded good. We knew that Hawaii had been well nuked by the Chinese, and that the survivors were definitely not friendly, so decided to skirt around the Hawaiian Islands and head for California.

‘We were dab hands by this time and knew exactly what we ate and drank each day. We had the supplies to reach the US coast – just – and would do a spot of fishing on the way. We knew that Kiribati was the last re-supply stop, and other sailors had told us they were friendly enough – they gave us a hand-drawn map of where to land. So we set off with one other boat for Kiribati. It was slow going, not much wind, but relaxing enough. Caught a few sea birds and ate them, worked eight hour shifts instead of four and co-operated with the other boat. It was a good few weeks sail, good in that the conditions were suitable for sailing.

‘At the north end of Kiribati we went ashore on a deserted beach and stocked up on fresh water, fruit and bananas. We didn’t see any locals, but found a compound with chickens and pigs, so did the decent thing.’

‘Decent thing?’ I queried.

‘We left a note.’

‘A note?’

‘Saying *thank you*. Then we nicked all their livestock and sailed off.’

I laughed at that. Even after World War Three, in a life or death situation, there was always sarcasm.

Jimmy continued, ‘We set aside areas of the boat for various animals and gave them some food, killing one each day. What we didn’t eat we salted so that it would last and by then we had the technique down. We sliced the meat into strips, dried it in the heat of the day – lightly salted – then dried it out and packed it in salt. It lasted a few weeks or more and you got used to it. Back at the community they had improved our technique and supplied us with a shit load of rock salt.

‘So we set off north east, by-passing Hawaii – which I guess was due north – and hit a storm that was going our way. We lost contact with the other boat in the storm but joined back up a few days later by radio signal. Then we found the Marie Celeste.’

‘Marie Celeste?’ I repeated with a frown.

‘We found a big old cargo ship just drifting. We tried to contact it by radio, circled it a few times and then went aboard at the rear, its gangway down to the water. Not a soul on board.’

‘What did you find?’ I keenly asked.

‘Lots of stuff, but mostly no fucking good at all. Cars, for one.’

‘Cars?’

‘Yep. We opened these big containers and found cars inside. It was so odd to sit behind the wheel of a car again. The engines started and all. I reversed one onto the deck and we took it in turns driving around a small area, laughing like kids stealing their first set of wheels. Toyotas they were, left hand drive, automatics. We eventually smashed the car up – driving it into things. Laughed liked teenagers, we did.

‘First aid bay had lots a useful stuff, Morphine and Iodine, so we had that away. Found one body below decks; he hanged himself. Couldn’t tell what nationality, but he looked Asian. His head was still in the noose, his body below and well decayed.

‘We had long since run out of diesel, so tried some from the ship’s tanks and it worked great. We had two boats with full fuel tanks, useful in a storm when you take the sails down but try and keep on course. The porn magazines we had away. They weren’t in English, so we just looked at the pictures.

‘In the galley we found plenty of tinned food and powdered stuff, so had that away. We found some battery packs and so got some old MP3 players working; frigging Michael Jackson was all we had. With the wind dying we tied off the boats and stayed on board for two days, stuffing ourselves with the ship’s food. It was drifting with the wind in the right direction so we stayed and stretched our legs for two days.

‘We pinched some tools that could have been useful before opening more of the containers. There was a bunch of tractors, some seeds and fertilizer ... Jesus, if we could have started the ship and got it back to the community...’

He sighed. ‘Still, we tried to get the engine to work, but no joy. What the hell did we know about big cargo ships? Probably an electrical cut-off somewhere. Then, on the day we decided to set off again, we spotted a sail on the horizon. Ship we were on

was clearly visible five miles away so we radioed them with our boat radios.' He rubbed his face. 'It was a mistake.'

'They were hostile?'

'No, no, they were English.'

'English?'

'They were from Taunton, North Devon. They had sailed away day after the UK got hit.'

'Why was that a problem?' I delicately probed.

He forced a big breath. 'They had sailed away, across to the Caribbean, did a lot of island hopping like us, then headed south and around the Horn, making it through; no mean feat. They were an extended family; a mum and dad in their fifties, teenage lad, uncle and another lad, a cousin. Their boat was big enough, but still – frigging cosy! Don't know how they got the supplies to survive. So, they tied up and came aboard. I had my pistol stuffed down my shirt, but they were fine. Better than fine, it was like frigging Christmas and we got the food on, soon swapping stories of epic journeys. The problem was Gareth.'

'Gareth?'

'He was not ... homesick as such, not for the UK, since he'd left the UK and retired to Tenerife years earlier. No, the new family did what he had wanted to do, to grab his family and sail off. It upset him a lot, and it upset me – since we could not have known they were dead; this lot made it out, so why not *his* family?'

'They confirmed that Cardiff had been hit by a nuke, and that Newport was probably hit. Still, they were not sure. We stayed another two days and swapped stories and spare parts again. We told them where the community was and they liked the sound of it, not so much the sound of Canada and the military.'

'It was another round of big hugs and goodbyes. Not that many Brits made it out, so we were all instantly close. As we sailed away Garth was quiet for a whole three days. Thankfully, we came across a US warship. We had a long chat on the radio and they told us that many Brits were still alive in the hills and farmland – guess they meant rural areas – and that US Air Force flights went back and forth to Scotland all the time, also some of their naval vessels.'

'It gave us hope that maybe we'd get some news, or that we could fly over to the UK. It cheered up Gareth a bit. We

discussed going through the Panama Canal, but the Navy said it was closed. Going around the Horn would have taken months, and the Navy had told us that The Brotherhood had landed by boat in the UK and were rounding up and killing people. They also told us that The Brotherhood, from the North African states, had landed in Italy and Southern France and moved north. By time we could have sailed back the UK could have been overrun, and we'd be captured and shot.'

'What did you decide?'

'We continued towards California, aiming to hit land north of L.A. and getting more supplies. Took us almost four weeks and supplies were running down a bit. We passed a few more US naval vessels and even saw some aircraft, the first time since leaving Tenerife. We caught a good wind as we neared the coast and followed it north, trying to avoid the populated areas. We actually hit land near a town called Eureka, putting ashore in what looked like a beachfront hotel complex.

'I went ashore with my rifle and scouted the area as Gareth filled up water bottles from a stream cascading down rocks near the beach. The hotel was empty, but there were signs that someone had been living rough in it. I tried the electricity and phones, just to see if they worked. I kicked in the kitchen door and searched around, but someone else had already had the same idea long before. Place had been well raided.

'When I heard shots in the distance I went back to the boat and we set off, but with no extra supplies. A few hours later, five miles offshore, we passed another sailboat, this time an American and a local. We passed close by and had a long chat on the radio —'

'How did you keep the radio working without fresh batteries?' I asked in my ignorance.

'There's a small wind turbine on most boats, generating enough juice for the radio. Anyway, the news was not good. Basically, he told us that if we set foot ashore we'd be shot and eaten.'

'It was that bad?'

'A post apocalyptic wasteland ... complete with roaming gangs. Still, he said it was better the further north you went and he confirmed the stories about the army in Canada and Seattle. So we sailed north, Gareth getting more morbid by the day. We

sailed into a big estuary near Astoria, south of Seattle and North of Portland. We sailed under a big bridge that crossed the river and found a landing some five miles in, in need of supplies by this time.

‘By then I had made my decision, and I kind of knew what Gareth would do. When we docked I said that I was going on ahead on foot, that I had had enough of sailing and that I would steal a car and head north to Seattle, not a long drive. We sat down and talked about it, quite solemn and morbid. We both knew what the other was thinking. I said to him ... *you’re not coming, are you?* I took some supplies, my rifle and some cold weather clothes and stood on the dock as he sailed off.’

‘And you never saw him again,’ I stated.

Jimmy shook his head. ‘I’d like to think he made it ... somewhere. Back to the UK would have been suicide; one person on a boat. Getting around the Horn by himself would have been impossible.’ He took a reflective breath. ‘I felt as bad as had done when I left my mum behind; Gareth’s fate was my fault. He could have sailed back to the UK –’

‘His family were dead.’

Jimmy slowly nodded. ‘Still, he should have tried at least.’

‘Why?’

‘You have to do what you believe in, you have to follow your heart. There’s nothing worse in this life ... than being persuaded to do something, to sleepwalk into something that you don’t fully believe in. Even if you know it’s futile ... you still have to try.’

We both took a moment and I considered my own indecision over what I was being trained to do. Still, my decision was easy enough to make: help Jimmy or watch the world burn. It was not a difficult choice to make. But I could not even begin to comprehend what pain he had gone through, or how he managed to keep going.

Finally, Jimmy said, ‘I had sailed three quarters of the way around the world, and the journey was only just beginning. I walked for a mile or so and found a highway, which I decided to avoid. I walked parallel to it and saw plenty of pickup trucks with militia types in the back, armed with rifles. Finding an abandoned hut and some abandoned cars, I got some sleep, aiming to set off at night and not risk the roads in daylight. One

of the cars started, but was low on petrol, so I syphoned out petrol from three other cars, finding plenty – filling my tank.

‘At 2am I had seen no trucks for an hour and so set off – driving a left hand American car on the right, fumbling with all the controls. I finally figured out the lights and the wipers, got the parking brake by mistake a few times, then just got on with it. I drove due north and followed the signs for Seattle. I passed another car – and had my pistol ready – but they didn’t stop. At one point some lights came up behind me so I took a corner and floored it, losing the lights behind.

‘Dawn came up on a road flanked by tall pine trees, the one good thing about American highways being the long straight stretches; I could see anyone ahead of me. But it was all quiet and I was lucky, no one tried to shoot me, or eat me.

‘Then my heart leapt as I rounded a corner and found a long line of army trucks parked in a row on my side of the highway. A few soldiers with rifles were stood around and I slowed down. I opened the window and put a hand out, a friendly wave. I stopped at the first soldier and asked him where his C.O. was. He just shrugged and said the first truck. I motored slowly along, waving nicely to the troops and stopped ahead of the first truck, walking back. Their C.O., a captain, was taking a piss on the side of the road.

‘*Who the fuck are you?* he growled at me. *British Army*, I replied. *I just sailed around from England to join up.* Well, should have seen the look on his face. He told me all the Brits were based around Manson and he gave me some directions. He kindly gave me a green jacket and a sign to put on the dashboard, otherwise I’d risk being shot. I thanked him and set off, a right turn and I headed inland, more confident now, my rifle – which was British Army Issue – on my lap.

‘Must have gone an hour before coming off the highway and onto the smaller roads, soon finding a checkpoint of sorts with a teenager half asleep in a truck. He asked me who I was, so I tried the direct approach: *British Army from Manson, what the fuck’s it to you, sonny?* Did the trick, and I drove around him. I used the same technique twice more then got stopped by the US Army. I explained who I was, and what I had done, and they were amazed. They gave me some food and told me Manson was six

hundred miles away. Fucking Yanks, they could have told me that before. To them six hundred miles is nothing.

‘Anyway, they told me I could join up right there and asked me what I was good at. When I told them I was a medic they couldn’t do enough for me. The C.O. came out and said: *Medic? You’re hired, Limey fuck, whether you like it or not.* They gave me a uniform, boots were a bit tight, and a lame two-hour briefing, then shoved a medic armband on my arm and gave me a kitbag of first aid goodies. I was assigned to a doctor, a Major Boggs, who we called *Major Shits* – on account that dysentery was common – and I was allocated a room and a pass for meals. I kept the SA81 for a while, people thought it was cute and everyone instantly recognised me after that. Well, in little over twenty-four hours after leaving the boat I was in the US Army, green combats and boots, cap on my head.

‘My first posting was in a lumber mill, as the resident medic. I had a cosy cot in a room above some offices, warm enough, and I spent my days treating cuts – and a shit load of splinters! Those people, the workers, were all army, not civilian woodworkers, although there was some of the original staff around; most had to learn the job as they went. The mill cut up logs that were delivered to us, the wood used to make barrack rooms around the area.

‘We kept our weapons because you’d find the odd *crazy* wandering around, half starved and well armed. They’d shoot you for some food. If we saw them first we’d shoot them and bury them shallow, away from the mill. It was bit like *Dawn of the Dead*, the movie. You’d hear a shout, then see a half-starved crazy walking down the road. *Head shot!* People would shout.

‘The winter was hard, some people freezing to death, and wounds got infected. Drugs were limited, so I often drove miles to nag for supplies. In the spring I got a promotion to Sergeant, no stop off at Corporal, and moved to a steel mill some twenty miles away. They had a different set of injuries, many cuts and burns. And jumpers.’

‘Jumpers?’ I queried.

‘The molten steel pits were exposed every so often and, if someone was a bit fed up with the hard regime, they dived in head first.’

‘Jesus, what a way to go!’

‘Life was cheap, the regime hard. You slept cold and wet, fuck all to eat, long days of permanent cloud cover. But after my time as medic in the UK, and the hardships of the voyage, I was used to it. I slept in four-hour shifts, just like on the boat, and provided more or less twenty-four hour cover. I got noticed for having a good attitude, often seen shouting at people and encouraging them – which was rare – and transferred after two months to an army boot camp, looking after the new recruits. One day I was pronouncing the executed dead –’

My brow creased. ‘You what?’

‘People were executed all the time: stealing food, deserting, that sort of thing. I had to stand in for the doctor, observe the executions and then pronounce them dead. If they were still alive it was my job to put a round through their heads – which I did once.’

‘Jesus,’ I blew out. ‘I thought the ocean voyage was tough.’

‘Then one day I had a meeting with the C.O. about some incident where medical supplies had been nicked; drugs and stuff. We got off subject and I told him what I just told you about the voyage. He was fascinated about the boat communities, and I could tell that if he had the chance he’d be in the South Pacific and not here. He was a reservist that had been called up; not a happy-chappy at all.

‘Anyway, we became good friends and he treated me like an equal, not like a sergeant. I got better food, even had an input into some of the training plans and how things were run; I organised a first-aid training programme for the new recruits.

‘I finally got moved to Manson, other side of the Rockies, and acted as liaison between the US Army Medical Corps and the Commissioner for British and European Refugees. It basically meant helping the doctors assessing the sick and then nagging for drugs that were never available. One day I said to the Yanks that they were not getting the most out of the refugees and that I could do a better job of it – better than the guy holding the post, a former British Ambassador to Canada. So they made me Deputy Commissioner for British and European Refugees and, all of a sudden, I was a politician without realising it.

‘I did that job for two years, but found the guy above me a pain in the arse, *and* on the make. One day he went fishing and never came back. Bear ate him, I think.’

We exchanged looks. I figured he bumped the guy off.

Jimmy continued, 'So I was now *the man*. I carried a pistol, and when I found corruption I shot the bastard in the knee. People soon realised that someone with a limp was a former black marketer. The US commander applauded my efforts: no mercy. It may sound harsh, but conditions were harsh, you had to keep as many people as you could alive. So if someone was an arsehole, or just in your way, you shot him. I eventually had fifty thousand people to care for. Fortunately, the farm land around the area was good, the fishing good, the wild bison good—'

'Bison?'

'Around 2006 some rich guy will introduce a giant herd of them to the area.' He shrugged. 'He built the herd, so we ate them. And I organised everyone into groups based on skills. We had people specialising in fishing, farming, Bison hunting, horse taming – petrol ran low – and in each town and hamlet I had a sheriff and deputy. I modelled it on the old Wild West and it worked well. My predecessor was still firmly in twenty-first century, not 1850. And 1850s social modelling worked very well. I was given the Jewish refugees to look after, around five thousand of them, and ended up with a daughter –'

'You had a daughter?'

'No, dope, not a biological daughter. The leader of the Jews, Eli, I put in my office and his family in the hotel I lived at. He was sixty something and had a granddaughter with him, six years old, who I looked after when he wasn't around. He died of a heart attack a year later and I was left with the kid, Sarah. It was one of my better decisions, looking after her, because it gave me focus. Plus a lot of fun taking her fishing, teaching her horse riding.'

'How old was she when you travelled back?'

He took a moment. 'She died in childbirth when she was eighteen; she had got together with a young Jewish lad and fell pregnant. I wasn't unhappy, as her guardian, since we needed to rebuild the population. I took her death badly, although it did make my leaving that much easier. She died a year before I stepped into the time machine.'

He got up and walked off without another word, leaving me with my head spinning. All of a sudden I felt very, very tired and I went to my room to lie down.

Part 7

Back to work

The post-tsunami euphoria eventually died down, apart from the million requests for interviews, not least from the scientific community, and the governments of those countries that suffered frequent earthquakes. Crusty was packed off to the Maldives for a long holiday with his wife, and his four bodyguards.

Life at the house settled down and we caught up on the mundane, the company accounts and various projects, business problems and legal problems. Oddly enough, we were still being sued for issuing the warning. Since we intended giving many more warnings in the future we would have to practice defending our predictions.

I went right through the accounts for the two clubs and visited both, happy enough with their turnover. That was followed by a meeting of everyone involved in Pineapple Records, now one of the biggest labels in the Western world. It was my job to oversee Pineapple, which freed up Jimmy to concentrate on Africa. Pineapple was making an obscene amount of money, both in the UK and States. International record sales were also good. Po's family made our CDs, and these days most music was CD based. We had also pre-empted Internet music downloads, and ran our own website offering paying downloads at a rate equivalent to seventy percent of the profit we made on a CD; overheads were low, profits good. Our musicians were still playing at the clubs, and still enjoying holidays at our hotels around the world. As part of the drive to help Sri Lanka - after their losses during the tsunami - we encouraged people to visit our hotels in that country, making it seem a moral support mission rather than a holiday. The hotels were full.

The music magazine was also doing very well and had matured into a publication that offered a balanced approach, not just music and bands detailed in its pages. It now offered a news section, political opinion, and interviews with stars and actors. We also competed, to some degree, with the new craze of lads magazines that were basically soft porn; babes with big boobs in bikinis. We had a few of our own babes at Pineapple, the young ladies always keen to be photographed in skimpy outfits.

Aiming to capitalise on our fame, Oliver Standish had bought up hotels in New York and Los Angeles, now secretly converting them to mimic the London club format. They would be ready soon. In the States, our music magazine was now being distributed by Anton's father, the Blake Carrington look-alike, but had an American slant,

some common stories and common artists. Its circulation dwarfed its British cousin by a factor of almost ten.

Having spent the best part of a week reviewing the businesses, I joined Jimmy and moved onto discussing CAR Ltd, and the corporation in the Congo. Mining and oil concessions were being issued faster than the various companies could get in there with their big yellow diggers, and the revenue we earned was soaring. But as we tore down the jungle and industrialised the area, we hit the snag of mines and oil companies dumping waste, and polluting both rivers and the local water table. To help, we set-up a body within our corporation to monitor the situation, and to assist directly. Fortunately, we had a good supply of depleted mines and they made excellent repositories for waste, the offending items covered over with concrete or soil and buried. Anticipating future complains about waste products, we commissioned a number of studies and put a sizeable team on it.

That led us to the problem of economic migration. Within the DRC itself we now found people moving towards the mines and oilfields looking for work, a few squatter camps set up. Where they became a nuisance the Rifles went in and bussed the people out, back to wherever they came from, a few dollars in their hands and a yellow plastic bucket full of household goodies. Still, it was a growing problem. Aside from the internal migration of people, we also had the problem of foreign workers seeking jobs. We had no problem with skilled foreign workers being recruited, but we clamped down hard on people just wandering across the border and looking for work. Jimmy was adamant that they would be repatriated, after a short spell in a camp with little or no food. He explained that, unless sorted now, it would be a large problem in the future. There was also the problem of local violence towards the squatters, especially the foreign squatters. Many were killed. There were no job-sharing schemes in the eyes of the indigenous Congolese people.

The Chinese Army had greatly reduced its presence on the border, that task now handled by a dedicated border force made up of the Rifles, the national police, and former members of each. Still, it was a very long border, most of which was jungle. As in Kenya, we began repairing the fence, and laying new fence.

The regional airports had mostly been finished, and officials and mine engineers could now hop on a plane and take a one-hour flight that would save a twenty-hour trip by bus or car. The planes were full.

The rail link from Tanzania had snaked ever west through Burundi and touched DRC soil over Christmas, the track meeting short sections that we had laid ready, principally from certain mines and oil areas in the south east of the DRC. The first ore train had made its long journey to the coast, much reported in the African Times, and was welcomed at the coast by the Tanzanian Government; the train cut a tape. Actually, the tape was stronger than anticipated and pulled over two flagpoles, dragging track workers along with it. The rolling stock was Tanzanian, as were the drivers, a concession we had made to them. Just inside the Tanzanian border a marshalling yard had been constructed so that trains could pass each other in a carefully co-ordinated ballet.

The ore truck logistics had been subject to much planning, and we now operated an efficient system. The corporation owned the trucks and paid the drivers, and we set-up two yards where drivers stopped to fuel and change vehicles. A group of drivers, all Congolese, would drive the trucks through Burundi or Rwanda and stop at the yard just inside Tanzania. There they would have a bite to eat and sleep the night. The next morning they would be allocated an empty truck that was up from the coast, and take it back to the DRC; they never followed their loads to the coast and back, an eight day round trip at times. Accidents caused by driver fatigue were a real concern, especially to slow moving Tanzanian housewives. So our ore trucks would be touched by three different “fresh” drivers on the way to the coast, three on the way back, the drivers getting to see their families often.

But the cost difference of a truck’s tonne-per-mile to a train’s tonne-per-mile was huge, so we hired as much Tanzanian rolling stock as we could, our trains often a mile long; two engines at the front and two at the rear. The tracks ran past the smelting plants in Tanzania, so ore would be off-loaded there, the trains heading back the way they came after unloading.

The first crude oil train met with much fanfare, reaching Mombassa in Kenya after circling through Tanzania. Other oil trains were dispatched to Uganda and Zambia, the crude sold cheaply. That oil was now being refined at two plants in our area, the resulting petrol and diesel being used internally. It was as cheap as water, and no one in our region much cared about how much petrol they put in their cars. Busses were now free, lauded by the UN, and a first for any country. Next was a plan to refine the gasoline further to aviation fuel standards, a plant commissioned.

The most obvious effect of the cheap oil was cheaper ore extraction, the costs of driving huge yellow machines around mines greatly reduced. Modest increases in wages were seen, and productivity was good, many mines working twenty-four hours a day. In the north, the Chinese had sunk six wells and were now extracting more oil than they knew what to do with. They needed it back in China, but transporting it to the coast negated the benefits. So they refined it, as we did, and provided petrol back to their own mines. They also sold the crude oil to Uganda, Rwanda and other countries, and the price of petrol in the region was falling compared to the rest of Africa. Globally, oil prices were also falling thanks to the new coastal oilfield discoveries.

As a natural progression from the mining of ore and the production of petrol, we encouraged foreign companies to open smelting plants, the first few already operating. That led us to then make use of the steel created by selling it around the region – principally to ourselves. High-rise apartment blocks became cheaper due to cheap steel; less concrete was needed. We then nudged Po's family to open a tin can plant, tin ore bountiful in the region. Farm produce from our region, and that of neighbouring countries, was soon being canned in locally made tin cans, from locally mined tin ore.

The net effect of Jimmy's self-sufficiency master plan was that ingots were shipped out instead of ore, the trucks moving in convoy with armed guards, each truckload worth millions of pounds. Yuri and Marko even flew some out. And our nice new road to Kinshasa developed its first pothole a month after being finished, four hundred trucks a day trundling down it, scaring slow moving Congolese housewives.

By February 2005, our personal income from the corporation and CAR topped three billion pounds a year, growing at a rate of around ninety percent a year. Board meetings were embarrassing; our financial officer kept thinking he had made a mistake. A great deal of money still went back into the local community, the orphanages topping out a hundred and twenty thousand kids, half of whom attended them like boarding school. The Congo Rifles were edging towards ten thousand men, our special police force now reaching three thousand and growing.

We made good on our promise to Kimballa Jnr to move west and clean-out any remaining warlords, the Rifles now running out of people to shoot. The Rifles had almost reached Kinshasa and roadblocks were common, punishments harsh. Each town offered its

own local police unit, but also units of the national police backed by the Rifles. Hangings were common, typically on a Saturday lunchtime – a growing spectator sport. They attracted the crowds. The UN, and various human rights groups, gave us grief over the harsh punishment regime, but Kimballa always made it clear that it was his wish – not ours. Actually, it was Jimmy's wish, but I saw the logic behind it. Many of the people in the Congo had grown up in lawless areas, where whoever was strongest did whatever they liked. Rape was still a problem, and the chances of a girl making her wedding without having been gang raped was slim. Still, things were improving rapidly.

The corporation had moved into Northern Zambia with that government's blessing, and we were both mining the area and policing it, mirror imaging the DRC, a tried and tested formula. And Kimballa, he had lazily granted us rights to anything east of Kinshasa, ninety-five percent of the country. After all, why should he lift a finger when we were doing all the work for him? His palace grew in splendour, the number of wives and consorts increased, and the people of Kinshasa still struggled to make a dollar.

CAR were now spending a great deal of money on oil operations, money that would be recouped in years to come. We now operated six oil wells in northern Kenya, and that many again off Zanzibar Island, the potential revenues huge.

In conjunction with an enlivened and proud Somalia, we began laying train tracks the short distance from the coast near Mogadishu, towards Mawlini, through northern Kenya and towards Southern Sudan, thereafter to turn west and join up with track growing from the northern tip of the DRC and heading east. When finished, the line would be as long as the Tanzanian track, an offshoot passing by Mawlini.

Equatorial Guinea

The UN met to discuss events in Guinea, as we had requested. They passed a resolution that encouraged the African Union to intervene; not to send peacekeeping troops, but to intervene, a dangerous precedent for Africa. As such, a full vote of the African Union rejected it.

That did not deter those nations that we were in bed with. Kenya, Somalia, the DRC, and even Zambia committed troops under the UN remit, a force of some eight thousand soldiers rallying in western DRC, and shown nightly on all TV news channels around Africa. As predicted, the Guinea Army Junta stole what they could and ran off into the hills, our soldiers landing unopposed.

Equatorial Guinea was a tiny country, and it took just a day to seize the territory; we seemed to have more soldiers on the ground than there were members of the indigenous population. Rescue Force set-up camps and began the hearts and minds campaign, the Cuban medics pouring in.

As far as nation building went, Guinea would be very cheap, not least because it was already oil rich. It was fair to say that it took three days to overrun, and to start rebuilding the tiny state. We put members of our corporation on the throne, with a group of Africans from the nations that had taken part, and advertised for presidential candidates to come forwards. That vote took place just two weeks after landing, an existing politician elected. He then had the task of selecting a cabinet and building a democratic country from the ground up. He did, however, have the benefit of Pathfinder bodyguards and a permanent garrison of a thousand Rifles to deal with any problems. It would not be difficult for him. But across Africa, various leaders had watched the events unfold with some trepidation, their own claims to power dodgy at best.

Hardon Chase kept his promise to visit Tanzania, eventually, and dropped in on Nairobi, the Congo and finally Guinea. And we issued contracts to American companies. The DRC corporation bought several Boeing airliners, thousands of computers, and US steel makers were invited in to open up plants. Since we had planned on doing that all along it was no big deal, it just made President Chase look better.

The day he returned to the White House, the first 747 lifted off from JFK, New York, packed full of tourists. It landed at Goma International Airport, doubling the weekly passenger throughput in one go, its passengers bussed to various lodges in the Great Rift Valley, where cute lion cubs awaited those from the concrete jungle.

Everything was going well, even Shelly was doing better with her nightmares. She was also old enough now, just, to play football with, to play catch with a tennis ball, and go diving in the pool with her child-size diving gear. The little lady was growing up quickly, her sister already toddling. And Shelly, she mothered her younger sister, making us very happy parents. We'd often let Shelly feed her younger sister under our careful gaze.

Shelly's features were changing, Jimmy often saying that he could see the older version of our daughter now, the adult within. We arranged a tutor for Shelly, since we did not wish the added security risk of sending her to the local nursery, and Cat taught Shelly basic reading or writing skills, as well as engaging her in educational games; our daughter was already a reasonable chess and draughts player. Unfortunately, pawns were "prawns" and she often took pieces that she liked the look of, rather than for a tactical benefit. She liked bishops and prawns.

Then it happened.

One quiet day in early March, after I had caught up on the day's work, I turned off the monitor of my computer in the main office and said goodnight to Jimmy, soon immersed in my other world, the family world. With Helen cooking, I cleaned and fed Lucy, and spent ten minutes explaining to Shelly why the squirrels in the trees outside did not get cold at night.

Easing up, time started to move slower than normal. I remember the images, but they're distorted. I just remember that time slowed down.

Shelly ran up the stairs to the toilet, slamming the door. A minute later I heard someone coming down the stairs, a very slow walk. Turning, I saw black combat fatigues first, webbing and belt. Boots. Mud stains on the stairs magnolia carpet.

I walked around the sofa, puzzled. At first I thought it was one of the security staff, but I did not recognise the clothing, or the face. Security at the house was based on one single premise – we all knew the faces. No new faces were allowed. This was a new face; a smirking new face, a man in his thirties with muddy boots, on my stairs.

He stepped down to my level. 'You need better security, mate.'

I stood three steps away from the man. Helen had peeked out of the kitchen at the sound of an adult voice, thinking it visitors. At the time I didn't notice her, I was focused on the stranger, and his muddy boot prints. I don't know how long it took, but it seemed like

ages; it seemed to take ages to register the threat. This man had come down stairs with muddy boots, and my daughter was upstairs. He was between me and Shelly, a bad place to be.

His mistake was not knowing about the history, either the blood, or my martial arts training from Jimmy. Still, I was the one who was afraid. I don't remember at which point I made the decision, but I moved. Thankfully, I moved as I had been taught to.

The intruder stood three steps away. Like an amateur, I took a large step, halving the distance, raising my left arm as if to grab him. But that was where my amateur days ended. I slammed my foot down, causing a pause in my movement, and buying me half a second. The intruder moved to one side, as he should have done, fully expecting me to keep going in a straight line, the laws of physics applying. But I had stamped down hard with my left foot and moved all of my weight onto it. He moved to my right, a mistake that anyone could have made. My kick hit him in the solar plexus, my opponent bouncing off the doorframe with a look of abject shock and surprise. Bending my left knee, I slipped forwards, my right arm extended, my hand flat. I fooled him a second time, falling to my knees and slicing up with the inside of my hand, catching him in the throat. It was a lethal blow; I knew that the instant I had landed it.

Helen had seen the man and panicked, hitting 999 on the house phone as I lunged. An alarm was now sounding, followed by an indistinct tanoy message.

I don't know how long I stood there, but it must have taken Jimmy half a minute to get to us, opening the door with the keypad, and to be knelt over the body. He turned the man over and checked for weapons first, opening the man's jacket and patting him down. He then lifted the man's head and checked his face. Checking the man's pulse, Jimmy said, 'He'll be gone a few seconds.'

Standing, Jimmy stamped down on the man's knuckles, both sides. He then lifted the man's face and punched down a moment before Big Paul and Karl arrived.

'Paul, upstairs! Karl, perimeter!'

Big Paul thrust his pistol up the stairs, Karl running out.

Jimmy stood, taking a moment to stare down at the man as the life left him. Turning to me he stopped, glanced at Helen and beckoned her closer. He hit me before I even registered it, and I was soon sliding down the wall, a shriek issued from Helen. He then hit her, knocking her down besides me. Lifting me quickly up by the

wrist he hit me again, leaving me dazed, Helen screaming at him to stop.

Jimmy knelt and faced us. I had a hand to my nose, Helen a hand to her mouth, blood visible. 'Now listen carefully, very carefully. Paul, you've killed him. Self defence, sure, but that could still be seen as manslaughter – seven years in prison. There's no guarantee that this will go away. So this is what happened. You found an intruder in your house, at the bottom of the stairs, Shelly screaming upstairs. You panicked and tried to get past him but he knocked you down, Helen joining in the desperate fight to get upstairs to Shelly. After a struggle, you hit him in the throat, as much by accident as anything else – since you *do not* study martial arts. Don't forget, you *do not* train with me.'

Helen was sobbing by this point, and I was bleeding all over the carpet.

Jimmy continued, 'When the man collapsed you sounded the alarm, but were in a daze, not thinking about an ambulance for him. You rushed to your daughter and the rest ... the rest is a blur.' He stood and lifted the house phone, dialling the police. 'This is Jimmy Silo, we've had an incident at the house, two injured, one looks dead. I'm declaring a terrorist incident, send police and ambulances.' He put the phone down as Big Paul came downstairs.

'Clear! And Shelly, she's on the toilet. He came in the window in her room; there's a mud trail.'

'Big Paul, when you arrived you checked this man and found no pulse. Now, make an attempt at CPR, break a few ribs.'

Big Paul got to work, Jimmy lifting me and Helen up and seating us on the sofa. 'I'm going to get Shelly and distract her for a while. Now, is there any part of that story ... that is not clear?'

We shook our heads, faces covered in blood.

'Remember, it was a blur, you were terrified for the kids, you can't remember much. When the ambulance gets here go to the hospital, and make sure that you're seen to be hurt. The police will want a statement in the morning, so concentrate on that possible jail term.'

He walked upstairs as Keely came in, pistol in hand. He observed Big Paul's half-hearted attempts at CPR before stuffing his pistol down the back of his trousers. Approaching us, he asked, 'Are you OK?'

I nodded, Keely fetching kitchen roll and a damp towel, helping to clean us up as Jimmy distracted Shelly.

Sykes received a call at home.

‘Sir, operations. There’s been an incident at Jimmy Silo’s house: two injured and one dead.’

‘Get me a car and a helicopter, right away.’ He dialled Jack. ‘Jack, what the hell happened?’

‘Someone broke in, got into a fight with Paul and Helen. They’re a bit busted up, but the guy is dead.’

‘Do we know who it is?’

‘They’re saying he’s British; ex-SAS.’

‘Christ. I’m on my way. When you know anything further, I want to know.’ He dialled the Prime Minister at Number 10, Downing Street. ‘Prime Minister, there’s been an incident at Jimmy Silo’s house, an intruder.’

‘They alright?’

‘Paul and Helen have been injured, the intruder dead.’

‘Dead? Who killed him; one of ours?’

‘No, Prime Minister, it looks like Paul killed him, hand to hand. And the intruder is one of ours.’

‘One of ours?’

‘Ex-SAS they’re saying.’

‘Sent by an agency here?’ the Prime Minister gasped.

‘Unknown at the moment.’

‘Jesus. I’m going to call the local Chief Constable, then the head of MI5 and shout a little. Let me know if you find anything.’

‘I’m on my way there now.’

Hardon Chase was in the middle of a meeting with a group of Republican Senators.

His Chief of Staff burst in. ‘There’s been a terrorist incident at Jimmy Silo’s house. Two injured, one dead.’

Chase was up and out the door, the Senators shocked. ‘Get hold of our man at the house, I want a full report. I’m going to try and reach the British Prime Minister.’

Within twenty minutes, US news services were reporting an “armed” incident at the house, one dead and many wounded. That story went right around the world, many of the world leaders we knew calling the British Prime Minister.

Some time later they led us out, lots of flashing blue lights, a helicopter overhead. One ambulance crew attended to us as another rushed into the house. Given who we were, they were taking no chances, an armed officer in the back with us, an escort to the local

hospital. Somehow, Karl managed to get there before us. We jumped the queue in the waiting room and went straight through to a surprised doctor.

‘Paul Holton. Christ, what happened?’

‘Intruder at the house,’ I responded.

Two other doctors stepped in. Lights were flashed into my eyes, and I followed a finger back and forth and up and down, falsely complaining of some discomfort. They put a stitch in my lip, checked my head thoroughly for lumps and bumps and then examined my neck and spine at length; they were taking no chances.

After thirty minutes of fussing, I insisted we were fine and signed a note to that effect, explaining that our private doctors were on their way to the house. I thanked them and nudged Helen out, the smell of hospitals doing nothing for me. We found more police officers in the waiting room than at a football match, and they flanked us as we left, half a dozen local photographers snapping us. The police bundled us into a Range Rover, Karl driving, but a uniformed police officer sat next to him, his radio buzzing.

Fifteen minutes later we arrived back, having gone through two roadblocks already. Four police cars were parked outside the gate, probably ten around the house, the helicopter still overhead. As I stepped down, helping Helen, I could see a dozen police dogs.

Karl said, ‘You’ve got to sleep in the old apartment, kids are in there with Jimmy. Forensics are all over your place.’

We were escorted inside, meeting a worried looking Han in the hall. ‘You are OK?’

‘Just cuts and bruises. Thanks.’

Outside of my old apartment we found one of Karl’s colleagues sitting on a chair with a paperback. He knocked the door as we neared, Jimmy opening it.

Shelly jumped up. ‘You were very silly, daddy.’

I stared at Jimmy, kneeling to hug my daughter.

Shelly added, ‘You must not run fast, you hurt mummy.’

‘I’m sorry, baby. I was ... running too quickly.’

Helen checked the baby, finding her asleep, clean and fed; Uncle Jimmy’s work.

Jimmy lifted Shelly. ‘Come on, young lady, mummy and daddy have baddies on their faces and they want to go to sleep. All better in the morning.’

With the door closed I stood over the baby, suddenly terrified. That bastard could have hurt my family; he could have killed us all. And I wasn’t at all sorry I had killed him. Helen and I had said not

more than two words since it had happened, and now Helen burst out crying, sitting on the edge of the bed.

I sat next to her. 'Sorry.'

'You didn't cause this.'

'No, but I killed him. And if the police want to be difficult...'

'They won't. Look outside.'

'It's down to the courts, and the papers will be full of it. Jimmy can do a lot, but I don't know if he can swing this.' I forced a big breath. 'Come on, hot bath and clean clothes.'

After a long hot bath and a cup of tea we felt better, and sat watching the TV with the sound turned down, still both a little stunned. An hour later Jimmy knocked and I let him in.

'You better?' he asked.

'A bit. Any ID on that guy?'

'Yes, I know him.'

'You know him?' I puzzled.

'He applied for a job with us, he's ex-SAS. This ... was supposed to happen a year from now, and he was supposed to wake me up. It's an aberration in the time line. And he would not have hurt you, he just wanted to show us how clever he was by breaking in. He was after a job.'

Helen and I exchanged looks.

'You think the police will be a problem?' I asked.

'We've never been more popular, so I can't see a jury convicting you of anything. Still, it has to go through the motions. If lucky, Sykes will stick a judge he knows on the bench.'

'You hit me,' Helen softly stated, touching her face.

'Sorry. Had to be done.'

'I have a loose tooth!' I told him.

'At least you have defensive wounds, and the doctors have seen that, so too the police. I've told the police you'll make a statement at 9am, and our solicitors will be here.'

'How many police are outside?' I asked.

'Probably a hundred; roadblocks at a mile, five miles and further out. Prime Minister has been on the phone twice, Sykes and a few others. Even Hardon Chase. There's an SAS counter-terrorism team here as well.'

'News will be bad,' I mentioned.

'Be every reporter in the world here tomorrow. At the moment, every news channel in the world is running the story as a major terrorist incident. A few think you've been shot.'

‘Fucking hell,’ I let out. ‘That stupid fuck ... coming into my house like that. If he wasn’t dead ... I’d kill him again!’

‘Cat’s here. You want her to take Lucy?’

‘No,’ Helen quietly insisted.

A knock at the door preceded a tray from Cookie, Jimmy placing it down for us. We had missed the meal that Helen had been cooking. Now the hunger hit us and we tucked in.

Outside, Jimmy called the house security staff together as blue lights flashed and the police searched the grounds. Lined up were Big Paul, Rob the dog handler, Ricky, Karl and his three police colleagues.

‘OK, gentlemen, no one ... will be getting any sleep tonight. You will, however, figure out how that idiot got in, and track back to see if he was alone. Then, you’ll think of ways to prevent it happening again. Granted, he’s an expert, but we need to be able to defend against such people. So, you are all docked two weeks pay, except Big Paul, who’s docked a month’s pay – because he’s head of security. And that fishing trip you were going on, the one I was going to pay for, that’s cancelled.’ They glanced at each other. ‘You’ll start with the cameras, looking at the time line, and work backwards from there. And gentlemen, you are all now in my bad books, not a good place to be for anyone. If Paul, Helen or the kids had been harmed – then some of you would have been in the ambulance. You will learn from your mistake, and you will plug the hole by end of play tomorrow – or you may not be here. Dismissed.’

At 5am Jimmy knocked, finding us up and dressed, Lucy on the bed and making reassuringly loud and nonsensical sounds.

‘Half the world’s media at the gate,’ Jimmy informed us. ‘They’ve been camped out all night. Good job we have two fences. Thousand faxes downstairs, handful of telegrams, couple of dozen phone messages, and a million emails. The usual.’

‘Nice to know we’re popular,’ I quipped.

‘Not with the Prime Minister you’re not, he was up all night, a few world leaders kicking his arse over lax security. Oh, Sykes is here. Going to be hell to pay because the guy’s British, and ex-SAS. Prime Minister told the head of MI5 that if any UK agency had motivated your attacker... well, it will be ugly in the corridor of powers today.’

‘Have you spoken to the press?’ I asked.

‘I will do, at 8am, at the gate. Can’t say much without the police getting pissy though.’

‘What have the police said so far?’ I asked.

‘They all think the guy broke in and attacked you,’ Jimmy reported. ‘And why wouldn’t they. They only have to look at the way he was dressed. At the fence they found climbing gear, a thermal camera, and a thermal suit to fool the sensors. He even had chemicals to fool the dogs. Big Paul says he crawled in the thermal suit for forty minutes to reach your house, a blind spot where he climbed up. Shelly opened the window, she remembers doing it. Oh, and the trees in front of your house – Big Paul took to them with a chainsaw. It looks like an Amazon logging operation gone wrong.’

‘He could have killed us,’ Helen delicately pointed out.

Jimmy stood. ‘No. I know who the men are that will try and kill you. You have a few years yet.’

He left us with that pleasant thought.

At 8am Jimmy faced the press at the gate. ‘Please quieten down so that everyone can hear what I have to say. Thank you. Last night, at approximately 8pm, a man – a former British soldier – entered the grounds and reached the house of Paul and Helen, where he climbed in through an upstairs window. He then seems to have attacked both Paul and Helen, injuring them both, but nothing serious. They were both seen by the doctors last night and had a few stitches put in. They’re feeling much better now. During the altercation, the intruder was struck about the neck and throat and died before an ambulance arrived, our security staff giving the man CPR. This man - the intruder - was known to us; he had applied for a job as a security guard or bodyguard, and may have gained access to information about our security. That is something that the police are looking into.

‘I would like to take this opportunity to thank the local police for the quick response, and for the thorough job they did of securing the area. Paul and Helen would also like to thank all those who sent messages. Now, given that the police are investigating the matter we can’t say anymore yet. Paul and Helen will be interviewed by the police, here at 9am, and we may have a further statement available after that. Thank you for your patience, and our staff will be down in five minutes with some food and hot drinks for you, especially those who camped out all night.’

He walked off to a chorus of shouted questions and a million camera flashes.

At the 9am interview our solicitors were present, and the police were already stretching the rules a little by interviewing us here instead of at the police station. They asked if we were OK, and well enough to undertake the interview.

Helen and I used the word “blur” a lot, “dazed” and “stunned”, and came across as quite forgetful. After forty minutes of repeating the same story in small detail, they concluded with a few questions that annoyed me greatly.

‘Did you shout a warning?’

‘Did you call the police first?’

‘Did you ask him to leave your house?’

I was on my feet. ‘I was terrified, my daughter screaming upstairs! No I didn’t ask him to leave after he knocked me down, you fucking moron!’

Our solicitor calmed things down and asked the police to conclude quickly or leave. The police thanked us for our time and left, Jimmy taking time to speak to them outside. Now we would have to wait.

An hour later I entered the office, getting odd looks from the staff, and sat at my computer, opening up the emails and flicking through them. When Shelly ran in I sat her on my knee and allowed her to help. After all, all she had to do was press the “DEL” key to delete. When Sharon got ready to go home at 4pm she stopped next to me, a hand on my cheek. We said nothing before she left. I continued to check emails and faxes, responding to a few. I created a generic “thank you” email and cut-and-paste it into many replies.

Jimmy walked in an hour later. ‘Still at it?’

‘Lot of African politicians, even some African schools. Even got some from the brain-trust kids in China.’

Jimmy seemed worried. ‘How did they sign it?’

‘Mombassa farming students studying in China, nothing more.’

He seemed appeased. ‘You holding up?’

‘I think so, but still annoyed as hell. We’re trying to save the fucking planet and ... and all this shit.’

‘Your house is ready. We’ve cleaned it, explosives sniffer dogs have been around, and we checked for bugs. Nothing. He came in through the window and walked downstairs. Do not ... have issues about re-possessing it.’ He stood. ‘Come on.’ We grabbed Helen and the kids and walked around, still a handful of police in their bright yellow coats about the grounds.

Everything in the house seemed the same, the heating on. The meal that Helen had been preparing was gone, the pots and pans

cleaned by Cookie and Sandra. The magazines on the coffee table were where I left them, a book with pages dog-eared. Shelly ran and grabbed her favourite toy, not noticing anything different.

Jimmy got the kettle on as Helen reviewed what had happened to last night's supper. 'Paul,' he called. 'Go check each room upstairs: private stuff, personal stuff.'

I did as asked, not noticing anything different. I even looked under the beds and in the cupboards. Back downstairs, Jimmy handed me a mug of tea and asked if everything was as I left it.

I shrugged. 'Think so.'

He sat Helen and me down. 'Now listen. Some people, after they've been broken into, have issues with the house they live in, often not wanting to return to it.'

'I'm OK being here,' I softly insisted, turning to face Helen.

'It ... feels a little odd, but I'm not leaving.'

'Good attitude,' Jimmy commended, Shelly running and jumping on him, spilling his tea. 'All you need now is a daughter instead of a little monster.' He faced her. 'Tell mummy and daddy what you did.'

'I didn't do it,' Shelly insisted.

'Then how did the orange juice get all over my computer?'

She shook her head and hid behind a cushion.

With Jimmy gone we reclaimed our family life, glimpsing both the police and our security staff through the windows as we cooked a meal. The next day, diggers arrived and tore up the roots of the threes that Big Paul had cut down, the holes filled in and flattened, grass seeds sewn. The house now stood isolated, but also difficult to approach unseen. Three extra cameras had been installed, a few trees near the fence cut down.

The Director Of Public Prosecutions made no case against us, the coroner recording a verdict of "Death by misadventure". So far, I was in the clear. Things returned to normal, a few extra private security guards to be seen dotted around the grounds. And the windows in Shelly's room were modified so that they only opened an inch or two.

A month after the incident at the house, and with me getting a little bored of the daily routine, Jimmy stepped into the office and told me to pack a bag. We flew down to Goma International Airport, then drove the short distance around to the airport hotel that we had built, Jimmy explaining that there was now a conference centre at the rear. And what a conference centre!

‘What the fuck is that?’ I asked.

‘In the future we’ll make this available for African Union meetings. And ... others.’

‘Others?’

‘Wait and see.’

We walked past security guards and into the conference centre, to a side room to meet a delegation from Malawi. I knew where their country was, just south of Burundi down the lake and nestled between the Zambia and Tanzania, at the tail end of Lake Tanganika. It was a small country, and dirt poor; we did not even repair the roads through Zambia toward its border. Our senior people from the corporation were present, as well as representatives of CAR. We had met with them first, in a separate room, before walking in to meet the President of Malawi, a country with a GDP just over what our nightclubs made. We played like politicians and smiled nicely, shaking hands and settling about a brand new table.

‘Welcome to the Democratic Republic of Congo,’ Jimmy offered our guests.

‘Thank you ... Governor,’ their President responded with a smile.

‘How can we help the Government of Malawi?’

‘We are a poor nation, with little to offer in the way of mining or oil, but we can offer road links between Tanzania and your southern region here. And we would be happy to co-operate on a train track across our territory.’

‘That’s good to know. Now, what’s really on your mind?’ Jimmy bluntly asked.

They blinked.

‘Well, we are seeking – obviously – to help develop our country.’

‘We could offer you cheap petrol, I guess that would help,’ Jimmy suggested.

‘It would, yes. And we have areas suitable for tourists, many animals.’

‘Let me be frank. How much help do you desire?’ Jimmy posed.

‘We are ... grateful for any assistance that you could offer our country.’

‘But ... you would like a lot of assistance, yes?’

‘We are willing to ... co-operate on a wide range of matters.’

Jimmy eased back. ‘I’d be willing to invest heavily in your country, but I would expect our interests in your country to operate in the same way as they do here, and in Zambia and other countries. First, you would sign over any and all mining and oil rights to CAR. Then, you would co-operate on raising a regiment of Rifles, plus special police officers. Then I would build safari lodges for tourists, and obviously build many orphanages, schools and hospitals. I would also build roads and rail links across your country. But I would not do any of that unless the security situation in your country was ... as I desired it to be.’ He waited as they exchanged looks.

‘We would ... hand over the security of our nation to you?’

‘Can you think of anyone you could trust more?’ Jimmy countered.

‘Look at the Congo?’ I put in. ‘Free busses, low crime, much new building work.’

‘And you would pay for the police and the soldiers?’ they asked.

‘We would,’ Jimmy replied. ‘We’d pay for all of it. And if we found minerals on your land you would benefit. But I don’t know of much in the way of minerals on your land.’

‘An interesting proposal,’ their President noted. ‘And one that we will consider seriously.’

‘Don’t take too long,’ I said. ‘We have yearly budgets and we’ll spend this year’s in the next week or so. Since Burundi want the same as you ... we’ll have to decide.’

They did not look happy. ‘You are talking with Burundi?’

‘This afternoon,’ Jimmy explained, which was a good guess on my part.

‘And if you decide to go with them...?’

‘Then we would not have much of a budget left to help you,’ Jimmy acknowledged.

‘May we discuss this for an hour?’

‘Of course, use the hotel,’ Jimmy suggested. ‘Have some food.’

We broke the meeting and told our people to stay close, but nudged them back into the room we had found them in. Jimmy led me to the main auditorium, a barn of a place with seats for two thousand, desks at the front with computers and translation units - headphones linked to translators sat in unseen rooms. We sat on opposite sides of the aisle, the room ghostly quiet with just us in it, and reminding me of a cinema.

‘Could hold a concert in here.’ I said.

‘They’d wreck the computers. No, this will only be used a few times a year. After I’ve upset the African Union.’

‘Done that already with Guinea.’

After a quick bite to eat we re-convened the meeting.

The President of Malawi offered, ‘We will be happy to have your assistance, and will co-operate fully.’

The CAR staff handed over a document.

‘That signs away your oil and mineral rights to us for twenty five years.’ Jimmy then slid across a separate document, quite a thick document. ‘That agrees to our assistance with the police and the army. It also details the formation of a Rescue Force unit, medical assistance programme, a clinic building programme and the construction of orphanages, roads and railways.’

‘And all of this...?’

‘Will began very quickly after you sign,’ Jimmy nudged.

They signed the documents and handed them back, copies given for them to study. A photographer stepped in, the group posing for a few snaps. He was accompanied by a reporter for the African Times. We sat again, and answered questions about the deal, and what we hoped to achieve. That led us to lunch at the hotel with our team, preparations made for the next meeting, that of the Burundi Government.

We met them in the same room, but they were not as reserved as the delegation from Malawi. They offered all mining concessions in Burundi to CAR and signed the document without even looking at it, then signed the same civil co-operation document that Malawi had signed, a sign-up to the full package. It was quick and simple and ... when could you start? The photographer snapped more shots, and the same reporter asked very similar questions.

The final piece of business was with a team from Kinshasa, and representatives of Congo Airways, who were still flying DC3s held together with string and tape.

‘We’d like to take over Congo Airways,’ Jimmy told them.

They shrugged. ‘OK. When?’

I hid a smile. These guys did not have a clue, or give a shit.

‘We’ll call it Central Africa Airways, and integrate it with the existing aircraft we’re running. The headquarters will be here, Goma International Airport. Flights will come down from Europe, then across to Kinshasa. We’ll use some of your existing aircraft, but lease more.’

He handed over a document, and the airline, what it was, signed alongside the government representatives. We dragged back in the photographer and smiled for the snap, giving an interview to the reporter again. That led to a coffee break, followed by a meeting with officials from Zambia.

‘We’d like to run an airline into Zambia. We’ll fund it, you get nice new shiny aircraft maintained by us here.’

‘Where do we sign?’

I smiled widely, shaking my head.

Next came a delegation from Rwanda, the final meeting for the day. We asked for slots at their airport and they were delighted, they’d be getting subsidised flights around Africa and to Europe.

We stayed the night in the hotel, finding it very nicely decorated and with great facilities. It did not offer a rooftop bar, not least because the area offered a high annual precipitation, but it did offer an indoor pool on the top floor, views out over the airfield. I found the infinity pool disturbing, because it seemed to drop away a hundred feet to the runway. Doing lengths, you felt as if you’d fall off the end and to your death on the concrete far below.

The next morning we entertained representatives from Boeing and Airbus, British Airways, Air France and Lufthansa, welcoming them into the same room and offering tea and coffee. The airfield’s apron now housed four aircraft, quite a crowd for the air traffic controllers. Jimmy produced a map of Africa and laid it out on the table. With a red marker pen he drew a line from the top, down into Goma airport, then out to Kinshasa, to the regional airports, to Zambia, Malawi, Burundi and Rwanda, and further to Kenya and Tanzania.

‘Gentlemen, we have – yesterday – taken over Congo Airways, and it will be integrated with our existing aircraft into a new entity called Central African Airways. That airline has been granted slots at all of the places marked on the map. As far as Burundi, Malawi and Rwanda are concerned, we will have primary slots. I will also be entering into talks to take over Kenyan Airways, Tanzanian Airways, and Somali Airways has already agreed to integrate with us. That leaves Sierra Leone, Liberia and Guinea, who we believe will join shortly. And, as you may already know, we are just about to open our own aviation fuel producer here.’

‘And if a BA flight lands here, what landing costs?’

‘For the next few years ... none at all. Fuel at half price.’

‘Half price?’ The man laughed. ‘Can we fill up here and fly on to Australia?’

‘If you like.’ Jimmy waited.

The men glanced at each other.

‘You’ll be wanting more stock?’ the man from Boeing realised.

‘Yes, we will. Lease to start, some to buy. Right, anyone who sends down a 747 from Europe will receive subsidised fuel, starting at seventy-five percent off the normal price. That makes it cheap, and viable, for you to bring down tourists – as well as oil workers.’

They seemed keen.

Jimmy pointed at the man from British Airways. ‘Mondays.’ To the French he said, ‘Wednesdays.’ To the German he said, ‘Fridays.’

The BA representative asked, ‘If we land here, and go onto another African destination...’

‘Your fuel will be subsidised. So if you drop off oil workers, re-fuel, and take people down to Cape Town, that leg has a massive fuel saving.’

‘And the return leg?’

‘The same, whilst the agreement is in place.’

‘And internal flights?’ they asked.

‘Are negotiable, but we’ll be trying to conquer that market ourselves, subsidising the costs.’

‘Are you looking for slots in Europe?’ they asked.

‘No, not beyond those held already by the airlines I’ll take over; that’s your area. I’m more interested in the internal flights to and from the hub, this hub. For those of you interested, office space at the airport is free for a few years at least, local staff cheap enough.’

Lufthansa cheekily asked, ‘We can have an office here ... free?’

‘Yes, move in when you’re ready. There are apartments for your staff nearby.’

Airbus asked, ‘What aircraft will you be interested in leasing or purchasing?’

‘We’ll make that assessment soon, and then judge the routes and passengers. At the moment I see a need to lease five Boeings and five Airbuses, then to buy when we know what routes we’re principally interested in. I will, however, wish to hire maintenance teams from both manufacturers and base them here, kind of straight away.’

They offered to price it up and send in quotes. We discussed onward tickets between the airlines and we were happy for joint ticketing for onward journeys. Each airline agreed to open their own check-in desks, and each agreed to help advertise the safari lodges through their holiday outlets. Having made them fresh tea and

coffee, we left them to chat and stepped next door, where the CAR staff waited.

‘CAR will own the new airline,’ Jimmy explained. ‘Get the wheels moving, and get the lawyers on it. Airline staff will arrive soon, as will maintenance staff. We’ll all fly to Kenya in an hour, so go and pack.’

We stepped back into the airline representatives and thanked them for flying down, asking them to have a good look around the airport’s facilities, the main reason for the visit. Packed, we checked onto one of our own flights and took off in an Airbus, turning east towards Nairobi. The plane landed at a very familiar airport at dusk, the usual compliment of soldiers greeting us. There was a time when I was anonymous, and I missed those days. They whisked us around to the hotel, Rudd and Cosy waiting in the bar. Arrangements had been made for the next few days, all in order, and talk turning to families. They stayed for a meal, and we caught up on the mundane and the important, Rudd reporting that the African Times was killing a national Kenyan paper. Since Jimmy aimed to kill many papers, we were not perturbed by the news.

The next morning we met with the Government, and Kenyan Airlines – who were struggling. We got straight to the point and made a hostile bid for the airline. The Government were happy, the airline sitting on large losses and trying to get the best deal they could. When Jimmy offered to wait till they went into administration they caved, a sum agreed. The photographer and reporter did their bit, and the news would hit our paper in the morning.

With the hostile takeover sorted, we met Cosy and Rudd again and drove around to a local college where we had just delivered two hundred new computers. The African east coast fibre-optic cable had been trunked from the offshore Internet cables and Nairobi was now wired up for better access. With TV crews filming, we sat behind screens and called up the African Times, reading the detail of yesterday’s meetings. That complete, our faces on the TV news, we drove down to Mombassa and the orphanage. Outside the main orphanage we inspected the new technical college, also now fitted with new computers and wired for Internet access, three hundred sixth formers attending.

In the main orphanage we greeted Anna, getting an update on statistics; five thousand kids, many day attendees. And twenty-six “special” kids from the Congo had been flown to Shanghai in a roundabout way, on Chinese transport planes, they reported. As a

group, we inspected the farm and its agricultural college, finding several classes of students up from Zimbabwe.

Jimmy and I met up with the CAR staff at the golf complex, and we stayed the night, greeting Kenya businessmen and tourists in the bar. In the morning we flew from Mombassa field down to Dar es Salaam, and met the Tanzanian Government. The news was mixed. The oil production was good, the revenue great, but the locals on Zanzibar were kicking off, provocateurs working out of the religious schools. The oil terminal had been ring-fenced and security tightened, but sabotage was an issue, one small bomb detonating. We made arrangements for supplies to arrive by boat, thereby further isolating the oil operations from the indigenous Muslim population. Beyond that, not even Jimmy could think of anything to do to ease tensions on the island.

We asked about airport slots for the new airline and enquired about two minor Tanzanian airlines, both struggling. The Tanzanians agreed to speak with them and ask about a merger with us. We agreed to another rail terminal and signed a document, soon back on the plane and flying direct to Mawlini, the CAR staff still with us. Coming in to land at Mawlini, I could see several new compounds out in the desert. When I asked Jimmy about them he said it was a surprise.

Mac picked us up in a jeep. 'A railway! They're building a fucking railway up here.'

'Oil transport,' I told him. 'Besides, you'll be able to get the train to ... Baardheere and Mogadishu.'

'Great, I was thinking of holidaying there!'

'It'll run thirty miles north at the closest point,' Jimmy informed him as we drove around to the hotel. Booked in, and luggage dumped, we climbed the stairs to the rooftop bar.

'It's good to be back,' I said as we emerged, finding the bar well attended with RF staff. Most of the new recruits stood, but were waved down by Jimmy. We grabbed a table and ordered beers, and I filled my lungs with the smell of the desert, noticing a familiar and welcoming orange glow on the horizon.

'How's the new house?' Jimmy asked Mac.

'What new house?' I asked.

'There's a new estate south of the camp,' Jimmy explained. 'The senior staff now live there, plus some oil workers.'

'Utopia we call it,' Mac joked. 'Very posh.'

'How're the Zimbabweans?' Jimmy asked Mac.

‘Good, all fresh faced and keen. Not that keen on the desert to start with, but a good bunch.’

‘And our American cousins?’ Jimmy asked.

Mac explained, ‘They made the mistake of joining in a few activities with the Rifles, some hurt, but now they mostly stick to what they’re good at – and teach on a blackboard! Hal and the others drink over there sometimes, at the Hawaiian Bar.’

‘Got the film?’ Jimmy asked.

‘Aye, all set for 7pm in the lecture theatre.’

‘Film?’ I repeated.

‘Lassie come home,’ Mac joked.

‘Cassie and Anton,’ Jimmy explained. ‘This is the unedited version.’

‘They’re here, and the nipper,’ Mac explained.

‘No maternity leave?’ I queried.

‘She’s on leave, Anton working here, so she stays here. Helps out a few hours a day.’

‘I though they’d quit,’ I admitted.

‘They love us too much,’ Mac quipped. ‘But they are looking at hospital jobs in the States somewhere.’

After a cool beer we drove around to Camp Delta, pulling up at the Officer’s Mess. Inside, we found Ngomo, now Colonel Ngomo.

‘What you doing here?’ I asked. ‘Shouldn’t you be in Nairobi driving a desk?’

‘Ah, what burden it is to be promoted,’ he let out. ‘But if I get ahead with the paperwork I can fiddle a trip or two up here.’

Jimmy shook his hand and we sat, a waiter bringing over a jug of water. ‘You’ve come a long way since we recruited you, old friend.’

‘From sleeping on the floor, to fighting in the desert, to the jungle, and now fighting with bureaucrats and politicians. I prefer the snakes of the jungle. And being shot at would be ... refreshing.’

We laughed.

‘And what of Afghanistan and the Somalis?’ Jimmy asked.

‘They have caught some al-Qa’eda men in the north, tortured and skinned alive.’

‘Any problems for the men?’ Jimmy asked. ‘After ... Afghanistan?’

‘Yes, they want to go back and do it again!’ he said with a smile. ‘Now the Somalis want to invade Yemen; they see the fighters coming across.’

‘And how is Abdi?’

‘He grows weary of his President. I think they will ... clash.’

‘Let’s hope cool heads prevail,’ Jimmy said. ‘And what of the living legend that is Colonel Ngomo, now in charge of the Rifles? How many kids now?’

‘Seven.’

‘Seven?’ I repeated. ‘Christ. When do you find the time?’

Ngomo laughed. ‘One wife, one ex-wife, but they both live with me.’

‘Bet you’re glad to go off to war!’ I said, making him laugh louder.

‘How are the young Zimbabweans?’ Jimmy asked.

‘They are making good progress, yes. We will return them in good condition. And your American friends, they ask about ... the detail of the mission to Afghanistan.’

‘I hope that you are discreet.’

‘I pretend to be stupid. That works with the politicians as well! So, sir, do you have any wars for me?’

‘No, sorry,’ Jimmy replied. ‘You have quelled Africa. You must get your portion of danger in your kitchen.’

Ngomo laughed. ‘And in Guinea they ran away, sir.’

‘Your reputation precedes you,’ Jimmy offered him. ‘Anyway, be happy that there’s less fighting. Enjoy the peace.’

We toured the camp, meeting some of the recruits as they trained under floodlights, and returned to the rooftop bar for a meal before the show. In the lecture theatre we found it packed, Cassie and Anton in the front row, Cassie sat with the baby.

‘Isn’t there a rule about babies in cinemas?’ I asked, closing in and holding the baby’s tiny hand.

‘We’re the stars of *Lassie Come Home*, so it’s OK,’ Cassie explained.

‘They haven’t been taking the piss, have they?’ I quipped, shaking my head.

Coup got the projector working and the room lights were knocked off.

Jimmy stood in the beam. ‘I’d like to watch this without howls of derision, so kindly shut the fuck up, there’s good rescuers.’

Everyone settled down and we caught glimpses of our people acting as extras. They flashed back to Cassie’s early life, and her family losses, the room quiet. When the actress stripped naked for the washing scene, in the spring water Cassie had found, the rude comments were plentiful. The film ended with Cassie accepting a marriage proposal from Anton. Everyone went ‘Ahhh,’ the lights turned back up.

I was very happy with it; it was very well made, and due for release soon. Cassie and Anton explained that they were renting an apartment in the new complex Mac had told me about, so we followed them to it.

South from the camp, two miles, we arrived at high brick walls and a gate with two guards. We followed Anton's jeep inside. Immediately inside the gate the road split left and right, the estate basically a large circle, and we turned left. Each house was set in its own grounds and was surrounded by plenty of mown grass, sprinklers working. These first few houses were four or six bedroom, and luxurious by African standards. As we circled around the complex I noted swimming pools at the rear of the houses.

They pulled up next to a three-storey apartment block, the apartments offering balconies, and a park opposite. We followed them up one flight of steps and into an apartment that was cool inside, nearly all white marble, or some similar material. A local woman greeted us, informing us that the food was on, Cassie explaining that all the houses and apartments here came with their own staff.

I peered out of the rear balcony, noting a large communal pool below, grass beyond it leading to a high brick wall, a security guard patrolling. Nosing into the bedrooms, I found them spacious and nicely decorated. 'All mod cons,' I quipped. 'Not quite the base hotel, is it?'

'We'll soften up here,' Anton joked. 'Still, can't have the baby in the hotel.'

'No,' I agreed. 'Those drunken twats will wake the kid at night.'

Anton laughed. 'Drink?'

'Cold beer if you have it.' I sat on a sofa and lifted the baby over. 'Hello little lady.'

'How are yours?' Cassie asked.

'Growing rapidly,' I replied. 'Food in one end, crap out the other, and they grow an inch while they sleep.'

'How old are they?'

'Shelly is four now, and growing rapidly. Lucy just about sixteen months.'

They were being careful not to mention the incident at the house; I could feel it.

'You're going to be famous soon,' Jimmy informed them. 'The film will put your faces out there for a while. Any more thoughts on a future career?'

‘Given the publicity, I’d rather be here,’ Cassie admitted, a glance at Anton and a look exchanged.

‘That publicity ... gets us new recruits for Rescue Force,’ Jimmy pointed out. ‘And that saves lives.’

They stared back for a few seconds.

‘Well, after the tsunami, everyone in the world knows who Rescue Force are,’ Cassie suggested.

‘It’s helped,’ Jimmy acknowledged.

‘Any more predictions from that guy?’ Anton asked.

‘No, no yet. How’s your father?’

‘Busy with your paper, we all read it here. It’s a good way to find out what’s going on around our regions. So, you’re buying up every airline in Africa?’

‘Many of them, yes. Be fewer plane crashes then, since we’ll bring modern aircraft in; Boeings and Airbus. And we’ll subsidise them. There’ll soon be regular flights from here to Goma hub, from there onwards to Europe and the States. Weekly flight from JFK now, make it easier for you to visit.’

‘Last trip took two whole days!’ Anton complained.

‘It’s now two hours to Goma, just under, and from there it’s direct to JFK,’ Jimmy explained.

‘Excellent. One more reason to stay here,’ Cassie suggested, getting a look from Anton. ‘Least for a while,’ she added.

‘We’re not paying for this place,’ Anton mentioned.

‘Your movie helps us, so we help you. Simple.’ Jimmy waited.

‘Very kind of you,’ Anton acknowledged. ‘And Cassie has the book royalties. It’s adding up.’

‘Has your father visited this place?’ Jimmy asked Anton.

‘No, no yet.’

‘Invite him, do a tour of Kenya, stay at the hotels.’

‘I will do.’

‘Listen,’ Jimmy began. ‘Your recruitment poster contribution will help us a lot, so I’m flexible on what you do. You can stay here as long as you like, or even think about training jobs at Mapley. We’d like to keep hold of you as long as we can.’

The meal their cook provided was tasty, and there was plenty of it. After coffee we walked around to meet the neighbours, dropping in on Mac, Jimmy explaining that Rabbit and Handy had also moved in. Well, it was a six-bedroom mansion. I rang their bell, the door opened by a local woman.

‘Yes?’

‘Jimmy Silo.’

‘Oh, my lord. Come in, come in.’

From the internal balcony, at the top of the stairs, Mac said. ‘I’m going to get a guard dog. Keep the door-to-door sellers out.’

‘Very ostentatious,’ I said, taking in the place as Mac came down the stairs. ‘Too posh for you fuckers.’

‘Way too posh,’ Mac admitted. ‘But it was cheap.’

Jimmy explained to me, ‘They pay a modest rent, the three young bachelors.’

In the lounge we sat, Rabbit walking in and joining us.

‘How’s the estate?’ Jimmy asked them.

‘Very nice, oasis in the desert,’ Rabbit reported. ‘Two minute drive to work.’

‘Who’s in the other houses?’ I asked.

‘Coup and his mate in one, Doc Hoskins and his lady in another, UN boss in one, six doctors sharing in one, Rifles Major in one - with his family of fifty kids. Hal has an apartment he shares with another flyer, some oil workers in the rest.’

‘Oil workers!’ I mock complained.

‘The mangers,’ Rabbit explained. ‘There’s only three left empty. Oh, Skids and Trev are here now.’

‘They are?’ I queried.

Jimmy explained, ‘They got bored with farming, so they teach the Rifles now. We bought back their land.’

‘I wouldn’t mind a farm,’ Mac suggested.

‘You’d last a week,’ Jimmy firmly told him. ‘Then you’d want to be back where the action is, old man. Learn from Skids.’

Mac faced me. ‘So what happened at your house? Really happened?’

‘Someone came between me and my daughter. He was dead as soon as I realised that.’

‘You were hurt?’ Rabbit asked.

‘No.’ I glanced at Jimmy. ‘The big fucker hit me to make it look like I’d been in a fight.’

‘So what happened?’ they pressed.

‘Ex-SAS trooper snuck in, taking his time, up my wall and in through an open window. Idiot was trying to impress us about how good he was; he just wanted a job. He surprised me in my lounge, so I hit him. A lethal blow.’

‘You fight?’ Rabbit asked.

I faced Jimmy, who said, ‘He’s had lessons for many years. He was never in any danger.’

‘UK police OK?’ Rabbit asked. I nodded. ‘Lucky.’ Facing Jimmy, he said, ‘UN asking for mine experts for Afghanistan.’

‘Don’t send any, they’ll get themselves killed.’

‘How many mines did the Rifles plant around that airfield?’ Mac asked.

‘Two thousand, plus booby traps.’

‘Stories coming out are incredible,’ Rabbit noted. ‘Did the Somali boys go psycho on the locals?’

Jimmy nodded. ‘They lost their discipline, wiped out a few towns; men, women, kids and livestock.’

‘The UN is saying twenty-five thousand dead or wounded,’ Mac posed.

‘I think more,’ Jimmy responded. ‘And they’re having a hard winter, bridges and roads blown.’

‘And those Taliban people still host these al-Qa’eda unhappy chappies?’ Mac asked.

Jimmy nodded. ‘They’ve been crossing from Yemen to attack Northern Somalia. But, so far, all stopped before they could do any damage.’

‘And how long before Abdi tops his President?’ Mac knowingly asked.

‘I would hope that he doesn’t,’ Jimmy responded. ‘But the President is ... corrupt to say the least. Anyway, what did you think of the film?’

‘Aye, nice,’ Mac agreed. ‘Good publicity, and it gets across the Darfur problem – which is still a problem.’

‘How many teams up there?’ I asked.

‘We’ve never got less than two hundred people up there. Camps are emptying slowly ... because we’re feeding them!’

‘Feed them less, nudge them back,’ Jimmy ordered. ‘How’s Doc Adam these days?’

‘Back in that clinic over the road, and that keeps growing,’ Mac reported with a grin.

‘To fit in all his kids!’ Rabbit joked. ‘He has six already, by three women.’

I suddenly realised something. ‘Where does the electricity for the estate come from?’

Mac explained, ‘Two miles up the road is an oil-powered power station. It supplies the local town now, the base, the oil derricks and this place. Not short of oil, they ain’t. We used to get electricity from the town grid, now it all comes from the new power station – thanks to you.’

‘Nice of us,’ I noted.

We popped into to see Skids, a brief visit, and drove back with our escorts, staying the night in the RF hotel. In the morning we caught a lift on a Dash-7 to Goma, landing in time to board a flight to Paris, soon back in the office and facing a mountain of paperwork created by our recent activities. And Jimmy, he informed us that we had three days before heading off to Cuba and the States.

Making new friends

The next day I approached Jimmy. ‘Got an idea.’ He led me to a quiet spot. I said, ‘You told me before, that we needed to get the American public on our side. I’ve got a few ideas so, unless there’s a crisis, I’m taking the family over there. We’ll have a bit of a break as well.’ I stood without waiting for a reply. ‘Been good chatting.’

The following day I took Cat and my family across the pond to New York. I had been saving money, and trading it, for almost twenty years, acting as fall-back banker to Jimmy. The amounts in my trading accounts now added up to a very large sum, hidden by the fact that it was tied up in stock. I suddenly felt like spending some.

Three vans had awaited our arrival at JFK, more security than usual, and they whisked us around to the apartment. There we found Oliver and his wife; they had stocked the fridge and stayed to chat for an hour, Shelly fascinated by the view of the lights and the streets far below. In the morning I met with Oliver again and we poured over figures.

‘The magazine, both versions of it – I’m not seeing any stats,’ I told them.

‘Sales stats you get,’ Oliver reminded me.

‘No, stats on how its used, perceived – demographics. Plus how people use the advertising, tourists especially. Do we know how many people book holidays through it?’

‘Not directly,’ they said. ‘People might see the adverts and decide a year later.’

‘Do a study for me,’ I insisted. ‘Demographics of readership, and if they pay attention to the adverts.’ They made notes. ‘Clubs ready?’

‘Within the week,’ Oliver said. ‘You around?’

‘Yes, we’ll be there.’

‘Jimmy in Cuba?’ they asked.

I nodded. ‘I had an idea. Charity galas for Africa, with our singers at the tables, charge a fortune for tickets – at least let them bid on e-Bay. Make it a series of gala events, right across the States, and a regular event thereafter. And I’d like to see the first one in ten days or so; we’ll stick around. Oh, and get some Rescue Force people in there as well.’

‘Hal coming over?’ they asked.

I lifted the phone and rang Mawlini, and requested Hal be shipped over as soon as possible, requesting Cassie and Anton if they were available.

‘OK, next,’ I said. ‘Can you get me an estate agent, I’m interested in a nice apartment for the family.’

‘Real estate-or,’ they corrected me.

‘Why can’t you Americans just use proper Queen’s English, eh?’

That afternoon the estate agent came around, a handful of sheets detailing various large apartments around Central Park. I found one I liked straight away and showed Helen, soon travelling around in the vans to view it. When Helen said she liked it I made the offer there and then, six million dollars. I guess the lady was on a commission, since she looked very happy.

That evening we agreed to a chat show style interview, a taped interview with the kids present – take it or leave it. They agreed, and we recorded the interview the next afternoon. Lucy was well behaved, but tried to answer the questions in her odd mix of sounds, and Shelly went all shy for a change.

‘So, Paul, the tsunami: it held our attention over the holidays, amazing scenes coming out of that region. And you, of course, sent in the rescuers. How many did you send?’

‘We sent all we had, plus reserves, plus a few on the sick list. We even had part-times and former members over there.’

‘And you obviously saved lives with your earthquake warning. Guess no one will be criticising that now?’

‘We’re still being sued by a few companies for loss of tourist earnings, but we’re determined to fight them.’

‘And we understand that you’ll be running a number of charity galas to raise money for Africa.’

‘Yes, starting next weekend, tickets to be auctioned to the highest bidders. Many of our singers will be there, and we’ll be there. Hal the pilot will be over, and a few others.’

‘And you’ve just started an airline in Africa.’

‘We’ve bought up several airlines and they’ll be formed into one airline, the biggest in Africa. We’re subsidising the ticket costs to try and boost tourism and trade.’

‘And now a weekly flight from JFK direct to the heart of the jungle.’

‘Yes, you can take off from the concrete jungle and land in a proper jungle.’

‘Helen, how are you juggling being a mother of two, and the work that Paul and Jimmy create?’

‘Living next door to Jimmy helps,’ Helen explained. ‘We have babysitters and a nursery nurse, so I have the days free to work.’

‘And your area is communications and the press, right?’

‘Yes, I handled the communications for the tsunami, and the press statements.’

‘Salami,’ Shelly said.

‘No, tsunami,’ I correct her. ‘One is sausage, and one is a big wave.’

Shelly waved at the interviewer, the small studio audience laughing.

‘No, we’re not leaving yet,’ I told her.

‘You’re old,’ she told the interviewer, the audience laughing.

‘Without the make-up – I’m ancient!’

‘Don’t be rude, young lady,’ I told Shelly.

‘And you’ve been house hunting over here.’

‘Yes, we’ve just bought an apartment overlooking Central Park.’

‘Be spending more time here?’

‘I hope so, we like our visits.’

‘I know it’s a painful subject, but let’s talk a little about the incident at your house. You have a house in the same estate as Jimmy Silo, yes.’ I nodded. ‘And someone broke in.’

‘He was a soldier, special forces, and someone who had applied for a job with us.’

‘So he was disgruntled at not getting the job.’

I nodded again. ‘I guess so.’

‘And he broke in and attacked the both of you, in front of the children.’

‘He came down the stairs, and I thought he was one of our security staff – till he hit me. Helen rushed to my aid, and she got hit as well. But I got up and landed a few punches, one hitting him in the throat, which closed his windpipe. Our security staff performed CPR, but he died.’

‘It’s a secure estate?’

‘Very secure, but the guy was Special Forces trained,’ I explained. ‘Besides, we try not to lock ourselves away too much.’

‘So what’s next for you?’

‘Well, we’ll be opening nightclubs, here in New York and in Los Angeles.’

‘Do I get an invite?’

‘No, you’re too old,’ I joked. ‘Yes, of course you do. We cater for the older gentlemen.’

The next day we viewed the new club, a hotel with several large ballrooms that had been converted to offer a modern feel. The hotel had also previously offered two nice restaurants that were typically the haunt of non-residents. Unlike the UK, we figured that the American patrons were not ready for a curry house, so we converted one restaurant to a Chinese and left the other as it was.

The club had a capacity of three thousand, not including the hotel rooms upstairs, one of which had been converted to a bar on each floor. Hotel guests would be able retire to these bars, but club guests could not follow.

That afternoon, with the sky clear, I took Shelly with me for an aerial tour of the city. We both sat in the rear of a Jetranger, the pilot thrilled to have me as a passenger, and we flew a loop around the island. Shelly was delighted. She was never happier than when up high, and looking down at the detail below, not at all nervous. I found myself thinking about her future, and would she ever fly a helicopter. And when she grew up, would they still use helicopters, or would something else have replaced them by then?

Back in the apartment, Shelly ran screaming down the corridor to Helen, rapidly explaining the helicopter flight.

‘She’s got no fear of heights,’ I said as I kissed Helen.

After our meal, Shelly sat down with a large piece of paper and drew the New York skyline, from memory. Noticing it, I called over Helen and we both stood in silence and observed our daughter add more detail than a typical adult could have remembered.

‘She’s autistic,’ Helen admitted.

‘According to Jimmy, she was supposed to be very bright without being autistic.’

‘But that’s incredible for a four-year-old.’

‘She is what she is - we can’t change that. Besides, she has no introvert tendencies. Look at that helicopter flight. Most kids would freak, let alone autistic ones.’

There was only one thing to do. We called an expert, the man coming around to the apartment the next day. He sat with Shelly and asked her questions, gave her mathematical problems to solve, showed her pictures with many coloured dots and asked her how many were there.

After an hour he stepped into the kitchen and found us. 'She's very bright. I'd go so far as to say exceptional. But she exhibits no signs of classical autism. She's outgoing and lively, no fear of strangers or a break in her routine. And she called me a Pillock, whatever that is England.'

Helen and I exchanged looks and hid our grins.

'That's good to know,' I said. 'Not about the Pillock, I mean. Thanks.' I paid him and let him out, explaining just how much legal trouble he would have if he spoke to the press. We felt better, then told off Shelly for using bad words, trying to explain that it was OK for us to use them, but not her. She stuck her tongue out at us, turned her back and carried on drawing, being reassuringly child-like and naughty.

With Senator Pedersen inviting us down to Texas, we hopped on a flight and ended up at a ranch that reminded me of the South Fork Ranch on Dallas. Our security occupied a bunkhouse, some staying at a nearby motel, and we dumped our luggage in a palatial guest bedroom. Downstairs, Chuck and his wife showed us the pool, which was a bad idea. Five minutes later we finally managed to fish out Shelly, who had jumped in fully clothed. Sat around the pool on patio furniture, Chuck and I got around to chatting about the medical insurance company. He gave me an idea and I called Jimmy.

'Jimbo. Senator Pedersen's medical insurance company: how about some CAR shares at a good price. There are seven shares hanging around.'

'Make it ten, some of ours. How's Shelly?'

'Fine. And we're OK too. Bye.' I faced Chuck over the ice teas. 'We'll sell ten percent of CAR to your insurance company at a good price. They'll appreciate at roughly a hundred percent a year.'

'If we have shares in CAR, and they're in Cuba, then we'd be breaking a few laws,' Chuck pointed out.

'CAR is not in Cuba; we sub-contract to our Chinese and Russian partners. So, technically, you're OK.'

'I'll check it out anyway. May be a good first step at lifting sanctions anyway.'

'How many people are signed up to the insurance company?' I asked.

Chuck lifted his eyebrows for effect. 'Coming up to twenty million; we've rolled it out to every major city. We're third nationally.'

'If the investment bank bought property in Central Africa, then it would appreciate very well, especially around Goma airport. That'll be like New York in a few years.'

'Yeah?' Chuck gave it some thought. 'There's plenty of cash lying around. Could invest a hundred and fifty million straight away.'

'I'll arrange it; there's a big need for quality apartments in that area - for the skilled workers. And it's very cheap to build. A hundred and fifty million would get you twenty tall apartment blocks. And the people here would see it as helping Africa.'

'How's Hardon Chase working out?' Chuck asked me.

'I would have thought you knew more than us.'

'Presidents don't much meet with party Senators, it ain't like England.'

'So far he's playing ball.'

'He's chosen a building to house our embassy in Cuba. They'll make the announcement soon.'

'Full diplomatic relations?'

'Well, as close as you could get given the circumstances. Bunch of Democratic Congressmen due to head down there on a fact-finding mission soon. Anyway, what you got Art Johnson doing for ya'll?'

'Global warming and green energy; he heads up a foundation we created. Keeps him close, and out of trouble. And Harvey is pushing a few projects such as the student exchanges. He's also involved in educational programmes in Africa and the Internet connections for them.'

'There's a function tonight in Dallas if you want to attend; a Republican fundraiser.'

'Sure. The more exposure the better. And if you can get us on the local news together...'

'Trying to help my ratings?' he teased.

'I'm trying to help my own ratings. We'll be doing more over here in the future, so may as well get the face around.'

'Most folk already know you. Hey, ya going to that premier in LA, the Cassie girl?'

'Yes, we'll be there. You?'

'No, work. But I'll try that club in New York next week, I'm up there for a fundraiser.'

‘Your party has only just got into power,’ I puzzled. ‘Why the fundraiser?’

‘They go on all year round; chance to posture, plot and scheme... as well as make some money for the party. Way it works... everyone already has their eye on the next election.’

‘In Britain, we start electioneering two months before the polls open. And even then it’s dull.’

With Cat watching the girls, Helen and I dressed up smart and followed Chuck to the fundraiser, causing turned heads as we entered. Chuck introduced us to his friends and they asked all about the tsunami and Africa, but were soon talking oil and money. Well, it was a Republican bash in Texas. My first brush with an oddball came when a woman in her fifties asked me if I was a churchgoer.

‘No,’ I replied, shocking her; or maybe touching upon her lack of tolerance for others.

‘Folks around here don’t much like non-believers,’ she threatened.

‘Some people pray for Africa, lady. I deliver the prayers. How many orphanages do you run?’

She did not like that, one bit. ‘I’m the chief fundraiser for my church district.’

‘How much do you raise?’ I pressed, Helen seeming uneasy out of the corner of my eye.

‘We raised more than a million dollars for the missionary fund last year.’

‘I spend just under five billion dollars a year in Africa. My orphanages have over a hundred thousand children.’

‘And do the children receive a proper Christian upbringing?’

‘They do, and we’re very strict with them. We also try and find all of them jobs when they leave us. So let me tell you what I think Christianity is: it’s about doing, not praying in your little white church full of white folk.’

Chuck was concerned at the tone and stepped in, introducing me to one of his other friends. This new conversation got around to prison reform.

‘Kill them all,’ I said. ‘Don’t waste taxpayer’s money keeping them in prison – it’s inhumane.’

The guy was one of just a few Republicans opposed to capital punishment, and stood shocked at my statement, Chuck again uneasy.

I continued, 'In Central Africa, we hang more than a hundred a week. And some don't make it to the gallows, they get shot in the act.' I shrugged. 'Bullets are cheap enough.'

'And do you not believe in a fair trial?'

'Sure. Before we got there the region offered one judge for every two hundred miles in any direction. So we paid for them to come in, plus lawyers and police. The local people like a good trial, plus a good hanging afterwards. It breaks up Saturday shopping, a good hanging at lunchtime.'

I hadn't set out to be so obstinate, and Helen was glaring.

Chuck led me away. 'God damn, Paul. Around here you'd be further right than ... anyone I've met of late. I thought you English were all reserved and apologetic.'

'I was hired for my straight talking. And to make the tea.' I promised to be a good boy, and chatted about helicopters to a man who owned a few. But it was a political fundraiser, and we got back onto politics again, this time Cuba.

'Don't much like your fondness for Cuba,' a white haired old man remarked.

'That's good, because we're buying up all the good land and hotels. They've appreciated thirty percent in the last year alone. And we've got oil contracts ... and you don't. By time you've kissed and made up with Cuba you'll be buying your oil from me. And as for them being a communist dictatorship – so is China, and you do a lot of business with them. In fact, Hardon Chase is trying to get them to loan you more money. How's that for double standards!'

The man walked off in a huff.

Chuck approached, 'If they ask you to give a speech – don't. Please. I have to get along with these folks.'

Helen led me to a table and we sat, snacks brought out. 'You're in a good mood.'

'I'm ... just a bit pissed off with it all. We're trying to fix things and ... and they're all in their own little world with their set views. Fucking States is a country of two hundred million individuals, all doing their own thing.'

'That's democracy.'

'That's not working.' I heaved a breath. 'So, you think they'll let me stand up and give a speech?'

Helen could not resist a stifled laugh. 'You may as well piss them all off in one go, dear, save working the room.'

I smiled. 'I'm OK. It just seems ... like hard work.'

We chatted to a few people for thirty minutes, and I tried to stay off politics, much talk of the kids and holidays. Then the speeches started; short durations per speaker, and often just party rhetoric. I noticed the man going around and setting the order of the speeches, and grabbed him, asking for a slot. With Chuck and Helen looking worried, I climbed the podium and took the microphone.

‘I hope you can all understand my English accent. My name is Paul Holton, and I’m non-political, in that I dislike both sides in equal measure.’ Helen closed her eyes. I continued, ‘I’ve had a few brief conversations with various people here tonight, and we’ve exchanged frank views. And the one thing that strikes me ... is how set in your ways some of you are, especially in your attitude to countries like Cuba.

‘Well, I get see the oil prospecting charts for Cuba, and over the next ten and twenty years Cuba will become as rich as Saudi Arabia. And while you’re trying to decide if you want to do business with a communist dictatorship – sorry, I forgot – you already do a lot of business with dictators, communist and otherwise. China is now the largest buyer of US Treasury bonds, and without them you’d be suffering. They hold so many dollars they own thirty percent of America. Then there’s Saudi Arabia, a dictatorship that doesn’t let women show their faces in public. They own around six percent of American stocks.

‘So let’s not kid ourselves, you deal with whoever suits your needs, communist or not, dictator or not. So let’s talk a bit about Africa, because it has lots of dictators as well. Africa is the planets greatest untapped resource; it has more ore than the rest of the world combined, more oil than the Middle East. And how often do I come across American companies in Africa? Hardly ever, accept those we invite in. Your greatest potential business opportunity is slipping you by whilst Russian and Chinese companies get into Africa and places like Cuba, because you’re too stubborn to ease relations with Cuba. Communist? Rubbish. Dictator? So are seventy percent of the world’s leaders that you do business with.

‘You can spend a lot of time plotting, scheming, and fighting with the Democrats, and all the while the real fight is out there – and you don’t even know where it is on the map. Well, you can hang onto your prejudices, because those prejudices are making me over five billion dollars a year profit from just one area of Africa. Our industrial area, the Congo, already has the largest GDP in Africa, and an annual rate of growth of close to a hundred percent. In the decades ahead, the population there will be looking to buy goods

with their new high earnings, and where will they buy the goods they need? Not here.

‘There was a time that America was good at building things and selling them around the world. What happened to all that, eh? You’re not so much doing badly in the growing regions, as not bothering to even send sales reps. Well, you can sit here and posture all you like, with your three percent growth in GDP each year, more like minus one in real terms, whilst Russia, China and Africa are growing at ten percent or more in real terms. One day - real soon - you’re going to wake up to find that the rest of the world has left you behind. And they’ll buy goods from each other, because you’re not even trying to sell to them because of your moral high ground and political sensitivities, and because you’re hypocrites who claim that you can’t deal with people because they’re dictators. Fine, sit on the sidelines and watch as your exports fall as your cost of living rises, and blame each other and the other political parties. You’re like two Prairie Dogs arguing, when you should have an eye on the hawk circling above you. And... thanks for listening, you’ve been a great audience. I also do weddings and circumcisions.’

I stepped down to a chorus of hushed conversations, not even noticing the camera in the corner. Chuck was trying, and failing, to hide a grin, and led us out.

‘Well, that was nice,’ Helen quipped as we got into car.

‘Thing is,’ Chuck began, ‘he ain’t wrong. We’re sitting by while others grow strong, and outpace us. Maybe we need a kick in the pants. Just not the shins and groin, which is where Paul was aiming.’

‘Sorry,’ I said with a sigh.

‘These things are normally right dull, so don’t be sorry. They’ll be talking about that for a while.’

The next morning, as we came down for breakfast, Chuck reported, ‘You made the local morning news.’

I picked up a paper, thinking the story to be in it. It was, but Chuck was referring to the TV news. ‘What page?’

‘Channel 9.’

‘TV?’ I queried, wide-eyed.

‘Yep. Texas got its kick in the pants at 7am. But, in your defence, they had you down as tipsy.’ He tapped a paper. ‘Full transcript of your *speech* on page three.’

We sat and ate breakfast, feeding the kids as Chuck took a lot of calls.

‘Be on national TV later. They’ve syndicated it,’ Chuck reported.

‘Yeah? Am I in trouble?’

‘They either love it or hate it, but a bit of a debate raging about some the issues. It’s a healthy debate, not least on the export deficit. And the five billion a year payroll got some attention.’

‘Should I say something?’ I asked.

‘Stick to your guns, Paul. You spoke your mind, so let the debate echo around the country a while. Might loosen some cobwebs.’

After breakfast I rang Jimmy. He listened, then asked how Shelly and Lucy were, suggesting I do something with veterans, and that was about all.

‘Jimmy annoyed?’ Helen asked.

‘No, hardly mentioned it, just asked after the kids.’

With the day cool we stayed indoors and played with Lucy, reading the papers and watching the TV news. At 3pm a national network asked Chuck for an interview and I agreed. Since they were already at the gate, we let them in, allowing them to set-up inside the house. Ready for the interview, Helen sat with Lucy, who was being very well behaved, and I held Shelly, who was not quite so well behaved. Not wishing to seem rude to our host, we invited him to sit with us.

‘Senator, has Paul’s comments caused you any problems?’ the lady interviewer began with.

‘Not at all. Everyone has the right to speak their mind, and for a British fella he’s ... forthright.’

‘Do you agree with what Paul said?’

‘Most of it, yes: we used to make things and sell them - that’s what made this country great. The export deficit is a real concern for everyone.’

‘And the Administrations view on Cuba?’

‘As Paul said, we deal with many communist countries, so we can’t hide behind that any more. Heck, according to the United Nations sixty percent of all world governments are undemocratic. And if we don’t do business with Cuba, someone else will. We’d be cutting our noses off to spite our faces.’

‘And Africa?’

‘I’m already involved with Africa, have been for a while, and shouting the cause for more investment over there. We can’t sit back while China and Russia get the best deals.’

‘Paul, were you drunk?’

‘No, but I had been drinking. Besides, we all tend to say what’s on our minds after a few drinks.’

‘You make five billion dollars a year?’

‘Yes, but it all stays in Africa, spent on orphanages, schools and roads.’

‘All of it?’

‘Jimmy and me, we live off our trading funds in the UK, we don’t take money out of Africa.’

‘But you could pay yourself that money?’

‘Yes.’

‘Helen, would you like to see some of that money?’

‘I have all I need right here.’ She touched Shelly’s head.

‘And I give her a ten dollar a week allowance.’ That earned me a look from Helen.

Shelly pointed at the interviewer. ‘Are you Jimmy’s girlfriend?’

The interviewer blushed. ‘I wish I was.’ We laughed. ‘So, Paul, any plans to get involved in American politics?’

‘I’m British, so no. But I will try and influence some areas, like getting you more involved with Africa.’

‘Will you be meeting the President this visit?’

‘I hope so, but he’s a busy man. Jimmy is in Cuba, and when he’s finished down there he’ll report to Hardon Chase on progress, so we’ll see the President then.’

‘You still work closely with ex-President Harvey, and now Art Johnson. Would you say that you’re a Democrat or Republican?’

I lifted Lucy off Helen and placed her on Chuck. ‘Kiss the baby in front of the cameras, it’ll get you some more votes.’ We laughed. ‘I’m not a follower of either party, I’ll suck-up to anyone who’ll helps us in Africa. I’ll be launching a drive for second hand computers soon, for schools in Africa.’

I was proud of myself; I had made that up on the spot. ‘I’d like schools and colleges to collect them and box them up, and then we’ll organise shipment points in major cities. Most adults in Africa have never touched a computer, let alone the children there.’

With the interview done, they packed up and thanked us. I offered the lady Jimmy’s number, but Helen stopped me.

That evening the phone went: Hardon Chase. ‘So, Paul, how’s your vacation going?’

‘Good. I’m staying away from anything controversial.’

‘You’re all over the news on the East Coast, quite a debate raging. Fortunately, you get my message across better than my own damn speechwriters. You want a job?’

‘I’ve got five jobs as it is now. When’s Jimmy up to see you?’

‘Not for a week or so, but I’m in Texas tomorrow if you’ve got a baby I can kiss.’

‘Send the details, and a speech, and I’ll get you some votes.’

‘Weddings ... and circumcisions?’

‘I didn’t know there was a damn camera there.’

‘Get used to being famous; always a camera around when you least expect it!’

Chuck got the details, a black-tie dinner with the State Governor at his residence. We enjoyed a quiet night in, Chuck off seeing people, and we sat and watched the TV news, and political debating programmes – those we could find. Across the board, my coverage was better than I had expected.

The next evening, at the dinner, Helen and I were both dressed smart, Helen always looking stunning in one of her black dresses. And we were honoured guests, sat two people away from Hardon Chase on the top table. To the side of me was a rich local businessman, opposite us a collection of politicians, the city mayor and the police chief. The businessman was most interested in our oil businesses, the mayor making very polite sleights about my speech. He managed to form the words, saying that he approved, whilst inferring that he didn’t. I held my tongue.

The Governor made a speech, dry jokes and little of substance, before Hardon Chase got up. With everyone glancing my way, he paraphrased my outburst to make it seem as if it was his own policy, and expanded upon the topics; exports and trade. In fairness, he was already pushing the policies where he could. At the end of his speech, the bugger invited me to talk.

I stood, not having prepared anything, and they clapped politely. ‘To all the politicians in the room, I must apologise – we didn’t bring the baby for you to kiss.’ They chuckled sedately. ‘And I’ve not had much to drink tonight either.’

I waited for them to settle and took in the faces. There was a time that I could not have done this, and I was proud of myself in a way for how far I had come. ‘There’s an old saying: many a true word spoken in jest. And I think we’d all benefit from seeing our politicians – in all countries – have a few drinks and speak their minds for a change. Of course, they’d all be out of a job the next day – but we’d know more about them.

‘America is in a race, a race with many other countries, and you’re falling behind. The wages that other countries pay are a tenth of yours, the skill gap closing. And those other countries, well, some of them have vast resources as well. You used to make planes, and tractors, and cars, and sell them all over the world. Then companies like IBM led the way and you dominated the computer market, and

you still do in some areas. But the days are gone of major industrial exports, and in many of those areas you cannot compete.

‘But there are some areas that you lead in, such as film, literature and music, still great exports. If I were the President I’d see Hollywood as an export industry worth assisting, same too for your music industry. But you now buy a lot more than you sell, and that has a limited duration before the deficit drags you down. The kind of things that keep me awake at night, the kind of long-term forecasts that I think about, are known to your politicians, and they’re known to most of you - they have been for a while. The problem is one of a short-term agenda. Which President, from which party, would have the guts to make a decision that is painful for the taxpayers now, but good for your children? Which President will set in motion things now that are good for the long term, but might lose him seats at the mid-term elections? From where I sit, it seems that being popular is more important than doing what’s right. I’d like to see President Chase, and whoever follows him, have a sign over the desk that says “Do what’s right for the long term, and to hell with the next election”. Of course, it’ll never happen, and twenty years from now the same problems will still be there.

‘Of course, if the Democrats had the guts to do something for the interests of the country, and actually shock us all and vote with the Republicans, then maybe the incumbent President could pin that sign up. After all, you did it during the last war. The problem, now, is that you’re not in a war. The problem is ... that your situation now is far worse than it was in 1941. Then you faced a five-year war, now you face a twenty-year slow economic death, sat around blaming everyone apart from yourselves.

‘Well, there’s only one group of people to blame, and that’s yourselves. President Chase can do so much, but only so much. He needs the Democrats to help make some tough decisions, and he needs the American people to wake up and notice the tide coming in. And I’ll make you this bet. Twenty years from now China will be the richest and strongest nation, followed by Russia, then India, then Africa, and somewhere down the line will be America. And you’ll still all be sat around blaming everyone else for the fall from greatness.

‘It’s not too late; it just needs a miracle. And that miracle would be the baby kissers thinking more about their children than their current ratings, or getting back into office. So ... given what we all know about baby kissers, there’s very little hope for you. And ...

you're welcome.' I sat to a shocked and deafening silence, Helen looking terrified.

Hardon Chase slowly stood. 'Sometimes ... it takes an outside point of view for us to see through the fog of politics. And yes, I will be appointing Paul as chief speechwriter.' He began clapping and the rest joined in. 'Unprepared, ladies and gentlemen, and from the heart. Wow.' He gestured towards me. 'If any of you need a speechwriter.'

After the meal we stood and mingled, drinks in hand, Chase sticking close by.

'That was helpful,' he suggested. 'Might get some Democrats on board.'

'Yeah, well here's something else helpful: stop printing dollars and start work on electric cars.'

He took a moment. 'The Chinese have turned down our requests to buy more bonds.'

'And you know why. Boom and bust.'

'We've tightened the mortgage rules.'

'Your banks just invented CDOs, right on cue, and the big banks are going to fuck around. Jump on them, and we'll talk to the Chinese. Around these parts, that's called horse-trading, I believe.'

Chuck closed in. He had been sat at the far end. 'There's no stopping you once you get going, is there?'

'We only have the one planet, the one lifetime.'

Chuck nodded to himself. 'True.'

'We'll be off to Los Angeles tomorrow. You about in the morning?'

'Gotta head back myself.'

'Then you have to come and stay with us soon,' I told him.

'Going to take a few buddies to that new airport of yours, a JFK flight. Have us a good look around and see if we can't find some land to build on.'

'Land is free; you pay for the building. Have a look at the towers near the airport, then just order one up and pay for it, we'll do the rest.'

'Kind of you. And the annual appreciation?'

'At the moment it's about a hundred percent; lots of companies wanting apartments for their staff.'

Arriving in L.A., we were driven to Po's family mansion, finding someone we knew in residence - Han's favourite family, the two daughters now much taller.

‘My god, they’ve grown two feet!’ I said in Chinese.

Shelly was fascinated by the taller and older sisters, and they adopted our daughter straight away, leaving us to chat about work and family. LA seemed to be much warmer than Texas, and Shelly spent a lot of time in the pool, the rest of us sat about the garden. I visited the Pineapple offices, plus a studio they made use of, and flew along the coast in a helicopter, Shelly getting the tour with me. But with the press asking for more interviews, I decided to be bold and agreed to talk if I could co-host my own programme and bring in chosen experts.

With Helen nervous, and wanting to call Jimmy, I reassured her that it would be fine, whilst wondering if we’d get out of the country in one piece. I drove around to the TV studio the next day and we shot the “evening” show with the afternoon sun warm. Inside the studio, a world where the time did not matter, we sat through make-up and settled around a large desk. Assembled about the desk was myself, the interviewer, a Democratic spokesperson, a Republican spokesperson, and three eminent professors: oil, economics and politics.

‘We’re here tonight –’ the lady interview began, despite the sun shining outside. ‘- with international entrepreneur Paul Holton, and a panel of selected political spokesmen and experts.’ She named each and listed their skills. ‘First of all, Professor Gibbs, how do you see Americas position in the race that Paul recently described?’

‘Well, it’s not so much that America is slipping, as that our rate of growth is not as fantastic as some of the emerging countries, and their rate of growth is good because they started from a smaller base. They’ll slow up in time, wages will rise, their middle classes will want more freedoms and rights.’

‘Doctor Marks?’

‘That’s a fair assessment, but we must all keep in mind that we live in the here and now, and getting any satisfaction from China struggling with its middle classes in twenty years time is not going to help us much. Besides, India and Brazil are democratic and have eccentric class structures. In those countries its the poor that will cause them problems.’

‘Professor Smith?’

‘On day one of an economics degree, I like to the use the analogy of a country operating like small business; you have to sell your goods to make money and maintain a high standard of living. You can sell your wife some goods, and your children and cousins, but if you want to succeed then you have to sell your goods to strangers.

American has always had a great internalising marketplace, that's not the problem. China has very little of an internal market place and they would benefit from developing it. In addition to selling to us, the Chinese could have a massive buffer to play with – which would be selling more goods internally. We don't have that buffer, because we're already operating an efficient internal market.'

'Paul?'

'As the professor said, you have to sell your goods to strangers to prosper. But what you've been doing is increasing personal, company and national debt to maintain the internal markets and your standard of living. You've borrowed beyond your means already, and that trend seems likely to continue till it breaks.'

'A Democrat view?' the interviewer asked of the Democrat spokesman.

'Our party did a good job of keeping the deficit down, and we handed over to Hardon Chase a good balance sheet.'

'I'd like to agree with that,' I put in.

The Republican spokesman said, 'We've always been the party of low spending on government and lowering taxes so that people can buy, thereby stimulating the economy.'

'The internal economy,' I pointed out.

Smith put in, 'And that internal economy has a saturation point, of which we're already over a hundred percent due to private indebtedness.'

'Let's talk about the oil economy,' the interviewer began. 'Paul?'

'A few decades ago, America persuaded OPEC to trade oil in dollars, and you thought you were being very clever. Successive governments have bailed themselves out by printing dollars to pay for your oil imports. But because those dollars live overseas, and are not sloshing around the States, it did not cause inflation. The problem comes if, and when OPEC decides to drop the dollar.'

'You think that is a possibility?' the interviewer asked me.

'Yes, and the evidence is in front of us. Other countries, and their currencies, are getting stronger – at a rate faster than yours. At some point the OPEC countries will figure out that your dollars are not worth as much anymore, and they will not wish to hang onto trillions of dollars that are depreciating in real terms. I estimate that around 2017 the balance will be out of kilter and they'll drop the dollar.'

'And what effect would that have?' the interviewer asked. 'Professor Gibbs?'

'Well, it would be a disaster. Our savings and pensions would be worth a third less overnight.'

‘Two thirds,’ Smith suggested, Marks and myself agreeing.

Gibbs continued, ‘Our exports would be much cheaper around the world, which is good in some respects, but the cost of oil would more than double, as well as the cost of food - and all other imports.’

Marks said, ‘It would cause a crash similar to the 1929 crash. It would be devastating.’

I put in, ‘And the one thing that the Treasury could not do, that it’s so fond of doing, is to print more money. That would cause hyper-inflation.’

Marks and Smith agreed.

‘And how likely is that?’ the interviewer asked.

‘I think it’s a certainty,’ I said.

Gibbs disagreed, the political spokesmen also disagreeing and going into party rhetoric mode.

After ten minutes, the interviewer asked, ‘And the solution?’

I replied, ‘Start planning ahead now with austerity measures, improve your manufacturing base, and develop nuclear energy, hydroelectric dams and electric cars – get away from oil as fast as you can.’

The debate went on for another ten minutes, then we had shot enough minutes for the show. Driving back, I thought it had gone well. If all it did was to cause more debate then that was an achievement in itself. The show aired that evening on the West Coast, shown on the east coast in parts during breakfast TV, the full show aired at 7pm.

Hardon Chase rang after the show. ‘Paul, is it *wise* ... to make such predictions public.’

‘You’re the bus driver, and you’re heading for a brick wall. Maybe, if the passengers can see the wall, they won’t mind you changing course.’

‘May I ask if Jimmy and *others* ... planned this?’

‘No, they’d never go public. This was all my doing. And ... you’re welcome.’

In Tinsel Town, my comment about the Government supporting the film industry - as a principal export - went down well; I was popular here at least. The only dark cloud was the President of Venezuela openly calling for OPEC to drop the dollar now, not quite the effect I was hoping for.

The opening of the LA Club was a major event, red carpet, and more stars than I could count. Helen and I, Oliver and his wife, and the Pineapple staff all arrived early and gave interviews, and we got to view the place without the crowds cluttering up the place. It was a

large club, larger than the London club, and backed onto a hotel. Just. They had built a glass walkway across, making the glass tinted as an afterthought. After all, stars and their mistresses would not wish to be seen popping to the hotel for a quicky.

We mingled, and welcomed people to the club. I had made a point of getting hold of a list of actors from yesteryear, and went down the list ticking who I wanted invited along, almost forty of them, many of the actors from the original Star Trek series invited. We were still there at 2am as people started to drift off. They had either sipped water all night and worked the room looking for business, or got drunk and tired quickly – being put in taxis in the hotel's underground car park without anyone seeing them. I received a few propositions, but pointed towards Helen, mentioning the mean right hook.

Hal had landed an hour before the opening and came straight around. I fixed a badge to his jacket lapel: Hal, pilot in Africa. When we decided to call it a night Hal came home with us, and we sat playing catch-up over a cold beer on the patio. The following afternoon we caught an industry insider's screening of the "Lassie come home" movie, its formal title RF12 after the helicopter that went down. Everyone seemed to like it. Now it was up to the cinema audiences.

The next day we packed our bags, Hal complaining that he had just got here, and headed back to New York and the opening of the second club. Hal camped out in the first apartment, and we stayed in the new apartment – our own apartment, a maid provided by Pineapple. Wishing to check on any problems, I rang the house in the UK and spoke to Jack - he had been monitoring some of my projects - and he reported no problems on the horizon. A few more squirrels in his garden, but no problems otherwise.

Hal came over for lunch the following day, Anton and Cassie turning up with the baby just five minutes after Hal.

'You made it,' I told them.

'It sounded like an order,' Cassie puzzled.

'No, a request,' I insisted. 'I don't order people with young families to travel across the world.'

Anton said, 'Hour from Mawlini to Goma, straight here overnight. I went to sleep over Sierra Leone and woke up over New York. Marvellous.'

'How is Mawlini?' I asked, all of us now sat about the coffee table, Shelly fascinated by the strange new baby.

‘Growing,’ they said. ‘From the air you appreciate the size. There’s now another workers compound at the top end, across the road from the oil workers hotel.’

‘Mummy, did you have another baby?’ came from Shelly.

Helen smiled. ‘No, that’s Cassie’s baby.’

‘Where did it come from?’ Shelly asked,

‘Is there a doctor in the room?’ I joked. ‘Shelly, come here, please.’ I grabbed my daughter and lifted her up. To Cassie and Anton I said, ‘Wait till yours is this age.’ I put my mouth to Shelly’s ear. ‘You told the nice TV interviewer that he was old.’

She shook her head.

‘Yes you did. And you asked the nice lady interviewer if she was Jimmy’s girlfriend.’

Anton and Cassie laughed. ‘Where is he anyway?’ they asked.

‘Cuba. Should be here ... soon I think.’

A knock at the door, and Hal opened it, a mock salute given. Jimmy appeared with Michelle.

‘Jimmy!’ Shelly squealed, running across to be lifted up.

‘I don’t get that,’ I told Anton.

Jimmy sat with Shelly still hugging him. ‘So, all the gang here.’

‘All the movie stars,’ Hal quipped.

‘You weren’t in the movie,’ I pointed out. ‘You’re a ... paperback star.’ I faced Cassie. ‘We saw your film in the afternoon, it premiered the night before last.’

‘Its getting good reviews,’ Jimmy put in. He faced Anton, ‘Your father wants a talk, so we’ll all go out there at 6pm - if that’s alright with you guys?’

Anton nodded.

‘And tomorrow is the club opening and the film premier here, so put your silly smiles on for the press,’ Jimmy told everyone.

‘How was Cuba?’ I asked Jimmy.

‘I did a few weddings and circumcisions.’ Everyone except me laughed. ‘In reality, the work only took three days, rest was a holiday, some diving and sailing. A month ago, ships started to arrive, a split between us and the Chinese – who want to look good in front of the Cubans. We delivered a ship load of cement, glass panes, nails, tools and wood – all given out free around Havana for a little bit of a facelift. We then delivered a container ship of Chinese motorbikes and cheap Korean cars – a bit of embargo busting. And finally a ship of corned beef from Brazil, enough for just about everyone on Cuba to have one to two tins each.’

‘The orphanage?’ I asked.

‘Full already, three hundred kids, state teachers and nurses.’

‘Hotels?’

‘We now own thirty-five indirectly, mostly assigned to CAR. And, best of all, Rescue Force el Cuba is now the regional training hub for Central and South America, ten new national teams there. Jamaica, Puerto Rico, Haiti, El Salvador, Chile, Ecuador ... and a few others. Soon have all South American countries signed up. I’m going to create large teams in the earthquake countries.’

‘Switzerland is on board,’ Anton mentioned. ‘And now Canada.’

‘Be all countries soon,’ Cassie suggested.

‘Malawi and Burundi have joined,’ Jimmy informed them. ‘Training out of Forward Base with the Zambians. China was an option as a regional training centre for the Far East, but I’m giving that to the Australians at Cairns. So, Cassie, if you want a desk job there’s Cuba or Australia to think about. Or you could just marry a rich guy and live off his money.’

‘She’s worth more than me,’ Anton joked.

‘Hacker wants to stay in Cuba,’ Hal informed us.

‘Fine, it’s a training centre – he trains,’ Jimmy replied.

‘I fancy a bit of time in Australia,’ Hal added.

‘How’s that girl?’ I asked him.

‘Good, she’s growing. I see her when I can, but the authorities won’t let her live with me. She’s popped up to Mawlini a few times, and we had a holiday at your place on the coast.’ He made a face and shrugged.

Jimmy stood, and handed me Shelly. ‘We’re in a posh hotel, so we’ll scrub up and meet you out in the Hamptons for 6pm sharp. I need to buy a shirt as well.’

After lunch, it was just Helen and myself.

‘Jimmy didn’t even mention your interviews,’ Helen noted.

‘Then he already knew.’ We exchanged looks.

That evening we enjoyed a meal with Mister Blake Carrington look-a-like in his posh house, his two Orthodontist sons still taken with Helen and her cleavage. The only point of business that he wished to discuss was the African Times, and its desired rollout around the rest of Africa. We offered to push its circulation even further, into the large South Africa market if we could, into the buoyant Nigerian market, and then to the smaller nations. Besides that, we discussed mostly the club opening, many of Blake’s high society friends attending.

The grand opening was a bit of a mad dash past queues of nutters on the sidewalk, up the red carpet and into the club. LA seemed to

offer a better class of nutters than these New Yorkers. I had only been in the club half an hour when I got into my first political argument, one of Blake's friends who wanted to tell me to stay the hell out of US politics. I reminded him whose club it was, and asked if he wanted to be the first person thrown out and banned. He went off in a huff.

Apart from that it went off OK. Towards the end of the evening I caught Jimmy alone. 'You haven't said anything about my political incorrectness.'

'You did what I expected, just three years early. You're suffering from a form of Post Traumatic Stress Disorder, as a direct result of the incident at the house. You're angry inside, and that's making you more forthright on the outside. It's not a bad release. And you being here ... was a subconscious desire to be away from the house.'

'Oh.' I gave it some thought. 'Maybe,' I finally agreed. 'Do you think it'll do any good?'

'Open debate is always a good thing; American Presidents like to keep secrets from the people, especially the oil dollar deficit. It's that one area that no President wants to face up to. That's why you were right to talk about future generations.'

An hour later we tried the New York theme diner on the ground floor, finding the burgers tasty. Sat opposite Jimmy, Helen upstairs with Cassie and Anton, I asked, 'Is there a fix to the US economy?'

'There's a fix to everything. It's having the will to do it, and see it through, that's the problem. Problem is ... US politics is a beauty contest, not a spelling quiz. In Europe the politicians can add up and spell big words, here they're well connected and rich – and smile nicely. They've dumbed down the whole political process, or they would know themselves what the fix is. The reason we're in Africa – is because they're not. We had to lead the way and set the example. But there's no way they'd have ever used the Rifles as we did. Without our intervention the Congo would still be a lawless jungle.'

'So ... do we fix their economy?'

'We'll ... help with the worst excesses of the boom and bust cycle. Beyond that, there's not much we can do. Hard to tell the people in the White House what to do when they think they're superior in every way.'

'And Hardon Chase's future?'

'He's proving a better man than I realised, but only with a gun to his head. He's taken a better view of the long game than even Art Johnson did – which has surprised me. He wants to cut his name into the tree of history, and that's great. We'll use his desire to be

remembered to make some progress. He's doing all the right things ... for the wrong reasons.'

Two days later, Hardon Chase welcomed us into the Oval Office. 'After we chat, the Joint Chiefs have some questions.'

'We're here to be helpful,' I suggested, getting back a quick look.

We sat opposite Chase and his Chief of Staff.

'OK, first: Cuba,' Chase began, notepad ready. 'I'm going to send down the Vice President in a month.'

'Wow,' Jimmy said. 'That's a big jump.'

'You think it's too much too soon?'

'No, I love the idea. It's the knives in your back I'm worried about.'

'Latest pole has fifty-five percent in favour of a reconciliation. And in Congress that's sixty-eight percent.'

'Then you may as well make use of it,' Jimmy suggested. 'Ride the wave of optimism.'

'Will the Cubans play ball?'

'Doubtful,' Jimmy replied.

'Doubtful?' Chase loudly repeated.

'They can see the oil potential, they can see the Russians, Chinese and us wanting to get in there, and they want to kick you in the balls. So ... doubtful. But, I'll get the other "M" Group nations to pressure them to play ball. And, if you can ease sanctions before that time ... it would help.'

'If we send down the Vice President ... will they welcome him?'

'Oh, yes, they're not that stupid. Just don't expect them to be grateful. You take a step back, they take a step back, but you don't smile at each other while you do it. Kind of a begrudgingly acceptable friendship.'

'Well, after all these years what did we expect?' Chase reflected with a sigh. 'And the best way forwards?'

'Inch by inch, with both sides getting used to it. Allow in US tourists. Cut the ice.'

'And this regional base for Rescue Force?'

'Gives Cuba lot to be proud off; a *feel-good* factor. And it helps to lower their guard. Besides, it's cheap to hold the training there, and if Cuba is seen to dispatch rescuers it will help their standing in the region. With that respect they'll lower their guard further and re-join the rest of the world.'

'Will they go democratic?'

'Not really, they'll follow the Chinese example; strong communist government with free enterprise. If you try and nudge

them that way you'll just be wasting your time, as you are with China. Start with the tourists.'

'OK, African oil. The Zanzibar field is mostly Chinese.'

'East Africa for them, West Africa for you. They'll not try and muscle in on the West Africa fields, and you should leave them Tanzania. If not – it's a free for all.'

Chase made notes. 'The DRC oil fields?'

'Are huge ... and a huge pain in the arse. They're so far from the coast that you double the price by moving it. Instead, it'll be used to assist the region to grow, making ore extraction cheaper, and to help Africa develop its GDP – which is good for you in the next decade.'

Chase eased back and took a moment. 'And what if we wanted to *accelerate* that process? Make consumers out of them sooner?'

'If you're willing to assist with infrastructure problems, I'll allocate you land and cheap buildings to buy – a good investment. What you spend on projects now you'll recoup in property price appreciation.'

'For instance...'

'You send us new passenger planes from Boeing, and we'll give you land and buildings for the future. You send us phones and phone lines, fibre optic cables for the Internet, and we'll allocate you mines to cover the cost. You could build a university and staff it, we'd give you a few large apartment blocks and shopping centres.'

'So whatever we spend we'd get back in ... what, ten years?'

'Or less with the mines. But you must be careful not to encourage democracy with the Africa leaders. They're corrupt now, and they'll be corrupt ten years from now. We work around them. Best way to deal with them is like children: put sweets in their mouths.'

'I promised the Tanzanians a few projects.'

'Carry them out, sure, just don't beat them up for oil rights. CAR makes a profit for American companies, and CAR is in Zanzibar. If you want to make a buck, build things in Dar es Salaam. It'll be a boom town in years to come.'

'Any major projects that we should be involved with?'

Jimmy made a face. 'There is one, but it's for the future, and that's a railway from northern Congo across to Nigeria and Liberia and to the coast. It's a long and very expensive project, less so with the local steel we're making. It needs a clever satellite to figure out the best direction for the track.'

Chase made a note. 'OK, what would a ten billion dollar investment get me Africa?'

I blinked.

‘It would get your money back to start with. Besides that, the money is best spent on the equipment that I described. Boeing aircraft – with pilots under contract, cellular phone towers, optic cables, and some clever people looking at the best ways to move around mountainous jungle.’

‘So I could earn some points with Boeing to start with.’ Chase made a note. ‘OK, al-Qa’eda. Are they contained?’

‘Contained ... no. Distracted and misdirected ... yes. Right now they’re sending their best people to Northern Somalia and getting a pasting, the Taliban are suffering and on the back foot, and the Northern Alliance well armed. Détente.’

‘But they won’t go away?’ Chase pressed.

Jimmy shook his head. ‘No.’

‘And the solution?’ Chase nudged.

‘Is to help to build up Pakistan, and to encourage them to attack the Taliban. That will cause the Taliban and al-Qa’eda to attack Pakistan instead of you. That border war will drag on for a long time, wearing down the Taliban and al-Qa’eda, and keeping them off American streets.’

‘There’s no better solution than that?’

‘None. If there was, it would be my top priority.’

‘And if we went in to root them out?’

‘I’d do everything in my power to stop you,’ Jimmy coldly stated.

Chase stared back for a several seconds. Lowering his head he said, ‘OK, Liberian Rifles. Not as good as the Kenyans according to our military.’

‘I’d be happy to assist,’ Jimmy offered. ‘I’ve had some experience.’

‘What we’d like is to know how you did it, and why our people on the ground are not doing it.’

‘I’ll visit and prepare a report for you,’ Jimmy offered.

‘OK, let’s talk about Paul’s movement into US politics.’

‘Not sanctioned by myself or Magestic. But ... I’m not that unhappy with it, since his wartime rhetoric is what you need; a national unity. And the OPEC comments should be something that causes you sleepless nights.’

‘It’s starting to,’ Chase admitted.

‘They’ll really drop the dollar?’ the Chief of Staff asked.

‘It’s flexible, or there would be no point in us making predictions. It could be put back, or avoided if the dollar stays strong – without any bad dollar politics pissing off the OPEC countries. But, you

can't just print dollars forever. Sooner or later you'll have to balance things up.'

'And what role could Africa play?' the Chief asked.

'As you lose market share around the world, I could swing African consumers your way. So if you lose five points, I could get you back three or more. You need to make up the two.'

'How?'

'Next generation nuclear power stations and research, hydroelectric projects, electric cars, better manufacturing and exports. And ... and a slow and gradual reduction of the dollar value towards its true level.'

'Devalue?' Chase asked.

'No, I said a slow reduction over ten years. If you know that you're going to fall off a wall - make the wall as low as possible first.'

'I doubt the boys on the hill would swallow that one,' Chase baulked.

'You never know till you try,' Jimmy suggested. 'And you need to follow Hawaii's example on healthcare, before it becomes seventy percent of the budget.'

'It gets out of hand?' Chase queried.

'Big time,' Jimmy emphasised. 'An older population, obese, lots of immigrants. And some nasty diseases to tackle, some of which will break your health service.'

'Can't they be prevented?'

'No. Some you'll develop cures for, others will just cause people to have ten days off work. But, if thirty percent of the population are off for ten days, it'll cripple the economy.'

'Is that during my term?'

'Depends on whether or not you serve two terms,' Jimmy said with a smile.

'Anything on the horizon to think about?'

'Hurricane Katrina, in August.'

'It's a bad one?'

'Politically yes.'

'Politically?' Chase puzzled.

'It'll swamp New Orleans, a lot of people killed, property destroyed, and they'll all blame you for not moving quick enough to assist.'

'Katrina,' Chase wrote down. Lifting his eyes, he said, 'Fucking Army will be all over it, you can bet on it.'

‘Then you’ll be a popular President. But concentrate on the poor people of New Orleans. Make a big deal of it, go visit as soon as it’s safe.’

‘Should Rescue Force be there?’ the Chief asked.

‘They can’t operate inside the States without risking being sued, and you’d never hear the last of it if foreigners helped ahead of your own people.’

‘Yes, I suppose.’

Ten minutes later we were led down a familiar route and to the Joint Chiefs. At least the reception we got was better these days.

Their first question was, ‘Your opinion on the Liberia Rifles?’

‘White men trying to teach black Africans how to fight like white men.’

‘Meaning?’

‘Meaning ... that you had a manual on what to do.’

‘There are things in there that we could never do, we’d break Army law and civil law here.’

‘Oh, dear. Raising a proxy army of non-Americans to fight and die in hostile jungles on your behalf ... being blocked by civilised America laws looking out for the rights of soldiers. How odd, and what a paradox.’

‘There’s always the Zimbabwean example,’ I suggested to them.

‘What’s that?’

‘They sent us a thousand fresh young faces. When ready, we’ll send them back trained and ready to go.’

‘You could have told us that before,’ they complained.

Jimmy said, ‘Your laws have not changed from the time I gave you the manual ... to now.’

They glanced at each other. ‘We had to try.’

‘I’ll takeover the Liberian Rifles. When ready – trained and disciplined – they’re all yours to play with.’

We got around to the subject of Kandahar.

‘The Somalis were ... worryingly efficient in Afghanistan,’ they posed. ‘Is there not a danger that they could turn on their neighbours?’

‘If there was, then I would not have trained them. Besides, Ethiopia will be a bit naughty in the future, and the Somalis need to be able to defend themselves.’

‘And the al-Qa’eda problem in the north?’

‘Is going well enough; al-Qa’eda fighters are attacking Somalia and getting themselves killed, they’ve lost interest in you. They’re also losing credibility around the Middle East.’

The Admiral asked, 'Let me ask you a direct question. If we put a thousand men up against a thousand Somali Rifles, what would the outcome be?'

'Assuming that they were both infantry and equally matched, a massacre of your people and twenty percent casualties on the Somali side.'

'And the reason for that?'

'You've grown too used to superior technology, which is fine for some types of warfare. But an *up-close and personal war* involves soldiers going eye to eye. Yours, however loyal and brave, want to go home to their families at the end of the battle. The Somalis don't care; they fear losing face, or the respect of their team, more. They don't care if they live to go home. They'll fight you with a gun, a knife, or hand to hand and never back down. Part of that is African culture, part in the training. Your soldiers are nice respectable citizens, educated people who would help a cat out of a tree. The Rifles would bite the cat's head off and eat the damn thing without a conscience. And, since Vietnam, you've designed your strategy around the technology, lowering casualties from face to face fighting. And I said it before: the Brotherhood don't have ships, or planes, or tanks. They only have people with a will to die.'

The men took that in. 'The solution?'

'Make use of the proxy armies, because you sure as hell don't want people like the Rifles walking down American streets. And if you train your boys to those levels of brutality they'll shoot up the local neighbourhood. But I'll give you an example. One war that you were supposed to fight, but did not, you used your Air Force and destroyed a very large army from the air, minimal casualties on your side. I'm not knocking the technology, but it fits a purpose – and that's not counter-insurgency.'

The Admiral said, 'How long does it take to create a proxy army?'

'Three years, ideally,' Jimmy replied. 'So you could start in 2022.'

'And wars before then?'

'Mostly started by you lot. And no, you could not use proxy armies in Venezuela, because the governments of the soldiers would not let you. The Africans will let you use their soldiers in certain circumstances, but they won't just throw them away. They have voters as well.'

'We've collected what data we could about the battle at Kandahar. Basically, you let the enemy come to you.'

‘Yes, we used their outrage and sense of superiority on their own turf to drive them forwards in predictable ways. They ran into mines and sniper fire.’

‘And the reported massacres?’

‘As we’ve just been discussing, the Somalis lost discipline and turned savage. In this case, not a bad thing. But you can only train them so much to be aggressive before they go off on one. Light the blue touch paper and stand well back.’

‘They lack discipline?’

‘They lack an OFF button. When they go ... they keep going.’

‘And against the Brotherhood?’

‘They’d win easily, but would be worn down if they entered town and cities, where bombs would be hidden. If the Rifles were in the desert then no one would touch them or cross their area. The problem comes in the cities, which is where most people live, and where the biggest problems will be. And things like trains. It would be impossible to both search the train, and not get blown up.’

‘No one here has any doubt that the Rifles could hold the Sinai,’ they offered. ‘But Europe would be a different matter.’

‘Part of that solution will be an army of reservists,’ Jimmy suggested. ‘Police with guns. Spotting a terrorist landing in Italy is easy enough, the appearance and language. Problem is, as soon as they’re rumbled they go bang - and we lose a few people.’

‘And conflicts between now and then?’

‘Depends on you. If you do nothing, then there’ll be no major conflicts that cannot be dealt with. If you invade Venezuela, Cuba or China, you’ll destabilize the world and there’ll be lots of small wars. It’s down to the guy upstairs.’

‘Paul, what you said about OPEC. If that happens?’

‘You’re fucked overnight,’ I said. ‘More so than any war.’

‘Should the CIA be keeping an eye on that?’

‘They should,’ Jimmy suggested. ‘Advance warning is always good. If only the CIA would appreciate us, eh. We give advance warnings.’

‘Any chance of selling the Africans our nice expensive weapons?’ a general asked with a grin.

‘Sure. Decide what you want to get rid off – that may suit – and we’ll buy up some of your old stock. Some old Hercules we could use, some old P3 Orion aircraft for maritime patrols, old Navy S61 helicopters, some Chinooks.’

They made notes. ‘Budgets?’ the same man asked.

‘I think more in terms of numbers that we need than budgets. If you consider Forward Base in the Congo as a hub, we could do with those aircraft there with a few technicians - for which we’d pay. If we can help you by buying up second-hand kit then we will, we have a need for it.’

‘Can we send you the right officer straight away?’ they asked.

‘Sure. Give me a list of what’s for sale. And there’s one regional airport we built with you and the future in mind; it has a very long runway and a high fence. Anytime you’re ready you can use it as a stopover or transit base.’

‘And the local fuel?’ an Air Force General nudged.

‘Cheap and plentiful,’ Jimmy replied with a thin smile. ‘So are the local women, but I would not recommend them.’

The next day an Air Force Colonel and his aide came to our hotel, with a file of equipment that was either de-commissioned, or about to be. We ordered four Chinooks and spares, five S61s - for a mixture of military and civil use, again with spares, four Hercules transports that would have certain bits of their electronics ripped out and replaced, and two P3 Orion maritime patrol aircraft – export versions – that had been ordered and cancelled. They would be delivered to Kenya, but used to patrol the Somali coast. All in, we have just bought a hundred and twenty million pounds worth. They threw in four old Hueys.

Back in the UK, a day later, Helen and I reclaimed the house, and I felt glad to be back. I never quite figured it out, why I liked to travel, but also liked to get back. It was if I had a restless soul. In the diner I caught up on gossip from Big Paul, finding out that Keely was serious about a girl – a sixteen year age gap between them; he was forty-eight, she was thirty-two. There was even talk of marriage.

I went and found Jimmy in the office. Checking over my shoulder I asked. ‘Will Keely marry this British girl he’s dating?’

‘She’s not British, she’s Canadian, and so is he – technically.’

‘Yeah?’

‘His parents were both in the US military, got citizenship. They’re from Toronto originally, and she’s from ... east of there, on the coast somewhere.’ He sighed. ‘Best we have a chat with him.’

‘It doesn’t work out?’

‘It’s a bit more complicated than that.’

We called Keely, in his room, and he came down to a lounge.

‘We need to talk about your young lady,’ Jimmy told him.

‘Really?’ Keely puzzled. ‘You won’t tell Big Paul how his relationship turns out.’

Jimmy took a moment. 'Unless otherwise stated, and altered, the CIA will snare her in around six years.'

Keely stared back. 'To get to me?'

Jimmy nodded. 'She has a skeleton in the closet, and it will not be easy to make it go away.'

Keely looked away, clearly angered. 'What is it?' he softly asked.

'Her father, who she loves very much, has made a number of mistakes – and will continue to do so. She has, in the past, provided a false alibi for him. They'll root it out, and blackmail her, threatening him.'

'The NSA could fix that,' Keely insisted.

'Only to a point. There are ... witnesses.'

'And the answer?' Keely asked.

Jimmy crossed his legs. 'Set a snare yourself, and when the CIA moves we send the detail to the President of the day. Make copies of all the statements, the allegations, and reinforce the statement she made. You've got a few years. If you don't, then they'll try other avenues - because you're here and their man isn't. They need to fall on their faces. Hard.'

Keely stared at the carpet. 'I'll need some time off for a visit to Canada soon.'

'Take your young lady, it will look like a holiday,' Jimmy offered him. 'But don't confront her about it – ever. You'll lose a nice girl. Do what you're good at, and behind the scenes.'

'Did they send her?' he asked. 'Because she's a bit of a find.'

Jimmy took a moment. 'She doesn't know that she was sent. A strange set of circumstances led to her working in Cardiff and meeting you, a ... carefully laid set of circumstances.'

'Who?' Keely asked after a moment.

'President's office.'

'If she doesn't know...?'

'They'll monitor her, to see if you're leaking intel to her. She's the next generation of spy, one that doesn't even know she is spying: they put her next to you, you date her – after checking her nice clean record, and after you've broken up they ask her a few questions. She would never even know that she was being played.'

'Do they trust me?'

'Yes, but they like to play these games.'

'Stupid of me think they wouldn't try at some point,' Keely admitted.

'She safe to bring in here?' I broached.

Jimmy nodded to me. 'Lovely girl. Too good for him.' We stood.

‘Was she drunk when she met you?’ I asked Keely.

‘To quote Big Paul: fuck ... right ... off!’

A few days later we got a tip-off about an American website that had Jimmy down as a time travelling clairvoyant who secretly ran the world. In fairness to the site’s creators, they had a lot of good facts, and I suspected that CIA might have had a hand in it.

Jimmy calmly sent an email to the brain-trust kids in Shanghai and they got to work. Within a few hours the site was operating so slowly that no one could get onto it. The next day it was moved to another url, which again slowed right down. The website’s creators kept at it, soon a third url populated with the allegations. Then the sites all disappeared for an hour, returning with a few subtle changes. Many of the dates had been altered, places, a few photographs doctored. And at the bottom of the page sat pictures of the site’s creators and their contact details, including home addresses and telephone numbers, their minor criminal records displayed for all to see. The originators of the site, a bunch of college kids, took the site down and went into hiding.

Tamil dawn

Jimmy called an “M” Group meeting at the house the next day, the topic Sri Lanka. The Sri Lankan Government had been fighting a small war with Tamil rebels and separatists in the north for a very long time. Now it would come to a head, several years early.

The Chinese desired a port in the south of Sri Lanka, and the US had been persuaded of the need for a naval base there. As a result of the Chinese interest, the Sri Lankan Government had enjoyed the delivery of weapons to fight the Tamils. They had also received money and fuel indirectly from Jimmy, and the campaign against the Tamils was progressing quickly.

Jimmy began, ‘The Sri Lankan offensive against the Tamils in the north of their island will soon end, literally within weeks. There will then be a refugee crisis that will ... tarnish the Sri Lankan Government a little and put tourists off visiting. Rescue Force will be involved.’

‘And the future for Sri Lanka?’ Jack asked.

‘A peaceful one; just a few Tamils setting off bombs now and then. But, for the most part, a complete end to hostilities. So, in the next few weeks the Tamils will be squeezed, some of the Sri Lankan soldiers benefiting from sniper training in Africa.’

‘And the problem?’ Keely nudged.

‘What makes you think there is a problem?’ Jimmy asked.

‘We’re sat here,’ Keely stated.

‘The only wrinkle in the plan is the refugees, who the Sri Lankans would like to round up, some to be shot. All of your governments must put pressure on them not to do so, and to allow Rescue Force into the camps.’

‘They’ll resist?’ Jack asked.

‘To start with,’ Jimmy explained. ‘So start the diplomatic offensive next week.’

With the meeting concluded, some talk of the curious websites, we drove over to Mapley.

‘You awake, Bob?’ I asked Bob Davies at the HQ building.

‘Yes, been busy doing a few weddings and circumcisions.’

I stopped, hands in pockets and looking peeved. ‘I’d been drinking.’

Jimmy sat. ‘Grab the comm’s officer.’ The man hurried in and sat behind a computer. Jimmy told him, ‘In reference to the following countries - China, Hong Kong, Australia, New Zealand, Britain, France, Russia and Cuba - prepare to deploy alpha teams to Sri Lanka. In regard to African units, and others, we’ll need surgical trauma teams. Send the signal.’

‘Civil war hotting up?’ Bob asked.

‘Should finish soon, then we’ll have one hell of refugee crisis.’

Doc Graham walked in, pager in hand. ‘Back to Sri Lanka so soon?’

Jimmy lifted his face to Doc Graham. ‘Prepare a long-term care programme and the building of clinics in the north. Do you want to head-up this deployment?’

‘Sure.’

‘No more than four weeks in the field for you. If that,’ Jimmy warned. ‘Rotate in and out.’

‘When?’

‘In a week. We’re flying out there tomorrow.’

I broke the news to Helen, who Jimmy rarely took on trips these days, and we flew direct to Delhi with Han, a connection to Colombo in Sri Lanka. Big Paul and two Government minders accompanied us, but in our pockets we had our “get out of jail free

cards”, our new diplomatic passports courtesy of the UK Government. We were both now deputy ambassadors to the UN.

We landed at Colombo airport in the small hours, and were met by a coach and armed police officers, whisked through the quiet city streets and to our hotel. Booked in, we ordered room service, little more than sandwiches and biscuits available, and got some sleep. In the morning, we caused plenty of looks from the other guests over breakfast, and not just because of Big Paul’s table manners.

Our appointment with their President was for 10am, and the same coach took us around to his palace. Big Paul and the minders were directed into a side room as we entered the designated meeting room; a long hardwood table down the centre, brass ceiling-fans whirring. We sat at the end of the table, the President and his aides greeting us warmly.

‘Welcome, welcome,’ the President offered. We all sat.

‘We thank you for the time in seeing us,’ Jimmy offered.

‘How are your hotels?’

‘They suffer a little from the increased fighting in the north.’

‘Which will soon be over!’ the President assured us, a finger raised.

‘Which is why we are here, Mister President. We are concerned about the refugee crisis that such a successful conclusion may bring.’

‘It is under control,’ he quickly assured us.

‘We wish to be ... sure of that,’ Jimmy insisted. ‘Which is why we wish to bring in Rescue Force to care for the refugees, and to settle them quicker.’

‘It is a dangerous area for your people,’ the President said dismissively.

‘Our people are used to danger, they will not be bothered by fighting. I would like to bring the first teams down in a few days, to treat injured civilians leaving the area.’

‘We could not have civilians in a military area, especially foreign doctors at risk.’

‘Mister President, we all wish to see a return to a peaceful Sri Lanka as quickly as possible, both for tourism and other investments. And I wish to buy land in the north, and to bring in mine clearance teams to make safe your jungles.’

‘When the fighting is over –’

‘No, Mister President. We’d like to work to our timescale. If not, then my investments in this country will cease, as will that of the Chinese Government.’

The President glanced at Han, who simply stared back. He took a moment, not looking happy. 'Why are you so keen to be in those areas?'

'We would not wish the world's media to accuse you of mistreating Tamil civilians. That would be bad for business, bad for tourism.' He waited.

Han finally put in, 'The development loans we have discussed would be subject to final approval ... of Mister Silo.'

The President lifted his eyebrows.

Jimmy added, 'And after a peace has been achieved I would look to buy many hotels in the north; an area that contains some of the world's best beaches. But first, it would need to be peaceful, free of mines, and the population would need to be settled and happy. We would also build clinics in the area.'

I decided to be helpful, 'The aid development programmes of Britain and France are also under our influence. Especially here.'

'Do you think we will massacre civilians?' the President growled.

'No,' Jimmy answered. 'And we are not interested in taking sides. We wish only to return your country to a peaceful state as quickly as possible – to help our investments here.'

The President eased back, still seeming angered. 'And what would you like to do, exactly?'

'Our medics would be ten miles behind the fighting, helping with the wounded. They would also provide medical care at any refugee camps created. That's all. We would then bring in mine clearance experts, and afterwards would build clinics and hotels – assisting your economy.'

'I will discuss the practicalities with the Army.'

'It takes time to move our equipment,' Jimmy explained. 'We need to give the go-ahead now.'

The President hesitated.

Han said, 'Is there a problem with our proposal, Mister President?'

'No, it's ... very generous.'

'Then we would like to prepare our teams,' Han added. 'As soon as is practical.'

Our host took a moment. 'The documents will be drawn up today,' he reluctantly informed us.

We stood. Jimmy said, 'Please keep in mind, Mister President, that we are only motivated by your best interests – and protecting our investments in this country. We have no other agenda.'

We were shown out, collecting the security detail. Back at the hotel, I asked, 'Will they massacre civilians?'

'In their eyes they're not civilians, they're Tamils. And, if we don't help, they'll create the next generation of terrorists.'

At 4pm a document arrived, giving us permission. Good job really, our jeeps were already being loaded up. We packed up and reversed our flight to Delhi, staying the night at the Taj Palace, one of those great Indian hotels where guests are not allowed to do anything. A guy took our bags, another opened door, a third pushed the lift button, yet another directed us down the corridor to our room and opened the door, more again following me into my room, turning down the bed and putting the heating on. I ran out of small change for tips.

At 3pm a knock at the door woke me, and I found Helen and the kids stood there. 'I don't have a woman in the room,' I insisted as Shelly ran in.

Helen kissed me. 'Tiring flight.' She put the baby on the bed, a man bringing in a cot for Lucy. The room only offered two single beds, so Shelly would be in one, us in the other.

'I thought we were flying back tomorrow?'

'Security measures. Jimmy changed the plans ... just in case.'

'Oh. Want some grub?'

'No, had a meal on the flight. Shower and bed I think.'

In the morning we lay about the pool, Shelly jumping into the cold water. We soon had several of the hotel staff hovering, everything from newspapers to massages offered. Jimmy joined us with Han an hour later, security detail in tow, Shelly wrapped up warm in a large towel. Han ran his fingers through the pool water and decided against a swim, Shelly nagging him. They sat on sun beds next to us.

'We'll be here a few days,' Jimmy explained. 'But it's a good hotel.'

'I saw an advert for the zoo,' I thought aloud.

'Don't bother, Delhi zoo is a tip. It's a national shame.'

'Oh. How far we from the Taj Mahal?'

'Five hour drive. If you want to visit it we'll travel overnight when the roads are quiet. No motorways here.'

'Helicopter?'

'Possible, but we'd have to check the quality of it first. The train journey is not bad, might try that. Oh, don't walk out of the hotel, not safe and nothing to see.'

The next morning we headed for a pre-arranged meeting with the Defence Minister and the Interior Minister, Jimmy only giving me the bare details of the meeting. From the hotel, we drove through Delhi, the city as bad as Nairobi – or worse, our driver trying his best to hit cyclists. We eventually drove through a large arch and onto a wide road, the old colonial buildings ahead, and quiet spectacular. Inside, driving around to the correct building, the peace and the beauty of the architecture was a hell of a contrast to the rest of the city.

‘Welcome,’ the Defence Minister offered. The room we had been led to offered high ceilings and brass fans, nice cornice work – period colonial, and a very old wooden table. Sitting, they offered us tea.

‘Genuine India tea?’ I asked. ‘Not from a British supermarket, I hope.’

They laughed. ‘The real McCoy!’

Sounds behind us preceded the arrival of Keely’s boss, Host, Michelle’s boss from France, and Sykes. We stood and greeted them.

‘Didn’t go to school here, did you?’ I asked Sykes.

‘No, but my father did. I was born here, on a train, in 1945.’

Everyone introduced themselves to the two Ministers and their aids, more genuine Indian tea poured and sipped as we again settled.

‘So,’ the Defence Minister began. ‘An intriguing mix of gentlemen we have here. And an intriguing request for this meeting.’

Jimmy got straight to the point, ‘Minister, you’ve been receiving tip-offs about terrorist actions on your soil for many years, from a man called Magestic.’

The Ministers all jumped an inch at the same time, clearly shocked. ‘How do you know that?’

‘I work for Mister Magestic,’ Jimmy explained. ‘I’m his right hand man.’

‘And I make the tea,’ I lightly offered.

Our hosts exchanged looks. ‘You work for him?’ the Interior Minister puzzled.

‘Yes, have done for a long time,’ Jimmy explained. ‘Which brings us to the reason for this *intriguing* meeting. We believe that there will be some very serious terrorist attacks against you in the years ahead.’

‘We thought Magestic a Pakistani Intelligence officer stationed in London.’

‘No, Minister, he is not. He is a powerful clairvoyant.’

‘A ... clairvoyant?’ the Defence Minister repeated, a glance at Host, Sykes and the French Intelligence officer. They all nodded in turn when looked at.

‘My god!’

‘So, to business, Minister. In addition to warning you about upcoming attacks, we would like to help you with counter-terrorist measures.’

‘What ... what measures?’ they asked.

‘We’d like to do something unusual. We’d like, with your kind co-operation, to recruit and train a dedicated counter terrorist force here in India. We would pay for the training and the equipment, and we would pay the wages of the units when they deploy to parts of your country. But they would be, obviously, your forces.’

‘What? Like those Rifles you have in Africa?’

‘Not quite like that. These would be dedicated counter-terrorist officers working in your cities.’

‘How ... how many?’

‘Around six hundred.’

‘And who would pay for this?’

‘The money would come through me, from a variety of interested parties.’

‘You’ll pay for, and equip, six hundred men?’

‘And their wages will be twice that of the typical police officer, their equipment modern and well maintained. But we would need secrecy, especially my role. As far as the world is concerned we’re here to talk about Rescue Force matters.’

‘And the training –’

‘Would be from British, French and American Special Forces instructors, the training held at a secret base in Africa. It could start as soon as you’re ready, because we’re expecting many major attacks against you in the next year.’

‘Major attacks?’

‘More severe than those that you have averted with our assistance. Far more severe.’

‘And we’ll be warned about them as normal?’

‘No. This new force will be warned, and they will be sat waiting for the attackers. You’re regular police are ... less likely to survive the encounter.’

‘And these attacks, they are Pakistani Taliban?’

‘You may think that, I could not possibly comment.’

‘We need to discuss this with the Prime Minister.’

‘Of course, we’ll be around for a few days yet. Oh, could you lay on a helicopter for a trip to the Taj Mahal?’

‘Er ... yes, I suppose.’

‘We’d pay the fuel.’ Jimmy stood. ‘Thanks. We’re at the Taj Palace.’

Back at the hotel I found the family around the pool with Han.

‘Show daddy what you found,’ Helen told Shelly.

Shelly displayed a few coins on her hand.

‘Good girl. Did you swim down?’ She nodded. Facing Helen, I asked, ‘Lunch?’ We moved inside.

The nice men from the Indian Air Force offered us an Mi8 helicopter, but I did not wish to risk my family in it. We hired a coach and set off at midnight the next day, a police escort front and back. Now that they knew who we were, who we really were, they were taking no chances.

We arrived at our new hotel at dawn, a stone’s throw from the Taj Mahal, and booked in. Not tired, and keen to see the palace, we took the same coach around to the Taj Mahal, or at least to a coach park. We then jumped into small yellow taxis and formed a convoy as we travelled around to the palace, halting at the entrance. Our police escort waved us in, we did not have to pay, and we found the inside quiet. It was a weekday, and the tourists were yet to arrive.

Shelly chased after wood pigeons and numerous squirrels as we sauntered through parkland towards the familiar white image. Impressive from the outside, the mausoleum was surprisingly plain on the inside. Back outside, we walked around it and to a view over the river, a fine mist making for a good photograph.

The sun broke through the morning haze, warming the first early-bird tourists as we wandered around, tour guide Silo pointing out a few interesting facts. It seems that the corner towers had been built leaning away from the mausoleum at three degrees, so that when they eventually collapsed they would not impact it. A curator of sorts gave us seed for the squirrels, which looked a bit like American chipmunks, and Shelly fed them. We lined up for the usual tourist photograph, one for the album. Having taken the shot, a voice said, ‘Are you Jimmy Silo?’ Jimmy greeted a retired couple from Adelaide, Australia, and I snapped them together with the couple’s camera.

After lunch in the hotel we visited the Red Fort, and I found it more interesting than the palace. This time we had a guide, plus a few tourists following us around, and I got the full history of the

place. It was a long way to come for a quick tour, and after a meal and a shower we set-off, back on the road to Delhi at 8pm.

Our Indian contacts came around to the hotel the next afternoon, and joined us around a table at the poolside. Our project had a green light. Jimmy handed over a document, a proposal that had our contact information in it, and waved over a Frenchman.

‘This is Pascal, your liaison. He’ll remain here, he already has an apartment. We’ll communicate with him, and he’ll talk to you, and we’ll all deny that we have such strange bedfellows.’

They laughed. ‘When do we start?’

‘As soon as you have a hundred men that you think are suitable. And, Minister, secrecy is essential.’

‘Indeed yes.’

They left with Pascal, whom it turned out had also been born here from colonial parents. And, by using the French, Britain could not be criticised by Pakistan if this leaked out.

A month later, Jimmy, Big Paul and myself flew down to Goma airport direct from London, the plane’s passengers a mixture of hairy oil workers, and rich tourists heading towards our lodges. When anyone asked, which they did, we reported that we were inspecting our lodges.

In reality, we caught a flight to a regional airport, then swapped to a green Army Huey, a short flight to a hidden base of the Kenyan Rifles, a plateau surrounded by jungle. Flying in, the size of it surprised me. We landed next to other Hueys, met by a jeep and a Kenyan Rifles Captain, a veteran of Kandahar.

‘Good to see you again, sir,’ the man offered Jimmy as he handed Big Paul a weapon and utility belt.

‘How’s Ngomo?’ Jimmy asked.

‘Wishing he was a sergeant, sir,’ the captain said with a smile.

‘Some are chosen to lead,’ Jimmy lamented.

The jeep halted at a viewpoint, looking down over cleared jungle, many houses having been built in the valley below us, built from grey breeze blocks and red bricks, and looking nothing like an African village. We stepped down to the sound of gunfire, men dressed in black darting about from house to house.

The captain pointed. ‘Close quarter battle, sir. House clearing and street fighting.’

‘Live ammo?’ I asked.

‘Not at the moment, they are learning.’

Big Paul scanned the activity with a keen eye, and possibly some jealousy. We drove down to the mock town. Halting, I could see white faces in green fatigues shouting at tan skinned men, some of the recruits wearing turbans. Stepping down, three instructors came over to us, the nearby Kenyans saluting their officer. Big Paul had a finger on his trigger, which I noticed.

‘How’s it going,’ Jimmy asked the first man.

‘Slowly,’ the man complained.

‘You have a year or more, so use it,’ Jimmy encouraged.

‘They ain’t Rifles, boss,’ the second man said.

‘No, but they have an important job, so make it count. You have a great budget, no limit on ammunition or kit.’

With stun grenades thrown, we observed a house clearing, which I thought went well. The instructor disagreed. Loudly. Back up the on the plateau we stopped at the Officer’s Mess, meeting Doc Adam coming out.

‘How’re the men?’ I knowingly asked him, shaking his hand.

‘They’ve been vaccinated against the usual, so they should be ... OK.’

Jimmy shook his hand. ‘How are you, old friend?’

‘Still following my calling.’

‘Is that to father as many kids as you can in one lifetime?’ I asked, the captain in hysterics.

‘I like to bring life to the world!’ Doc Adam boomed with a smile. ‘And now I go to your very small orphanage to see some new arrivals.’

‘They yours?’ I asked as he left us.

Inside, they made us tea and offered cake as we chatted to the Indian Army officers assigned to the unit. Thirty minutes later we emerged into the sun again, finding Skids and Trev stood waiting.

‘There are lions around here?’ I asked them.

‘Gorillas maybe.’ We shook hands and mounted up.

Pulling off, Jimmy asked, ‘They shoot straight?’

‘If they take their fucking time, aye. It’s the shooting as they move that’s the problem. If we gave them live ammo they’d kill each other – and us!’

‘They’ll get there,’ Jimmy assured our drivers. ‘If not, you don’t get paid.’

‘So,’ I asked. ‘You prefer this to lion country?’

‘Once a soldier, always a soldier,’ Skids remarked. ‘And that ... *incident* took the edge off. After that we wanted to go back to shooting the bad guys. Your legs OK, Big Paul?’

‘Couple of operations, but now they’re fine,’ Big Paul replied.

‘So what did you do with the money?’ I asked. ‘From the farm?’

‘Tucked away for when we’re too fucking old to do this.’

‘Which, considering they used the serum, will be a long time,’ Jimmy pointed out to me, a look exchanged with Big Paul.

‘Yes?’ I asked. ‘How fit are you now, Skids?’

‘Off the fucking scale: I sleep two hours and run twenty miles before breakfast. You?’

‘I could do it, but I’d be divorced. My time is spent with the rug rats.’

‘And I’m playing at family man,’ Big Paul grumbled.

‘And that fucker that you killed?’ Skids asked me.

‘One of yours, a trooper.’

‘There’s a few of them out there that are unbalanced,’ Trev suggested. ‘We’ve come across a few, asking for work down here. They don’t want to knuckle down, they want a quick bit of glory and a paperback book with their names on. They get shitty when we don’t help them find work, so we avoid them.’

Our jeep pulled up next to a very long, and quite thin, firing range carved into a hill, its sides still virgin jungle. The main firing point was concrete, sand in front of that, then mud. The distances had been marked out, from fifty yards to seven hundred yards. Eight men were firing away with AK47s from the kneeling position at man-sized paper targets. With the instructor calling a halt, and the men making-safe their weapons, Jimmy accepted an AK and a fresh magazine. With Big Paul close, and again with his finger on the trigger, Jimmy cocked the weapon, took aim in the standing position and fired ten rounds in quick succession, five targets falling over, the wooden poles at their bases hit.

He made safe the weapon. ‘Instructor. Did you see me damage those targets?’

‘No, sir!’

‘Then the men must have done it.’

‘Right you bastards, press-ups! Now!’

They dropped down and started pushing.

Skids closed in to me. ‘And he’s not ex-anything.’

‘Canadian Army, as a medic,’ I said, getting back a disbelieving look.

The next training station we inspected was simply a large patch of concrete as big as a football pitch. Teams were screeching around in old cars, pulling up and firing blanks as they poured out. Beyond that we penetrated a heavily wooded valley and came across a three-

storey apartment block, not dissimilar to Faulty Towers. Men were climbing up, jumping down, and firing at targets in the surrounding hillside as they went. Driving back up the muddy track, the way we came, we found a swimming pool, and next to it a small pond, men crossing it with their weapons held high, firing at targets on the far side.

The next station I recognised, a sandpit for mine clearance, the trainees now clearing the area with their metal detectors. We sat and had lunch in the main canteen, chatting to some of the men, enquiring about homes and families and discovering that they were here for twelve weeks at time, two weeks at home before returning. I detected a few French accents in the dinner crowd, and we were joined by serving British and American instructors as we had a coffee; SAS and Delta Force. They informed me of the helicopter drills that the men underwent, and the voluntary parachute training that was not quite so voluntary. The men could refuse, but they would not get a full qualification at the end of the course, or the extra pay.

We left them to it, flying off in the Huey with myself right seat. It had been a while, and I missed this. I just hoped that no one would tell Helen, and secretly longed for some danger.

A week later we glimpsed white uniforms landing at Colombo airport in Sri Lanka, the first batch Chinese. Their jeeps had landed by IL76 transport and could now be seen driving around the war zone, tents set up at various refugee camps. Mawlini dispatched a team of sixty mine clearance technicians, all working through a UN remit, but paid by us. The biggest problem that they faced was the growth of the jungle over fields that had previously been mined. What had once been a ploughed field had now returned to its jungle state, making the clearance work harder.

I watched the Sri Lankan campaign in the Tamil regions unfold each day, some items on the TV news, some useful Internet feed, plus intel' reports from Han and Keely. As the Sri Lankan troops moved north, so the civilians moved out of their way, adding to the refugee crisis. The Sri Lankan Army would often give notice that a town or area would be cleared, that statement causing the population to flee en mass, and straight into the camps where our people waited.

With the end of the campaign in sight, the number of casualties increased as the intensity of the fighting increased, and rumours of atrocities emerged. They took the form of executions of fighters,

something that Jimmy was not against. Old fighters made for either the next generation of politicians, or the next generation of terrorists. Having cleared and secured all areas, the Tamil leadership more killed than captured, the gunfire ceased. That just left a hundred thousand people in the camps. We sent food and water, and as many medics as was required, some six hundred in total. The surgical teams had been kept busy, much gunshot trauma to attend to as the fighting had ended. A week after the end of hostilities we began withdrawing the surgical teams; it was now a case of disease, and infected old wounds.

A month after the end of the fighting, the Sri Lankan Government could finally see the benefit of our work; the faces behind the wire looked well-fed and not as terrified as they had been during the conflict. Everyone in the camps had access to medical care, so it was not a criticism that could be levelled at the Sri Lankan Government. Jimmy said that he was satisfied with the outcome, and we closed that chapter in the history of the planet.

Katrina

August came around and Hardon Chase sent in the Marines, taking a personal interest in Hurricane Katrina as it slammed into New Orleans. He deployed large numbers of soldiers ahead of time, and helped evacuate the people – all of the people. After the storm hit he moved thirty thousand soldiers back in and made several visits, not least to complain about the local authority and their lax maintenance of the flood prevention barriers. He was the “prepared and caring President”, and he was not about to let anyone forget that.

We landed back in New York with the whole family on August 28th, and planned on staying a while, a meeting at the UN scheduled for Sept 14th. We camped out at my new apartment, rooms enough for Jimmy and Cat, Big Paul and his family over in the old apartment. We enjoyed a Thursday night at the club, not too busy, and met both a few of our singers, and a few celebs, in the VIP area.

Two days later, Jimmy said that he had a surprise, and we all packed our bags again. In reality, we always travelled in the same manner and expected the sudden moves, suitcases never fully unpacked. Shelly, however, complained about having to repack her little pink suitcase. And no matter what we did, what had come out of it would not go back in. We flew the short distance to Toronto,

Canada, and the gang boarded a train, compartments for all of us, plus the Canadian minders that we had hired. An hour later I was sat with Helen and Shelly in the bubble-glass of a viewing car and watching the beautiful Canadian scenery go by. I hardly said a word to my daughter as she stared contentedly out of the window, occasionally pointing at something.

The way that this special train operated was different to previous generations of cross-Canada tours, Jimmy explained. We'd sleep on the train at night, moving from one location to the next. In the morning we'd wake to find ourselves at a new city or point of interest, such as a nature reserve. We ate together in the evenings as the train pulled off, sleeping through the darkness, and woke to a new location each morning, enjoying walks around small towns, catching tour busses to view local points of interest or to visit nearby animal sanctuaries. Shelly loved the animals, and so did I, adult bears glimpsed through high fences and cute bear cubs fed and stroked.

After six days we approached the Canadian Rockies, Jimmy informing us that we were booked into a hotel, and at the end of our journey. And what a hotel. The Canadians did not build small hotels, they built monsters with four hundred rooms in. This hotel came with mountain and lake views, spectacular views. Our room offered a balcony and we held Shelly tight as we took in the magnificent scenery from our lofty perch.

Jimmy appeared on the next balcony. 'Like it?'

'Superb,' I said, Helen echoing my words.

'Good, because we now own it.'

'We do?'

'We're twenty miles from the time machine.' Helen and I stood rigid, staring at him. He added, 'When you're ready, Paul, I'll show you. Meet me downstairs in ten minutes.'

Ten minutes later we boarded a jeep, security in tow, and set off, Jimmy giving the driver directions. In the heat of the day we wound through pleasant countryside, and came to a small hamlet with a fishing tackle shop. Stepping down, the midday air warm, we left the security detail at the jeep and wandered inside the shop, the doorbell pinging. The shop was like its own time machine; it took you back twenty years as you crossed the threshold. We wandered past lines of fishing rods, nets hung from the ceiling, adverts for favourite baits.

'Can I help you there?' a man in his fifties asked.

‘All the years I’ve been coming here, and you still don’t recognise me, Cole,’ Jimmy told the man.

‘You do look familiar. You English?’

‘Yes, just bought the hotel.’

‘You ... bought the hotel? Well, you’re not short of a shiny nickel then. Will you be needing something for the guests, we stock the best sticks.’

‘Rods,’ Jimmy told him. ‘How long have you called them sticks, Cole, they’re rods. Hasn’t Martha beat that out of you yet?’ Cole stood puzzled as Jimmy closed in. ‘If I used the toilet, and reached up behind the cistern, would I still find a naughty packet of cigarettes that Martha doesn’t know about?’

‘How on earth...?’

‘And you still don’t recognise me, after all this time.’ Jimmy shook his head. ‘Still panning for gold when Martha visits her sister?’

‘Now you’re worrying me.’

‘He does that a lot,’ I put in.

Jimmy put a wad of dollars on the bar. ‘My party will be fishing in the lake tomorrow, so we’ll need some of your best bait, and an assortment of rods – not sticks, would be appreciated, Cole.’

We left the puzzled shop owner with the money and mounted up again. Ten minutes later we passed a farm and halted, Jimmy telling the driver he wanted a look around. We stepped down, wandering across to a brisk stream, the trout visible below the makeshift wooden bridge we stood on. I followed Jimmy across a field and through a line of trees, emerging into another field. He took a few steps, bent down and lifted an old wine bottle, rubbing a thumb across the faded label before handing it to me.

‘What date does it say?’

I read the small and faded print. ‘2023. My god, 2023! It’s from the future!’

‘You’re stood right next to the portal.’

I jumped to one side and scanned the field. ‘There’s nothing here,’ I whispered.

‘Not yet there isn’t. When it’s built, it will be right here. The portal you come through is twelve inches off the ground, four feet in front of you. At least it will be in the future, or was in my past. No guarantee that it will be built again, and I hope it won’t be; there should be no need for it.’ He took a long breath and glanced around. ‘Take a good look around, note the hills and the features. At some

point in the future, should it be necessary, you may need to come here and ... do something. That you'll figure out at the time.

He took the bottle off me and shoved it into the ground, neck first, and stamped it down. Back at the jeep we pretended to be interested in farmland around here, and drove slowly back to the hotel. Big Paul and his son were already in canoes on the calm lake, Cat and Helen sat with the girls on the lakeshore, Shelly wet from a dip. I tested the water and, despite the warm air of summer, it was bloody freezing. Helen had a picnic basket, provided by the hotel, and we sat enjoying the weather and the view, the lake backing onto huge cliffs below a perfect blue sky.

A shout caused me to lift up and open my eyes from where I lay. A man, fishing on a canoe, was shouting at the water's disturbed surface. He was shouting for his son. I jumped up, Jimmy there a second later, and we approached the shoreline. Before I had a chance to do anything, Shelly had moved from where she stood in the shallows and dived into the deeper water. I called her name, but she was gone.

'Wait,' Jimmy said, as he stripped down.

I stared at him, angered, not seeing my daughter anywhere as Helen shouted after Shelly. From the time the boy had shouted and disappeared, to now, was twenty seconds, the father's canoe a good forty yards offshore. A full ten seconds later a head appeared ten yards out. Shelly. Jimmy waded into the cold water and met her half way, taking the immobile boy off her and lifting him. In the shallows, Jimmy lifted the limp and lifeless lad up by a hand on the boy's stomach, the boy bent in two, Jimmy opening the boy's mouth with a finger to clear any water. At the shore, Jimmy held the boy and forced several quick breaths into him, the boy coughing and spluttering a second later, the security staff now running across.

Jimmy held the boy up by the ankles and swung him around three times, grabbing him and stripping him quickly as bystanders rushed over. Helen had grabbed Shelly and wrapped a blanket around her, others offering a blanket for the boy as Jimmy stripped the wet clothes off. The father's canoe hit the shore with a scraping sound and he bound out, finding his son coughing, but OK. Our security detail led them away.

Jimmy faced Shelly. 'Well done, Shelly, good rescue.'

'I saw a big fish,' she said as Helen rubbed her down, Shelly soon trying to wriggle free.

'Was that supposed to happen?' I asked Jimmy.

'No, but I know Shelly's swimming abilities.'

‘She’s four and half!’ I complained.

‘And just swam thirty yards and down to drag up a ten year old boy.’ Jimmy lifted up Shelly. ‘Cold?’ She shook her head. ‘You did very well. You want some sweets from the shop?’ She nodded.

That evening, Jimmy carried Shelly into the restaurant, and my daughter received a round of applause from the guests, Helen and I still a bit shocked, and quietly annoyed at Jimmy. The next day was just as glorious, and we all set off fishing in canoes, Shelly made to wear a life preserver and sat between Helen and myself. We found a nice spot in the shade of tall trees and caught trout periodically. Then we spotted a bear on the shore eyeing us as a potential snack.

‘They come down to the rubbish bins,’ Jimmy explained, none too concerned.

Big Paul and his lad caught several large fish and took them back; they’d be eating them later. We canoed back as a group around 4pm, the air still and warm, the sun glistening off the water, and I was in love with the Canadian Rockies in general and our new hotel in particular. We took Shelly for a swim in the indoor heated pool, to stop her nagging, and enjoyed the next five days, much doing of nothing much. We hiked up the nearest hill, hotel rangers in tow with rifles in case of bears, and photographed our hotel from above, and I took Shelly up in a Jetranger helicopter, getting an appreciation of the area from the air. I was sad when we left.

Back in the bustle of New York, we met with various diplomats at the UN and flashed our IDs at security. In a planned series of meetings, we met with UN Ambassadors from Sri Lanka, the African nations, Cuba and finally the UK – since Jimmy would be speaking to the full assembly, to all the world’s leaders. He had pulled a few strings, and the weight of the “M” Group countries was behind him for this unusual move.

On September 14th our security drove us around to the UN building, the corridors full for a change as the special three-day summit progressed. Jimmy had shown me the assembly hall empty, and now we viewed it full. It was smaller in real life than it seemed on the TV, and Helen and I gazed down at the nations we knew.

An hour into a meeting on international co-operation, Jimmy was invited to speak, receiving a lengthy round of applause. He carried no notes, no speech prepared. When the applause had eased, he began, ‘First, I would like to thank the UN for allowing me to speak here today. I could offer greetings in many languages, but it would take a long time, so I will stick to just English on this occasion. I will, however, try and talk slowly for the translators. I would first

like to report that there are now fifty eight countries offering Rescue Force teams, or that will be doing so shortly, and that number is likely to increase again in the near future.

‘I would also like to take this occasion to report that the UN has now formalised relationships with Rescue Force. As a result of that, a Rescue Force liaison will have an office here, and a UN representative will have an office at Rescue Force headquarters. It is our hope, that aid work and disaster response can be better co-ordinated in the future as a result of this partnership. As you may already be aware, Rescue Force now has several regional training centres where junior countries can train their staff with our experienced instructors, and at our expense. Countries, smaller countries, should not be put off showing an interest in Rescue Force if they are short of money. Those regional centres are Cuba – for the Americas, Kenya for the Africa continent, Australia for the Far East, and Great Britain for Europe. I can report that those centres are doing well, in particular the Cuban centre, which has been generously opened to the South American states, some of which have limited means. I would like to take this opportunity to thank the Cuban Government for its kindness and generosity in its support for Rescue Force, and its good work in Central America.

‘Moving on, many nations have enquired about our earthquake prediction research, and the computer software we use for predictions. That predictive technology is not one hundred percent accurate, and as such we are very careful in its use. We do not wish to evacuate a populated area, or inconvenience the local population unnecessarily. Having said that, I would like to take this opportunity to issue our next warning. We believe that a substantial earthquake will hit the Kashmir region of Northern India in the next two or three weeks, with a great loss of life and damage to buildings. Rescue Force will be deployed, just in case. Let us hope that we are wrong in our calculations.

‘Moving on, I would like to report to the chamber that our operations in Sri Lanka are winding down, and that the displaced persons in the camps are being well tended. Despite claims in some newspapers, our people have not reported any mistreatment of the Tamils by the Sri Lankan soldiers, beyond that expected of a war zone. We have nothing to report that may make a claim against the Sri Lanka Army.

‘Moving west from Sri Lanka, I would like the United Nations to look at the worsening situation between Chad and the Sudan, and the remaining refugee crisis that still blights Chad’s border region.

Some of those refugees have been there a long time, and they need to go home.

‘As most of you know, Rescue Force is a non-political organisation; we don’t take sides. We do, however, take the side of the under-dog, the victims, and whoever is suffering. That is the politics of care. What Rescue Force has done over the past fifteen years, has been to show the world that we have a common human condition, and that no matter how much we may disagree in a chamber like this, when a disaster strikes all sides like to help. When a disaster strikes, all sides put aside their political differences and pull together in a rush to offer assistance. If we had an earthquake each week, then we would see unprecedented co-operation between nations, because we would have a common enemy – and a common goal.

‘So why can’t the people arranged in front of me co-operate on more than just the sick and dying? The answer is somewhere between politicians being stuck in their ways, outdated dogma, and vested interests of big business. Americans, and the British, are just about interchangeable with us, as are Australians and Canadians. We can live and work in each other’s societies without any problems. And if you were to take a holiday in Cuba you would find British, Canadian and Australian tourists, all remarking on how lovely the country is, and how friendly the people are, going home with fond memories. And so would Americans if they were allowed to visit. They’re not allowed to visit ... because of out-dated dogma, and stubbornness.’

‘Oops,’ I said to Helen. ‘I wonder if Hardon Chase has a trap door below his seat?’

‘If you were to take another holiday, this time to the beautiful Egyptian Sinai resort of Sharm-el-Sheik, you would find a lot of British tourists, and some Americans sampling the scuba diving. And, in the evening around the bar, those American men would be discussing just how attractive, and how friendly, the Russian girls are. And if they took the time to chat to some of the Russian men they would find them friendly, and no different to themselves. They all have the same job problems, relationship problems and hopes for the future. Yet back in Washington and Moscow, the two countries still see each other as adversaries, because old habits die hard.

‘On the Indian and Pakistani border there are many divisions of soldiers sat facing each other. Yet, if you were to fly down to South Africa to watch the cricket, you’d find Indian and Pakistani businessmen chatting about the game, not wanting to fire missiles at

each other. So what's the problem? Why is it that the people of this planet can meet each other as civilised human beings, but not their governments? Are we saying that the politicians of the world desire conflict – when we can be sure that the people they govern do not? Or are some of those we elect to office trying to justify their fat salaries by creating problems, so that they look good trying to solve them?’

‘Perhaps he should just throw stones at the audience,’ I suggested.

‘Part of each of us is Rescue Force - wanting to help. Part of each of us ... is the person on holiday who is surprised to find out that the Serbian at the breakfast table is very friendly, and very much like us. And part of us reads the papers, and what our political leaders tell us, and wishing our countries to be tough in the face of provocation from abroad.

‘In Africa, during the Darfur crisis, many Africa countries came together and raised a common army for a common cause, countries that would not have normally been so friendly toward each other. If only there was a common cause that we could all get behind, a threat to the planet perhaps.’

I swallowed, and exchanged a look with Helen.

Jimmy continued, ‘But just how sad are we ... that we would need such a common threat ... for us all to come together and pull in the same direction. For an earthquake, we'll all pull together. For the sake of human development, peace and harmony, our political leaders cannot be bothered to pull together. It's easier for them to cry wolf, and to unite their voting public behind a perceived threat, to help them stay in office.

‘America ... is the world's superpower, and America likes to lead the world, not only in music, film and questionable new financial instruments. If the world is to move forwards, then it is – unfortunately – mostly down to the man in the White House. The Chinese ... they want peaceful relations, without the Americans criticising their well-run country and well ordered society. The Russians want normal relations, and to spend less on weapons. And I'm sure that even North Korea wants a settlement. It's down ... to the man in the White House. And does a very strong country appear weak if it makes the first move? Will America's enemies, who are outgunned ten to one, respect American any less ... if America tries to find peaceful solutions? Will a number of small countries bite America on the ankles ... when they see the superpower lowering itself to open a few doors ... and to make a few peace overtures?

‘There is only one factor that truly influences world peace, and that’s the man in the White House. He could make the first move, secure in the knowledge that after such a move he’ll still outgun his rivals ten to one combined. And for those in the Pentagon bothering to listen to this, talking peace does not make your aircraft carriers any less potent.

‘We often hear American politicians talking about leadership, and of America leading the world, at least what they would label as the free world. Well, all President Hardon Chase needs to do ... is to make the first move, and I’m sure that he will find the Russians and the Chinese very receptive. And if he won’t risk his reputation with a visit to North Korea, I’ll happily volunteer to make that visit. I have no pride to worry about.

‘I’ll finish with this thought: we all keenly come together for an earthquake or other disaster, and none of us desires to see any further wars in the future. So why can we not come together to prevent those future conflicts, which will produce far more casualties than any earthquake ever will?’ He took a moment, taking in the faces. ‘Thank you for allowing me to speak.’

They started clapping, all except Hardon Chase, who looked stunned, or shocked, I couldn’t decide which. And since Chase was talking next, I smiled all the more. Our good friend in the White House stammered a bit to start with, his balls still sore. But when he got going I was quite impressed with the directions he was hinting at. He even paraphrased Jimmy about America’s leadership.

An hour later, the “M” Group countries met in a private room in the UN building, buzzing wands checking for bugs at length.

‘How’re the balls?’ I asked Chase.

He offered me a fatherly, disappointed look as he sat. Still, I was used to those from Jimmy.

Jimmy began, ‘I would like to start this meeting by asking President Chase to speak first. To give us some ... leadership.’

‘Don’t start that again,’ Chase said, looking peeved. ‘You started off well enough, very commendable, then put all the world’s problems at my door.’

‘That’s because they *are* at your door, oh powerful one.’

Chase cocked an indignant presidential eyebrow. He took a breath, and a moment to study the expectant faces in the room. ‘I guess you already know what I do.’

‘Not really. You are an ... *aberration* in the time line,’ Jimmy said with a false smile.

‘If ... within my term, we mend some fences, what do we get out of it?’

‘The glory, for one,’ Jimmy began. ‘A reduced defence expenditure for two, increased trade for three. And, when the good people around this table co-operate on more than just Magestic matters, some benefits of combined actions against people like the Iranians, and Venezuela, and others. Having made friends, those friends would be expected to give back a little. Horse-trading, I think your countrymen call it. So let’s start, shall we. I’ll go first. How about ... America and Russian updates and increases its treaties on the numbers of nukes; a reduction, but not enough to worry the folks back home. American drops it rhetoric about Chinese human rights, and China makes sure that fair trade agreements are ... a little more fair. We’d then like to see China play a large part in turning North Korea into a South Korean look-a-like, a suitable trading partner for the future, not one that throws nuclear bombs towards Japan.

‘Then we’ll look at Russia and China putting pressure on Iran to stop developing nuclear weapons, the good old US of A assisting Russia to modernise its electronics and computers. Britain, France and Europe then welcome Russian tourists – and businessmen alike – with almost open arms. And you all assist Africa to grow into a nation of consumers with some money to spend, because they will spend it, whereas the Saudis and the Chinese put their money under the mattress.’

‘So what would we do the week after?’ Chase quipped, making many of the national leaders laugh, even the Chinese.

‘The week after, we would try and figure out ways of surviving the variety of plagues that will kill a hundred million people in the years ahead. And when that is solved, we might just look at 2025.’

The room fell silent.

Jimmy continued, ‘Now, everyone in this room wants to get to 2025 in one piece, and in the best possible condition. Unfortunately, if you jostle for best position you’ll stop co-operating. And, if you don’t co-operate one hundred percent in 2025, the Brotherhood will find a weakness and exploit it, and then you all lose. So I have this suggestion. Here, in this room, we horse-trade. We look at American GDP, Chinese growth curves, Russian modernisation, and other factors in play, and we negotiate. Maybe the Chinese will modify their growth a point or two, in return for something. Everyone at the table has something to offer, and things that they desire. Now, let’s start simple. How about a US and Russian reduction in long range missiles of twenty percent inside a year?’

‘It is workable,’ the Russian President offered.

‘It’s not a million miles away from what we’ve been discussing,’ Chase admitted.

‘And you both appear good in front of your voters,’ I put in.

Jimmy said to the Chinese, ‘It was always my intention to give first, and ask for favours afterwards. You have the Zanzibar oilfield, which will reduce your oil costs by tens of billions in the decade ahead. How about assisting US exports to you by a few points? And before you answer, consider always that I have more to offer.’

The Chinese asked, ‘What percentage points?’

‘Why don’t you discuss that, and bring an offer to the “M” Group.’

‘In principle we will look at a few percentage points,’ the Chinese Premier offered.

‘Really?’ Chase uttered, seemingly surprised.

‘Next,’ Jimmy began, ‘I could arrange some extra oil finds for America if the Administration did *not sell* arms to Taiwan.’

‘How will Taiwan turn out?’ Chase asked.

‘They’ll choose to join China as part of a confederation when China is doing so much better than you.’

‘Oh.’

Jimmy explained, ‘China needs to act as a big brother, and to guide and lead with kindness, and not to be the angry father of Taiwan. That will get the best results. And Russia, it needs to do the same with the Ukraine – which will fall apart in chaos and unrest.’

‘When?’ the Russians asked.

‘Around 2013. The disruption there will affect you badly if it is not dealt with. You also need to be better bedfellows with the Baltic States; don’t try and ruin their economies. If they fall apart it affects you as well. Europe is your biggest buyer, and you don’t want a wall of broken down countries between you and Europe. So lead, don’t criticise.

‘OK, next. India should soon be brought into this group; they already receive Magestic letters and know of my involvement. In the years ahead there will be several major terrorist attacks on their soil, leading them to the edge of war with Pakistan – something that must be avoided at all costs. All of the nations here should try and boost trade with them, and to make consumers out of their middle classes. If India is strong enough in 2025 they could hold the line by themselves. That would give China and the Far East a buffer. Indian forces could also cross to Oman and meet Africa forces.’

‘Will you talk to the Germans?’ the French asked.

‘In a few weeks, in Paris,’ Jimmy offered. ‘They can join this group, since some of your people have already told them more than they should know.’

The Chinese criticised that breach of security, so too the Russians.

‘The German participation was inevitable,’ Jimmy finally admitted.

‘The Indian earthquake,’ the British Prime Minister began. ‘It’ll be a bad one?’

‘Hundred thousand dead, millions homeless, political unrest in the area.’

‘What about Iran?’ Ben Ares asked.

‘If the nice people here don’t act, then they’ll develop nuclear weapons and use them, causing the rise of the Brotherhood well ahead of schedule. Next year they’ll help Hezbollah provoke you into a war in Lebanon.’

‘And when were you going to tell us that?’ Ben Ares challenged.

‘When the time was right,’ Jimmy responded. ‘If you know too soon you’ll just put back the start date.’

‘Should UN peacekeepers go in first?’ Chase asked.

‘Hezbollah would work around them.’

‘How about African peacekeepers,’ I suggested.

‘They’d start their own war with Hezbollah,’ Jimmy cautioned.

Ben Ares gave a big shrug, his hands wide.

‘If they were used, and opened fire, the UN would not use them again. And ... I have plans for the UN using them at a later date. Can’t play that card twice, Ben.’

‘They’ll fire rockets?’ Ben asked.

‘They’ll kidnap some of your soldiers. Anyway, let’s get back to horse-trading. I would like everyone here to create a list of the things that they most dislike about what the other nations are doing ... for our next meeting. Then I’d like to see a wish list for China, Russian and America, and a trade-off list. I’ll then sweeten any deals with some Magestic magic. Might I suggest that the next meeting is in Hawaii, since China has travelled far many times now.’

‘I’ll be out of office in six months,’ the French President informed us.

‘You would still be involved,’ Jimmy replied. ‘Once “M” Group, always “M” Group.’

‘Do I win the election?’ Ben Ares asked with a smile.

‘We would not have put up with you all this time otherwise,’ Jimmy quipped, causing a few smiles. ‘OK, let’s say Hawaii in three

or four months. Any objections? No? Good. Go out and buy some Hawaiian shirts, and draw up the lists. We'll discuss the lists at my house, with your representatives. That way we will have some definite answers – either way – at the meeting.'

Kashmir

On the way back from the States, driving along the M4 motorway from Heathrow, we dropped into Mapley, since it was on the way and just a short distance off the motorway.

'You awake, Bob?' I asked as we entered Bob Davies' office, finding Doc Graham sat opposite him with Dr Hoskins up from Mawlini.

Having greeted each other, and been suitably rude, we sat.

'Grab the communications officer,' Jimmy suggested, the man trotting in a minute later and sitting behind his screen. 'I want the following countries put on alert for a full mobilisation: UK, France, Russia, Kenya, Australia, China, Hong Kong, Cuba, and Canada. Plus any Europeans that are ready, and the British and French Supplemental groups. Leave the Central Americans, except Cuba, and grab several Cuban surgical teams, and grab the best teams from Africa.'

The man typed away, pagers checked and knocked off.

'Kashmir, right? When?' Doc Graham asked.

'Plan to get the jeeps on the ground on October 6th, a one day drive to reach dispersal points.'

'Who'll be heading it up?' Doc Graham asked.

'You will, with Bob, from here.'

'Here?' they queried.

'It's mountainous terrain, and the radios won't work, and we'll need satellite comm's up. So you may as well be here. Set up a room for it. Right, there are no useable airfields nearby, so Hueys will need to go, but just for re-supply runs. I don't want Hueys back and forth through those mountains in bad weather. Look at the map, make your plans, pick a supply depot and a nearby airport. Oh, and the natives are not too friendly, so hostile territory protocols apply. I want an Indian RF member in each jeep with an Indian soldier.'

'Tents?' Doc Hoskins asked.

‘Lots of them. They don’t build houses very well over there, and it will get cold at night. So lots of tents.’

‘Numbers?’ Doc Hoskins asked.

‘Quarter million homeless to start; pinch the tents off the UN where possible.’ We stood. Jimmy added, ‘We’ll be camped out here from the evening of the 6th.’

Back at the estate, an hour later, we reclaimed our house, finding everything as we left it.

On the 6th of October we packed our bags and drove back to Mapley, settling into the apartment, just one more place we called home. Helen now had several assistants to call upon and got the communications centre ready, already two camera crews settled into the hotel outside of the base. The airfield and the canteen was quiet, the rescuers already deployed, and in the map room I studied the topography of Kashmir, finding it just high hills and deep gorges. Tapping the map, I told Bob Davies, ‘Some of these bridges may go.’

He lifted his eyebrows and nodded. ‘And our people will be cut-off. If the injured are not treated on site – they won’t make it to a hospital through those roads!’

‘How many Hueys?’

‘Just the six for re-supply and emergencies.’

‘Jeeps?’

‘Better part of forty of them, trucks supplied by the Indian Army.’

On the morning of the 7th we gave TV interviews, suggesting that the predicted date was within the next four days. We could have asked people to sleep outside, but the cold in the mountains would have killed just as many as the quake. Still, the Indians themselves had organised a small evacuation and were recommending that people sleep in “safe” buildings, whatever that meant.

The quake hit on the 8th, and I shouted at the national leaders because we had twenty injured staff to start with. ‘The first rule of rescue – is not to become a victim yourself!’ I ordered an investigation in to each injury, fuming. We now had to divert Hueys to grab our people, some badly hurt. They had spent the night in “safe” buildings out of the cold.

The damage caused by the quake was extensive, an estimated thirty thousand dead despite the warnings, but our surgical teams were busy saving people; our supplies and tents were getting through and having an effect. Helen gave numerous updates of facts and figures, all good material to the press. We supplied lists of the

counties involved, numbers and equipment. And, as ever these days, we had camera crews embedded with our RF teams, some live shots of the quake taken. On our advice, the Indian Army had moved many soldiers in ahead of time, and they were now having an affect, a few damaged bridges being repaired.

On the fifth day after the quake we began to pull teams out, leaving doctors in place. Those that could have been dug out had just about been dealt with. Jeeps drove back to the command areas, many remaining with the surgical tents. The Cuban and Chinese hospital teams were there for the long haul, and made themselves comfortable. Our surgical team from Kenya was also dug in, where a local hospital used to be. They would be providing after-care for at least eight weeks.

Despite the early injuries, the deployment had gone well, and everyone at HQ congratulated each other for a smooth operation. Doc Graham had lost some sleep, but had run everything from the command centre easily enough.

Commandos

Jimmy and I grabbed Big Paul, and we jumped onto a scheduled flight down to Goma a week after the Kashmir deployment ended, journeying to the secret base housing the Indians. Skids met us at the heli-pad and assured us of the remarkable difference that the soldiers were showing, Big Paul getting himself “tooled up”. As we drove through the camp we saw the Indians in black fatigues with black webbing, M4s slung. Their berets were black, with a yellow insignia. At the Officer’s Mess we halted and stepped down, meeting Ngomo inside.

‘Let you out of the office, have they?’ I asked him as we shook.

‘I told them it was urgent business,’ Ngomo boomed, grinning.

‘Are they ready?’ Jimmy asked him.

‘They will run down the terrorists and eat their hearts!’ Ngomo confidently reported. ‘Come, we have them ready.’

We drove around to the village in the valley, buildings made of grey breezeblocks and red bricks. Three groups of four men stood ready in their black fatigues, respirators hiding their faces, and M4 rifles slung. I noticed their radios and earpieces as we neared. A whistle was blown, the men splitting right and left and slamming

their backs to the walls. With one team covering the street and rooftops, stun grenades were thrown through windows, the men charging in and firing blanks a moment later.

A man appeared on a roof, the covering team firing. He made a suitable dying sound as he collapsed. The teams advanced along the street, covering each other, grenades thrown, would-be terrorists gunned down as they appeared. With a final whistle was blown, the teams jogged back to us, pulling off their respirators.

‘Well done,’ Jimmy commended. ‘Do you think that you are ready?’

‘Yes!’ they shouted.

‘Good, because you leave tomorrow. We’ve received information about planned terrorist attacks on Delhi in the next week. You will be going to meet those nice gentlemen, and hopefully you’ll kill them all. Carry on, men.’

Skids drove us around to the firing range, but we found only two men. As I stepped down I could hear the distinctive crack of a round being fired, but could not see the man. The instructor led us forwards, soon to a lump of grass that moved, a camouflaged sniper. The man stood up when his name was called, hardly recognisable as a human.

‘Good work,’ Jimmy commended.

Back outside the main canteen, we stopped and jumped down from the jeep. A British instructor was walking towards us, his weapon slung. Jimmy glanced at Big Paul, who fired a round quickly, hitting the startled man in the shoulder. Other men came running as we closed in, Big Paul disarming the wounded man.

With quite a crowd gathered, a crowd of stunned instructors, Jimmy said, ‘He’s about to sell his story to the world’s newspapers. He has you all photographed, and you would have been named. Why don’t you interrogate him, and then search his belongings.’

Two British instructors lifted the man up and led him away, more following.

An American instructor asked, ‘He was going to sell us out? I’ve seen him taking snaps, but so do we all.’

‘Check those snaps carefully,’ Jimmy told the man.

‘You going to warn me next time?’ I complained.

‘He would not have shot you, and I was not sure about his face till then. I had to wait. Some of my memories are ... faded.’

Having shot the man, Big Paul had worked up an appetite, so we sat and chatted to the recruits as we ate. Explaining the spy to the

Indians, they wanted to interrogate the man themselves. I got the impression that our hapless spy would not be leaving the jungle.

Ngomo joined us. 'Problems?'

'A spy,' I explained.

'Have we been compromised here?' Ngomo asked, clearly concerned.

'We'll have to wait and see,' Jimmy told him.

After a quick tour we departed, our 747 refuelled at Goma and now full of tourists that had finished their holiday.

A little over a week later, we sat and watched the news at the house as the new Indian commando force was seen in action, storming buildings and bringing out bodies. Explosives had been found, and a series of major terror attacks thwarted, a few prisoners taken.

The terrorists were Pakistani, but part of our deal with Indians was that the identities of the terror suspects be kept secret, and so the men were labelled as Indian Muslims, even when the men's Pakistani sponsors tried to claim responsibility. A major diplomatic incident was averted.

New year, 2006

We flew over to New York to see-in 2006, staying at the two apartments. The senior staff from Mawlini had been invited over and flew out of Goma, a convenient non-stop flight to JFK. Many from the UK flew out, some came up from Cuba – now being able to fly to Miami and catch a connection.

Two days before New Year we all met at the club for a private function, a fundraiser for Rescue Force, a few people forced to wear their whites and protesting at length. Hal and Hacker re-acquainted themselves with Cassie and Anton, who were still in Mawlini - and still undecided on the future. Mac and the old dogs had been squeezed into black tuxedos and again looked like dog turd wrapped in flannel. Doc Graham and Hildy broke the news that she was expecting, so we all enquired if she knew who the father was, and placed bets on the colour of the baby. Bob Davies was walking unaided, and now engaged to a secretary at the base who worked for an NGO, the lucky lady now introduced to us. Mackey, on the other hand, had ditched his wife and vowed never to allow another woman

across the threshold. I found myself wondering if he kept his hiking boots on in bed.

When Anton's father, the Blake Carrington look-a-like cornered us, he had a suggestion. 'How about a paper here, but a national paper?'

'Sounds like a good idea,' Jimmy approved. 'Produce some figures.'

'You serious?' Blake asked.

'Sure. Seems to be about the right time.'

I put in, 'Will Hardon Chase see that as ... us kicking his balls even more?'

'It's a free country,' Jimmy insisted. 'And Presidents enjoy having their balls kicked.'

'I could raise two hundred million,' Blake offered.

'We'll put in three hundred million. That enough?'

'It'll be a good start, and I can use the existing presses and staff, and distribution channels.'

'As soon as you're ready, we are,' Jimmy told him.

With Blake gone, I asked, 'Is that ... wise?'

'It's something that I would have done in years to come, more out of anger. This will be ... planned and measured. And, if it's impartial, no one can complain.'

'We'll use it to influence people?'

'Christ, yes! There're also a few papers in the UK about to bite the dust. Might grab one of those, just to wake up the Prime Minister.'

Senator Pedersen appeared with some of the CAR executives, all warmly greeted.

'How'd you get past security?' I asked him.

'Slipped them a dollar,' Chuck joked. He faced Jimmy, 'President is winding down the sanctions on Cuba big time. Guess he's showing some ... *leadership*. Also talk of a new arms deal with the Russians, and a new trade agreement with the Chinese. Be nothing for us left to do soon.'

'You'd have to get a proper job then,' Jimmy told him, Chuck laughing. 'And I'm going to North Korea.'

'You are?' I asked.

'Yes, *we* are.'

'We are?' I puzzled, Jimmy nodding with emphasis.

'Oh. Through China?'

'Yes, and with a shit load of sanction busting goodies, just to annoy those Yanks.'

‘They got oil?’ Chuck asked.

‘Don’t think so,’ Jimmy responded. ‘But they are developing nuclear bombs to throw at Japan, and that would be bad for our stock portfolios.’

‘Sure would,’ Chuck agreed.

The gala went well, the food OK, but we did top up in the diner afterwards, huge burgers with extra everything. The next evening was a quiet affair, just the family, building up to the New Year event at the nightclub, many of our singers performing live. At the apartment, Shelly was allowed to stay up late and watch the lights of the street below through the windows.

After the midnight celebration, Big Paul approached, no sign of his partner or son. ‘Can I have a word?’ We led him to a quiet corner. ‘I’m thinking of ... well, going to split with the missus.’

‘You will,’ Jimmy told him. ‘And the boy will visit weekends, and when he’s pissed off with her. The split won’t affect your relationship with the lad, and when he’s old enough he’ll work with us.’

Big Paul seemed cheered by that news. ‘And what do I do, you know, for women in the future?’

‘You bungle along telling them you know me, shag them for a few weeks till they get fed up with your bad habits, and then you find others.’

‘Oh. I don’t settle down with anyone else?’

‘Who the fuck ... would put up with you?’ Jimmy asked him, making our trusty bodyguard grin.

Back at the apartment we found Cat awake, Lucy running around.

‘Couldn’t she sleep?’ Helen asked.

‘No, wide awake and screaming if I don’t let her out.’

I lifted Lucy. ‘Not sleepy, baby?’

She shook her head. ‘No.’

‘You want to watch TV with me?’

She nodded. ‘Telly Tubbys.’

‘I don’t think they have them here; we’re in America. I think its Sesame Street.’ I sat, Lucy curled up on me, and we flicked channels till we found a program about sharks, which seemed to fascinate her. It left me wondering if she would take after her sister, soon to be five. ‘Five years,’ I repeated to myself. ‘God it goes fast.’ At least Lucy still liked to be cuddled, Shelly becoming ever more independent and confident. And my eldest daughter’s favourite word was “no”.

Jimmy had said, 'You're rich, you're right hand man to a time traveller, but when it comes to raising kids it don't mean shit. Your relationship with her will have to be worked at - you can't buy a good relationship.'

And he was right. When we disciplined her she would open the door and run around to the house, tall enough to punch in the right door-code, and would find Jimmy. If Jimmy or Han were not around she would sit in the diner, and Cookie would always make her something nice till we collected her. The only bright spot was her lack of fondness for Keely, sometimes kicking him in the shins and running off.

Hawaii

Three days after New Year we said goodbye to the gang and flew across to Los Angeles, staying at Po's family mansion. We inspected the club, played like managers and moved a few things around, and gave a TV interview. After four days of relaxing in the sunshine, we continued west and boarded flights to Honolulu.

The hotel that had been selected had been done so for its relative isolation in the city, and its ability to be easily defended for an "M" Group meeting. This meeting was described in the press as "three plus two", meaning America, Russian and China, plus Britain and France, no mention of Germany and India. When the title "M" Group had appeared in the press, a quick witted White House aide had labelled it as "Mother's meeting", its unofficial title from the hard working aides that followed their political paymasters around.

We booked into a series of third floor rooms, a view over the pool and the nearby beach, palm trees lining the road. Within thirty minutes I was at the poolside, the Secret Service not recommending it. They didn't have a five year old in tow. Shelly plunged in, and I sat with a cold beer, not a bad trade off. Jimmy joined me with Han, both dressed casual, cold beers ordered, the security staff watching the public road like hawks.

'I think we can get a deal,' Jimmy suggested, sitting back and enjoying the sun.

'Chinese will offer a compromise?' I asked.

‘A ... trade off, I believe the term is,’ Han pointed out. ‘We are not ... compromising.’

‘You’re starting to sound like a politician,’ I warned. ‘That’s not a good thing.’

‘It is my calling,’ Han insisted. ‘And this meeting may be ... historic in its nature, with the catalyst known as Magestic.’

Shelly ran across and made Han wet, standing at his knee. She handed him a coin.

Han said, ‘Let us promise not to take your daughter to Rome.’

We all laughed, thoughts of Shelly swimming around the fountains for coins.

The British Prime Minister joined us, with one of his aides. ‘That looks good,’ he said, meaning the beer, and sat, ordering two more beers.

‘Should have the bleeding meeting here,’ I suggested.

‘A very fine day,’ Han agreed.

I faced the PM. ‘What’s on *your* shopping list?’

‘A bigger slice of Africa, long term oil at ... reasonable rates.’

Jimmy said, ‘If you can get it from the jungle to the coast, you can have it cheap.’

‘It’s only a thousand miles of jungle,’ I put in.

‘I was thinking more of West African oil.’

‘Don’t have quite so much influence there,’ I reminded him.

Ben Ares joined us with Dave Gardener. ‘This a private party?’

‘No, get a beer,’ I told him, shaking hands with Dave, now a less common visitor at the house.

Shelly had returned to the pool, and now a large sea bird landed on the water.

‘Shelly,’ Jimmy called. ‘Swim under and pull its leg.’

With us all observing, she swam down and under the bird, tugging a webbed foot. The bird beat its wings sharply and flew off.

Jimmy calmly mentioned, ‘During the Second World War, fliers shot down over water would sometimes use that technique to catch birds, and then eat them raw.’

The French Prime Minister joined us with Michelle, his nominated interpreter for the moment. No one bothered to stand, another two beers ordered.

‘Those security chaps don’t look happy,’ I pointed out, Helen joining us with Lucy. Han grabbed our youngest and took her to the poolside, to the shallow end. As we watched, he took his socks and shoes off and put his feet into the water, sitting on the side and calling Shelly over. Lucy made large splashes and issued loud

screams as we sipped our beers, but I was a pleased father when Shelly tried to teach Lucy how to swim. The French PM asked if we would make progress, Jimmy being positive and upbeat.

The various groups sat apart from each other at the evening meal in the hotel's restaurant, but a few gifts were exchanged. Since I saw Jimmy with all of the gifts early, a little conspiracy was unfolding before my eyes. The Russians gave Hardon Chase a bottle of vodka and some caviar, and the Chinese issued the other leaders with jade mementoes of the meeting. The French had brought their best wines and champagne, opening them at each table. I was glad the British Prime Minister had not brought a bag of chips and mushy green peas, noticing him giving out snow domes with all of the various leaders accurately caricatured inside as tiny figures. When I shook mine up, to get the snow moving, the French Prime Minister floated around. I showed it to him. Ben Ares presented the various leaders with exquisite small figures carved out of the salt of the Dead Sea.

Arriving just as we were finishing dinner, the German and Indian delegations were greeted by Jimmy. The Germans sat with the French, a large Indian party occupying a table of their own. All told, I figured the mood was a good one, Jimmy suggesting a few wrinkles tomorrow.

The "M" Group met in a function room an hour later, the room checked by sniffer dogs and humming wands. Several square tables had been pushed together, bottled water laid out next to note pads. The various leaders sat around the table, their translators and aides behind them, but there was plenty of room for all.

Jimmy stood up. 'Ladies and gentlemen, politicians, and hard working political aides.' A few cheeks creased. 'I would like to take this opportunity to welcome the German and Indian Governments. They have both had their briefings, so we will not recap on my role, and the role of this group. So may I first ask the Indian Government how its counter-terrorist actions are progressing?'

The Indian Prime Minister said, 'We are most grateful for the unit you have provided us with, and the timely information. It's a bit like an Indian wedding: here's your bride and the cake, now get on with the reception.'

We all laughed, even the stiff Chinese Premier.

Jimmy said 'I'm not sure if the pains and pleasures of courtship quite relate to investigating terrorists, but I guess they both come with satisfactory outcomes. The remainder of your soldiers will be back from Africa soon, and we will begin with a second batch, reaching the figure of six hundred that we promised.'

‘We are most grateful, but I guess that there is good reason for this generosity, one that I am hoping will be explained to us today.’

Jimmy took a moment. ‘As you are aware, we receive information about the future, very accurate and detailed information, and make good use of it at these meetings. One piece of information is the high probability of you going to war with Pakistan, that conflict becoming a nuclear exchange.’

The Indians were shocked. ‘And these terrorist warnings?’

‘We aim to help you defeat the terrorists, without your people pressuring you to go to war.’

‘There will be more?’

‘More, and more severe, some extreme,’ Jimmy explained.

‘So we mop up the milk after its spilt, and we don’t ask who’s doing the spilling?’

‘You can stop the bottle from spilling, no matter how many times it is nudged,’ Jimmy suggested.

‘That is not much of a strategy,’ they complained.

‘The alternate ... is war for you, ruin for the rest of us. Which course of action would you prefer?’

‘We must tackle the source of these attacks!’

‘No, you must be a part of this group, enjoying its benefits and protection. Because if you go to war with Pakistan it will lead directly to a global conflict ... and the destruction of our civilisation. And, you should know that the people around this table take the matter very seriously, and will put pressure on you to co-operate with us, for the benefit of all. I’d like a show of hands as to which countries would put economic pressure and sanctions on India if they do not co-operate?’

All except India raised their hands in silence, the Indian Prime Minister focused on China.

‘You see, Mister Prime Minister, we all believe the predictions of the future, the most dangerous of those being a war between you and Pakistan. So, we will all go to great lengths to prevent such a war, even if that means direct pressure on your country to co-operate with us. Such a set of sanctions, agreed around this table, would cost your economy a great deal.’

‘So we sit and take it?’

‘No, you sit shoulder to shoulder with us, and we all take it, doing what we can to pressure Pakistan in the meantime. You are not alone. Now, it is a matter we will discuss with you later. For now we will move on to other topics. OK, Germany. You will suffer no major problems of any kind in the decades ahead. In geo-political

terms, may I take this opportunity to say how boring your country is.'

'Thank you,' the lady offered. 'I think.'

'I have only one request, and that is – given future threats – we would like to see you increase the size of your infantry brigades.'

'Oh. How much of an increase?'

'Ten percent, year by year, and with training given in Africa so that your men are experienced in fighting and operating overseas.'

'Will there be a future conflict?' she asked.

'Hopefully not, which is why we are here. Beyond that, your only other area of interest will be in the upcoming financial crisis, concerning poor investments in high risk American financial instruments.'

'We're dealing with that,' Chase insisted.

'And we should all be out of Icelandic banks by now,' Jimmy suggested. 'We have, directly, interfered in UK and US house prices and money supply and, although higher than expected, house prices have not rocketed. They should continue to climb steadily. Germany should also be aware that the individual economic outlook for Greece, Spain and Portugal is very poor, as it is for the Baltic States. There will be problems in those countries around 2011. You should also be aware that the Ukraine will suffer, and may even split into two countries after 2013, a north south divide based on Russian language speakers or native Ukrainians. If there was one thing that Germany could do to assist this group, and the future well-being of the planet, it would be to nurture the Baltic States and the Ukraine.'

'OK, moving on. I'm sure that we would all like to rebuke the CIA for sending men to the Indian training facility in Africa – without the consent of the US President.'

'The managers responsible were fired,' Chase insisted, not looking happy at being put on the spot. 'And I apologise to the group. What happened to the men they sent?'

'You don't want to know,' Jimmy told him, holding his stare.

'Is that facility known about?' the Indians asked.

'You would have to ask the President Chase that question,' Jimmy quipped. 'Now, getting down to economics, world powers and horse-trading. China, do you have a figure for America based on your oil benefit?'

'We do. We offer a five percent increase in US goods bought, year on year for five years, thereafter to be reviewed.'

'Good. And the US offers...?'

‘No human rights complaints, no courting of the Dali Lama, the expulsion of various Chinese dissident groups, and a five year freeze on any major arms sales to Taiwan.’

‘Do the Chinese accept?’

‘We do. But we would like the small arms deals to Taiwan to be... detailed.’

Chase did not object.

Britain and France wanted better access to the Chinese markets for their banks, a number of new joint ventures agreed. We were making progress.

Jimmy raised a new project, that of combined research into the next generation of improved nuclear power stations. All sides would co-operate on it. He then handed out a document detailing research on electric cars and their batteries to each nation, suggesting that there would come a time when oil was very short. ‘That document, ladies and gentlemen, will save you fifteen years of expensive research. And let me remind Europe and the States, that if you don’t get a move on then China will conquer the export market of electric cars, Japan doing well with hybrid cars.

‘Next, Israel: and the pain that successive American Presidents go through in trying to halt the building of new settlements. I’m going to make money available to build houses and apartment blocks in the east of the West Bank, introducing a natural pull away from Israel’s new security wall and towards the Jordan River. I would like modest donations from the older members of this group to build many houses, offering them cheap to Palestinians living close to Israel, a kind of pull – rather than a push. Israel *will* co-operate.’

Ben Ares offered no comment.

‘Whilst on Israel, the good gentlemen should note that his country will run short of water after 2013, and desalination plants will be necessary. He should also note that Jordan will run out of water, and that it will cause political unrest in that country. Desalination plants on the Red Sea will be necessary, and it is in the interests of all here that financial help be given. An unstable Jordan is not desired.’

‘And Yemen?’ Dave Gardener asked.

‘Runs out of water and oil in 2013, and goes to war with Saudi Arabia in a small way.’

‘And the answer?’ Ben asked.

‘Is across the water,’ Jimmy enigmatically stated.

‘The Somali Rifles,’ Ben noted.

Chase put in, 'Send them into Yemen - and they'll leave no one alive!'

'The alternate, is the rise of various terror groups in Yemen,' Jimmy explained.

'So you *will* send them in,' Chase stated.

'I won't need to. When Yemen goes to shit, they'll attack Somalia.'

'And Somalia reacts,' Chase concluded. 'There an alternative?'

'Build several very expensive desalination plants in Yemen, and then pay their way for ever more.'

'You sound harsh,' the Russians noted.

'It's a Saudi problem, and they have a lot of money. Let them help the Yemen economy, not us.'

Most of the delegates seemed to be in agreement.

'2013 sounds like a bad year,' Dave Gardener noted.

'It is for those countries,' Jimmy agreed. 'But I would expect the Americans to nudge the Saudis into doing something for a change. OK, let's come back to economics. Russia, do you have a list for America and Europe?'

They handed it out, the French and Germans getting a translation each, and time to digest it.

Jimmy asked, 'Will Russia agree to do more to stop stolen German cars crossing its border?'

'We do.'

'Will Germany take a large and active role in my farming projects in Russia?'

'Sure. But what is the future there?'

'Russia is capable of growing all of the food that Europe needs, and keeping prices down when South American prices rise. It helps the Russian economy, and Europe.'

'We will look seriously at it,' the Germans offered.

'If you spend enough money, I will allocate German mining groups more concessions in Africa,' Jimmy told them.

India asked about oil. Jimmy explained, 'Within three years, China will extract enough oil from Tanzania to offer to sell you some of that oil at a reasonable rate. So will my company CAR. And, if you co-operate with this group, I will tell you where to find oil on your soil.'

'Why can't you tell us now?' they complained.

'Quid pro quo, Mister Prime Minister. And may I request, firmly, that India mends its fractious relationship with Sri Lanka, and criticises them a little less.'

‘China will build a port in the south of Sri Lanka, with a US naval base?’ the Indians queried.

‘They will, and that base is important to us all.’

They seemed to reluctantly agree.

Chase asked, ‘If the Tanzanian field allows China enough oil to be able to sell some, then how will that affect Chinese oil buying from Iran?’

‘A good question. It will allow China, and others, to put greater economic pressure on Iran, and to stop buying oil from them. That could be traded ... for the Iranians taking a step back from nuclear enrichment.’

Chase addressed the Chinese directly. ‘And will you pressure Iran?’

‘It is a more likely option now,’ the Chinese offered.

‘OK, Cuba we’re on track with. In fact, doing better than expected. So, will America and Russia be able to release a statement this week on arms reductions?’

‘We will,’ Chase agreed.

‘Iranian nuclear development; as previously touched upon. Pressure needs to be brought to bear, because the most likely outcome is an American military strike at them around 2013, which will not be as bad as you may think. By then the African oilfields will be doing well, and sudden jumps in oil prices can be absorbed.’

‘How do the Iranians react?’ Ben Ares asked.

‘They attack US ships in the Gulf, they try and bomb Kuwait and Dubai, and attack shipping in the gulf. They also encourage Hezbollah to attack you.’

‘And that by you is *not too bad*?’ Ben challenged.

Jimmy smiled. ‘It could be a lot worse. Besides, they’ll need a reality check at some point.’

‘It won’t escalate?’ Chase asked.

Jimmy shook his head. ‘No. It’ll simmer for four or five years, and the Russians and French will help them with peaceful nuclear technology thereafter.’

The Chinese asked, ‘Can they be persuaded not to develop nuclear weapons? Through diplomatic channels?’

‘Why don’t you, and the Russians, go and find out,’ Jimmy firmly nudged. ‘OK, that’s it for tonight, but your aides can travel around the hotel and try and work deals. Oh, and one more thing, they’ll be a bomb blast on the beach in the morning, around 10am. No panic, it’s not a very big bomb.’

They were worried, and I made a note to keep Shelly away from the pool.

‘Who’s behind it?’ Chase asked, horrified.

‘A disgruntled ex-serviceman, one of yours, with links to ... certain agencies.’

‘Oh, great,’ Chase said, his eyes closed. ‘And you could not have warned us sooner!’

‘Some lessons are best learnt when they are ... painful,’ he told Chase, a hint of a grin. To the assembled leaders he said, ‘OK, please release your press statements tonight, let’s let the world know that we’re doing more than just drinking beer in a nice Hawaiian hotel.’

After consulting with Keely, Chase said, ‘The American delegation would, apparently, like to protest the Chinese delegate at your house encouraging your daughter to kick the aforementioned American delegate at your house in the shins on a regular basis.’

‘Oh gawd,’ Helen muttered as the leaders smiled.

The Chinese discussed the matter. ‘We would like a full vote on the matter of this allegation against us. Those in favour of the American representative being kicked?’

China, Russia and France voted in favour, Israel and Britain backed America, Germany abstained, and Indian wanted to know why they had not been informed of the matter in advance.

I stood. ‘I would like to state for the record that my daughter’s favour could be bought with either mining concessions, a new port facility ... or a bag of sweets.’

‘The French would like it entered into the record that the aforementioned daughter also pokes her tongue out at our representative.’

‘Yeah?’ Chase asked as he packed his notes. ‘I do that to you when you’re not looking.’

In some disarray, we broke for the evening. Chase ordered the beach searched with metal detectors, and they found the bomb. Eventually. It had a few convenient fingerprints and the man was picked up.

After the meeting, the various aides travelled between floors and met in groups, whispering and bargaining. It was, as Jimmy labelled it, the real work. We concentrated on the Indians, who were still being difficult, and further inducements had to be dangled. Given that we were trying to stop them entering a war, it seemed a bit cheeky of them.

By midnight, the Americans had persuaded the Chinese to go to six percent for the first two years, less later. That gave Chase good news ahead of the mid-term elections. In reality, Jimmy had persuaded the Chinese to reduce the mountain of dollars that they held onto, by buying American airliners that would last twenty years, a good investment in nice safe aircraft. There was double-dealing afoot, and Helen could not believe that our daughter's behaviour was a matter of international debate.

At dawn I stood on the balcony and peered out at the beautiful ocean, the beach empty. Actually, the beach was empty because it was taped off, and now the road was closed. Still, it meant that the Secret Service perimeter had been moved back and we could relax a bit around the pool. With the kids awake, and the pool inviting, I took the family and Cat down and we all plunged in. Han joined us half an hour later.

Sat at the tables near the pool bar, we realised that we could order breakfast here and did so, Han feeding Lucy chips with ketchup, her favourite. The Chinese team joined us, all looking odd in their casual shirts and slacks. Then Shelly took my breath away. She approached the Chinese Premier and tried to drag him towards the pool. When he resisted, she said, 'Come on you old stiff,' in perfect Chinese. I was both horrified, and delighted at my daughter's linguistic abilities, and surprised when the Premier took her by the hand to the pool. He had his swimming shorts on underneath, and his aide grabbed a towel. We soon had the Premier in the water with Shelly, a conversation going on in Chinese.

When Jimmy joined us, he told Han, 'I would like to distance myself from any attempt by Shelly to drown your Premier.'

'Noted for the record,' Han responded as he headed back to the pool. Once in the water he acted as translator.

Within twenty minutes everyone was around the pool bar, the breakfast waiters giving up on the indoor restaurant and working out here. Conversations broke out as people ate, aides moving back and forth between various groups, the Secret Service worried. At least the perimeter had been moved right back. Official snaps were taken of various groups, and of the whole group, an image of the leaders relaxed and co-operative.

Shelly sat with the Chinese, rather than her strict parents, and stuffed her face, conversing in part Chinese. I suspected they were also encouraging her to kick Keely in the shins. Jimmy informed everyone that the next meeting would be 11am in the same room, and could they get their thoughts together before then.

At 11am we reconvened, no one dressed smart for the meeting - as requested by Jimmy. He began with, 'China and India have border disputes in a few places, and for the sake of harmony we would like them resolved, or at least quietened down. May I request that both sides pull their border posts back one mile into existing territory.'

The Chinese said, 'We will set-up a working group and negotiate directly with the Indians to resolve this as soon as is practical.'

'I think that would be a good move. Does anyone wish to add anything? Next, the Falklands.'

The British Prime Minister look horrified. 'The Falklands?'

'You'll start drilling for oil in 2010. If you push back that date I'll look at oil concessions that are far easier to reach, and more economical.'

'Well ...I suppose, yes,' the PM reluctantly agreed, the French and Germans nudging him.

'Good. Next, Gibraltar. It's not British, it never was. We'd like to see you give it back to Spain, with a ninety-nine year lease. Nothing changes other than implied ownership and Spanish pride.'

The PM was again horrified, but everyone at the table voted in favour of it, the French and Germans loudly in favour of it. 'Bleeding ambush,' our PM muttered. He agreed to look at it, and we agreed to kick him in the shins if he did not. No sooner had he agreed, than Jimmy suggested that the US Navy should consider it an important base for the future, especially 2025.

We got into the detail of Russian and American co-operation on a wide variety of topics, including airliner leasing. That led us to the lunch break, the next meeting not scheduled till 8pm, when it would be cooler; it would give the aides time to scurry about, and to plot and scheme. The British Prime Minister caught up with us outside and vented his concerns.

'It's simple,' Jimmy told him. 'Ditch Gibraltar and ease back on the Falkland Islands and you get cheaper oil. Everyone is happy.'

'And the future for the Falklands?'

'You'll drill for oil and piss off the South Americans, affecting your ability to sell goods there.'

The PM walked off in a huff, Jack trailing after him, and making me wonder if we would get back into the country. We grabbed sun loungers and ordered burgers, sat in the sun and doing very little for a few hours. Most of the delegates sat around the pool for lunch, the hotel staff now pulling their hair out with the nice three-course meal they had prepared being delivered to the pool bar.

At 3pm, full of beer and relaxed, I heard a light aircraft and looked up, soon wondering why it was diving towards us.

‘Look out!’ someone shouted, Secret Service men darting about. I grabbed Lucy and lifted her, not seeing Shelly and shouting for her. She was in the pool with Helen.

I ran in slow motion, my memories of that day blurred; but I can remember each step. Paving, chairs, a corner of the neatly mown grass. Reaching the pool I looked up, certain the plane would hit. ‘Dive down!’ I screamed toward Helen and Shelly. I was three yards away from my family. I put a hand over Lucy’s nose and mouth and dived in head first, breathing out to reduce my buoyancy as I did. The last thing I saw was Helen’s green bum as she dived down. I hit the water near Helen’s feet, my nose soon protesting the irritating chlorinated water that seemed to be trying to force its way up. I forced my eyes open as soon as I could, seeing bubbles and shades of colour; pale blue, green, blue sky. With the sounds of the splash just a memory, the bubbles gone, mine was a silent world, the little fish that was Shelly approaching me.

Two seconds later I heard the bang echo through the water and peered upwards, seeing only clear sky. I eased up broke the surface and scanned the pool bar, seeing smoke coming from the side road leading towards the kitchens. I let go of Lucy as she wriggled and she breathed again, Helen and Shelly surfacing. ‘Get out of the pool!’

Sopping wet, we ran and grabbed our things and padded barefoot into the hotel, through the security and up to our rooms. From the balcony I could see the crumpled remains of a Cessna 152, the air full of the sounds of sirens. I could not see any casualties, although I figured the pilot would need more than just an aspirin and an incident report to fill in. Part of me figured that it might have just been an accident, but not with all of us here. I went and found Jimmy, and we headed for Chase.

‘Did you know that would happen?’ Chase loudly demanded.

‘No,’ Jimmy calmly replied. ‘You know who it is yet?’

‘Local TV news got a tip-off, a suicide note from some guy who’s being divorced.’

‘Then I suggest that it’s no more sinister than that; an opportunist suicidal pilot. Where does that leave us as far as tonight’s meeting?’

‘They’ll want us gone - the hotel and the local authorities. There’s some damage to the kitchens as well,’ Chase reported.

‘Then I suggest we call it a day. We got most of what we wanted.’

‘You heading back to the States?’ Keely asked.

‘No, Hong Kong,’ Jimmy informed him.

We visited each delegation in turn and asked them to return home, apologising for the disruption. Within an hour we were out, into vans with blacked-out windows and on our way to the airport, flights booked to Hong Kong, everyone still a little shaken up, except Jimmy. At least the kids had no idea what had happened, it was just a game of jumping into the water.

In the bar of the 747 I downed several beers and relaxed a little, Shelly sat on the floor between my knees and playing with her Gameboy. If the other passengers objected – I didn’t give a shit. When Shelly got sleepy, Jimmy took her back down to First Class and she curled up on him, always managing to sleep soundly on the big pillow that was Jimmy.

I didn’t manage to get any sleep on the flight, and we landed in the small hours, a discreet police escort to Po’s hotel. Our room came with two double beds, an odd arrangement, so we put the girls in one. At breakfast we met Po and his family, many other kids for the girls to play with, and we moved away from parental concern, to wanting to strangle Shelly. Normal family life had returned.

For that first day we dumped the kids around the pool and talked business with Po and his directors, increasing their involvement in Africa. They made the CDs that we used at Pineapple Music, and that aspect of production was going well. The next day we inspected the Rescue Force unit, Hancock giving us a rundown of the Kashmir deployment, problems and gripes. Some of his boys had been injured sleeping in buildings, instead of their cold jeeps, and I raised my voice. Team leaders had been disciplined, small fines issued. On the third day Jimmy and I flew across to Shanghai, and around to the military base that housed the brain-trust kids.

Stepping down from our coach we inspected an electric car, not dissimilar to any other car. I made the mistake of getting in with a teenage lad, and we sped away, soon going around the building at speed, stopping and starting and accelerating away, the performance of the car impressive, the driving skills atrocious.

‘Who the fuck taught you to drive?’ I asked.

‘I’ve not had any lessons, but I read a book about it.’

‘Driving cars is like sex: reading about it does not help your technique!’

The lad was in hysterics as we pulled up.

Easing out, I said, ‘Keep him away from fast cars and sharp objects.’ Han led us inside.

In the canteen we sat with the professor and the senior students, the oldest now twenty-one, and a father.

‘A father?’ I queried

‘With a girl here,’ Han explained.

‘I figured that. Aren’t there ... you know, rules or something?’

‘No,’ Han explained. ‘Since Jimmy wishes the offspring.’

I faced Jimmy, and waited.

He explained, ‘One in ten of the children - of those with the blood - could offer an anti-body that’ll be needed in the future.’

‘Hence twelve pregnancies,’ Han informed us.

‘Did you read the book first?’ I asked the elder boys, making them laugh.

‘There are now sixty-two children here,’ the professor put in.

‘From the Congo?’ I realised, the professor nodding. ‘So, you finished with electric cars?’

‘No, that will take much longer,’ the professor explained. ‘But already some good progress, which was easy enough when Jimmy gave us the plans.’

‘So what’s next for you?’ I asked.

‘Nuclear power,’ Jimmy stated.

‘Haven’t they invented that yet?’ I quipped.

‘The next generation of cleaner nuclear power stations, powering lights, desalination plants and water destabilisation.’

‘Water ... what?’

‘In the future, a nuclear process will cause a type of heavy water to be unstable. If it’s then heated up it will split into hydrogen and oxygen, which will then burn like jet fuel, turning back into water.’

‘Clean energy,’ I realised.

‘And it’s perfectly stable till it’s heated. You could even drink it, but I wouldn’t recommend it. Passing wind could be an issue’.

The older boys laughed at that joke. Well, they didn’t get out much.

‘So, desalination plants for Israel?’ I thought out loud.

Jimmy nodded. ‘And other countries, like Somalia, which is where we’ll stick a nuclear reactor; on the coast. Once that’s working we’ll place another in Jordan, if the Saudis come up with the money. I’m not funding it.’

They showed us a new building next door, and the busy crèche, and we made like campaigning politicians and lifted a few babies. They weren’t talking yet, so not so smart.

Back in Hong Kong, we enjoyed a huge meal, Shelly adept at using chopsticks, putting Helen and myself to shame. After the meal

we entered a function room full of invited guests, around a hundred businessmen from Hong Kong and mainland. Since they stood and applauded politely as we entered, I figured it would not be a hostile crowd. Jimmy took to the podium and activated a slide machine, the lights turned down. In Chinese he described the growth of our region in the DRC, the availability of ore and cheap fuel, the low cost of land and building materials. The difference between this meeting, and my first time in the Red Room at the Mandarin Hotel, was that I understood most of it. Jesus, that was 1986, twenty years ago, I realised.

At the end of the statistics, Jimmy clicked the slide machine and displayed an image of Gotham City in the jungle, skyscrapers and monorails. ‘Gentlemen. Who here would have liked to buy land in Hong Kong in 1948? Well, that is the opportunity you have here, to be in at the ground level.’

‘Where do we sign’, their faces said.

Pamphlets were handed out, contact details and a web address that described the corporation in the DRC, and Jimmy took questions for thirty minutes. One man ran a factory that made tractors, another diggers, a third made metal tools; all things that could be sold to the mines. They wanted to build factories near Goma and, with guaranteed low fuel prices, it was a giveaway. They were told to work through PO for advice, direct with the corporation for land. We did, apparently, have a small office in Hong Kong now. And that office, and its staff, would help to build the new Hong Kong in the jungle.

Breaking for coffee, and to have a look at a large map of the area, Jimmy showed me his vision for the area. There would be a lake for water and recreation, a series of canals to move drinking water around and to provide fishing for the locals. And the city would be huge.

‘The key is transport systems,’ Jimmy said. ‘Roads, rail and air. I’m going to build deep canals near the factories, with barges to move heavy goods around; drive on drive off.’

‘It’s like a blank sheet of paper, just empty savannah and jungle.’

‘The Americans have commissioned a number of apartment buildings, a mile from the airport. There are now three cement factories working flat out, and we’re importing more. Hardon Chase has budgeted twenty billion over three years.’

‘Jesus. For that he could build a million apartments!’

‘Some of the money will go on improving the road networks, some on rail, a few aircraft, but most on buildings and factories, some on an American university.’

‘And with investments from this lot as well?’

‘Twelve years of investments in just the one year,’ Jimmy said with a grin. ‘GDP will be off the scale.’

‘Did you order some planes from Boeing?’

‘Twenty-four. Which kinda pissed off the French and British Governments, upset about Airbus. But I explained that it was a grant from Chase. Central Africa Airways will soon have six 747s, six 747 cargo planes, and a bunch of 767s. It’ll be the biggest airline on the continent, the hub at Goma. Since we have the fuel, the other airlines will struggle to compete.’

‘You aiming to cripple them?’ I puzzled.

‘They’re flying out-dated and dangerous aircraft,’ Jimmy pointed out. ‘And they crash a lot.’

‘Guess so.’

‘I struck a deal between South Africa and British Airways; they’ll both stop their journeys at Goma now, and the leg down to Cape Town is just about free. People can now have a week with us, and a week in Cape Town, especially Americans.’

‘How much traffic at Goma from that deal?’

‘Twelve flights a week each way, so twenty-four landings. Within a month, Goma will see sixty-eight landings a week. A month after that, over a hundred.’

‘Shit.’

‘I’ve ordered a second hotel at the airport, built with a walkway to the airport, and anyone flying onwards intercontinental gets a free room, up to a maximum of sixteen hours. It’ll have four hundred rooms.’

‘What capacity do we have at the lodges now?’

‘In the DRC? Over two thousand, but they’re all told to keep a few rooms empty. We get people just driving across Africa and dropping in for the night. A company runs jeep trips from Kenya across the lake and Uganda and to us.’

‘Long old trek.’

Po approached. ‘My family build factory to make furniture.’

‘Don’t forget, we’ve imposed a minimum wage for men over twenty-one,’ I told him.

‘Yes, yes. It small.’

‘Next job is the railway link,’ Jimmy said. ‘From Mogadishu, up past Mawlini, through Southern Sudan and into the north of our territory. We’ll run oil and ore trains to the coast.’

‘We growing enough food for all this?’ I queried.

‘We’re keeping up, thanks to the kids in Shanghai.’

‘Yeah?’ I asked, a glance over my shoulder, Po not paying attention.

Jimmy nodded. ‘Congo has very fertile soil, and some things grow well. They’ve spliced a few plants together to come up with huge bloody things. Also got a few large fish farms going, with monster eels and catfish in. The people are getting regular fish for the first time in their history.’

‘What did I hear about Lake Victoria? Water level falling?’

‘Yes, but I’m looking at lakes and dams in the north of our territory and pipes across to the lake. Whatever we pump in, the Kenyans will be allowed to take out on their side. They’ll have a bad drought from 2009 onwards. The river, at River View, will get low.’

‘Bugger.’

Two days later we boarded the plane for Beijing, picked up Han, and headed toward a chilly Moscow. Yuri met us at the airport with a luxury coach and whisked us around to his apartment, plenty of rooms for all of us, Han staying at the Chinese Embassy.

In the morning, I realised that this was the first time I’d been in Moscow without being cold. It was un-seasonally warm. The day was glorious, and we took the coach around to the Moscow White House, a tall white office block that housed the Russian Government. We presented them with the documentation for six BO105 helicopters, kitted out in a similar fashion to British police helicopters; they would be used by the Moscow police. We also donated twelve BMW motorbikes kitted out for paramedics, Rescue Force personnel to operate them from various motorway intersections around Moscow, aiming to be the first on the scene of an accident.

We gave a TV interview that evening, speaking only in Russian, and describing the helicopters and bikes. After the interview, we enjoyed a meal with Yuri and Marko, then boarded the coach for an eight hour drive down to the farm area through the night.

Arriving at the farm offices, we found a large hotel in the middle of nowhere, a large office block next to it. We booked in, soon on the balcony of a top floor room, staring out at fields and a flat horizon. Well, it was a farm project, what did I expect. After a shower, we left the kids with Cat and moved next door, where they

showed us a great many bland charts. Basically, production was increasing four fold every six months, as was the acreage. At this rate, we'd be ploughing the outskirts of Moscow in a few years.

I noticed the logo of the coffee shops, and asked about it. Turned out that the farm produced the milk for the coffee shops, and the wheat for the bread rolls they sold, steak, and even sausages. The rest was mostly shipped to Europe, where it was sold for more than the Russians consumers would wish to pay for it. And, as the money came back, more farmland was taken over, now some six thousand Russians gainfully employed.

I approached Jimmy. 'So, coffee shops.'

'Are ... just coffee shops.'

'Will this all make a great profit?' I asked.

'Not really.'

'Then why, numb nuts?'

'Why not?' He walked off.

I checked with Yuri, and we now had two thousand coffee shops spread across Russia, a healthy profit being made. Finding Helen, I said, 'I still can't figure out the coffee shops.'

'I figured it out,' she proudly stated.

'You did?'

'Yes, because I'm smarter than you.'

I waited. 'Well?'

'Each coffee shop has a TV screen showing the news, plus free newspapers.'

'Yes?' I said after a moment.

'TV, papers - media.'

I waited. 'And?'

She sighed. 'Some day, we'll have a paper and TV channel here...'

'Ah,' I loudly let out. I grabbed Jimmy, Helen close. 'The coffee shops will be a media outlet for us.'

'No.'

'No?' Helen queried.

'The Russians would never allow that. Keep thinking.'

We met with recently arrived representatives of the German Government, made a few plans, and sat with Yuri discussing cows, milk, and grain quotas.

I took the kids into the fields for an hour, the day not too cold, the countryside here very pleasant, and not what I had expected of Russia. The hotel offered a rooftop bar, and we watched the sun set from up there, finding the Russian countryside most agreeable.

The next day we inspected a field of cows. ‘They look just like ours,’ I said after studying the animals.

‘They are, I shipped them in. They’ve been in quarantine for six months, but now we’re breeding them. There’re some British sheep around here as well, but the pigs are Russian.’

‘And the long term aim here?’ I nudged.

‘Cheap global food. At the moment, less than one percent of Russian agricultural land is being used effectively. In years to come German housewives will be buying Russian sausages, Russian milk, Russian wheat, Russian gas to stay warm, and Russian oil for their cars.’

‘I can see a problem with that.’

‘Yes,’ Jimmy admitted. ‘They’ll be dependent. But that works both ways. Russia won’t fire nukes at those who buy its produce, and Europe won’t fire nukes at its supplier. Dependency is a good thing.’

‘British Prime Minister won’t be a happy chappy when we get back.’

‘He needs us more than we need him,’ Jimmy suggested. ‘Besides, I’ve got Somalia interested in Hawk jet fighters from British Aerospace.’

The luxury coach transported us back to Moscow, and we spent the night in Yuri’s apartment before our flight home. Back at the estate we found it damp, the Alsatians looking cold and miserable.

I stopped next to Big Paul in the entrance hall as he walked out. ‘You ... er ... sorted?’

He thrust his hands in his pockets and inspected his shoes. ‘Big empty bed, quiet house – just me. Lots of tears from her, shouting from the lad.’

‘It’ll settle down, give it time. Jimmy said it wouldn’t last.’

‘I know, and ... you know, the time with the lad was the right thing to do.’ He showed me a picture of a teenage girl. ‘That’s the girl down in Bournemouth, I made contact.’

‘And?’

She walked around the corner, with a fine forty-five year old woman, her mother. Big Paul introduced us. Seemed that they were “staying” for a while, and Big Paul led them off for a chilly walk around the lake. In the diner I met Keely, and his lady, our first meeting. Sitting, we spoke about Canada and our new hotel. Shelly ran in, but stopped short of kicking Keely when she noticed the strange new face.

‘Hello,’ she politely offered.

The lady knelt and shook Shelly's hand. 'I'm Jane, from Canada.'
'We were in Canada.'
'Yes, I've just been hearing. Did you take pictures?'
'Yes.' Shelly ran out to fetch the digital camera.
'Where are you working, Jane?'
'HSBC bank, Cardiff. Not far.'
'Not in Canadian terms, no,' I said. 'Have you been to Africa?'
'We're going next week.' She showed me the sparkler on her hand.

'Keely, you old fox.'
'Keely?' Jane repeated.
'We call him Keely. Sorry, long Story.'
'I think of myself as Keely now,' Bob Donnely admitted.
Shelly burst in with the camera and data cards, so I led Keely outside.

'You sorted ... the *thing* in Canada?'
'More or less, I got a buddy on it. He hates the CIA, so it's a labour of love for him.'

'Engaged eh?'
Keely shrugged and made a face. 'Jimmy's never wrong. Well, almost never.'

'No, he didn't see that light aircraft. Any news on that?'
'Guy getting divorced – his fucking wife worked at that hotel. When he heard that the world leaders were there ... well, opportunist target.'

I nodded. 'What does Jane think you do?' I whispered.
'US trade representative to Africa.' He shrugged. 'Big Paul's a cheeky bastard; one out, one in a week later.'

'That did surprise me,' I admitted. 'And the girl's mum is nice.'
'She went all soppy when she saw this place. Still, if I looked like him I'd have to make use of an edge.'

'What do you mean, *if* ... you looked like him, old man?'
Back inside, Jane was mothering Shelly, my daughter fascinated by the new face, and describing the lake and the swimming. When Keely made a rude joke, Jane playfully tapped him on the shin. Shelly took that as a cue, and whacked Keely in the shins before running off. When I laughed, Jane was not impressed – at all. I left Keely to explain it.

Springtime

Springtime 2006 was surprisingly quiet for us. After the New Year circumnavigation of the globe we settled down to the same old routine of reports and meetings. CAR was producing a lot of reports these days, and we attended regular meetings in London, the offices now packed with warm bodies. Jimmy was fixated with Gotham City in the jungle, and it occupied most of his time. I looked after the clubs, the property business and Pineapple Music, Jimmy still ticking the list of artists to sign up. Some days I hardly said a word to Jimmy, we just sat working on different things, and attended different meetings. I would hand him a summary and he'd glance at it and nod. Then it was on to the next project.

Blake Carrington came to stay for a few days, most impressed by the house and the lush Welsh countryside. Having our own lakes and prime trout river made him quite jealous. Towards the end of his stay Jimmy dropped a bombshell, that was not quite so bad in reality. The Russians, the Chinese, CAR and others – acting through proxy companies - had been secretly buying up stock in Blake's media empire, of which he himself only possessed twenty percent of the stock. We now held just under thirty percent and told him so, making it sound like a pleasant surprise. After Blake had mopped his brow and sipped a water, we explained that the move was made so that we could support him against the other shareholders. It brought him back from the brink. We explained that we would not be launching any kind of a bid, and that he would now be in a much stronger position at shareholders meetings. We also indicated that we would have some input to programming on the TV news, the magazines and the websites. Naturally. He needed another sip of water.

Jimmy explained that we would be expanding the TV news to cover the whole USA, on cable, and that the news slot would now be almost six hours a day, with regular half-hour topical political debates, and plenty of overseas news items. We asked Blake to instruct the programme makers to be politically neutral, and unbiased. But we did ask nicely.

When May came around we got together to plan the next RF deployment, another earthquake in Sumatra. We dispatched Alpha teams from ten countries, and left the main thrust of the operation to RF Sumatra, Hancock from Hong Kong given operational control on the ground. It went off without a hitch.

Summer at the house was nice and quiet, a few new faces, and I got some fishing time in. Keely's fiancé moved in and they grabbed an empty house. The UK Government were in talks with Spain over Gibraltar, and we were dangling carrots for them, black oily carrots. Cuba and American were playing nice at the moment, and the world was suddenly optimistic as Chase visited Russia and China and signed even more deals. The only hiccup on the horizon was Lebanon.

In July, the Indian counter terrorist force was sat waiting each night in Mumbai harbour, and at various points around the city. On July 12th, a day late, a group of twenty Pakistani fighters came ashore. When challenged, they opened fire, and were cut down, several Indians injured. India played down the incident, and no blame was laid at Pakistan's door. Jimmy ticked a box on the list. That just left Lebanon.

After much debate, some very heated, we dispatched a thousand Kenyan Rifles with blue UN helmets to Lebanon. And there started the trouble. The Lebanese didn't know the reputation of the Kenyan Rifles, and most Arabs considered themselves superior to "blacks from Africa". The Lebanese population did not respect the Kenyans, and insults were levelled, a kind of racism. The Kenyans were well behaved, but they knew they were not welcome.

One evening they stopped a car and discovered a mortar in the boot, which they intended to confiscate. The men in the car were not having blacks tell them what to do, and tried to move off. Their car was blocked in, so they opened fire with pistols, killing a Kenyan. The Kenyans opened fire, the car filled with holes when the Lebanese press inspected it the next day. The mortar tube was displayed, but ignored, the dead Kenyan labelled as having been killed by his own side as they fired on the car. The funeral for the dead men was large, calls for the UN "murderers" to leave.

That evening the UN base came under mortar fire, a few men slightly wounded. The UN then considered pulling out, and Jimmy was not opposed to that; he had not been too happy about the Rifles being there in the first place. He admitted that having them acting as a buffer was better than a war, but still considered that they would be better removed.

The next evening, the Kenyans snuck out and awaited the mortar firing teams. When those teams turned up and made ready they were shot dead, the mortars seized. The UN ordered the Kenyans to stay in their base, and not to go out at night again. Another large funeral for the local men was followed by another mortar attack, this time

four Kenyans killed. Jimmy sent a signal to the Kenyan commander, telling them to defend themselves or leave. The Kenyans snuck out again that evening, in four different directions, and surprised three different mortar crews setting up. They killed them all, including a few teenage boys helping the mortar crews. Fearing the Kenyans being surrounded and cut off, Jimmy shouted down the phone at Ben Ares and dispatched the Pathfinders from Kenya, five hundred of them fully armed. They landed at a military airfield in Israel under the cover of darkness and moved north in buses, their jeeps arriving by IL76 transport. At the border they halted, ready to assist their countrymen if necessary.

Hezbollah dispatched troops south as the UN ordered the withdrawal of the Kenyans. The Kenyan convoy did not get far, roads blocked and mined. Caught out in the open, they came under sporadic fire, Jimmy ordering them south towards the Israeli border. The Pathfinders made ready for a night action to secure the rear of the evacuation.

The Kenyan convoy reached the border, ditching their blue helmets, the Pathfinders moving north on a parallel route. Hezbollah had gone and gotten themselves lost, and its convoy of almost a thousand fighters took a wrong turn, and drove straight towards the Pathfinders, who were trying to find the tail end of the snaking convoy of their countrymen. They met each other at a dark bend in the road, and opened fired.

In the house, Jimmy smashed a chair against the wall and told Dave Gardener to “get the fuck out”. I had never seen him like that, and we all kept our opinions to ourselves as the reports came in.

The Pathfinders dismounted and formed up, moving by squads towards the Lebanese fighters. Using night sights and sniper rifles they picked off the fighters, then outflanked them, coming side on to the long convoy of fighters, most of whom just stood around wondering what was going on up ahead. By dawn, none were left alive, the report relayed to Jimmy by satellite phone. Jimmy had not slept, but calmly contacted the Kenyan Rifles and ordered two thousand men, plus supplies, to be flown to Israel. That left us all confused, if not stunned. I risked asking for clarification.

Jimmy took a moment. ‘The fight should have been avoided. But, once started, there’s no point in making it worse by leaving Hezbollah to attack Israel as planned. If the Kenyans leave, Hezbollah will go straight towards the Israeli border.’

Jimmy contacted the Pathfinders and told them to take defensive positions away from towns and villages, and to await re-supply.

Meanwhile, the original peacekeepers turned around and moved north to join their colleagues. The UN Security Council met and voted for a withdrawal of the Kenyans, but also read a note from the Pathfinders commander that said they were “pinned down” and that retreat would be done so under fire and in disorder. That was a lie concocted by Jimmy, something else that surprised me.

The Kenyans got their re-supply, and more men, soon a buffer zone set-up, which was what the Israelis had wanted all along. And when the first rocket landed in Northern Israel, Jimmy moved the Kenyans forwards, still “pinned down”. Although the Rifles were taking injuries from sniper fire and mortars, they were building up a good tally of enemy fighters killed each day. Hezbollah sent more fighters south, the result a massacre. The Rifles were spread out, and hidden with their sniper rifles. And they took no prisoners.

The next evening, with the UN Security Council due to meet again, and Hardon Chase on the phone during the day, Jimmy ordered a push twenty miles forwards. The rifles would move to the edges of a village, fire a few shots and see who came out armed, any armed men being cut down. Cars were stopped at improvised checkpoints, the occupants typically opening fire and getting themselves killed. At dawn the Rifles moved south and re-occupied their original bases, their blue helmets back on.

Jimmy met with the “M” Group at the house, and each representative sent messages to their governments. The UN Security Council now voted for the peacekeepers to stay put, and condemned the aggression towards them. The alternative was a war between Israel and Lebanon. Hezbollah licked its wounds, and thought better of sending more men south, the Kenyans now occupying a buffer zone some fifteen miles deep, some three thousand of them dug in. An uneasy truce reclaimed the area, and Jimmy took me for a walk around the grounds.

‘That should not have happened,’ he said as we walked, the day warm.

‘But if it stopped the war...’

‘Yeah, I know.’ We walked on, nothing said for a while. ‘Might get away with it,’ he finally said.

‘Get away ... with it?’

‘Hezbollah might try and set-off bombs in Kenya.’

‘Ah. That would be bad for business. But they did start it.’

‘True,’ Jimmy admitted. ‘They may just sit and stew about it. Or they may launch a full attack south.’

‘If they do, they’ll run out of people before the Kenyans run out of bullets.’

‘True again,’ Jimmy admitted. ‘And I was tempted to use the Kenyans to sweep north. At least the Israelis wouldn’t get the blame.’

‘But Kenya would, with no UN remit. At the moment, it looks like a UN mission gone wrong.’

Jimmy nodded as we walked.

‘You blame the Israelis?’ I asked.

‘No,’ he said with a sigh. ‘It would have harmed the cause if they had gone to war.’

‘How long do we keep them there?’

‘If the UN pay ... indefinitely. If it keeps the two sides apart, then that’s not a bad thing.’

‘I think Dave Gardener has changed his name and gone into hiding.’

‘Invite him down,’ Jimmy suggested as we passed Rob fishing in the main lake.

‘I’ll tell him you won’t eat him.’

‘A flashpoint like that could seriously fuck-up my plans. We have to be more careful. I ... have to be more careful.’

The days ticked off the calendar and Lebanon remained quiet, little more than the odd sniper duel reported. Ben Ares flew over and we discussed the situation, Jimmy happy to keep the Kenyans there, most of the pathfinders withdrawn. The UN sanctioned the operation and the money, and the Kenyan soldiers were rotated out after three months. It looked as if we had got away with it.

Gotham city

In October, Jimmy and I made a quick visit to Goma International Airport, the place now deserving of that title. As I negotiated the aircraft steps I could see a dozen other aircraft on the apron, many of them belonging to our airline. Passport control was busy, the arrivals lounge busy, queues visible through the glass walls to departures. We followed the signs for the new hotel, along a glass walkway, and

into the reception area, greeting travellers as we progressed. The lift took us to the top floor and a guard let us out onto the windy roof.

‘Fuck me,’ I let out.

In front of me, the main boulevard stretched out towards Goma, two lanes on each side of a grass divider. On either side, new high-rise apartment blocks were sprouting up, a dozen finished. Beyond them a number of tall cranes attended the huge Lego sets that would be new buildings soon enough.

‘How tall is that far building?’ I asked.

‘Twenty-five storeys,’ Jimmy proudly stated. ‘For Africa, that’s quite tall.’ He pointed. ‘You see that yellow bus?’

‘Yeah?’

‘Two of them go round and round all day, free to anyone, from Goma to here and back. Come on, let’s go see what we can see.’

A small coach awaited us, our bodyguard detail sitting behind us. Pulling off we passed the first hotel that had been built, and then out through the airport gates and onto the boulevard. Four tall apartment blocks flashed by, each sat in their own fenced-off grounds, surrounded by grass with benches.

‘That’s a shopping centre,’ Jimmy pointed out. After passing another four apartment blocks he added, ‘That’s a public swimming pool for locals; workers and their kids. That’s a police station, those are corporation offices, that’s our CAR office – accommodation above them, and that’s our tourist office.’

‘What are those?’ I asked, pointing a row of smart colonial style houses.

‘Embassies.’

‘Embassies?’

‘We agreed it with Kimballa Jnr; we can have our own embassies here. So far, nine countries have missions here.’

The coach negotiated a large roundabout, watchful police eyeing the traffic, and we headed back along the opposite side of the boulevard.

‘That’s the airline office. They have another office at the airport itself. In there is a call centre; customer enquiries.’

We passed the first large apartment block to have been built, its ground level dotted with well-attended shops. Next to that stood the new tall tower.

Jimmy explained, ‘It has offices for rent on the first three floors, penthouses at the top – or at least it will when finished. It’ll have a gym and pool, restaurant and bar. Marko and Yuri have grabbed the penthouses.’

We passed another six apartment blocks, most of them complete, and turned right before the airport roundabout. A mile along the road, the sides of this road littered with new foundations, we found an industrial park, one of ten new such parks in the area. Individual units and factories were now being erected.

‘In here, the various businesses will support the mines and other projects, save having to import it all. Africa doesn’t make much, so we’ll make what we need here.’ We passed a large factory under construction. ‘Po’s place; they’ll make all sorts.’

Two miles further on we came across large cranes scooping up mud, carving out deep canals. Behind them sat a number of smelting plants, steam belching from tall steel chimneys.

Jimmy explained, ‘You have heavy industry here, light industry closer to the town, then the apartments. And free buses go back and forth all day. The locals don’t earn much, but they save on transport costs and living costs, and food is subsidised to a degree, so they do well. A lot of Africans buying apartments here.’

The coach turned right again, away from the airport. Five miles down the road we came across shanty houses, then the start of a modest neighbourhood of uniform houses that all looked prefabricated.

‘These houses are two bedroom, nice enough, but cheap to build. There’re three thousand of them here, a bus route and a couple of shops,’ Jimmy explained.

‘This the poor part of Gotham City?’

‘Not many locals can afford those apartments.’

At a large roundabout we turned right again, soon at the top of the boulevard, signs labelling Goma to be off to the left. Now we passed brick and breezeblock houses, soon two storey houses, then houses in their own grounds and with high walls, finally hitting the roundabout we had circled earlier.

‘Progression,’ Jimmy explained. ‘They start with the small houses, get jobs and work their way up. And they can go as far as they like.’

Crossing the roundabout, we soon approached the new hospital, a huge building, parts of it still under construction.

‘There’re Cuban doctors in there, a Rescue Force unit, and doctors on swap from around the world. When it’s finished it’ll be able to accommodate three thousand patients. At the moment, there’re about sixty patients in there. Most of their work is attending injured workers at the factories and mines, and they have a decent ambulance service – even a helicopter ambulance.’

We turned left and halted, the road blocked.

‘That’ll be the American University; accommodation for three thousand students, pool, gym, library, running track, the works.’

‘Bar?’ I asked.

‘No, this is Africa. They don’t get pissed like western students.’

At the airport, our ride was just about ready. I stood next to a map board and scanned the destinations that were now available. Seemed like we offered flights to every country in Africa. At the next board I checked the prices, finding that a hop from here to Kinshasa was just \$50, Nairobi a \$75 return, and Cape Town was a \$100 return. It was no wonder the flights were full. As I climbed the steps, I could see three 747s from three different airlines. Our hub was now truly a hub, and I smiled contentedly.

‘How much more will this grow?’ I asked Jimmy.

‘Till you can drive for half an hour and not find jungle.’

The 747 lifted off from Silo Airport, on the edge of Gotham City.

2006 ended with many boxes having been ticked, and a strange optimism gripped the world. The various leaders were talking about co-operation, rather than confrontation. Even Jimmy was surprised, because right about now he had been expected to be in a small war against Hardon Chase and the CIA.

The world economy was doing better than we had planned for, and interest rates were nudged up to try and cool things down. House prices were appreciating annually at over twenty-five percent, but we desired less than twenty percent. More new houses were built to compensate, and oil flow reduced to raise prices a little. The regular “M” Group meetings were now largely economic debates, often in small detail and with a little horse-trading going on. What went on in our lounge affected the globe.

For New Year we launched a massive advertising campaign for Cape Town, and flew down for the New Year celebrations, changing flights at Goma hub. Ex-Presidents Harvey and Art Johnson came along, the former French President, the serving British Prime Minister, and senior politicians from the States, Russia and China. Sykes attended with his wife, and many of the senior staff from Mawlini and Mapley joined us. Cape Town was put on the map, the number of New Yorkers visiting it growing rapidly.

On New Year’s Day, 2007, we were sat on the brilliant white sands, in the sun, Shelly trying to feed Antarctic penguins. And I was optimistic for the future, at least the near future.

Magestic

Part 8

It's quiet, too quiet

2007 should have been the start of a financial crisis, but we had averted the worst aspects of the sharp rises in property prices, and the worst excesses of the banks and financial institutions for the most part. Interest rates had been nudged higher, existing mortgage laws re-applied, hints dropped.

At a dinner in the city of London, a room packed with stockbrokers and bankers, Jimmy had made an off-the-cuff remark about "shorting" Icelandic banks. The next day Iceland went into crisis mode, and had a good look at the reasons behind the sudden run on their banks; they called Jimmy directly. They were overstretched, and bluntly told to pull their necks in. There was also the small problem of many British investors pulling their money out of Icelandic banks, causing a shortage of cash, which highlighted the exposed leverage that the banks had been employing. Instead of a major crash, they suffered a short and sharp minor crash. I put a note in my diary not to visit Iceland for a while.

Besides that hiccup, which was more of a deliberate hiccup, the start of 2007 was quiet. Global politics was giving people the world over a warm and glowing feeling, house prices were steadily climbing, economies were growing thanks to manageable oil prices and supply, and all was well with the world.

The "M" Group countries met in Delhi in February amid tight security, our Indian commandos on hand, and went off without a hitch, its format settling down. We'd hold an opening meeting, where Jimmy would list a few topics and predictions, and then the political aides would scurry around for a day to both make proposals, and to receive counter-proposals, the next meeting discussing the conclusions rather than wasting time with offers and rebuttals. I got involved, and often travelled back and forth between parties carrying messages, the kind of messages that no one would admit to in public, or in writing.

'Like fuck,' Hardon Chase would say. To the Chinese, I would report, 'The nice man is not entirely in favour of that.' My diplomatic skills were growing; I could now lie convincingly. But when Helen asked about a dress, and I said that I was 'Not entirely in favour of that' I got a slap. I also employed our special adjudicator on occasion, Shelly being sent around to someone who

everyone agreed was a complete idiot, and delivering the message in person. ‘You’re very silly man!’ Shelly would tell them, the person in question knowing that such an approach required a majority vote of world leaders to instigate.

With spring approaching we were worried. It was all going too well. Sat in a lounge one day, Jimmy said to me, ‘It’s the calm before the storm.’

‘It’s going too well, something’s bound to go wrong,’ I agreed.

‘Yes, but what?’

‘CIA!’ we both said at the same time.

‘So what could they do?’ I asked. ‘Try and kill us?’

‘As far as they know, Magestic would carry on delivering warnings. Killing us would only be a hiccup to Magestic.’

We gave it some thought.

‘What’s their gripe at the moment?’ I posed.

‘They have less to do, their budget has been frozen – and may even face a cut, because we’re putting the world to right. So they’re pissed.’

‘So they want a war, or a crisis.’

‘Well ... that would give them more to do, but they must figure that I know where all the hotspots are,’ Jimmy suggested. ‘Besides, people would see straight through it.’

‘Exposing us would be the easiest way,’ I suggested.

‘Then Hardon Chase would jump all over them. He loves us to bits because we’re helping him to look good.’

I blew out. ‘Then what else could they do? Where are we vulnerable?’

‘Nowhere really; any bomb or sniper in any one place would achieve little, we’re spread far and wide.’

‘So, what do you care about the most?’ I posed.

Jimmy took a moment. ‘That question ... would produce different answers at different points in the time line. It may have been Mawlini at one point, still would to a degree. Then Forward Base, now Gotham City.’

‘You can’t call it Gotham City, that’s my joke,’ I said with a smile.

‘Can’t call Russian Paul *Ivan* or Donnelly Keely, but we do, thanks to you!’

‘So what could they do to Gotham City? They can’t blow it up or cause a fire - it’s huge, spread far and wide.’ I clicked my fingers.

‘The airport!’

‘A problem there would hurt,’ Jimmy admitted. He got on the phone to Sykes.

That following week, a team of sniffer dogs were flown down to Goma with their handlers, a unit of ex-police handlers that would rotate every six weeks. Passengers, and their baggage, would now be sniffed by keen wet noses. The airport already possessed western style metal detectors and body searches, but they were checked, and procedures tightened up. Full background checks were extended for everyone who worked at the airport, or in anyway touched it. All local workers were visited at home, in the nearby apartments or houses, and random searches were instigated.

Sykes had a list of all CAR staff, plus everyone else who worked for us – anywhere in the world, even sub-contractors, and began the process of re-screening them all. We provided funds, and MI5 staff worked on the checks, MI6 making checks overseas. A week into the project they unearthed a CIA mole in CAR. Instead of removing the individual, we recruited the man – work for us or go to prison for twenty years – and fed the CIA information that they would know was being fed to them. His contact numbers were cut, and he was quietly fired by us.

Security at the Pineapple offices was tightened, scanners and sniffer dogs used on occasion, and senior staff were given drivers and bodyguards, homes checked for bugs at random. Our nightclubs were already secure, but procedures were tightened further. And at the house, extra cameras and sensors were installed, the small camera room moved to the basement to accommodate all the screens, two people positioned there permanently. Ahead of schedule, the main gate was modified and a gatehouse built, cameras fitted to the road and angled up so that they scanned the underside of vehicles entering.

The main house was already bomb proof, and any device going off in one section would not affect many people. My house had also been built to be tough, and car a bomb would have achieved little.

We flew down to Gotham City and tightened security further, a ten-man team of Pathfinders now always on duty at the airport, extra Congo rifles wandering about. At the main gate we installed a small tower with tinted glass and holes for sniper rifles to fire out of. The airport could now withstand a direct assault. Cameras were fitted to the hotels, and extra guards posted. The airport already offered a great many cameras, but Sykes sent down a few people to look for blind spots. The final piece of the security puzzle at the airport came

in the form of a batch of radiation detectors. It was a remote possibility, but we were covered.

Forward Base was already heavily guarded, but a few changes were instigated, a special police unit created simply to monitor Americans or Canadians in the country, the detail of their names being fed back to Keely. Mawlini was a death trap for anyone daft enough to try and attack, but we got Mac on the case and gave him a budget. He had cameras fitted, and they took possession of their own patrol dogs for the fence, plus sniffer dogs for passenger aircraft.

Relaxing in the lounge, back from Africa, I said, 'How about ... they blow up the train track?'

'It would be fixed in a day, and it doesn't cross any bridges that they could blow.'

'We have bridges in our region,' I pointed out.

'Concrete! Built to be cheap, and very fucking hard to blow up.'

'What if they got to Kimballa?'

'He's both terrified of us, and loves us, in equal measure,' Jimmy insisted.

'And if they killed him?'

'His replacement would not dare upset us. If he did, the Congo Rifles would cut the country in half and we'd keep our bit. The people trust us more than their own politicians.'

'I reckon their best bet is exposure.'

'Not really. Think it through: they expose us as ... what, time travellers who know the future. Who the fuck would listen to them afterwards? Everyone would ask us!'

'Yeah, I suppose. So they want us gone, and quietly.'

'They still have the problem of Magestic: unknown, unseen,' Jimmy insisted. 'No, what they want ... is the American public against us. At least the American Administration against us, and the idea of Magestic.'

'So how do they achieve that?' I wondered out loud.

'A rift between us and Chase,' Jimmy also thought out loud, staring up at the ceiling.

'And how would they achieve that?'

'They may know that we have dirt on Chase. In fact, I'm certain they do, from the first meeting with that Admiral in the room.'

'Could they find that dirt?' I asked, now worried.

'If they did, they'd shoot themselves in the foot; I've made it all look like *they* covered it up. Besides, whoever replaced Chase would jump all over the CIA and not trust them again.'

'So, they need to use that dirt as leverage ... somehow.'

Jimmy eased back and gave it some thought. ‘Somehow ... meaning that they sour our relationship with Chase who – at the moment – is doing more for me than I could have ever hoped for.’

‘Assassinate him, make it look like you?’

‘No one would believe that, I’d have no reason. And the “M” Group countries would say so.’

‘So they assassinate Chase ... and make it look like the Chinese?’

‘That ... would be a worry,’ Jimmy admitted. ‘But they’re not about to assassinate a President; he’s not Kennedy. And his replacement would just carry on and deal with us. They need ... a lack of co-operation. But, at the end of the day, I designed my plans for the future assuming that the Americans would always be difficult, if not downright hostile. So even if they pull out of the “M” Group it wouldn’t affect my plans. And they would never wish the other countries to have a lead over them, so they’d never pull out of the “M” Group.’

‘They must be up to something,’ I said with a sigh.

‘Keep thinking.’

‘Those coffee shops...?’ I posed.

‘No!’

Plenty aforethought

The CIA made its move a month later, Hardon Chase making a frantic call to us. The two largest medical insurers in the States, Republican Party donors, had received documents from the CIA about us, detailing our support for Senator Pedersen’s insurer – the stock market tip-offs. Chase could not risk annoying them, since they were large donors and well connected. It was a mess for him.

Jimmy asked him to arrange a meeting with the CEOs of the companies in question in a few days, and we packed a bag. In New York we made a point of being seen having fun, not a care in the world. Jimmy made a pass at a famous actress, and she was snapped leaving his hotel in the morning. We had set the tone. The next day we flew down to Washington on a private jet, a Learjet, and allowed ourselves to be filmed getting in and out of it. We were whisked straight around to the White House, a nervous Hardon Chase waiting.

‘This is serious,’ were his first words.

‘Sure is,’ I agreed. ‘No tea waiting for us. I mean, you’re the most powerful man in the world – and the beverages here are crap.’

He stared at me, controlling his disappointment in me. ‘They’re waiting, so I hope you have a rabbit in the hat.’

‘Well, let’s go and see, shall we,’ Jimmy said with a confident smile.

In the meeting room, five sour-faced men waited. They each looked at us like we had driven over their flowerbeds.

‘God bless all here,’ I said with an Irish accent as I sat. ‘Who’s round is it?’

No one bothered to try and shake hands, and no introductions were offered.

Chase said, ‘I assume everyone here knows who everyone else is?’ None of the men opposite responded.

Jimmy took in the faces of the men opposite, smiling dangerously. ‘In just a short while the FBI will be arresting the CIA agents who gave you the files.’

‘They will?’ Chase queried.

‘They will,’ Jimmy insisted, not having taken his eyes off the men opposite. ‘So, why don’t I save us some time and sum up: you’ve been provided with documents from the CIA, top secret documents – the kind not to be caught in possession of – and you think that this clairvoyant known as Magestic has been favouring Chuck Pedersen’s insurance company. Well, you’d be right.’

Chase blinked.

Jimmy continued, ‘But you should have read the files in more detail, and applied your brains a little more. A clairvoyant ... is someone who can predict the future. Predict ... the future, such as meetings like this. As a result of that ability to predict the future, we knew about this meeting twenty years ago. Since that time we’ve had private detectives monitoring you fine gentlemen. Mister O’Leary, that nice man that your daughter married, and recently divorced, was one of ours.’

The man looked horrified.

‘Mister Bankovich, your son’s existing wife is on our payroll.’

‘What?’ the man gasped.

Jimmy reached down and lifted his briefcase, taking out two thick files. He slid them over. ‘We know every prostitute that you’ve ever fucked, every bit of weed or cocaine you’ve ever bought, every insider deal. And, we know which whistle-blower one of you had killed two years ago.’

The men had been scanning the files, but now looked up, horrified.

‘You’ll notice in these photographs of you going back twenty years. Of course, the police, your shareholders, your wives, and the SEC would be interested in some of the detail, if ... it got out.’

‘Jesus,’ Chase let out. ‘I can’t believe I’m in this room.’

‘So,’ Jimmy loudly called. ‘What did you want to talk about today?’

We waited with smug grins, the men sipping water and mopping their brows.

‘Nothing?’ Jimmy asked. ‘Oh well, then I guess we’ll conclude with me asking that you both donate ten million dollars to Rescue Force Kenya and ... it was a pleasure.’ We stood.

‘Some day, we’ll get a good cup of tea in this place,’ I complained.

Chase led us out, staring wide-eyed at the floor as we progressed. In the corridor, he stopped and forced a breath, shaking his head. ‘God damn, boys.’

‘The CIA waiting for us?’ Jimmy asked.

Chase led us on, now smiling and shaking his head. In the bowels of the White House we stepped into a room of CIA directors and managers, a reception even more frosty than the previous. And still no bleeding tea!

‘Please, don’t get up,’ Jimmy told them when they stood for the President. He sat. ‘So, who do we have here? Mister Drake and Mister O’Sullivan, there are some nice gentlemen from the FBI waiting for you upstairs, with proof of your involvement in the Magestic documents that you handed to the medical insurers.’

As we sat there looking smug, the men were led out, their colleagues both surprised and horrified in equal measure.

‘So,’ Jimmy loudly said ‘Here we all are. Now, I won’t keep you long, because you’re going to be busy later today and ... tomorrow. You gentlemen would prefer that we did not give tips about security matters, because that’s your job. Never mind that we’re trying to save the planet, you’re more interested in your own careers.’

‘That’s not true,’ a few tried to argue. After all, they were not about to have that label pinned on them in front of the President and the CIA director.

‘And yet, here we sit, two of your managers under arrest for trying to expose us and discredit us, classified documents handed over to businessmen,’ Jimmy detailed. He waited.

‘They were not following orders from the top,’ the Director insisted.

‘Guess they have no respect for your authority,’ I noted, the man not happy. At all.

Jimmy said, ‘And then there were the other attempts to attack us, and to discredit us.’

‘Those people have been dealt with,’ they insisted.

‘Lame,’ I put in, now even less popular with the Director, Chase oddly quiet.

‘OK,’ Jimmy began. ‘Let’s get down to business. You have – some of you have, yet again gone against the wishes of the President – and the Director – and operated on your own to attack us. So there’s going to be a penalty.’

‘Oh god,’ Chase muttered.

‘Many years ago, the then President Harvey asked us to boost civil service pensions. That gave us access to CIA pensions and welfare funds.’

‘Oh no,’ Chase muttered, dreading whatever Jimmy was about to say next.

Jimmy explained, ‘So we traded that fund, and did quite well.’

‘Very well,’ I put in.

‘Extremely well,’ Jimmy added. ‘Unfortunately, we bought a great many stocks just before secret takeovers were announced, before the Pentagon issued contracts, and before the boys on the hill sanctioned projects. As such, anyone looking hard at the trades might conclude that the CIA – that’s you – had insider information, and that you were making money for yourselves.’

Mouths opened and eyes widened when they realised where this was going.

‘As of – oh – about an hour ago, the detail of those trades went to the Washington Post, the New York Times and CNN.’

Chase put his hands to his face.

Jimmy faced the CIA Director. ‘I’d resign now if I were you. Then there’s the problem of the SEC seizing your pension funds and stopping all payments for former officers, including sick pay. That should take about ... oh ... nine months to iron out.’

‘What have you done?’ Chase whispered.

Jimmy ignored him. ‘Gentlemen, we know what you’ll do ... before you do it. Every time you push, we push back.’ He stood, and I followed him up. ‘I look forwards to your next move, which we were planning for twenty years ago.’

I patted a stunned looking Chase on the shoulder as we left. In the van, I said, 'You knew all along.'

'When I set-up the insurance scheme I figured that the others would be unhappy.'

We met Pedersen on Capital Hill and explained what had happened. He and his colleagues would now be calling for an investigation into CIA activities, but supporting Hardon Chase.

A few days later, Mac called, his bank balance twenty million dollars better off. We ordered the money spent in Darfur, on relocating refugees back to their own villages. The American news was full of the investigation into the CIA, Chase under pressure and not a happy bunny. He had no choice but to sack the current director and appoint another. That director had been in the job just three days when Chase called. Jimmy was not about, so I took the call.

'Home for fallen women, Matron speaking.'

'Paul? Hardon Chase. Jimmy about?'

'No, hence you're talking to the monkey, and not the organ grinder.'

'Are you in the country for the next twenty-four hours?'

'You can't fire a nuke at us, it's against some law ... somewhere.'

'You in?' he pressed.

'Yes, no trips planned. What's up?'

'The new head of the CIA is on his way, military flight to RAF Fairford – on the quiet. He wants to find a peaceful solution, so do I. So I would really appreciate you speaking to him.'

'I'll get the kettle on. How're things across the pond?'

'Settling down, thankfully. But they've suspended the CIA's pension fund. We're having to put money forwards for the payments till this is sorted out. Try and work with Petrosi, eh?' The line clicked dead.

When Jimmy appeared, I relayed, 'The CIA chief is coming over. Guy named Petrosi. Is he OK?'

Jimmy nodded absently, picking up a file. 'As soon as he's gone we'll pop over to Zimbabwe, we just got their airline.'

'Cool.'

Petrosi turned up at dawn the next day, a Saturday. And it was just him, an escort of four RAF Military Police officers. We were in the diner having breakfast when he was shown in, a short and stocky man with thinning black hair and a pockmarked face.

‘Coffee, black, please Cookie,’ Petrosi said as he took off his coat. He sat straight down. ‘Fucking C5 Galaxy flight. Jesus, at least I was tired and slept most the way.’

I stared at him for a moment, then faced Jimmy.

‘I got Bouncy the masseuse coming around in an hour,’ Jimmy told our visitor. I was still staring.

‘Good one, Jimbo. Gagging for a young bird with large hooters.’

Now my mouth was opening.

‘Daughter’s wedding soon?’ Jimmy asked.

‘Fucking yes! And I could do with a few dollars.’

Jimmy took out a dated gold pocket-watch with a chain. ‘Your great-granddad’s heirloom. Have it appraised; should be thirty thousand dollars.’

I was still staring.

‘Nice one, Jimbo. Fucking wife is bleeding me dry.’

‘And I’m Paul,’ I finally said.

‘Hey Paul,’ Petrosi offered. He turned his head towards Cookie. ‘Pancakes, buddy? Thanks.’

I said, ‘Would I be correct in assuming that you have met before?’

‘You would,’ Jimmy replied. ‘I had to get a lot of people sacked to get this reprobate into position.’

Now Petrosi faced me, and with a huge grin. ‘It was ... 1985, not long after I joined the agency. Jimbo introduced himself when I was stationed in London. In fact, I think I met you, Paul, at a club somewhere. Jimmy introduced me as a trader, which I was - it was my cover. Thanks to Jimmy my trading did *very well*.’ He faced Jimmy. ‘I miss those days. I was always drunk, and always getting laid.’ To me he said, ‘Jimbo gave me tips about work, and I got noticed and promoted.’ He stopped smiling. ‘He also told me what was ahead for the planet. Twenty years of predictions – and never wrong!’

‘I was wrong about your wife,’ Jimmy suggested. ‘I figured she leave your fat arse by now!’

Petrosi laughed. ‘She gets money, and peace and quiet away from me. What more does she want, eh?’

The pancakes were placed down.

‘So, how’s Hardon Chase working out?’ Petrosi asked as he drowned his pancakes in treacle.

‘I confronted him when he was nominated and we struck a deal. Since then ... he can’t do enough. I’m well ahead of schedule.’

‘Africa is looking good,’ Petrosi commended, talking as he chewed. ‘Financial crash sorted?’

‘More ... or less,’ Jimmy responded. ‘I think they’ll still go over the top, just a few years later.’

‘I uncovered a unit in the Congo, called their asses back,’ Petrosi informed us.

I shook my head. ‘You rigged ... the head of the CIA.’

‘Get some work done now,’ Petrosi firmly suggested. He faced Jimmy. ‘Can you identify all the shits working for me?’

‘I think so. Keely has a secure link here, so if I can see the names and faces I could probably tick them all off.’

Petrosi nodded as he chewed. ‘Later.’

Keely walked in sat. ‘Mister Petrosi. Sir.’

Petrosi regarded Keely coolly. ‘Later today, I’ll want to use your secure link and show Jimmy some names and faces. See if he can’t spot anyone that may be a problem ... in the future.’ He wiped his mouth with a napkin. ‘I don’t quite buy all this clairvoyant crap, but I have a job to do – and the President is on my case.’

‘We’ll try and be as helpful as we can,’ Jimmy offered, now acting a part in front of Keely. ‘We’re here to help.’

‘Cut the crap, Silo. It’ll take ten years to repair the damage you’ve done.’ He faced Keely and stared. ‘You mind?’

Keely stepped out.

‘He OK?’ Petrosi whispered.

Jimmy nodded. ‘He’ll break a few rules on our behalf in the years ahead. Oh, when you got the pension fund sorted, I’ll trade it up – but in a legal way.’

‘Good of you, Jimbo.’

Jimmy faced me. ‘Helen ... does not need to know.’

‘I won’t be mentioning Bouncy the masseuse either!’

Zimbabwe

Jimmy, myself and Big Paul caught a BA flight to Goma the next day, hopping on a connecting flight to Harare. Peering out of the window as we taxied to take-off, I could see ten aircraft at the terminal, and smiled contentedly. Landing at Harare, we were met by two cars and an escort of Zimbabwean Rifles.

General Solomon Beke, a young man to be the head of the Army, was waiting in the car, a huge smile for us. ‘Welcome, old friends. Welcome.’

‘Those guys outside, they Rifles?’ Big Paul asked.

‘Zulus, they like to be called,’ Solomon informed us. ‘And their reputation is known to all citizens here.’ We pulled off. ‘Mothers tell their children – if you are bad, the Zulus will come for you!’

‘Do you use them as police?’ Jimmy asked.

‘Yes, they patrol lawless areas, and then peace comes quickly,’ Solomon enthused.

We booked into a nice hotel, dumped our bags, and headed off again. On the outskirts of the town we approached one of our new orphanages. Pulling through a high gate guarded by two police officers in blue, we halted next to a new brick building labelled as “Office”. Anna and Doc Adam stepped out.

‘Any of these kids yours?’ I asked Doc Adam, shaking his giant fat paw of a hand.

‘I see them all as my children,’ Doc Adam boomed.

I hugged Anna. ‘It going well?’

‘Yes, we have some good staff.’

‘How many kids?’ I asked as Anna hugged Jimmy.

‘Nine thousand, so far,’ Anna reported. ‘Many were ... unwell, but are better now.’

I glanced over my shoulder at Solomon, who was out of earshot. ‘Got the kettle on, love?’

Anna led us inside, and to the administrator’s office, the man down from Ebede in Mombassa and looking familiar. After tea and a chat we stepped out into the main courtyard and toured the various buildings, the kids all dressed in blue and marching around in neat lines, some chanting and singing as they went. It made me smile; this was Ebede II, three if you included the Congo. We stopped to chat to a group of English teachers that had a better grasp of the Queen’s English than I did.

‘They’re all graduates from Ebede, Kenya,’ Jimmy proudly pointed out.

‘Haven’t had enough of kids and orphanages yet?’ I asked them.

‘It is a calling,’ one responded.

They showed us around a modern school building, complete with gym and swimming pool, tennis courts and football pitches outside. Mounting up, we drove to a second section, finding it identical to the first. Beyond that we found a large muddy field with the foundations of two additional sections in progress. When finished, there would

be twenty thousand kids housed, fed and taught here. The uniforms were uniform, the buildings identical, and the formula seemed to be working.

We thanked Anna and headed back out of the gate, Solomon oddly excited at the prospect of a trip to the Zulu's barracks, an old base that had been improved with a lick of paint and a new fence. Passing through the main gate, I could see familiar formations of men jogging around. At my request, we pulled up at the enlisted men's canteen. Stepping down, all the soldiers stopped dead at the sight of Solomon and saluted. He returned a collective salute as we entered the large canteen. Our presence created its own Mexican wave as men scrapped back their chairs and stood, silence soon gripping the room.

Jimmy stepped forwards. 'Sit down, men.' They sat, but remained nervously silent. 'Carry on and eat, please.'

We sat at the first table, a handful of men halfway through their meals. I pinched a chip. As we asked questions, four meals were brought over and placed down, good timing because I was peckish. The men at the table answered questions about the training, their time in Camp Delta and their fondness for the desert, and characters like Mac and Ngomo. Turned out that some of these were going back to Kenya soon for parachute training.

At the end of our meal we stood, everyone else standing. Jimmy thrust his first onto the air. 'Zulus!'

A deafening roar came back, shaking the building. 'Zulus!' If these guys ever formed their own choir it would be enough to scare the crap out of the enemy before the shooting started. I remembered a Michael Caine film, a few British soldiers holding off thousands of Zulus. They would have had no chance against this lot.

We waved, thanking the men, and mounted up, soon heading back into town and our scheduled meeting with the President, the guy having survived in office longer than anyone would have predicted. Pathfinder bodyguards in plain clothes greeted us at the parliament building and led us inside, part of the reason why the old guy was still alive; two assassination attempts had failed. Outside of the President's office stood two more Pathfinders, this time in uniform, M4s slung. They snapped to attention. Jimmy recognised one and enquired about the battle at Scorpion Base. We left Big Paul there to chat. Inside, we found the short and unimposing President, and several of his aides, stood waiting.

'How are you, sir?' Jimmy asked, extending a hand.

‘Alive, thanks to your men.’ They shook, and we were soon gestured to seats around a coffee table. ‘And the Rifles, known as the Zulus, have returned with a loyalty to me and their country, a respect for law and order, and a fearsome reputation. I fully believe that just the thousand of them is all we shall ever need.’ He took a moment to study us. ‘In Kenya, they studied the history of *this* country, and *our* culture, returning to us as honoured sons – not as strangers.’

‘That was always my intention, Mister President.’

‘We have sent another thousand young men to Kenya, but we believe that within two years we shall be able to train the men here.’

‘We’ll supply instructors when you need them.’

‘You are ... most kind, and an unusual benefactor.’

‘How’s the airline working out?’ Jimmy asked.

‘Very well; Europe has never been closer. I flew to a conference in Portugal – if I pronounce it correctly, leaving in the morning and arriving at night, passing through Goma Airport. I was ... most surprised by the size of your undertaking there.’

‘I aim to fix Africa, Mister President. All of it.’

‘You may just succeed, Mister Silo, from what I have seen.’

‘How are the tourist dollars?’ Jimmy asked.

‘Growing,’ the President responded. ‘I believe that the lodges are at capacity, a direct flight from Livingstone to Goma – which makes all the difference. These days, when us Africans wish to fly, we ask for *your* airline: I fly Silo, or I don’t fly!’ We laughed. ‘How many aircraft do you operate now?’

‘With those we took over ... almost a hundred.’

‘It was something of a shock for my people to be able to board a flight to Europe after all the years of sanctions, and a cheap flight at that.’

‘How are the farms?’ I asked, as much of Jimmy as the old guy.

‘They produce food,’ the President quipped. ‘Which is an unusual use for our land after all this time.’

‘And your currency is now US dollars?’ I asked.

‘Yes, we have stabilised things – to a degree,’ the President explained. ‘The people do not worry so much. And, after another two years, perhaps to return to our own currency.’

‘We’d like to look at mining, and oil exploration here,’ Jimmy told our host.

‘There is no oil here,’ he said with a sigh.

‘It can do no harm to look,’ Jimmy insisted. ‘And your mines are inefficient.’

The old guy nodded, soon handed a document from an aide. 'This grants you the rights, to mining and to oil exploration. Existing mine ownership must be honoured, but you may enter into partnership with them.'

'We will,' Jimmy assured out host. He handed over a bank transfer confirmation for fifty million dollars. 'An advance.'

'You will take many years to recover this,' the President puzzled.

'We are in it for the long term, Mister President.'

I somehow figured we'd be lucky in our explorations, and two hours after our tour began we arrived at the airport with Solomon, farewells made. We boarded our own plane, and headed towards our own airport, in our own region of the DRC.

At Goma airport we left what little luggage we had brought with us at the security desk, Big Paul minding it, and took the control tower's elevator to the top. It opened to a darkened room of orange screens. Passing through, we climbed the stairs to the busy glass tower.

'Jimmy,' the senior man called, a Brit. He stepped over. 'Jesus, when you said this place would grow...!'

'And more to come. How's it going?'

'Fine, enough bodies to cover everything. They've started building work over there.' He pointed. To the right of the huge maintenance sheds a new area was now being prepared.

'What'll go there?' I asked.

The man explained, 'Extended parking area, and more maintenance sheds, capacity for twenty aircraft. A lot of the old stock will come here to be checked over, all done in one place.'

'Boeing and Airbus mechanics?' I enquired.

The man nodded. 'There's fifty of each, plus a hundred trained Africans – from far and wide. Boeing and Airbus have offices here now, it's an important maintenance hub.'

'Where are you living?' I asked him.

'Tower block Four, nice enough pad. Waiting for a house on the hill.'

I faced Jimmy with a quizzical look. He grabbed a large pair of binoculars and handed them to me. 'Hill in the distance.'

I focused the glasses, soon noticing a gentle hill about two miles away, a spiral road climbing up and around it, numerous houses under construction.

'Known as The Spiral,' the man reported. 'Two hundred houses, getting nicer as you climb up; gate at the bottom, bar and restaurant at the top.'

‘That’s all American money,’ Jimmy said. ‘When that’s complete, we’ll start a second one nearby. Other side of the maintenance sheds is an industrial estate, but we only let in companies linked to the airport. Behind that will be apartments and shops, an estate for the workers.’

‘I’ve started fishing in the new lake,’ the man informed us with a smile. ‘Some real monsters in there.’

‘Our security staff said it was good,’ I put in, Big Paul and the others having visited.

‘That the guy who hooked a croc and shot it?’ the man asked us.

Jimmy and I exchanged looks. ‘I think we need to have a chat to Big Paul,’ Jimmy suggested. ‘Although I haven’t seen him with a new crocodile skin handbag of late.’

‘There’re crocs in the new lake?’ I asked.

‘It has a canal linking it to the main lake,’ the man explained. ‘They come up it, crawling the last fifty yards across the grass.’

‘Still,’ I said, ‘we shouldn’t kill the wildlife. The locals have hunted the crocs in the main lake nearly to friggling extinction already.’

We inspected dots on orange screens, lots of them coming and going, then boarded our flight, soon heading north, the distinctive shape of the volcano visible to the east. And Big Paul was fined five hundred quid for shooting a croc.

Cyprus

The people and politicians of the island of Cyprus had already made moves towards reconciliation between north and south; the Turkish north and Greek south. We would now use hard currency to move that along.

As part of an existing EU initiative, we paid for a register to be made of people who had fled their homes, either when the Turks invaded, or during the resulting civil war. On both sides of the divide our people hunted around and asked just about every family what they had lost, and who they knew who had lost property. When that list offered up a reasonable number we began the difficult process of tagging people who had benefited, rather than lost. The

biggest problem facing us was that land had been developed on both sides, hotels and apartment blocks built over former homes.

Having identified the worst cases of profit being made on someone else's land, we compensated both sides – on consideration that they assign their old properties to us. Having done that to five hundred families we were twenty-four million pounds out of pocket. With the UN behind us, and the EU, we then suggested that we would take the existing occupiers of the land to court. Unless...

In London, we met with the Turkish authorities, the Greek authorities, and the governments of Southern Cyprus and Northern Cyprus – no love lost between them. The EU, the UN and the British Government sat off to one side.

'Ladies and gentlemen, we are not here to apportion blame. We don't care. What we are interested in ... is in a peaceful and prosperous Cyprus. Turkey has aspirations towards EU membership, something that would be less easy with the outstanding issues of Northern Cyprus. So we would like to use our money and influence to try and find a solution, the solution to those who lost property.

'As you already know, we have compensated several hundred families on both sides of the divide, and they have signed their properties over to us. If necessary, we'll start legal proceedings against the current occupiers of the land to get some of that money back – if for no reason other than to acknowledge that land was lost during the troubles.

'Now, during the troubles, some people moved into vacant houses, houses which are now worth a lot of money. They did not buy the property, nor inherit it; they found them abandoned. We ask that they now try and pay something towards their good fortune as part of the peace process.'

'The Turks have benefited the most,' the Greeks unhelpfully put in.

'That may be true,' Jimmy agreed. 'But Southern Cyprus has enjoyed a great tourist trade for decades, whilst the north has not. Turks living in the south may have gone on to sell their property to a hotel chain.'

'It will be hard to define the land,' the Turks complained.

'Would the authorities of Northern Cyprus sell me land - that which belonged to Greeks - and at a good rate, for the sake of peace?'

'What will you do with the land?' they asked.

'I'll build houses, villas and apartments, then sell them, the profit being paid to compensate those whose land it was.'

‘How much land?’ they asked.

‘Around five thousand acres to start.’

‘That’s a great deal of land,’ they noted.

‘What price for peace, and Turkish entry to the EU?’ Jimmy posed. ‘And do I need to remind you that during your worst earthquake I spent a hundred million pounds to help your people.’ It was not so much a gentle reminder, as a punch in the throat.

The Turkish Government were in favour, their island counterparts not sure yet. Jimmy went around the room and asked for opinions, soon everyone in favour save the North Cyprus Turks, and they would consider it. In reality, it was a good deal for them and they knew it. We offered to send in mine clearance teams to those areas on the border that were affected, and to pay for old barriers to be torn down, and even offered to buy the abandoned properties in no-man’s land.

A month later we reconvened, this time with the Turks from the north in favour. They had come with a prepared list of available land and property. Jimmy scanned a map that they showed us, and asked for a large bay and its surrounding area; all of it, some six thousand acres. That way, we could concentrate our efforts. They had come prepared, and we bought the land for just five million euros, a token amount.

After the meeting concluded we popped around to the offices of our property business, and sold ourselves the same land for forty million pounds. That money then winged its way quickly to Cyprus, as compensation to families, provided that they sign away any future claims. Hundreds of families were compensated, some on the Turkish side. Jimmy handed over the designs of what we wanted built on the land: six large hotels, twenty apartment blocks and two hundred small villas. The bulldozers were already on their way.

Rubber gloves

At the end of 2006, Jimmy had given Han and myself a project, an important one. That project was now just about ready.

In our region of the DRC we now housed a plastics producer, using convenient local oil, and we opened a number of synthetics factories, Po’s family involved. The smelting plants produced steel, and that was shipped the very short distance to factories that utilized

the steel to make general goods, as well as quality instruments for the medical world. Those instruments were tested and inspected, the best of them being sidelined for my project. The rest would stay in Africa.

On a wet Monday, Han and I flew down to Goma and booked into the hotel, setting off the next morning to inspect our hard work and planning. We first drove around to a factory unit near the airport. It was not a big place, but they could produce a hundred thousand medical goggles a year. We inspected the product, placing on the plastic glasses and peering through them at each other. Surgeons and doctors would wear them when at risk of fluid transfer from a patient. We gave the factory boss the go ahead and their first shipment was dispatched aboard a 747 cargo version.

At the next factory unit we tried on disposable surgical gowns, headwear and over-socks, all blue, soon looking quite silly. The items met with western hospital standards, and we shipped them out, all two million of them.

At the third factory we inspected latex gloves that were not latex, but something similar made from oil by a clever German engineer. We tried them on, dispatching eight million of them as we wiped talc off our hands. That led us to some rubber tubing that was not rubber, and bits of plastic tubing that I dare not ask about its applications. They were boxed up by the thousand and shipped out.

The next day we turned our attention to steel, and to scalpels and surgical tools, clamps, and things that turned my stomach. Rescue Force doctors and surgeons had tested them at length, and found them no different to those bought elsewhere. Tens of thousands were boxed up and shipped to the coast by train. Our final visit was to a factory unit that employed as many Chinese as it did Africans, a great deal of new high-tech equipment on hand, and the various finishing rooms sterile; we had to don blue masks and over-socks to enter, our blue masks and over-socks. Inside, we found an assembly line making syringes and needles, tens of thousands of them. Rescue Force had again tested these, and found no problems. A shipment of a million was sanctioned, and dispatched by 747 cargo plane.

Back in the UK, we gave our people in Hawaii the go ahead, and they prepped their medical sales reps - that were not quite sales reps. The reps travelled around to the various hospitals in Hawaii as typical medical sales reps would. But that's where the similarity ended.

‘We’d like you to try some free samples.’

‘How many?’

‘Here’s a year’s worth, let us know how they turn out.’

‘A year’s worth? You mad?’

‘We’re trying to conquer the marketplace, so make the most of it. If you like them, you can have them at seventy-five percent of normal retail.’

‘Seventy-five percent off?’

‘OK, you drive a hard bargain; let’s call it eighty-percent off.’

Within a week we had the medical community of Hawaii confused. The equipment was good, it was not rubbish, and it was free to start with, then damn cheap afterwards. Every hospital and clinic in the islands received a visit from our reps, and got their free goodies, those items that they used a lot of during the week.

When Keely expressed an interest in the project, I explained it. ‘A box of disposable over-socks, or headwear, is say ... ten dollars typically. A large part of that cost is distribution, fuel, salaries and profit. We’re producing the equivalent for less than a dollar because we have the oil and steel, the cheap labour, no salesmen or distributors, no sales staff - really, and no profits to worry about.’

‘So ... why?’

‘Jimmy says that after 2013 your Medicare goes crazy and just about bankrupts you. For every billion your government will send us at the time – in the future, we’ll take nine billion out of your costs – at least for certain parts of it. And Jimmy has a few other things up his sleeve towards saving costs there. Just across the Mexican border, the Cubans have opened a hospital, part run by us. It’s open to paying clients and the first few people from Los Angeles have driven down to have operations they can’t get – or can’t afford - in the States. The doctors are Cuban state surgeons, the medical supplies ours.’

‘Medical tourism,’ Keely noted. ‘That used to work the other way around; rich Mexicans coming up for quality surgery. Does Africa get the supplies cheap?’

I nodded. ‘In those countries where we have a footprint. It’s a massive saving for you, almost ninety percent. We’ve also started making plastic sheets for the UN, for refugees, and tents from synthetics. We even make the tent poles. Rescue Force now receives a shit load from our factories each week, and we’re shipping the stuff to Cuba to support their initiative in Central America.’

‘Cheap surgery,’ Keely noted. ‘I hear it’s making them popular in Central America.’

‘As Jimmy says, most of the cost of these things is profit and distribution. A lot is already made in China, but the price goes up five fold when it hits the hospitals in the States.’

‘So why Hawaii?’

‘It’s socialist,’ I toyed.

‘Socialist?’

‘State run healthcare, different to the mainland. We’re going to set it up as a shining example.’

‘Won’t the medical insurers get pissy?’ Keely posed.

‘Not really, it saves their core costs, while premiums stay the same.’

‘Chase know about it?’

‘I sent him details yesterday, and he phoned me. He’s fucking delighted. I didn’t tell him it was his aid money that funded it, I’ll do that after a year or so. We don’t want people thinking Chase is a socialist now, do we.’

I showed Jimmy the stats, the production costs and schedules.

‘Good work,’ he said. ‘Now treble the output.’

‘There’s no pleasing some people!’ I mock complained, and went to find Han.

A few days later the Prime Minister flew down to see me. He got straight to the point. ‘We want cheap medical kit.’

‘Oh, well ... it’s all earmarked for various projects and people.’ He folded his arms. ‘OK, the way it works, is that for every pound you spend with us in the DRC - it saves you nine up here. We could open more factories in a few months.’

‘The National Health Service is just about our largest cost.’

‘That’s doctors salaries and building upkeep,’ I insisted. ‘How much of that is plastic shoes?’

‘About three billion a year is spent on disposable items.’

‘Ah. OK, how much do you want to ... invest?’

‘Start with a hundred million pounds, then we’ll ramp it up. We’ll make the money a loan into CAR, transferred next week. And the French already know.’

‘For fuck sake - we’re doing all we can!’

‘Do more, and faster.’

I wagged a warning finger as Jimmy entered and sat. ‘He’s trying to bully me,’ I complained.

‘Kick him in the shins,’ Jimmy suggested.

‘He wants medical kit,’ I informed Jimmy.

‘So will everyone else in time,’ Jimmy said with a sigh. To the PM he said, ‘Set-up a small office near our airport; health service procurement team and quality testers.’

‘Be done before you know it,’ the PM threatened.

Jimmy slid his gaze across to me. ‘Been an incident in Somali.’

‘Al-Qa’eda?’ I asked.

‘No, Abdi.’

‘Ah. He topped his President?’

‘No,’ Jimmy began. ‘He’s in Kenya. But the President sacked him as head of the Army, announcing it whilst Abdi was away. So the President’s bodyguards shot him full of holes, along with the new head of the Army. The Vice President has taken over, and re-appointed Abdi.’

‘Or else!’ the PM commented, a disapproving look adopted.

‘Will Abdi try and get the President’s job?’ I asked.

‘Not yet, he’ll wait two years to the next election,’ Jimmy explained.

‘Will he win?’ the PM asked.

‘Yes,’ Jimmy answered. ‘Why else would we have groomed him all this time?’

‘And my successor?’ the PM toyed.

‘Won’t be your Chancellor,’ Jimmy suggested.

‘No?’ the PM puzzled.

‘No, he’s due a heart attack.’

The PM took a moment. ‘Oh. Should you ... should we –’

‘Inject him? No, he’s a pain in the arse,’ Jimmy suggested.

‘Then ... my successor?’

‘You could keep going,’ Jimmy suggested.

‘A forth term?’ the PM considered.

‘Why not,’ I said. ‘You behave well enough.’

The PM shot me a look. To Jimmy he asked, ‘What do you think?’

‘It’s your call, your future, your family that you may wish to spend more time with. But ... but 2013 is ... problematic.’

Big Paul stepped in. ‘Jimmy, you’re dad has died.’

We all stood. ‘Head back,’ Jimmy told the PM, Jimmy and I driving down the short distance to the old house, an ambulance arriving. In the house we found the family doctor coming down the stairs.

He stopped on the last step and took in our faces. ‘He went to sleep, and went peacefully.’

‘Thank you, doctor,’ Jimmy offered. We found Jimmy’s mother in the lounge, her sister visiting. I called the undertakers and made the arrangements, then called Helen and asked her to release a statement to the press.

The unspoken question, on everyone’s lips at the house, was why Jimmy had not injected him. The following day Keely delicately enquired. Jimmy took a moment, and said, ‘I didn’t want him to see what comes next.’ That left us a bit stunned.

Four days later we were stood at the graveside, blessed with a glorious day of no clouds and little wind. After the priest had performed the graveside service, we drifted back towards the cars.

Jimmy stopped, and took in the view towards the village of Caerleon. ‘We used to come up here a lot as kids.’

I took in the pleasant view, the old bridge and the River Usk. ‘Not a bad spot.’

‘Jimmy!’ Big Paul called, his tone a worry.

We turned and walked towards him, Big Paul pointing out a grave as we drew near.

Big Paul read out, ‘Here lies Shelly Holton. Magestic: VAT14:JDI.’

‘What the fuck...’ I began, but could not finish.

‘Get hold of Sykes, seal this place off,’ Jimmy told Big Paul. ‘Then make sure no one sees that grave.’

We walked back towards the main group.

‘What the fuck is that?’ I whispered.

‘A message,’ Jimmy said.

‘A ... message? It’s got Shelly’s fucking name on it!’ I stopped Jimmy, a hand on his arm. ‘Is my fucking daughter in that grave?’

‘I ... don’t know. Possibly.’

‘She went back? Is that why you favour her so much?’ I asked in a strong whisper. ‘She destined to go back?’

‘No. Well, at least ... not to my knowledge. We’ll exhume the body and run a DNA analysis.’

I forced a breath. ‘If she did go back, how old –’

‘Could have been a hundred years old. I have no idea.’

We joined the procession and pretended that nothing had happened, travelling back to the old house as the local police sealed off the cemetery, and we made small talk with the relatives.

At 6pm Sykes stepped in, dressed suitably in black. ‘I’ve removed the item, its here. The grave contains the remains of ... someone.’

‘Perform a DNA test against Paul, his blood is on record,’ Jimmy quietly requested. ‘Then scan every other grave for odd messages.’

Sykes nodded conspiratorially. ‘You know what it means: VAT14:JDI?’

‘Yes.’

‘You do?’ I queried.

‘It’s a message, another one,’ Jimmy explained.

‘Does that mean that 2025...?’ Sykes posed.

‘Not necessarily. The first time machine was built out of desperation after World War Three. If I’m receiving messages, then it’s because of a desperate situation at some later point. Maybe beyond 2025. And ... let’s not discuss this too much.’

‘I have a body to attend,’ Sykes said.

I grabbed his arm before he left. ‘Show her the respect she deserves. Please.’

Sykes glanced at Jimmy, back to me – nodding, and left us.

I did not sleep at all, Helen worried as I paced up and down. I explained that there was ‘a message’ but that I could not say what it was. And I made no mention of Shelly being in that grave. For several hours I sat in Shelly’s room, just watching her sleep. As the sun came up, I felt rougher than I had done for a long time. When cars arrived I rushed around, unshaven and looking haggard.

Sykes stepped down. ‘It’s not a relative of yours in there.’

‘No?’

He shook his head. ‘The gravestone replaced the original. In the grave is a local woman, jewellery on her confirming it, no DNA link to you.’

I turned away and took in a dog patrol. ‘So ... they placed the gravestone there knowing that we’d see it. See it now, this week.’ I led Sykes inside and found Jimmy in the diner. We relayed the detail to him.

‘From this moment on ... no discussion of it. Sykes, make up a story, a ... bomb or something. Bury it deep, no records. If this gets out we’ll have a problem.’

Back at the house I gave Shelly a big bug, despite her trying to wriggle free. That was followed by a hug for a surprised Helen.

‘Shelly,’ Helen called. ‘Go clean your room.’

‘Ah, what for,’ Shelly protested, stamping a foot.

‘Just ... do ... it!’ Helen insisted. ‘J ... D ... I.’

I stopped dead, my heart skipping a beat.

‘What?’ Helen asked after a moment.

‘Nothing.’ I forced myself to look away, my thoughts jumbled.

Later that day I took Shelly out for a drive; she liked the Wye River Valley. I played the dutiful father, and spent a lot of time staring at my daughter as she threw sticks into the water. I found myself wondering what 'VAT14' meant. That, and what the hell were those coffee shops in Russia for?

New faces

The French voting public changed their President, and he attended his first "M" Group meeting in New York a few weeks later; in at the deep end. In an unusual move, Jimmy had sent me and Helen to brief the guy after his own security people had given their briefing. Helen acted as translator, and I answered his questions. Now, we met at the UN building, re-occupying the same room that we had used previously.

In the past two years, the various leaders had met each other more than any of their predecessors had ever done. Previous American Presidents had met with their Russian counterparts little more than twice per term – if that. The current batch of various "M" Group leaders now met at least four times a year, and relationships were good. 'Peace in our time,' the papers had reported. I was still waiting for something to go wrong.

Jimmy began with, 'We welcome the new French President to this group, and we hope that he does not get a kick in the shins in his first year.'

The leaders laughed, the French President aware of the joke. He has even met Shelly. But the good mood did not last long as we moved onto vaccines, and who might produce them ahead of the outbreak of Swine Flu in 2009, and for subsequent pandemics. After thirty minutes we were getting nowhere; each country wanted drugs sales for its own companies, and I could see Jimmy getting frustrated.

'Ladies and gentlemen, the purpose is to save lives, not to make a profit,' Jimmy reminded them. It did not do much good. The idea that drugs would be mass-produced by the cheapest supplier was just not being swallowed, or injected, not even by the British PM. Suppositories came to mind as I listened.

Jimmy finally said, 'I will make my own research available to all at the same time. You may treat your own people as you see fit, and

I'll try and treat those people that fall outside of those warm arms. There'll be an outbreak of Swine flu in the spring of 2009, in Mexico. That will be a start point to a process that will either become cheaper, or will bankrupt you all.

'OK, moving on. Gibraltar has been settled, as has the Indian-Chinese border. I would suggest to the British Government that they take a similar approach to the Falklands as they did with Gibraltar, and consider the benefits of co-operation. Because the South Americans will not let you use their ports, and so the oil and support ships will have a very long way to travel.'

The British PM did not look happy with that idea. More suppositories came to mind.

'Next, the Chinese have made a modest breakthrough in the use of stem cell activation. By this time, I would guess that the Americans have as well, but that they are keeping it to themselves.' We all focused on Hardon Chase.

'We've had some successes, yes,' he finally admitted.

'The progress of that research is not important,' Jimmy explained. 'Quite the opposite: if it appears too soon, and is used widely, it will cause more problems than it fixes – many more. But, in addition to the various governments here conducting their own research into the advanced features of stem cell medicine, there are also various researchers around the world discovering it all by themselves. Do my Chinese colleagues have a statement to make on the subject?'

Han interpreted, and reported, 'We have created a serum from the blood, and can mass produce it. It does not cause strong appetite, and does not repair injuries quickly, but it does cure a variety of diseases. And we will share that research.'

Hardon Chase seemed most put out at being beaten to that announcement.

Jimmy explained, 'That serum could be used for AIDS, TB, Hepatitis and a variety of diseases common to Africa and the southern hemisphere. It will not, however, extend life or make people stronger.'

'When should we ... announce that to the world?' the British PM delicately enquired.

'It will benefit all here if a cure for AIDS is found and used. So let's vote on its release this year in Africa alone. All those in favour?'

They all voted in favour.

‘Fine. China, kindly make the details of your research available.’ To Chase he said, ‘A cure for AIDS is worth billions to you. How much will you save from treating those without health insurance?’

‘A great deal,’ Chase reluctantly agreed.

‘Do we have to buy it off the Americas?’ the French asked.

‘No, because by time the FDA approves the drug you’ll have developed your own with the Chinese research.’

‘Another shopping list?’ the French asked.

‘A small one,’ Jimmy admitted with a grin. ‘Now, that serum, once modified and improved – and mass-produced – will be needed in the years ahead by all of you, and the rest of the world. The 2009 Swine Flu pandemic is not serious, those that follow will be. But keep in mind that once injected it’ll last twenty years, for some people perhaps a lifetime. So that serum could be used now, and your key workers would be covered for later.’

‘Could that vaccine be passed on blood-to-blood?’ the French asked.

‘Yes, but it would get very weak. And it’s not a vaccine - it doesn’t really work like a vaccine – it’s an active agent. It’s best used *after* someone is infected, to keep the potency strong. It will diminish with time.’

The British PM said, ‘So, its best use would be waiting for people to fall sick, then inject them, lowering vaccine costs.’

‘Yes. But some future pandemics will be quick, and by time you reach a person they may be too far gone, or living in remote areas. You don’t want a pilot to fall ill on a long flight, do you? I intend to experiment with it in Mexico in 2009.’

The French listed a number of small conflicts in the Sahara region. And should the Rifles be used?

‘If black African soldiers are seen to be aggressive towards Islamic citizens - too soon - then that may cause more problems than it solves. Most of the countries in question are not key players, and will be cleared of terrorist elements at a later date.’

‘Do we all get cheap medical equipment?’ the French asked.

‘That equipment is earmarked for Africa and America, but for two very different reasons. Africa does not have the money. America has the money, but needs to re-structure its health service before it has less money than Africa.’

‘We have a growing health tourism industry,’ Chase noted. ‘Your doing. Got some twenty thousand people a year heading south for cheap operations.’

‘Which saves you having that headache in Medicare, does it not?’ Jimmy posed.

‘Well ... it takes some pressure off the public hospitals. But it also highlights the problems we have!’

‘Really? Bummer.’

Chase cocked an eyebrow. ‘You want it to embarrass us.’

‘Sure do, old buddy,’ Jimmy said with an accent.

Chase said, ‘Hawaii is saving a lot of money in its annual medical bill. Some people may start going there for some health tourism: get a tan and have a melanoma removed!’

I laughed.

‘Don’t joke about it,’ Jimmy told Chase with a smile. ‘You’ll soon see citizens of Florida hopping into planes to Cuba for operations they can’t afford at home. But that’s not a bad thing, it saves the US taxpayer.’

‘How much of an affect could you have on the health budget?’ Chase asked.

‘My aim is to shave twenty percent off it.’

‘That’s a big number,’ Chase cautioned, as if he did not believe it. ‘Won’t do that with plastic tubes alone.’

‘Wait and see,’ Jimmy enigmatically stated. He checked his notes. ‘OK, whilst on the States, let’s talk about the Mexican border, because you’re *still* ... not on top of it. First, may I suggest that you change the law so that a citizen cannot sell a second-hand firearm unless through an approved exchange, where background checks are made.’ Chase made notes. ‘Then, may I suggest that your weapons manufacturers not make weapons with a view to smuggling them south. If you don’t act, I’ll expose them.’

‘You have a list?’ Chase asked without looking up.

‘I’ll send it to you,’ Jimmy offered. ‘Because by 2012 the Mexicans will be losing twenty thousand a year dead in drug related shootings.’ Jimmy took a breath. ‘Next, we need to discuss a future nuclear attack on Israel.’

Everyone sat upright, Ben Ares and David keenly attentive. They already knew some of the detail, more than the rest of the group.

Jimmy began, ‘As we speak, several senior Indian Army officers – and members of the intelligence community – are considering a way to rid themselves of the Pakistani problem ... forever.’

Everyone was now focused on the Indians, who were horrified. They looked like the guy who had farted loudly in polite company.

‘They will create a very realistic nuclear device that is not designed to go off. It will be made to look like a Pakistani nuclear

device, complete with the correct components and specifications – provided by their spies inside the Pakistani nuclear programme. There will even be a few fingerprints to be had. That device will be smuggled towards Israel by Pakistani agents who think they are working for the Pakistani Government. It will be discovered on the border, and will be quickly followed by a US strike on Pakistan, a conventional strike ... to start with.'

'Indian?' Ben Ares questioned.

'The enemy of my enemy ... is my friend,' Jimmy stated. 'If you get rid of Pakistan, they don't have to.'

'You know who these men are?' the Indians demanded.

'Yes, but if you reveal the full detail of this plot you'll do more harm than good,' Jimmy insisted. 'They need to be dealt with ... slowly, and quietly.'

'This is the attack you mentioned before?' Ben Ares puzzled.

Jimmy nodded. 'Members of Rescue Force Jordan will be involved. Some innocent, some expecting the bomb to go off.'

'When can we know who is involved?' the Indians asked.

'It has to be handled quietly,' Jimmy reiterated. 'So give me a unit of the men we've trained, and we'll decommission some of your senior staff.'

'I can't believe it,' the Indian Prime Minister stated.

'If you don't co-operate...' Ben Ares threatened.

'Gentlemen,' Jimmy called. 'If the Indians co-operate or not, those men *will* be dealt with.'

We broke for thirty minutes, the various leaders a bit stunned.

Ben Ares came up to us as we made ourselves coffee, to a confidential distance. 'Should we allow the Indians to be in these meetings?' he angrily asked.

'Funny, but in the years ahead, many of the people in that room will ask the same about you,' Jimmy illustrated as he stirred his coffee.

'What?' Ben Ares challenged. 'Exclude us? We have a lot to lose in the decades ahead. We have every right to be in this room!'

'The Indians may say the same,' Jimmy pointed out as he lifted his coffee. 'Because they face ending up in a war with Pakistan. So perhaps the person making choices of inclusion or exclusion ... will be little old me, and me alone.' He walked off, leaving Ben glaring at his back.

'Do we blame the White House when the CIA poke us in the ribs?' I posed, Ben turning towards me. 'No. And we don't blame the Indian Government ... because they aint behind it. And without

their help we'll have a hard time dealing with it. To quote Churchill: jaw, jaw, not war, war.'

Back in the meeting, the mood was frosty and formal, a step back after recent successes.

Jimmy took a moment to take in the faces. 'The path ahead for us ... is a difficult one, even knowing what will happen. After 2011 it will get ... interesting, then dangerous, then life or death. All you have to do, is to keep the final objective in mind: that we all get to 2025 in a reasonable condition, and shoulder to shoulder. Because you can be certain that anything less than a united front will lose us the war.

'Now, the men in India - who will be a problem - are known to me, and they will be dealt with ... *with* the co-operation of the Indian Government I'm sure. If not - should the plot succeed - I'm sure some around this table may actually consider a strike against India. The way to proceed, is to monitor those men and - when they meet to conspire - to record their conversations, confront them and make them resign whilst the plot is still just an idea.' He glanced at a sour-faced Ben Ares. 'That way everyone is happy. And please keep in mind that over the next ten years the members of this group will be - at times - downright hostile toward each other. Poke your tongues out at each other if you wish, just keep talking and listening.

'OK, Russia, your internal postal service is a national disgrace. Could you please look at it in the next few years. America: the small country of Georgia, north east of Turkey, wishes to court both NATO membership and EU membership. If they do, then Russia will invade, and that will cause some significant problems for the cohesion of this group. Mister Chase, if you arm Georgia I'll put the Rifles in South Ossetia, just so that there's no misunderstanding. This group exists so that such future flashpoints can be avoided, not blundered into.'

'Will they join NATO?' Chase asked. 'Eventually?'

'I hope not,' Jimmy answered. 'Not least because I aim to undermine their government. Their President is a nutter, who thinks he can put himself centre stage by creating a conflict between America and Russia.'

'I'd like the names of the Indian plotters,' Ben Ares asked.

'No,' Jimmy responded.

'No?' Ben loudly questioned. 'They're planning attacks on Israel!'

‘And need to be dealt with quietly. As will the other - and more severe - attacks on you later. If you wish to talk further on that matter, see me after class.’

Ben got up and walked out, Dave Gardener trailing after him.

‘Moving along,’ Jimmy began before Ben had even closed the door.

‘Do they not have a right to know?’ Chase challenged.

Jimmy took a moment. ‘That information ... I have held for a long time. I’m its custodian, and if you don’t trust me then you have a problem, you all have a problem. The information must not leak out ahead of time. I’ll give you a scenario. A major western city will be destroyed, a million dead, a million or more injured, economic collapse for that country. At what point do you give the warning? Ten years before perhaps? Would people believe it, and how would they react? Would property prices crash, the city evacuated, economic collapse now? Or do they deserve nine good years whilst the people around this table make plans for it in secret?’

He gestured towards Chase. ‘If you knew, for example, that San Francisco would be destroyed in eight years time ... what would you do?’ He waited.

Chase took in the expectant faces. ‘I’d make plans now, sure.’

‘And risk it getting out?’ Jimmy posed.

‘Well ... that would cause people to move, businesses would move. But they’d have time to move.’

‘And they would move because they all believe in clairvoyants?’ Jimmy teased.

‘Well, no,’ Chase admitted. ‘Most wouldn’t move.’

‘So you’d have to force an evacuation ... on what basis?’

‘Well, that would have to be ... discussed with the emergency planning committees.’

‘Who would all have to place their faith in the predictions of an unknown clairvoyant,’ Jimmy pointed out. ‘You’d be laughed out of office. So ... how would you do it?’

‘The simple answer is ... I have no idea at the moment,’ Chase admitted.

‘I do,’ Jimmy pointed out. ‘I have a detailed plan of action, and a way to move the people. What you have to weigh up and consider ... is how much faith you have in me and that plan, because at the end of your second term – assuming you get one – we’ll activate that plan.’

‘What?’ Chase stumbled with. ‘A major US city is hit?’

‘Yes, but not the one you’d expect. So, like Ben, you have some thinking to do about how much you trust me, and this group.’

‘You’ve not been wrong so far,’ Chase reluctantly admitted. ‘But I guess we’d still like to know.’

‘Not a pleasant feeling ... is it, someone else in charge of your destiny.’

‘Don’t know how you sleep,’ the British PM stated.

‘Will any great disasters befall India?’ the Indians asked.

Jimmy faced me. ‘Do you ever wonder if you’re getting through?’ He faced the Indian PM. ‘I will tell you what you need to know, at the right time, and not before. I could have created your commando force years earlier, but the time would not have been right.’

We got into small detail for an hour, the mood a bit off, and broke for the day. The aides would now do the important work. Jimmy and I had a 6pm appointment at the apartment, and I opened the door to the CEO of Caterpillar and two of his sales directors. I got the kettle on as Jimmy and the visitors introduced themselves.

Jimmy began with, ‘Good flight from Illinois?’

‘Company jet, quick trip,’ the CEO responded.

‘To business, then. Hardon Chase has been on my case to buy some of your equipment for Africa. So, first of all we’d like you to open an office at our airport near Goma, and establish a point of contact with our corporation. The office space is free to start with, cheap apartments nearby. We’ll then want you to open a showroom near the airport, where mine exec’s can come and inspect your diggers. But I’ll want a good stock held there so that people can buy or hire without waiting eight weeks for it to be shipped. I’d like a stock of close to a two hundred machines, a variety.’

Their surprise was clear as they took notes.

‘We’d then like to look at buying machines from you, the detail to be finalised based upon price and availability. Now, you do refurbished bulldozers, eighteen tonnes?’

‘Yes.’

‘We’d like to buy three hundred.’

‘Three hundred?’ the CEO repeated. ‘Would ... have to pull them in from a variety of places.’

‘Next, we’d like a hundred trench diggers, also refurbished. Then eighty front loaders, and two hundred off-road dumper trucks.’

They exchanged looks.

‘That’s year one,’ Jimmy explained. ‘In the second year we would need that again plus fifty percent, third year doubled.’

They stared back. ‘Doubled?’

Jimmy nodded. ‘And I want a yard full of your engineers to maintain them, to offer on-site maintenance to the mines, and to refurbish them when they get a bit worn. Unfortunately, it’s a big area, and so you’ll need engineers in at least six locations, and your own helicopters to get about.’

‘Helicopters?’ they queried.

‘From the farthest mines its eight hundred miles end to end, twenty hours by car. And the mines would probably want help sooner than three days later.’

‘It’s a big order,’ the CEO admitted.

‘The equipment needs to be shipped to Mombassa then put on the train,’ Jimmy explained. ‘It’s a hell of a journey. We’ll pay fifty percent up front, so that will help with your cash flow.’

‘That’s ... very good of you,’ the CEO offered. ‘What timescale are we working to?’

‘As soon as possible, the money’s been allocated. Step one is your rep in the area. He’ll get the formal order once we have prices and timescales from you.’

‘We can release this to the press?’ a second man asked.

‘Yes,’ Jimmy agreed. ‘Right, are you in a hotel?’ They nodded. ‘Meal at my club and a drink afterwards.’ We all stood.

‘Can we wash-up first?’ the CEO asked.

‘Sure, meet us there in an hour, taxi drivers all know it.’ With the men gone, Jimmy said to me, ‘Did we buy some shares?’

I nodded, then answered my phone to Dave Gardener. Ben Ares wanted to come straight around. Jimmy heaved a sigh and nodded. Ten minutes later I opened the door to Ben and Dave Gardener, their security waiting outside. Helen offered them some food, politely refused, but made them coffees. Jimmy had been sat, and did not bother to get up. He just offered our guests a fixed gaze.

Ben composed himself. ‘If something happened to you ... we’d get the right information?’

‘You’d get the right information ... at the right time,’ Jimmy coldly stated. ‘So don’t go bumping me off just yet.’

‘And there are other threats, besides the Indians?’

‘Plenty. It goes with the charming little territory you occupy.’

Ben took a moment. ‘It’s not easy to have someone else hold that information.’

‘Without me, you would never have known,’ Jimmy pointed out. ‘And you, young man, will be out of office when these problems hit. As you sit there, you presume to speak for your successors.’

Ben glanced at me. 'And ... when will we know that the Indian plot is dealt with, satisfactorily dealt with?'

'I'll list the men to the Indians within weeks. After that, their careers will be limited, but they won't be released for a few years. But, as soon as the plotters get together the Indian Government will panic and just kill them.'

'You just said they'd be released quietly,' Ben challenged.

'That's the plan. Unfortunately, it involves people, and people are unpredictable and emotional. I fully expected the Indians to make plans, then to panic when *you* put pressure on the Americans to put pressure on them. In an ideal world you would just trust my judgement.'

'You're asking us to trust your judgement on the future of Israel.'

'There's only one thing that stands between you ... and complete destruction, and that's me. And if I told you of each threat too soon you'd alter the time line and a new threat would come around, one that I don't know about, and that's the dangerous one. It's a bit like preventing a plane crash when a passenger is a future terrorist leader. Saving the plane is the right thing to do, but has consequences. I know most of the consequences, you don't. If you kill future terrorists now, you make terrorists out of their brothers – people who may never have taken that course. The timeline is a fickle thing; if you make a move out of sequence you'll create a more severe threat further down the road. Better to hit the bumps that I know about ... and make do.'

'Seems reasonable,' Dave tentatively put in.

Ben took a moment. 'You said before I made it to Canada.'

'Yes, and I helped you. The Israeli refugees were given an area of their own and made a little Israel in Canada, soon building settlements outside of their designated zone.'

I laughed, earning a look from Ben.

'You take these things lightly,' Ben complained.

'I wouldn't sleep otherwise,' Jimmy told him. 'Now, pay attention.' He eased forwards 'We'll deal with the threats, to your country and others, with or without your co-operation, since my plans were always for a world with more of a ... lack of co-operation. Being in the group is a privilege, not your right. If you want what's best for your people, oh great leader, you'll follow my lead.' He eased back and waited.

Ben stared back for several seconds, then stood, Dave following him up. 'We'll be there tomorrow,' he reluctantly got out as he

turned for the door. Dave forced an awkward smile and followed Ben out.

With the door slamming shut, I said, 'You're welcome.' I faced Jimmy. 'Will they be difficult?'

'I doubt it, but you never know. Americans politicians can be difficult, but Israelis politicians are Olympic champions at being obtuse. I think they run courses on it.'

We met the men from Catepillar at the club and enjoyed a meal, Cat minding the kids. They had released the news, their shareholders and staff delighted with our order.

The next day, the "M" Group remained a little sombre, a shame considering how good things had gone in Delhi and Hawaii. I even thought about bringing Shelly in to lift the mood. Some advances had been made overnight, a US pullback from support of Georgia, a few technology sharing agreements, and a Chinese offer of serum sharing with the Europeans for a few favours. All in all it was not bad progress.

Jimmy announced, 'With the groups consent, I will make use of the Chinese serum as an experimental drug in Africa. I'd like a working group of medics from each country, ideally your Rescue Force doctors, to work with me on it in South Africa to start with. Anyone opposed? Any comments?'

'How will it be applied?' the British PM asked.

'Treatment for worst cases, kids, but not a blanket roll-out,' Jimmy suggested. 'Once the results are in you can use it in Europe, claim wondrous successes and save a great deal of money treating AIDS patients in the western world.'

'It's a complete cure?' they puzzled.

'One simple injection, a complete cure; Jimmy explained. 'The cost savings will be huge. Unfortunately, the cured individuals are then immune to most things, and if that gets known they'll enjoy the kind of lifestyle that got them infected in the first place.'

'What effect on sexually transmitted diseases?' Chase asked.

'They'll become a thing of the past,' Jimmy informed them.

'And these people, the cured ones, how do they fair during pandemics?'

'For the most part they'd be immune, but certain diseases will need extra protein and short-term hospitalisation. What would kill a normal person would hit them like the flu.'

Chase said, 'So if all police, military and public officials get an injection ... they'll not be at risk in the pandemics?'

‘Correct. The danger for you is that the drug companies develop an early version of the stem cell booster and sell it to old women with wrinkles, and men that wish to look younger. If that becomes cheaply available you’ll have an obesity problem, and people will live longer – drawing civil service pensions and costing you a fortune.’

‘We can’t deny the benefits of a breakthrough like that,’ Chase argued.

‘True, but adjust your retirement age when you do it, because sixty-five year old men will be as fit as forty-five year old men – and you’re committed to pay pensions till they die. You would see someone working from twenty to fifty-five, then living another seventy years on a pension.’

‘We couldn’t do it,’ the British PM agreed. ‘We have a shortfall now.’

‘And if the poorer nations got hold of it?’ Jimmy posed. ‘A shortage of food would be caused by a population explosion, followed by famine and war. You solve one problem, and create another. You may not like it, but population growth will be a serious issue that you will all have to face in the decades ahead. Growth in Africa can be sustained, because most of its land is not being used. South America will see huge numerical increases, so to India and Asia. But China will be stable, and European and Russian populations will fall. On the matter of Russia, I recommend that you keep capital punishment.’

‘Keep it?’ the British, French and Germans complained.

‘Yes. We’re not short of people, we will be short of resources and money, and thirty years in prison costs a lot.’

‘Are there things beyond 2025 that we should be planning for?’ the Germans asked.

‘An excellent question, and typically German in your desire to plan ahead,’ Jimmy acknowledged. ‘Yes, there are things to plan for – assuming that we win - and we’ll discuss them at the right time. That time ... is not yet with us.’

Jimmy concentrated on the release of the serum, and warned that its release could be volatile, and that no one should under-estimate the impact of the drug. It would change the world forever. With predictions of great cost savings in western hospitals, and the eradication of certain diseases, the mood lifted. This was proper “M” Group stuff, action that would change the world, and everyone felt more important for being a part of it.

We broke on a high-note, talk of huge financial savings and large populations being affected. For the first time in a while I was looking at the direct benefits of future technology now. Back in the apartment, Jimmy gave me a task, another joint venture with Han; we'd be releasing the drug. Jimmy offered me a few guidelines, but suggested that it would be fluid.

AIDS

A month later, Han and I travelled down to South Africa – through Goma hub - and met with their health authorities. I informed them that we had been working on a cure for AIDS for many years, and we'd like to trial it on those victims that were in its late stages. You could have heard a pin drop. I added that, due to copyright technology, we'd not be giving them a description of how the drug worked. After their initial shock they signed us off to operate out of an AIDS hospice, where the prognosis for its patients was a lingering death; they, us, and the poor patients themselves had nothing to lose. A group of Chinese doctors, plus a few senior doctors from Mawlini, set up camp at the hospital. Day one was interesting, and years later I would look back at how stupid I was being.

'You have a cure ... for AIDS?' our RF medics asked.

'Yes. Jimmy and I funded its research over many years, working with the Chinese.'

They stood and stared.

'You have a fucking cure ... for AIDS?'

I was puzzled by their reaction. 'Not just AIDS. If this works, it'll attack a whole host of germs,' I explained in my non-medical terms.

'And it'll help late stage AIDS patients?'

'It'll cure them, not help them,' I corrected our staff.

'Cure ... late stage AIDS patients? Paul, there are thirty million people dying from AIDS in Africa alone, and no fucker has a clue as to how to cure it.'

I shrugged. 'We do. So one injection for each patient, plenty of protein and water, and monitor their condition.'

'Paul, do you realise what you're saying?' they gasped.

'Just do it, and let us know the results.'

We left them with that, and I was being naïve. I had spent years knowing the future and dealing with time travel, so it was not easy to see breakthroughs like this from someone else's perspective.

I made a mistake.

Landing back in London, Han and I were met by the media. The news had leaked. Well, the news had not so much leaked, as spread like wildfire amongst Rescue Force. Since they often had journalists embedded with them it had reached the hacks and snappers. I made a line straight for them, Han slipping by unseen.

After a million camera flashes, and a lot of shouted questions, I waved my hands and asked them to be quiet. The first question was, 'Paul, have you developed a cure for AIDS?'

'We hope so. It's under trial at the moment in South Africa.'

'Does it work?'

'We'll know in a month, but other test subjects were cured.'

'Completely cured?'

'Yes, completely cured. Now, I have no more than that till the trial is complete and the doctors give us the OK.'

'How much did you spend on it?'

'We spent a lot of money on it, as you can imagine, and worked with the Chinese and other governments.' I forced my way through, the police now helping. Back at the house, I found a mountain of faxes and a million emails, not quite understanding the reaction. In the diner I found Jimmy. 'The bloody press are going crazy,' I complained.

He nodded. 'It's an important breakthrough, not least for those infected with it. It'll be an interesting few months.'

I accepted a tea from Cookie. 'I got a question.' Jimmy waited, and I glanced over my shoulder. 'If we cure a lot of Africans, then won't that put pressure on the population growth curve?'

'First, we won't cure everyone; it would be just about impossible to produce enough of it, and to get around to them all. Second, we need Africa's population to jump up and then stabilise; remember, we need a lot of consumers. Third, a few things down the road will thin out the population a bit. One of my main reasons behind wanting its release now ... is to reduce healthcare costs in the western world, so that money can be spent on a few other things I have in mind.'

He sipped his tea. 'The problem with western healthcare, is that the leading edge of technology is always moving along quickly – too quickly. If someone invents something that extends life by a year – just a year, then the patients want it and the damn hospitals adopt it.'

If a drug eases suffering, but costs a fortune, the hospitals must have it. A bed is not a bed, but a £2,500 bed that must meet the latest protocols. And the drug companies are making a fortune out of us taxpayers. If unchecked, western healthcare will bankrupt the western world.'

'How will the drug companies react?' I knowingly asked.

He lifted his eyebrows. 'We'll need to tighten security.'

'Oh.' I didn't like the sound of that.

The next day was Shelly's first attendance at a nursery/junior school, the school located just a few miles away, and a private school that Jimmy had said she would attend. Sat in the headmaster's office, I lifted a sheet of names: Portia, Trixy-Belle, Dizzie, Siobhan, Victoria, Rupert, Gladstone. Christ! This was a posh private school, and I felt out of place. We had more money than the parents of all the other kids combined, but we were not 'blue blooded.'

The headmaster stepped in with a lady teacher. 'Sorry about that. So, this is Michelle, yes?'

'The one and only,' I said, a hand on my daughter's shoulder. 'Although her younger sister may follow in a few years.'

'Well, we're happy to accept your daughter, but you said you had some *issues* to discuss?'

Helen glanced at me.

'Given who we are, and the publicity we suffer, we'd like to offer you a few security enhancements – and we'd pay for them of course.'

'Security? Such as ... what, in particular?'

'We'd like to pay for additional CCTV cameras for you, and a few guards dotted around,' I explained.

'Well ... we've not had any problems up to now,' the headmaster delicately complained.

'We have ... specific threats against us, so we'd either need your help, or teach the kids at home.'

'I see. Well, unobtrusive cameras could do no harm, and I'm sure that the other wealthy parents would not mind such a measure.'

'And a man sat behind them, another at the gate,' I nudged. 'They'd be police officers.'

'Police officers? You ... can arrange that?'

'Yes. And before you ask, the officers dropping her off and picking her up would be armed.'

'Crikey,' the headmaster let out. 'Well, er, do you wish to look around the school?'

‘No, we’ve done our research, we’re happy for her to be here.’

We left Shelly in their care, our daughter being shy for a change, and arranged to pick her up at 3pm, a car waiting up the road. Helen had given Shelly a good talking to before we left: no talk about the house, or kicking the teachers here in the shins. Driving off felt a little odd, Helen and I exchanging looks; it was our daughter’s first day at school. Wasn’t that long ago that I was shocked at the news of Helen being pregnant.

When Shelly arrived home she seemed happy enough, mention of a few new friends. The next morning she dressed in her new uniform, a few snaps taken, and I drove her to school. She jumped down from the car and ran inside, not so much as a look back.

‘Yeah, you have a good day too,’ I shouted after her, a look exchanged with Karl. We drove off. ‘You do your best for them,’ I reflected. ‘Then they find new friends in school and ... off they go.’

Back in the office, Helen asked, ‘She OK?’

‘The little bugger bound out the car without even looking back.’ I settled behind my computer.

‘She’ll be fine,’ Jimmy commented from behind his screen. ‘And the news just hit about early successes of the AIDS trial in Africa. So you two are on press detail for a while.’

I led Helen to a lounge and found Han, and we made plans, to both handle the press and to roll out the trial.

‘Helen?’ a voice called, a woman in the doorway, smartly dressed and attractive. ‘I’m Trish, your new assistant.’

‘You have an assistant?’ I asked my wife. ‘I don’t even have an assistant.’

‘You have many assistants,’ Han pointed out. ‘I am one of that honoured group.’

I wagged a warning finger at the cheeky bugger, Helen greeting her new assistant. I went and found Jimmy. Talking quietly, I said, ‘Helen need an assistant?’ He just stared back. ‘And you know her, she’s OK?’ He held his fixed gaze. ‘She’s not in the know, yes?’ He did not answer. I stood. ‘It’s been good talking.’

Helen and I, and her new assistant, drove over to Mapley and fired up the video conferencing equipment. We called the BBC back, they’d been nagging, and made a lengthy statement about the successes of the drug. That done, Helen and her assistant created a press release and fired it off around the world as I met with Bob Davies.

‘A cure for AIDS?’ he asked. ‘Where the fuck did that just pop-up from?’

‘We’ve been working on it for years,’ I said, and that was basically true.

‘You spent a lot on it?’

‘Of course. And the trial has gone well.’

‘Late stage AIDS patients recovering? Fucking hell, Paul.’

Doc Graham stepped in and sat on the desk. ‘So why the fuck did you keep all this quiet?’

‘Had to test it first. Didn’t want to give anyone false hope or get the press worked up,’ I lied.

‘If you sold it...’ Doc Graham posed.

‘We’ll try and cover costs, but we didn’t do it to make a buck,’ I said.

‘When will it be available?’ Bob Davies pressed.

‘We’re going to offer it at Goma hospital first - to check it out carefully - because over there we can’t be sued. And the South African trial will now be expanded to include a lot more hospitals.’

‘African times has been running the story every day,’ Doc Graham informed me. ‘So has every African TV station. If it works... Jesus, the implications, especially for Africa.’

‘While I’m here, send twenty doctors to Goma hospital for the trial; kind of straight away. I’m having the drug shipped there now. Another twenty to go to Kinshasa to trial it there.’

I had made a plan, but I had not thought it through, and was about to feel the heat. Back at the house I asked my dear lady wife to issue a statement to the African Times, indicating that paying clients could trial the drug in Goma. Jimmy was there when I made the instruction, but offered no comment, no words of wisdom, nor any complaint. The blue touch paper had been lit, well and truly lit.

A few days later, middle-class Africans began flying to Goma on our nice new aircraft, their flights subsidised. They checked into the hospital and paid a modest \$250 towards the drug and their short stay. I then received a call from the head on our airline; they had more people wanting to fly to Goma than we had planes. Thinking it a matter of logistics, I told him to hire additional pilots and fly at night, making better use of the aircraft. A few days later the man was back on. Even flying at night we had too many people trying to fly. I agreed for him to lease additional aircraft and pilots.

That led to the hospital officials calling me direct, and shouting down the phone. They had beds for three hundred – already full, a queue of two hundred people at the door, more calling ahead. I told them to grab beds from Forward Base, and from the Army, and informed him I would arrange more doctors.

I called Mapley. ‘Bob, get me another twenty doctors at Goma hospital, and fifty nurses. Don’t care where they come from, just do it today.’

The facilitators at Forward Base called, reporting a near riot outside the hospital. I sent in the Rifles, unarmed, to keep the peace. And the facilitators reported that we had taken half a million dollars already, all in cash. I told them that the money was to stay with the hospital. The next day a few white faces turned up at the hospital; Europeans. I checked with the hospital, and it turned out that they had flown down. Scratching my head, I went and found Jimmy.

‘People are flying down from Europe to Goma to get the drug. I’m charging \$250 to cover costs, but what do you reckon?’

‘That the trickle will become a flood.’ He held his gaze on me.

‘Oh. Then ... we ask the airlines to put on more planes.’

‘Planes carrying late stage AIDS patients? Hmmm, the crews will love that. Plus the odd law about people not well enough to travel ... not being allowed to travel.’

‘Well ... those that are early stage could fly.’

‘And the rest?’ Jimmy posed.

‘I’ll give it some thought,’ I said, wanting to handle this by myself. I discussed it with Helen, then got on the phone. I ordered two new 747s on ten year leases, and asked our airline to find African pilots and cabin crew, all of whom would get the serum – plus extra pay and many assurances. The airline technicians at Goma were ordered to receive the 747s, to add our typical paint job, and then to remove some of the seats to make room for wheelchairs and stretchers. I asked Bob Davies for twenty RF staff for the flights, labelling them as medical flights, and got a license from the British Government.

When ready, we announced it to the British and European press, pricing the tickets at just over cost price. The first flight left from Gatwick, the second from Munich, both full. Despite the press coverage, the press did not wish to take the flight. Doc Graham, however, did, and set-up base in Goma Hospital, in charge of the advanced trial - as well as riots and shortages. He took one look at an apartment block about to be completed and grabbed it, additional beds moved in, RF staff turning up en mass. The sick, and their families and escorts, were allocated an apartment each, charged a modest rental fee by our property management company.

Over the next week, RF staff injected the dying, and observed the miraculous transformations. And some of the first Europeans to have travelled down were now flying back out on regular flights, not

standing out from their fellow passengers - other than their huge smiles. A few had even stayed for a quick holiday at our safari lodges.

Reading the reports, I ordered other apartments made ready in a hurry, beds brought in. Some apartments offered nothing more than a bed or two, but the sick and dying didn't care. By the end of the second week we were housing some fifteen hundred people in apartments, close to three hundred RF nurses in attendance. Then the next problem hit. AIDS patients from the States were jumping on the subsidised holiday flights from JFK. When it became known, some tourists cancelled rather than sit next to an AIDS patient. I immediately imposed a rule: no one on a flight without a safari booking, or valid reason to travel. Without realising it, I had inadvertently damaged our holiday trade.

Hardon Chase was soon on the phone, frustrated because he could not rush through a trial in the US; it would take two years at least. Without meaning to upset him, I suggested a trial in Mexico or Cuba. It did not go down well, so I consulted with the oracle of knowledge that was Jimmy Silo.

'Go ahead and run the trials in Mexico and Cuba,' he said. 'It's the end result that matters, not US law and procedures. I'll talk to Chase.'

I gave it some thought, then rang the British Prime Minister and explained the situation. He offered to try and arrange a trial here as fast as possible, and would consult with the French and Germans. But, since the technology behind the drug would not be released, he was not hopeful of a speedy solution. Han and I discussed the situation and decided to roll out the drug in Mexico and Cuba. And Jimmy, he admitted that he wanted the US public and lawmakers to re-examine the FDA.

With the release of the news about Mexico, US citizens headed that way, and not halfway across the world. Our tourist flights started to recover. I settled into a routine, now in charge of the drug use, as well as my other duties, and was kept very busy, concerned when we were called to Shelly's school one day. The headmaster was apologetic for calling us out, but was concerned. He displayed for us drawings that Shelly had made in class; they were astonishing in their detail. He listed off her ability to speak some Chinese, Russian and French, and delicately suggested that she may be autistic.

'We've had her tested,' I told him. 'We were just as worried. But the expert says that she's very bright, but not autistic. And as for the

languages, we have Chinese, Russian and French people living with us. She's grown up with them.'

'Well, we have to check these things. We must be aware of any special needs –'

'She doesn't have any,' Helen insisted. 'She's just very bright.'

'How's her swimming?' I asked.

'Another ... unusual set of observations,' the headmaster delicately broached. 'She won the races, all of them, and beat girls a few years older by swimming underwater ... whilst they swam on the surface.'

Helen and I exchanged looks. 'I'll talk to her,' I said. 'Ask her to swim on the surface.'

The headmaster stared back, wide-eyed. 'Oh. Right.'

'We have a pool at the house, and she leant to swim at two years old,' Helen explained.

'Ah, that might explain it. Parents and teachers evening next week if you're available.'

'We'll be there.'

In the car, I said, 'What the fuck is she going to be like on school sports day? Track events?'

'We'll have to talk to her,' Helen said with a sigh.

At 4pm Shelly arrived home with two other girls in uniform, bringing them into the office, a woman trailing them.

'I'm Portia's mother, Gwen,' the woman offered, Helen and I shaking her hand.

Shelly led her friends to the pool, so we led Gwen to the diner, teas organised. And this was odd. It was my first time chatting to another parent, a parent of one of Shelly's friends. We had an instant affinity, and common purpose, soon chatting about schools and curriculum. Did we want Shelly to learn French or German? Gwen had been quite awe-struck by us, but when Jimmy came in and sat she went all wobbly on us, blushing. He informed her of a dinner party that Friday night, and invited her and her husband, plus the parents of the third girl. Half an hour later the girls burst in with wet hair, bags dumped down, and sat at the counter and asking Cookie for ice cream and pancakes.

'Lots for them do here,' Gwen noted, glancing over her shoulder. 'I understand you have a gym, as well as the pool.'

'It burns off the calories after pancakes,' Helen suggested.

The Prime Minister stepped in, tickling Shelly, and ordering food and drink from Cookie as he joined Jimmy. Gwen returned to her previously wobbly state. When I managed to chat to the PM about

the drugs, he hinted at Holland; they would co-operate. The Dutch had always maintained lax drugs laws, cannabis legal, but they also just happened to sit geographically between Britain, Germany and France. I got to work, and contacted the Dutch authorities after Jack had informed me who to talk to. I asked for a drug trial to be run there straight away and they readily agreed, the French and Germans already having discussed it with them.

I found it all a bit odd, why those other countries could not trial it, but arranged the Dutch trial in detail, burning the midnight oil. Their first shipment arrived from Beijing two days later, the news released. The net effect was the cancellation of flights to Goma by Europeans, and a mad rush to Holland. Every hotel room in Amsterdam was booked within twenty-four hours, the Dutch authorities taken by surprise.

Meeting with Han to discuss the drug's roll out, he admitted that his government had been using it for many months, on AIDS patients and others, whether they liked it or not. Drug addicts were forcibly injected, as were prisoners, and anyone with a communicable disease, the results nearly one hundred percent successful. And the cost saving was huge. They had taken to rounding up drug addicts and forcibly injecting them, as a way to stamp out AIDS transmission in the future.

Across the pond I was not popular, not even amongst the sick and dying. I had sent a great many doses to the hospitals on the Mexican border, and the queues heading south were huge, tailbacks ten miles long. Then something even more odd happened. One evening, a drug gang broke into a Mexican hospital and stole twenty thousand doses, soon shipping them over the border and selling them on the black market. Since the drug was not illegal, just not FDA approved yet, there was little anyone could do, the authorities not too fussed on chasing down the dealers. An injection sold for between \$200 and a \$1,000, a bargain considering what it meant to the people who needed it. It gave me an idea, and I didn't bother to consult with Jimmy, I wanted to handle this myself.

I shipped a hundred thousand units to the hospital that had been raided, and told them to sell the drug for \$50 a vial. People purchasing the drug for themselves soon bought boxes of the drug and took them back, customs officials clueless as to what to do; the drug was not listed as illegal, and people claimed that they were for their own use. The drug dealers also bought boxes, bulk discounts applied for at the end of a machinegun, and the vials all ended up north of the border. And the funds created? I ordered the Cuban

medics to perform as many operations as they could free of charge, using the money earned.

With the last batch of drugs disappearing inside of a week, I ordered up more, the TV news full of it. I waited for a call from Chase, but none came. Curious about my lack of a kick in the shins, I went and found Jimmy and confessed all.

He listened, seemingly unconcerned. 'If, and when, the drug is produced by US drug companies, it will cost the US taxpayer a lot of money. You've circumvented those drug companies, and negated much of the cost to the taxpayer, which is what I wanted. Keep it going till it slows up. And in case you hadn't noticed, the same is happening in Holland. Sykes arranged for vials to be stolen, and his friends in low places are selling them around the UK. At the end of the day we want people cured, we don't care how we get to that point. And in Europe, as in the States, it'll save on medical bills. The medical community now knows that it cures Hepatitis, TB, Herpes and a variety of other things - and treating someone for those diseases in a British hospital costs hundreds of thousands of pounds. We've now got doctors secretly injecting people late at night, nothing on the records. One simple injection saves half a million pounds in treatment costs, at least. Someone dying, and taking a year to die, costs the taxpayer a million or two. I aim to shave ten-percent off the UK health budget, more for the States. And those cured ... can return to work and pay their taxes like good little citizens.'

'And the deal with the Chinese?' I asked.

'They got it ahead of anyone else, and they're enjoying the cost savings. They're also using it like a weapon with addicts; after being injected the addicts don't enjoy the high, and typically either kill themselves with overdoses, or go cold turkey. And they have millions of addicts, many more than they would admit to. They've also injected their soldiers and key officials, millions of them. They're all now immune to future threats.'

'Should I ship more to Holland?'

'Definitely. More the better, young man,' he commended.

There was more trouble ahead, and I was still being naïve. A few days later a US TV show displayed "before and after" pictures of a man, a minor celeb' that had been injected. The price of the drug on the black market rocketed, the stocks running out at the Mexican border.

Now Chase called, not least because of gang related deaths at the border. 'Paul, we're rushing through a piece of legislation, and the

FDA will co-operate. We've got the data from the trial in Africa, and we think we can just about get away with it.'

'Don't you need a few years - to see if patients remiss?' I posed.

'Normally, yes, but this is too important, so we're bending a few rules. Our batches are not ready yet, so we'd like some of the Chinese batch sent over.'

'I'll check stock levels. Email me the details of where to send it. But there is one thing I'd like to know: how will it be charged for?'

'It'll go through the public hospitals to start with, that was my deal with the Democrats.'

'I'll get you a batch as soon as I can,' I promised.

As soon as I had hung up, Helen grabbed me and led me outside. 'We're late. Apparently.'

'For what?'

'Shelly promised that we'd go around to her friends for dinner.'

'Oh. OK.'

We drove out the top gate, avoiding the press at the main gate, and to a small estate on a hill overlooking the town of Monmouth. I knocked the door and waited.

A woman appeared, tea towel in hand. 'Paul, Helen, come in.'

We wandered inside, glimpsing our daughter lying on the floor and playing a board game with two other girls. In the kitchen we were introduced to other parents that we already knew, soon stood with drinks in hand.

'So how's this AIDS drug panning out?' a man asked.

'So far, very well,' I said. 'Releasing it was always going to be a problem, a bit of a mad rush, but its been crazy. In Mexico they break into the hospitals, steal it, and then sell it north of the border. But I just spoke to Chase and we'll ship it direct to the States now.'

'Chase?' a woman queried.

'Hardon Chase. Grey haired fella in the White House.'

'You speak to him often?' she queried.

'We're not supposed to say,' Helen cut in with.

They exchanged looks, knowing full well there were many things we did not like to discuss.

'You're Shelly is teaching the girls to swim just like her,' they informed us.

'Shelly's style is ... unusual,' I agreed, our daughter swimming like a Dolphin, her hands out front and elbows locked, her legs straight back, and undulating through the water like the Man from Atlantis off the TV. I found myself picturing the guy, Patrick

something, married to the tasty bird off Dallas with big tits, Pamela something.

We waited for the food to be ready, two of the ladies checking in on it occasionally. I got into a conversation about the property business on the Spanish coast with one of the fathers, since we had properties down there, as well as on the Spanish Isle of Tenerife.

During the meal we discussed Kenya and the safari lodges, Shelly wanting to return. I offered to take the whole group, and we threw around a few provisional dates. Shelly was very well behaved in front of the other girl's parents, and I could detect a few new words in her vocabulary. She was starting to sound posh, and I was not at all unhappy about it. Even her table manners were improving, things getting cut up first and not wolfed down sideways. Driving back, Shelly alive with new ideas and things to tell us, Jimmy rang.

'Your parents are here, you forgot.'

'Shit!'

'I told them you had a teacher/parent thing that you could not get out of, and that you were due back earlier.'

'Thanks. Be back in ten minutes.' I hung up. 'Shelly, darling, Grandma and Grandpa are at the house, so we need to tell them we've been to a parent/teacher meeting, OK?'

She nodded, and I exchanged shrugs with Helen, both of us overlooking their arrival. Shelly greeted my parents quickly, fortunately still in uniform, before we told her to attend her homework. The next morning, a warm June Saturday, my father took Shelly fishing, and I found myself observing them from a distance, thinking about the relentless advance of time. I was forty-three, and I couldn't decide if I felt my age or not. The stems had kept me young, but they did not alter your mind or your memories, and those memories pegged my age for me; I was married with two growing kids, talking with other parents about school curriculum.

A phone call brought me back to the here and now. A new website had appeared, this one labelling Jimmy as a time traveller who had brought back super-drugs from the future. Oh, shit. Sykes, and Petrosi at the CIA, had tracked it down, only to find that it was hosted in the Middle East and beyond their influence. I emailed the brain trust kids and they attacked it, but the web designers had anticipated that. They swapped urls every thirty minutes, hundreds set-up in advance. They also bombarded the world with emails about Jimmy and the new drug, email attachments offering a lot of information, most of which was true to some degree.

Jimmy's unofficial biography had been published years earlier, and he had a hand in its editing. He looked like his brother and father, and his family and school-day friends had been interviewed. No one really believed that he was anything other than himself. Jimmy was not that fussed at this latest hiccup, and said an odd thing to me. 'If you're going to fall off a wall, reduce the height of the wall first.' He had said the same thing to Hardon Chase about US dollar levels a while back, and I puzzled it. Was he thinking of going public?

I went and found Helen in our house. 'Some time ago, Jimmy said to me that it was inevitable that we'd be exposed. And ... it terrifies me.'

'You're not the only one,' Helen admitted. 'We have one daughter in school, another to follow. If this got out we'd have no life.'

'I'm not sure how the world would react to it,' I said, heaving a sigh. 'They may like the idea, or may want to string us up.'

'We wouldn't be able to show our faces in public.'

'No, it would be ... difficult. But I know what Jimmy would say – stop thinking about yourselves, see the big picture!'

'He's not wrong; we're talking about World War Three. Shelly would be twenty-six, maybe with kids of her own by then.'

I hugged my wife. 'Yes,' I whispered. 'We're doing it for them, and their little webbed feet.' Problem was, I was still terrified.

Jimmy gave a recorded interview the next day, and made light of the website claims, again suggesting that he would go back to the days of disco if he could travel through time. Unfortunately, his interview had barely finished when a group of eminent doctors and biologists got together and made their own statement, suggesting that the AIDS drug was like nothing seen on this planet. I stood in front of the TV, hands in pockets and wanting to arrange a hit squad. But Jimmy was ready for them. I just wished he had warned me the earth was about to shake.

The next day he gave another recorded interview, to explain the drug. 'Back during the Cold War, various countries experimented with biological warfare. The Russians came up with a drug that made use of the bodies natural defences, but don't ask me how – I'm no scientist. That information was leaked to The West, but the drug was found to be unstable. It had remarkable qualities, but was difficult to implement. The Chinese then picked up on the technology, from a Russian source that sold it to them in the 1980s. I got involved because of my interest in Africa, and the AIDS

epidemic there. When I heard about the Chinese research I offered funding, on condition that I could buy the end drug at reasonable rates and use it in Africa.

‘Fifteen years ago the Chinese had a breakthrough, as much by accident as anything else. That success was leaked to the CIA, who’ve been experimenting with it all along. Many years ago we tried the drug in Africa, injecting AIDS patients without their knowledge; and it cured them, it cured them all. We experimented with the drugs potency, and finally had a version of the drug that was cheap enough to mass-produce whilst at its best potency. That’s the drug that has swept the world; it cures AIDS, even late stage AIDS, and could act as a vaccine.’

He took a breath, and time stopped. ‘We’ve also found that it cures TB, Hepatitis, Herpes, Dengi Fever, Malaria and a whole host of other diseases.’ The interviewer just stared back, dumbstruck. Jimmy continued, ‘We’ve been experimenting with Cancer patients, and so far we enjoyed a ninety-five percent success rate curing cancer with it. I’m certain that, within a decade, this drug will cure all diseases currently known to man.’

The interviewer just sat there when it was his turn to speak. He, and the rest of the world, held its breath.

I stood with my hands to my face, staring wide-eyed at the TV, Helen stunned, Shelly not understanding the problem with Uncle Jimmy on the TV. ‘What ... what has he done?’ Helen and I exchanged looks for a good thirty seconds, before slumping down, too stunned to speak.

When I had recovered, eventually recovered, I walked around to the house, my head still spinning. I found Jimmy in the diner with Han, Ivan and Michelle. I slipped down. ‘What have you done?’ I whispered.

‘Deflected attention away from us,’ he calmly began. ‘The Russians get the credit, and tomorrow they admit to designing it. China gets some credit, and the money from sales at the moment, and tomorrow Petrosi at the CIA will admit they knew about it for fifteen years, getting previous administrations some heat. Everyone will focus on them, not us.’

I forced a breath. ‘You said you’d cut the US healthcare bill by twenty percent, not a fucking hundred percent! You trying to put the world’s doctors out of work?’

‘Some of them, yes,’ he said with a grin. ‘You know, I wasn’t planning on making that statement for almost six years. I must be getting adventurous.’

‘The news...’ I began.

‘Will rock the world back and forth for a while, yes.’

I didn’t sleep that night, and neither did Helen; we stayed downstairs watching the news as it evolved around the different time zones. The CIA admitted their knowledge of it, and Hardon Chase made a statement, basically saying that they could not get it to work effectively. Russia claimed the credit, but China stated that it was their scientists that did all the hard work to perfect it. And not a single person on the planet believed that Jimmy had brought it back from the future. Unfortunately, every sick person on the planet now wanted some.

Karl dropped off the newspapers when he picked up Shelly for school, and we scanned them, the first ten pages covering nothing other than the wonder drug. The PM tipped us off about his statement, and we watched him live on the news an hour later.

‘Given the extraordinary properties of this drug, we will rush through the licensing of it, and move quickly ahead with large scale tests in this country as quickly as is practical.’

I met Han later, and he reported that just about every country in the world was trying to purchase it from the Chinese. China was selling the drug at a modest rate but, considering how much money it saved, it was a bargain. The People’s Republic stood to make themselves a trillion dollars, but Hardon Chase didn’t care. He was buying it at \$25 a vial, an injection saving him probably a hundred thousand times that much. His cost saving would be around \$200bn a year to start with, and this was a politicians dream - a cut in the largest part of public spending. Pie charts would have to be re-drawn.

Trying to digest what had happened, and the magnitude of it, I took a walk around the grounds, the day glorious, not a cloud visible. Stood staring into the brisk river, Rob the dog handler joined me.

‘OK, Boss?’ he asked.

‘A bit stunned, actually.’ I stroked one of the keen dogs.

‘I just seen it on the news; it’s fucking incredible. You must be popular.’

I slowly turned my head. ‘Huh? Popular?’

‘Yeah, all those people cured.’ He led the dogs off on their patrol, and I realised that I had been focused on being exposed. The drug had already saved tens of thousands, now it would save tens of millions.

All these years, all the problems, all the hiding of the truth, they suddenly seemed insignificant. If we did nothing else, then we had advanced the world and saved a lot of lives. My faced smiled all by itself. It didn't matter any more, even if we were all killed tomorrow. It didn't matter. I headed back, walking slowly through the grounds, and they had never looked better. The sky had never been more blue, the breeze more pleasant. I remembered Jimmy's speech to the UN in Hong Kong, all those years ago, his idea of a connection to the planet, to the earth itself. Well, what we had just done made me feel like I was now on first name terms with mother earth.

I sat in the office for a while, but I couldn't think straight. I grabbed Helen, and then pulled Lucy out of nursery class, and went for a walk, just the three of us. We strolled around the lake, Lucy chasing dragonflies, Helen and I hand-in-hand. It had been a while. Above the lake we lay on mown grass and watched Lucy play with Rob's new Alsatian pup, the rest of the world somewhere else at the moment.

I made a call, and ten minutes later the "M" Group members joined us via the golf carts, Cookie laying out a cloth and placing down strawberries and cream. Jimmy joined us five minutes later, and just lay down, not saying anything. Lucy jumped on him, and used him as a seat as she ate ice cream, letting the pup lick her fingers.

An hour later we were still there, just chatting about all sorts – but not about work. Jimmy stepped away a few times to take calls, but did not trouble us with the detail. It was as if no one wanted to spoil the moment. And when the PM's helicopter landed no one bothered to get up. Our illustrious Prime Minister and his aides walked up past the lake and joined us, offered the last few strawberries.

'Problem, Mister Prime Minister?' Jimmy asked him, squinting against the bright sunlight.

'A lot of out-of-work doctors, if you call that a problem.'

'No,' we all said.

'The cost saving will be huge,' he admitted. 'But we will have to make people redundant in the years ahead, so we're planning for it now, and slowing recruitment and training. A lot of unhappy people, some mixed feelings.'

'There's no pleasing some people,' I said.

'Health Service has been inundated with people asking about the drug. They've left their phones off the hook.'

‘Your first batch of a hundred thousand vials will be here tomorrow,’ Jimmy told him.

‘Tonight, I believe,’ the PM said. ‘And heavily guarded.’

‘How will you prioritise it?’ Helen asked the PM, fiddling with a daisy.

‘Terminal cases first, youngest patients. Then early onset cancer.’

Jimmy idly mentioned, ‘It doesn’t work if someone has a large tumour or cancerous lump.’ Easing up, he led the PM away, chatting as they strolled back towards the house.

That evening, the news was still full of the same story, the various shipments from China being awaited like a drug addicts next fix, the aircraft being filmed landing. Doctors in Holland were filmed explaining their successes with a variety of diseases, South African doctors being interviewed and relaying their dramatic successes with AIDS patients. They had also cured people with TB and Hepatitis. I was waiting for someone to claim it cured male-pattern baldness and premature ejaculation.

The only dampener on the whole thing came when Chinese doctors admitted that the drug was filtered through live pigs. That ruled out the Muslim world, and I wondered it was deliberate. We stayed up late again, transfixed by the news, but slept soundly that night. The next day we drifted back to work, deleting emails by the thousand, binning faxes, and returning a few hundred calls.

Rescue Force Kenya took delivery of twenty thousand vials and travelled down to Nairobi, distributing it to the hospitals in a well-advertised move. I didn’t now if we could have been more popular there, but I guessed we could squeeze a few more percentage points. The next “M” Group meeting of world leaders was due, in Paris, but Jimmy had delayed it. He asked them all to deal with the immediate issues, to make assessments of impact – and the all-important cost savings.

All that week we were never far from the TV, people previously diagnosed as terminal giving interviews, the medical world amazed. They filmed the children’s wards of various cancer hospitals, not least because they were emptying out. It touched Helen and me, and we held hands when the story was being relayed. After everything we had done with Rescue Force, these were direct and tangible benefits of our work – and on a grand scale.

Three days later, Gwen – the mother of Shelly’s friend, called and asked if we could come up; someone wanted to meet us. We jumped into the car with Shelly and Lucy, escorts in tow, and slipped out a side gate, still a small crowd of reporters and spectators

there, but less than the front gate. We lost the cars following us on a country road, the police slipping in and halting the traffic, allowing is to proceed on alone. Above Monmouth, we pulled into Gwen's house, a few other cars already there.

Shelly ran forwards and opened the door, disappearing inside as we held Lucy's hand and walked in. They greeted us in the hallway, all smiles, and we followed them into the lounge. A new couple stood there with their son, as if posing for a family photograph, each parent with a hand on the boy's shoulders.

Gwen began, 'This is my cousin, David, and his wife Jane, and their lad Dave Junior.'

'How you doing?' I asked, shaking their hands. Helen repeated that gesture, the couple just standing there and looking stunned.

Gwen added, 'David has something to say.'

'Thank you for saving me,' the lad formally announced.

'Sorry?' I asked, turning to Gwen.

Gwen explained, 'David Junior was diagnosed with terminal cancer six months ago, chemotherapy not an option. Six weeks ago they took their son to your safari lodge in the Congo, the Rift Valley. A ... final holiday.'

The father cut in, 'While we were there we heard about the wonder drug, so we queued up at that hospital for two days, sleeping rough, and paid for the injection.' He glanced down at his son. 'Doctors say he shows no signs of cancer now.'

Helen went all weepy and wobbly, kneeling down and hugging the lad. I just stood feeling really damned awkward, cursing our host under my breath.

'We didn't invent it,' I quickly explained. 'We ... just paid for some of the research, and the trials in Africa.'

'And without it we'd be without our son,' the wife laid on me, making me feel even more uncomfortable.

The hostess made us tea and we sat, and I steered the conversation towards the safari, asking the lad which animals he liked. We used the excuse of Lucy's bedtime to get out of there, and I was glad to get back into the car.

I blew out. 'God that was awkward.'

'Hits you when you meet people like that - what Jimmy's done. The scope of it.'

'Yeah, well we had the world at our door before all this. From now on it'll be even more difficult. Should we pull *you know who* from school?' I asked, Shelly puzzling the coded references.

'Well ... no, not unless absolutely necessary.'

At the gate I spotted a group of Japanese tourists. ‘What the fuck are we, a circus?’

‘Paul, not in front of Shelly.’

The next day we requested our Agusta helicopter and flew over to Mapley. Greece was suffering wildfires and we would dispatch Rescue Force.

‘Awake, Bob?’ I asked as we entered.

‘Fucking hell, Paul. We aint getting any work done; whole fucking world asking about the drug! And may I take this opportunity to say ... fucking fucking hell!’

Jimmy stepped in. ‘Grab the comms officer, when you’ve finished swearing.’ Bob called the man, who once again attended his computer screen. Jimmy instructed, ‘I want British, French and German units to deploy to Greece to help with the wildfires. They can drive down. Use the Supplementals as well, but no one outside of Europe.’

The signal was dispatched.

When Doc Graham stepped in, Jimmy said to him, ‘Crusty is predicting a quake in Peru in August. Make some plans, but let Cuba take the lead. And no, you can’t go. Run it from here.’

‘Can I go to Greece?’ Doc Graham testily asked.

‘For a few days, sure. How’s the sprog?’

‘Fine,’ Doc Graham responded.

‘Bring the baby to the house,’ Helen suggested. ‘If you can get through the gate.’

‘We’ll fly in,’ Doc Graham joked. ‘An escort of Rifles.’

We caught up on the gossip, answered questions and agreed budgets and deployments, Mackey coming over to discuss training at the base. Two hours later we flew back, and I figured we bought this helicopter a few years too soon. Now it may be used more often.

Paris

When it came time to attend the next Paris “M” Group meeting we drove up to Heathrow in the early hours, through tight security at the rear of the airport, and boarded the waiting Air Force One, the British PM already aboard for the short hop across to Paris. The “M” Group representatives at the house had travelled over the day before,

aboard a private jet. Now we sat with Chase and the PM, discussing the many features of the famous Presidential aircraft as we took off, Jimmy pointing out a few features of the plane that even the President was not aware of.

En route, we discussed NATO matters, East European countries, strategic areas of the world for the years to come, and how western armies could be shaped most effectively.

‘You’ll never get away from fast jets and aircraft carriers,’ Jimmy told Chase. ‘The boys on the hill will never allow it. They’ll see Russia and China as threats for a long time to come. And, to some, extent, your navy is a great asset. As I said before, you have two great big oceans between you and the rest of the world. Your armour could be scaled down in favour of mobile units and infantry, but you have a few years yet.’

‘What medical cost-savings are you figuring on?’ I asked Chase.

He tipped his head and lifted his eyebrows theatrically. ‘They keep revising them up - every damn day! Assuming we get as much of the Chinese serum as we need this year, and produce our own next year, we’ll knock half a trillion off the medical budget over three years.’

‘That’s a big number,’ I noted.

‘Start putting money aside for a disaster,’ Jimmy told Chase. ‘You’ve got nine years.’

Chase slowly nodded to himself. ‘Was thinking about a few tax cuts.’

‘Sure,’ Jimmy agreed. ‘It’ll boost the economy. But also put some money aside for that disaster, or it’ll cripple your successor. Hide it in the military budget for ... emergencies.’

‘How does the release of the drug affect your interest in health insurance companies?’ Chase asked.

Jimmy glanced out of the window. ‘I wasn’t planning on releasing the drug for almost seven years. I changed my mind.’

‘Why now?’ Chase puzzled.

Jimmy took a moment. ‘The drug, and its effects, will cause a few problems of their own around 2025, but will save a great deal of money before then. That money saving can be used for many things. It’s a bit like getting to 2025 well prepared, but with only enough energy for a short fight.’

‘Is that ... wise?’ Chase posed.

‘The year after 2025 is the important one. That’s make or break, not the following decade.’

‘What adverse effect will the drug have on 2025?’ Chase puzzled.

‘A baby boom, starting the year after next. They’ll all be twenty-five in 2023, many born to former druggies, and not raised well. When you help good people, you also help the idiots.’

In Paris, we travelled in the motorcade around to the Presidential Palace, the new French President stood waiting, the man surprised to find Shelly the first out. At least she didn’t kick him; school was having a good effect on her. She even greeted him in French with a curtsy. After posing for a photograph we met the others inside, the same room that we had used previously. Han introduced me to a new face in the Chinese party.

‘Your sister is a goat,’ I told him in Chinese.

Embarrassed for me, he turned to Han, who explained it away at poor pronunciation. The various delegates chatted away in small groups, drinks in hand, and Jimmy got around to them all, enquiring after their families, and the various long flights to get here. He even managed to get a smile out of Ben Ares. At his designated seat, he called, ‘Ladies and gentlemen, politicians, and hard working aides. Please be seated.’

We waited as they settled, notepads made ready, prepared notes taken out. As usual, I sat at the table with the leaders, right hand to Jimmy, Helen immediately behind me.

‘The first order of business is obviously the wonder drug, and the profound effect it is having on the world, on your governments, and on your health budgets.’ Leaders smiled. ‘To answer a question – I had intended only to release the drug for use with AIDS in Africa, not indicating the fuller effects till later, many years later. But, knowing some of the problems that we will face in the next few years, I decided to be bold, and to try and get the maximum benefit of it now.’

‘A little while ago, meeting with the nice man from the White House, he asked me how we could accelerate the process whereby Africans become consumers earlier – rather than later. He then made a rather large investment in those areas of Africa where I have some influence. The release of this drug ahead of time is a parallel move to that, a way of accelerating the processes I had planned. I have asked all of you to consider the implications of cost savings from the use of the drug, with a view to asking you to invest some of the money saved into projects in Africa, thereby making consumers of them much sooner. I will not try and bully anyone over the amounts -’

‘Hah!’ Chase let out, causing a few smiles.

‘- but I will leave it to you. I may suggest a few figures. In particular, I am interested in railways across Kenya, Somali, and road projects across the Congo, south towards Zambia, and hydro-electric projects that you may wish to be involved with there. I would also appreciate investments in Zimbabwe.

‘OK, coming back to the drug. What is not known to the world yet is that its generic properties will cure a very wide range of diseases, far more than are currently realised. There are no side effects, and its potency is limited - someone bitten by a poisonous snake would probably still die. You will find that your doctors will experiment with it, and that none of them will fully understand it, not for a decade, and that people will start to wish to be inoculated with it. If they are inoculated they will avoid catching most of the diseases they could be exposed to, although boosters may be necessary for some diseases. But, if people know that they cannot catch a sexually transmitted disease, they will be less inhibited, and more pregnancies will follow – a lot more.

‘It’s fair to say that those sexually transmitted diseases will reduce in time, and start to disappear, and the world’s population will be healthier – more or less. Unfortunately, all diseases are adaptive, and they mutate, so there is no knowing what’s around the corner. This drug may cure them, or make them worse. And let us be clear about one thing: if this drug was available to all poor countries in quantity, the population explosion would cause great problems. It may sound harsh, but the availability must be managed. If you don’t wish to be that harsh then you can, of course, feed the people of the world and bankrupt yourselves.

‘So I say this: make the drug available for the worst cases, for emergencies, and not to be used as an inoculation yet. And *do not* flood the poorer nations with the drug.’

‘Are we included in that?’ the Indians asked.

‘Yours is a country of contrasts: some very rich, many very poor. How you deal with your own people is your choice. But I will be asking the other nations, the richer nations, not to make the drug cheap for you, because if widely used you’ll have uncontrollable population growth. The drug has benefits, it also comes with penalties. If, in Great Britain, everyone had access to it, then people would live longer – not dying from disease – and the state would have to pay pensions for longer, a serious burden on a country with an old population.’

‘But we would save on health costs,’ the British PM noted.

‘For the first few decades, yes. Then you would get used to the adjustments, and still spend more money than was prudent – just on other things. All of you would be wise to put the health savings away into pension funds, because people *will* live longer, and there will be more of them.’

People took notes.

‘OK, future events – near future events. Next year there will be a serious flood in Myanmar. That will be followed by a serious quake in China. I ask the Chinese to consider allowing in foreign Rescue Force units to show solidarity - peace and harmony amongst the nations represented here. We will then have to consider Georgia. I would appreciate it if the European Union and the United States would look into the matter before its too late. My advice is to leave well enough alone. Next, US elections.’ He focused on Chase. ‘Will you be standing?’

Chase took a moment, taking in the faces. ‘I aim to ... yes.’

‘Then you will have my support, as far as that influence goes.’

‘It goes very far,’ the Indians noted.

‘You’ll endorse me publicly?’ Chase asked.

‘Yes, very publicly,’ Jimmy emphasised.

‘Will there be a shopping list?’ Chase asked. Faces creased.

‘Yes. Shelly and her school friends wish to stay at the White House.’

Everyone laughed.

‘Be wiping the crayon off the walls,’ I cautioned.

The French put in, ‘We’d like to try and find a solution to the Middle East crisis.’

Oh dear, I thought. It was going well up to that point.

‘There isn’t one,’ Jimmy told them. ‘Because the nice man from Israel does not want peace, he wants victory. And why shouldn’t he desire that, he outguns the Palestinians a million to one, and has the every amenable United States to back him.’

‘There will be no solution in the years ahead?’ the French pushed.

‘None that I am aware of,’ Jimmy responded. ‘There will be continuous conflict, ebbing and flowing like a tide, then a gradual turn away from Israel by its friends, followed by economic crisis. Their future is a long and painful struggle.’

‘It’s very good of you to share that with us,’ Ben Ares quipped, not looking happy.

‘Is there a solution?’ Chase asked.

‘Of course, just not the will to implement it. And I will not be getting involved until my good friend across the table needs a boat to evacuate on.’

‘Is there a more practical solution than that?’ the British PM asked.

‘My aim is to wait until Israel is on its knees, then to help, because nothing short of that will get them to talk peace, seriously talk peace, and not just go through the motions.’

‘You’ll let us suffer like that?’ Ben asked.

‘I’m just one person, what can I do?’ Jimmy held his hands wide. ‘You have America behind you, you’re in control of your own destiny, what more do you want? You can’t possibly want guidance from little old me.’

‘You’ll not get involved?’ Chase puzzled.

Jimmy faced him. ‘There are two times to help someone: when they ask for it, or when they are so badly hurt you feel obliged to help. I’m waiting for the later, because only then will they finally listen. And if, before then, they wish to save themselves, they already know what to do.’

‘I’m right here,’ Ben quipped.

Jimmy ignored him. ‘OK, do Russia and China have anything to report on Iran?’

Thirty minutes later we broke for coffee and cake. I brought Shelly in and she worked her magic on the room, practising greetings in many languages, several of them perfect due to a lot of practise at the house. She was even civilised to Michelle and Keely.

When we reconvened, Jimmy started on electric cars, and thumped the table a few times, raising his voice. ‘Oil – limited – going to run out!’

We moved onto an experimental nuclear reactor in China, but one that would have co-operation from all here, a sister reactor planned in Somalia inside of two years. All would benefit from the next generation of cleaner nuclear power stations, technological hints to be provided by Jimmy. That would lead to desalination plants, of keen interest to Ben Ares. When he asked if the use of desalination plants for Jordan constituted helping Israel, Jimmy replied, ‘I’ll help you when you’re desperate, not after you’ve died from thirst. There would be no point then.’

Russia, China and France were putting pressure on Iran to limit its nuclear ambitions, China threatening to half its Iranian oil purchases. They were having some success, not least because Britain and America were not involved. Breaking for the day, we headed off

to various hotels or embassies, meeting up later for a state dinner at the palace. The aides would now work their magic, as well as remove paragraphs, words and commas from communiqués.

The next morning we got into beating up British and American banks, talk of limiting size, and greater scrutiny of risks taken. At the end of the day, Chase had no choice if he wanted Chinese money for bond sales. That evening session was one of the most upbeat we had ever held, many jokes made, all leaders looking forward to massive healthcare savings. And we secured the promise of substantial investments in Africa. A private jet returned us to Cardiff airport the next morning, Air Force One on its way back to Washington.

Jimmy gave me the task of prioritising the investments in Africa, so I figured the best place to think about it was in Kenya, and with a cold beer in my hand. We checked if the parents of Shelly's friends were available, packed a bag and set off a week later. In addition to Cat, we dragged along the nursery teacher that taught Lucy, and her own daughter, so that Lucy would have a friend of her own age.

The other parents found the escort to the airport a bit odd, the room just for us at the airport strange, and the reaction of other First Class passengers a little bewildering. Touching down at Nairobi, we were led off first, just the usual two hundred soldiers to greet us, little more than sixty police officers forming a funnel as we boarded the coach. The other parents were wondering what the hell they had let themselves in for. Our coach followed a police escort, and four hours later we arrived at the golf complex in the dark, no reporters or crowds apparent.

Booked in, we met in the rooftop bar for a few beers and a snack before bed. In the morning we all gathered to have breakfast in the main restaurant, suffering the stares of the other guests, a few photographs snapped. With swimming costumes and beach bags collected, we led the group down to the beach hotel, our Pathfinder bodyguards hovering at a discreet distance. The girls ran screaming across the sand and into the water, Cat keeping an eye on them, as we grabbed sun beds in the shade, soon sat with a cold beer in a warm breeze.

Watching the girls in the surf, I felt very contented, and very relaxed. The release of the drug had been a shock, followed by a growing pride, some relief, and ultimately great wonderment at what we were doing. What Jimmy was doing; I was still Robin to his Batman.

The other parents got over the shock of the airport and soon relaxed, seats moved around so that the ladies could gossip and the men could sup cool beers and talk 'man-talk.' The men had all been scuba diving before, so after lunch I took them out, finding the damn turtle still there, although appearing a little old and slow these days. Returning toward the beach, an elephant swam over the top of us, an usual sighting for any diver. At the dive centre, Steffan and Lotti now off enjoying Cuba, we poked the wall chart of local fishes and asked about the elephant fish, taking the piss at length.

Returning to the families, I noticed Shelly on the back of the older elephant, the animal now in the shallows. She stood up and confidently dived off it, surfacing some thirty yards out. She was growing too quickly, and I wanting to stop the clock. Later, the scuba instructors found her a small wetsuit and jacket and took her diving, the other parents not so keen for their girls to try it. I found a snorkel and mask for Lucy and took her out, finding that, like her sister, she had no fear of the water.

At 4pm the beach was hot, the air still - no breeze off the ocean, and most people on the beach were asleep. Even I felt drowsy. Shelly and the girls were under the trees and chatting about stuff that six year olds chatted about. It was just about perfect, and I sat there taking it in, wondering what might go wrong, then chiding myself for being so negative.

That evening we listened to one of our singers, and then strolled slowly as a group around to the next hotel and up to its rooftop bar, the girls peering out at the twinkling lights in the distance. Two RF staff introduced themselves and I vaguely remembered them, from the Mozambique deployment. God, how long ago was that, I wondered.

After some debate, the other men nagged for a visit to Mawlini rather than just sitting on the beach the next day, so I made a call and arranged the Dash for the next morning. After a quick early breakfast we all drove the short distance to Mombassa field, Tubby stood waiting.

'Carry your bags, sir? It's only a dollar.'

'Got a flight suit that fits you yet?' I asked as we boarded. I took right seat, taxied us around and lifted off, not too shaky considering it had been a while. I caught up on the gossip for twenty minutes, then moved back to the passenger cabin, swapping with Sue. When Shelly walked forwards to the cockpit I was curious; she seemed to be pointing out bits of instrumentation to Sue. I exchanged a look

with Helen. Sue moved her seat right back and put Shelly on the armrest, our daughter fascinated by the numerous cockpit dials.

For the most part, the ladies slept en route, and the men glanced down at parched Kenyan countryside. Arriving at Mawlini, Tubby did his tour guide bit and detailed the various compounds for our party. He flew us over the oilfields, now some twenty derricks spread out, and turned to the border, illustrating what was left of the refugee camp. On the way back he pointed out the various live-firing ranges, a few Hueys passing underneath us.

On the apron, a line of jeeps awaited, Mac greeting us. 'Had the ten dollar tour already then.'

'You weren't kept waiting, were you?' I asked, feigning concern.

'Aye, I was, your majesty.' We mounted up, our Pathfinder bodyguards joining their colleagues in jeeps at the rear. 'You're in a house down the road, there's a big one empty.'

'How many bedrooms?' I puzzled.

'Eight, I think.'

Mac drove us out the gate, turned south and soon entered the estate where he lived, turning right this time and to a large house with neatly mown lawns, sprinklers working and creating mini-rainbows. The girls ran straight for the sprinklers, shrieking and running away when wet. Four locals walked out and helped with our luggage, our party soon in the cool white marbled interior of the house, the patio doors opened. Shelly stripped to her pants and plunged into the inviting blue pool, the other girls soon following, Cat keeping a watchful eye over her charges.

On the patio we sat in the shade, cold drinks bought out, and caught up on the gossip with Mac, the others fascinated by Rescue Force work. Cassie was still here, she and Anton at odds about where to live – still. Dunnow was visiting with a group of Huey pilots, Ratchet and Spanner involved in the airborne exercises. I was jealous. The men folk wanted to play with the boys-toys at the base, the ladies happy enough to sit here all afternoon, so we left them and drove back. On the apron I found Dunnow, hugs given, insults exchanged. He was about to take off, a quick sortie to a firing range, so we caught a lift. The doors were clipped open, safety harnesses employed, and my guests perched with their feet dangling as we lifted off, soon skimming low over the sand, a roar and a breeze. I was now very jealous. At the range we blew up a sand storm as we touched down, spare ammo unloaded by the Rifles as I led my guests forwards.

I spotted Skids and closed in. 'What boys-toys you got?'

He glanced at my guests, and led us to a range, beckoning soldiers over. He handed Gwen's husband a grenade, waving down the soldiers. 'Pull the pin, throw hard towards that target, then duck.'

Gwen's husband pulled the pin and threw. When the rest of us hit the dirt he figured he should as well. The blast washed over us, loud without ear defenders. Standing, and dusting down, we could see a few jagged cuts in the target.

'Not bad,' Skids commended. 'Thing about a grenade – you don't need to be too precise. Grenades are not selfish creatures, they're happy to give everyone a piece.' He made ready an AK47 and handed it over to the same man, correcting the adopted stance. 'Finger on trigger, gentle squeeze.'

A burst of rounds flew out, the muzzle climbing.

'OK, now do that again, but hold it tighter – expect the rise.'

A second burst of rounds flew down the range, less movement of the muzzle this time.

Skids put the weapon onto single shot. 'Single shot: squeeze - release, squeeze - release.'

Gwen's husband put ten rounds into the target, the next man firing another ten. We all accepted weapons, moving onto fresh targets, and lay down, firing carefully aimed shots. Making safe the weapons and walking forwards, we inspected our handiwork. Skids then showed us to a brick wall, a target placed behind it. Standing back, he fired at the wall. On close inspection we could see no holes, but the target was shredded.

Skids explained, 'If you duck behind something solid, and get shot at, the force of the round goes through and chips off bits of concrete or brick, and that hurts a tad if it hits you.'

We moved on to a breezeblock wall, another target placed behind it. This time the rounds went straight through.

Skids said, 'Never duck behind a breezeblock wall. Even if there were two of them, you'd still be hit. And most houses in the UK are fucking breezeblock.'

We stepped up to a jeep and accepted cold drinks, Skids relaying war stories from his days in the SAS, the men keenly attentive. They had read the book about Scorpion Base, and were fascinated when Skids drew a map in the sand and explained his part in the battle. I explained my role, on the control tower with the snipers, before Skids drove us back, a cold beer enjoyed in the NCO's bar in the Rifles compound. Many familiar faces came across and said hello, and we reminisced about battles, dust and heat, and some dodgy flying.

As the sun hit the far horizon, creating my favourite time of day – complete with amber glow – we drove back and found the ladies making dinner. I explained that we'd make a formal tour of the base the next day, to inspire the troops. Over dinner, I brought up the subject of the new money to spend in Africa, my assigned task.

Gwen's husband said, 'Schools. If the people are better educated, they don't need us, do they.'

It set me thinking, and the thought would not leave me. After the meal, with the girls playing a board game in the lounge, I sat on the patio with a cold beer and stared into the night sky and up at the stars.

'Penny for your thoughts,' Helen said.

'Hmm? Oh, just thinking about the new budget for Africa. Schools are a good idea but, well – it's a big old area, Africa.'

'Then we should create teacher training colleges, and they go off to teach in the towns and villages when qualified.'

I nodded absently. 'Doing that already at Ebede, and the Congo.' I grabbed my phone and called Anna. 'Anna, how many kids opt for teacher training?'

'Many wish to do it, but difficult to find jobs afterwards.'

'And if we paid them, but they taught around Africa...?' I asked.

'We could produce five hundred teachers a year. Many former pupils come back, asking about jobs.'

'Hire them, all of them, I have a new budget. Anna, I want as many teachers as you can produce, at Ebede and the other orphanages. We'll sponsor them, they can go and teach in the towns and villages.'

'I'll call back those that are seeking work. Where should I send them?'

'Anywhere that they're needed. Start with Kenya, the Congo, Tanzania, and work outwards. Hire a co-ordinator, please.'

'And the budget?' she asked.

'I have a spare billion or two, don't worry about the cost. Bye.' I hung up and faced Helen. 'Teach the teachers, send them out to produce more teachers.' I called Jimmy and told him, and he agreed it was a good idea. He then hinted at water.

'Water?' Helen queried.

'Water ... clean water for people to drink?' I considered.

Gwen's husband put in, 'We make stand pipes.'

I stared at the side of his head, then glanced at Helen, a secret look exchanged. 'What ... er ... what kind of standpipes?'

‘We used to make them for the building trade, plus pipes. We now produce plastic pipes, but we helped a local charity a year or two back, made standpipes for them to send to villages in India; pumps, simple hole boring equipment. You know, two people stand next to it and walk in a circle, and it digs down to get at the water. It takes a day or two, but there’s no fuel or electricity needed - the villagers do it themselves.’

‘You fancy a trip to the Congo?’ I asked.

‘OK,’ he said with a shrug.

The next day we found the Rifles lined up, and patrolled the ranks like Prince Charles – but without the annoyingly slow voice, questions asked of the men. They marched up and down for us, and Helen and I presented medals, stripes for those being promoted. In the RF compound we observed new recruits performing drills, and issued awards for good years of service and exams passed. We led our guests to lunch in the famous rooftop bar, the gang offered an hour or two in the pool below whilst we caught up on RF work with Mac and Coup. At 3pm we boarded a scheduled 737 full of RF and UN staff, and landed at Goma hub just over an hour later, the sun setting.

The airport concourse bustled, Africans still flying in for treatment at the hospital, and the hotels were packed. So we stayed at Yuri and Marko’s penthouse apartments, our lofty perch affording us a view of the airport lights in the distance, and the brightly lit boulevard below. For the first time here I noticed a lot of yellow taxis darting about, no idea where they came from, perhaps Goma town. The next day I arranged for a coach and escort for the gang, for a visit to the lake, whilst I took Gwen’s husband to the local plastics factory – without explaining why.

After a quick inspection of the facilities and machinery, I asked, ‘Could you make your standpipes and water drills here?’

‘Sure, all the right equipment.’

‘If I gave you a factory like this, only bigger, could you run it for me?’ I posed.

‘Well, I have the business in the UK keeping me busy,’ he delicately mentioned.

‘This would make you more money, a lot more. Basically, the raw materials are a tenth of the cost in the UK, labour costs very low, and I’d be giving you a very large order.’

He thrust his hands in his pockets and made a face, pursing his lips as he blew out. ‘It would be done through my UK business?’ he finally asked.

‘They’d be the parent company, you’d send down a few staff with the right knowledge.’

‘How many units would we make?’

‘How many villagers are there in Africa?’ I countered.

‘A lot, I’d guess,’ he said with theatrical emphasis. ‘So, you’d buy the pumps, wells, and filtration kit ... and give it to the villages?’ I nodded. ‘Be a worthwhile venture as well,’ he admitted. ‘OK, I’m in.’

We shook. ‘You start as soon as you get back. I want as many as you can produce.’

At the lake we found the rest of the gang, photographs being taken of Pelicans, and nudged them aboard the coach, soon on the way north and to the nearest lodge. We stepped down from the coach to a commanding view of the troublesome volcano, a wide valley of savannah stretching out before us, a variety of grazing animals conveniently on display for the paying guests. The manager rushed out in a flap, not expecting us, and I put him at ease; we were only here for lunch.

The lodge rangers brought out a Cheetah cub, and the girls knelt down in a circle to stroke it. When the cub’s mum came out on a lead they shrieked, hiding behind their parent’s legs. The mother Cheetah flopped down, panting in the heat, and allowed the nervous girls to stroke it, many snaps taken of mother and cub. It turned out that the cub did not belong to the Cheetah, but she tolerated it anyway. The rangers offered bottled milk and the girls fed the cub in turns.

This particular lodge was close to civilisation - to Goma and the nearby villages, but it offered one of the best views of the Rift Valley and the distant volcano. With the staff moving tables around for us, we sat on the bar’s veranda for lunch, enjoying the view.

I pointed at the valley. ‘Tectonic plates divide right there.’

‘This an earthquake zone?’ they asked.

‘No, these plates don’t cause earthquakes. Most do, these don’t, because we paid them off.’

‘But that volcano did blow?’

‘Yes, it blows quite regular – in geological terms,’ I explained.

I ordered the Dash for the morning, and we deliberately flew over the volcano, no ash clouds for Tubby to fly though this time, along the north end of the lake and across Rwanda to the southern tip of Lake Victoria, landing at the grass strip at River View many hours later as we continued on our magical mystery tour.

At the larger of the two lodges they now housed a variety of cubs and, after booking-in, the girls were kept busy with furry balls of fun to stroke and feed. The others in the group had already heard about this particular lodge, and now appreciated the views from the rooftop bar, binoculars provided. When I spotted a large pair of ears I suggested to the women that they try the east view, soon a scream let out as a giraffe's head came over the wall, a huge pink tongue displayed. With a larger lion cub being brought out, I dropped to the floor and held it, soon getting cuts on my arms as the damn thing tried to eat me alive. I had missed this, and made a mental note to have more "me" time.

The weather held, and we enjoyed five days of safaris, the girls enjoying the abandoned offspring of many local species, including orphaned elephants. They rode on tame ostriches, on elephants and zebra. All in all it was a great holiday for the girls, and I found myself thinking - that I was thinking like a parent: we were here for the kids, not for us. Still, I got to play with the cubs as well.

Back in the UK I went and found Jimmy upon our return, and detailed my ideas and plans.

'Good ideas, but not what I had in mind.'

'No?'

'No. If you feed a hungry man, he'll be hungry tomorrow. Give him a fishing rod and he'll catch his own food. Give him a hoe and he'll grow his own crops.'

'You wanna get to the bloody point,' I urged.

'Africa cannot produce goods to sell abroad, the quality is not there, so they sell resources – like ore from the mines. That makes them money, and creates jobs. And that's what Africa needs; genuine jobs, not handouts. If you start with the big cities, and help them to create genuine jobs, then those jobs will filter down to the towns, eventually the villages. Give the villages clean water ... and they'll be poor villagers with clean water. So what? Now, what does a factory in this country have ... that they don't have in Africa?'

'Good roads, rail links.'

'Transport infrastructure, yes. What else?'

'Ready markets.'

'Well, Africa is a big place, lots of people, a growing economy. So the markets are there, you just need to identify them. What else do their western counterparts have?'

I gave it some thought. 'Skills?'

'Yes, training and education – as you intend to tackle. What else?'

‘Finance?’

‘Correct, you win a cookie. A struggling factory in Nairobi can’t get the skilled workers, or the finance, or use the transport infrastructure as well as they’d like.’

‘So we tackle all of them,’ I suggested.

‘That’s a big job. So, what do we have plenty of?’

‘Money...?’ I said after a moment.

‘So create a bank, and put branches in each country, then offer venture capital to existing small businesses so that they can do more of what they do already.’

‘Our own bank,’ I stated, considering it.

‘Create a partnership with an existing Kenyan bank, offer them forty percent of the shares. Or just buy them out. Then put a branch in each town, and offer business capital. And, for certain areas, offer mortgages.’

‘In Gotham City,’ I realised.

‘Yes, for mine workers and managers.’

‘What about the water pipes?’ I nudged.

‘Still a good idea, spend some money, just don’t go crazy.’

‘And the teachers?’ I asked.

‘Can never have enough of them. But again, get them teaching adult literacy in towns and cities first; poor villages contribute nothing to the economy. Start with the cities and work outwards.’

I was deflated as I walked the short distance around to my house. ‘Grumpy Guts shot down my master plan’, I told Helen.

‘Oh, it seemed to fit.’

‘We’re going to open our own bank in Africa and offer business capital.’

‘Ah, well that would have a greater effect on their economy,’ Helen agreed.

I joined Shelly as she downloaded images from her digital camera to the house computer. One caught my attention, and I took charge of the mouse. I zoomed in on people in the background of a shot of a cheetah cub, at the lodge in the Rift Valley. A face seemed out of place, and familiar. The man had been frozen in time, an unfriendly stare towards the back of my head. I printed it off and found Jimmy, showing him the image.

‘Where was this taken?’ Jimmy puzzled.

‘That lodge overlooking the volcano. Seven days ago now.’

‘It looks just like the Belgian who set that car bomb at Skid’s place. But he’s dead. Oliver Hest, his name was.’ Jimmy called Sykes, who ran the name. Oliver Hest had a twin brother, Maurice,

also former French Foreign Legion. Jimmy asked me, ‘Your trip to Goma – it was unplanned?’

‘Spur of the moment.’

‘And this was taken when?’

‘Day after we arrived.’

‘Not enough time for him to get into place,’ Jimmy puzzled. ‘So what was he up to? No bombs have gone off, no shootings?’

We faxed his image and details to the airport and Forward Base, putting him on our most wanted. We rang the lodge in question, but no one of that name had stayed as a guest. One Belgian man had stayed for five days, no record of him at the airport or with the border police. We called Sykes and put an alert out for him around the UK.

The next day we got a call, from the security staff at the hospital. Hest had been a patient. Jimmy and I exchanged puzzled looks, then checked his treatment regimen; he had booked in with advanced syphilis and herpes, and was wheelchair bound. And we had cured him; he walked himself out.

I sent the digital image to all of our contacts in Africa, and Jimmy put Skids on the case. The days ticked off the calendar ... and nothing, no one spotted him. Sykes mentioned that our friend was wanted for minor offences in Belgium, so he exaggerated them and added him to Interpol’s list, plus every UK watch list.

Another week went by and nothing happened in Africa; no explosions, no incidents. Our friend had disappeared, which worried me. A wanted poster was emailed to every lodge and hotel that we had contact with, just to be sure.

Setbacks

Things were going well, the world still talking about nothing other than the wonder drug, all sorts of uses being found for it, the rich taking it for supposed cosmetic reasons, and to act as a vaccine. Wrinkly old women were taking the drug and claiming great benefits. In reality, everyone had a few bugs hanging around all the time, and the drug removed them, making people feel a little better, affording them a little more energy in the mornings. It also had the

placebo effect, in that people felt better from a psychological standpoint, Jimmy amused by some of the claims.

The drugs companies, however, were not so amused, a sixty percent drop in their stock values, people made redundant, research projects cancelled. After all, why look for a cure for cancer when one already existed. I asked Jimmy if the drug companies would come for us, but he said no, since the Russians and Chinese admitted responsibility for it. We were just seen as wanting it for Africa, which was typically philanthropic of us. Jimmy had bet the downside of the drug stocks and the markets, without telling me, and made a killing, a few people at McKinleys enjoying a new villa or two in the South of France.

One man in Holland had injected his sick dog and was claiming that it cured the animal, leaving Jimmy wondering if it could, but doubting it. It would, however, cure any ailment that a pig suffered, and was being tested on sick Gorillas in various zoos. I was amused to see that it did not yet cure male pattern baldness.

Then the first athlete admitted to its use, and got himself banned. That ban was over-turned by the courts, since the drug was not known as performance enhancing. Jimmy had a word with the "M" Group, and any athlete testing positive for it would be banned for life, a way of preventing people with the blood from scooping all the medals. That was another shock that the world was yet to endure, and for the moment any talk of the blood was hidden behind the drug, or variants of it. We were safe from exposure for the moment.

Then one of our planes fell from the sky, a 757, no survivors. The manifest listed over two hundred people on board, a flight from Dar es Salaam to Goma hub. Another aircraft, close to the doomed airliner, reported that it was fine one minute, and in two pieces the next. A bomb. The "M" Group met at the house and an investigation was initiated, Sykes sending down forensic teams, plus men to the airport. We moved a hundred Pathfinders in plain clothes to Dar es Salaam, and I had my eye on Zanzibar.

The next day a series of bombs went off, both on the island and in the city of Dar es Salaam, western interests or oil concerns targeted. A claim of responsibility about the aircraft bomb was also made from Zanzibar, a group with links to al-Qa'eda. That just about sealed it, and we tightened security at all airports. The air crash investigators found evidence of a bomb straight away, the device placed in the forward cargo hold.

At the house, I read the passenger manifest, finding that the flight had held many sick people heading towards Goma hospital, ten oil

workers, and eight American advisors to CAR; geologists. Without consulting with us first, Chase dispatched FBI investigators to see who had killed the US citizens. Before their plane had even landed, two bombs went off at two separate mosques on Zanzibar during Friday prayers, the dead and injured in the hundreds.

Jimmy was despondent, worried about the American reaction to the terror attacks, and the damage it could do to the oil industry in that region. We did not need Zanzibar to become a war zone. He also suspected that the Tanzanians were behind the mosque bombings; they were not about to let anything come between them and their growing oil revenue.

We dispatched sniffer dogs to Dar Es Salaam airport, and bought extra luggage scanners for passengers booked onto our flights. Spending money with a purpose, we ordered up extra scanners for Nairobi and Goma hub, additional western security staff sent down to operate them. We also insisted that all transit passengers have their luggage re-examined at Goma hub, and carefully, the sniffer dogs gainfully employed.

Few westerners related the air disaster with African safari holidays, because where the hell was Dar es Salaam, the Middle East? Kenyan tourism was unaffected, Congo tourism still a little down due to the sick flying in. Overall, we did not suffer any bad publicity from the incident. The Tanzanians took to screening anyone and everyone using the ferries and planes to Zanzibar, internal flights now subject to the same scrutiny as international flights. That led to the next incident. A man on a ferry panicked when he saw the guards searching, so pressed the button. He took down the ferry, and two hundred people, western oil workers now growing fearful of Zanzibar.

The Tanzanians put Rifles at the docksides and searched passengers before they got near anywhere sensitive. They also instigated random road searches, and found something that I wish they hadn't. They had stopped a family in a car; mum, dad and kids. In the boot they found explosives, instructions, and documents. Sykes team flew straight over and pinned the explosives handiwork on al-Qa'eda, Afghanistan, but the encouragement and funding on Saudi Arabia. When the man's home was searched they found more links to Saudi Arabia, and the man's relatives offered up similar leads when they were raided. The Rifles "interrogated" the people, getting the names and details of contacts in Dubai, linked to the Saudis.

The editor of the African Times called, worried about running the story. Jimmy told him to go ahead, but to be accurate and impartial.

‘Which part of *impartial* did the editor not understand?’ I asked when I read the story.

Everyone in Africa now blamed the Saudis for trying to disrupt the Tanzanian oil supply, to their own benefit. They also blamed the Saudis for bringing down the plane, various Saudi missions in Somali, Kenya and Tanzania being stoned, its staff evacuated. And Abdi, he had slapped the Saudi Ambassador about the face and booted his arse onto a plane, the story causing Jimmy to put his head in his hands. He had expected trouble on Zanzibar, we had discussed it and planned for it, but this he considered excessive compared to what should have happened. But our problems were nothing compared to those of Hardon Chase, who was now pressuring the CIA to make the evidence go away. The last thing he wanted was the Saudis blamed for the deaths of US citizens. Jimmy made a few cryptic comments about something called 9-11, but I did not understand the reference.

The Saudis denied involvement, and the British and American Governments played down their link. The Chinese, however, just about threatened a war with Saudi Arabia if such attacks continued. They sent extra coastal gunboats to the oilfields, plus four destroyers, and began to look at re-supplying their rigs from Sri Lanka or Kenya.

When Jimmy took his head out of his hands, he said the time was right. He called a meeting of African leaders in Goma, but only invited certain countries, mostly the sub-Saharan countries. “M” Group security ministers were invited, and we flew down with Sykes and the British Home Secretary, the security tight.

The hotels had been cleared of health tourists, and apartments were made available for leaders, plus a few lodges within a reasonable commuting time. The large conference centre had been used twice already for meetings of the African Union, its central location very popular. It had also been used for various other meetings, including the African Football League, and various meetings on co-operation and trade, an international trade fair run every three months. Now Jimmy had an idea.

The first morning of the meeting, Jimmy kicked things off, managing to speak after a ten minute standing ovation. And that was for just turning up. He invited leaders to say their piece on security matters in the region first, the politicians setting the mood. It was

4pm before they were all done on their opening speeches, not much in the way of practical steps to defeat the terrorists.

When Jimmy got back up, and the applause had subsided, he suggested the expansion of a counter-terrorism unit we already made use of, suggesting that it be called Pan African Counter Terrorism, and that all the nations here commit a few men to it. Jimmy would fund it, of course, and we'd bring in experts from Europe and America. He asked for a vote from the leaders, a unanimous verdict given. The new unit would be based here, at Forward Base, with offices in many countries. Its officers would be granted the right of travel about Africa, and the power of arrest, and would be made up mostly of former and current members of the Rifles. He handed out a discussion document, and closed the session for the day.

Afterwards, as we mingled, Sykes asked, 'How big a unit?'

'As big as MI6, and with teeth,' Jimmy responded. 'Get me twenty former officers that are not yet ready for a pipe and slippers. Then ask the PM for ten current officers.'

'This will grow?' Sykes nudged.

'Yes, and be used for counter-Islamic threats ahead of ... you know what.'

The delegates and leaders hung around for a while, chatting in small groups, drinks served. I greeted Abdi, and asked him if he was practising his diplomatic skills.

'I wonder if I am suited for this work,' he said with a sigh. 'I thank people with a false smile - that I wish to shoot between the eyes.'

'How's your northern border?' I probed.

'They come across, we torture and kill them. It is the game we play. But now they are from Yemen, not so much from the camps in Afghanistan.'

'Is that US Naval base finished?'

'Yes, and a runway nearby. It is good to see the large ships there, but they do not discourage al-Qa'eda. They tell us when the small boats come, and we play our game.' He wagged a finger. 'Some day I will land on the beaches of Yemen and see if they like it.'

'Please, let us know first,' I encouraged. 'Besides, the Yemen Government is fighting these terrorists. You can't blame them all.'

'You have a wisdom that I lack, or maybe my anger defeats my wisdom,' Abdi wondered out loud before walking off.

The diminutive Zimbabwean President squeezed through to greet me, Solomon at his elbow and beaming as ever. We caught up on

tourism, and quickly moved onto the wonder drug, Zimbabwe receiving its first batches not long ago and seeing dramatic results.

‘Mister Silo said he would change Africa, and I labelled it as a dream. I think, maybe, I will eat my words. He is more African than we are.’

‘How are the soldiers?’ I asked.

‘They put their regular colleagues to shame, the occasional fight – which they invariably win, quickly and easily.’

I greeted a few other leaders, all happy to co-operate with PACT, and we got into tourism and the wonder drug. Seemed like half these old boys had already taken it, and their wives, some twice. Back at the hotel we held a mini “M” Group meeting in a bedroom, people sat on beds, some standing against walls.

Jimmy explained, ‘The Rifles are a great force here in Africa, and could be used to push north, but they also need to know who their targets are ahead of time. PACT will be their eyes and ears, both for counter-terrorism and battlefield intelligence. All we need to do is to get them up to speed. Here, in Africa, a few dollars goes a long way, so there are a great many potential spies sitting at every street-corner café, behind the wheel of every taxi, in every bar, and in the mosques. I want each of your countries to send a liaison, and we’ll build up PACT quickly. The legwork will be done by the Rifles, because white folk will stand out in back-street bars. And tomorrow, we’ll see if we can’t upset the North Africans.’

Jimmy and I split up after the evening meal, and we worked our way around the delegates, gently suggesting that a new body may be created, a Central Africa Co-operation Group. Oh, and no Muslim nations would be allowed in.

The next morning, Jimmy again opened the conference, detailing what he thought PACT would need, and which areas it would tackle. He then publicly suggested that a new body be formed, since the African Union was not achieving much for sub-Saharan states. He suggested that he would speak to each leader and poll their opinions, offering this conference venue and free flights and hotel stays for leaders who joined that new body. I was sure that they’d all sign up there and then.

An officer of Sykes’ mob took to the podium and worked the slide machine, reporting what they knew about the bombs in Tanzania, little mention of the bombs in the mosques, which we felt were down to the Tanzanian Rifles, officially or otherwise. The Saudi link was detailed, and the propaganda flowed. Problem was,

we didn't make it up - the Saudis were linked, officially or otherwise.

Security Ministers gave speeches, some discussion of co-operation between the Rifles units, and we halted at 3pm, drinks served. Delegates either stood about chatting in small groups, or sat in discrete groups and whispered conspiratorially. That went on till 5pm, when the various groups headed towards waiting planes, and matters of state back home. Bag searches were intense, more sniffer dogs on duty than there were people queuing up. The planes got away without incident.

That evening, the "M" Group representatives drove to Forward Base, the new building ready for PACT. In fact, it had been ready for many months. It offered satellite uplinks, the latest computers, a forensics lab, many offices, and a command centre with real-time streaming TV news from around the region and the wider world. Two-dozen people already worked in the unit, and ex-SAS and Rifles "hit squads" were on call.

'Ladies and gentlemen,' Jimmy called in the command centre. 'Let me say one thing. In the decade ahead, careers will be made in PACT – more so than elsewhere. It will have a large budget, a very large budget, its operatives enjoying the best of everything. Kindly relay that to your colleagues when looking for people that may be suitable to work down here. Bill?'

A man stepped forwards, a colleague of Sykes; stocky, five ten, late forties.

'This is Bill Chambers, the first acting head of PACT. I've selected him ... because I know how he turns out. PACT will report to me, I'll report to the "M" Group, so let's not get jealous of who runs this show. National section leaders, and departmental managers here, will be recruited as soon as we can find them. Now, in addition to problems like Zanzibar, and al-Qa'eda in Somalia, the group will also tackle any and all small guerrilla groups in Africa, rooting them out and using the Rifles to shoot them full of holes. It will be a large task ... for anyone to undertake.'

We toured the building in small groups, finding that the CIA had already taken up station, plus Mossad and MI6. The Pathfinders had an office - a Captain now in residence, as did the Congo Rifles and our border police. The Somalis had a sizeable team here, satellite equipment from us linking them back to Mogadishu. From what I could see, the facility was just about ready to go. Leaving the building, Jimmy explained that the walls were a metre thick, concrete, and that the windows were bullet proof; a small bomb

would have no effect. Even the office doors were blast proof. Whether the children would get along and play nicely together was another matter.

Back at the hotel, I held a meeting with Kenyan Government and Bank of Kenya, my desire being to create a new bank, this new entity imaginatively called The Central African Bank. They liked very much the idea of venture capital for Kenyan companies, and the Government gave the bank chiefs a firm nudge to co-operate. The papers had been drawn up ready and I signed for CAR Ltd, the ultimate owner of the new bank. I offered not to try and take domestic business away from Bank of Kenya, and explained that it was all about providing business capital. Still, the men from the bank seemed a little reticent, no doubt worried about their own jobs. They went off to create the bank, its headquarters in Nairobi – at least its registration there, its de-facto headquarters here. I had even started the recruitment process.

After the meeting, I met with staff from CAR and some of our facilitators in the corporation here, and signed off the building of bank branches in twenty five small towns in the area, positioned to be near the mines so that payroll and wages could be handled for them. Armoured cars had been ordered, plus specially modified S61 helicopters that would carry cash around the region. A central cash repository was to be built at the airport, used as a clearinghouse for foreign currency. The British PM had leant me a few “chaps” from the Bank of England, and they would sit down here for a few months, ironing out any wrinkles as the bank got started. The bank's first customer would be CAR, followed by the corporation, then the individual mines and the privately operated mines. It would handle a great deal of money, the deposits and weekly movements propelling it to Africa's largest bank within months.

International branch offices were planned for London, Beijing, Moscow and New York. That done, I went for a swim, and afterwards enjoyed a lengthy massage from two Thai ladies that had just seemed to appear at the hotel. And from my room's window I could see fifty yellow taxis, still not sure where they came from. Flying back, I mentioned to Jimmy the Thai ladies and the taxis.

‘Civilisation and commerce will always creep in where there is a need. All you need is to create the right conditions. And the taxis, they were provided to an existing company in Goma, that's now licensed to service the hotels, the airport/hospital run, and the conference centre when it's in use. Can't have Gotham City without

taxi. I've also ordered a sports stadium and football pitch, and a golf course north of the airport.'

'People will see it when they fly in,' I said with a grin.

'It'll be a good course, regular competitions – once the hospital has emptied out. The drug is being shipped to all the African capitals, so the people flocking here will ease up and stop. That just leaves us with some extra pilots and aircraft.' He held his gaze on me.

'Extra routes to the US, I reckon.'

'The Russians will give us a slot, as will the Germans, so both 747s will be gainfully employed on those routes.'

'That was my second choice.'

He gave me another look.

End of year

As expected, the North African states did not like the idea of a sub-Saharan group meeting and excluding them. We didn't care. What's more, neither did the other nations involved. The first full conference was held in October, the leaders curious about the new golf course as it took shape. Po and his family came over, a large side-room set-up for them to showcase the products they made, both in Hong Kong and here in our region. Not wanting a long argument, we gave Po shares in the sub-company that would own and run the golf course and its hotel. The rest of the shares would go to CAR.

The meeting went well, a great many topics to discuss. Oil deals were struck between those that had, and those that had none. Roads and rail links would be extended, sections repaired where necessary. The medical equipment company diverted some of its production away from the States and serviced the nations represented, the cost savings appreciated. PACT was coming along, already responsible for a number of key arrests of terror suspects, and the delegates at this conference were left in no doubt about the benefits of brand Silo.

The two hotels at the airport were now four hotels, the second two built outside the airport fence and aimed at the low budget traveller, one of the hotels a whopper at six hundred rooms. American money had been used. On the second morning I grabbed a

taxi before dawn one day, wanting to see what they were like, my escorts in a second and third, and we drove the short distance to Spiral I, an estate that climbed and circled a low hill that was actually the very old remains of a small volcano. The houses increased in size and grandeur as we circled around, many high walls and guards visible. At the top I found a viewpoint opposite a restaurant and bar, spotting a great many blue pools surrounded by well-tended grass. I could see Spiral II across a small valley, some of its houses still under construction. It reminded me of Beverly Hills. Given that much of it was down to American money, it was appropriate.

The restaurant staff came out to see who the three taxis belonged to and let me in to have a nose around. The balcony offered a view of the airport, the golf course, and in the distance you could make out the lake and the volcano. The restaurant offered a rooftop bar and I climbed up dark wood stairs, finding the upper bar all dark wood, and somehow very African. The deputy manager of the restaurant pointed out houses below and labelled who lived in them. Many I didn't know, but I recognised the names of a few of the African Presidents. Seems that they kept houses here, possibly as an investment.

Back at the hotel I inspected a small branch of the new bank, housed just off the main concourse, and chatted to the staff. Turned out they were kept very busy with currency exchanges and the cashing of travellers cheques, taking that task off the hotel staff. The tourists also drew money here. Since there was another outlet in the airport itself, the tourists were now spoilt for choice.

In December, we returned for the grand opening of the golf course and hotel, all of the various national leaders invited, Kimballa Jnr given the honour of teeing off first. Po went second, his handicap improving, and a quick tour of the hotel confirmed to me that it was a copy of the one in Mombassa. Escaping the crowds, my escorts and I drove around to the factory that was making water pipes and filtration systems, thousand of the completed products stacked up outside and awaiting allocation to an NGO for delivery to a remote village somewhere far off.

I pointed my escorts towards the factory that made bits of medical kit, and found that it was now a complex, not a factory, at least ten times bigger than its original, long lorries coming and going. The manager rushed out with his staff and greeted me, and I inspected charts on walls in his office, all of them pointing upwards. I found nothing to complain about. I thanked them and told them to

return to their work, before wandering through the design section, picking up and examining bits of equipment to see what they did as technicians in white lab coats moved back and forth.

Someone moved quickly, I caught it out of the corner of my eye. I felt the jab in my arm and turned. There stood Hest dressed in a white lab coat, smiling contentedly, a syringe in his hand. He had four guns pointed at his head a second later as the Pathfinders rushed forwards, not sure what had happened.

They were too late.

Whatever he had jabbed me with was already in my shoulder, and I found myself wondering what it was that might kill me. I stepped towards him and glanced at the syringe as the guards held him.

‘You’ll be dead in thirty seconds,’ Hest spat out.

‘At least I won’t have too long to think about it then,’ I quipped, making him frown, and puzzle my attitude. ‘What’s in the syringe?’

‘You’ll never get the antidote in time.’

‘Then there’s no point in not telling me then, is there,’ I lightly suggested.

He stared back. ‘Snake venom. I’ve been keeping it for just this occasion.’

‘Oh,’ I casually commented. ‘And you work here?’

‘I’ve endured this place for months, waiting for you or him to return.’

‘Should I be feeling anything my now?’ I asked my attacker.

He looked me up and down, then at the syringe still in his hand. It was almost empty.

I checked my watch, then considered that my shoulder felt a little numb. ‘What time do you have? Silly me, you can’t see your watch.’ I shifted my weight to one leg and tapped my foot. ‘Should anything ... you know, have happened by now?’

My attacker was most vexed. I tipped my head to the bodyguards and they led him outside, a good minute taken to reach the jeeps.

‘Guess your venom has no effect on me, although I do feel it in my arm a bit.’ I made eye contact with a Pathfinder. ‘Take him to PACT at Forward Base, interrogate him.’ They bundled him into a jeep as I mounted mine. At the golf hotel I found Jimmy and led him to one side. ‘That man Hest, the brother, he just stabbed me in the shoulder with snake venom – fella was working at the medical factory.’

‘How do you feel?’ Jimmy asked, concerned.

‘Fine. Arm is a bit numb at the top.’

‘You have my blood, so you’re just about indestructible. Still, worth taking it easy. Grab some protein and drink a pint or two of water, that’ll speed up the recovery.’

I made like a good patient and stuffed my face, drinking plenty of water. The arm felt numb for many hours, but eventually started to recover, like a gum after the dentist. The Thai ladies helped, and I made sure that they pounded on that arm and shoulder, completely recovered by 10pm.

Bill Chambers then called me. ‘Paul, you OK?’ He did not seem to know about the blood.

‘I am now, was just a bit numb where he jabbed me.’

‘It was snake venom in the syringe...’

‘You know that wonder drug we developed ... well I inject myself regular. Had one this morning.’

‘Fucking hell. I’m going to carry some around with me.’

‘What did he say?’ I probed.

‘He wanted revenge for his brother – he knew that he had died coming for you, and when *your* frigging wonder drug cured him he was mobile again. He’s being working at that factory for months, false passport.’

‘And you all missed him...?’

‘The authorities were looking for him everywhere apart from on the payroll,’ Chambers explained.

‘Lesson to be learnt there,’ I nudged.

‘A bit beyond my authority, but I’ll mention it to the right people. What happens to Hest now?’

‘I think the Congo Rifles should see if they can get anymore out of him.’

‘Oh. Well, gets him out of my hair, closes the case.’ Bill did not sound happy at handing the man to the Rifles.

‘We’re in a war, Bill. Don’t dwell on foot soldiers, or individuals.’ I hung up.

Putting down the phone, I stood at the window of my room, my hands in my pockets, staring down at the yellow taxis. I had just sent Hest to his death, and a very unpleasant death it would be, surprising myself. Just when did I stop worrying about the value of a life? Or maybe it was that I cared more about saving lives, no time to dwell on individuals. We had saved millions, we’d save more, and this was too important to worry about an arsehole like that. No, it wasn’t that I had lost sight of the value of a life, I had a greater appreciation of the numbers game. A million was more than one: I could save a

million, so I'll lose the one along the way. Or many 'ones'. Jesus, I was starting to think like Jimmy.

I found myself wondering about 2025, the African Armies and the battle ahead. Now, for the first time, I thought I could send armies into battle, knowing the costs. I went and found Jimmy, and relayed what had happened, and my feelings, over a cold beer in a quiet corner of the bar.

Jimmy had listened patiently, and now took a sip. 'In Canada, when I first started to come across injured, dead and dying, it was hard. Then I got used to it, and stopped caring for a while, quite I while if I'm truthful. But then my attitude changed. I would give people first aid then see them walking around weeks later, all smiles. That act of saving was like an act of creation: here's something I made. After that, I fought to try and save as many as I could, without worrying about the losses, but I was delighted when I could fix a broken body and see them recover, get up and walk around. I've always liked making things, fixing things, and first aid and medicine was like that; making things and fixing things.

'Releasing the drug early was an act of hope; I was rebelling against my own sense of order and timing. I just wanted to shout it off the rooftop, frustrated with all the sneaking around, doing deals and persuading people. I think part of me just wanted it over. Part of me wants to be exposed.'

'I know how you feel,' I admitted. 'It's a constant stress. I was stunned when you made the announcement, but relieved as hell afterwards. Of all the things we've done, the drug has been the most dramatic: you can actually see the results. And no matter what happens to us its out there, they can't take it away from us.'

'Very true,' Jimmy approved. 'It's odd really, but right now we should be in a small war with the CIA and Hardon Chase, and the Americans should be in Afghanistan. My gamble with Chase has paid off better than I could have ever hoped for, and now the drug is out there, so a great many ticks in boxes. Problem is, now I can't see the future so well because I've altered the time line so much.'

'That's a good thing, isn't it?'

'Good in that things are going well, bad in that I can't see next months assassins.'

'Yeah, well there is that,' I said with a sigh.

'It'll take a while to get back into synch, so I won't be trading the markets as much.'

‘Don’t need to,’ I pointed out. ‘CAR is making enough. I see Zambia has offered us the mining rights to just about whole country. Now Botswana wants a deal.’

‘I like Botswana, best run country in Africa,’ Jimmy mentioned. ‘Don’t need police or Rifles there, you can walk the streets.’

We were soon interrupted by delegates, and spent the night playing politician, never quite saying to people what we really meant.

At the end of the evening, with the mere mortals off to bed, we found ourselves again in the same corner, cold beers.

Jimmy began, ‘I was once captured by the Brotherhood.’

I sat up and took notice.

‘I was held in a camp with hundreds of other prisoners, and conditions were pretty harsh – even with my blood full of stems. They didn’t know who I was, they didn’t recognise me, and when I told them I was a medic I got better treatment.

‘Conditions were harsh, in that they made the prisoners play Russian roulette every day, or they’d hack off a limb for fun. One day a guard took a disliking to me because I was big, so he beat me. When I healed quickly he was annoyed, and nearly beat me to death. In the camp’s hospital I recovered quickly, and he was re-assigned somewhere. But I had taken the decision to do something. I stole the food off the terminal patients and eased their suffering, building up my strength. I ran on the spot, did exercises, practised martial arts moves, biding my time till I was ready. On the final evening I killed four patients with no hope, ate their food ration and made my move.

‘I killed the guard in the hospital hut easily, took his weapon and webbing, spare ammo. I killed the second and third guards quietly, but then got spotted, the alarm raised. I shot dead more than ten, and by this time other prisoners were grabbing the weapons of dead guards and firing back. That gave me an edge, because it caused a distraction as I circled around the guard barracks. I killed the camp commander and his cronies, then picked off the rest one by one. It was dawn by time the shooting finished, probably fifty dead on their side.

‘I grabbed what food I could find, water bottles, and walked out the gate and into the woods. I walked day and night for three days, being careful, and reached a river. I found a small boat, and slipped into the water at sun down, drifting quietly along. It then rained like hell all night, keeping people in doors, and I wasn’t spotted. That river, it took me almost thirty miles overnight. In the morning I grabbed branches and waded to the bank, walking for a day before I

spotted a NATO patrol. They knew who I was and whisked me out of there.

‘So you see, when you consider Hest, and the value of his life, I don’t stop to do the sums. I believe in my own cause, and it’s not a cause to line my own pocket, it’s a cause to save this planet. So if I need to kill patients and take their food for me to keep going ... I will, and I won’t worry about it.’

‘I hate to say it, but I’m edging that way.’

‘Nothing wrong with that, Paul. Nothing at all.’

Back in the UK, the choice of where to spend New Year came up, something of a debate for a week or so. Jimmy surprised everyone by suggesting the Spanish Isle of Tenerife, off the coast of Morocco. No one had any particular objections, and we booked rooms at a five star hotel between Los Christianos and Las Americas - the famous haunt of drunken young Brits. Our IT guy, Gareth, had bought one of the apartments we had built in Los Christianos, and he was down on the Isle with his family.

On the second day, Jimmy drove me to a marina close to the airport whilst the girls enjoyed the beach, the Spanish Police kindly providing us an escort. At the marina we strolled along the concrete sea wall, glancing at boats, Big Paul and Karl hanging back.

‘This is where it started,’ Jimmy reflected. ‘Right here.’ He pointed at the water. ‘I was here when World War Three kicked off, and where it ended a few days later. From here I set sail on the long voyage, and I’m still on that voyage.’ He noticed a boat, and recognised the name. ‘Mind if we come aboard?’

A grey haired man raised a hand to his eyes. ‘Jimmy Silo?’ he gestured us on board. ‘You ... er ... you have a boat down here.’

‘I did, some time ago,’ Jimmy said. ‘You cross over to Gomera much?’

‘Now and then, nice run. But if the winds are wrong you can’t get back in here.’

‘Yes,’ Jimmy reflected. ‘Better to have the wind with you, than against you.’

‘Get the kettle on, mate,’ I urged the boat’s owner.

Part 9

2008

The New Year started with PACT getting involved with the Anjouan Islands, off the coast of Africa, where a coup of sorts was on the cards. The Rifles landed, and the coup was off the cards. Still, PACT and the Rifles rounded up the rebel leaders and seized weapons, a thorough search made of the islands, and the rebel's expensive weapons would be costly to replace. Jimmy ticked a box.

After the death of his father, Jimmy had spent more time with his elderly mother, and she could be seen visiting the house more often, Han always taking the time to talk with her. She had no grandchildren, neither Jimmy nor his brother having families, and loved Shelly and Lucy to bits. Now that she was alone I encouraged Shelly to visit more often. But to say that she was alone was not strictly correct. Jimmy's aunt had become a widow two years earlier and moved into the old house after Jimmy's father had died, along with two cats. The old house also offered a live-in housemaid and cook and five of our security staff, none of whom seemed to mind sharing with two old widows. The lads had their lounge, Jimmy's mum and her sister had their own.

Jimmy's brother had always been a bit of a mystery, and I could count on one hand the number of conversations I had with the guy. He was a year older than Jimmy, lived in Newbury with his long-term girlfriend, and shunned any publicity. He did, however, accept a million pounds off Jimmy towards additional security, and compensation for the intrusive and annoying press attention. He worked in a toyshop that specialised in complex model trains and read a lot. And that was just about all I knew of him.

Sykes kept an eye on Steffan Silovitch, who always used his full name to try and lose the connection with his famous brother. A security camera had been set-up in the shop, another across the road, and the local police knew to keep an eye on the place. He visited their mother every two or three months, and remembered family birthdays better than Jimmy. So far, he had not visited Africa, nor our clubs. No one knew the history between the brothers, and no one dared ask.

January saw the Prime Minister ask for the nutters and tourists at our gate to stay away, and the police erected signs: no waiting. The terrible January weather was keeping most of them away, and the

die-hard kooks were being picked up and moved on by cold and miserable police officers. Cars that stopped were issued a sixty pounds fine, and if they returned, even to slow down, additional fines.

With snow on the ground, and school closed for a few days, we were all inside and staying warm, the kids playing in the main house. Sharon had brought her daughter to the house get some work experience, and I had to stop and wonder how the girl had grown two feet since the last time I saw her. She was now eighteen. When did that happen?

Three days after the daughter had started to attend the office, Sharon approached me before it was time for her to leave, and asked if I thought there was any work for her daughter – proper work. I said I'd discuss it with Jimmy, and found him later in the diner with Michelle, who now qualified as Jimmy's longest running girlfriend, of sorts. It was "of sorts", because Jimmy delighted in annoying Michelle by sleeping with any beautiful actresses he fancied, then telling her about it – in detail. I was jealous, of sorts.

'Sharon's daughter is looking for work.'

Jimmy gave it some thought. 'In order to be of any use to us, she has to first go visit the empire for a few months, get some experience of the far corners of the empire, then return. Discuss that with Sharon, and devise a schedule where she would work a few weeks at each place, and in each country. Then we'll see.'

'You must already know?' I pushed.

'No, since she was supposed to have died in a car crash a few months back.'

'Ah. You ... altered it.'

He nodded. 'So it's a bit of an *unknown*. Mystery, eh?'

'Adds a spice to life,' I said as I stood. I gave Trish, Helen's assistant, the task of planning a schedule and arranging tickets, and called Sharon at home. She was a little reticent about sending her daughter around the world, but finally agreed. Young Jane would now go on her travels, and I decided that the first stop should be the Cardiff club. She could start with bar work, and work her way up.

The plan had left me wondering about Shelly and Lucy, and what they would do when they grew up. University? Definitely. But then what? Jimmy had said that Shelly would be a marine biologist, and so far it could be said that she had a leaning towards things aquatic. I guessed that they'd have their own ideas by then, and would ignore anything I said. By then I'd be "the old man".

The next morning, Keely presented me a large file, the detailed plans for a new rail link across the DRC, through the other country that was called “The Congo”, joining existing track in Nigeria, and heading towards Liberia and Sierra Leone. I sat with a coffee in the diner and scanned the very thorough document, the plans seeming to indicate a few bridges - quite a few bridges, and four short tunnels. A trunk of the line would even touch Kinshasa.

I had the file sent by secure courier to the Foreign Office, to the people we still housed there. They studied it, and reported that it was feasible, sending the file down to the corporation on the next flight. The corporation studied it for a week and agreed; it was feasible; bloody expensive, but feasible. I presented the figures to Jimmy, who glanced at them, then asked me to make a start, using forty percent corporation money, forty percent US aid money, and twenty percent CAR money; and to release the news it to the press. Since the western press would not be interested in a train line in the DRC, I got my wife on the case, and she sent the details to the African Times. Only afterwards did I think that I should have told Kimballa first, and the Nigerians and others. I just hoped they’d see it as a ‘planned’ new rail line.

I had not put the file down for even ten minutes when Jimmy’s brother stepped in. ‘Steffan? You looking for Jimmy or your mum?’

‘I was looking for you,’ the tall fella explained.

‘You were?’ I puzzled.

‘The shop that I worked at closed and ... Jimmy said you had track building projects that I might be interested in.’

I resisted a smile and composed myself. ‘The tracks we’re building, they’re ... bigger than Horny gauge for model trains.’

‘I have a degree in surveying, with a Phd in train and cargo logistics,’ he flatly stated, stood stooped, his chin on his chest.

‘Ah. Well, in that case you’d be ideally suited,’ I acknowledged, feeling a bit silly. ‘What did you want to do ... exactly? It’s in Africa.’

‘I’ve discussed it with my girlfriend, and we’re happy to move down there.’

‘Oh. Er ... in that case we could make you project co-ordinator, a house in Goma, near the airport. Nice area, safe, lots of amenities.’

‘OK.’ He waited.

‘Right. Well, when did you want to go?’

‘Next Monday. House is up for rent.’

‘That soon. Well, if you deal with Sharon, she’ll arrange the tickets ... and everything else, and I’ll let them know that you’re

coming. But don't forget to arrange shots if you're going to live down there.'

'We need that super drug stuff?' he asked.

'That would do it. One size fits all.'

'I'll arrange it when we get down there.' He turned and sloped off in his size thirteen shoes, and I went and found Jimmy. 'Bit of a turn up, your brother and trains.'

Jimmy nodded reflectively. 'He'll do a good job. And they'll all mistake him for me and salute. Variables in play.'

'Huh?'

'Nothing. Listen, Chinese not happy about us stuffing America full of cheap medical kit - that's their area. So we'll buy some of their kit and sell it at cost price around the States.'

'Won't that fuck off the distributors for this stuff?' I asked.

'Yes,' he said with a sigh. 'But we need to get healthcare bills down. And that complex making the medical kit, I want it doubled by the end of the year, which will please the Chinese ... no end.'

'I was thinking about that hospital in Goma, and the health tourists. What if ... we fill it full of Cuban surgeons and offer reasonably priced operations? Make it ... a centre of excellence in Central Africa?'

'Great idea. Go do it, young man.'

Pleased with myself, I went off and called the corporation, and gave the co-ahead to both move more Cubans to the hospital, and to advertise for paying patients. It then dawned on me that the Cuban Government might not like the fiscal elements to my plan, so I rang the Cuban Embassy in London. They would get back to me.

The next day I got a fax from the nice gentlemen in Havana, happy with the proposed use of their medics, but asking for a small percentage to come back to them. They asked for twenty-five percent, I agreed to thirty. I even sweetened the deal with a twice-monthly direct flight to Havana from Goma hub, on one of our 747s.

This new use of the Cubans had hardly been agreed when they faxed again. How about we roll out the same idea around Africa? Without consulting with Jimmy, I agreed to trial it. I could locate hospitals in Kinshasa, Nairobi, Mogadishu for definite, Zambia, Sierra Leone - where there were still Cubans at the main hospital, and Liberia. And Zimbabwe for sure, Malawi, Burundi would be up for it, and Rwanda. Oh, and Tanzania wouldn't object.

I studied at the piece of paper in front of me and said, 'Oh ... my ... god.' Sharon and Helen turned towards me as I stood and headed

off to find the oracle. He was sat reading a newspaper. ‘When you agreed the Cuban hospital thing, you had more in mind, yeah?’

He lowered his newspaper. ‘Yes.’

‘A rollout to all African capitals, nice clean hospitals with subsidised Cuban medics, our cheap medical supplies, and advertised through the Africa Times.’

Without detracting from his study of the papers, he said, ‘And don’t forget rotations of RF staff, to keep them sharp.’

I faxed back the Cubans and asked if they had enough medics, and how many medics did they wish to commit? They had upwards of twelve hundred doctors they could commit to it, so I informed them that I would roll out the programme in as many capitals as I could. Giving some thought to the commercial considerations, I ordered a new company created, and would allocate thirty shares to the Cuban Government, the rest owned by CAR, the Cubans paid as contractors. Two minutes later I altered my plans and made it fifty-fifty.

I went and found Jimmy, who was still sat reading. ‘Listen, if this model works, and it *will* because we have cheap everything, then how about we stick a few hospitals in South America, where the Cubans already have that programme running.’

‘Yes.’

I stood. ‘It’s been good talking with you.’

I grabbed Helen and Trish, found a quiet corner and we thrashed out a few ideas. The name Central African Medical Services had already been sent to the corporation, but Helen said that was fine; when operating in South America we’d transpose A-African to A-American. Simple. Helen knocked up a job advert and sent it down to the African Times straight away.

A week later we had a list of people applying for administrators positions, most of them British or European, some travelling up from Africa for an interview, a few already working in Europe. The European candidates I liked, because they wanted to “go and make a difference”. The African candidates were looking for work, rather than a calling, and this project was one step removed from good old-fashioned missionary work. At the end of the interviews, held at the club in London, I hired three people straight away. The director for all operations would be British, the Director for Africa would be French, and the Director for South America was of mixed parentage, British and Spanish.

Their first assignment would be to work out of the existing hospital in Goma hub for a month and get a feel for things, and to

create a master plan. They'd then need to locate suitable buildings in each capital, or even have them built. I suggested that they try just Nairobi and Kinshasa to start with, to get the basic model right, and sent them packing with a good budget – not that they needed it.

Getting back to the house I was upbeat, never happier than when I was solving problems or creating new ventures. In my lounge I found Helen with a sour face, Jimmy sat on the sofa, Lucy sat playing with a Gameboy and Shelly sat with a bruised eye. I knelt in front of my daughter. 'What happened, baby?'

'A boy hit me,' she informed me, her bottom lip quivering.

I turned to Helen, who faced Jimmy.

Helen said, 'Jimmy had a word with the boy's parents.'

'Damn right,' I said as I stood. 'And?'

'And the local police have been around,' Helen reported, not looking happy. 'The father has taken his family into hiding.'

'Ah. Well why did the little sod hit Shelly anyway?'

'She threw his ball over the school wall, or some nonsense,' Helen explained, her arms folded. 'Gwen's been on; they're not too happy - they know the family!'

Jimmy stood. 'Shelly's bruise will be gone in the morning, I've told the police I didn't threaten the family - merely hinted how unhappy I was, and I've assured the police that the family is in no danger. Rest is down to you.' He knelt in front of Shelly and kissed her on the forehead. 'All better in the morning, don't be sad, OK.'

With Jimmy gone, I led Helen to the kitchen. 'I would have done something to the little bastard. Boys don't hit girls!'

'They're kids, seven years old for god's sakes!'

'Yeah, well it may have saved my arse by Jimmy ringing the guy. I would have lost it with him.'

She grabbed a dishcloth. 'I want you to ask Jimmy not to get involved in this sort of thing, they're our kids.'

I forced a breath and leant on the kitchen top, locking my elbows. 'They're our kids, and Shelly's part of his great master plan. We can't disentangle ourselves, the world wouldn't let us.'

'It should have been our choice, not his!'

'True, and if I'd been here I'd probably have been charged with making threats.'

'Talk to him, or I will!'

I lifted the phone and asked Karl to come over and watch the kids, leading Helen to the house. In the hallway, I turned towards the pool, and led a perplexed Helen to the basement. Tapping in a code,

I opened a heavy door and knocked the lights on. From under a cloth I revealed the gravestone, and stood back.

‘What the hell is that?’ Helen gasped, pointed at our daughter’s premature headstone.

‘We found it at the funeral of Jimmy’s father; we were meant to find it. It’s a message for Jimmy ... from Shelly.’

‘From ... Shelly?’

‘VAT14 is the message, JDI is your doing.’

‘My doing?’

‘Just ... do ... it: JDI you always tell the girls.’

She closed in on it. ‘VAT14 – JDI. What does it mean?’

‘He knows, but he won’t say.’ I tapped the headstone. ‘Our daughter sent that back through time. And yes, she’s our kid, not his. But if that message makes a difference, maybe even to 2025, then she’s not just our kid – she’s a part of it, an important part of it. Perhaps even the key part of it all.’

I led Helen out of the basement. ‘We have her till she’s too old and too independent to be told what to do, then she belongs ... elsewhere.’ In the house we thanked Karl, and I followed Helen into the kitchen. ‘Just what do you think would happen if we fell out with Jimmy?’ She didn’t answer, and attended the dishes. ‘What would happen if we took the kids, said *to hell* with all this and moved out, bought a little house somewhere and pretended to be normal?’

‘First, our new neighbours would move out, not wishing to be next door to us. Then who’d run the girls to school? You? Running the gauntlet of the press, let alone the world’s terrorists. And in case you had forgotten, this house is his, the clothes on our backs were paid for my him, the money I have in the bank is his.’

‘So we’re prisoners.’

‘I’m not. I like what I do, and I like being a part of it, and I’m in this to the finish. However it got started, we’re in it, and you’re far from bloody innocent; you came here to spy on him. And if you weren’t doing that, what else would you do doing now? Some shit job spying on someone else, and risking your life? Most likely you’d be in prison by now, or dead. Instead you have all this.’

I forced a breath and took a moment. ‘I seriously doubt Jimmy would do anything to you if you wanted to leave, but he’s not the problem. What would the CIA do if you were out there and vulnerable? And if the kids didn’t have armed police guards – then what? Are you willing to put them at risk?’

She sighed. ‘Some days I just want to run away.’

I straightened. 'If you did ... you'd go without me.' She glanced at me. 'I'm staying, right to the end,' I told her, and I meant it. 'I don't always like the idea that I got caught up in this, but I'd rather be in here than on the outside. This train we're on is heading for a brick wall. We can be in the cab, trying to change course, or we can be in the back, completely unaware of when it'll crash; blissfully ignorant.' I took a moment. 'You wanted me to go talk with him. Fine, I will. And you ... you give some thought as to what else you'd be doing if this had not got started.'

In the office, I found Jimmy alone, and sat at my desk. 'Helen's not happy, she wants you to stay out of the kid's lives, at least the kind of crap that happened today.'

'Inform your dear lady wife, my PA, that I have been suitably chastised. And, in the years ahead, when people try and kidnap and kill your kids I'll deal with them harshly, but I'll get written permission from her ladyship first.' He held his gaze on me and waited.

I took a moment, and sighed. 'Do we stay together, me and Helen?'

He turned back to his screen. 'I'm not going to discuss that with you.'

'That's what I figured. And if she wanted out?'

'She may say that, but she won't. Ever.' He looked up. 'It's one thing to look at the fence and long to be over it, but when you get over there you're all alone in the wilderness. And it wouldn't be a very pleasant wilderness for you two; press would never leave you alone.'

'Just for the record, I have no desire to jump the fence,' I told him, fiddling with a stapler.

'I know. And I created this environment to be as pleasant as possible for you and the family. This place, and its facilities, is more about you than it is about me.'

I stood. 'I appreciate it. Just hope that I can make her see that.'

'Paul,' he called. 'I ... got you into this, and sometimes I regret that. You could be a tired stockbroker in London on the tube, but ... but at least you'd have less pressure.'

'I wouldn't swap, you know that,' I quickly came back with.

'I know.'

Back in the house, we got the girls ready for bed, the atmosphere a little frosty. When they were tucked up, and Helen had downed her second large glass of red wine, things were finally back to normal.

Almost. We sat at watched the news, the sound turned down to a quiet background hum.

‘If I wanted to go, you wouldn’t come with me?’ she softly asked, focused on the TV.

‘No,’ I replied straight away, also focused on the TV.

‘And if I took the kids?’

‘I’d still be here. I’d arrange security and money for you, but I’d still be here.’ I took a breath. ‘Back in 1985, Jimmy told me about the future, and the war in 2025, and the rise of the Brotherhood. At first I figured ... it’s not my war, it would be a long way off. Then Jimmy said an odd thing. He said: you can fight them over there, or wait till they walk up the Richmond High Street. Well, my mum lives around the corner from the High Street. So if I go ... out there somewhere and fight, the bad guys don’t land up here. And now that I know where the fight is, I’d rather the fight be over there than here, our kids in the firing line. Well, everyone’s kids in the firing line. So if you go, I’ll be on the front line for our girl’s sake.’

She put her feet on my lap, a peace offering, and I started to rub them. ‘Was a time when I hated the whole idea of kids, and men for that matter. After the car bomb, and being exposed, I was suddenly very lonely and afraid. You know, I actually thought Jimmy might kill me.’

‘If someone pulled a gun on you ... he’d step in the way.’

‘I crawled into *your* bed because I thought that would protect me.’

‘And I knew we’d be married years before we met,’ I confessed. ‘I knew before we went to Africa together. That’s why I put up with you.’

‘Hah! I’m a catch.’

‘Well, you weren’t at the beginning, but Jimmy said you would change after getting pregnant, and you mellowed from hard spy-bitch to a nice woman.’

‘Maybe I’ve gone too far,’ she considered. ‘Lost the edge I once had. I should have rung that guy. Hell, in the old days I would have knocked him down and stuck a stiletto heel in his groin.’

Shelly came downstairs in her Harry Potter pyjamas and fluffy slippers, her eyes moist. ‘I had a bad dream.’

I lifted her onto me.

‘I want Jimmy,’ she whimpered.

After exchanging a look with Helen, I called Jimmy, and he came straight over. He sat in a comfortable chair and Shelly snuggled up,

a blanket over her, soon asleep. We left the TV on, the sound down low, and withdrew upstairs, turning on the TV in the bedroom.

At 6am he was still there, and I woke Shelly. 'Come on, sleepy head, school.'

'It's Saturday,' Jimmy reminded me.

'Is it? Bummer.'

'You're a silly head, daddy.'

Jimmy eased up and let Shelly down. 'Get dressed quick, and we'll have breakfast in the diner, yes?' She ran upstairs. He faced me. 'All well in the marital bedroom?'

I nodded. 'We had a good talk, she'll be fine.'

Jimmy took a moment. 'You'll never know just how jealous of you I am.'

There was little in the way of words to answer that.

The tabloids ran the story about Jimmy threatening the boy's father, but stayed just inside the line where we could start legal action. I called Gwen, she found me the number of the father, and I did the dutiful and apologetic bit – at length. I expressed my concern about his lad hitting Shelly and he was very apologetic in turn. I assured him that he was in no danger and being silly; Jimmy would never have hurt him, it was a great big misunderstanding. The family moved back into their house, having stayed at a relative's house, and things would return to normal. Hopefully.

On the Monday morning I drove Shelly to school, the snow now cleared. She said goodbye for a change, jumped down at the school gates and walked in. But as I observed, she stopped dead, turned to a boy poking his tongue out at her, and slugged him with a right hook, knocking him down. I was out of the car in an instant, running in, teachers closing in to attend the boy, whose nose was now bleeding. 'Shelly!'

She became tearful. 'He hit me!' she said, stamping a foot.

'That was the boy?' I asked, Shelly nodding. I led her inside, and to the headmaster's office.

'Ah, Mister Holton...' the headmaster stumbled with.

I sighed, frustrated. 'My darling daughter just punched the boy who hit her. Nose bleed.'

'Oh my.'

'Listen, I've sorted it with the parents, at least I had done, and now this. I would appreciate it if you'd do the job you're paid for, and sort this all out. They're just kids! I know the people who own this school, and if you can't get this under control I'll buy the school

off them and make a few changes. We on the same page, Mister Headmaster?’

‘I believe we are,’ he reluctantly stated, stiffening and adjusting his black robe.

‘I’ll leave Shelly in your care.’ I knelt and faced Shelly. ‘The boy hit you, and you hit him, so you’re even. If I hear of you hitting anyone else we’ll take you out of school and you’ll study at home.’ I wagged a warning finger at my tearful daughter, and left, more frustrated than angered.

In the office I stopped, and let out a loud, exasperated sigh. ‘Shelly just hit that boy with a mean right hook.’

Helen was horrified, Jimmy not commenting. ‘They’ll expel her?’ Helen asked.

‘I doubt it, but we’ll have to wait and see.’ I sat at my desk. ‘But why don’t you price up some private tutors lunchtime.’

Nothing was said for ten minutes, our office atmosphere like an “M” Group meeting on a bad day.

Independent thought

I scanned a report from Zimbabwe, and their use of US dollars to stabilize their economy. It gave me an idea. I called an expert, without Jimmy knowing, and asked a few questions. That was followed by a discreet email, in fact a dozen discreet emails, to various Africa finance ministers: what did you think of a common economic zone with US dollars as the reserve currency? The result was fifty-fifty, with half in favour, two wanting to sign-up there and then. And why wouldn’t they, their own currencies were used as toilet paper.

I called Kimballa directly and asked him what he thought, hinting that it would have significant fiscal benefits. He was keen, and also had no problem with a parallel currency running. We discussed the new bank, and if it would work in dollars. After the chat, I cheekily called the Bank of England, and got through to the busy Governor, taking his advice at length. A common reserve currency, or a parallel, in the new economic zone would make all transactions easier, and it would control the typically Africa hyperinflation, but would also make the nice man in the White House happy. After all,

the US Treasury could print dollars at no cost, and use them to buy African oil and ore. It would be OPEC all over again.

Concerned that Jimmy wanted to move away from OPEC working in dollars, I went and found him and confessed to my research.

‘The problem with OPEC ... is not that they deal in dollars, it’s that they hold a lot of them, and may drop them. The Africans are far less likely to drop their dollars in the decades ahead. Unfortunately, if they all switched now, then the US economy would get a boost now, instead of in 2017 - when they need it. With the medical benefits we’ve given them, and the wars that they’re not involved with, their economy would rocket, then crash even worse in 2017 – if and when OPEC drops the dollar.’

‘Then when would be the best time to do it?’ I asked.

‘From 2010 to 2015, and in slow incremental steps. Start with our region, and start paying people in dollars. Give them three months warning then pay all our staff in dollars. Some are already paid that way, some in Euros.’

‘It was a good idea, then?’

‘Yes, a very good idea, just a little premature,’ Jimmy commended. ‘Now, you remember what happened with the drug?’ He smiled. ‘Wait for the phone to start ringing. And don’t forget, it was your idea.’

I stood, and walked frowning down the hall, wondering why the phone might start ringing.

The next day Han cornered me, wanting an explanation of this major shift in fiscal policy.

‘It was just an idea to stabilize the currencies of the countries we’re involved with. Did you have a particular concern?’

‘Did the Americans ask for this?’ Han probed.

‘No, it was my idea. We’ve started the bank, and that will have branches all over the region. Besides, it’ll be easier for you.’ I then made an off-the-cuff remark that would have ramifications. ‘You have a lot of dollars; you could buy Africa ore with them, pay wages with them.’

Han seemed to have been hit by sudden realisation, and thanked me, walking off.

‘You’re welcome,’ I said, puzzling his reaction.

I sat with Helen in our house, eating lunch and discussing our daughter. When my phone went it was Hardon Chase.

‘Paul, you at the house tomorrow?’

‘You can’t come around, we don’t have enough milk in.’

Chase laughed. 'Are you there?'

'Yes, no trips planned, we're busy trying to figure ways of disowning our kids.'

'I'll be there for 9am,' Chase informed me.

'Does that mean you're bringing a hundred Secret Service chaps?'

'It does, unfortunately.'

'Will your visit to us, and here ... piss of the Prime Minister?' I nudged.

'That's my next call, he'll meet us there.'

'Where you landing?'

'RAF Fairford – if I pronounce it correctly.'

'I'll get the kettle on. And more milk.' The lined clicked dead. 'Whoops.'

'He's coming here?' Helen puzzled.

'Wants a room with us.'

'What!'

I smiled. 'Just kidding, we'll stick him in the main house. That is what it was designed for.' I walked around to the main entrance, finding a dozen police cars coming up the drive. I was, however, reasonably sure that this was not about Shelly. But not completely sure. In the office I found Jimmy. 'Chase is coming here. Tomorrow.'

He turned his head away from his screen, and nodded. 'Do you know what you've done?' he calmly asked, returning to his screen.

'Not ... entirely. They want to discuss Africa using dollars?'

'And if African nations adopted dollars, and their economies grew as we expect?'

'They'd ... make a buck?'

'They'd ... make a few bucks, a few trillion bucks.'

'Ah. In which case ... we're popular, yes?'

'I told them it was all your doing, and your project. They're coming to talk to little old you.'

'Han was being a bit odd earlier, till I suggested they could pay wages in dollars.'

'It may be *wise* not to discuss that with Chase. Very ... wise.'

'Ah.' I went and found Han, and asked that he keep it quiet, surprised when he was most insistent that it be kept quiet as well. The corridors were full of intrigue, as well as police officers with sniffer dogs. I cornered the senior man. 'Hey, you!' I wagged a warning finger. 'One of our Alsatians is on heat, and I know what

you coppers are like. If she gets pregnant I'll arrange a DNA test, and send you the fucking bill!

'I'll keep an eye on the dogs,' the man said with a smile.

Meanwhile, the headmaster at the school had been doing a good job of making the peace. The nice man then decided to drive around with the parents of the lad, a surprise for us. They crawled along through two police roadblocks, through the gate – eventually – past a hundred armed officers and up to the house, imposing at your first visit at the best of times.

When the gate staff informed me of their arrival I let my head drop. 'Helen, we have visitors; the parents of the boy Shelly hit.'

'Oh Christ! And why now?'

We met their car outside, armed police and dog patrols rushing about.

I shook the father's hand, the man looking terrified. 'It's not normally like this, but the US President is popping in for coffee in the morning.' I gestured them inside, and to the diner, where Han and Ivan sat with Jack. We eased into a booth, teas ordered. 'So, how's school?' I asked the headmaster.

'Well, we think we've ironed out the problems, and the warring parties have shaken hands and said sorry.'

'You should come back tomorrow,' I suggested. 'See if you can't get the Americans, Russians and Chinese doing that.'

'They ... are all coming here?' the headmaster delicately enquired.

'Bit of a pow wow. Actually, we sit and eat and drink, and get nothing done, but it makes the voters think that they're earning their keep.'

The headmaster stared at Han.

'This is Han, from the Chinese Secret Service, Ivan from the KGB, and Jack does our rose garden.'

The labelled men bowed their heads in turn.

We all did the parental apologetic bit in turn, and offered to try and rein in the worst excesses of our kids. It was going well. Then a dog nipped Jimmy on the shins in the corridor, right outside the diner.

Jimmy lifted the heavy Alsatian by the scruff, eliciting a horrible noise from it. 'If your fucking dog bites me again I'll bite it back, then I'll fucking bite you!' he roared at the dog handler. We couldn't see what he did to the dog, but it sounded horrible. He stepped in and ordered a tea, sitting at the next booth, eyeing the parents of the lad. Calmly, he said, 'I'd like to take this opportunity to apologize

for any misunderstanding. As a sign of good faith, I'd like to offer you a First Class trip to Kenya, to one of our lodges.'

The father nodded, still looking terrified, as the senior police officer stepped in. 'I'd like to apologise for the dog, Mister Silo. You ... won't be suing us for millions and millions will you?'

'No, I won't. Relax.'

The officer stepped out as Sharon stepped in. 'British PM be here later, staying overnight.' Jimmy nodded.

'Should my government be here as well?' Han asked Jimmy.

'They are here – you're here. Besides, I would never allow major decisions to be taken without discussing it with them first. Relax, or I'll set the dogs on you.'

We agreed to meet the other parents at Gwen's house in a few days, and escorted them out through the police. They drove off as Sykes arrived in a silver Mercedes, his driver opening the door for him.

'All this fuss for the President,' he grumbled. 'Got a room for me?'

'Ask Cookie or Sharon. I guess the police have grabbed a few, and we don't know how many Chase is bringing.'

'Jack has spare rooms, we'll stay there.'

It took Shelly longer than normal to get home, despite her police escorts, and she asked what was going on. She thought we were in trouble, again, and took some reassuring. All night long the police patrolled around the house, the advance party of Presidential Secret Service arriving around midnight and running their own checks.

At dawn I noticed two small marquees on the lawn, TV crews already in place and looking a bit haggard as our security boys issued them with tea and coffee. I stopped to say hello, a few of the lady presenters looking less than presentable without their make-up. When asked about the President's visit, I pretended that I didn't know.

When they asked if it was a snub to the Prime Minister, I countered with, 'It was the Prime Minister's idea to meet here, away from it all, and Air Force One can land at the US air base up the road.'

I figured the school headmaster would understand, and kept Shelly home; she had official business to attend to. In the diner I met Jimmy and French Michelle. Michelle was now an early riser, and I wondered if she had been injected – but didn't ask. It set me to thinking as I plonked down.

‘With the super-drug out there, what are we doing about Rescue Force staff?’

‘Some have already injected themselves,’ Jimmy reported.

‘Should we not roll out Doc Adam ... to them all?’

‘They’d notice the effects – they’re doctors, but I guess we could hide it behind the super-drug. Yes, tell Doc Adam to widen his programme, but on a voluntary basis.’

‘And today?’ I nudged.

‘Today is your show,’ he toyed.

‘Oh. Well, some guidance would be good. That way I won’t upset anyone.’

‘Treat the subject matter as more of a ... *what if* than a certainty, and take opinions. That’s all.’

‘You want me to chair the meeting?’ I queried.

‘Yes, you need to start practising, young man. I’d say *just be yourself* – but I won’t. Try and be polite for a change.’

Michelle laughed, getting a wagged finger from me as Sykes stepped in.

‘We all secure?’ I asked him.

‘Like bleeding Fort Knox,’ Sykes grumbled.

The PM stepped in with his aide.

‘Sleep well?’ I asked.

‘Great rooms,’ he commended, ordering a coffee before he joined us.

Jimmy faced the PM and said, ‘Chase won’t get all he wants today.’

The PM stared back for a moment, then nodded.

‘What does he want, exactly?’ I probed.

‘Let him ask,’ Jimmy suggested. ‘No point in having a meeting if you all have fixed opinions before hand; these are not Middle East peace talks.’

I headed back and got the girls up. Despite the stems, they still slept a lot, and behaved much like normal kids – apart from kicking world leaders in the shins. I had another shave, changed my shirt, and fussed over what suit to wear. Helen put on her pin-stripe outfit and looked gorgeous, and we checked each other over before leaving the house.

‘Do you know what you’ll say?’ she asked.

‘Not a clue.’ Which was true. We didn’t even know exactly what Chase was after yet. I put the TV on and watched his motorcade winding its way towards us, inconveniencing the locals. We’d be even less popular.

His motorcade pulled in at 8.30am, and it was a good job the house offered a lot of parking space. That free space had been cleared of other cars earlier, most now parked on the grass near the lake. Police helicopters buzzed overhead, and the TV presenters were ready, make-up slapped on, their hair done. I stepped out as Chase pulled up, the cameras now filming live, and got myself filmed shaking his hand as he stepped out of the car. He waved at the press before following me inside.

As we progressed, I quickly got out, ‘We can’t talk alone without a major incident, so the “M” Group representatives need to be in on it.’

‘I figured that.’

We entered the dining room, the others stood waiting, greetings exchanged. Good job it was a large room. It took ten minutes to settle everyone, drinks brought in. Notepads were taken out, the President’s aides making ready, all eight of them. And for this trip he had dragged along the head of the Federal Reserve and his Treasury Secretary. That nailed it; this was about the dollar being used in Africa.

I stood. ‘Ladies and gentlemen, electioneering politicians, hard working aides.’ They laughed.

‘Is it an election year?’ Chase asked, causing more laughter.

‘Yes. Now, I guess that we’re here to discuss African fiscal policy, especially in relation to the dollar, and the proposed future use of the dollar there. So, I’ll start at the beginning, since this is fluid, and moving quickly.

‘We’ve created a sub-Saharan economic co-operation group, and they meet in the Goma hub conference centre. It’s obvious that we wish that group to grow in stature, and for the existing African Union to be less influential. We’ve also created a bank in the region, the purpose being to offer venture capital at good rates to boost business and to help fledgling businesses. It will also help the movement of money around the DRC mining areas. To that end, we have decided to simplify things and pay our staff in US dollars in the region, since the local currencies are ... volatile, to say the least. May I ask, at this point, if other “M” Group nations plan on paying their workers in dollars?’

‘We do,’ Ivan stated.

‘If it is convenient and desirable,’ Han stated, making me puzzle that.

‘We have not discussed it,’ Michelle offered, the British PM saying that it made little difference, but might be easier. They were, however, all certain that it would add stability to wages.

‘OK, in addition to paying wages in dollars, we have – very recently – floated the idea of our region in the DRC adopting the dollar as its official currency. That would simplify things for everyone there, although many transactions are already dealt with in dollars or Euros and outside of the region, bank to bank.’

‘Is it certain?’ Chase asked. ‘Your region will adopt the dollar?’

‘More or less,’ I replied. ‘We still have to finalise it with Kimballa. And, given that our region is – in fiscal terms – a heck of a lot bigger than the Kinshasa economy, they’d surely follow suit. So that would mean that the DRC adopts the dollar, as well as Zimbabwe already using them.’

‘And the other nations?’ Chase nudged.

‘Somali is already in favour, Kenya could probably be persuaded, and the small nations would sign-up straight away. Zambia and Tanzania are considering it.’

‘How keen ... is Tanzania?’ Chase probed.

‘Their own currency is starting to climb against its neighbours, which means that small businesses there are suffering at the hands of the oil dollar. I’m sure they would be interested. Sierra Leone and Liberia are keen, as is Rwanda.’

‘That covers most of Central Africa,’ Chase noted.

‘It’ll be discussed at the next meeting of the co-operation group, which is –’

‘Six weeks,’ Helen put in.

‘Six weeks,’ I repeated. ‘From our point of view, it makes life easier, and should make it easier to trade between nations. But, it will take many years to roll out, assuming that all of the various nations wish to join up.’

Chase said, ‘We’ll be happy to help your bank, to send you a few experts to help out and to build a relationship with the US banks.’

‘Can never have enough experts,’ I quipped. ‘By all means, send them.’

‘Do you have revised estimated GDP figures for the region?’ Chase asked.

Jimmy handed over a sheet. ‘They’re provisional. And I’ve factored in a five year roll-out.’

Chase showed his colleagues. ‘And if we desired to accelerate that process?’

‘We’d be concerned about a boom and bust cycle,’ I told Chase. ‘We expect that OPEC *may* drop the dollar around 2017. Any support you get from African dollars should peak at that time, should it not?’

‘Well, perhaps...’ Chase admitted.

Jimmy said, ‘So we would need to see some measures in place to avoid a boom and bust - to be encouraged to accelerate that process, always assuming that the Africans will co-operate.’

‘Measures?’ Chase queried.

‘I’m sure that the fine and good gentlemen that you brought with you could work out a strategy that means there’d be no dramatic economic benefit, but a smooth curve. Perhaps they could work on such measures today and tonight, and we’d discuss it again in the morning.’

Chase glanced at his people and nodded.

Michelle asked, ‘Will this boost the US economy?’

‘Since your economy is linked, do you worry about it?’ Jimmy asked her. ‘It will brush off on you, as my good habits brush off on you.’

Everyone at the table froze, Michelle staring back.

‘We’re not worried,’ the British PM stated, breaking the tension, people hiding smiles.

‘We’re in favour,’ Dave Gardener put in for Israel, making us laugh.

‘Russia has not decided yet,’ Ivan declared.

‘A stable currency in the region will benefit all,’ Jimmy told Ivan. ‘OK, let’s break for one hour, and I’ll meet with each of you in turn, so please consult with your governments.’ To the British PM he said, ‘You can consult with yourself.’

‘It’s the only way anyone listens!’ our PM retorted.

Fresh drinks were ordered as Jimmy and I led the US delegation to a lounge, security trailing behind. Everyone settled around a coffee table, drinks placed down, biscuit tins opened, ties loosened.

‘So, what do we need to do to get this moving?’ Chase asked.

‘All that’s in question ... is the speed, not the process,’ Jimmy insisted.

‘So what measures?’ the Secretary of the Treasury asked.

‘A control of house price rises, control of personal debt, and no wild spending plans.’

‘We’re Republicans,’ Chase noted with a grin. ‘We don’t believe in public spending.’

‘You’ve cut taxes?’ I asked.

‘Small cuts, yes. A ... health dividend,’ Chase suggested. ‘Insurance premiums are falling, direct pressure from me.’

‘Good,’ Jimmy commended. ‘The world’s health services will need an overhaul. There are, apparently, a few out-of-work doctors.’

‘That’s already causing problems. But, they can’t have it both ways,’ Chase stated. ‘So, if we work out a five year plan...’ He held his hands wide.

Jimmy said, ‘I’d also work out a five year plan, and then you’d print lots of dollars and get something for nothing from Africa.’

‘We want Tanzania,’ an aide put in.

‘No doubt,’ Jimmy quipped. ‘And we’ll do whatever we can to help, we just desire a smooth curve, not a boom and bust. And whilst we’re on that, housing prices are overheating, and your investment bank, Liebermans, is stretching itself. Its bubble will burst, and take down a few others when it does. If you don’t act I’ll cause a run on it.’

They made a note.

Jimmy added, ‘And you could nudge domestic interest rates up a bit, dampening the housing market, or build more low cost units.’

We met with Han ten minutes later.

‘You’ll be able to offload more dollars than they realise,’ Jimmy told Han. ‘And quietly. Besides, if the region grows, then the Africans will buy cheap goods, your goods, over expensive American goods. You can still sell in the Yuan if you wish.’

‘My government will take your advice on this, since they are still analysing it.’

‘Your country is not the problem; an unstable America is the problem, and this will help at a critical moment.’

Ivan had no problem, or opinion, either way, but Michelle conveyed European ‘concern’ over favouring the dollar. We grabbed the President and stepped out to the cameras for a little electioneering, several US news crews now joining their British colleagues.

Jimmy began, ‘President Chase is visiting today ... to once again try and urge me to buy American goods for Africa, and that’s what America needs: you need your salesmen out there selling your goods and fighting your corner. I am sure that, by the end of this session, even greater investments will be made in Africa, because I am fighting their corner. We are also looking at adopting the dollar for our region of the Congo.’

He made way for Chase, who gave a speech aimed at the folks back home, followed by the British Prime Minister sucking-up. The

next photo-op was scheduled for the morning, the press booted out to nearby hotels. That left us re-convening the “M” Group meeting and airing opinions, which led to lunch around the table, and talk of other matters.

Shelly came over, and sat asking the President innocuous questions, such as why did he have so many bodyguards, and so why did people not like him? Then she asked if, when he stopped working at the White House, they would put him in a mausoleum – being careful to pronounce it correctly.

‘Not my doing,’ I insisted as people laughed. ‘Must get it from school.’

Chase told Shelly, ‘They put dead Russian leaders in mausoleums. Former American Presidents make a living by visiting those countries that no one else would visit.’

The various Presidential aides met with the “M” Group representatives during the day, and we all sat down to a working meal in the evening, relaxing in the lounges afterwards as the aides continued to scurry about. At least they did not have far to go, Cookie keeping everyone happy with coffee and tasty bites.

The following day, at the morning session, the Chinese made a statement through Han, wishing to see projected figures and plans. Ivan echoed that, and we got into percentages, but more or less amicably. Chase and Jimmy made another electioneering speech, and announced a few new deals, plus the planned new train route. We bid Chase and our Prime Minister goodbye, the house slowly returning to normal. When all of our guests had finally departed, and the police had left us, our own staff performed a thorough search of everything, Big Paul organising things. He found a watch, a ring, a few coins, some notes, but no bugs. Calm reclaimed the house.

In the weeks that followed, Shelly came home each day happy enough, and we sighed with relief when a day without incident was marked off the calendar. She then brought home a boy from class. I found myself asking him questions: what he wanted to be when he grew up, how his studies were going, till Helen grabbed me and stopped me. I was in shock; my seven-year-old daughter had a male friend. I always figured I’d not let her have a boyfriend till she was perhaps thirty – or older. I spied on them through a crack in the door.

Floods and quakes

The dramatic effect that the super-drug was having on the world was not abating, and the news was still full of it. It had already resulted in job losses, that dark cloud counterbalanced by money saved in the health budgets. There was talk of tax cuts here, which made us, and the current government, popular. That just left the problem of a few out of work doctors. University places were cut back, and the first protests by medics had taken place. Jimmy then annoyed me by making an off-the cuff comment that made the front pages: 'Doctors in this country would prefer people to be sick, and dying in pain - it helps them justify their salaries.' It did not help the mood of the medics.

As the weather improved through the spring, the world underwent an adjustment, a large adjustment. And it was all our doing. The number of emotional TV reports about people coming back from the edge of death had eased; it was now common and of little interest to the TV viewing public. The Chinese were happy enough, making a killing from being the first to package and sell the drug, and we dispatched close to a million vials to Africa. It wasn't enough for Africa, nowhere near enough, and that was deliberate. We didn't aim to cure everyone, and even allowed the middle classes to buy a dozen vials each. We did, however, make sure that all medics and NGO staff working in Africa took priority.

That programme led us to the next meeting of the co-operation group in Goma, where we floated the idea of an economic federation, whilst not pushing the adoption of the US dollar too hard. The DRC, Zambia, Malawi, Burundi, Rwanda, Zimbabwe, Sierra Leone, Guinea, Liberia and Somali joined the economic group straight away, and we did not push the others. We did, however, explain that our banks would give preference to those countries as far as investment capital was concerned – quite an attractive incentive. Kenya and Tanzania resisted joining the economic group until they were sure that it did not mean that their hard earned wealth, what it was, would be shared with the poorer neighbouring countries. So much for African unity.

Kimballa signed off on our region adopting the US dollar, and the whole of the DRC adopted the dollar as a parallel currency until such time as all of the local notes had been collected in. Chase was happy. He printed a shit load of dollars and flew them over.

Not to be outdone by Chase, Senator Pedersen met us in Goma with his colleagues and inspected Gotham City at length, the tallest tower being his own. I showed him around our hospital, TV crews filming his party entering, which was odd considering that the place was mostly staffed by Cubans. Still, he wandered around the wards with me, meeting and greeting staff and patients. The hospital still issued super-drug vials, and surgical health tourism was growing rapidly. The westerners in the region all made use of the facilities, and mine managers often sent their workers here for the best care after accidents – which were plentiful. The hospital now offered a thousand beds and edged close to its capacity on a bad day. At the rear of the hospital sat three white RF Hueys, kept busy acting as ambulances for far off mines.

Our new hospital administrators had begun their observations here, the group's overall director remaining whilst the others set off on their travels. We found the overall director in an office next door to the African director's office, next door to the hospital director. He showed us a map on the wall, pointing out the coloured pins for hospitals now open in Nairobi and Kinshasa, the first South American centre opening in Rio de Janeiro. Others were being constructed from scratch.

Jimmy had handed me this project, and did not interfere. I now had this project to oversee, the nightclubs, Pineapple Music, the bank and the medical supply companies. I'd consult with Jimmy if I was unsure about a direction, but otherwise would make my own decisions. That freed up Jimmy to plot and scheme in world politics, and spend time staring at the grass or at the wall, which occupied a fair bit of his time.

Arriving back in the UK, I decided to be bold. It was either that, or to get snowed under with work. I found Jimmy in a lounge, watching the TV news. 'I was thinking of building another office, somewhere nearby, then I'd stuff all of my projects and staff in it.'

'Where?' he asked without taking his gaze off the TV news.

'Back of the house, down by the fence, other side of the red-roof houses. Office block, two storey, twenty offices.'

He shook his head. 'Up past the lake, over the road, is a farm up for sale. Grab it, and use that. Put a tunnel under the public road; it's raised anyway. Oh, and put some apartments up there for staff and visitors, the kind that don't need to come in here.'

With Helen helping, I got to work buying the land, and sat down with Rolf the architect. It had been a while since we'd worked on anything together, and he was still busy buying houses for us and

renovating them. I handed him a specification, and left him to come up with a few drawings. I asked for a large room with a large desk, so he had to adjust his drawings at the second meeting. Scanning his latest offerings, I then asked for the ground floor windows to made smaller, and positioned higher, and made the walls thicker; bomb proof. Behind the office block would sit a block of thirty apartments hidden behind tall trees. We duly received planning permission and got to work.

Four weeks prior to a storm hitting Myanmar, we invited representatives of their secretive junta over to London and met them at the club. They did not have an RF unit, and had never expressed an interest in one.

‘We would like you to consider allowing Rescue Force staff access to your country if you suffer floods in the future,’ Jimmy began, Han in on the meeting. ‘We have many countries to call upon, so you may be *selective* on which rescuers you allow in.’

‘We can deal with our own country ... and our own people,’ they politely stated, making me wonder why the hell they had flown over.

‘But if you allow in our rescuers, and our aid, then you will have to spend less money yourselves,’ Jimmy pointed out. ‘And such a joint venture between us may lead to us putting pressure on those that organise sanctions against you, and criticise you.’

I smiled, and forced it away when they stared at me.

‘You have much influence,’ they noted.

‘We’d also like joint oil projects in your country,’ Jimmy told them. ‘So, coming back to Rescue Force. What we would like to do, is to ask you if rescuers from China, Indonesia, India, and other nations could help you in the event of a flood.’ He handed them a list of nations. ‘Please choose which nations would be acceptable to you. Then, if you have a flood, they could assist, and it would be a first step towards us working together in the future – and towards me busting some sanctions.’

‘We will consider your proposal –’

‘I’d like an answer by tomorrow,’ Jimmy cut in with. ‘Then, we can talk about oil, money, and sanctions. I’d like to meet here again, tomorrow at 3pm.’ We stood and shook their hands, getting back bewildered looks, not least by the short duration on the meeting.

That evening we met Po, over on a visit, and enjoyed a meal at the Chinese restaurant, Shelly now adept at the chopsticks, Lucy coming along. I still used a fork. Later, in the old apartment, when the girls had been put to bed in the spare room, Helen, Jimmy and myself in sat in the lounge with mugs of tea.

‘This is where it all began,’ I told Helen. ‘And you know the odd thing - I keep picturing you here, but you weren’t.’

‘That was Judy,’ Jimmy pointed out. ‘Or maybe Katie Joe, or one of the others.’

I wagged a warning finger as he grinned.

‘It’s transposition,’ Helen insisted. ‘People and places. I sometimes picture Jimmy at my boarding school.’

‘In a skirt?’ I asked.

‘I *was* there, off an on,’ Jimmy suggested. ‘I visited perhaps ... ten times.’

‘Why?’ I asked.

‘Had to time it right - when Helen’s uncle would attack her.’

‘And you topped the bugger,’ I remembered.

‘How does it turn out?’ Helen asked after a moment, staring into her tea.

‘Which bit?’ Jimmy asked.

‘The three of us,’ she said.

‘I won’t say - exactly, but you’ll be there ... at the end.’

‘Can you fix it?’ she asked, now lifting her gaze to him.

‘Don’t know ... is the simple answer. And I sometimes think that I’m determined to try and fix it for the wrong reason.’

‘Do explain,’ I nudged.

‘I sometimes think ... that it’s a challenge to me – to fix it – and not a desire to save human life.’

‘Right thing for the wrong reason,’ I quipped. ‘Just like Chase. So, does it matter?’

‘Not really, the end result speaks for itself,’ Jimmy said with a sigh.

‘And Shelly has a role to play?’ Helen asked.

‘Yes ... and no.’

‘Come again?’ I asked.

‘She has an important role, but I know what she does, and could do it without her – to a degree. That’s not to lessen her achievement, but it’s an achievement that I already know about.’

‘Then why re-invent something?’ Helen puzzled.

‘I may not be around when she grows up. So, she *should* re-invent it. Besides, I have a question to ask her when she’s older.’

‘Question?’ I puzzled. ‘How could she know the answer, in the future, if you don’t?’

‘Wait and see,’ he enigmatically stated.

‘What about the message?’ I nudged.

‘It may not have been your daughter who sent it. The message has a hidden meaning.’

I took a moment. ‘I was sat right here when you first told me who you were; scared the crap out of me. Then you played to my weaknesses.’

‘Money and girls,’ Helen put in with a sigh.

‘Yep. That and the fact that I’d be rich.’

‘Does your dear lady wife know just how much you’re worth?’ Jimmy toyed.

‘Hell no! She may want to divorce me.’

‘How much are you worth?’ Helen pressed. ‘How much are *we* worth?’

‘Over a billion pounds,’ I told her.

‘Might be worth divorcing you,’ she joked.

‘Your daughters would never forgive you,’ Jimmy quietly stated, stopping Helen dead. ‘And they may restrict access to the grandchildren.’

After a brief awkward silence, I said, ‘Stuck with me, love.’

The next afternoon, the delegation from Myanmar were a little more amenable. A deal was struck, allowing in Chinese, Indian and Indonesians rescuers. And, oddly enough, the French. On the way back, we dropped in to Mapley.

‘Awake, Bob?’ I asked as we entered.

‘Deployment on?’ he asked, looking up from a mountain of paperwork, now a wedding ring on his finger after a private ceremony on the Maldives.

Jimmy explained, ‘Crusty is predicting a major quake in China in May, mid May. It’ll be a major deployment, so warn everyone now.’

‘How many we sending?’ Bob asked.

‘Around sixty percent; hundred jeeps and two-dozen Hueys. Cubans will go, but no one else from the Americas. No black Africans; Chinese can be a bit prejudiced.’

‘Who’ll head it up?’ Bob enquired.

‘Hancock from Hong Kong, he speaks the language,’ Jimmy explained. ‘Right, next. There’s a UN mission in South Ossetia, northern Georgia. Get hold of Handy and Rabbit in Mawlini and get some mine clearance going. I also want a team of fifty sent over there to ... assist, and to provide cover for the mine clearers, plus hearts and minds to the locals. Send them in via Russia, and get RF Russia in there. I also want some money thrown at a few NGOs to help clean the place up a bit.’

Bob took notes. After a thirty-minute chat we met a few of the national representatives, and toured the busy base, ending up in the AMO building. They showed us the latest dummy, the Silo Stiffy, and I was aghast at how lifelike the damn thing was. As I leant in and studied it, the head turned and the eyes opened. 'Help!' it said, shocking me upright, the instructors bursting out laughing.

'Fuckers!' I whispered.

'It's all computer controlled from next door,' they explained. 'Voice box as well now; it describes where it hurts in several languages. You also get make-believe shit to stuff in the colon, bile, the works. One of these in every frigging hospital now.'

'Give the out-of-work medics something to do,' I quipped.

'Plenty of those about,' they informed me. 'Lots more applying to Rescue Force as well!'

'Kiss me, Paul,' the dummy asked in its mechanical voice, everyone bar me laughing.

'Fuck ... right ... off!'

'Touch me there,' it said as we left. 'Please, don't go!'

The Myanmar flood, created by a cyclone, caused a great deal of damage, but the authorities duly allowed in the nominated rescuers, and NGOs to help with the clean up – which would take a while. That left us to concentrate on the Chinese quake, for which we packed our bags and headed off to Beijing via Moscow.

Security at Beijing airport was tight, and we were whisked away in a coach, around to a hotel that Po's family had built with permission of the People's Republic, and now a favourite haunt of westerners. Po greeted us at the hotel, the manager and his staff lined up ready. That annoyed me a little, since I just wanted a shower and a bite to eat, not to be treated like royalty. After ten minutes of greetings we made our excuses and headed to our allotted room, two small beds laid on for the girls, Cat in an adjoining room. Not wanting to face the mêlée below, we ordered room service and unsociably ate in the room. When Jimmy called, I said we'd face the bustle in the morning, and he didn't request our presence.

In the morning, we all sat down to breakfast together and discussed the itinerary, the first task being to meet those Chinese officials that constituted their internal "M" Group, Po figuring it to be about business in Africa. Han turned up as we finished breakfast, Cat given charge of the girls till Han brought forwards a Chinese language teacher. The girls would now get some practical Chinese lessons, which pleased me.

Glancing at the smog on the horizon on this warm morning, I boarded the coach with Jimmy, Helen and Han, and we journey the short distance around to the grey and drab government buildings, through tight security and to the same building that we had attended before. I remembered the first time that I had arrived here; I was terrified, and wondered if we'd ever leave. Now, my head was full of scenarios, plans, ambitions, and problems to solve; but no fear. They led us along familiar corridors and down into the bowels of the building, a few familiar faces waiting, many new ones. Han introduced me to his assistant.

'My sister is not a goat,' the man quipped, dead pan features. 'Although she is starting to grow a beard.'

I laughed, impressed at how far the stiff Chinese had come in adopting trivial western humour, not sure if it was progress or not. Helen had been studying Chinese for quite some time, not wishing to be left out, and greeted the officials in reasonable phrases. And, unlike the White House, we had a plentiful supply of tea and coffee on hand, even biscuits. With cups in hand, we settled about the same huge table, white boards and maps sat ready.

'I'll start with a summary briefing, if that's OK with you,' Jimmy began. The Interior Minister gestured Jimmy towards a white board. 'Let us start with Afghanistan, Pakistan and India. The Taliban took heavy casualties from the Somalis, and have not fully recovered. We continue to supply the Northern Alliance, and the checks and balances are maintained. Al-Qa'eda continues to attack Northern Somalia, which is a good thing – we are capturing and killing their fighters – and they are not directing their interest towards the west. They are, unfortunately, directing some interest towards Zanzibar and the oilfields. The interest they're showing is perhaps forty percent more than I had anticipated, which may be due to the acceleration of the extraction from that oilfield. All alterations of the timeline have consequences.

'Now, with the use of PACT in Africa, we're on top of al-Qa'eda in the horn of Africa, and Zanzibar has settled down. Please note, that it is my intention to use PACT aggressively in sub-Saharan Africa to quell all terrorists groups and freedom fighters. You should also note that PACT will have a key role in the 2025 preparations. Coming back to Afghanistan, I am happy with where we are. It is not ideal, but it is neither moving forwards nor backwards. It is contained, and the Americans will not invade, not with Chase in office at least.

‘Pakistan is getting support from America and Britain, and making arrests of al-Qa’eda operatives as they move in and out of Afghanistan. We’ve had an officer placed inside their army for many years, and the man is now a general. We pay him, and he keeps the pressure up on al-Qa’eda. He also provides us with information.

‘OK, India. The commando unit now numbers just over six hundred men, paid and equipped by me, and they enjoy regular training exercises in Africa. So far they have successfully intercepted each terror attack by Pakistani Taliban fighters. We have also struck a deal with the Indians, as you know, to keep those attacks out of the press. As we speak, the Indians are aware of the men who will plot against Pakistan with a bomb aimed at Israel. I see no danger of that plot developing. Instead, the greatest danger is that the story leaks out. There will be further attacks in India next week, and the commandos are sat waiting.

‘Africa. The growth curve of the region is well above that which we anticipated, as is the oil output, and the growth of the Zanzibar field. I will admit to making some changes there to try and fix other problems, such as Iranian nuclear ambitions. We also have the situation where President Chase, someone who I expected to be at war with, is now on board one hundred percent. As a result of that, he has invested in the region, and the region continues to grow way above our previous estimates. All projects are ahead of schedule by at least one or two years, some five years.

‘Most recently, we accelerated the release of the super-drug, with the profound affect that it is having on the world, and on cutting health budgets around the world. Most significantly, it will cut western health budgets. You must factor in an increase in spending by the west on your goods.

‘In Africa, we have created the airline as planned, and that is stable. Despite subsidising the flights, its near one hundred percent usage is causing a profit. We have also created the bank, as planned, and that is growing steadily. All mines and oil operations will soon use that bank, and we can be sure of smooth money flows around the region, and payment transactions between buyers and sellers. As you are aware, our region has adopted the US dollar a full five years ahead of schedule, for reasons that I will outline later. President Chase is now very keen to see the economic region we have created grow, and use to dollars. The danger there ... is of an overheated western economy. But I’m afraid we started that process with the release of the drug. As such, I have asked the various governments to nudge up domestic interest rates. Whilst discussing President

Chase - he will win the next election easily, and will have my assistance doing so. OK, questions.'

The Interior Minister started simple. 'The biggest problem in the next five years?'

'I think that, with the factors in play – especially in America – that Cuba and Venezuela have been dealt with as potential flashpoints. That goes for a 2015 American attack on you. The US economy will be buoyant for the next five years at least, with the health benefit extending well beyond that. I believe that with Cuban oil, African oil and electric cars, the worst elements of the energy crisis will be dealt with as well. That leaves earthquakes in several modern cities causing severe economic problems, plus pandemics up to 2017, and eventually an OPEC crisis.'

'Will your plans in Africa be enough to counter-balance OPEC?'

'No, never. But it may soften the blow some,' Jimmy suggested. 'That, coupled with a strong US economy between now and then, and we're in a much better position. The danger is that Chase allows the economy to heat up, and that US banks take bigger risks because of the feel-good factor. There is also a danger that the next Democratic President may spend what money Chase has tucked away under the sofa.'

'No significant problems between now and 2015?' they asked.

'We've altered the time line, so we're in new and uncharted waters,' Jimmy cautioned. 'There is always the danger of the unpredictable. In 2010 there will be a major quake in Haiti, followed by another in Chile, and the economic costs will be high. We'll then suffer a quake in Europe that will cause severe economic hardship. The Ukraine may tear itself apart around 2011, but I'm hoping that the Russians get on top of that. If I was to make a guess, then I'd say that an overheated economy is the greatest danger, followed by exposure of myself and the "M" Group.'

'You expect exposure?'

'I expect the Europeans to accidentally disclose details and, combined with the super-drug, it will arouse suspicions. It was always my plan to deal with exposure around 2010. But, now that we have the co-operation of the Americans, that may be put back.'

We got into small detail for an hour before breaking for lunch, eating upstairs. And I still didn't have the hang of chopsticks. Han thoughtfully fetched me a fork as Helen and Jimmy made do with chopsticks. In the afternoon session we got into arguing growth curves for Africa, and the benefits that the US was receiving.

‘Listen,’ Jimmy began, sounding a little frustrated. ‘You ... are not the problem. Future American presidents are the problem, that and a volatile western economy, and it’s those two that I’m interested in. You’re not going to invade anyone or be reckless with your economy. So if I take a few percentage points off you and give it to them ... so be it. You can count the costs in Yuan, but if the plan goes wrong out there you’ll count the cost it in bodies!’

An hour later we broke for the day, no doubt to give them time to come up with even more questions. Back at the hotel, Helen and I found the girls in colourful Chinese outfits, a floral patterned silk, and looking just gorgeous. We snapped pictures with our phones before grabbing the digital camera. The girls kept the outfits on during dinner, Po joining us, Han explained that the outfits were a gift from him. They were simple, and inexpensive, yet a delight.

The next day Helen made her excuses, not following much of the talks, and took the girls to the zoo with our Chinese minders. Jimmy and I re-entered the bunker and rolled up our sleeves, the Finance Minister and his team now in attendance. Making use of a translator for some words and phrases, I detailed my areas of operation, the new bank and the hospitals. The hospitals were of little interest to them, other than the fact they were part owned by CAR – in which they had a stake. They were, however, very interested in the bank. I cut a potentially long conversation short, and quite innocently.

‘Why don’t you send an expert or two to work at the bank – help to give me some guidance, eh?’ It stopped them dead, and left them nowhere to go with further probing questions. I explained, ‘The aim of the bank is to assist with venture capital to established African businesses, to increase the GDP ... and to make consumers of them sooner.’

‘And the medical equipment factories?’ they nudged.

‘They should help you a lot,’ I suggested, already knowing their objections. ‘They lower western medical bills, which means the western governments can offer tax breaks, and so people spend more. More spending helps you. President Chase has already lowered taxes and US consumer spending is up a few points. Is that not good for you?’

They reluctantly agreed, Jimmy sat quietly, observing our hosts more than myself.

The Minister asked, ‘Which African businesses – which types of African businesses – will do well in the decades ahead?’

‘Exports will never amount to much, its an internal marketplace in support of ore, oil and tourism. But, as they grow, their cities will

have all the same needs as western cities, so they'll have all sorts of businesses. The growth sector in the next ten years will be those businesses that support the mines.' I glanced at Jimmy, and he seemed happy with report. Well, the monkey had listened to the organ grinder often enough.

Jimmy took over, and we got into the small detail of a twenty-year plan that had been seriously disrupted due to recent events. We factored in revenue from the drug, that revenue diminishing next year, but still offering up a great deal of money considering how cheap it was for them to produce. Those figures were programmed into a laptop by two earnest Chinese geeks. They were just like western geeks, only more so. We then factored in the increased western buying of Chinese goods due to tax breaks, the Zanzibar oil, and the ore from Africa. On the minus side, we asked for money for the next generation of nuclear power stations, for very conventional desalination plants that were quite unconventional, and their rollout to Somalia and Jordan. We also piled on financial requests for dams in the DRC and Uganda and a pipeline across to Lake Victoria, another pipeline the other side feeding Kenya.

The geeks did their sums, and their paymasters reluctantly agreed that they were way ahead of the curve. Jimmy then gave them two future dates, and suggested that both would cause a sharp drop in western spending in China, and that was factored in, although it was hard to estimate the effects. I then piped up and insisted that the Chinese's own savings in healthcare be factored in, plus extra productivity from its workers as a result.

After three hours we had an adjusted growth curve that left China in a very healthy position in the decades ahead. In order to wipe the smiles of their faces, Jimmy detailed two pandemics that would kill fifty million Chinese – even with the drug – plus a rise in middle class dissention. Our hosts factored in a drop in productivity, due to many of their key workers being quite dead at the time, and they adjusted their figures at two key points. That caused a lot of debate, and further thought would now have to be given as to how to plan ahead for it.

After lunch, we again got into the small detail, answered specific questions, discussed the quake deployment, and broke at 3pm to meet with the current Premier in his office.

When I shook his hand, he said, 'If you label my sister as a goat I'll have you taken out and shot.' He held his cold stare on me, then smiled, gesturing us to seats. I began breathing again.

Han sat with us, tea made in small cups as we settled.

The Premier continued, 'Of course, it is an odd statement - to mention someone's sister here in China - since none have siblings.'

'And a good policy that is,' Jimmy mentioned, being carefully studied.

'I believe we are ready for the earthquake,' the Premier added. 'And I must admit, foresight is a wonderful thing. Although, some days I wonder if our ability to solve problems is lessened by that knowledge - and our lack of desire to seek solutions for the unknown.'

'A swordsman must practice,' Jimmy acknowledged. 'Till he turns his sword into a plough to work the fields.'

'Indeed,' the Premier acknowledged with a forced smile. 'Although I do not follow such ... *Christian* doctrine.'

'I'm surprised that you knew the reference,' Jimmy responded.

'There are a great many Christians here,' the Premier acknowledged. 'Many phrases woven into our language from your early missionaries. Are you ... a Christian, Mister Silo?'

'I raise my head and shout at whoever is up there every day,' Jimmy replied.

'If you ever get to meet him, you will have a lot to discuss - after some lengthy apologies.' We laughed. 'Now, what do you believe - or indeed know - about problems we may have with our middle classes in the future?'

'That they are easily dealt with - in comparison.'

'In ... comparison?'

'If you were to compare the houses, household goods, and luxuries that your people possess... against America, then there is a shortfall, followed by a natural desire to copy. But if you were to consider that the Americans offer greater freedom, then that freedom comes with a price, namely not much of a safety net. They are free to lose their jobs, to have no healthcare, to suffer high crime rates, and to live on the streets. You need only manufacture a large net and sell its virtues, especially in the years ahead when known problems hit America and the west. They ... will suffer great volatility, whilst you will plod along steadily - yet surely.'

'And, at the end of the day, democracy is over-rated. Once every four years we get to vote for someone who is not obliged to keep his election promises, who *will* do a bad job, and then change to someone else - leaving a mess behind. The people cannot vote on individual policies, and big business directs the politicians. Democracy, in the west, is a commodity that can be bought, or lobbied for. In America, the Jews are a tiny minority, yet their lobby

groups enjoy a hundred percent success in influencing presidents, something that will backfire in the future. The blacks and Hispanics are large minority groups, but have no political clout. In the future that will change, especially the Hispanic influence.

‘The one good thing about the advancement of technology, is that the internet allows individuals to voice their opinions, and in the future that will be real-time, people making their voices heard by clicking a button and voting. That’s real democracy, which is about the people voting, not about corrupt politicians trying to make themselves popular.’

‘An interesting viewpoint, and I will consider our *safety net*,’ the Premier offered.

‘Don’t worry about your political system,’ Jimmy told him. ‘When things go badly wrong in the west they’ll admire your stability, and your ability to react to a crisis. At the end of the day, people don’t know that all they want is a roof over their heads and some food – till it’s not there!’

‘We receive criticism every week from American civil rights activists and politicians,’ the Premier stated, ‘whilst the American President asks if we can buy more Treasury bonds. We are ungodly barbarians to be criticised in public, yet asked to loan them money in private – now America’s single largest creditor.’

‘To try and judge western politicians by any measure of logic – would be a waste of valuable time,’ Jimmy suggested. ‘China is a whorehouse.’

The Premier blinked. ‘What!’

I stopped breathing.

‘They like to visit you in the dark of night, yet condemn your impropriety during the daylight hours,’ Jimmy said with a grin.

The Premier cocked an eyebrow. ‘I doubt that I will make use of that analogy, Mister Silo. Even in the dark of night.’

We made small talk for twenty minutes, stood for a photo, and then headed back to the hotel. The girls were full of news about baby Pandas that they had been allowed to feed, digital images displayed for me on their cameras.

The next day we hopped onto the coach and drove for two hours, leaving the smog of Beijing for the coast, and to the nearest supply of salt water. Our coach negotiated its way through a well-guarded building site, and arrived at a small and experimental desalination plant.

Traditional desalination involved boiling water, capturing the steam, cooling it and making pure water from it; drinking water.

That process of distillation used up energy, which typically came from electricity, possibly generated by a nuclear power station. This first plant that we visited used the sun's energy to heat the air between glass panels, a large area of glass laid out in front of us, the size of a football pitch. Salt water was being pumped in one end, drinking water produced at the other end. Other than capital costs, it was cheap to run, but did not convert much water compared to its powerful counterparts. Still, it would be implemented in Somali since it was cheap to run. The next plant looked similar, but contained millions of what appeared to be glass tubes.

'The tubes are made from plastic, from oil,' Jimmy explained. 'Salt water goes in one end, the water evaporates and is collected in good volume. At night, the pipes are flushed with additional seawater to remove the accumulated salt, then a little fresh water with some chemicals in. Compared to the first plant, this is much cheaper to build in Africa; it has few moving parts and maintenance is very low.'

'So we use the local oil to make them, to make the pipes,' I noted.

Jimmy nodded. 'But at some point in the future, someone will notice fresh water supplies not far from the coast in Somali. Between those supplies and the ocean are certain types of rock that produce the osmosis and membrane effects, filtering the water. The first large-scale test is just about ready, a few miles up the coast from Mogadishu. It takes longer to filter the water, but the volumes pumped can be huge.'

'Are those rocks found in the Middle East?' I asked.

'In some places, but not quite where I'd like them,' Jimmy admitted. 'Which is why I gave samples of the rocks to the kids in Shanghai a few years back. Come on.'

We boarded the coach and negotiated more building work to arrive at an area of large steel vats looking like grain silos. I could see VAT1, VAT2 labelled. 'VAT14?' I whispered.

'No.'

'Oh.' And we found only six of them. Inside them rested numerous layers of a synthetic fabric, made again from oil, and substances that the kids had come up with, based on combinations of crushed rocks.

Jimmy pointed up at a tall vat. 'There's very little energy used, the production costs are small if you don't try and use nice shiny steel vats, and maintenance is limited. The water flow is good compared to other osmosis techniques and ... it's cheap as fuck

basically. Couple of these already in Somalia, the special project ready for us to test when we arrive.'

Thirty minutes in the coach brought us to a tightly guarded nuclear power station, long corridors plodded down to find the site managers office. In the office, I was surprised to find technicians from Russia, Britain, France and the States.

'That's what I like to see, some international co-operation,' I quipped.

Each man was introduced in turn as we settled about a table. One of the men attended a white board, numerous figures already annotated on it. He gave a twenty-minute talk, explaining the difference between the cost of building certain types of reactors – they were all very expensive, but some less so – and the running costs and efficiencies achieved. Seemed like this plant had been cheaper to construct, would be cheaper to run, and its efficiencies were greater – much greater, thanks to a few hints from Jimmy. Its operational twin was being built in Somalia and would be fully operational in two years, the aim being to power both Mogadishu, as well as a few desalination plants of various specs.

We peered down through clear water at fuel rods, although I wondered why, had tea and a chat, then headed back. In the coach, Jimmy examined reports of the efficiencies of the desalination plants and the nuclear plant, making notes. As we arrived back, he handed his corrections to Han.

Helen and the girls had been on an outing to the great wall, something I was still yet to visit, and Shelly stood spouting stats to me about the famous tourist trap.

At dawn the next day we packed up, escorted to the airport for an internal flight down to Shanghai, a plane for just our party as usual. In Shanghai, we booked into a very tall hotel, in an area that reminded us all of Hong Kong, the modern city a stark contrast to its sedate capital. With Cat taking the girls down to the hotel pool, we boarded a coach with Han, and made an hour-long journey through terrible traffic to the military base that housed the brain-trust kids.

This was Helen's first visit, and I briefed her on the way. She questioned the kid's apparent captivity, not that they were kids anymore. In the main canteen we joined the professor and several older boys – the eldest now twenty-six, food collected from the buffet counter.

Jimmy informed the professor, 'I've given Han the necessary adjustments, and areas to look into.'

‘We don’t think we can improve the desalination model any more,’ the man reported, shaking his head.

‘You’re ten percent short,’ Jimmy pointed out. ‘So keep at it.’

One of the Kenyans announced, ‘I would like to return to Kenya, to help there.’

‘Of course,’ Jimmy readily agreed. ‘What would you like to do?’

‘Agriculture was my first passion, I’d like to return to it.’

‘I’ll arrange it with Cosy,’ Jimmy offered. ‘We’ll get you a house, a car and some money.’

‘That is good of you, sir,’ the young man acknowledged.

‘What about others?’ I asked. ‘They homesick?’

‘There is a group of Congolese who desire a return,’ the same man informed us. ‘Some are interested in mines, some oil, some like finance – if you have work for them.’

‘I should think so,’ I agreed. ‘Send them to the corporation, and call me when they get there. Do they have kids?’

‘Some do, yes.’

‘Families?’ Helen queried.

‘The older students here are free to ... mingle,’ Jimmy explained.

‘Oh. And where do they live?’ Helen asked.

‘Here,’ Jimmy replied. ‘There’s a crèche, a nursery, and individual apartments at the rear.’

‘We’ve isolated the anti-body,’ the professor put in, a conspiratorial nod exchanged with Jimmy.

‘Is it safe to return?’ another young man asked.

‘Not really,’ Jimmy told him. ‘Others will take an interest in you if they know about your skills. We’ll have to see if those who return are ... monitored. But, now that we have the anti-body, and much of the experimental systems working, it’s less of a problem.’

‘And now that the world knows of the super-drug?’ they posed.

‘Its use will not produce many like you,’ Jimmy informed them. ‘Perhaps one in every twenty or thirty thousand, and the kids will simply be labelled as autistic.’

‘You will not release the blood?’ they queried.

‘No, not yet,’ Jimmy firmly insisted. ‘The time has to be right. If it were to be used widely in poorer nations, then the population explosion would cause great hardship.’

‘We found no answer to the pandemics,’ they stated.

‘There are none,’ Jimmy agreed.

‘Pandemic?’ Helen asked.

Jimmy explained, ‘In the years ahead, certain diseases will mutate, killing many. And no, there’s nothing we can do. Only

people with my blood could tackle it, and even they will fall ill for a while.'

'So ... what will happen?' Helen pressed.

'It will run its course, then come back around every few years till they find a cure,' Jimmy replied.

'And you're not aware of one?' she asked, clearly surprised.

'No, because some diseases are adaptive. There will always be a need for further research.'

'And the effect on Africa?' one of the Kenyan's asked. 'Many will die?'

Jimmy nodded. 'Yes, and trying to save them would be almost impossible.'

'But not completely impossible,' they nudged.

'If the blood is used early, the diseases will adapt to it early, and cause greater problems later. Remember, the flu family is adaptive.'

From the looks on their faces, I doubted that they were buying it, not completely. After the meal, the young Kenyan men introduced their girlfriends, and we sat on sofas in the crèche for a while, the toddlers curious about us strangers. Jimmy handed them a few extra projects before we inspected the latest variant of their electric car, a joint venture with a Chinese motor manufacturer. I sat in one, pushed the start button and sped away. It possessed no gears of course, being electric, and the acceleration it offered was smooth. Going around in circles, I stopped, started and pulled away quickly, trying to imagine pulling away from a junction.

One of the main complaints about electric cars had been the acceleration bite, but this little baby shifted. Back at the entrance to the college, I asked, 'How many miles on a charge?'

'Five hundred,' they said with a smile.

'Five hundred? Shit!' I reflected as I stood back and inspected their handiwork. 'Time taken to recharge?'

'Flash charge at one hour, over overnight at seven hours.'

'Re-charge costs?' I asked.

'In western terms, ten dollars of electricity,' the professor stated.

'That's a ten dollar tank of petrol then,' I realised. 'Less, because five hundred miles equates to two tanks. Five hundred miles for ten dollars - that'll piss off a few people. Capital cost?'

'Nine thousand pounds here, plus shipping costs and taxes, so thirteen thousand pounds in the UK,' the professor ran off. 'Battery technology is the expensive part.'

'But, once bought, you could go a week on one charge at ten dollars,' I thought out loud.

Jimmy pulled up with a screech, easing out of his vehicle with Helen.

‘Did you just take my wife for a drive?’ I dryly asked.

‘It’s OK, she behaved herself,’ Jimmy said as he approached. He beckoned Han closer. ‘I want the first thousand shipped to the DRC straight away, second thousand to the UK. A hundred for Rescue Force Kenyan, and two thousand for Hong Kong – through Po.’

Han bowed an acknowledgement.

‘We going to upset a few people?’ I asked.

‘Most likely,’ Jimmy responded. ‘Especially the British Prime Minister, who puts a hefty tax on petrol. If people go electric then he loses that revenue.’

‘He’s got the health cost benefit, so fuck him,’ I suggested.

‘A good attitude, young man,’ Jimmy commended.

Back at the hotel, we enjoyed the facilities - pool, sauna and massage – followed by a lengthy meal, the girls reporting their trip to a technology museum that sounded nothing like a museum; they had played with robots and video games.

Arriving in Hong Kong the next afternoon, we were picked up in an electric coach, courtesy of Po. At his hotel we booked into familiar rooms, time for a wash and change before heading off for a surprise. The same electric coach took us slowly through the petrol traffic and to a local taxi firm. We pulled inside its massive garage, and halted short of assembled TV crews and journalists. I straightened my tie. Stepping down, the press snapped us, Jimmy leading us towards Po, whose family owned the taxi firm. A gleaming green and yellow taxi sat on display, large letters proclaiming it to be electric, a man in a green and yellow uniform at the wheel.

Jimmy stood behind the microphone. ‘Ladies and gentlemen. For many years I have invested in electric car technology on the mainland, and we now have the fruit of that labour in the form of this taxi.’ He gestured towards the vehicle. ‘This vehicle is electric, has an acceleration as good as any similar vehicle, and can drive for five hundred miles on one charge of its battery. That’s ... five hundred miles ... on one charge. And that charge costs ten dollars. This, ladies and gentlemen, is the future ... here and now. This taxi company has four hundred cabs, all of which will now be electric. And, because of the savings made, we will be subsidising all journeys for the next month.’

He repeated his previous words in Chinese before fielding questions, finally being filmed inside the taxi, driving it back and

forth. Helen and I sat in the back and waved for the photographers, followed in turn by Po and his executives.

Back on the electric coach, thirty minutes later, I asked, 'Will we roll out these to the States?'

'No, not yet. Let them see it working here first.'

I grinned. 'Best way to get someone's attention - is to ignore them.'

'And there are other reasons,' he enigmatically stated.

'How many taxis will go electric?' I idly enquired as we negotiated the busy petrol traffic.

'All of them; it'll become the law here, and in Shanghai to start with,' Jimmy explained. 'I'll bring in thousands of them, letting taxi drivers hire them for next to nothing. The buses will go the same route soon, no pun intended. We're even looking at electric motorbikes. My deal with the People's Republic, is that they get five years from now before I release the technology.'

'The Germans like green technology,' I put in.

'They'll buy some, and the Dutch and the Swedish; the cars will be big in Europe. In the years ahead you'll be able to grab an electric car, drive it town to town, leave it or pick up another – and all for free. By then we'll have road-tracking technology, so you just tell the computer where to go and ease back. It's great fun to start, then gets boring. At the end of the day, people like driving like idiots.' We exchanged indifferent shrugs.

'What about ships?' I asked as we negotiated annoyed motorists.

'Yes, some go electric. They have wind turbines on deck, recharging as they go. Odd thing is, all the electric energy technology I'm sharing now – was created by people very short of petrol. When they developed it, Africa had not been developed, nor the Zanzibar field or others like Cuba. The people of this planet are getting the benefit of it, without being short of petrol, which will lead to less oil needed, so it'll last a bit longer.'

'Does that constitute a paradox?'

Jimmy made a face. 'More or less.'

We enjoyed a relaxing two days at the hotel before heading to Dubai, changing for a Mogadishu flight, now boarding one of our own Central Africa Airways Boeing 757s, our tickets swapped at the last minute for security. Big Paul, and two of his mates, were already onboard the flight, and armed. They showed me their official Air Marshal badges. With the aircraft levelling off after climbing, Jimmy walked back and greeted Somalis in Arabic, some of them

being government officials. He had also scanned all of the faces, just in case.

At Mogadishu International Airport, our escorts were waiting, the government here only having been notified of our arrival a few hours earlier. A coach whisked us the short distance to a hotel that we had built through our property business. Jimmy had designed it, so it was secure – and came with a rooftop bar. We drove through high gates in a high wall, some fifteen feet tall, through pleasant gardens and to reception. The entire ground level seemed to be solid concrete and offered no windows, reception built with an airport-style security check; they did not stop us when we bleeped through the machines. Checked in, we claimed the top floor penthouse suites, Big Paul and his mates adopting the room whose door faced the lift. The first man dragged out a chair and sat staring at the lift doors, Somali Rifles now in the hotel grounds.

I took Helen and the girls to the roof whilst the day was still hot, finding the rooftop bar and pool a replica of that which I first found in Nairobi. With no one apart from us in attendance, I asked a waiter about its popularity.

‘Sir, only de guest on de first class come to here. Floor number ten and more bigger, sir.’

Well, that explained it. The girls hit the pool the instant their clothes were off, and I lovingly accepted a cold beer. For an hour I sat in the sun with Helen, Cat sat on the edge of the pool. But when I noticed a pair of binoculars fixed to a wall I went to investigate. By standing on a bench you could see out over the city, the glasses for those that liked close-ups.

From what I could see, Mogadishu was doing well, many new buildings, even a handful with glass exteriors. The streets looked clean, nearby gardens were well tended, houses offering blue pools, and there was the distinct absence of gunfire on the breeze. In the distance, I could make out many cranes earnestly lifting materials up to the roofs of new buildings reaching skyward. The airport had looked clean and tidy as we passed through it, and the journey from it – although along dry and dusty streets – was no different to many countries I had visited. Yes, Somalia was coming along nicely. I returned to Helen as Jimmy and Big Paul arrived.

‘Abdi will be up in a bit,’ Jimmy reported.

Since we had four waiters attending us, drinks were quickly placed down. I questioned the beer with Jimmy.

‘For westerners only, locals would get flogged. They do drink, some of them, but it’s against the law.’

‘How’s the house?’ I asked Big Paul.

‘Lot of building work up the top end,’ he reported. ‘Your new place. Bunch of temporary security guards watching it.’

‘Found a nice woman to settle with yet?’ Helen asked him.

Big Paul gave her a look. ‘I’ve done my bit for the species, and procreated, creating a fine lad and a fine daughter.’

‘He finished school?’ I asked.

Big Paul nodded. ‘In college, studying hotel management.’

I turned to Jimmy, and waited.

Jimmy shrugged a shoulder. ‘It was not meant to be, but ... why not.’

‘What was he meant to do?’ I asked.

‘Fuck all,’ Big Paul put in. ‘Bunch of dos jobs.’

‘And your relationship with the girl and her mum?’ I asked.

‘I send them money...’

‘And?’ I nudged.

‘The mum’s not looking to hook up. She has her life down there.’ He made a face then sipped his beer.

General Adbi, Defence Minister, joined us ten minutes later, an aide and four bodyguards accompanying him. Before he had arrived, the girls were asked to exit the pool and cover up. This was still Somalia. We greeted him and ordered cold drinks, non-alcoholic drinks, our own beers removed.

‘The city looks good,’ I told him.

‘Much building work with the money from the oil, and investment from abroad,’ Abdi keenly reported.

‘And the new President...?’ Jimmy asked.

Abdi seemed reluctant to answer. ‘He is a politician.’

‘As you may well be, soon enough,’ Jimmy pointed out.

Now Abdi seemed reluctant with that career path. ‘Perhaps.’

‘You must see it as a battle, my friend,’ Jimmy told him. ‘A battle to get the best quality of life for your people, to increase trade, and to build the economy. Your service to your people will continue, just in a different format. And who better to protect their interests ... than you?’

‘Perhaps,’ Abdi acknowledged, brightening a little with the compliment.

‘Everything set for tomorrow?’ Jimmy asked him.

‘Yes, all is set. I will accompany you to the facilities, to see how you make clean water from dirt and seawater. I must tell you, many here think you are crazy – but I have faith.’

Jimmy smiled widely. ‘Tomorrow we shall see.’

With Abdi and his party gone, the girls reclaimed the pool, two white families appearing. I guessed they were from floors ten or above.

One man came straight over. In an accented voice he began, 'Sir, I work for you at CAR.'

'Take a seat,' Jimmy told him. The man joined us, his family grabbing sun beds. 'Where are you working?'

'In the northwest, near Baardheere. I have been overseeing a new railway marshalling junction. When finished, we shall be able to increase the number of daily trains. Unlike cars, they cannot pass each other.'

'No,' Jimmy agreed. 'If you have a diagram, bring it up later. I would be interested.'

The man stood. 'I will, sir. Enjoy your stay ... at your hotel, sir.'

'We could go by train from here to Mawlini?' I asked.

'No passenger trains that I'm aware of,' Jimmy replied. 'Be a rough trip.'

'Don't the workers go back and forth, all the way to the DRC?' I puzzled.

'No, they fly. It's three whole days by train, so they'd need a week in this hotel just to recover!'

Shelly brought over coins that she had found, plus a diamond ring.

'That real,' I wondered.

Helen had a look. 'Yes, it is. We should ask reception if anyone reported it lost.'

'Can I have it?' Shelly asked.

'No!' I snapped. 'Some lady lost that.' I lifted Helen's hand. 'See mummy's nice rings: how would you like it if she lost them and someone else kept them?'

Shelly spun around, ran and dived back in, no doubt cursing under her breath. Jimmy beckoned a waiter and asked for the manager. When the manager arrived, a Frenchman, we showed him the ring.

'No one has reported it lost.'

'I want you to give me a list of all western women that have stayed here,' Jimmy instructed. 'I'll take the ring to London, to my solicitors, and see if they can have it appraised or identified.'

'Yes, sir,' the manager said before withdrawing.

'How could someone not notice it was missing?' Helen puzzled. 'The first time you washed your hands you would notice.'

Jimmy puzzled that with a heavy frown. 'Big Paul, go down stairs and ask the manager to check with the police; see if any western women have gone missing around here.'

'Something? I asked Jimmy.

'No, just seems odd that it wasn't reported.'

Big Paul was back within minutes. 'French lady went missing a few weeks back, couple of days, then turned up. Said she'd been to Kenya on a trip and stayed too long.'

Jimmy gave that some thought. 'I want name, address, occupation and passport details.'

Big Paul headed back to the lift.

'Something?' I nudged.

'People don't come to Mogadishu without good reason, and don't visit Kenya whilst forgetting to inform their hotel.'

Big Paul returned with the details, Jimmy calling Sykes with the passport number. At the end of the call he smiled widely.

Lowering his phone, he called over Shelly. To Helen and me he asked, 'How much cash have you got on you?'

We raided our pockets and produced two thousand dollars, which Jimmy handed to Shelly. 'That's for you, for finding the ring.'

With Shelly sitting down to count the money, our money, I asked, 'What the hell did you find out?'

'The woman who lost that ring, who never came back for it, is a nuclear technician, working at the new plant.'

'Oh shit,' I let out. 'She loses her ring, disappears in Kenya, gets swapped, and her body double doesn't file a report for a ring that she doesn't know about.'

'The French are spying?' Helen queried.

'No, they're contributing,' Jimmy pointed out.

'So who,' I thought out loud, 'would be interested, knowing that it's next generation? Iranians?'

'They're not that good,' Jimmy scoffed. 'This took planning. So, I guess we'll have to find out.' He lifted his phone and dialled PACT, asking for their best agents in the country to get on the case.

Helen and I spent all night speculating on just who may be behind it, plus trying to persuade our daughter to loan us some pocket cash.

The next morning I took an early swim, boarding the coach later and now with increased security. We took the long way around the city, a random route, and journeyed north to the new nuclear facility. That nuclear facility was on Somali soil, but the area it occupied was given over to the British Government under license, now sovereign territory and guarded by Kenyan Rifles and Pathfinders. A small

breakwater and dock had been built, and just about everything came in by boat. The construction workers had been Swiss and French, no Somalis let near it.

We slowed as we passed through an outer gate, manned by Somali Rifles and police, and reached a second gate after some six hundred yards of parched desert, this one manned by the Kenyan Rifles. Inside, British and French soldiers patrolled with their own police officers. Security seemed very good, but an insider, an employee, had obviously breached it. I had previously questioned the logic of a sensitive facility on Somali soil, but Jimmy was up to something, not revealing what. Now we stepped down to a screening by British police officers.

‘Wanna check my ID?’ I asked the senior man.

‘Since you’re paying my wages – no, sir.’

‘How do you know that I’m me, I could be an impostor.’

‘There couldn’t be two of *you*, sir.’

I wagged a playfully warning finger and stepped into the cool interior, soon in a control room, the reactor not ready, and certainly not working. We made small talk with the managers and staff, asked about progress and glanced at charts.

Jimmy then shook a ladies hand. ‘Monique, yes?’

She was momentarily startled. ‘Yes.’

‘I read your staff profile,’ Jimmy quickly got in. ‘So, how is your fiancé?’

‘Fine, sir. We hope to be married next year.’

‘You don’t wear his ring I notice?’

‘Not in work, sir. Metal is not a good idea around here.’

‘Of course,’ Jimmy said with a smile. ‘Oh, you lost this in the hotel swimming pool.’ He lifted the ring for her to see. ‘Your engagement ring.’

She blushed. ‘That ... can’t be mine.’

‘You’re right, it’s not. It belonged to the woman you killed, and replaced.’

The managers were now closing in, our suspect going red and glancing at the faces.

‘You can answer my questions, or I’ll hand you to the Somali Rifles for interrogation, informing them that I don’t want your body ever found. Now, I want you to whisper in my ear who sent you. Or else.’

After many seconds, she leant in and whispered in Jimmy’s ear. Jimmy straightened, making eye contact with two plain clothes Pathfinders, who led her out.

‘She was a spy?’ the manager gasped.

‘Yes. Is your French head of security here?’

They summoned the man, the managers and technicians disturbed by the turn of events.

Jimmy stepped up to the man, and looked him over. ‘We’ve just discovered a spy, who took the place of Monique. Since she – the original – was a French citizen, I’ll be making a formal complaint to your President about your lack of ability. You may resign your post today if you wish.’

Before anyone had a chance to do anything, the plant manager shouted at the security man and led him out, a toe up his arse.

I closed on Jimmy. ‘Lucky we found that ring.’

‘Very.’

‘Fortuitous, almost,’ I softly quipped.

‘Planned, almost. Someone knows Shelly’s habits well.’

We walked out, boarded the coach and navigated the short distance to the desalination plant across parched desert. There, Abdi awaited us with a pack of journalists, and a host of African TV crews. I even noticed a Jordanian crew.

This desalination plant was not so much a plant, as a long stretch of moist ground, about four hundred yards long, pipes in and out of both ends. What the press could not see, that a large sign conveniently displayed, was that it was actually a deep trench, some ten metres deep and twenty metres wide, lined with concrete and filled with a special dust made from rock and compacted down. The trench rested at a slight angle, and seawater had been pumped into a reservoir at the far end, now creating a pressure that pushed the water – very, very slowly – down the trench and through the compacted rocks. At the far end, filters cleaned up the water and stored it.

With Abdi and his government colleagues in tow, we now walked to the arse end of the trench, stepped down into a concrete box and accepted glasses of tepid water from technicians dressed in white. I sipped mine, finding it palatable. It was not perfect, but it was OK. Everyone downed their drinks of plain water, and made suitable noises and faces. It was not perfect, they agreed, but it was OK.

Climbing back up, we approached the TV crews and the press. Jimmy began, ‘This desalination facility, the pipe under our feet, is very cheap to build, simple to operate – since there is nothing to do, and the end result is clean water, good enough to drink. This is the prototype. There is a larger version under construction, and that will provide Mogadishu and its surrounding area with drinking water.

Any country that wishes to send its scientists here is welcome to do so, to see the very simple technology behind the process.'

He fielded questions for ten minutes, the technicians handing out pamphlets on the technique.

Moving back toward the coach I asked, 'This fix Jordan?'

'Partly. And partly by regular desalination, and partly our plastic tubes. And we can swap some of this technology for Jordanian Uranium ore.'

'Jordan has Uranium?'

'It has one of the world's largest deposits. Better to buy it now than after 2025. It'll boost their economy as well, when they need it.'

'And our spy? Who was she working for?'

'She fully believes that she's working for the French Government.'

'But isn't...?'

'No.'

'You have an idea?'

'An idea, but not much more at the moment,' Jimmy admitted.

As we landed back in the UK, the ground was shaking in China. Fortunately, the People's Army had insisted that everyone sleep outdoors the night before, an AK47 up the backside of anyone not co-operating. Buildings collapsed, schools and hospitals, and people in remote areas were still hurt. Rescue Force moved in and set-up camps and temporary shelters, complete with field hospitals. Five thousand people died on that first morning, Jimmy suggesting that it should have been sixty thousand. Now came the awkward part for the Chinese authorities, the admission that their building codes were crap, and that local authorities built sub-standard buildings out of sub-standard concrete. The recriminations would last a long time, reverberating around like an earthquake.

Shelly had been discussing what to do with her money on the flight on the way back, and I was tempted to take it off her. I certainly wasn't going to allow her to take it to school on Monday. Back at the house, her first suggestion pleased me: a huge fish tank for the school, so that all the children could see the colourful fish. I sanctioned it. Next was a fish tank for our house, which I agreed to after discussing it with Helen; after all, our daughter was due to be a marine biologist. Finally, she wanted a golf buggy converted, a pink Hannah Montana golf buggy. Picturing her tearing around in it I agreed, wanting to see it parked next to Big Paul's combat model with its camouflage colours.

Two days after returning home, a stray rocket – fired from Georgia – wounded several Rescue Force staff. Jimmy rang the President of Georgia and told him that the next time he set foot in Europe he'd wake to find Jimmy at the end of his bed. And left it at that. We put together an international team, and they visited Georgia, leaning on the Georgian President. If he wanted western aid, he would have to stop his countrymen lobbying the odd missile at South Ossetia. He'd also have to sleep with a chair up against the door.

Plans, plans and more plans

My new office was finished a month later, and I moved in the people that I had hired, Jimmy checking their faces first. I had allocated myself a grand office – chairman of the board, space enough for my new secretary. Helen was banned, not least because she always took the piss out of my filing system. That filing system meant that everything important - and not dealt with - was in plain view, even if on the floor. I had two walls of continuous desks made up, and now my existing project files were laid out under their departmental headings.

On my desk lay the important files, and within hours I knew where everything was. Stepping out from my office, an open-plan room offered sofas around a large coffee table, the all important tea and coffee making facilities nearby. On my immediate left sat an office for my Pineapple liaison. After him came my bank liaison, because I thought that was important. Next came the airline, then CAR, then a guy from the corporation, the property business and finally the clubs.

Some of the men, and they were all men, now lived in the apartments, and a few had bought houses locally. When they were moved into their new homes, and settled into their new offices, I called the first meeting around the coffee table. My secretary was Sharon's cousin, a bit of a forty year old frump, but apparently excellent at her job. Jimmy recommended her for her sharp tongue, and ability to tell very important people to "go stick it up their backsides".

We all grabbed mugs of tea, and sat facing each other. 'Welcome to this ... the first meeting of the "Paul is disorganised" club.'

They laughed.

‘Your job is to make me less disorganised, and to save me time, because I have only so many fingers, and many pies to dip into. OK, first rule: if I’m here – I’m here. If I’m not here, chances are I don’t want to be answering the phone to you lot. If it’s not life or death, it waits till I come in or call in, because if there’s a meeting in the house – called at short notice – then I’ll be tied up. You’ll also have lots of peace and quiet when I’m abroad, which is a fair amount of the time.

‘What I want from each of you ... is a summary of your departments, and by that I mean a page at most, if not two paragraphs. Behind that should sit a more detailed explanation, which I would expect to be more verbal than written, but also written for the file. But be careful, because Jimmy will ask for figures and reports, and he’s not as polite as me when things are not ready. So, for instance, let’s ask – how are things at the club?’

The relevant man reported, ‘Cardiff club is down five percent on last year, year on year. Food consumption is up, drink down a bit. London club is other way around, with lots of idiots buying expensive champagne to impress the ladies. It’s up three percent year on year, hotel now full most of the time, Cardiff hotel lagging. And the London club benefits from many corporate meetings being held there midweek.’

‘Good, short and sweet. No corporate work in Cardiff?’

‘It’s Wales, guv.’

I nodded. ‘OK, that’s the kind of report I like. If I then wish to go into detail, I’ll do it with you individually. So, let’s start with problems.’

The airline guy raised a pen. ‘Boeing and Airbus are charging us for the wages of apprentices in Goma, yet they’re paid by the corporation.’

‘Rip them a new arsehole. If they don’t pay it back, remind me to get involved.’

The bank guy raised his pen. ‘The Chinese have sent advisors to the bank HQ in Goma.’

‘Fine, I was expecting that. Let them audit, observe, and sniff around to their hearts content.’

‘They’ve offered investment capital, just about a hundred million dollars, but only for mines.’

‘Fine, use it, but not out of proportion to other investors. Is all corporation money going through the bank now?’

‘Yes, and they’re building a secure cash repository at Forward Base.’

‘I thought we had one?’ I puzzled.

‘We do, but it’s not big enough. It’s holding a lot of local currency.’

‘OK. Corporation, what’s new?’ I asked the man.

‘Steffan Silo is working on the rail link –’

‘How’s he ... fitting in?’ I probed.

‘He has a house on Spiral Two, he’s taken up golf at the course, and people often mistake him for Jimmy.’

‘And the train project?’

‘They say he’s come up with some great money saving ideas, and some efficiencies. Instead of shipping concrete sleepers for the track, he’s ordered up their manufacture at three sites on the route, and made the track a twin track. That way, a supply train comes alongside the crane that lifts the sleepers and track into place. They think it’ll shave a third off the time at least.’

‘And the cost?’ I asked.

‘Be cheaper, but still expensive as hell.’

‘OK. The roads?’

‘There are new roads down to Zambia, through Burundi and towards Malawi. Many new internal sections, and the Burundi-Tanzania section could be a motorway, of sorts. We’ve widened it to four lanes in some places.’

‘Give that stretch priority over the Kinshasa road. And where the train track runs from the north, across Southern Sudan and into Kenya, see if we can’t create a road that follows it. OK, what about Gotham City?’

They laughed at the name. The corporation representative answered, ‘We’ve got more apartments than people at the moment, so we’re building small towns in other areas, where mines are concentrated and where the roads are good.’

‘And those spare apartments?’ I nudged.

‘They’ll fill up as the factories in the area grow.’

‘Are they growing as fast as they could?’ I pressed.

‘Yes, painfully fast.’

‘And the university?’ I asked.

‘Just about finished, first term is September.’

‘Did we sanction a zoo after all?’ I asked with a frown.

‘There are plans for one, south of the airport, about three miles.’

‘Make a start on it, but let’s make sure it has a captive breeding program and a lot of interesting exhibits. Let’s have people flying in

just to see that. And coming back to those empty apartments, let's see if we can't think of ways to attract other factories down there. Start with European companies involved in plastic and synthetics, since we've got the cheap oil right there. Remind me of that in a month.'

After a hard day at the office, a few piles moved around, some actually getting filed, I jumped into one of our new electric cars and sped under the road and down past the lake, halting outside the house. It was not a long commute. I hadn't charged the car since I took receipt of it, and figured it would last a hundred and fifty years at the rate I was using its battery.

'I'm home honey,' I announced. 'Did you have a hard day at the office?'

'More space now that your junk has gone,' she told me. 'How is it up there?'

'I'm getting a lot done, and I can find my piles on the floor where I left them.'

'Shelly, show daddy what you got today.'

Shelly jumped up and led me by the hand out of the front door. There sat her pink Hannah Montana golf buggy, making me smile. She unzipped the plastic rain covering and jumped in, so I sat next to her, peering through the front plastic. She hit the start switch and then the pedal, shooting off at a worrying speed.

'Slow down, baby, that's quite fast.'

She slowed a little, turning and heading around to the front of the house. And straight for a silver Mercedes coming up the drive.

'Turn, baby.'

Shelly yanked the wheel.

'Other way, baby.'

She turned, but so did the driver. His breaking was good, Shelly's a bit slow, and we smashed the front of the buggy, plus his lights.

With Shelly giggling, I stepped down as Sykes eased out with his driver. 'I'm terribly sorry, Mister Sykes.' I inspected the damage to his car with my hands in my pockets.

'Is she on your insurance?' he barked.

'Mr Sykes, I dare you to report that you were hit by a pink Hannah Montana golf cart.'

Jimmy stepped out. 'Shelly, dear - drive slow, like I told you.'

She reversed, turned and sped off.

'Send Paul the bill,' Jimmy told Sykes as he shook his hand and led him in, a scowl my way. I had to walk all the way back around to the house.

‘Shelly, when you crash into someone else’s car, you stop and say sorry,’ I told her as we got ready for dinner.

‘What?’ Helen puzzled.

‘She just smashed Sykes car.’

‘Oh, god. I knew it was a bad idea.’

‘There’s an inhibitor in the buggy, I’ll alter it to six miles per hour,’ I offered. ‘Then she can just crash slowly.’ I inspected the fish tank, delighted with it. Sometimes, late at night, I’d turn off the main lights and just watch the fish, the brightly coloured creatures illuminated by their own tank lights.

In the weeks that followed I began to appreciate the family more, always having to catch up on what had happened at school or home. My office was only a third of a mile away, but I was a commuter now, and not a home worker any more. With President Chase hard on the campaign trail – but well ahead in the polls, we flew over and gave him a resounding endorsement, even attending some of his rallies.

Message in a bottle

Keen to see Gotham City grow faster, I met with several US plastic manufacturers, but could not convince them of the cost savings; their markets were here in the States, and Africa was somewhere around the atlas. I decided to take a more direct route, and followed Jimmy’s example. I found one of the largest suppliers of plastic bottles in the US and bought a controlling share without even asking Jimmy, the money coming from CAR. I sent their best people to Goma to open a factory. Given that it was a CAR company the land was free, the oil dirt-cheap, the labour keen – and very cheap.

By time Hardon Chase had been re-elected I was finishing off my plastic bottle factory at break-neck speed. The first bottles out of the moulds were sent to African bottling plants, since they were closer. And we beat their previous purchase costs. When they had been satisfied, we sent the bottles further, but still within Africa, soon cornering that market and producing a million bottles a month. That became five million as a second plant came on line, working twenty-four hours a day in three shifts.

With African markets just about conquered – stiff competition coming from Nigeria, I set my sites on the Middle East, and soon

found a few customers there. That led north to Europe, where the bottles were shipped in very large batches. But not just bottles for fizzy drinks; we had won orders for the nice shampoo containers and other products you'd find on the shelf at any chemists. Seemed that there were a lot of products sold in plastic bottles.

Using my name as influence, I waltzed into the boardrooms of several British supermarkets, and offered to beat any price they were currently paying, and to match the quality of their existing line. They asked for labelling and printing on the bottles, save it being done up here, so I organised a labelling extension to the factory and bought equipment that sprayed on coloured images, organising experts from Europe to operate the new machines. Jimmy knew of the project, but left it to me. He did not interfere.

We enjoyed New Year 2009 in Fiji, stopping off in Auckland and Sydney on the way back, but flying back via Goma hub. There I proudly showed Helen and the girls my bottle factory, the ladies each recognising the labels for products they used at home, especially shampoos. My daughters already knew more brands of shampoo than I did.

Hardon Chase was sworn in on a chilly day, and we stood in the crowd of honoured guests, feeling suitably cold. And we only got to talk to him for ten minutes. The day after the ceremony, I visited the plastic bottle supplier and pointed towards their bottom line, the company profits now soaring. I set them the task of getting our bottles into America and in turn they handed me specifications for the first few lines, which included smaller, but more expensive bottles, hotel shampoo vials and perfume samples. After working out a few figures, I estimated that I could put them on a 747SP and fly them over without killing the margin, till they explained that the contents came from the Far East. Simple. I shipped my bottles from Mombassa to South Korea, a year's supply at a time.

With Shelly celebrating her eighth birthday, Lucy now six, I was busy opening up new markets in Europe and the UK, and in Gotham City my plastic factories gainfully employed three thousand people.

At Shelly's birthday celebration, Jimmy said to me, 'Good work on the bottles, really good work.'

It was strange; I no longer felt like Robin to his Batman. Buoyed by that, I sat down and had a brain storming session with my team. We isolated the most complex and expensive items we could find that were made of plastic, and most of them seemed to be fitted to cars, vans or lorries. We got to work, and chief salesman Paul Holton got on the phone, always getting through to the managing

director, whether they accepted calls from salesman or not. I soon had an order for hard plastic parts that would fit cars being manufactured in the UK. Our margins started to increase, even though that was not the main aim. The main aim was for Goma industrial area to make products that sold around the world, and to employ more people.

Bushfires, mate

After the New Year visit to Fiji, the trip to Sydney had an ulterior motive; Jimmy wanted to check out the units, to review inventory and readiness. Before leaving, he had asked Dunnnow and his team to re-assess their previous effectiveness during bush fires. Now, as we edged into February, reports came in of bushfires, the start of the season for south Australia.

On February 1st, Jimmy ordered British, French, and German alpha teams to Australia – just in case. As well as for the experience. When he dispatched Doc Graham, people figured that something big may be up. As the days ticked off the calendar, I called up a web page that I had book-marked and checked the bushfire reports. When I noticed a report suggesting that they were getting worse, I brought it to Jimmy's attention.

‘More bodies and jeeps, please,’ he said to me.

I called Bob Davies. ‘Bob, send the white Kenyans to Australia, jeeps in Il76 aircraft. Send over New Zealand, Samoa, Fiji. Oh, and the new Hawaiian teams. But make sure they all have jeeps.’

‘Hueys from Kenya?’

‘Yeah, couple.’

Each day I checked the news, and each day the situation on the ground was deteriorating. And when I caught a particular news article I stopped dead; an RF medic had injected a burns victim with super-drug, and was not only filmed doing it, but describing it as well. I checked with Bob, discovering that the deployed teams carried Doc Adams super-drug. In other words, his own damn blood with the red blood cells removed. Jimmy calmly suggested that people would put it down to the super-drug. Besides, it was great for burns.

The bushfires turned out to be the worst for decades, but our people were on top of it, the backpacks containing a blood product from the future. If only they knew.

Bottles, lots of bottles

Seeing my successes back in December, in the plastic bottle market, the Chinese wanted in, not least because I was pinching some of their trade. I readily agreed, and they constructed four large factories, each big enough to land a plane on the roof. They began producing fittings for the Far East car market and I tried not to pinch any more of their trade. Since they now employed an additional nine thousand people I was happy enough.

The spare apartments had gone, but not by workers and managers; all sorts had moved in. It was as Jimmy said: create the right commercial conditions and it will attract people to it. These new residents accompanied small businesses that serviced the factories; we even had our first brothel open up. Jimmy and I could not decide if it was a good thing for the workers or not, but left it in place. After all, if we closed it down it may go underground. At least this one would pay taxes. That gave me an idea, but Jimmy said no.

With most of the apartments in Goma now full, or at least sold to someone – absent or otherwise, I commissioned new apartment blocks, still plenty of investment dollars sloshing around. The zoo had been built quickly, little more involved than digging ponds and throwing up fences, and it now housed every type of animal that you could find in Africa. It stretched almost a mile end-to-end, and came with a large visitor centre, a small hotel for visiting experts, a staff accommodation block and a research centre. That research centre, and its carefully targeted projects, would be sponsored by us; grants would be available for research into a variety of animals, large and small, and the diseases that afflicted them.

Sat in my office one day, looking at the literature for the zoo, I had an idea. I didn't discuss it with Jimmy first, I simply ordered the new project. Our zoo would now have a college built next to it, for Africans to come and study for degrees in zoology. It would come under the wing of the main university, and all of the places on this new residential course would be free. When I informed Jimmy, he just nodded approvingly.

Unfortunately, we received four thousand applications for just sixty places, so it was back to the drawing board. I ordered an extra four hundred rooms built at the zoo college, plus an additional five hundred at the main university, which was a short commute on a free electric bus.

Thinking on, I persuaded HSBC and Barclays to open branches near the airport, and a British supermarket to open a store. A number of restaurants had popped up, a few shops selling all sorts, and the locals now enjoyed all the modern conveniences.

One day I asked my team, 'What could we grow ... and sell?'

Bananas, was one answer put forward, coconuts another – for an export market. I ordered a massive swath of land cleared, irrigation trenches dug, and banana trees planted. Those trees occurred naturally in the region, so it was a case of simply finding the specimens below six foot tall and pinching them. Finding that many villages already nurtured banana plots, I arranged for their produce to be bought and transported to a central sorting area. From there the bananas would go by truck to Nigerian, Kenyan and Tanzanian markets, some to be shipped up to the UK. In Goma, they were given out free at various outlets, and each factory had a free lunchtime delivery. The coconut trees would take longer, but at least many had had been transplanted. We would have to wait a few years for any sizeable coconut harvest.

That set me to thinking more. What could we put in the bottles we made? Fruit? Fruit juice? Tomato juice? I could ship it up to Europe.

At that point Jimmy stopped me, and asked that I try and feed Africans with cheap produce, which would also help to boost the local economy. That led to a big pow-wow with the corporation staff, and an inventory of all things grown, animal or plant. The orphanages grew their own crops, and generated around sixty percent of what they needed. The fish farms were very productive, but little in the way of crops were currently being grown in the region; wrong type of soil. Zimbabwe, however, had great soil for crops, so I sanctioned extra money for farming projects there, so long as they were super-sized.

Seeing that the land in the DRC was fertile, albeit a little sodden in most parts, and we had sunshine, I asked about greenhouses. Glass was expensive to import, they reported.

'Don't need glass, we have Perspex factories coming out of our ears!' I told them.

A factory was duly tasked with making small square panels. They disobeyed that order, and made panels that were six foot high and three feet across, with one edge rounded and one with a groove; a green house could be put together in two minutes. Pleased with this innovation, I ordered up hundreds of thousands of panels and set a team to work. A hundred miles west of Forward Base, land was cleared of trees and flattened by Caterpillar bulldozers, the new muddy zone the size of ten football pitches. Concrete lines were laid, twelve inches deep and ten feet wide. On them, the panels were clipped together, soon creating long lines of parallel greenhouses. Fearing that a storm might topple the flimsy greenhouses, metal wire was run across each and the individual greenhouses were pegged down like tents. Large trays, made of plastic, were placed inside the greenhouses, filled with soil from the nearby ground, and a variety of plants seeded, including tomatoes.

I was happy with this gardening project, not least because it gainfully employed two thousand locals. Po shipped us fertilizer for free, aboard empty trains returning to the region from the coast, and our crops had an excellent environment in which to flourish.

A nutritionist, a British man, then approached us. He had seen a write-up on the greenhouses and had been involved with Africa for many years. His idea was simple: grow the crops locally, convert them to paste, a bit like tomato sauce, then sell it cheap to Africans. But because it was a paste, a certain amount of water removed, it would be concentrated, and free of the additional packaging typical for loose fruit. That would also mean that transport costs would be lessened. If we put the mulch in three or five litre plastic containers it would be cheaper again. I hired the guy on the spot and sent him off to get started, the processing plants required being very simple to set-up and run, and employing even more locals.

When a corporation official questioned the cost of employing the locals, on projects not yet showing a profit, my answer was simple. 'The oil and ore in the ground belongs to them, not to us. If the profit from that oil and ore creates jobs, and they get paid, then that's the correct use of the money we make. Furthermore, if you ask a question like that again I'll give you to the Congo Rifles for target practice.'

I flew down in March, to see the fruits of my labours, literally, and took only Big Paul with me after he asked to accompany me. We stayed one night in the first airport hotel, since I always liked to check out the ambience – and the quality of service it offered our guests. As with River View, all those years ago, I would walk

around the guests during the evening meal and enquire if everything was OK, conversing in a few different languages.

In the morning we grabbed four Pathfinder bodyguards and hopped onto a bus, simply because I wanted to see what the new electric buses were like. Very few people were travelling outbound from the airport, and when the last passenger jumped off I ordered it to return, stood next to the driver and asking questions of the vehicle's performance, passenger numbers, and all the interesting things that people left behind on it.

Back at the airport we hopped off and waved forwards two green and yellow electric taxis. I gave the pathfinders dollars for their driver, worrying that they'd just stick a gun in his face, and we set off, a very smooth and quiet ride to my latest venture, the fruit concentrates. At the factory gate they were not expecting us and a call had to be made. Paul who? Once inside, I sat down in their canteen with the Pathfinders and Big Paul, three litre containers grabbed, dishes and spoons to the ready. We squeezed out the concentrate, one each of banana and tomato into separate dishes, and sampled them. The banana concentrate was just like mashed up bananas, and the tomato concentrate just like mashed up tomatoes, only a little less bitter. That lack of bitterness seemed to come from the heating process. All in all, we all thought they were great.

The bottling facility had been cleaned and sterilized overnight, after numerous test batches had been sampled, and now I ceremonially threw a switch that re-started the machinery, being photographed by the African Times. An hour later the first batch of a thousand three-litre containers were ready, filled and labelled. I ordered them put on a truck and took charge of it, asking for the next run of a thousand containers to go to the orphanage as the additional bottling lines were brought up to speed.

With the Pathfinders following in their green and yellow taxis, Big Paul and I sat in the lorry cab and directed the driver to the working-class suburbs of Gotham City, on the east and towards old Goma town. I stopped the lorry at a busy crossroads and stepped down, our white faces being noticed. From the back of the lorry we grabbed containers as people looked on, and placed down the concentrate. With the Pathfinders forming a chain, I lifted the first container and offered it to a woman stood watching us. She read the label and walked slowly off with the heavy banana concentrate. Kids ran forwards, and I gestured towards the containers already lined up on the side of the road, young kids soon struggling along with my produce. Other adults, mostly women, now closed in, and each

carried a container away, Big Paul and myself working up a sweat as we off-loaded them.

People soon came running down the street, and I noticed some of the same youths more than once, not that I cared. In thirty minutes we had offloaded the lot, mounting back up for the return trip. The second lorry sat ready, and I directed it to the university, to the student canteen; they would be my willing volunteers. We carried twelve containers inside, finding a few dozen students sat about. I called them over.

‘I would like you all to taste this new product, and to give an opinion.’

They fetched dishes and spoons, the refectory staff coming out to see for themselves what was up. We were a hit; the students and staff loved it, especially if you added a dollop of ice cream. They helped us unload a hundred containers, and we set off again. This time I headed for the nearest factory, a plastic components factory, and towards their canteen. The manager rushed around, worried, and surprised at what I was carrying into his staff canteen. We repeated the taste test, finding similar results, but some of these poor buggers would find it waiting for them when they got home tonight. I dumped a hundred containers and set off, offloading all of the containers at nearby factories before returning to the bottling plant.

The plant machinery was now at full capacity and producing more containers than I could give out in a lifetime. With an IL76 sat waiting at the airport, I confirmed that five thousand units would go to Mawlini, to be sent on to Darfur after some sampling at the base. The rest would be distributed around our region by truck, sold through shops and given out free to corporation workers of certain grades.

Back at the hotel, I showered and changed my sweat-soaked clothes, having lunch with Big Paul and staying well away from the fruit. I’d had enough. I was then surprised to find that Big Paul had a project of his own that he had been working on in secret, but with Jimmy’s permission, hence his interest in accompanying me for this trip. It involved fishing, and was to be a surprise for me.

After lunch, we drove around to the airport, a Huey sat waiting. We threw the pilot and co-pilot into the rear with the bodyguards and lifted off, Big Paul knowing where he was going. After getting lost, twice, we eventually found what he was after, an area of what appeared to be swamp at first glance, a group of modern steel sheds next to a helipad and a road, a few trucks dotted about and a dozen workers.

With the rotors winding down we eased out, being greeted by the project manager, a local man named Seth. He led us forwards and pointed out numerous narrow channels of water, each no more six feet wide, but stretching into the distance with no end in sight. The banks of each channel appeared to be just overgrown jungle, small trees and bushes overhanging the water.

‘OK, I’m curious as to how you’d get a fishing rod in *there*,’ I told Big Paul, stood with my hands in my pockets.

‘You don’t, the locals fish with nets and spears,’ he began. He pointed at a channel. ‘This was all shit land, jungle, but without too many big trees. Basically, it was swampland. We dug the trenches, each about three feet deep, let them fill up with water, and put in catfish and other species from the other fish farms. The difference, is that this needs no one to maintain it, and all the tasty insects from the leaves fall into the water for the fish.’

I saw a splash. ‘What was that?’

Big Paul grinned. ‘The fish around here don’t wait for the insects to fall off the leaves, they jump up for them.’ He nodded to the manager, who sent forward two men with spears, the men soon hauling back a catfish some four feet long. ‘They can grow to that size in a year, and it needs no maintenance. Besides, in the shallow water like this they breed well, and there’re no competitors for their eggs.’

The manager handed over a chart. Big Paul said, ‘One acre produces one tonne a year.’

‘A tonne an acre? That’s good,’ I commended. ‘How big is this spread?’

‘Two hundred acres,’ the manager informed me.

‘And all it cost was a digger for a week,’ Big Paul pointed out.

‘Excellent.’ I faced the manager. ‘You have permission to increase the size of this to twenty thousand acres.’ The man blinked. ‘Employ locals, get whatever you need.’ I faced Big Paul. ‘Excellent project, low cost and natural, and it keeps the locals gainfully employed.’

We let the pilots fly us back, chatting in the rear about production quotas. This was low tech, but the fish could be frozen locally and shipped, or even shipped alive. We spoke of a fish plant that would clean and process, and I left that to Big Paul to work on. He was a fisherman at heart.

L'Aquila

With our RF teams home from the Australian deployment, Jimmy informed me of a quake in Italy in April. I was concerned, since this was close to home and in the middle of Europe. We drove over to Mapley and called in the senior staff.

'Right,' Jimmy began. 'Crusty is predicting a quake in Italy.'

'Italy!' they queried.

'Italy,' Jimmy confirmed. 'In the north, some place on the map called ... the L'Aquila region. It does, apparently, have a history of quakes, and Crusty has been over there looking at the recent small quakes. He has a tight date range, which helps I guess. I want all European Alpha and Bravo teams, and our reconstruction teams. And I want tents for fifty thousand people set up days before the quake. Seven days from now you all drive down together, across Europe.'

'Shit,' they let out, sat looking stunned.

'Doc Graham, you're in charge on the ground,' Jimmy ordered. 'Start making plans now, please.'

Leaving Mapley, we drove east down the M4 motorway and to London, a 4pm appointment at the Italian Embassy. Once through the security, we were led straight in to the Ambassador, a warm welcome offered. The mood would not last.

'Mister Ambassador,' Jimmy began. 'As you know, we have a man that predicts earthquakes with his clever software, and you will also be aware that you signed the Rescue Force Charter. That Charter allows us to move into Italy without additional permission from you.'

The Ambassador stopped smiling.

Jimmy continued, 'We are predicting a quake in six days, in the L'Aquila region, which may cause a lot of damage, so we are – obviously – keen to discuss it with you.'

'Yes ... of course,' the man stumbled with. 'What ... what did you wish to do, exactly?'

'We wish to move our people into place before the quake strikes - to be ready.'

'But this earthquake prediction is not an exact science,' the Ambassador pointed out. 'Your presence may cause panic amongst local population.'

'That ... is the price to be paid for vigilance,' Jimmy insisted. 'Arriving two days later achieves little. Besides, our man is happy

that he can pin down the date due to small recent quakes and micro-quakes. So we wish to deploy at the end of this week.'

'This week? I ... will need to discuss this with my Government—'

'You'd then be in breach of the charter you signed,' I pointed out. 'And you'd be expelled from the Rescue Force family.'

'Again, I need to discuss that as well, and its implications.'

I was just not in the mood. 'OK, tonight we go public and issue the warning, with or without your blessing, Mister Ambassador.'

'Such a move could lead to legal action,' the Ambassador pointed out.

'It could,' Jimmy suggested. 'It could lead to people staying put when you don't back our warning, being killed, then suing your government. And let me be clear about something: I would set aside a hundred million pounds to give to the families of the dead for their legal costs in attacking your government.'

'We on the same page, mate?' I asked the man.

'I do not appreciate threats.'

'And we don't appreciate making treaties and then having people break them,' I countered with. 'You ... signed a treaty. All you need do is stick to it.'

'As I said, I will consult with my government. This meeting is ended.'

Back in the car, I said, 'That could have gone better.'

'Same old bollocks, same old politics,' Jimmy commented as we drove around to the BBC studios. Jimmy went straight for the jugular. 'We're predicting a serious earthquake in Northern Italy, in the L'Aquila region for the end of this week, but the Italian Government has failed to honour the Rescue Force Charter and is refusing to allow our rescuers in. That will probably lead to Italy being expelled from the Rescue Force organisation. I just hope that we're wrong, and that the people of the region are not killed in large numbers. I would hope that some, at least, leave the area in the next few days, those that value their lives, and the lives of their families.'

We had lit the blue touch paper.

Driving back, the Prime Minister called. He had been on the phone with the Italian Prime Minister, who was furious at many people and many things, feeling the heat already and not knowing why – or how this had even come about.

The morning news ran the story, the Italian press all over it, people starting to pack-up and leave the region in question. At least some were listening, and the news coverage was a hundred percent in Italy and Europe. We received a fax around noon from the Italian

Prime Minister, confirming that we'd be allowed in under the conditions of the Charter he had signed. We had kicked the front door in, and cut short a lengthy diplomatic process with some very un-diplomatic language and conduct, Jimmy suggesting that they would have dragged their feet.

We drove over to Mapley in the morning as the various RF teams assembled, brought back from abroad and off training exercises. Fifty white jeeps sat lined up, equipment being strapped to the roof racks. I patrolled the line under a grey and threatening sky, rallying the troops and meeting some old faces. We now seemed to have some large white RF lorries, although I had no idea where they came from, which were now being stuffed full of tents. These days, we had white RF tents, not stolen UN tents.

With TV crews filming, and several crews embedded, the teams ran through their final checks and mounted up. Jimmy walked out to the line of jeeps, paused as he took in the long line, then blew a whistle, pointing the first jeep towards the gate. An impressive column of fifty jeeps, and ten large trucks, moved slowly out of the gate and towards the Channel ferry ports. In France and Germany, similar columns were either moving off or getting ready. They were due to meet in Switzerland late tomorrow, and to drive south together, a deliberate spectacle for the cameras. Hueys would take off from various locations tomorrow, refuelling en route to Italy, another spectacle for the cameras as they grouped together.

Back at the house, we packed our bags ready; we'd be at Mapley for the deployment. Two days later we drove over early, missing the nutters at the gate, who all seemed to sleep in late. We dumped our bags and checked our suits, Helen and Trish setting up the communications centre. As they were doing that, a column of white jeeps and trucks a mile long wound its way through Italy and to L'Aquila, white Hueys overhead. Italian TV news had filmed the column on a stretch of straight motorway, the image making the front pages under the playful heading of "Invasion". The vehicles turned off the highway onto side roads and spread out, each moving to a pre-planned halt, where camps would now be set-up. On the outskirts of the regions, RF doctors and nurses pulled up at the local hospitals and made themselves known, many booking into nearby hotels.

That evening, I gave my first interview, along the lines of "better safe than sorry". But so far we had little to report.

As a grey dawn appeared over Italy, the tented cities grew out of nothing, covering previously green fields with a uniform matrix of

white tents and portable plastic toilets. Many of the local residents had already given up their homes, but an estimated sixty percent remained. Now, Italian RF teams knocked on doors and tried to persuade the stubborn locals to spend a few nights under canvass, the offer of free food and drink dangled. Many took to the tents, whole extended families, and all local schools were closed.

The next evening, Jimmy spoke to Doc Graham, urging him to try and lever more people out of their homes and into the tents. The teams redoubled their efforts, begging people to leave for the night at least, and to come back in the morning. Thousands more were nudged under canvass, cold for them this time of year.

Early the next morning the quake struck, the damage great, the death toll rising as rescuers returned to those houses that had not been evacuated, and sifting the rubble. But at least the families in the tented villages celebrated their survival, and Jimmy ticked a box.

The press descended upon us that day, the communications room full as we relayed facts, figures and opinions; a well-practised routine. On the ground, RF teams rushed about under the gaze of a hundred TV cameras, shoulder flashes of Britain, France, Switzerland, Germany and Italy displayed. They moved with professionalism and practised ease, and it made me proud to observe them on the TV news.

With Mackey sat in the lounge with us, I remembered our first meeting, at a fair in Scotland. It had taken a long time to get here, but the teams were now excellent. And he still wore hiking boots to the office. As we sat there, he informed me of a pending retirement. Christ, he was almost seventy, I realised.

Packing up, we returned home early the next morning, the kids glad to see us. The main RF teams returned home a day later, leaving behind the reconstruction teams, and enough people to man the tented cities.

Jimmy commented, 'Those tents will still be there a year from now, the houses not rebuilt. But we'll give the Italian Government some shit over it.'

Haiti

A week later, and with the weather improving, Jimmy handed me a new project, as if I didn't have enough to do. Haiti would suffer a

quake in 2010, and we needed to make preparations now. I sat down with paper and pad and had it all worked out within two hours. In the main house I asked Helen's assistant, Trish, about planned trips, and fixed a weeklong holiday in Cuba for Helen and myself, no kids allowed. Uncle Jimmy would be helping out with the girls, a task he relished. I grabbed Big Paul and Karl and told them to pack; we'd leave in two days.

Landing in Cuba, in the tourist north, our low-key minders drove us around to a new hotel, built by us through the property business. The hotel had been laid out in the shape of a horseshoe surrounding a large pool and park, and totalled three hundred rooms. Settling in, Helen found it odd for the girls to not be with us. She rang the house within ten minutes of unpacking, finding the girls in the diner with Jimmy, eating all the things that we generally rationed – or disallowed.

'He's spoiling them,' she complained after the call.

'That's what uncles do. And grandparents. C'mon, sangria at the beach bar.'

We knocked on the room shared by our earnest bodyguards, and led them down to the bar, picking up two plain-clothed Cuban officers in the lobby. With some sangria downed, Helen relaxed a bit. Local ladies offered massages on tables, just on the grass in front of us, so we both lay face down and indulged ourselves for an hour.

Returning to the bar, I stepped towards the guys, and time started to slow down.

I reached their table, moving in slow motion, focused on Big Paul's hideous Hawaiian shirt. A silver coin on the floor spoke to me. It offered me my life back. I bent down, touched it, and Karl's head exploded, the high velocity round passing through my bodyguard, my friend, and making a very large hole.

A shove from Big Paul, and I was somehow underwater, the clear pool water tainted with delicate swirls of red blood as I looked up at the sky. A splash caught my attention, a blurred face, a lot of hair swirling in the water, a hand on my head lifting me up. I broke the surface facing Helen.

'Paul!' she screamed.

'I'm OK,' I got out, scanning the people running back and forth.

A second shot rang out, indistinct, then a third.

'Stay down!' Big Paul shouted, now knelt next to a short and stubby palm tree.

We stayed in the pool till the screaming had subsided, realising that most of the holidaymakers had fled. Looking over my shoulder,

I could see a large pool of dark red blood that used to be Karl, a hole in the back of his head big enough to fit a tennis ball in. That fate had been meant for me, and I had to stop and ask – why?

The air filled with the sounds of sirens, police officers soon running about, and we were still in the pool, Big Paul close. The officers formed a line and we eased up, bent double and running inside. Through the lobby we sloshed, leaving wet footprints.

They escorted us to our room and took up position outside as I closed the door. I reached for my phone and dialled Jimmy as Helen towelled down, my wife shaking, but not from the cold. ‘Jimmy, Karl is dead, sniper aiming at me.’

‘Helen OK? Big Paul?’

‘Just Karl, round took his head off. I think maybe a fifty calibre from the hotel next door.’

‘Then we were lucky. They’ve had their shot, they won’t get a second one. Take it easy for a few hours, decide what to do, I’ll deal with the security.’

I hung up and stripped off the wet clothes, placing on dry ones, putting the wet clothes on the balcony before I realised that was probably a bad idea. From the balcony I confirmed where the shot had come from: roof of the hotel next door. I opened the door and told the police what I thought before attending the mini-bar. I twisted the top off a small bottle and handed to Helen. ‘Down it in one, it’ll help to take the edge off.’

She did as asked, and I could see her hand trembling. I eased down to her on the bed, an arm around her. ‘We’re still alive, and the kids are OK.’

‘Karl got engaged last week,’ she got out before bursting into tears.

I had forgotten, someone had mentioned it in passing. And I knew that it was not the loss of Karl that she was crying over. I hugged her tightly, the image of Karl’s head still fresh. And that coin. That coin saved me.

But who wanted me dead, and why now? We were in Cuba, so we were close to the States. Were the CIA still pissed? At least, were some elements still pissed at us? And what about all the people we got sacked? My mind was racing with possibilities. Jimmy had not issued a warning, so this was an aberration in the timeline, something unexpected. And the more we fixed things, the more of these we could expect.

Helen eventually composed herself, a knock at the door leading to the local police chief stepping in.

‘We can talk?’ he asked in a heavy accent.

I showed him to a chair and sat on the bed, his assistant standing.

‘You are not hurt?’

‘No. And the sniper was on the roof of the building next door, I worked out the angle.’

‘We know, he killed the two officers guarding you,’ the man unhappily reported.

‘Look for Americans,’ I suggested.

The chief took a moment. ‘CIA?’

‘We have had problems with some of them. They lost their jobs.’

The chief nodded slowly to himself. ‘Our President has called me; he is most concerned. Such things as this are rare here. Who knew you would come here?’

‘Just the household staff, a few others. We only book tickets a day or two before we travel for added security.’

‘Someone knew your intentions. This sniper, he must have taken a day or two to travel.’

‘I’ll ... investigate who knew in our organisation,’ I offered. ‘If we find out anything ... we’ll tell you.’

‘If this man is a professional, he will have a way to leave this island.’

‘He’ll go to a house nearby, five or ten miles, isolated, and wait for a week or two.’ After I said it I wondered why, but it made sense. ‘Use all of your men - we’ll pay their wages. Search isolated farms. Start ten miles out and work in. I’m serious, we will pay the wages, pay them overtime, bring them in from other areas.’

‘I would have done so, our President wishes this man found.’ He stood, and I followed him up. ‘You will stay here?’

‘Yes, for a few days, then I have business in Haiti.’

As I showed them out, Big Paul stepped in, his tacky Hawaiian shirt splattered in blood. He reported, ‘They found a rifle on the roof, but it won’t have prints.’ He stood at the window, peering down at the crime scene below.

‘Then the shooter’s still in that hotel,’ I thought aloud. I dialled Jimmy. ‘Get on a flight. The sniper is in the hotel next door, posing as a guest.’

‘On my way.’

Jimmy handed the girls to Cat, jumped into a car and headed towards Heathrow with a police escort, flashing lights all the way. By the time he arrived he had hired a 747 over the phone – his credit was good, the plane for just him and the security detail. A flight plan

was filed as the plane took off, the Cuban authorities notified when it was in the air.

Helen and I ordered room service, and we sat in the room with the curtains drawn, numerous calls taken; the news was now all over the world. I had asked the police chief to stop any guests from leaving the hotel next door for twenty-four hours, and he agreed. Still, if our sniper was any good he'd be in no hurry, he'd be sat around the pool with an accomplice, a woman. And I was determined to have him.

Jimmy arrived at 4am, a ten-hour flight from London, brought around under heavy escort. 'You holding up?' he asked.

Helen nodded, but didn't answer.

'Helen,' he called. 'Toughen up. Some day soon someone may pull a gun on the girls, and I need to be sure that you'll fight, not sob.' He led me out.

In reception, he spent an hour looking at names before leading me next door. The same exercise was repeated, one name causing him to pause before continuing. 'No.'

'You paused at a name.'

'Did I?'

I put a finger at the name.

'May as well wake him up, then. Since we own this damn hotel, we can make it official.'

With the police close, we took the stairs up to the man's room, the individual booked in with his wife according to the register. At his room, the police stood either side of the door, Big Paul with his back to the wall. Jimmy knocked, a finger over the spy hole.

'Hello?' came an American accent.

Jimmy nodded to an officer, who said 'Hotel Manager' in Spanish. The door clicked open and revealed the man stood there in the room's electric light. He was in his forties, moderately fit, but displayed no tattoos of a military nature that I could see.

'You're ... Jimmy Silo,' the man stated, stood surprised.

'I got here quickly in my time machine,' Jimmy whispered. 'So, as the owner of the hotel, I'd like to apologise for the ... disruption.'

'You ... you wake people at 4am to apologise ... for the disruption.'

'Not all of them, just the special ones.'

'Special?' the man repeated.

'Those that have served time in Columbian mercenary units.'

The man stared back for almost ten seconds, then tried to slam the door. When Jimmy was in your doorway that was always more

of a hope than a practicality. Jimmy slammed his arm into the door as he moved forwards, Big Paul moving in behind him. Jimmy caught the man with a kick to the back, a right hook at the 'wife' sending her flying and knocking her cold. The man had hit the floor, making contact with the sliding doors with his head. Jimmy dropped and punched down, a blow to the ribs. I could hear the crack from outside. The police rushed in, grabbing the couple, not that they were resisting. I began to search the room, but Jimmy led me out.

'He's not our man,' Jimmy stated as we headed back for the lobby.

'No?' I queried.

'No, he's the man we were supposed to find. We'll find out that he was paid to be here to ... watch some innocent tourist. And the woman probably has no idea.'

In the lobby, Jimmy asked for coffee and food from the receptionist, and sat himself where he could observe the stairs and lift. 'We have a few hours. Maybe I'll recognise the man, maybe not.'

'You sure that's not him?' I pressed.

'What agency would screw with us?' Jimmy posed. 'No, if someone was going to make an attempt they'd need to be very sure of themselves. A simple check of that man's name in the CIA database would have revealed him. Shit, even I knew his name.'

The police returned, and we positioned them around the exits as we sat quietly sipping coffee and eating cake. The hours passed slowly. At 6.45am the first early-bird tourists appeared, old couples with towels wanting a dip, odd looks towards us as they recognised our group.

At 8.30am I figured most of the guests had trailed past us, and were now in the restaurant. We stood, stretched, and walked in, playing like owners and apologising to the guests for the disruption. A few photographed us as we walked around the tables. Having met just about everyone, Jimmy returned to a table and sat, now facing a man in his sixties, a woman in her thirties, and a teenage girl.

'How are you?' he politely asked the woman.

'It's rude to sit without being invited – even if you do own the hotel.'

'I'm glad you said that, because I needed to place the accent to the correct part of Canada.'

The woman hesitated.

'Canada? We're American.'

‘No, you’re not. *They* may be, but you’re not. *They* may just get away with a very long prison term. You, on the other hand, would be handed over to me – since I have a lot of influence here, Kate.’

She was up and running, Big Paul catching her with a punch and sending her across a table. Screams went up as the police grabbed her.

Jimmy faced the older man. ‘There was probably a time when you believed in the good guys winning. I strongly suggest that you dig deep and find what’s left of your morality, and strike a deal. If not, I’ll fly you to Africa, where they’ll cut bits off and make you eat them.’

The young girl burst out crying, now led away by the police. Jimmy held his gaze on the elder man, police now stood behind him.

‘What kind of deal?’

‘You tell all, I decide what happens to you. Roll ... the dice, my friend.’ He waited.

‘The Company hired us for this.’

Jimmy shook his head.

‘No?’ the man queried.

‘No, the people hiring you were disgraced former members. That leaves you with a retirement plan in the Caribbean, otherwise known as a Cuban jail. And the inmates may not like you.’

‘Kressip.’

‘Mister Kressip is an incompetent buffoon. Try again.’

‘He had another man with him, a hand missing.’

‘Ah, well ... you may have just earned a reprieve,’ Jimmy said as he stood. A nod to the police and the elder man was led away. ‘Can I have your attention, ladies and gentlemen,’ Jimmy loudly called. ‘Yesterday, someone tried to assassinate Paul. These were the people behind it, and they have now been caught. By way of compensation - for your disruption, you will all get a full refund from us, and the offer of another holiday free of charge. I hope that you can make the most of what is left of your holiday. Once again, I apologise for the disruption.’

We turned to leave.

‘Hold on!’ a British man loudly called, and we stopped. A tall and wiry man in his fifties walked forwards, a hooked nose and an unhealthy red complexion; he reminded me of my old school headmaster. ‘I, for one, will not be looking for a refund. My wife had cancer and you ...’ He stumbled. ‘Your drug cured her. No one has done more for Africa than you, so you ... you can shove your

refund.' He wagged a finger. 'And my sister sent ten thousand pounds to Rescue Force, most of her life savings.'

The people on his table started to clap, soon followed by the others in the restaurant, many standing. I stared at them, dumfounded. They didn't want to lynch us, they actually wanted to thank us, gunfire disturbing their holiday or not.

'Do you have a camera?' Jimmy asked the man, leading him back to his table. A silver digital camera was produced. 'Ladies and gentlemen, if you would honour me, I'd like a group photograph.' He gestured people towards the fruit counter, tallest at the rear, kids at the front, Jimmy stood with an arm around the man's sister. Big Paul took several snaps. 'Please email a copy,' Jimmy requested of the spokesman before we left.

Without saying goodbye to Helen, Jimmy headed back to his waiting aircraft under heavy escort.

In our room, I found Helen sat staring through a crack in the curtains. 'We caught them,' I softly stated. 'Jimmy recognised them.'

'I used to be stronger than this,' she muttered.

I sat on the edge of the bed. 'That was the work you were doing. And ... and back then you didn't care - you had nothing to lose. Now you do. C'mon, pack; I'll bring forwards the trip to Haiti. Day there and we'll head back home.'

Later that day we boarded a plane to the Dominican Republic, no direct flights to Haiti available, and hired an executive jet for the short trip to Port Au Prince. Sykes people had already landed in Cuba and were now making arrangements for Karl's body, and to continue the investigation.

We spent the night in a well-guarded, yet rundown hotel in Haiti, the shit hole of the Caribbean, a place with a crime rate slightly higher than the Congo before we got involved there. It was an unpleasant room, in a strange in a violent city, and we hardly spoke. In the morning, a car whisked us around to the Presidential Palace, a grand white building that was out of place with the rest of the city. It felt odd to approach it, knowing what would happen in a few short years. The President welcomed us, Helen conversing in French and acting as translator, our hosts English limited.

'Thank you for your time in seeing us,' I opened with.

'We are most thankful that you have turned you attention this way.'

'Let me get down to business. We would like to open an orphanage here, room for ten thousand children.' They blinked. 'We

would then like to help you with your security, offering to take your young men and turn them into fine soldiers.'

'How many soldiers?'

'Five thousand to start with, and we would pay for everything, creating barracks here. We would also equip them.'

'The Haitian Rifles?' the President asked with a smile.

'Yes, sir, the Haitian Rifles. We would also like to open a Rescue Force unit here, trained in Cuba.'

'How many?'

'Two hundred to start with,' I informed him. 'And again, we would pay for everything. We would then like to open small clinics here.'

'We do not get many visitors like you,' the President said with a smile. 'We agree to all of that.' He handed over the documents. 'Ask for whatever facilities you need.'

I handed over a banker's draft for twenty million dollars. 'Towards your administrative costs in dealing with us.'

'You have an ... interesting approach.'

Little more than twenty minutes after entering the Presidential Palace we were leaving, documents in hand and heading straight back to the hotel, grabbing our luggage and setting off immediately to the airport, where our jet waited. We said nothing on the way, and my wife's mood was worrying me. That jet took us down to Barbados, where we hopped onto a 747 bound for London, a discreet change of plans – just in case. On the flight, sat in First Class, people delicately ignored us, glances made underneath eyebrows.

Jimmy was waiting in the coach at the airport, with the girls, a thoughtful touch. Through good old British rain we journeyed slowly home, the girls relaying to us all of the treats Jimmy had allowed them, showing us the new laptops he had bought them, Shelly's customised with Hannah Montana stickers, Lucy's adorned with Harry Potter stickers.

I studied the rain streaking diagonally across the windows, and heaved a sigh. To Jimmy I said, 'You found the mastermind?'

He nodded. 'The gentlemen lost a hand in a grenade accident a long time ago. He recently lost the second hand, just before getting arrested.'

'Should make going to the toilet hard,' I commented, no joy in my voice. 'Karl's fiancée?'

Jimmy took a moment. 'Wants nothing to do with us.'

'She blames *us*?' Helen asked.

Jimmy made a face and shrugged. 'Anger has to find a focus. I've compensated her, but I doubt she'll stay in touch. I compensated his parents as well; they're OK about it. Well – not OK about it, but they don't blame us. Mood at the house is a bit off, Rob and the guards a bit down, as you can imagine.'

Shelly told me, 'Karl has gone to work in London.'

I glanced at Helen, then addressed Shelly as she fiddled with her laptop. 'Yes, baby, he's gone to work in London.'

The next day I sat in my office, and just stared at the piles, wondering why I was bothering with any of this. I swivelled my chair and watched the rain hit the window for a minute before picking up the first report: Big Paul's fish farm. A diagram showed the areas developed, those yet to be developed, and rate of progress. I heaved a big breath and turned the page.

Jimmy knocked, and stepped into my office, the first time he'd viewed it. Without taking in the place, as if he'd been here many times before, he sat opposite me. 'Weather forecast for the next week is good, so how about our Scottish Castle? Your romantic trip away was ... cut short, so I thought we'd go ... fishing.'

I eased back and, swivelling, glanced through the window, the clouds broken.

Jimmy added, 'The files will still be there when you get back.'

'Have you spoken to Helen?'

'She's my PA: where I go, she's obliged to follow ... or be absent from work without a note from her mum. I may have mentioned it to Lucy, who's keen.'

'Yeah ... why not.' I stood.

That evening we departed by coach, our escorts following, soon on the M5 motorway and heading north. At 5am we negotiated tight bends down to the Castle, and I noticed a few tents on the grass as we pulled up. The castle staff were, quiet sensibly, fast asleep. As were the two girls. Jimmy and I stepped down and stretched, Big Paul easing out of his Range Rover as the sky adopted an amber hue, the sun fighting to rise. As a group, we walked down to the concrete jetty, the tide low and the sea dead calm.

'Peaceful,' I noted.

'I've got all the fishing gear,' Big Paul idly commented.

We sat on the coach till 6.30am, a maid at the castle noticing us and opening up. As quietly as we could, we claimed our rooms, soon heading down to a full English breakfast, the first customers of the day. Four RF medics joined us, surprised to find us in residence, and we caught up on the RF gossip. A Royal Marines Major and Captain

came down to breakfast a little later, their men camped out on the hillside. Still, the men had the weather. And if they didn't, they were supposed to be tough.

Big Paul set out before us and grabbed winkles for bait, plus a Mackerel pilfered from the kitchens, and some squid. The girls put their little pink Wellington boots on and we walked down as a group to the jetty, plenty of room for the group to fish off. Big Paul's two rods were already set-up, and he patiently helped Lucy whilst I assisted Shelly, the girl's rods suitably small and light. They lowered their baited hooks over the side, straight down till the weights touched the bottom. Helen laid out four deckchairs and opened a magazine, Jimmy and myself casting out. Despite the rocks at the shoreline, the bottom of the loch was supposed to be mostly sandy.

With our rods set-up, we admired the view down the loch, the day warming quickly. Ten minutes later, Big Paul pulled in a flatfish, the girls excitedly examining it, the odd arrangement where its eyes were both on the top of its flat head. Our first catch was not big enough for the pot, so was tossed back in.

When Shelly screamed I assisted, holding the rod whilst she reeled in a six inch Blenny. I unhooked it and put it in her bucket, my daughter squatting and studying her catch. After all, it had put up a fight. Lucy brought up crabs, shrieking and shaking them free. When Shelly brought up a crab, she grabbed it from behind and shoved it towards Helen's face, causing a shriek.

The day warmed nicely, everyone removing layers of clothing, lunch brought out to us, wet wipes to remove the stink of fish off fingers. Big Paul caught flatfish, eels, and a horrible looking Monkfish – all destined for the pot.

At 2pm I sat with Jimmy on the deckchairs, faces to the sun, cans of lager in hand, the girls off exploring rock pools with Helen. 'Peaceful here,' I commented.

'Far from the madding crowd,' Jimmy responded.

The RF team leader came and asked for a few fish, his team intending to eat some raw, cooking the rest. Big Paul took a bit of persuading, but allowed the man two fish.

At 4pm, the day hot and the tide right out, the sand was now exposed. We could see Shelly itching for a swim, goggles in hand and nagging Helen. Jimmy and I walked around, undressed down to our pants and walked in, the water absolutely bloody freezing. Shelly disappeared below us, back up a minute later with a lobster held high.

‘Hey, Big Paul!’ I shouted from the water. ‘Shelly got a lobster; better than your crappy fish.’

Shelly took her catch to the beach and studied it intensely for several minutes, soon going back for more, five large lobsters recovered from the depths. I figured we’d be eating them over Big Paul’s meagre catch. Chilled, we all towelled down and dressed, retiring to our rooms, the castle chef handed his live ingredients for tonight’s feast. I had figured that the girls would shy away from boiled lobster, but no, they observed us break them open. The girls copied, creating a mess, but enjoyed the white lobster flesh. So what if the waitress crunched exoskeleton as she walked around – we owned the damn place.

The good weather extended to the next day, so we ventured up the opposite hillside to the castle, peering down from our lofty vantage point, RAF jets screaming by. We met two RF teams out hiking, sweating as they plodded along with heavy rucksacks, and loudly encouraged them to put one foot in front of the other. The girls picked heather and chased after rabbits as we sat on the grass and took in the view, time moving very slowly.

Hiring a local tourist boat the next day, we donned red life jackets and set off, soon slowing to enjoy sea otters in the distance. That experience was topped by numerous inquisitive seals popping their heads above the water to view us. Colonies of seabirds were observed from a distance, the craft’s captain giving a running commentary of interesting facts, and we glimpsed dolphins on the way back. With a few hours of daylight left, we followed Big Paul to the trout stream and practised fly-fishing, not catching a damn thing.

The girls had enjoyed the boat trip, and nagged a little, so we repeated the loch excursion the following day, this time heading further around the headland, the wake of our boat briefly attracting dolphins. It took all of my strength to stop Shelly from plunging in after them.

After five days at the castle we all displayed modest suntans, and had all slowed to a different pace, to holiday pace. The Canadian style canoes were brought out of a shed and washed off, the whole gang setting off on an around-the-bay paddle, inquisitive sea otters again glimpsed. Then, following Jimmy’s direction, we suddenly sped up and reached the middle of the loch and upped oars. When Shelly shrieked I spun around, to see a dolphin breaking the surface nearby. These dolphins, British dolphins, were nothing like Flipper off the TV; they were eight feet long and a darker colour, black and white almost. They were bigger than our damn canoes. The pod

honoured us with their company for ten minutes, gracefully sliding through the water and circling us.

Turning back towards shore, I noticed other canoes, a darker colour, two men in each. 'Who are they?' I asked Jimmy, now concerned.

'Royal Marines, Special Boat Service,' Jimmy responded. 'Come on, let's race them.'

We picked up the pace and closed the distance, moving back towards the loch shore and adopting a parallel course.

'Nice day for it,' I shouted across the water's calm surface.

'You Jimmy Silo?' a man asked, looking very tired.

'Yes,' Jimmy responded. 'Want a race back?'

'You're not exactly in fast canoes, guv,' a solider responded.

'Thousand pounds if you beat us in,' Jimmy said, he and Big Paul taking the lead. It was the like the opening scene to Hawaii Five-O, and I even hummed the tune. Helen and I picked up the pace, soon cruising quickly along and surprising the soldiers, Jimmy in a mad race with the lead military canoe, he and Big Paul frantically paddling.

'Come on, ya fucking Marine poofters,' Big Paul shouted at them. He had been Special Air Service; these lads were Special Boat Service, their archenemies in dick measuring contests.

Jimmy got into his rhythm, and his damn canoe was about to break the surface and start flying, pulling away from us, the girls encouraging mummy and daddy to go faster. Jimmy's canoe hit the sand first, by two lengths, and Big Paul was suitably ungracious and rude, the solders downright bleeding knackered. Well, they had already completed a ten-mile ocean trek. We pulled in just behind the last soldier's canoe, a respectable placing for a married couple with kids. Big Paul was soaked from Jimmy's splashes, Jimmy now splashing his face with cold seawater.

It was a good finish to the holiday, and after a wash and a meal we set off south towards the house. En route, Helen and I agreed that we had enjoyed this more than we figured we would have enjoyed a week without the girls. I think we both turned middle-aged in that instant.

We had found more time for each other this trip, even with the girls with us, and held hands a lot. And, after Cuba, Helen seemed more affectionate, more needing of my attention. I guess all it needed was to be shot at. Again.

War in the desert

Somali and Ethiopia shared a long border, and as such shared a few small areas that had been disputed over the years, but mostly just by those locals living close to them. One day in July, a brash group of young Ethiopian soldiers walked up to the border and to a Somali checkpoint. The Somali border officers on duty smiled and welcomed their visitors, soon held at gunpoint and marched across to Ethiopia.

When the news reached Jimmy he called Ngomo straight away. 'Launch Operation Bucket and Spade.' He opened the basement command centre and I was worried, and rightly so. Jimmy had been waiting for just such an incursion, and hinted that this incursion was both advanced and 'timely.'

In Somali, Abdi put on his combats and his boots and called in his senior officers. Ngomo ordered the Pathfinders – those now training in Somali, to board their helicopters and fly up to the section of border in question. There they disembarked, marched all night and crossed the border, encircling the small town where the Somali border guards were being held. And I found nothing in the news about the men's abduction, puzzling it. The Pathfinders liberated the captive men, storming the police station where the Somalis were being held, killing thirty Ethiopians. Extracting the men and withdrawing, the alarm was sounded, the Pathfinders now killing anyone that approached or challenged them. They walked a mile out of town, skirmishing on the way, to be picked up by helicopter and whisked back across the border. Now Reuters reported the Somalis abducted, making me scratch my head.

The morning edition of the African Times ran the story that the Somalis had been abducted, and that the Somali Rifles had rescued them. They neglected to mention the sixty dead Ethiopian soldiers, plus the odd slow moving Ethiopian housewife and a few goats.

The Ethiopian Government responded with threats, and moved tanks towards the border. That constituted a 'material threat' to a member of the economic co-operation group, which triggered a mobilisation of some ten thousand Rifles from a variety of nations, even from down in Zimbabwe. Mawlini went on full alert, the base a hive of activity as Jimmy told me to pack a bag. With a bad feeling about where this was heading, and Jimmy not being very forthcoming, we flew down to Goma hub overnight, changing to a

flight to Mawlini and arriving in time for breakfast. Booked in at the hotel, we climbed to the rooftop bar in time to see a dozen Cobras take off.

Mac came up to us. 'We going to fucking war or something?'

'Hope not,' Jimmy responded.

Mac did not seem convinced by that. 'All the Cobras are live-firing in the desert like they'll be needed soon!'

'As I said, let's hope not,' Jimmy reiterated, camel steaks placed down.

Mac sat and studied us. 'You reckon the Ethiopians are daft enough to attack Abdi?'

'Abdi has no fighter aircraft, few tanks, and the Ethiopians do,' Jimmy pointed out.

'So what happened at that border incursion?' Mac asked.

'Somali Rifles launch a quiet and discreet rescue – Somali style.'

'They shot up the whole fucking town!' Mac noted.

'As I said – Somali style.'

'Congo Rifles flew in here last night; Zimbabweans, Zambians, the lot,' Mac reported. 'Fucking flights all bastard night long! They've all driven over the border.'

'So, besides that, how're things, Mac?' I lightly asked.

'Aye, fucking peachy,' he quipped.

A long way off, a column of Ethiopian tanks moved east, and towards the town that had witnessed the quiet and discreet Somali rescue. They halted at the border, their orders simply to protect that part of their territory. Since the Somalis did not have many tanks of their own, it was a bit of overkill. Across the border, in the hills and rocks that flanked the border road, the Pathfinders and Somali Rifles dug in and made ready.

After a camel steak breakfast, I drove around to the helicopter compound, finding Hal walking across the apron with his gunner. 'Aren't you a bit old for all this?'

'Still show you how to fly, sonny. What's the flap anyway?'

'Ethiopians may cross the Somali border.'

Hal stopped dead. 'And we'll go out and attack them? Paul, Kenya has a border with Ethiopia. You looking to start a war?'

'Somali and Kenya are signatories of a mutual defence pack.' I shrugged. 'Politics.'

He poured me a cold drink in the pilot's lounge, and we slouched down. After a moment studying me, he said, 'You lost a bodyguard in Cuba?'

I nodded. 'Bullet was meant for me. Missed by six inches, if that. Guess I haven't been doing enough to help the world of late.'

'They caught them?'

'Ex-CIA, and ex ... because we got them fired.'

Hal shook his head, wiping sweat off his forehead with a sleeve. 'It's a fucked up world. After that drug you released I figured you'd be popular.'

'We are in some circles. And ... there's something you need to know. I ... asked Doc Adam to inject you with the wonder drug a few years back, when you fell ill after Mozambique. You were touch and go.'

'That explains a lot; it took ten years off me. I go jogging in the mornings with the others.'

'You got the full strength dose, most just get a quarter of that,' I explained, bending the truth a little.

'Most of this lot have had it lately, hell of a difference – they all jog around the airfield in the mornings! And none of the big-brained fucking doctors can figure it out. Quacks!'

'It's made a difference around the world,' I sighed.

'Made more than a difference, Paul,' Hal stated, a serious expression adopted as he eased forwards. 'Folks around here have put two and two together ... and come up with an AIDS orphanage free of AIDS.'

I glanced at the other pilots. 'We injected them all years ago, cured the lot.'

'And in the Congo, and down in Zimbabwe?' Hal nudged.

I nodded. 'We injected about fifty thousand kids.'

'That's fifty thousand reasons why people should not be trying to shoot holes in you.'

'Well, there are other things we're involved with, like world politics.'

'Always a dangerous business. How's the family?'

'Great. We just had a holiday in Scotland, good weather, nice break away. How's *your* nipper?'

'Growing rapidly. She wants to be a nurse,' Hal enthusiastically reported. 'She was up here the other week, stayed with me during half term. She likes to fly as well, and she's smarter than me. That orphanage of yours – they bring them along quickly, by god. I got a computer in the house, and she teaches *me* how to use the damn thing!'

'Listen, if there's any action over the border – be careful, huh.'

'Yes, mum.'

Driving back, ten minutes later, my escorts stopped at the Rifles HQ building and informed me that I was wanted inside. I found Ngomo and Jimmy huddled around a map. 'Didn't you used to have a desk job?' I asked Ngomo as I shook his giant steak of a hand.

'I prayed for a conflict,' he boomed. 'And Ethiopia delivered.'

I scanned the map, seeing marks for Rifles units all along the lengthy border. 'They kissed and made up yet?'

'No, they threaten to take the land they claim,' Ngomo reported. 'We shall sit and wait like the spider.'

After twenty minutes of listening to movements and dispositions reports coming in, I got the impression that they were plotting something. They used the word 'trap' and 'trigger' a lot. Driving back to the RF compound, Jimmy explained that the senior staff were not happy and wanted a word about the drug. We pulled up at the lecture theatre and stepped in, finding twenty of the senior staff assembled.

'God bless all here,' I said. 'Who's round is it?' It did not generate a smile, just polite, forced movements of cheeks.

'So,' Jimmy began, his hands held wide. 'You have some questions.'

Doc Hoskins asked, 'May we ask ... did the kids at the orphanage get injected with the wonder drug?'

'They did,' Jimmy responded without hesitation.

'They were tested upon?' a doctor asked.

'No, we ... were tested upon, Paul and myself. Fifteen years ago we were both injected. And, as you can see, there are no side effects, Paul producing a healthy set of girls. And as for Ebeye, you need to be aware of only one thing: ninety-five percent of the kids were terminal, most dying of AIDS. From the day I took over we lost no more than half a dozen, and none since that time.'

'You had the drug all those years ago?' they queried.

'As you've already mentioned, it had to be tested. So we injected terminal patients, thousands of them, and all survived. Besides, we didn't want to cause the kind of reaction that the drug has caused, the furore, and the misuse of it.'

'Misuse?'

'Old ladies inject themselves to look better. The drug doesn't always go to the sick or the terminal.'

A man raised his hand. 'I have friends who are experts in disease medicine, and they can't make head nor tail of it.'

'I'm sure they'll figure it out eventually,' Jimmy said. 'And don't ask me, I'm no scientist.'

‘Were the Rifles injected?’ a woman asked.

‘Yes, all inoculated. That’s why they’re so fit.’

‘Jimmy, you haven’t aged a day since I met you,’ Coup stated. ‘Is that the drug?’

‘There’s a stronger version,’ Jimmy suggested. ‘The common drug, the one curing AIDS, is one eighth of the strength. The drug Doc Adam has been offering you is one quarter.’

‘What’s the difference – in practical terms?’

‘If you take Doc Adam’s drug you’ll sleep four hours a night and run thirty miles before breakfast, as well as being immune to every disease known to man. It also seems to slow the ageing process.’

‘Fucking hell, Jimmy,’ Coup let out, the medics glancing at each other.

‘If you have any doubts, don’t use it - it’s a personal choice. I will, however, recommend the lower dosage for all Rescue Force staff working in tropical areas.’

‘What effect does it have on trauma patients?’ they asked.

‘Injecting a trauma patient will accelerate the healing process; four weeks will become four days. And its excellent for burns; someone with ninety-percent burns would be cured in a week.’

A chorus of whispers shot around the room.

‘Where the fuck did it come from?’ they asked.

‘Russia, some accidental breakthrough, and the CIA had it for twenty years. I bribed a few people, got hold of it, and developed it for AIDS treatment. Rest was a side effect.’

‘Will it be carried by all RF staff in the field?’ a man asked.

‘I hope so, because it’ll make a hell of a difference. But it’s not cheap, not yet.’

‘You all driving the electric cars?’ I asked, wishing to change the subject.

They nodded. ‘I haven’t charged mine in a month,’ someone said.

‘Another miraculous breakthrough,’ someone curtly commented.

‘There’s no pleasing some people,’ I quipped.

Jimmy told the man, ‘The technology was there twenty years ago, but hidden by the oil companies. There’s also a shit load of secret patents that I’m after, all sorts of technology that they don’t want out there.’

‘You out to fix the world, Jimmy?’ a medic asked.

‘Yes.’ He waited as they glanced at each other.

This group was not stupid, they had observed us close up for many years, and these latest breakthroughs were astounding. They

loved us to bits, but were just as curious as anyone else. For the first time, I felt that our cover was about to be blown.

A man raised his hand. 'When this "M" Group of world leaders meet – do you address them?'

'Yes, about a variety of projects I'm involved with, in particular African investment.'

The same man said, 'You have a drug that cures everything – which is impossible, an electric car that never stops, your man Crusty predicts quakes – which is impossible, you make more money than anyone else on the planet, and you don't age. Is there something we're missing, Jimmy?'

'Some gratitude,' I suggested, now secretly worried.

'There's only one thing to say to that,' Jimmy began. 'Wait and see what I do in the next few years. You ain't seen nothing yet, people.'

'Do you have any sensible questions?' I asked.

'You mind if I ask why they tried to shoot you in Cuba?' Coup asked.

I stepped closer to him. 'A difference of opinion, about releasing advanced technology,' I carefully stated, and lied. 'Our electric car will cost the oil business a lot of money, but might just save global warming. You figure it out.'

Jimmy put in, 'When we took over in the Congo they tried to kill us many times - they even shot down a plane - because they wanted to continue to remove ore, and to keep Africa poor. Now look at the Congo.' He held his hands wide. 'Jobs, hospitals, law and order, and - most importantly - a future. Not everyone wants that for Africa. Now, does anyone wish to question the value of what I have achieved for Africa?'

No one responded.

'Fine, because I fancy some lunch. We'll be here a few days if you have Rescue Force questions, problems or gripes.'

In the rooftop bar I said, 'Ungrateful bunch of fuckers.'

'They're not stupid, they can see it more than most. They've seen me pull far too many rabbits out of the hat, and they're afraid. And I'm afraid that the clock is counting down.'

'You think we'll be exposed?'

'Two or three years.'

I sighed. 'Not looking forward to that; be even more nutters at the gate then. And I have two kids!'

'They'll turn out fine. The kids, not the nutters. Now, shut up and order.'

That evening, the Ethiopian tank commander got bored of sitting in his warm tank, and ordered his troop of twenty-five tanks forwards - without permission from his superiors. The Pathfinders sat quietly eating meat from tins, no fires allowed, and carefully watched the tanks trundle past as the sun set on the horizon.

The TV news had been reporting the build-up of African Rifles units some ten miles from the Ethiopian border; tents pitched, campfires going. And no armour. No tanks, no armoured personnel carriers, and no air cover. They were a tempting target, sat having a brew and sing-a-long around the campfire.

The last tank in the slow moving Ethiopian column was closely followed by four support vehicles. As soon as the last of those vehicles had rounded a bend, the Pathfinders on the Ethiopian side of the border blew a very large hole into the road at a narrow passing. No re-supply would be coming anytime soon, and no retreat was now possible.

History would record that, as soon as the Ethiopians knew that their tanks had crossed the border, a recall order had been dispatched. Jimmy knew that as well, but he had a plan. The road in front of the lead tank blew, alerting the column to the fact that something was amiss. It was the cue for the Pathfinders, who took their time to pick off the intruders with anti-tank rockets.

By dawn, the border road was strewn with burnt-out tanks and destroyed lorries, bodies littering the roadside. None of the invaders had survived. Kenyan military cameramen had filmed the scene at dawn and transmitted it by satellite, the Ethiopian Government waking to the images of a tank column that had been decimated. They, the Government, did not wish to escalate things, but they had a population to serve, and that population now wanted blood, protests breaking out in the streets.

Ethiopian Migs took off and headed east at high speed, their target being Mogadishu, secure in the knowledge that the Somalis possessed no aircraft. It was a mistake, because north of Mogadishu someone had positioned a great big brand new shiny nuclear reactor, paid for with western money. Now, high above Mogadishu, an American AWACS plotted the approach of the Migs. An operator tracked their course, projected that they were on a course for Mogadishu, and got on the radio.

‘Ethiopian Migs heading directly for the nuclear power plant.’ The truth had been stretched by some twenty miles.

I had been in the Rifles HQ when the message was received, and became seriously concerned.

Jimmy tapped the map. 'There's never a US Navy carrier battle group around when you need one. Oh, I forgot, there is one – off the coast of Mogadishu.' He made eye contact with me. 'Forget my own head if it wasn't screwed on.'

'Carrier battle group?' I repeated.

'F14 Tomcat; the best aircraft ever invented, now or in the future. Joint strike fighter? Bollocks!'

The AWACS reported the nuclear facility under threat, several flights of F14s screaming in at wave-top height to avoid being detected. The residents of Mogadishu received a rude wake-up call as the jets screamed overhead, heading west. A few minutes later, the formations of Ethiopian Migs were buzzed at high speed by the F14s and thought better of it, turning for home. Problem was, that AWACS operator.

'Bogeys turning after you, they're hostile. Break and engage.'

The Migs turned in a circle and headed west in hurry, the F14s vectored onto them. None of the Migs survived. As the last Mig hit the desert sands, scaring the goats, the UN Security Council met in the middle of the night in New York. They sent Ethiopia a complaint about the attack on the nuclear facility, and aggressive moves against the peaceful US F14s, the communiqué leaked to the press.

Ethiopia was now down twenty-five tanks and six expensive Migs, this whole episode being a very costly adventure for them. Not wishing to invade Somalia, but wishing to appease its unruly crowds, the Ethiopians mobilized their army and moved columns towards their southern border. One particular column, in the very south, was isolated on the map by Jimmy. If you drew a wiggly line, you could – if you were a bit drunk – say that it put them on course for Mawlini. And that was not allowed.

The base alert was sounded, all non-essential staff ordered to leave, medics to make ready for casualties. The Rifles were already on the border, and anyone moving towards us would have to be suicidal. As I stood there, quietly cursing Jimmy for arranging all this, I heard the Cobras take off. I stepped outside to see a line of twenty Cobras and ten Hueys disappear into the distance, my thoughts with Hal. I heaved a breath, cursed Jimmy, and returned to the map table.

The Ethiopian tank column had no intention of crossing the border, but a move towards that border was a provocation. What were the tanks there for, if not to attack? They halted ten miles short of the border and formed a nice neat line, their parking skills admirable. On their hot engines they heated water for a brew, and lit

cigarettes, wondering if they could hear distant thunder as they discussed the current market rate for goats. Time was when a weary soldier could go home for the weekend, buy a goat and slaughter it for a good family feast. Not any more, prices were rising. As they lamented about better times in years gone by, the roar grew. The sky was clear, so they scratched their beards.

The first Cobra in the line fired from a mile out, hitting a tank and decimating the crews sat around it. It followed-up with anti-personnel rockets before banking southwest, its colleagues taking it in turn to fire at the line of neatly parked tanks. The tank crews managed to move several tanks, forwards or backwards, but their efforts were of little use. Inside an hour some thirty tanks and twenty support vehicles were burning, few left alive as the Cobras returned to base.

‘Job done,’ Jimmy stated.

‘And the purpose of this in the grand scheme of things?’ I testily questioned.

‘To ... diminish the Ethiopian Army and Air Force a little, to let them know that our nuclear reactor will be protected, to discourage them from any future border incursions, and to let all the terrorists in the Middle East know that we have a great big shiny nuclear plant here. Now, without that plant we could not have justified the US involvement, and their involvement will help to peg the power plant as western, and therefore a nice target.’

‘Why the fuck ... would you want them to target it?’

‘Mop up. If they come for it ... we’re ready. And they will, their best fighters being lost in the process.’

‘It’s a hell of an expensive decoy!’

‘Oh, it does have a genuine need here, but I like to have several uses for something. And now CAR will open up a few nice oilfields here, in Somalia. Guess ... where?’

I gave it some thought. ‘Along the Ethiopian border?’

Jimmy lifted his eyebrows and nodded. ‘If not dealt with now, they would have disrupted our oil production later.’

‘And you’re using Somalia to mop up Middle East terrorists.’

‘Better than the Richmond High Street!’

The UN asked for a ceasefire, and got one. The Rifles were pulled back, a few brigades left in place as a token gesture, and peace reclaimed the region, the Ethiopians now certain to think twice about future border incursions. CAR would move into the new region and sink wells, striking oil, finding a substantial field.

And in the weeks that followed, Arab fighters journeyed to Somali, to a well prepared killing zone that a fly could not get through, our agreement with an enlivened Abdi being that the attacks would not be made public.

Back at the house, I had asked Jimmy, ‘What *exactly* would exposure entail?’

‘A good speech by me, support of the world leaders, and then lots of silly questions about Elvis, and what would happen if I killed my own grandfather.’

‘Oh. And ... it’s certain in the years ahead?’

‘Would have been around 2010, but ... but the drug has aroused suspicions ahead of time. But, on the other hand, the drug will make us popular. The electric car is five years ahead of itself, so that will arouse some suspicions as well. But, Hardon Chase and Petrosi at the CIA are onboard, so they could manufacture some nice decoys and be helpful. They’ll have to be careful about lying to congress, and if asked directly they’d have to admit the truth. Then we’d go and live on a small island. Or in China. You know, I actually thought about relocating there if things got hairy over here.’

‘And will they? Get hairy?’ I pressed.

‘Like a roller coaster. But all you need to deflect attention away from yourself, is something far more scary on the horizon – and that we have by the bucket load, unfortunately.’

‘I’m sure you know what you’re doing...’

‘But?’

‘But I have a family. And ... people shoot at me,’ I pointed out.

‘If and when we’re exposed, the world’s governments will have no choice but to offer better protection than a US President,’ Jimmy said, adopting a reassuring tone. ‘And I’m hoping that, with Hardon Chase on our side, we can drag it to the end of his term.’

‘Four years,’ I thought out loud. ‘Shelly will be ... twelve.’

Prince Ali Bin Something

Sykes took a call at his London office inside the MOD building, from a Saudi Prince that insisted on meeting him. The British Government were not about to upset the Prince so, after consulting with the Prime Minister, Sykes drove around to the hotel that the Prince was now staying at, protection in tow. In a penthouse suite he

found the Prince and his entourage, Sykes leaving his security staff outside the door.

‘Greetings, Mister Sykes,’ the Prince announced from where he sat in the window, his aides stood waiting. ‘Please, do come in.’ His accent was the result of an expensive education, finished at Oxford University. He sat now in his full regalia of white Arab robes. But, despite being a prince, he was fifty-five years old.

Sykes eased down. ‘Thank you, Your Highness. How may I be of service?’

‘So much more polite than your countryman; Mac, I believed he was called, the commander of the base at Mawlini.’

‘You ... spoke to Mac?’ Sykes puzzled.

‘Yes, with regard to a donation to Rescue Force. He referred to me as Your Worshipfulness, which may be down to his lack of education, or the attitude he picked up in your army. I would hope that he was just being ignorant, but I have also had correspondence with his paymaster, the legendary Mister Silo, who referred to me as Your Royal Smelly Fly Trap.’

Sykes shifted uneasily in his seat. ‘My Government would like to distance itself from *both* ... sets of references.’

‘Ah, ever the eternal diplomat, Mister Sykes, the product of a proper education.’ The Prince dismissed his entourage to the next room. ‘Now, let me be frank, Deputy Director Sykes – a Deputy Director for a very long time. Mister Silo and his associates first caught my attention many years ago, since I take an interest in the horn of Africa and Somalia, and I have followed his activities very closely. May I say, Mister Sykes, that I as a child I enjoyed a puzzle to solve, and your Mister Silo has been a source of amusement for a decade or more. Amusement – in that I am amused when I ask my staff questions that confound them.

‘You know, the Somalis slapped my ambassador about the face and threw him out of the country - the first time in living memory anyone has shown us such affront. But my spies inside the Somali establishment suggested that your Mister Silo cautioned tolerance and diplomacy, at a time when I thought such an affront might have been his doing. He is an enigma, wrapped in a puzzle, surrounded by a high fence with dogs that have very sharp teeth. And by those dogs, I mean people like yourself.’

‘Your Highness?’

‘Don’t be coy, Mister Sykes. I have spent three hundred million dollars on bribing people the world over in order to unwrap some of the puzzle that is Jimmy Silo, and I know more than you might wish

me to. Recently, both an American gentleman and a French gentleman were most forthcoming, and most generously rewarded. You see, Mister Sykes, I have a lot of money, and I don't mind using it to solve puzzles that keep me awake at night. In Riyadh, I have a team of ten men who do nothing other than scour the world for information about one James Silovitch. They collate it, sort it, sift it, make intelligent assessments, then tie themselves in knots when they try and explain what motivates him. I have ten researchers, and twenty opinions, which is why I like to bribe former members of the intelligence services.'

'I'm not one of them, Your Highness,' Sykes firmly pointed out.

'Indeed no, or I would have no respect for you. No, you are a puzzle in yourself – in that no one has ever held such a post as yours for so long: "M" Group liaison. And you look ... fit and healthy.'

'Did you have a question, Your Highness,' Sykes nudged.

'I know far more than you realise, and I seek an audience with Mister Silo, for which I have already donated a substantial amount to Rescue Force Kenya, to this rude man, and may make further substantial donations. I may also make public what I found out, something that may make your job a tad harder in the near future.'

Sykes pulled out his phone, and selected Jimmy's private number. 'Jimmy, it's Sykes. I'm sat here with Crown Prince Ali Bin—'

'Tomorrow, 2pm at the house, three aides, British police escort.' He hung up.

Sykes stared at his phone for a moment, then put it away. 'Mister Silo will see you tomorrow, at his residence in Wales, at 2pm. You are requested to bring only three aides under a British police escort.'

The Prince smiled widely. 'And yet, Mister Sykes, you did not even ask a question. It was as if ... he knew in advance.' He stood. 'Please send me an escort in the morning, at the prescribed time to depart – allowing for dreadful London traffic.'

Sykes had followed the Prince up, and now bowed respectfully.

At 1.30pm the next day, the three-vehicle convoy arrived at the house, extra police laid on. I knew who was coming, and when the vehicles pulled up I stepped outside to greet them.

'Alright, mate,' I offered the Prince, he and his aides now dressed in a western suits, looking up at the house and taking in the grounds.

'The ever-rude Mister Paul Holton.' We shook.

'It's not the words that are spoken, but how they are heard, that sets the tone,' I said, one of Jimmy's phrases.

The Prince stopped. 'Then I shall listen with better ears.'

I gestured him inside, and led his party to a lounge, the group keenly peering into each room like tourists as we progressed. In the lounge, Jimmy sat reading a paper. He did not stand, but he did at least lower the paper, folding it neatly. I gestured the Prince's party to a sofa. 'Drinks, gentlemen?'

The Prince sat. 'Would you ask Cookie for four green teas, please.'

I sat and lifted a phone, ordering the teas, a beer for myself.

Jimmy began with, 'Did you come here with the intention of bugging this meeting, Crafty?'

The Prince smiled widely. 'No one has called me Crafty since boarding school, here in England. And no, no bugs.'

'Are you sure?' Jimmy posed. 'Really sure that you trust your men, that your uncle does not keep track of you – and your activities?'

The Prince stopped smiling, and I noticed Big Paul hovering in the doorway. Jimmy now beckoned Big Paul in, and pointed at the man on the end. Big Paul gestured the man up, then patted down the man's lower back. He faced Jimmy and nodded. The Prince was on his feet, shouting in Arabic. He got back a few terse words, the man stepping out, Big Paul following closely. Sitting again, the Prince composed himself. I took out the gizmo for interfering with electronics and turned it on.

'I apologise for that,' our visitor offered. 'Family.'

'And when your family is your boss...' Jimmy said, his hands wide. 'So, how can I help you?'

'I believe you already know the answer to that question.'

'Yes, but it would be impolite to assume.'

'And yet, not impolite to treat me like your gardener.'

'Who is the king, and who the serf?' Jimmy posed.

'I shall adopt ... a subservient role for this meeting, since this is your house.' The teas were brought in, so Jimmy grabbed the spare one. 'I have bribed a great many people, and I have spent a great deal of money doing so, many hundreds of millions of dollars –'

'What a waste,' I cut in with.

'Perhaps. But I like to solve problems, especially when they affect me directly. May I ask, first of all, if you are blocking the African nations from joining OPEC?'

'Yes.'

'May I ask ... as to why?'

'It was a gloriously foolish mistake for the Americans to persuade OPEC to trade in dollars. A great benefit for America for decades,

but the books will need to be balanced at some point. That point, in the years ahead, will see OPEC dropping the dollar, and problems for the American President in power at the time, who, having a large nuclear arsenal, will wish to use it to ... solve problems.'

'Ah,' the Prince said after a long pause. He sighed, 'It is something we know of, yet never dare speak of; like a distant relative who is in prison.' He sipped his tea. 'Are my assumptions about you correct, Mister Silo?'

'You would have to list them, for me to correct you,' Jimmy suggested.

'You work for this Mister Magestic?'

'If not in body, then in spirit, yes.'

'An ... intriguing answer. And he can predict the future with great accuracy?'

'He can indeed.'

The Prince took a moment, staring into his tea. 'The Chinese super-drug, filtered through pigs blood; was that in any way deliberate – the choice of pigs?'

'No, just simple biology.'

'But the drug that *you* were injected with was pure; a concentrate.'

'Correct.'

'And if one wanted to obtain this drug...?'

'It's expensive,' Jimmy pointed out. 'And I am selective about who receives it.'

'My price ... is one hundred million dollars, but I have some questions first. It cures and prevents all diseases?'

'Diseases are adaptive. There may occur something in the future that may make you unwell.'

'But would not kill me?'

'No.'

'And it would slow ageing?' the Prince pressed, and by his tone I figured that it was the main point of interest.

'You would live to be a hundred and sixty in good health.'

'That is a long time. And with further injections?'

'You would live forever,' Jimmy suggested.

'And if I wait, will the drug be developed in the decades ahead?'

'Yes, in around fifteen years, maybe less.'

The Prince thought it through. 'I wish it now.'

'Order the transfer of the funds to Rescue Force Kenya,' Jimmy suggested as he stood.

The Prince and his aides followed Jimmy up, and I wondered where my bloody beer had gone. Our guest took out his phone and ordered the transfer.

‘Follow me, but just you,’ Jimmy told the Prince, and led him out. They stepped down to the basement, where one of Sykes doctors waited. Jimmy took off his jacket and rolled up his sleeve, instructing the Prince to do likewise. The doctor drew blood.

‘I heard that it was blood to blood,’ the Prince commented, injected a moment later, two full needles worth.

‘You’ll run a temperature for a day, drink plenty of water,’ the doctor explained. ‘Your urine will smell bad for a week, and you should eat more protein, more meat. You’ll sleep less and be able to start exercising after five days.’

‘Exercising?’

Jimmy explained, ‘You’ll be able to run marathons – and win!’

‘The soldiers, the Rifles?’

‘Have all been injected, and are very hard to kill,’ Jimmy pointed out. ‘Pray that you are never on the receiving end of their anger.’

Jimmy led the Prince out, thanking him for the donation, and waved the cars goodbye.

‘That supposed to happen?’ I asked as we stood on the gravel at the front of the house.

‘Yes. I’d be tempted to use him, but he can’t be trusted. Besides...’

We turned, stepping into the house.

‘Besides what?’

‘A year from now his uncle will kill him.’

‘Then why inject him, for fuck’s sake?’ I pressed.

‘First, the money, and second ... he would have gone public with what he thinks he knows.’

I rang Rudd and asked him to check the bank account, getting back a “Fuck me!” The Prince was good to his word, and would soon be jogging about the royal palace in, well, wherever he came from. And I never could pronounce his bleeding name.

I then rang Mac. ‘Mac, what did you say to that Saudi Prince?’

‘I was right polite, like. Honest,’ Mac protested.

‘I know, he just donated a hundred million dollars to you.’

There was a long pause. ‘He what?’

‘You heard, check with Rudd. He said you persuaded him.’

‘Oh ... he ... er did, did he. Well, aye.’

‘Nah, just kidding. You nearly blew the fucking deal, you dosy fucking Scotsman. Jimmy had to twist his arm to get the money.’

‘We got the money?’

‘Yeah, check with Rudd. Free beer for the troops this weekend, you rude bastard.’

A hell of a September

At the beginning of September, Jimmy informed me of a flood and two quakes. Then I noticed the dates. ‘You’ve got to be kidding!

‘Nope, they all occur at the same time.’

‘They serious?’

‘Quite serious, yes.’

‘We’ll split three ways?’ I questioned, getting back a nod. Oh, hell.

On September 15th we drove over to Mapley, a command meeting called, the senior staff up from Mawlini. After an hour of meeting and greeting, taunts and jibes, they eventually settled.

‘OK,’ Jimmy began. ‘I have a guy who reckons he can tell the difference between a bad cyclone, and a really bad one.’

‘What’s the difference?’ they asked.

‘One cause lots of damage, one causes lots and lots of damage,’ Jimmy said with a shrug. ‘He’s betting a cyclone in the Philippines will be a peach, so we’ll attend. That just leaves us the other problem: Crusty has come up with two earthquakes, both faults on the same plate, or crust, or whatever. And guess what: they all fall on the same day.’

‘The same fucking day? Three places? Three deployments?’ Bob Davies queried.

‘Three *major* deployments,’ Jimmy emphasised, causing a chorus of complaints.

‘Where?’ they asked.

‘Sumatra, Samoa, and the aforementioned Philippines. But, they’re not too far apart.’

‘Jimmy, your globe at home is a bit small, maybe,’ Doc Hoskins said. ‘They’re all a thousand miles apart.’

‘Yeah,’ I said. ‘But on the map they’re only this much.’ I held my forefinger and thumb close.

‘The budget cover this?’ Bob Davies asked.

Jimmy nodded. 'Leave that to me. Now, Samoa is a small island, so numbers will be limited, Sumatra will be headed by their own teams, and the Philippines will have their own people as well. So, work out some numbers and teams accordingly. I want the Australians, New Zealanders, the Fiji unit, Hawaii unit and Hong Kong as principles, Chinese behind them. British and French Alpha teams to Samoa, some Hueys to the Philippines, some to Samoa.

'Right, Doc Graham, you're running the show from here, since not even a superhero like you can be in three places at once. I want the New Zealand director responsible for Samoa, the Australian national director to handle Sumatra, and you can choose someone for the Philippines field command. Questions?'

They all grumbled under their breath, and we left them to it, our part done. We were the money and the direction, they were the nuts and bolts, the plans and procedures, the small detail; as well as a bunch of whinge-bags who loved stuff like this, yet always moaned and pretended that they didn't.

The following afternoon we returned, and they presented a plan to the entire assembly of national representatives in the lecture theatre; dates, times and routes. Advance parties of facilitators would set off within days, working like movie scene scouts and getting a lay of the land; hotels, access airfields and storage facilities. They would book themselves into hotels, reserve rooms, and start paying local workers to be prepared.

We stopped for lunch and made a few adjustments to the plan, before touring the airfield and greeting trainee rescuers and old hacks alike. A few new buildings had sprouted up, and some seemed to have moved all by themselves. That, or I had just forgotten the layout. The UK Huey training school had grown, and now qualified dozens of fresh pilots each year. One new building caught my attention, over the road from the main gate, and we drove over. The large building announced itself as "Diagnostic Training and Testing", which could mean that they tuned cars. We walked in, being greeted by nurses and doctors in their typical hospital uniforms, and climbed the stairs to a darkened observation lounge. We sat with a few grey-haired old doctors and peered down through soundproof glass at a Silo Stiffy, getting a commentary through speakers.

'Start again!' a senior man shouted.

The trainee, or young doctor, walked back to the door, stopped, and advanced when waved forwards. The dummy relayed a few symptoms and was checked over, soon going into arrest. From a side

room a crash team rushed in, the young doctor shouting instructions at them.

‘Stop!’ went up from the instructors. ‘You useless fucker! Start again!’

Laughing, we eased up and wandered the building. After all, we’d paid for the damn thing. Ten such rooms had been set up, one dummy now being operated upon. We sat next to other onlookers.

‘Will the patient make it?’ I whispered to the man next to me.

‘He’s not bad. First time appendix for the young lad.’

‘Is it realistic enough?’ I asked.

‘Oh, hell yes. You sometimes forget it’s a dummy.’

‘These all hospital employees?’

The man turned his head and nodded. ‘A hundred a week come through here: short, sharp shock treatment. It scares the hell out of some people, but they leave knowing what to do, and having practised it. Save fumbling on their first few patients.’

‘Is our drug ... making people redundant?’ I risked.

The man made a face. ‘In some areas, but it doesn’t affect trauma or injury, or geriatric medicine, which is seventy-five percent of it. The researchers were affected the most, but they’re not doctors, mostly biochemists.’

I felt better. Biochemists: fuck ‘em.

We returned on Sept 25th with our bags and reclaimed our rooms, expecting a busy week. Helen fired up the communications centre and I fired up a Huey, taking Air Cadets for a spin and posing for group photographs.

In Bob’s office, the communications officer sat keenly ready. Jimmy told him, ‘Set filter to operation Philippine Storm.’

Fingers hurriedly struck keys. ‘Filter active.’

‘Sound deployment.’

‘Deployment order sent, Operation Philippine Storm activated.’

‘Re-set filter to Operation Sumatra IV and Operation Samoa I, and sound deployment.’

‘Filters set, sending signals.’

Bob and Jimmy both signed three forms, authorising the deployments. A distorted tanoy message echoed, teams forming up ready and being checked before heading towards waiting coaches, the local Air Cadets observing with keen envy. From the roof of the command building I watched the coaches pull away, our people heading towards Gatwick airport, where jeeps were now being loaded into the backs of IL76 transports. Our Hercules, four of them in the fleet now, were winging their way towards Samoa.

The only hiccup to the whole thing was the reaction of nice people of Samoa and American Samoa. When we issued the warning they all collectively panicked, many fleeing to New Zealand. Tourism died instantly and holidaymakers rushed to get off the island, those planning on travelling now cancelling their trips. Fortunately for the hotel owners, a very mad bunch of people called "RF watchers" descended in force, keen to see and feel a quake close up. The hotels filled back up.

On the islands, indigenous peoples living near the coast moved inland, to where we had already formed tented camps, and boats brought villagers over from small islands. To be fair to them, the local authorities handled it well.

Given that half of the name American Samoa was "American", and the island was technically a US colony, Hardon Chase sent a few thousand soldiers, a medical team and many tents. The poor island was weighed down with more rescuers than indigenous people.

On the 25th, the cyclone started to have an effect on the Philippines, and the last few flights to land were buffeted. Now there was little our people could do till the rains stopped. They hunkered down in hotel rooms in Manila, since tents were out of the question during the storm. Theirs was a waiting game.

During the day of the 28th, night time in Samoa, the ground shook, and the crazy quake followers jumped up and checked their equipment, rushing outside in the hope of filming a tsunami actually coming ashore. They were not disappointed, and several were killed, many injured, making me shout and curse at them from afar. The locals, feeling the ground shake, ran for the hills, and few were injured or killed. Houses had been destroyed by the quake and resulting tsunami, but the tented towns easily coped with the influx. Search and rescue operations began, but there were few missing persons to find. A long and costly rebuilding programme began.

The next afternoon the quake struck Sumatra, the people less prepared and many killed and injured across a wide area. There, our people were more keenly needed, and kept busy.

In the control room, warm bodies came and went all day and all night, people sleeping when they could. It was a well-oiled machine these days, but there was always the unexpected, such as searching for a bunch of twelve tsunami watchers who were now missing. In Sumatra, a chimney had toppled onto a RF jeep injuring its crew, which meant several other teams now had to extract them, and we had to arrange return flights and medical care.

In Manila, the rain lashed the streets and filled the gullies, people and houses swept away. Our teams ventured out whilst the storm was still raging, being filmed yanking people up out of the water from the sides of bridges, our Hueys following victims caught in fast flowing rivers as they sped along toward an uncertain fate. One Huey hit a power line and dropped like a stone, breaking in two, the crew and passengers all suffering minor injuries. I checked if Dunnaw was flying. Each incident generated a mountain of paperwork, forms and more forms, plus families to be notified.

Poor old Bob Davies and Doc Graham were knackered, dark rings around their eyes. I felt like injecting them. Still, we all pitched in and covered for them when they wanted a few hours sleep. I even called a few families to inform them of injuries to their loved ones. Helen kept the press fed with updates and details, names of British rescuers injured, and I kept the press fed with coffee and doughnuts.

By time October appeared on the calendar we were just about done in Samoa, long-term teams left in place, the main body of rescuers withdrawn. Sumatra was dragging on a bit with searches in remote areas and the outbreak of disease, but we scaled down and withdrew many of the teams. The Philippines, on the other hand, was getting worse and we increased the size of the teams, Hong Kong deploying two hundred rescuers, European Supplementals being flown out – when the weather permitted. Some got stuck in Singapore. Remote villages were cut off by mudslides, and the few deployed Hueys were kept busy.

We left Mapley after five days, the girls staying with us some of that time, and returned feeling tired. But it was a contended kind of tired, a feeling that we had made a difference. A mountain of paperwork awaited me, and my team gave me verbal reports to speed things up. Sat there, I'd say: yes, no, no way, or tell them to fuck off. Two hours cleared quite a backlog. The report about our electric cars had caught my interest.

Several British politicians had taken to driving the cars in order to show their green credentials, and a number of London taxi drivers had adopted them. Many of those new cars had been smashed up within weeks by other, jealous, taxi drivers, a lesson for the future. We had given the staff at Mapley a hundred vehicles to make use of, and they could be seen tearing along the motorways, all sporting large lettering that proclaimed them as electric cars. Bumper stickers announced: the car in front of you is electric.

In South Wales, we had given a hundred cars to taxi drivers, who were now making huge profits from having not paid for their

vehicles, plus the low running costs. Several more were duly smashed up by their rivals, but at least they all wanted one now. The staff at Pineapple and CAR were handed them as pool cars, and they became a common sight. In Sweden, the government took delivery of a thousand and sung the car's praises. That was echoed by the Dutch, the Germans and the French. We even had the first few cars stolen and driven to Moscow. Well, you know you have a good product when Russian mafia gangs steal them to order over BMWs and Mercedes.

Jimmy then introduced hundreds of them to the islands of Malta and Tenerife, where fuel imports were costly. Tourists were soon being whisked around in taxis that cost around a penny a day to run. Advance orders for the cars, from China, topped fifty thousand around Europe.

In the States, a report both puzzled me, and made me smile wryly. Several of our cars had crashed and caught fire, injuring drivers, several more leaked fumes and made their drivers ill, and their road safety was being panned. That was all very interesting, since we had not sent any to the States, and the cars had not been given either import licenses or road worthy certificates yet. Still, numerous lawsuits were pending against the Chinese manufacturer. Given that it was illegal to import the vehicles to the States, I couldn't wait for the day in court to come around: madam, where did you buy this vehicle?

I sent Pineapple Music magazine a lengthy piece on the conspiracy by the oil companies, and they ran it, the article soon copied in the mainstream press. Jimmy had been right to keep the cars out of the States.

In China, meanwhile, they were rolling out electric buses based on the same technology, their oil consumption dropping by the day. They had also designed a car for the internal markets, a tad cheaper, and were rolling them out as only the Chinese could, by the thousands each day. Prince Ali Bin something may have been feeling a lot fitter these days, but his bank balance was about to catch a cold.

India then bought the technology off China for a staggering sum of money, a portion of which came our way. Soon, those little yellow taxis with lawnmower engines would all be electric, and Prince Ali Bin Something would be echoing around his bank vault, the one that used to be full of cash.

Unit 402

Flying down to Goma hub overnight, Jimmy mentioned Unit 402, the reason for the visit.

‘Wasn’t that a pop group in the sixties?’

‘I think that was Unit Four Plus Two.’

At the airport hotel, we welcomed Ngomo and a Pathfinder captain into Jimmy’s room, Big Paul having checked for bugs at length. We had brought in two chairs from my room, and now sat facing each other, tea served from a tray on a coffee table.

‘How’s the Ethiopian border?’ I asked Ngomo.

‘Quiet, unfortunately,’ he sighed.

‘Well, I may have some work for you,’ Jimmy began. ‘In Europe, I now have a team of agents monitoring African politicians visiting Paris, London and Switzerland. These ... *politicians* are all involved in stealing money from their governments here, and hiding it in banks in Europe for their retirement, plus the use of prostitutes and cocaine. It is my intention to monitor them here, to collect evidence and to expose them.’

That surprised me, since Jimmy vowed never to get involved with African corruption, instead, making use of the politician’s willingness to be bribed. This seemed to be something of a U-turn.

Jimmy continued, ‘Unfortunately, exposing them will be bad for business, and bad for Africa’s reputation. Still, we can’t have them stealing the money that I’m helping the various governments to make.’

The captain piped up. ‘If they fell ill, or had accidents, then Africa would not be painted with their colours.’

My eyes widened.

‘An interesting idea,’ Jimmy reflected. He faced Ngomo. ‘What do you think, old friend.’

‘I think ... that a small team of good men could arrange a few *accidents* well enough. A little food poisoning, fishing accidents, car accidents.’ He shrugged. ‘These things happen all the time.’

‘They do,’ Jimmy agreed with a dangerous smile. ‘But such a unit would need a man we can trust to stay the course of time.’

‘I would be happy to serve Africa in this way,’ the captain offered. ‘I have no love for such men.’

‘Could you find others ... like yourself?’ Jimmy asked.

‘Perhaps ... eight or nine thousand,’ the captain quipped. ‘The soldiers hate the politicians; they see the fat pigs wasting money.’

Jimmy opened a drawer and retrieved a wad of dollars, handing it to Ngomo. ‘Such a mission would have to be ... *off the books*.’

‘Indeed,’ Ngomo agreed. ‘No written records.’

Jimmy handed him a sheet of names. ‘These gentlemen are the worst of the fat pigs. But those at the bottom of the list deserve a loud and public passing. A ... *message* to others.’

‘There are no leaders on this list,’ Ngomo noted.

‘They would be ... too noticeable,’ Jimmy suggested. To the captain he said, ‘This mission requires careful planning, delicate execution, and the detailed removal of any evidence.’

‘I have a few ghosts in mind,’ the captain offered.

‘More money will be available via my man Cosy in Mombassa,’ Jimmy told Ngomo. ‘Ask for what you need to make the project run smoothly. Don’t take risks, old friend. And for those on the list in Somalia, Abdi will assist you – with relish.’

We left the hotel an hour later, hopping on the return flight.

‘Should have done this a long time ago,’ I commented.

‘I wasn’t planning on doing it all,’ Jimmy reflected. ‘But ... lately I just feel – to hell with being nice.’

‘You’ve altered a lot of plans of late,’ I posed.

‘Yeah,’ Jimmy reflected. ‘I opened up African oil to help the western economies, then released the electric car five years early, plus the drug. They’re getting all the goodies up front. But, if the momentum and the co-operation can be maintained, we could sail through 2015 and 2017, a straight enough run at 2025.’

‘Those Russian coffee shops...’

‘No.’

Part 10

Exposure

As my wall calendar changed to October 2009, displaying a nice picture of a mountain range, I was quietly concerned; Jimmy had always suggested that 2010 was the first probable year of exposure. Work was progressing well, all African projects growing dramatically, but I had a feeling in my gut that took the edge off, and took the joy out of a lot of what I was doing. And Jimmy, he did not seem to be in the mood for being stealthy anymore.

At a dinner in the city of London, one Friday night, he made several off-the-cuff remarks that he was “shorting” Liebermans, that the banking sector was looking stretched, and that when Liebermans folded it would take a few with it. It was like a slow moving atom bomb going off.

The Financial Times ran the story on the Sunday, but at least used the Queen’s English and a few nice words, a flowery account of the comments attributed to Jimmy. The British tabloids were not so concise: banking world coming to an end! The PM was on the phone, disturbing us on Sunday, and these days I appreciated my weekends now that I was a nine-to-five office worker. And a commuter!

On the Monday morning the markets turned red, the banking stocks losing six percent in an instant, Jimmy having bet the downside through Switzerland. He may have been a loudmouth, but he was also a sneaky loudmouth that liked to plan ahead. The FTSE Index dropped, and the DOW opened lower, banking stocks taking a hit, especially Liebermans. They couldn’t take legal action against Jimmy because the comments were made at a social function, beer in hand. Besides, he was still legally registered at McKinleys to offer formal advice on the stock markets, tipsy or otherwise.

At noon Jimmy led me to the basement, always a worry, but I found one of the rooms now set-up as video conferencing centre. Jimmy checked himself in a full-length mirror, sat at a desk and hit a few buttons, an earpiece placed in. ‘Can you see and hear me?’

‘Yes, all good,’ crackled back. ‘Two minutes.’

The voice counted down, Jimmy staring at a camera which displayed a small image in a corner of its lens, that of the news studio the other end. I put in a second earpiece and sat.

‘Mister Silo, the markets have reacted nervously to your comments regarding Liebermans in America, and the banking sector in general. Do you stand by your comments?’

‘Yes, I do. Not least because I received an unsolicited copy of Liebermans trading accounts a while ago. Those accounts confirmed what I already suspected, which is that they’re heavily leveraged, and even a small downturn in the property market would hurt them, probably forcing them to file for bankruptcy. I estimate that just a three percent downswing in house prices could force them over the edge, because they’re leveraged thirty times their own size.’

‘Could you explain that for us.’

‘Liebermans, as a business, is worth just about four hundred million dollars. It has borrowed twelve *billion* dollars, and invested that money in the property market, some of it in highly leveraged positions. They’re badly exposed to the property market, as are many of the US banks. In the UK, I’d expect Mortons to get into trouble soon for the same reasons - which are stupidity and greed, nothing more complicated than that. I was also sent the details of large scale accounting fraud by many of the British accountancy firms involved in auditing British and American banks. In particular, a practice whereby debt is swapped ahead of reporting quarters, and swapped back afterwards. A great many American bank directors should be in prison, along with many of the directors of the largest accountancy firms in the city of London.’

And that was that. Balls had been kicked, cages rattled. Still, we made a lot of money off the falling market, being just as dishonest as those that Jimmy had condemned. Later that day, Hardon Chase ordered a review of banking guidelines, but it was too late for Liebermans. For them, the ground was rushing up quickly. In a conversation with Chase, Jimmy suggested that there would be consequences if the New York Fed bailed out Liebermans. He wanted an example made of them, followed by a review.

A document was released to the world’s press, anonymously, detailing leverage rates for individual banks, ranked in order of exposure. They ranged from one multiple, which meant that the bank had borrowed what it was worth – something that no sensible business would ever do – to those in the high twenties; it was name and shame time. Mortons, in the UK, showed a leverage of eight, the next highest UK bank leveraged at just four fold.

The run on the banks continued, although some fared better than others and recovered quickly, those with low multiples. And Mac in Mawlini, he scratched his head as eighty-seven million pounds

arrived in his account, donated from an S. Mellie Von Flytrap in Switzerland. And all this occurred just a week before the next “M” Group meeting, this one due to be held in Berlin. I had to wonder about the timing.

With the banking sector furore settling, I got back to work. Jimmy had suggested that I nurture those African businesses that were already established, making use of our bank’s considerable investment funds. On my desk rested a magazine about African industry, produced to coincide with one of the trade shows at Goma conference centre. The back page held a picture of Mombassa docks, which set me thinking. I researched the company that ran the port, and discovered that they also ran some of the trains we used, plus a fleet of trucks. I called their managing director, a Samuel Obotou.

‘Samuel? Paul Holton from England.’

‘A great honour, Mister Holton. Indeed, a great honour. How may I be of service?’

‘Do you mind if I ask ... do you have finance that you’re paying off?’

‘All businesses have finance that they are paying off.’

‘Do you mind if I ask about the arrangement you have?’ I pressed.

‘Six million pounds at twelve percent over twenty-one years.’

‘Could you do with more finance? I mean - if you had more, could you expand your business and employ more people?’

‘Certainly. We are struggling because of the finance, not the lack of work,’ Samuel stated.

‘Then I’ll offer you twelve million at one percent over twenty years.’

‘That is most generous. But may I ask ... why?’

‘We want to boost jobs in Kenya, nothing more complicated than that.’ As I said it, I realised that I was starting to sound like Jimmy.

‘Then I will be happy to receive your assistance.’

‘I’ll arrange it within days. Oh, do you know of any other businesses in your region that could do with some ... you know, finance to grow?’

He gave me a list. All the time and effort I had put into trying to figure that out, and all I had to do was ask. I offered the main trucking company in Mombassa ten million at one percent, the largest rail company six million, and a small Kenyan shipping company three million towards leasing more ships. And for each recipient of my donor cash I asked how many new jobs would be created. My notepad jottings added up to around eight thousand new

employees, not a huge number for Africa. I was happy enough with what I was doing, my new approach, but still not a hundred percent.

Next came a train company that worked out of Dar es Salaam. It was state owned, but did its own thing. Kind of. I got through to the main man via an interpreter. They did not have any loans, but it could be argued that they owed the government money. Since the Tanzanian Government owned it, it was all a bit odd.

‘How much money would you need to create a thousand new jobs?’ I asked.

‘Around a million pounds,’ was the answer they finally came back with, based on existing figures. These were better numbers.

‘And they would be sustainable, long term jobs?’

‘Yes, we have many more orders than capacity.’

‘OK, I’ll loan you twenty-five million, secured by the Tanzania Government. Will they do that?’

‘Yes, sir, they own the business.’

‘And how would you spend the money?’ I pressed.

‘More track, more rolling stock and engines, and cargo yards.’

‘Fine, I’ll send someone to you. Thank you.’

I went and found Jimmy. ‘Tanzanian state railway company: good investment?’

‘Sure. Ask them to help with an improved east coast track. From South Africa right up to Mogadishu.’

Dave Gardener stepped into the office, and I was surprised by how ill he looked. ‘Got a moment?’ he asked.

Jimmy and I led him to the diner. Dave had been injected, but that was almost twenty years ago, and he had been sixty-seven at the time.

‘Dave, are you well?’ I asked.

‘Struggling on.’

‘Why not have another injection?’ I pressed.

He smiled, shaking his head. ‘Wife went last week –’

‘Why didn’t you tell us?’ Jimmy softly enquired, both of us shocked.

‘Well, I’ve done better than I should have,’ Dave reflected. ‘Should have left a while back, and I thank you for all you’ve done.’

‘But?’ I nudged.

‘But I don’t want to go on forever. And, from what I understand, even another injection will not make that much of a difference at my age.’

‘It’ll stretch your life by another ten or twenty years,’ Jimmy softly stated. ‘But with some deterioration.’

‘So, no, no injection, thanks. And, this is my official goodbye, I’m ... retiring.’

‘You’re welcome here any time,’ Jimmy told him.

‘I know, and I’m glad to have seen what I have, to have witnessed what I have, and worked alongside a time traveller. And ... I hope you fix it all.’ He took a moment. ‘I’ll be leaving tonight, but I wanted to see you one last time; so strong, so young looking, so determined.’

‘Leaving tonight?’ I queried.

Jimmy said to me, ‘We don’t enjoy many freedoms in this life, choosing the time and place of your own death is one of them.’

‘Christ,’ I let out. ‘Would you ... like to see the kids again?’

‘I said goodbye to my own yesterday. Coming here was my last bit of business to settle. My replacement will introduce himself soon.’

‘He as polite as an Israeli?’ I asked, making Dave smile.

‘Hopefully, as polite as the British.’

With Dave departed, I took a stroll around the grounds, the relentless march of time catching up with those around me, but not with myself. Down by the river I bumped into Rob and his dogs.

‘Out for a walk, boss?’

‘Yeah, needed to ... think a bit. How’re the dogs?’

‘And I’m OK too,’ Rob quipped, making me smile.

‘Don’t start, I got enough on my plate.’

Rob settled the two dogs. ‘Karl used to feed them, and I reckon they know he’s gone.’

‘That’s the problem, isn’t it: time moves on, people go.’

‘And new ones arrive. Can’t dwell on it. I’ve buried six dogs here. All of the current batch are third generation already.’

‘Really?’

‘The pups make up for the loss of the old dogs,’ he said as he headed off.

I stared after him, thinking about children. I plodded slowly on, hands in pockets, trees inspected, squirrels glanced at. Back at the main house I jumped into my electric car and returned to my office, finding a few new messages left on my chair.

A week later we flew over to Berlin, accompanying the British PM and his party, and trying not to discuss “M” Group material too much, although some plotting and scheming went on en route. The German security was modest, blacked-out coaches used to transport us to a country hotel just outside the city, a sprinkling of reporters already camped at the gates.

Our rooms were palatial, and there was no need for extra beds for the girls, they had school. After unpacking the basics and hanging up suits, I left Helen to update her laptop and went for a walk through the hotel. Downstairs, I bumped into Ben Ares and his team coming in, shaking his hand.

‘You lot comfortable with the venue?’ I whispered.

‘The hotel, or Berlin?’ Ben asked as we walked on together.

‘Berlin,’ I whispered.

‘Would not have been my first choice.’ He gestured towards a man in his late thirties. ‘Oh, this is David, your new contact.’

‘That’ll keep it simple, another David.’ I shook his hand. ‘Must admit, I miss the old one.’

‘As do we all,’ the new David commented.

I left them at reception and walked into the grounds, the rain holding off as President Chase’s motorcade wound its way in. His car slowed, and his Treasury Secretary stepped down, the convoy pulling off again. The man strode purposefully towards me.

‘Wilkommen in Deutschland,’ I offered.

‘Got a minute?’

‘Sure.’ I gestured him towards a pond, and we strolled slowly on.

‘We’re thinking of bailing out Liebermans.’

‘That would put you on a collision course with Jimmy.’

‘It’ll be bad for the US banking sector if they fold,’ the man pointed out.

‘And, it’ll be worse if the warning is not heeded, and many large banks fold in a few years time. You can deal with the one now - and no market crash - or many later with a recession. Take your pick.’

‘And if we do bail them out?’ he pressed.

‘I guess we’d keep the spotlight on your banking sector, then ask the Chinese to make your eyes water.’

‘We don’t need to borrow so much from them, the economy is buoyant.’

‘Suggesting that you want a fight,’ I noted.

‘Not in an ideal world.’

I stopped. ‘You’ll save the hand and lose the arm later, because your banks won’t give up the leverage.’

‘Is there a half-way measure?’ he asked.

‘That would probably involve capped multiples,’ I suggested. ‘Always assuming that you get accurate and truthful figures from your banks, a novel approach for them.’

‘We could cap them at twenty,’ he tentatively suggested.

‘I think we’ll publish all multiples anyway in the years ahead, so the investors can make up their own minds, whether you’re comfortable with twenty or not. And even if we don’t, people will look for them.’

‘The markets will adjust,’ he suggested. To what, was not clear.

‘Look, you were supposed to crash last year, but you didn’t. Now, every year that rolls by sees even more money leveraged. So if you crash this year, it’ll be worse than last year could have been, and next year worse again. If you crash in ten years time it’ll be a hundred times worse. The whole point of Liebermans is a boiling exercise; a warning to others. And don’t insult my intelligence by telling me you can reign in the banks worst excesses - you can’t! If you crash now you could survive it, but do it from 2015 to 2017 and you’ll lose America ... and we lose the planet, so you go figure that out with your slide rule.’

At the first meeting, held around a large rectangular table, I noticed that the leaders were all the same old faces. We had not changed a leader for a while.

Jimmy began with, ‘Welcome to Berlin, a peaceful, prosperous and vibrant city that was once the centre of a great conflict. And that’s the thing about wars ... and the advance of time; wounds heal, albeit slowly in some areas. Those that were fighting on opposing sides can come together, and the next generation does not hold the same grudges. So, welcome world leaders, hard working aides and former enemies.’

‘First order of business.’ Jimmy nodded toward an American security official. The man stepped up to an Indian aide and lifted a scanner for a few seconds, nodding towards Jimmy when finished. To the Indian aide, Jimmy said, ‘Your mobile phone seems to be on continuous transmit.’

The man apologised and switched it off. ‘I must have nudged it accidentally.’

‘And yet ... the journalist at the other end was not nudged.’

Everyone focused on the man, especially the Indian leader. Words were exchanged.

Jimmy said, 'You can leave now, through the door, or through the window.' The man was escorted out as further devices were waved around the room.

'I would like to apologise to the group,' the Indian Prime Minister offered.

'I accept your apology,' Jimmy said. 'And I'm sure that rest do as well, and do not hold you responsible for this man. OK, moving on, the first order of business is ... oil. As you will have seen, oil over-production has lowered prices, making me popular in Saudi Arabia.' People smiled. 'That boosts the western economies, but also makes countries like Russia suffer a little, since they benefit from higher oil prices. It is not my intention to force prices lower, but to stop them rocketing higher. Crude is currently \$55 a barrel, with a good supply. By this time it should be \$70 plus, spiking above \$120 – which would hurt many oil-dependent nations. I would like to point out to the Russians that European oil and gas demand will only ever increase.

'Now, the electric car technology has been released well ahead of the planned date, and many of you should reap the benefit of its cost savings - except our Russian friends – who may desire a higher oil price. What our Russian friends should also consider is that Russia will benefit from selling its oil, not using it on its own consumers. The less its own citizens buy, the more foreign currency is generated.'

Jimmy took a breath. 'It may be hard to picture the turbulent future at this peaceful juncture, but without the steps that I've taken in recent years, then the key year of 2015 – and subsequent years – would have been flavoured by severe economic problems in the west, leading to political unrest. I hope we can all be grateful that we have the chance of reaching that point in the future ... without either problem.

'President Chase. Your oil industry has already attempted to derail the electric cars. Fine, their implementation is your choice. You may, if you wish, continue to gas-guzzle whilst the rest of the world reaps the cost benefit.'

'We aim to go all electric vehicle in seven years,' the Germans put in, albeit heavily accented.

'We have similar plans,' the French added with a softer accent.

'As do we,' India stated. 'As you know, we have bought the technology off the Chinese.'

'China aims to make good use of the technology,' Han announced.

‘Unfortunately,’ Jimmy began, ‘we have a problem. Many countries retain large numbers of dollars to buy oil, and if they end up buying less oil then their fondness for hanging onto dollars may wane, something that America should plan for.’

‘How ... exactly,’ Chase firmly nudged.

Jimmy explained, ‘As a natural consequence of the electric car technology, OPEC will focus on the developing countries in the years ahead. But, the developed countries will still need oil for lorries, for industry, and the change over to electric cars will never be total; the developed countries will reduce their oil consumption by little more than thirty percent over the next ten years. There will be more dollars on the market, but it won’t be a dramatic change. Besides, Africa and the other developing nations will ... develop.’

‘And the impact of all of this?’ Chase nudged.

‘I’ve affected oil production, the western housing bubble, and released electric car technology, to avoid a serious economic crisis,’ Jimmy informed him. ‘My strategy moves us away from that danger, but presents other potential problems that need to be planned for. You all need to consider the impact of a lower volume of oil purchases, and the effect on the petrol-dollar. You also have the super-drug health dividend, and a more stable availability of oil. If not managed, those factors could lower the value of the dollar. But, as the US economy benefits from cheaper oil and consumer tax breaks, a counter-balance could be created. And that’s why we have such a capable person in the White House.’ Chase cocked an eyebrow. ‘I’m confident that he can sort it all out, so that one area counterbalances another.’

‘Will America adopt the electric cars?’ the Chinese asked.

‘Yes, but in small quantities to start with. Oil is now stable, so why should its gas-guzzling citizens worry? What the nice man in the White House should consider ... is the extra growth seen in European and developing economies from the costs savings. He needs to remain competitive. Which brings us nicely around to those fine gentlemen who run the major US banks. As most of you will already know, I expressed my feelings about banks such as Liebermans recently, and the nice man in the White House is considering bailing them out.’

Jimmy opened a folder and handed out a list of US banks. ‘This is a list of US banks, ranked in order of risk. Those at the top have a multiple of more than thirty. That means that they have borrowed, for themselves, more than thirty times their net worth, and invested it into the housing markets. So long as the US housing market

remains strong there's no danger. But, as soon as the music stops, it's a case of musical chairs, with just six chairs for twelve banks. I strongly recommend to all nations, except America of course, that no fresh investments be made in the top US banks, those with multiples over ten.'

'That's most of our banks!' Chase complained.

Jimmy held his hands wide. 'I informed you many years ago what would happen, and now they're over-stretched. If - and it's a big if - house prices dropped five percent, you'd have to bail them out to the tune of half a trillion dollars. If you wait three years, and property prices drop five percent, you'll bail them out one point three trillion. After five years, that becomes three point five trillion. You with me so far, Mister President?'

'Is there a middle road?' Chase unhappily asked.

'Find some honest bank directors?' I toyed.

Jimmy smiled. 'That would be one solution, albeit a bit ... improbable.'

'And if we capped multiples?' Chase asked.

'They'd lie to you, and hide the truth, as they're already doing with debt swaps.'

Han said, 'The Chinese Government is most concerned about this matter, and will be reviewing its investment policy. We will impose a multiple of twenty to start with, lowering that in subsequent years.'

'Have you met with the banks?' I asked Chase.

'The Treasury Secretary met with them recently,' Chase replied, sounding unhappy to be discussing the topic openly.

'And they reminded you of the money they make for the US, and of the liquidity benefits that they bring,' Jimmy posed.

'Something like that,' Chase reluctantly admitted.

'My preferred course of action would be for Liebermans to hit the wall, followed by a statement from you that *no one* will get a bailout. Followed by a tough investigation into accounting standards.'

'Again, is there a middle road?' Chase pushed.

Jimmy took a breath. 'Have you ever wondered why I developed the drug in secret, along with the electric car technology? I've done many things by myself, because I don't have an electorate to worry about, nor can I be compromised, bribed or bullied. I do these things for the good of the planet, and I make the choices, knowing that it would be very hard to get a consensus in a group like this, where each of the leaders present has a vested interest. And my relationship with Russia, China and Europe is as much about counter-balancing

the worst excesses of US policy as anything else. You can follow my guidance, and the consensus here, or you can do your own thing, Mister Chase. If, next year, your banks need bailing out, you'll leave office as the man who caused a severe economic crash, and not as the great leader we all hoped you'd turn out to be. You need to look forwards ten years, then look back and ask ... how did I handle that financial crisis? They warned me ... but it still happened, and I left office with a very low approval rating.'

The room fell silent, everyone focused on Chase as he unhappily stared back at Jimmy. We waited.

Chase lowered his head and heaved a breath. 'We'll tighten up the worst excesses of the bank, and give Liebermans notice to reduce its multiple to twenty – with a warning that they'll get no bailout.'

His Treasury Secretary shot a dirty look at the back of Chase's head.

'We'll take a one hour break,' Jimmy ordered. 'During which time the Chinese and Americans can discuss ... future bond purchases.'

I led Helen back to our room and ordered food.

'That going to be a big fight?' Helen asked.

I shrugged. 'Jimmy won't back down, so Chase can co-operate or lose Jimmy's help. The patient ... doesn't like the taste of the medicine.'

At the next session, the mood was a little off, few smiles evident. I should have brought Shelly.

Jimmy began, 'The Chinese and the Americans have made some minor agreements, but not completely to the taste of the nice man in the White House. Moving on, whilst still on the same basic subject, the French and Germans should be aware that when Greece applied to join the Euro, the figures it presented – prepared with the assistance of certain American banks – were completely fraudulent.'

The French and Germans sat upright.

Jimmy continued, 'Their debt is three times higher than that declared, and some members of the American team here knew that fact all along.'

Looks were exchanged.

Jimmy added, 'Greece will get into trouble in the years ahead, speculated upon by those very same American banks that assisted the fraud. Whilst on the subject, Portugal and Spain – which will become known as the Club Med countries – will also face great difficulties. If, and when, the US banking sector falters, Spain will

plunge into a recession that will lead it out of the Euro, a similar fate for Portugal and Greece. If the banking sector does not falter, the Club Med countries will falter at a slower rate, but they will still falter.'

'They leave the Euro?' the Germans questioned, aghast at that suggestion.

'Their people will see things as having been better before the advent of the Euro, with a strong desire to fix their tourist trade through a lower currency. Spain will suffer twenty-five percent unemployment for years, forty percent amongst its young people. The voting public will only tolerate that for so long. So you can see why I wish to avoid an economic crash.' He faced the Russians. 'When that crash comes it will take eighty percent off your stock markets.'

He took a moment. 'I had always assumed that, at this date, we'd be in a war of words with America, and by "we" I mean everyone apart the Americans.' Chase straightened. 'So *everyone* ... listen carefully. Between now and 2015 there will be pressure on the dollar, downward pressure, and that pressure will be resisted by the nice man in the White House at almost any cost. During that economic conflict, America will make use of its banks to its own benefit. All other nations must be careful in the use of large American banks, because they have a vested interest in propping up the dollar, knocking the Euro - and any other currencies in Eurasia.

'The decline of the dollar is inevitable; it's overvalued by a long way, and pegged to the price of oil. So long as there was a shortage of oil and a steady rise in oil prices the petrol-dollar remained strong, falsely strong. That cannot go on forever. It will, eventually, fall back toward its proper value, a painful adjustment for not just America, but the whole world. What happens in the next five or ten years is not a question of ... *can it be fixed*, but how can the pain be eased. That process can either be a negotiated process, through this group, or it can be a fight - every country for itself. The first step in that fight, and the start point, is how President Chase deals with his banks. If he deals with them as I expect, then the war will start soon, and America will not be invited to further "M" Group meetings.'

'Not invited?' Chase challenged.

'If we begin a conflict, you'll be on your own,' Jimmy coldly stated. 'You won't be getting any guidance from me, but those you're in conflict with will receive help - because they're not the problem.' He held his gaze on Chase.

'I said we'd tackle the banks,' Chase curtly pointed out.

‘Mister Chase, I can already see the knives in your back.’

Chase took a moment. ‘There’ll be resistance?’

‘That’s something of an understatement. The people around this table are not your immediate concern, your own countrymen are. Even some of your own cabinet will be an issue, and they’ll leak details of these meetings to undermine you.’

The British Prime Minister put in, ‘You once said, in one of these meetings, that we should always keep talking – even if we don’t like each other.’

Jimmy faced him. ‘And you could sit with an American President when US banks and hedge funds are creating a run on the pound to benefit the dollar? These meetings are only useful if the participants don’t lie to each other, about things such as Greek debt.’

‘Why did you not mention that before?’ the Germans asked.

‘Ammunition is not much good unless kept dry ... and ready for use at the right time,’ Jimmy responded. ‘There are many things that I know, that you don’t.’

‘I’d like a recess ... and a private chat,’ Chase curtly demanded.

‘By all means,’ Jimmy said with a false smile. ‘Thirty minute break, please.’

Jimmy led Chase and myself to a side room and arranged chairs.

‘Just where the hell did all this come from?’ Chase demanded.

‘We warned you many years ago about your banks,’ Jimmy calmly stated. ‘Now we’re reaching the tipping point, a point where’ll I’ll have no choice but to expose your banks.’

‘You knew the multiples,’ I put in.

‘There must be a solution,’ Chase insisted.

‘Even if you wanted to control your own banks, your own people would trip you up,’ Jimmy suggested. ‘And your Treasury Secretary is more loyal to them than to you. He has an eye on his next job.’

‘And if I was amenable to a solution...?’ Chase nudged.

‘Then I’d say ... do what you can, but gently, and I’ll play hardball. That way, there’ll be fewer knives in your back.’

‘So instead of them coming for me they go for you,’ Chase questioned. ‘And they may try and expose you!’

‘If they expose me, they’ll strengthen my arm,’ Jimmy pointed out. ‘No, more likely they’ll try and discredit me, or shoot me.’

I didn’t like the sound of that. At all.

‘Can we keep channels open?’ Chase asked.

‘I would hope so, but I know what will happen with the banks, and they’ll all need a punch on the nose,’ Jimmy replied. ‘There’s

not much of an alternative. It'll become a dirty fight and, at the end of the day, you're paid to fight their corner, not mine.'

Chase stood and glanced out of the window. 'One of the first things you said to me ... was to think about the end of my life: how I'd view myself looking back.' He turned. 'I don't want to be at the helm during a crash, nor do I want to be undermined by my own people and discredited. I know what they can do.'

'If you leave it to me ... it'll hurt,' Jimmy informed him. 'But, you'll have less of a problem with your own people.'

'And if they undermine you we lose the planet,' Chase pointed out.

'There is that,' I lightly stated.

Chase returned and sat. 'So we do a little a both. I'll push as much as I can, you ... kick some balls, and I'll try and deal with the fallout.'

'It'll be messy,' Jimmy warned.

Back in the meeting, we discussed the electric technology, the wonder drug, African development and oil quotas before breaking for the day. Now the serious work would begin, not least the French and German governments discussing what to do about Greece. Jimmy met with them and offered to assist the Club Med countries in the next few years. Following that, he made a call with ramifications; the CEO of Liebermans would now be under the spotlight. A copy of their dodgy debt-swaps, ahead of shareholder meetings, had been handed in to the SEC, the New York Post, the Washington Times and CNN.

At the group meal that evening, Chase was called out to take a call. Returning, he unhappily informed us that Liebermans was under investigation. The first blow had been struck, but one that Chase could not be blamed for. He issued a short statement to the waiting press after the meal, condemning any sharp practices in the banking sector and siding with the poor old investor; Joe Public. And I had a chore. I went and found Chase's Treasury Secretary.

'Got a minute?' I asked, leading him away. 'Just wanted to point out that Jimmy handed a file to Chase, the contents of which would put you in prison for a long time.' The man socked upright. 'Some of the detail is real, some has been very cleverly manufactured over the past twenty years.' I tapped him on the shoulder. 'Enjoy the rest of your evening.'

The second blow had been delivered. I went and found Ben Ares. 'Got a minute?'

He gestured me to a seat. 'Problem?'

‘Of a sort.’ I took a breath. ‘Jimmy knows that various Jewish investment managers will perpetrate some major frauds in the years ahead, which will harm the reputation of *Jewish* investment managers. He’s going to deal with them as he has done with Liebermans – very public, and very loud. Of course, if they were dealt with quietly first...’ I held my hands wide and gave a big Dave Gardener shrug, and left it at that.

In London, the Serious Fraud Office took receipt of a bundle of documents regarding a British accountancy firm. In the morning, the British PM was not a happy bunny, voices raised in a private meeting with Jimmy. The PM had been warned years earlier, so I had no sympathy for him. I sighed, another frosty “M” Group meeting on the cards.

Jimmy began the next session with, ‘OK, as some of you are aware, there have been a few developments overnight. Documents outlining illegal practices at Liebermans have been handed to the SEC in New York, and the Fraud Office in London have taken receipt of documents relating to an accountancy firm. There will be fallout. All you need keep in mind is that the *people* elected you, and that you work for those people.’ He focused on the American team. ‘It may have been wise for you to consider that I’ve had moles inside your banks for some twenty years.’

‘I’m going to get tough with them, where I can,’ Chase reluctantly offered, a statement meant for the other nations assembled about the tables.

Russia stated, ‘We will be ... *cautious* about investing in certain American banks.’

China and India echoed those words, France and Germany stating that there would be a far reaching review. I guessed that they meant Greece, as much as their own countrymen investing in the nominated US banks.

‘Israel will also be conducting a review,’ Ben Ares stated, causing Chase to focus on him.

‘Moving on,’ Jimmy called. ‘And to recap. The next ten years will be dominated by the slide in the dollar, and the steps taken to prevent that slide. There is no easy way of dealing with it. In a worst-case scenario, a future US president will go to war to prop-up the dollar. At best, there will be economic war of some degree. The path will not be smooth, and there’s very little that I can do to assist; there is no magic formula to apply.’

‘Our American friends at this table are aware of the problem, and everyone else is aware of both the consequences, and the possible

actions that may be taken. For each American action, they have a reaction planned – I’ve made sure of that. My role, in the years ahead, will be to try and lessen the damage to both sides. One solution, a definitive solution, would be for the US to lower its currency whilst reducing health costs and implementing new technologies to remove the dependence on oil. That ... is unlikely to happen till its absolutely necessary, a little late in the day.

‘What Mister Chase needs to be aware of is that the health and energy savings available to America’s competitors are huge. Their economies will benefit, as yours could. It’s up to you.

‘Now, if OPEC dropped the dollar around 2017, the effect would be a lowering of the value of the dollar, causing America’s imports to double overnight. If the health and energy benefits are in place, then the pain of those rises would be greatly lessened. US citizens need not worry about the rise in oil prices ... when they drive electric cars. And the rise in food imports can be offset by tax breaks, caused by the health budget savings.’

He faced Chase. ‘You may have assumed that was my reasoning all along, to help deal with your two largest cost centres; oil and healthcare. You can wait till 2017, or you can take small steps towards that date, using the savings to adjust the dollar’s position in the world. This is the best opportunity you’ll ever get – but I’d bet my life you don’t take it.’

Jimmy pointed at the Treasury Secretary. ‘I’d like you to arrange a meeting of the top banks for next week. I’ll see if I can’t make them see sense. OK, moving on to the next generation of nuclear power stations. They will cost less to build, less to run, and will produce a greater output. And as for their waste products, our friends in Somali are happy to accept as much waste as you have. I’m preparing a facility there, and the fees will be low.

‘OK, the Swine Flu pandemic will run its course – no pun intended, but will not be as severe as various pharmaceutical companies would like it to be. Those people injected with the super-drug will be ninety-percent resistant, but all countries here should divert a large portion of their medical research toward flu variants. In the future, they will kill a great many people, even some of those with the super drug.’

We got into small detail, and the mood lifted a little, sensible questions asked and answers given. We even managed to finish with a few jokes. Landing back at Cardiff airport, we found the girls in the coach, full of news of hamsters and mice and rabbits. After my heart had started again, they explained that the animals were in a

large shed near the rose garden, and not running around our house. Helen and I sighed with relief.

Back in my office, I accepted a mug of tea and listened to updates for an hour before Jimmy stepped in. He waved people down when they attempted to stand, and eased down onto a sofa.

‘So, this where all the proper work happens, eh?’ he said with a smile.

‘Deep thinking and doughnuts,’ I said.

‘I figured we’d finally float Pineapple, sell some stock to make a few quid.’

I pointed at the Pineapple liaison. ‘That doesn’t mean that you’re fired. Don’t worry.’

‘Quite correct,’ Jimmy confirmed. ‘Good people are hard to find. But your work may alter a bit.’ He faced me. ‘I fancied more shares in the media group, Blake Carrington’s.’

‘Blake Carrington?’ they queried.

Jimmy stood. Thumbing towards me, he explained, ‘That’s what he calls the guy. And yes, he does look like Blake Carrington.’

‘Timescale?’ I asked Jimmy as he headed towards the door.

‘Best do it before the news leaks,’ he said as he waved goodbye.

I raised my iPhone and selected the picture of our accountant. ‘Neil, float Pineapple as fast as you can, sell some of our shares, raise some dough. Thanks.’

I pointed at my Pineapple liaison. ‘In addition to Pineapple, you just became our liaison to the media group. The guy’s name is Ted Schapp-something, and our accountants should have some info on them.’

‘Media One Inc,’ the man stated.

‘That’s them, they own the African Times.’

Later that evening I asked Jimmy how many of our shares we would offload.

‘All of them, but quietly,’ Jimmy responded.

‘And the reasoning...?’ I nudged.

‘If ... exposed, then people would see it as *unfair* that we pick future hit singers, and may see a lot of what we do as being unfair. The media group could not be said to make use of any unfair advantage. Besides, I’ll need the media group to beat up a few banks.’

‘Coming back to exposure...?’ I nudged.

‘The American banks will want to fight back,’ he said with a shrug.

That weekend, eight new security staff appeared. Extra cameras were fitted, more sensors, and a small hut was built on the main house, on its purposeful flat roof. Positioned up there would be four new men, ex-soldiers and mates of Big Paul. They would be furnished with binoculars, night sights, and rifles licensed by the government. I was asked not to mention it to Helen yet. When I asked Jimmy if he expected the US banks to get dirty, he enigmatically said, ‘Amongst others.’

Four new Range Rovers appeared, all of them identical, and a second coach, this one fitted with bulletproof glass. These vehicles would now drive around at random, just to see who was following. It wasn’t a very relaxing weekend, not least because Liebermans dominated the news. Late on Sunday night Jimmy came over to my house after the girls had gone up to bed. We cracked open cans and sat with Helen, the sound on the TV turned down.

‘Need to kick an idea around,’ Jimmy began. ‘This meeting I’ve asked for with the bank chiefs, it was not supposed to happen, not this way. It’s an ... unknown. My first instinct would be to try and strong-arm them. Well, my first instinct would be to try and talk nicely, but they’d never respect that. And who the hell am I to ask them to behave?’

‘Do you have dirt on any of them?’ I asked.

‘On all of them, or at least elements of their businesses.’

‘The room will probably be bugged,’ Helen suggested.

‘Definitely,’ Jimmy agreed with an odd smirk. ‘Some of them have already researched me, and think they know a thing or two.’

‘They’ll try and expose you?’ I asked.

‘No, because then we’d tell people to avoid them, and the public would probably listen,’ Jimmy explained.

‘You think they’ll try and bribe you?’ Helen asked.

‘Same difference, it wouldn’t work. Besides, some of them are honest – to a degree. It’s just the risks that they’re taking that’s the problem.’

‘So you can’t threaten them with anything,’ Helen thought out loud.

‘Could bust up one or two as an example,’ I put in.

‘They’re unlikely to respond to that. Besides, they don’t work as a group; it’s a cutthroat business – they’d be happy to see each other suffer.’

‘So what motivates them?’ Helen posed.

‘Keeping their jobs and making money,’ I responded.

‘Can’t risk offering them bribes,’ Helen noted. ‘*You’d* end up in trouble then.’

‘Correct, since they may report the fact.’ He wagged a finger. ‘But, when faced with a bribery charge, the authorities would ask what I’d make out of it. The banks could hardly say that I bribed them to stop breaking the law.’

‘That would be an odd day in court!’ I quipped.

‘I can’t bribe them ... directly,’ Jimmy said, staring at the carpet. He looked up and grinned. ‘But I am licensed to offer stock market advice.’

Witchcraft

The following Tuesday we flew overnight to New York, to a meeting that the White House had arranged with the bank chiefs, none of whom were supposed to know about us, about the secret parts of what we got up to at least. Staying at my apartment overlooking Central Park, Jimmy handed Helen and myself small pouches to keep our mobile phones in, to prevent interference.

‘Interference from...?’ I nudged.

‘You’ll see later.’ He gave me a pouch that fitted well into my jacket pocket, another that slipped into Helen’s handbag. ‘You won’t have much of a signal when your phones are inside, so just use the pouches for this meeting. And ... don’t react when I do strange things.’

‘If you start dancing like New Year, then I’m walking out,’ I threatened, wagging a finger.

‘I think today’s meeting will be a little more ... frosty. No dancing. Be lucky to get a coffee.’

Two hours later, we drove the short distance around to a hotel, into an underground car park and up to a penthouse suite retained by one of the banks. It came complete with a mini-boardroom and a waitress, and left me wondering if secretive meetings went on here, power deals done.

The first two people I met were pleased to see me, and reacted a bit like giddy tourists. The rest were a mixture of polite, to downright sour-faced. And the CEO of Liebermans, he was not in attendance today. I guess he had his hands full, or his hands cuffed. The natural leader of this supposed “group of equals” was the CEO

of BNK, Art Ritter, a thickset man in his fifties. He now nudged people towards the meeting room, where the nice young lady waitress dispensed coffees. So far, so good.

When everyone had settled, Helen at my side, Art Ritter curtly began with, 'You called this meeting, Silo.' He said side on to the table, facing the window.

'Actually, Hardon Chase asked if I could try and work out my differences with you, since I explained to him my intention of giving you all a hard time in the years ahead.'

'And why do you think you need to ... try and give us a hard time?' Ritter testily asked.

'Because for some of you, your balls are bigger than your brains, and when you collapse you'll take a lot of good people with you. You can think of me as Robin Hood to your Sheriff of Nottingham.'

'So you represent the little people,' Ritter thought aloud. 'Yet you use the system as well as anyone to make money, legal or otherwise!'

'I'm not investing other people's money in risky ventures. And if I went bust, I'd not take down the western economy.'

'That's a rather dramatic statement,' one of the other men put in.

'Do you think so?' Jimmy asked. 'I don't, and I'm smarter than all of you. As such, I sent a detailed report to AIG today, along with copy of documents from several of your banks, so that they know what they've been buying.'

Several of the men glanced at each other, seemingly uneasy.

'And the leaked Liebermans documents?' Ritter asked.

'Yes, that was my doing. As will be the other documents to be released, depending on how well this meeting goes,' Jimmy explained.

'And you bribed people to get hold of them?' Ritter risked.

'Certainly not,' Jimmy said with a coy smile. 'They were sent to me anonymously. And it's no good trying to trick me into saying something that I shouldn't, since all the electronic gizmos you have on you stopped working when I entered.'

'What makes you think we're bugging this meeting?' Ritter posed.

'All electronics give off a signal, and I was born with the odd ability to detect them, as well as block them.' I frowned at that. Jimmy added, 'Why don't you check them, and your phones and watches.'

'My watch has stopped,' two men echoed.

They checked their phones, finding them off, and could not get them to switch back on. We sipped our coffees as we waited for them to settle again; to stop cursing, and to settle.

‘Clever trick,’ Ritter acknowledged, his own phone dead as a Do-Do.

‘You ain’t seen nothing yet,’ Jimmy threatened. ‘So, why don’t we just cut the crap and see if we can keep you all out of jail, and prospering.’

‘You’re deluding yourself, Silo,’ Ritter baulked.

‘I have your trading statements, Ritter,’ Jimmy coldly stated. ‘The real ones. They could go to the New York Times.’ Ritter lost some of his smugness. ‘Just call my bluff, I’ll send them to the press, and we’ll meet again in a day or so. Then, after each meeting, I send another file in, and we’ll keep meeting till none of you are left in charge.’

‘You must have spent a lot of money to get those files,’ Ritter tried to draw out of Jimmy.

‘I put people in place ten and twenty years ago,’ Jimmy replied. ‘Just for this very occasion.’

‘What the hell is that you want?’ a man asked.

‘Stability - nothing more complicated than that. I want you fine gentlemen to make money now, and twenty years from now. Unfortunately, my spies in your organisations suggest that you’re all heavily overstretched, that you don’t understand the risks that your bright young traders are taking, and that those very same traders don’t really understand the risks they’re taking in turn. Some of you have five traders making ninety-five percent of your profits. And CDOs are just downright dishonest. So, to answer your question, I want what you want. I want you to carry on doing well, and not to be fucked over by stupid young traders given a free hand to bet billions in markets they don’t fully understand. If not, I’ll keep leaking documents till you’re all tarnished – as well as all out of a job.’

‘And who the fuck made you God?’ a man asked.

‘I don’t think God cares what you do; he has a policy of *non-interference* in the development of mankind. I, on the other hand, have a policy of direct interference, hence my work in Africa. And, unlike God, I don’t forgive.’

‘Just who the hell do you think you are?’ a man asked.

‘Who and what I am is not the point. It’s what I can do if you don’t play ball that should be of interest to you.’ He turned his head to a man on his left. ‘I sent the New York police a file about the secretary you made pregnant and had killed – as we sat down to this

meeting.’ The man stared back. ‘I found the doctor you used to remove the foetus from her dead body, thereby removing any DNA link to yourself. That doctor is willing to ... confess all, to ease his conscience.’

The man’s mouth slowly opened.

‘Bob?’ others called, getting no response. ‘Bob?’

The man got up and rushed out, others standing, and horrified at this turn of events. When they returned, Jimmy said, ‘Does anyone here have any doubts about just how ruthless I can be?’ He had made his point.

The remaining men settled, one standing by the window and peering down, his hands in his pockets. That man now turned. ‘I did some bribing of my own. Some ... research on you, Silo.’

‘I’d expect nothing less from men as capable as yourselves.’

‘*You* ... have a few skeletons in the closet,’ the same man noted.

‘Skeletons?’ I repeated. ‘He could start his own bone factory!’

‘Why don’t you tell the nice men here what it is that you think you know,’ Jimmy urged.

The man stepped closer. ‘The CIA think you’re a time traveller, the White House believes you to be a power clairvoyant. And you host each “M” Group meeting. You don’t attend those meetings, you are the meeting.’

‘OK, show of hands please for those people who think he’s correct?’ Jimmy called.

Only two men raised their hands.

‘That’s the thing about outlandish theories,’ Jimmy noted. ‘They’re ... outlandish. It’s the Michael Jackson effect: people like his music, so who gives a fuck about his habits behind closed doors. And ... I’m popular. Your outlandish claims would probably just make me more popular. More of a ... curiosity.’

The man went back to the window.

‘Can we get off this waste of time, and get back to cases,’ a man urged. ‘I’m not even sure I want to be in this meeting, some of the things being discussed here.’

‘What the fuck do you want, Silo?’ Ritter asked again.

‘I would like the following: I’d like you to lower your multiples, to take fewer risks, to apply proper risk strategies, to be less ... dishonest about quarterly and annual accounts.’

‘That all,’ a man baulked.

Jimmy lifted his face to the man in the window. ‘There’s one question you’ve not yet asked.’

The man took a moment, stood with his hands in his pockets. 'What do we get for being good little boys and playing nice?'

'Good question,' Jimmy commended. 'What would you like?'

'To know what the markets will do next week...?' the man risked.

'OK.'

The man hesitated. 'What?'

'I said ... OK, provided we have an ... agreement, of course. There are also oil sales that I can route through you, ore sales. And you can have shares in certain business that are doing very well, at a discount.' He held his hands wide. 'Why do you need bright young traders with Phds when you have me?'

'You saying what I think you're saying?' the man queried.

Jimmy nodded. 'Those that wish to join my exclusive club may do so. I take no money, I give tips, and you then adjust your positions and ... your greed. At the end of the day, you're there to try and make money, something I'm very good at. I just don't want you to screw around with risky ventures.'

The same man stood staring down. 'Got a business card?'

Jimmy handed the man a card. 'Does anyone else wish a further - and private - meeting?' Two men took the cards, stared at by Ritter. 'The rest of you may measure the success of these three, plus the pain that you're about to suffer, and decide to come and talk to me.'

'You'll hand us African business?' another man asked.

'I'll hand you oil business in many areas, and my Chinese colleagues will invest with you.'

A forth man took a card. That was four out of nine, and I was smiling inwardly; greed was God here. It was all about the dollars.

Jimmy stood. 'Your phones will work again now.' He pointed at the man who first took his card. 'I'm floating Pineapple music. You can handle it if you like.'

Several phones chirped into life, startling people. We left them to check on messages, and to puzzle the witchcraft used.

Back in the apartment I asked, 'How'd you screw with their phones?'

'A type of EMP, but on a very high frequency. It stops electronics dead whilst it's active, but then dissipates. I had someone in the room below with the equipment. The Ebeye kids developed it for me.'

'Cool. And dangerous,' I said. 'Hope they don't take it on plane.'

'In years to come it'll be used to bring down planes,' Jimmy informed us. 'But not till around 2020.'

That evening, we met with Blake Carrington and talked shop, Jimmy insisting that his media empire pressure the banks, especially over multiples. Oliver Standish, current CEO of Pineapple and now living in Los Angeles, caught wind of the floatation and called me.

‘We were trying to keep it quiet,’ I told him.

‘Shouldn’t I know?’ he complained.

‘When it’s floated you’ll make a shit load of money, so stop whinging. You got those shares for fuck all, and you’ll place them at one hundred and fifty million dollars at least.’

‘Well, yes, but then we’ll have a board, who may not wish to keep me on.’

‘When you get the millions, worry about it then. Or retire to the Caribbean on a big fucking yacht. Besides, it was inevitable; you knew that. And don’t forget to remember us at Christmas.’ I hung up and returned to the polite chitchat with our media mogul.

The weight of the world

Back in the UK, I again tried to find ways of creating more jobs in Africa. And, after much headache, I figured that mines were the best way forwards, issuing many concessions, some to American companies linked to various banks that we were suddenly best buddies with. New mines were opened in Burundi, Malawi, Zimbabwe, Sierra Leone, Zambia and our region in the DRC, the nice people at Caterpillar kept busy. The mines made money and employed a great many local people, plus skilled workers to operate the machinery. From the DRC, our fuel tankers travelled out, soon delivering cheap diesel to many mines, even as far south as Malawi.

Jimmy attended a meeting in London, regarding donor aid to Africa, and came away with most European countries finally offering to channel all their donor aid through us, a significant move that would upset many leaders in Africa. Charities and NGOs would now have to ask us for money - and prove where it was going, and poor old Switzerland would have to make do with less stolen cash being tucked away. The various European governments received complaints from several African states straight away. Those Africa nations were told to contact us, but never did.

After some persuading, Kenya and Tanzania finally joined the economic cooperation group, and Jimmy formalised the group with a sitting chairman and a fulltime staff in Goma hub, a staff of some two hundred. Their job was simple: to boost trade, and to find ways of cooperating with each other to save money. They started with a complaint from Somalia that we were pinching banana trade from them, and we eased back on the free bananas heading for Kenya. Trade shows would now be held every two months, with major deals often being signed at the conference centre.

I would sometimes receive innocuous reports from Gotham City that pleased me, such as the first car wash, a new cinema, a football league, a private dental practice, a college for evening classes. These were all things that we in the west took for granted, but had to be built to spec in Gotham City, population now seventy-five thousand and growing rapidly.

Without my hand in it, the corporation had created several business parks offering small units at low rent, complete with free electricity, and those same units now housed all sorts of new ventures, including bike repairs, washing machine repairs, a carpenter or two. Gotham City was attracting those industries that the people needed, and we were developing a service sector.

West of Forward Base, Big Paul's fish farm was growing, and well beyond the limits I had set. A few locals had seen the fish farm and asked for help setting up their own. Diggers were sent in, the rest would be down to them.

The mayor of a town on a river had been cheeky and asked for a small dam, for no reason other than to make the fishing easier. A simple dam was quickly constructed from concrete, a road across the top for locals to drive over. It offered an overflow that regulated the water's height, and boats that were idle much of the year were now employed for fishing, many young fish inadvertently added to the river upstream by our earnest fish farming efforts. They were the ones that got away.

When the UN lauded the effort to help the local people, I sat back and gave it some thought. I ordered another twenty stretches of river, those near villages, to be dammed in the same cheap manner, road bridges built. The corporation were careful to point out the dangers of flooding, so dam heights and overflows had all to be carefully checked. One particular group of villagers lived in an isolated tight gorge, not far from where the airliner had crashed years before, and their request for a dam was duly granted, its height worked out. Since there were no other villages for miles up stream, or chance of

an overflow, a ten metre concrete dam had been constructed in a deep gorge, a useful new road across the top of the overflow. The brisk river filled the dam quickly, the water backing up some five miles and lapping another village. Those villagers rejoiced at the water level, and the calm water. They jumped into their boats and headed down stream, soon trading with the other village, two sturdy boats being furnished by the corporation. Since the previous jungle trek, village to village, was a three-day event, the locals were happy.

Looking at the next valley across on the map, I ordered a similar dam, and another jungle highway was soon created, more boats dropped by Huey. Then the same nice lady from the UN came back on: could they please have one of those small hydroelectric generators fitted. I agreed, and soon received a photograph of what looked like a car engine with a propeller on a long shaft, the propeller simply lowed into the lively overflow. Lights were now on in the village. Progress. I instructed the corporation to build as many dams as it pleased, with the same small generators fitted, and to extend the project south into Zambia, as well as east into Burundi and Malawi.

Divide and conquer

A month after meeting America's top bankers, two of them came over to the house, both of them now far more amenable. One was handling the Pineapple floatation, and both had bought shares in an oil and mining group. We now allocated them oilfield concessions off Sierra Leone and Guinea, plus several mines in the DRC. That deal was sweetened even further with stock market tips. In return, they displayed and admitted to their multiples, and volumes of CDOs traded. Jimmy offered comments on their exposure, and positions were duly adjusted.

Oddly enough, there was no mention of clairvoyants from these bank chiefs, just an odd acceptance of what we could offer. Liebermans had hit the sidewalk and been bailed out by the Fed – but now with Jimmy's private approval. Another odd occurrence was Jimmy's secret purchase of Liebermans shares, after the company was re-launched with a new management team. I realised why a week later when the new CEO paid us a weekend visit, the

kind of visit kept out of the press. Jimmy knew the man. Having met the guy, I smiled for ten minutes after I left them to chat, Helen enquiring as to the source of my merriment.

Blake Carrington's media group had run dozens of stories about over-stretched banks, the word "multiples" on everyone's lips, and all of the world's private investors both understood the term, and now looked for it when investing; as did many of the institutional investors, the all important pension funds. Declaring a multiple above twenty was now suicide for a retail bank, many banks boasting of their low multiples in their prospectus or in newspaper ads. But when I asked Jimmy if we had won, he said no. And the security remained tight.

'I may have just made things worse,' Jimmy explained. 'Because when you start to feed the tiger its hard to stop. And the next "M" Group meeting might just see America and Israel sat there, since the rest are pissed off at what I'm doing. Chase is just about the only happy one in the group, not the one being expelled.'

'Bit of a ... turnaround?'

'Yeah,' Jimmy sighed. 'But the others are not going to do anything stupid, so staying close to Chase might be the best policy. If you want to swap, I'll do Africa and you can run the "M" Group for a while.'

'Is the extra security necessary?'

'There's one bank group that has teeth; not them, but their bedfellows. They may be an issue. Anyway, we have another serious problem to face, and that's the Haiti quake in January.'

'It's a bad one?'

'It'll just about flatten the entire country.'

'Shit,' I let out.

'But that's not the problem. Once again we'll have to convince the people to sleep outside, and the world will be watching this one.'

'We'll be exposed,' I realised.

He nodded. 'It will be hard to bluff our way through this one. And, our own people will be suspicious.'

'How many people are you deploying?'

'All of them.'

'All of them? A full deployment?' I questioned.

'And others.'

'Why so many?'

'Two reasons: first, a dry run for a larger quake, and second – half a million casualties.'

‘Fucking world *will* be watching. When will you let the boys at Mapley know?’

‘That ... is a good question. The later we leave it, the less chance of a leak. But ... less room to get everyone in place. Given the size of the deployment, we should have started planning a year ago.’

‘They got it down now,’ I confidently stated.

‘Should hope so after all this time.’

‘So what’ll you do?’

‘Get Christmas out of the way, then sound the alert. The rescuers deserve their Christmas; we’ve robbed them of a few.’

‘You’ll bring in the reserves?’

‘Yes, and the Rifles to keep the peace. Plus five thousand French soldiers - because the locals speak French, plus the US Navy.’

‘That’ll leak in five minutes flat,’ I warned. ‘So how long can we leave it before the call-up?’

‘January 1st. That will give us just eleven days.’

We decided to call a meeting of the household “M” Group in the lounge.

Jimmy began, ‘There’ll be a quake in Haiti in January, a very bad quake. Because of the size of this quake – the damage done and the size of the force I’ll send - publicity will be an issue, as will exposure. Warn all of your governments that exposure is a possibility. In addition to that, I’ll be requesting five thousand French troops for a lengthy deployment, the US military to run the airport and provide fuel, as well as to provide a hospital ship and logistics. I’ll need C5 or C17 transports from Britain and America from January 2nd.’

‘Why such a large deployment?’ Jack puzzled.

‘A million casualties,’ Jimmy responded. ‘Most of the country will go.’ They were shocked. ‘Besides, this is a dry run for another quake in the future, a more severe quake. Those of you involved – please make the requests.’

I faxed the Haitian President and enquired if he would be visiting Europe or America anytime soon. He’d be in New York, at the UN, in late November, so we pencilled a meeting. Sitting with his file, I could see that their RF unit had been created at an old airfield, two hundred people employed, most of whom were now training in nearby Cuba. The Rifles were still a fledgling unit, but they gave me an idea. I increased the intake of trainees and dispatched more instructors from Africa, French speaking Congolese instructors. Besides that, there was little I could do to get extra bodies in places ahead of time. More Cuban medics in Haitian clinics was one idea,

rejected when I considered what might be left of the clinics afterwards. Now we'd wait, and worry.

Preparations

In early November I firmly nagged Jimmy, telling him that we could wait no longer before making preparations. He reluctantly agreed, and we drove over to Mapley, to a meeting with Bob Davies and Doc Graham.

'Awake, Bob?' I asked as we entered, finding his wife with him. 'No impropriety going on here, I hope?'

'That was before we got married,' she quipped on the way out.

Jimmy brought in Doc Graham.

'Deployment on?' Doc Graham asked as he sat, notepad ready.

'In January,' Jimmy began. 'And ... it's classified top secret till I say otherwise. I want you two to delegate whatever tasks you can, call in whatever help you need, and free yourselves up to plan a job. Its working title will be Operation Anaconda.'

'So why's it a secret?' Bob puzzled.

Jimmy took a moment. 'Crusty is predicting a quake in Haiti.'

'It's in a quake zone,' Bob acknowledged.

'He's predicting the destruction of just about the whole country, millions of casualties.'

They both eased up and stared at us for a moment.

'How many would we send?' Bob asked.

'Everyone,' Jimmy answered. 'And if it leaked ahead of time...'

'Panic on the streets,' Doc Graham finished off. 'And if he's wrong, or the dates are out?'

'Then we'd move the whole force for nothing,' I acknowledged.

'Jesus,' Bob let out, throwing down his pen and running his hands through his hair.

'We did it before,' I pointed out. 'In 2004.'

'We were a tenth of the size back then!' Bob noted.

'We'd want thirty Hueys and a hundred jeeps,' Jimmy suggested. 'And between now and then I need a plan, but kept secret.'

'Sending the jeeps by plane would be expensive, as well as that many Huey's,' Doc Graham thought out loud. 'Could pretend that they're off to Cuba for an exercise and send them by boat. Two weeks sail time.'

‘Do it,’ Jimmy agreed. ‘They need to be in Cuba for January 6th. The Huey’s can fly over to Haiti, the jeeps will go by ferry. I’ll arrange that.’

‘That just leaves the warm bodies and kit,’ Bob noted. ‘What specialists would we need?’

‘Full surgical capability and aftercare, basic search and rescue, plus dogs.’

‘We put a dent in the budget in September,’ Bob cautioned.

‘There’s plenty in the Mawlini account, more coming soon,’ Jimmy responded. ‘Don’t worry.’

‘Moving everyone won’t be cheap,’ Bob again cautioned. I was starting to wonder whose bloody money it was.

‘Good job I have an airline then,’ Jimmy quipped. ‘We’ll use some of them, especially the 747s. That’s four hundred bodies a go. I’ll borrow some C17s and C5s as well.’ He heaved a breath. ‘So, you’ve got an operation to plan. Label it up as an exercise in Cuba for now.’

On the way back, Jimmy took a call from Sykes. It was not good news. The former French President had been a bit tipsy at a cocktail party in the South of France, and had described the “M” Group and Jimmy in detail, to a reporter who had secretly taped it. It was aired on primetime French television an hour earlier. My stomach turned. Now it was a case of getting to January without exposure, let alone beyond it.

At the house, Jimmy asked if the BBC had been on. Yes, twice! He told Sharon to call them back and descended to the basement, straightening his tie. He fired up the video conferencing equipment and sat in front of the camera.

‘Anyone there? Silo to London. Come in London.’

‘Two minutes,’ came a disembodied voice as I sat off to one side, wishing I had a time machine of my own.

They counted down.

‘Mister Silo, thank you for joining us at such short notice. Have you heard the comments from the former French President?’

‘I got the gist of it, yes. And may I say, that since the man in question has left office he’s been feeling less important, if not useless. I guess these ... pleasantly odd allegations are a way of him impressing journalists.’

‘You do attend the meetings held by the world leaders.’

‘True, but I don’t attend G8 or G20, or anything with a “g” at the front, I’m not important enough.’

‘What do you say to allegations of a global conspiracy?’

‘I’d say that ... if there is a single group of people controlling the planet, then they’re doing a really bad job of it, especially of fixing the Eurovision song contest. I mean, how fixed is that? I think the secret Illuminati are doing a bad job with Eurovision.’

‘What do you say to the claim that you control the “M” Group meetings?’

‘I’d say that if I did control those countries we’d have peace on this planet, tattoos would be banned on girls, and there’d be no adverts between programmes. Do you have any other silly questions?’

‘Thank you, Mister Silo.’

We were off air. Jimmy faced me as he stood. ‘How did I do?’

‘Is Eurovision fixed?’

‘Who ... cares?’

We called an “M” Group meeting in a lounge, Michelle on the spot. Her fellow housemates were now very formal in their condemnation of her countryman. Unfortunately, there was little we could do to the former French leader without arousing suspicions further. It was a mess. After the meeting, I gave Helen a hug, and we sat facing each other, watching the kids play with their laptops.

‘This the end?’ she asked.

‘Well, after the big deployment in January, Jimmy thinks it may be.’

‘We’ll be prisoners then,’ she sighed.

‘The house and grounds were built for us,’ I informed her. ‘A very pleasant prison.’

‘The press will look into my past,’ she softly suggested.

‘Sykes has been through it,’ I told her, a surprise for my wife.

‘He did?’

I nodded. ‘Jimmy had your past wiped. And that general – your old boss, he died a while back. His daughter may suspect something, but I doubt she knows.’

‘Best get some shopping in then,’ Helen wistfully stated.

‘That’s the attitude. You know, in the basement there’s food for three months. There’s also a new generator in case the lights go out, fuel for a month, they strengthened the fence and there’re more bodies around it.’

She focused on the girls. ‘They couldn’t go to school.’

‘No,’ I said with a sigh. ‘Probably not. Anyway, this weekend, London club, you and me.’

‘Last time?’

‘I should hope not. If the worst comes, we’ll blame Jimmy for everything and plead ignorance.’ We laughed. ‘Besides, Gotham City is quite nice these days. Then there’s Hong Kong, or the castle in Scotland.’ I took Helen by the hand, glanced at the girls glued to their laptops, and led her upstairs, throwing her onto the bed.

‘What’s brought this on?’ she whispered as I lifted her skirt.

‘The face of imminent danger. Always a turn on.’

The entire household “M” Group journeyed to London with us that Friday night, everyone labelling it as The Last Supper. We enjoyed a meal in the Chinese restaurant, the mood upbeat, the gang resigned to the problems ahead. We ate a lot, drank a lot, and made rude comments to other guests. It was an odd time, and an odd mood. It was if our bank manager had asked for his money back, and we all stood in an empty warehouse. That’s how it felt: the end of an era.

We mingled with celebs in the VIP area, being suitably rude to anyone who asked about the “M” Group, and Helen and I danced close, the first time for many years; it was as if we were meeting for the first time, all over again. A few people asked for a word, probably about business, but I ignored them. Jimmy joined us on the dance floor with a model, not Michelle. That either meant that he would describe his antics to her later, or there’d be a threesome later. Keely and his new wife took to the dance floor, Han and Jack chatting in the computer room, Big Paul and the security patrolling for girls daft enough to date them.

Then the music stopped, and we could hear singing. Our song. Down in the Red Room, Katie Joe was singing, the song piped around the club; Jimmy’s doing. I exchanged a look with him. We were like the last two couples on the Titanic as it went down, defiant to the end.

Helen and I quit early, making love in the shower of our room. Bored with just lying in bed, we got dressed and headed back down for more food. We had worked up an appetite, and giggled like teenagers as we sat eating. It was odd, but the pressure was off now that we had this new reality, that of being exposed to the world. We chatted to Katie Joe and her husband later, surprised that they had lasted the test of time. Well, at least eight years, but no kids so far. Jimmy now stood flanked by two models, one on each arm, with no sign of Michelle.

Helen and I slowly drank ourselves into a stupor and we were helped to our room, collapsing on the bed clothed and falling a sleep. Jimmy, on the other hand, had placed the models in separate

spare rooms upstairs, and was trying to set some kind of record. He attended both in turn before returning to Michelle to tell her about it. In the morning, we heard about damage to their room; I guess she had limits after all. When I saw the papers I laughed, not caring too much at all anymore: Silo beds three in a night! They even had pictures of the models, so I guessed that Jimmy had planned it. Talk about going out with a bang.

At 10am we found Jimmy and Michelle in the diner, uniformed police officers sat in the corner. I wondered if they were keeping the peace. Michelle looked a bit moody, and Jimmy displayed a bruised eye.

‘You’d best ring the Prime Minister and apologise,’ Jimmy told us as we sat.

‘Why?’ I asked. ‘You were the one having all the fun!’

‘Helen?’ Jimmy called.

‘What?’ she puzzled. ‘What did I do?’

‘Check your mobile log. You called the Prime Minister and, just for a joke, told him that I was stoned and running down Oxford Circus naked.’

Helen put a hand to her mouth. ‘My god!’

‘They sent police cars out to find me, apparently.’

I faced Helen. ‘I don’t remember you doing that.’

‘Me neither,’ she replied.

‘You were both very drunk,’ Michelle informed us. ‘Triple vodkas.’

‘Did that make the papers?’ Helen asked, now concerned.

‘Not yet,’ Jimmy answered. ‘But it will. The officers behind me asked if I ran down the street naked.’

‘Ah, fuck ‘em all,’ I said. ‘We needed to let off steam.’

‘Feeling better?’ Jimmy asked us.

‘Much better,’ I replied, Helen nodding.

‘What happened to your eye,’ I indiscreetly asked. Deliberately.

‘I hit him,’ Michelle answered.

‘Will England and France be going to war?’ I teased.

‘He said De Gaulle was an idiot,’ Michelle complained.

I stared at her, wide eyed. ‘Well, Jimmy, how ... how could you?’

Helen sniggered, now being stared at by Michelle.

The police officers finished up and stood. Approaching, one said, ‘Can we have a snap? Whilst your still in one piece, boss.’

‘Sure,’ Jimmy said as he stood. They used their phones and took a few pictures, leaving us to our breakfast.

At 1pm, cleaned up, we jumped into a coach and headed towards the rear entrance of No. 10 Downing Street, not actually giving a shit if the PM was in a mood or not. Jimmy, Helen, Jack and myself walked through, led to a meeting room, the PM's residence quiet.

The PM entered, sighed theatrically, and sat. 'You made the papers for all the wrong reasons.'

'Smokescreen,' Jimmy said. 'They're less likely to believe I'm not just an ordinary Joe.'

'Ordinary Joe's don't bed three stunners in the one evening!' the PM pointed out. He took a moment. 'You think exposure is close?'

'Yes,' Jimmy answered. 'And, after the quake, there'll be questions. So you'd best prepare yourself for that all important speech.'

'I've dusted that off a few times over the years,' the PM admitted. 'But I'm kind of hoping that you'll make the speech first.'

'I'll try to,' Jimmy offered. 'Naked or not.'

The PM focused on Helen. 'I could believe it from your rude husband, but not from you!'

'Sorry, Prime Minister, we'd been drinking,' Helen offered.

'I got that from the loud background music. I had a hundred officers trying to find Jimmy. I even woke-up Jack in his hotel room.'

'Well, with things like that in the papers, who'd believe the truth about me?' Jimmy posed.

'Yes, well ... no more smokescreens like that, please'.

'We'll try and be good, sir,' I offered, less than sincerely.

'French and Germans are mad as hell over Greece,' the PM informed us. 'We're trying to defuse it, but I think they'll formally accuse Greece of deception.'

'That's what it was,' Jimmy pointed out. 'But where I can I'll try and boost the Greek economy, after the Greeks offer to tighten things up. They're still running a high deficit and lying about it, *and* they have money in certain American banks still.'

'Where are you with the US banks?'

'I've got four on board,' Jimmy stated.

'When you say ... on board?' the PM nudged, seeming worried.

'They receive trading advice - all above board, and oil deals,' Jimmy explained.

'On condition...?' the PM asked.

'That they behave.'

'Is four enough?'

‘It’s enough to make a comparison, and to show up the others. Divide and conquer. They’re only strong if they act together, and AIG is about to rip them a new asshole as well for miss-selling.’

‘Is that enough?’ the PM asked, adopting a serious tone.

‘It’s a start. And quite good considering that at this point we should be in an all-out war with the States. So, yeah, things are better. I’d go so far as to say ... things are good.’

‘Except the exposure,’ Jack put in. ‘My wife doesn’t have a clue, and that’s not a conversation I’m looking forwards to.’

I focused on Jack. ‘You mind if I ask if you were injected?’

‘Both of us were, a few years back,’ he admitted. ‘Half strength.’

I faced Jimmy. ‘Michelle?’ He nodded. ‘Han?’ Again he nodded. ‘Best do Cookie and Sandra, I’d hate to lose *them*.’

The PM asked Jimmy directly about his parents.

Jimmy took a moment. ‘I buried them more than once, so it’s ... a bit odd. And I don’t want them to see the next decade. It’s ... too much for them to understand.’

‘And our girls?’ I testily put in.

‘They’ve grown up with high fences and guards, they’ll think nothing of it,’ Jimmy insisted. ‘They’ll adapt better than anyone else.’

‘Will Haiti be expensive?’ the PM asked.

‘We floated Pineapple, so all the revenue will go there.’

‘It will?’ I queried, snapping my head around.

Jimmy nodded. ‘It will. And more. If not, it becomes a failed state and turns to crime.’

‘How much will you spend?’ the PM asked.

‘Well over a billion. Probably two.’

‘Expensive pastime,’ the PM noted.

‘A few years down the road, Athens will be hit, and that will cost Europe two hundred billion. So start saving your pennies.’

‘Athens?’ the PM repeated, looking horrified. ‘A quake?’

Jimmy nodded, suddenly appearing saddened.

‘How bad?’

‘Complete and utter destruction. The city won’t be habitable for decades afterwards.’

‘My god,’ the PM let out, straightening. ‘The cost to Europe...’

‘As I said, start saving your pennies. And not a word to anyone. And I mean ... *anyone*.’

EMP

That afternoon, Jimmy held an impromptu “M” Group meeting at the old apartment, the lounge checked carefully first. I welcomed the new Israeli representative, now known as New Dave.

Jimmy began, ‘An hour ago, the American Embassy in Kinshasa was hit with a small EMP weapon.’

‘What?’ Keely queried.

‘An EMP weapon,’ Jimmy carefully mouthed.

‘Who ... who’d have the technology?’ Keely asked, horrified.

‘I would, I organised it,’ Jimmy explained with a grin, the group quietly shocked. ‘It was hit by a low yield device, the size of a football, and the effects are temporary. And yes, you can tell Chase that it was me, done as an example, a ...wake-up call. OK, the reason for this meeting is to discuss the future use of such weapons, and to prepare for them, hence the practical lesson. Six years from now, many of your embassies will be hit by EMP weapons. British and American embassies will be the principal targets, but once the technology is out there others will be hit. You must, all of you, constantly search for anyone working on EMP technology and stop it. You must also start to plan for detectors and counter-measures, which I’ll help you with.

‘The house in Wales is EMP proof - it was designed that way; lead lining and copper coils help to disperse and disrupt an EMP wave, as well as EMP high frequency weapons. The US Embassy in Kinshasa was hit by a high frequency weapon, the device simply switched on and then off. It was not a pulse, and frequency weapons are not as destructive. A frequency weapon prevents use of electronics, but a pulse would fry them.

‘Beyond 2015, students will build EMP weapons in their garages and use them in places like New York, causing great damage. Such weapons need time to charge, and give off characteristic energy waves first, so early warnings can be given. You can run wires down buildings and embassies, and switch on a high frequency current that causes a strong magnetic effect when needed, disrupting the pulse. If not stopped, then in 2015 a group of student activists will wipe out the New York Stock Exchange and a whole city block. That brings us ... to the dangerous part.’

‘That attack isn’t dangerous?’ Keely loudly questioned.

‘No, that can be planned for. In the future, a device the size of mobile phone could be taken aboard an aircraft and used to fry the controls in flight.’

‘Jesus,’ I let out.

‘A larger version of that same technology could be fired at an aircraft in flight from three thousand feet below, frying the controls. Aircraft can still land, more or less, but most will crash. In the decades ahead, civil aircraft electronics will need to be built to military specs, to resist EMPs. I’ll be providing you all with detailed files. And, if my requests are not heeded, I’ll start frying your embassies just for fun. That won’t hurt anyone, and landline phones may still work – although certain handsets will pack up. You’ll just need to replace all other bits of electronics, and computers.’

Keely asked. ‘Could a foreign power use it for economic warfare?’

‘Most definitely,’ Jimmy affirmed, nodding. ‘A device could wipe out a bank. The first detectors will be available within months, made in China under license. In six months I’ll be running tests on British embassies in Africa – removing people with pacemakers first!’

‘Will anyone ever develop a battlefield version?’ Keely asked.

‘Yes, *you* will. And, in 2025, they may be put to good use to deny the enemy the use of its communications – a most effective tool.’ He pointed at New Dave. ‘You, will feel the effects first as Palestinians realise that it’s an effective weapon. Fired at a jeep, the jeep stops. Tanks are protected to a degree, but Apache helicopters are vulnerable. Don’t believe everything the manufacturer says!’

‘Will our banks be attacked?’ New Dave asked.

‘Not really, since it would require a device the size of a car or van moved into place first, and then wired to the mains electricity. No, your jeeps and helicopters will be the targets, plus infantry; your soldier’s radios will stop working. That, and your embassies will be hit after 2015.’

‘It’s a lot of effort, on the part of the terrorists, for no loss of life?’ New Dave posed.

‘It’s a weapon that can be used over and over, costing you money to tow away jeeps and repair them. And the Palestinians *will* bring down helicopters, a great victory for their propaganda machine. And if they did manage to hit the business district in Tel Aviv, a great cost to you. Hitting your embassies is more of an annoyance, but it still costs a great deal to replace all the communications equipment. Since there’s no sound, or evidence left behind, it’s easy enough to

avoid getting caught. I'll fly a prototype to Israel and fire it at a few things, see how you cope. If you're confident, sit in the helicopter and I'll fire up at you.'

People smiled at New Dave, who declined to participate in the live test.

We enjoyed a Saturday night at the club, Jimmy popular with the kind of men who wished to emulate his wayward lifestyle, and Helen and I again let our hair down. Travelling back on the coach, on Sunday afternoon, the mood was positive. Cat handed us back the girls, who explained what they had done without their controlling parents around, which included bringing the new hamsters into the house for a visit. And a rabbit. And a tame owl. Helen and I exchanged looks. Where the hell did the owl come from? Fearing an invasion of things furry and smelly, I went straight out later that day and bought a kitten, the girls delighted by it, but also distracted from other creatures, crawling walking or flying.

Having kittens

A few days later, Jimmy popped around to my house in the evening. Helen handed him a bottle of beer as he sat on the sofa.

'The Haitian President should be as cooperative as we need, he has nothing to lose,' Jimmy began with.

'But...?' I posed.

Jimmy sipped his beer. 'But, population control will be at the front of his mind; mass panic, looting and crime. People will empty their bank accounts – those that have them – and piss off abroad.'

'Which won't be good for business,' I noted.

'It won't make that much of a difference given what will happen, but he'll want it managed well.'

'How do you *manage well* a disaster like that?' Helen scoffed.

'You don't, but it's his country, so we have to gloss it up a bit,' Jimmy replied, seeming tired for a change.

The kitten ran out, chasing nothing in particular, and inspected the three of us as we sat there. It decided that Jimmy looked more comfortable and jumped up, sniffing the newcomer. Jimmy lifted it onto his lap, the kitten settling almost immediately. Lucy bound in, looking for it, plonking down next to Jimmy.

‘Have you been feeding the owl?’ Jimmy asked our daughter.

‘Yes.’

‘So tell mummy and daddy what you feed it.’

‘Dead mice.’

‘Dead mice?’ I repeated.

‘Rob catches them with the dogs, keeps them for the owl,’ Jimmy explained. ‘Sometimes rats from the river.’

‘Lucy, darling,’ I loudly called. ‘You wash your hands after feeding the owl, OK.’

She ignored me and stroked the contented kitten.

Jimmy lowered his head towards her. ‘What do you want to be when you grow up?’

‘A vet,’ she came back with straight away, Helen and I exchanging looks. This was news to us.

‘And what is Uncle Jimmy building you at the top end?’ Jimmy asked.

‘A paddock.’

‘A paddock?’ Helen repeated. ‘You’ve bought them a pony?’

‘No, they’re your kids, you can buy them one,’ Jimmy quipped. ‘Shelly’s friends all ride, and you can’t leave her out.’

‘I could teach them,’ Helen put in.

‘You can?’ I asked.

‘Junior champion,’ she informed me. ‘About time I got back into the saddle.’

‘Jimmy rides,’ I pointed out.

‘You do?’ Helen asked Jimmy.

‘Have done for years, although not for a while – if that makes sense. I rode across Canada a lot, slept under the stars. Proper horsemanship.’

‘Well, when we get back from New York we can go horse hunting,’ I said with a sigh.

‘Ponies, not horses,’ my wife corrected me.

‘Gwen has a few for sale,’ Jimmy informed us. He handed the kitten to Lucy and stood. ‘Have a think about a strategy for the Haitian President.’ He wistfully added, ‘Some cash in his back pocket might do it.’

We landed in New York two days later, security tight, a private security firm hired instead of the men that Pineapple used to supply us with. But Chase had a surprise, and had arranged an FBI escort as well. I was feeling popular and wanted, not! After an evening in my apartment, the other now back under the ownership of Pineapple, we

journeyed down to the UN building, to a meeting with the Haitian President. It was never going to be easy, I considered on the way.

Jimmy already knew the way through the UN building and, once through security – flashing our own UN Ambassador identity badges – we found the Haitian delegation. They made us coffee from a tall plastic urn on a trolley. Well, it was the UN building.

‘How goes the Rescue Force unit?’ they asked through an interpreter.

‘Fine,’ I said as we sat. ‘Two hundred medics being trained in Cuba.’

‘And many young soldiers being trained?’ they asked.

I nodded as I stirred my coffee. ‘Yes, that’s progressing well, but we’re here to discuss a ... problem.’

Jimmy offered no comment and let me take the lead.

I took a breath. ‘We have computer software that predicts earthquakes, and an expert in such matters.’ The interpreter did his bit, and the Haitians were on the ball. They stopped smiling. ‘We’ve had great success with earthquake predictions, and we’re now predicting an earthquake in your country.’

‘When?’ they asked, a logical question.

‘In January, the first or second week,’ I replied.

‘You will send your people?’ they keenly asked, obviously desiring our assistance.

‘Yes, we would like to. But there is a question of people panicking.’

‘Yes, yes, of course,’ the President acknowledged. ‘There may be unrest.’

‘And some may wish to leave, to go abroad,’ I ventured. ‘So maybe it is best kept quiet for now.’

‘Yes, but we must make plans.’

‘We ... are making plans. We will coordinate all UN agencies, all supplies, and all of the rescuers. We could also offer you soldiers from Africa, the famous Rifles that you already see training your men. They could be under your control to ... keep the peace.’

‘Yes,’ they agreed. This was going well enough.

‘And afterwards, we would help to pay for reconstruction,’ I offered. That cheered them.

‘How much?’ they asked, straight to the point.

‘Around two billion dollars,’ I said, and I should not have.

They stared at me as if I had grown a second head, and I realised that I should not have said it.

‘That is a lot of money,’ they noted. ‘What damage do you expect?’

I glanced at Jimmy. He said, ‘Earthquakes are hard to predict, so we always allow for the worst, and hope for the best.’

‘Yes, good. So, what damage do you expect?’ They waited.

I said, ‘If the quake is as bad as we think it will be, then much damage.’

They all shrugged. ‘What is ... much damage?’ they pressed.

I glanced at Jimmy again. ‘We don’t know,’ I lied.

‘You must have an idea, or you would not have earmarked two billion dollars. It is a lot of money for a little damage!’

Jimmy eased forwards. ‘If the quake is as bad as we think, then not a single building will be left standing afterwards.’

They digested that, eyes widening and mouths opening.

Jimmy added, ‘If our man is correct, then your country will cease to exist and have to be rebuilt from scratch.’

This was just the approach we had hoped to avoid, and I had to wonder why our presentation skills were so lacking. Our hosts glanced at each other, nothing said for many seconds.

‘And if you are wrong?’ the President complained.

‘You still get the two billion dollars from us,’ Jimmy answered him. That seemed to appease the man, as well as shock him upright.

‘So ... what do you wish to do?’ the President finally asked with a large shrug. ‘We should ask for UN aid to be ready.’

Jimmy said, ‘The UN will not act until after a quake has caused damage, but we would like to move before the quake strikes. We can have tents, food and medics in place - away from the cities to avoid panic, and could make use of them when the quake strikes. We’ll also supply some money up front to assist with preparations, but we should try not to panic the people.’

‘They will panic when the buildings collapse!’ they pointed out, and they were right. They were being more practical than I figured.

‘We could warn them to sleep outdoors, or in the tents for a few nights,’ I suggested. ‘Fewer people would be hurt.’

They glanced at each other and shrugged their agreements. ‘Yes, maybe.’

‘How many people would you send?’ the President asked.

I countered with, ‘How many would you like? I mean, the more people, the quicker we can repair buildings.’ I was happy with the question after I asked it.

‘Send as many as you can,’ the President suggested.

‘We’ll group our people in Cuba, at the training base,’ I suggested. ‘Then fly over or come by boat when ready.’

‘Oh, OK,’ they acknowledged.

‘We would land our people around the 3rd of January onwards,’ I told them. ‘We expect the quake around the 12th, give or take a few days. Before then, we should try and keep it quiet.’

‘But you will be making plans?’

‘Yes, we’re busy making plans now,’ I confirmed.

‘And you can move many people in a week?’ they asked.

‘Yes, we can move many people,’ I confidently stated, putting on my diplomatic smile. ‘We would send people to help at the airport, to help with logistics. Everything will be ready and in place.’

‘And what assistance will you give us after the quake?’ they just about demanded.

Cheeky buggers, was what I wanted to say, but didn’t. ‘We will provide long term care and reconstruction assistance. Many years of assistance.’

That seemed to appease them, and I had to wonder why the fuck we were even talking to them. I handed them a document that expanded upon the standard Rescue Force Charter and allowed us to land as many people as we thought suitable. They signed and handed it back, and I handed over a banker’s draft for fifty million dollars, although my hand didn’t want to let go of it. We left after forced diplomatic smiles were exchanged, and promised to keep them informed of developments.

On the way out, I said, ‘Did we just try and persuade them, and bribe them, so that we can help them for years to come?’

‘We did.’

‘I’m sure there’s something wrong with that, somehow.’

‘It’s an imperfect universe. Still, if he’s a problem he’ll disappear the night of the quake.’

‘How many Rifles will you land?’

‘Enough to take the whole of the Caribbean. And by time he figures that out, he’ll have a rifle up his nose and the world’s press watching him.’

‘You know, you’re becoming more of a diplomat in your old age.’

‘Next comes a TV interview, after a hospital visit,’ Jimmy explained.

‘Hospital?’ I queried.

‘Publicity time comes ahead of exposure time; we need the people to like us. So make like an electioneering politician.’

‘Should have brought the girls,’ I grumbled.

An hour later we entered a public hospital, TV crews tipped off, and headed towards a pre-arranged visit to a cancer ward. The chief physician met us with his assistant and we fell into step as they led us on.

‘Haven’t put you out of a job, have we?’ I asked as we walked down a corridor.

‘Not yet, but the workload is lessening. Events of the past six months have been extraordinary. Now, Chemotherapy seems outdated and barbaric, but that’s medicine. We used to bleed people and use leeches.’

‘Still do in the UK, mate,’ I quipped.

He led us to a ward, but these American wards were not like the UK; here, everyone had a room. In the UK and Europe, twenty same-sex patients would be attended in the one long room. This place reminded me of the UK’s private hospitals, and I’d only ever been in them briefly during the birth of the girls. Our guide now led us to a forty-year-old man that appeared too well to be in the bed he occupied, the TV crew trailing behind.

‘How you doing, mate?’ I asked.

‘I go home in an hour,’ he said with a smile.

‘What was wrong with you?’ I asked.

‘Pancreatic cancer. I was diagnosed two months ago.’

‘Two months in bed?’ I puzzled.

‘No, I had a bank of tests first, went through the motions, then insisted that they try your drug. I was injected last week.’

‘So what’s the prognosis?’

‘No signs left, none at all,’ the man keenly informed us. ‘Wife picks me up in a while.’ He let his legs down and stood next to us, the four of us now facing the camera, and making like electioneering politicians.

‘You do realise,’ I whispered, talking out of the side of my mouth. ‘That your wife won’t be here in an hour. She collected the insurance on you and left with a nice young doctor!’

The man laughed. ‘She only collects if I’m dead.’ He opened a cabinet, pulling out a large photograph of what he used to look like.

‘That was you?’ I asked, holding the picture.

‘I put on twenty pounds in a week.’

‘That’s not a good thing!’ I warned.

‘They’re throwing a “welcome back” party if you guys are available.’

I faced Jimmy.

‘What kind of food?’ he asked the patient.

‘Italian!’

‘Then we could eat,’ Jimmy agreed. ‘We’ll be back in a bit.’

The doctor led us out of the room, and to another waiting patient, a man in his thirties that also looked very well. This guy, however, had his wife and kids at his bedside. I focused on the younger daughter, about the same age as Shelly, and not dissimilar in appearance. I lost my smile, and had to look away from her.

‘So, what were you diagnosed with?’ I flatly asked.

‘Prostate cancer, but aggressive. I ... was terminal.’

‘And now?’

‘Now I could run around the park with the girls,’ he joked, and I was not enjoying this; his family looked too much like my own. And the look on the girl’s faces hit me right in the heart. I wasn’t afraid of death, but I was terrified of leaving my girls without their father, an odd skew on my mortality.

Jimmy asked the girls what they wanted to be when they grew up. One wanted to be a doctor, a good answer for the camera, and the other wanted to be a lawyer. That kind of balanced things out. We made small talk, posing for both the TV crew, and a growing army of hospital staff with cameras. In the corridor, I asked the doctor if we were making medics redundant.

‘Take a look at that family. Who’d put their job ahead of that.’

I glanced over my shoulder as we moved off. Most of the time I was insulated from the real world; that happened on the TV news. This was all a bit too real, and awkward. I didn’t quite know why I felt so out of place, I should have been happy with what we had achieved. We met additional patients, stopping to talk with the staff as we progressed, finally ending up in a room with the latest Silo Stiffy, two doctors stood ready beside it.

I closed in and touched a scar on the make-believe skin. ‘It had its appendix out?’

‘Dozens of times.’

‘Does it degrade?’

‘No, we have a man that repairs it good as new,’ they explained, laughing. ‘That guy could take out an appendix better than us!’

‘What do you use it for?’ I asked.

‘Junior doctors, and nurses’ annual tests. This is not a teaching hospital – not really, so everyone should be competent enough in their various fields. But it all helps. Even some of the senior staff come down and use it for fun; they give each other scenarios, a few dollars or a beer on the result.’

‘So what does this one do?’ I asked.

‘This model handles a punctured lung better - very realistic. And the temperature control is better. This thing is warmer than my wife!’ We laughed.

I pointed at it. ‘If it gets any more realistic, they sell them in sex shops.’

‘That’s no joke. A doctor was fired for being ... too friendly with one,’ they explained.

I faced Jimmy. ‘Maybe we should modify it.’

‘Can’t do that without removing the Obstetric benefits,’ Jimmy explained. ‘There’s a version that delivers a baby.’

‘I’ve seen it,’ one of the doctors put in. ‘It has a foetal heartbeat. Surgeons can practise a “C” Section.’

‘Yeah, well listen guys - we’re not trying to do you out of a job,’ I tried to explain.

‘You won’t, because someone will always have to inject the old ladies with the super-drug,’ they joked. ‘Down in Florida its a thousand dollars or more a shot.’

I shook my head.

‘Rumour has it there’s a stronger version, and a much stronger version,’ they nudged, closing in.

‘It has side effects,’ Jimmy told them. ‘Including insatiable appetite, chronic weight gain, and insomnia. So forget it for now.’

Glad to be away from the dummy, I followed Jimmy back to the first patient we had met, the man now dressed and ready. He handed us the relevant address, and we arranged to meet at the restaurant - complete with our sizeable security detail. We hopped into our vans.

Fortunately, the establishment in question was big enough for us all, many people already in attendance. Jimmy placed our security detail on a table by the door, a few men posted outside. And then we became family, Italian family, hugs and kisses aplenty, thanks from everyone – filmed all the while by the stalking TV crew. Jimmy lifted a young girl up, closing in on her parents, as I was handed a beer by a group of well-built men.

‘What do you lot do for a living?’

‘Fireman, next door.’

‘Next door? That’s handy. You come here for food after shift?’

They nodded. ‘Rick is one of ours.’ They pointed at the man who had invited us.

‘What’s his job?’

‘Driver mostly, but we train to do all the jobs.’

‘Over here, ambulances are run by the firemen - yes?’ I queried.

‘In most places, yeah, but not always in the big cities.’

‘In England, ambulance drivers and firemen are quite different jobs,’ I explained as background music started. ‘We have people who are drivers and basic medics, or paramedic trained.’

‘When are you opening Rescue Force here? We keep asking around.’

‘Difficult over here: the law, the cost - and getting sued. In Africa, we have top quality western doctors working for thirty thousand dollars a year, and no chance of suing us.’ I shrugged a shoulder. ‘It’s a calling, not a job.’

‘Do they get their food and accommodation thrown in?’

I nodded. ‘Good accommodation, and travel tickets for holidays. Plus they can go on safari when they want, or visit the beach hotels. And our medics ... we teach them to fly Hueys. After a year in the job they don’t want to leave; we have a very low turnover rate.’

‘They all very fit?’

I lifted my eyebrows and nodded. ‘Long walks in the desert heat, jungle survival training, the works. And we put them across assault courses.’

‘What about the ladies?’ they keenly asked.

‘There are more women than men at the bases, free beer, disco on a Friday and Saturday. If you’re interested, apply online. In England, firemen can do a year with us on their old wages, their jobs held open for them.’

‘Shit...’

I was led to a table, starters placed down, soon surrounded by eight people all trying to talk at once, a little bewildered by it all. At least the food was good, and the beer plentiful. An hour later, the firemen were keen to show off their ladder, which I later figured out was their station, and not just a really nice ladder for climbing up things. They led Jimmy and myself next door to meet the night crew, the cancer patient being greeted warmly by his colleagues. I guessed he’d be back in work soon.

We wound them up about having to work, and told them how good the beers next door were, soon drifting back towards the open doors of the station. But that was when fate took over, and time started to slow down. I remember the smiling faces, the TV crew on the street, our security guys stood on the pavement. Jimmy was stood two steps ahead of me, and chatting to the cancer patient. On the pavement, a shout was issued by one of our security staff.

I was still smiling, my senses deadened by the beer.

Turning my head to the right, I saw a man with a gun, and a sudden movement in front of me. What happened next caused me to reach out with a hand, a subconscious reaction.

Jimmy took the cancer patient by the shoulders and pulled him in, and to Jimmy's left, Jimmy turning his back to the gunmen – and putting his big frame in the way.

Three flashes, three modest cracks, and three rounds hit Jimmy in the back. The security men fired back, the attacker falling backwards. People, and time, seemed to freeze. Jimmy turned his head towards me, and I remember the look. He looked ... at peace. He looked me in the eye, and his eyes said: it's OK. Then he smiled, dropping to his knees a second later.

I started forwards, soon grabbed by three of the security men and pushed firmly back into the station as screams went up. Shouts. It was a blur for a while. And all I could see was the girl's face, the girl in the hospital wondering if she'd have her father around.

They led me inside, the fireman now helping me as if I was a victim. And I wondered if Jimmy was gone. I wondered ... was it just me now, and I felt desperately alone. He said this day may come, and now it was here. I was now point man for the entire fucking planet, but I just wanted to be sick.

A few minutes later I could hear sirens, lots of sirens, and now I was more annoyed than afraid. 'I need to go with him!' I shouted at the wall of men protecting me. I moved through the firemen and found the security detail, the men now blanketing me as they led me toward a van. I had wanted to ride in the ambulance, but they said no. Now in a van, we followed the ambulance. I lifted my phone and dialled home, getting Ricky, on duty in the basement camera room.

'Ricky, Jimmy's been shot, let everyone know.' I redialled, and woke Helen. 'I'm OK, don't panic - but Jimmy's been shot.'

'Shot? Badly wounded?'

'I don't know, he may be dead. I'll call you when I can.'

The trip to the hospital, the waiting room, the fussing doctors - it was all a blur. Then the entire New York police department turned up, surrounding the hospital and putting men in each corner inside the hospital. I had never seen so many uniforms.

Reports came out to me: Silo in surgical prep', Silo on his way to surgery, Silo in surgery. It was a full hour, and numerous dreadful coffees, before the head surgeon came out to see me. And now a police chief, New York FBI director, and a few other faces were present.

The man in blue operating robes said, 'He was built to last.'

‘What?’ I puzzled.

‘Three rounds hit him in the back, severed two arteries, punctured both lungs. He should be dead, but his body seems to have ... well, closed up the holes. His ruptured arteries closed, saving blood loss.’

‘We’ll need to move him to a military hospital,’ the FBI guy said, the doctor puzzling that.

‘I’ll decide where the fuck he goes!’ I barked at the man. Facing the doctor, I asked, ‘How long till he’s well enough to be moved?’

‘A week or two! He was shot three times.’ He walked off.

The New York FBI director obviously knew the security risks of Jimmy being here. ‘We could bring in a doctor that’s in the loop,’ he offered.

I gave it some thought, and nodded; Jimmy’s physiology would cause questions. And as I stood there, I considered that there were probably things about his physiology that even I didn’t know about.

My phone went, Hardon Chase. Looking at the phone, I could see a dozen missed calls, but didn’t remember the phone ringing. ‘Mister President.’

‘Paul, are you OK?’

‘Not hurt, if that’s what you mean. And Jimmy is making the medics scratch their heads.’

‘How is he?’

‘Healing far too quickly. Your FBI guy is fetching one of your doctors.’

‘That’s probably a good idea. Any word on the shooter?’

‘You tell me, I’ve no idea.’

‘I’ll call you back when I have a report. Are you staying there?’

‘Yes.’

He hung up, and I asked for the senior hospital administrator. When the man came out, I said, ‘I realise that this is not a hotel, but I want to be in Jimmy’s room, or next door.’

‘For you, no problem.’ That was a nice reaction for a change. He led me through the corridors, two of my security men sticking close by. They were hardly needed, there was a police officer positioned every five yards. I waited in a room upstairs for twenty minutes, finally seeing Jimmy wheeled past. He had no tubes down his throat, which I considered was a good sign, just a drip in his arm. I followed. They pushed the wheeled surgical stretcher he was on against a bed, lifting him over – six of them struggling with the weight, and wired him to a dozen machines.

A doctor was worried. ‘His breathing is still low, so too his pulse.’

‘That’s normal,’ I quickly put in. ‘He’s always been like that. Born like it.’ That earned me odd looks.

They spent five minutes checking everything before leaving a nurse in a chair. I took the second chair. When the administrator appeared, I explained that the chair was enough, and that a private doctor would arrive. He wasn’t sure if he liked that, but sloped off as I settled to the reassuring rhythmical sounds of the monitors.

Going back through the missed calls, I called back each person in turn, giving an update. At midnight, Jimmy opened his eyes and turned his head. To the nurse he said, ‘Could I trouble you for a drink?’

She jumped up, startled, and fetched a doctor. The young doctor stepped back in, soon joined by an FBI doctor, a grey haired and stony faced individual straight out of the X-Files. I would not have left my girls alone with him. The FBI medic was in his late fifties, and left the young doctor in no doubt as to who was in charge. He dismissed the young doctor and closed the door behind him. We now both closed in on Jimmy, a drink poured.

The doctor said to Jimmy, ‘You probably know more about your own physiology than I do. Anything you need?’

Jimmy sipped the water. ‘Blender, milk, tinned ham, tuna.’

‘How quickly will you recover?’ the man probed.

‘Quick enough ... to cause a few questions.’

‘We’ll move you tomorrow,’ the doctor suggested, standing back.

‘That was a daft thing to do,’ I told Jimmy.

‘Was it?’ Jimmy asked. ‘Do we measure a life in a moment, or by a lifetime of moments averaged out?’

‘Huh?’ I exchanged a look with the doctor. Facing Jimmy, I asked, ‘Did you recognise the shooter?’

‘No.’

‘Any clues?’

‘Again ... no.’

‘Well, half the fucking New York cops are downstairs,’ I told him. ‘And I see a problem.’

‘Just the one?’ Jimmy toyed.

‘Your scars will go, but people will know that you were shot. So next time you’re on the beach with a model, people will notice the lack of scaring.’ Only now did I realise that they had cracked open his chest, a large white pad fixed down his chest and partly covered by a blue blanket.

‘It’s a good point,’ the doctor agreed from across the room.

‘You’ll have to stick to Michelle,’ I risked.

Jimmy gave me a look, an eyebrow cocked. 'I'll keep my t-shirt on. Besides, January will be ... interesting enough by itself.'

The doctor turned to me for an explanation.

'There'll be major quake in Haiti. We're going to have their entire population outdoors on the night in question.'

The man lifted his eyebrows. 'That could arouse suspicion alright.' After a moment, he said, 'You know we've started to inject all Special Forces soldiers with the blood product?'

I gave it some thought. 'We can hide the truth behind the super-drug.'

'That is turning out to be a good smokescreen,' the man agreed.

'So, tell me,' I asked, folding my arms. 'There really an X-Files?'

He gave me a look. 'I'll go work a blender. If I can find one!'

With the medic gone, I faced Jimmy. 'Containment will be hard.'

'Maybe not. I'll tell the waiting press that I heal well because of a concentrate of the super-drug.'

'Every fucker will want it then!'

'Those that can afford it. We'll sell it, starting at five million a pop, all donated to Rescue Force. That way, we make some money from the smokescreen.'

'Will that risk the blood getting out there?' I cautioned.

'The rich recipients are not about to inject other people, and they'd not think to do it. Besides, five years from now it'll be out there.'

'That Arab prince will be pissed!'

'I never promised him an exclusive deal, and he offered the sum – I didn't set the price. So fuck him.'

'How long till you're up and about?'

'I could walk now, but I'll be a good boy for a day or so. Besides, there may be a few nice nurses to give me a bed bath.'

I took a moment. 'I thought I lost you back there. Thought for a while it would be me running things.'

'If I'm killed you'll receive detailed files after thirty days. After that ... who knows what you do.'

'It's not something I'm looking forward to,' I admitted.

'I have confidence in you.'

The doctor returned later, with the horrendous milkshake, and Jimmy downed most of it before trying to catch some sleep. At dawn, I woke in the chair, finding Jimmy stood dressed, the FBI medic asleep in the other chair. Jimmy had his jacket on with no shirt underneath – white pads visible, his shirt obviously

bloodstained and ruined. He eased off his jacket as I stood, and poked his fingers through the three holes.

‘Waste of a good jacket,’ he commented.

The FBI guy stirred, and eased up. ‘Shouldn’t you be in bed?’

‘When you’re ready, arrange the move. I’ll play nice and sit in a wheelchair. But instead of skulking around, I’ll make a statement downstairs. And see if you can’t get me a shirt.’

The FBI director, the same man from the night before, knocked and stepped in, surprised to see Jimmy stood. ‘Should you be up and about?’

‘I’m fine. Any word on the shooter?’

‘Claude De Bouche, Belgian, former French Foreign legion. He was in a hotel room, suitcase full of cash. We’re tracing back his calls now, which were mostly to Belgium.’

Jimmy faced me, a look exchanged. ‘Thank you. Let me know what you come up with.’

With the FBI gone, I asked, ‘You know who was behind it?’

‘Kind of glad they made this attempt. Well, glad they failed. It confirms who was behind the lady at our nuclear plant in Somalia. But ... let’s not discuss it here.’ He held a finger to his lips.

Half an hour later, and feeling hungry enough even to try that god awful milkshake, I pushed Jimmy out of his room in a wheelchair, the attending physicians on the ward surprised to say the least. The police fell into step and we took the lift down, the main reception busy, the ambulance bay packed with TV crews. A snowstorm of camera flashes began, a thousand questions asked at the same time once the sliding doors had opened. Cold fresh air enveloped us.

Jimmy waited a few seconds. ‘If you quieten down I’ll make a statement.’ He waited. ‘Last night, we were invited to a meal by a fireman recovering from cancer. He had been treated with our super-drug, and wished to express his thanks. On the pavement outside of the restaurant, a Belgian man shot me three times, and it was me he was aiming at – not the fireman or anyone else.

‘Now, some of you may be wondering why I’m looking as well as I do, given that I was shot three times and underwent major surgery. The answer is simple: there exists a concentrated form of the super-drug, which not only has amazing powers of recuperation, it also halts the ageing process. I, and others, have been injected with that drug, and it appears to be perfectly safe. But, at the moment, it’s expensive to produce. Having said that, we will be offering a trial of it in the New Year for those that can afford it. They would be injected at their own risk, and all proceeds would go to Rescue

Force. Now, I have some healing to do, but I will be making a further statement in two day's time.'

I pushed him towards the funnel of blue uniforms as the questions started up again, soon in a convoy of vans and heading out of New York and to the nominated military hospital. I wasn't sure if the security here would be any better, given our track record with the CIA. They allocated Jimmy a nice room, offering me one next-door, en suite shower to boot. We ordered up enough food for four hungry patients, and sat eating as several military medics asked questions of the recovery process. They took pulse and blood pressure readings, and examined rapidly healing scars, front and back. Digesting the huge meal, I lay on my bed and closed my eyes for two hours.

I found Jimmy asleep when I checked in on him later, so watched the TV or answered calls. The news was still full of it, but they seemed more interested in the super-super-drug than the shooting. At this point I figured we should give it a name, and made a note to ask Jimmy when he woke. 'Super-super-drug' sounded naff.

'Manson,' he replied when awake.

'The Manson drug,' I thought out loud. 'That was the place in Canada...'

'That's where they developed it, experimenting on people in a very unethical manner. But, after World War Three, no one gave a shit.'

'That's another paradox,' I realised. 'Because people are now getting the benefit, but no war.'

'Yep. Any nice nurses?'

'Not so far.'

Jimmy eased up, took off his shirt and pulled off the white pads affixed to his skin. 'How'd they look?'

'Red and blotchy, but healed up. Will the marks go?'

He nodded. 'Might just be a ridge or two.'

Our allotted doctor knocked and stepped in, closing in quickly to view Jimmy's chest. 'Jesus.' He ran his hand over the long vertical scar. 'And the internal damage?'

'The bones heal quickly, but end up thicker by about ten percent. Rest of the flesh will be fine. And the reason that I'm still alive is that my arteries were altered to be more elastic. For most people that would be a problem, but I also have a greater concentration of red blood cells and my blood carries additional nutrients to compensate. When my arteries are cut they close.'

'I'm on the research team looking at your blood, and we're still puzzling the damn stuff that's in there.'

‘You’ll get there,’ Jimmy encouraged.

‘We just found what appears to be a protein compound common to algae.’

‘Must be a mistake,’ Jimmy suggested.

‘Anything you need?’ the doctor asked.

‘I’ll be ready to leave tomorrow. After that, a little physiotherapy, some nice lady masseurs, and it’ll be fine.’

‘You’ve been shot before,’ the doctor stated.

‘Many times,’ Jimmy answered, putting his shirt back on.

‘May I ask, why you grabbed that fireman?’ the doctor delicately broached.

‘The truth? Because I don’t value my own life that much,’ Jimmy replied as he buttoned up.

The doctor glanced at me. ‘Given what’s at stake, is such an attitude ... wise?’

I closed in on the man. ‘Given that your own fucking CIA try and kill us on a regular basis ... is that fucking wise!’

‘Don’t tarnish us all with that brush,’ the doctor insisted.

Jimmy told him, ‘There’s a story, a long story, that you don’t know yet. You’d need to know it all to understand my ... attitude, and maybe someday that story will be out there. Now, if you have a few sick people that may benefit from my cheery disposition, then why don’t you introduce me.’

We made like electioneering politicians, and did the rounds with the doctor, stopping to chat to many servicemen, most suffering from more regular diseases than the trauma of warfare, or day to day military training. In one room we found an admiral with advanced cancer.

‘You had the super-drug?’ I asked the man.

‘It’s too late,’ the doctor replied.

‘Get a needle,’ Jimmy told the doctor, easing off his jacket.

‘I’d need authorisation,’ the doctor stumbled with.

‘The prognosis is not good, so fuck the authorisation,’ Jimmy insisted.

The doctor closed the door after checking the corridor, and fetched a needle and syringe from a drawer.

‘Three of those,’ Jimmy suggested, pointing at the small volume the syringe offered. A rubber tourniquet was wrapped around his bicep, the admiral now staring up at us and looking bewildered. When done, Jimmy told the admiral, ‘If it’s not too late, then you’ll be up and about after five days. Eat a lot of protein.’

Out of the room, we continued our rounds, four additional terminal patients injected. Hell, what did they have to lose? Back in Jimmy's room I fielded a dozen calls from various world leaders before we sat down and watched the news together, flicking the channels.

The following morning they brought us fresh shirts, our old shirts binned. A group of doctors stood and marvelled at the scars on Jimmy's chest, or lack of them. We thanked them and signed out, vans taking us back around to the apartment. It was as we left it, and we packed our bags, fresh flights booked. In the First Class nose section of the 747, for the flight back to London, we were an oddity as normal, finding a few of our singers and a scattering of celebs. Helen and the girls met us in the coach, it was a Saturday, and we caught up on what the girls had been up to.

Driving past Mapley on the M4 motorway, Jimmy lifted his phone. 'Bob, Jimmy.'

'You OK?'

'Fine, stop fussing. Listen, cancel all training exercises for January and February, cancel all leave, but give extra holidays over Christmas. May as well cancel all exercises from now on, that way we'll have no injured people for January. How's Anaconda?'

'Coming along, I think we got the logistics covered. Be a hell of an operation, though. And with these changes to normal operations you want ... people will be suspicious.'

'Don't care, I want everyone available for January.' He hung up.

Five minutes later Rudd called me from Nairobi. 'Paul, how's Jimmy?'

'Fine, we're heading home now. What's up?'

'There have been thousands of small donations to Rescue Force, totalling some thirty million dollars, and two large donations of a hundred million dollars each – anonymous.'

'Put it all in the general Rescue Force fund ready for January.'

'January?'

'There'll be an earthquake, but keep it quiet.' I hung up and faced Jimmy. 'Have you put some money in Rudd's account?'

'I sold some old shares.'

'Individual donations are up.'

'Good. Have to get shot more often.'

Back at my house, I noticed that the kitten had changed colour. I stood with my hands in my pockets, staring at it. Then I pointed. 'Did you dye the kitten?'

‘They have one each now,’ Helen explained. ‘Save fighting over just the one.’

‘Oh.’

‘And Shelly mixed up the hamsters in their cages. Four have become eight.’

‘You can give her the birds and bees talk, that’s your area.’ I poured myself a beer.

The fall-out from the Manson drug, which it was now officially named, was huge; it completely sidelined the shooting, people desperate to get hold of it. But it also re-opened the debate about Jimmy being a time traveller, or even from another planet, a few of the tabloids running silly stories. For the most part, people didn’t care, and the rich and famous all desperately wanted the new drug.

Christmas

After consulting with the PM, we decided against selling the Manson injections in the UK. Sykes put together a team and flew them to Goma with fresh vials – Jimmy having given blood, the sale of the drug now widely advertised. Flights were booked solid, despite the price tag of five million dollars for an injection. I bet that the Saudi Prince was kicking himself.

In the weeks that followed we sold most of the vials, and replaced them with a new batch. And I never knew that there were so many millionaires in the world. We had raised two hundred million dollars and sent it on to Rudd, who was just not getting used to large numbers.

Pineapple was floated in London and New York, but we had sold our shares to one of the friendly US banks, who would sell it on for whatever they could make. The initial listing was oversubscribed three fold, so they’d have no problem. One point five billion dollars winged its way to Rudd, who needed more fingers and toes to count the zeros. Two point four billion dollars now sat in the account, a statement sent to Mac in Mawlini, who called.

‘Paul, there’s a gazillion dollars in the account!’

‘How many zeroes is that? I toyed.

‘More zeros than I could count!’

‘There’ll be a big exercise in January, the money will go towards it.’

‘An exercise! We couldn’t spend that money in ten fucking years!’

‘See what happens. And relax for fucks sake.’

In the days that followed our senior staff called us, all concerned; they could see the build up. I told them to wait, not being very helpful. Jimmy was back to making use of the gym, and making good use of a new masseuse, although I didn’t ask just how good she was. The news of the Manson drug had spread around the world, and the world’s elite were now flying down to Goma hub, many staying for a holiday, and all surprised at how advanced Gotham City now was. Ageing TV stars of yesteryear were being enlivened and rejuvenated, singing the praises of the drug, which caused even more health tourism.

Jimmy and I figured that January may bring exposure, so we concentrated on making money to cover Haiti, and stopped caring about what the world thought about us. I hit the trading screens and made money from a few takeovers that Jimmy had listed for me. Bob and Doc Graham came over to the house a few days a week and we opened a room in the basement, files spread out. We had booked a dozen 747s, in addition to our own, and the RAF dropped in with details of what aircraft they had available. Boats and ferries were secured for the water crossing from Cuba to Haiti, and the US Navy made ready for an “exercise” at their base in Cuba, Guantanamo Bay. Jimmy said that it was poignant that the US base was being used to launch medical ships, but did not explain why.

Christmas was spent at home, time with family and friends. We had considered inviting the usual people, but we knew that there would be lots of questions. Instead, we sent money to the senior RF staff and flew some of them to the Seychelles for a week, those that didn’t have family gatherings planned.

On Christmas day, two ponies arrived for the girls, both animals suitably small in stature. Helen had bought the girls suitable riding gear and helmets, and we watched our girls canter around in the rain. The place was becoming a menagerie.

Fed up with a damp Christmas, we headed for the club for New Year, tickets expensive for those who had booked ahead. Many of the household “M” Group joined us, and I felt quite relaxed, secure enough within the club walls. A police officer delivered me a yellow telegram before midnight, a note from the Queen herself: good luck in January.

I showed Helen. 'Next week everything changes, and I don't care.'

She wasn't quite as stoically defiant, but was now resigned to a few changes. We ate too much, and drank too much, a bit wobbly as the New Year was rung in, not getting to bed till 3am, and then just collapsing. In the morning, in the diner downstairs, Jimmy said that we'd drive to Mapley in an hour. It was time.

Helen and I finished our breakfast without saying much, packed up and boarded the coach as if condemned prisoners heading for our own execution, pulling into Mapley at 1pm and finding it surprisingly busy. And when people saw us they stopped; they knew something big was up. In Bob's office, Jimmy asked him to use the tanoy and to gather all of the staff outside. When the troops had assembled, Jimmy carried a chair outside and stood on it, waving everyone closer. I looked out over almost two thousand people. Thankfully, it was a fine day.

Jimmy loudly began, 'It has taken us twenty years to get to this point, twenty years of hard work, training, and planning. Rescue Force began its life in Kenya, as a small unit to backup the mine clearance teams. Since then it has grown a little.' Faces in the crowd smiled. 'I have never failed to be proud of the work you've done, or the way in which you've done it. Apart from maybe the drinking in Mawlini.'

Everyone laughed.

'Now we have a major deployment to attend, and one that will stretch us. Our earthquake software is predicting a major quake, larger than anything seen so far. Many of you will not return here for two months.'

Looks were exchanged.

'What we go to do now ... is what must be done to save life. Our family ... of forty-three nations ... will work together, as they have always done. For those of you here that are deploying for the first time - don't worry, just follow your team leaders and do as you're asked; you'll make us proud. And, if you're lucky, you can fly in a Huey with Dunnow.'

They laughed.

'I hope you all had a good Christmas, because it's now back-to-work time.' Jimmy turned, and lifted his gaze to the windows of Bob's office.

The tanoy came to life. 'All Rescue Force staff: full kit check, you have twenty-four hours. Dismiss to your duties.'

People headed off in their groups as we stepped back inside, climbing the stairs to Bob's office, the communications officer sat waiting.

'Communications officer,' Jimmy called. 'Sound full kit check worldwide, followed immediately by full recall worldwide, including all reserves and affiliates.'

The message was sent, pagers knocked off. Jimmy made a few calls, and the RAF turned up, plus a dozen police cars. I turned on the news as I sat having lunch with Helen, the recall already known.

'The single largest call-up of rescue personnel the world has ever seen,' they reported.

'So much for a quiet deployment,' I quipped. I went up to the roof after lunch, and stared down at thousands of people coming and going, numerous lorries unloading kit, others being loaded up ready.

I remembered the first time we stood on the air traffic control tower roof with Rolf the architect. When we told him there was a twenty million pound budget he almost fainted. Now I took in the airfield, little resemblance to that first image. And our lease still stated that we would have to return the airfield to how it was if we left.

We were not planning on giving a briefing to the press till the following morning, but I noticed a few cameras, the embedded crews; some of these guys were making a career out of following us around. Back downstairs, I took off my jacket and double-checked movement logistics, calling Gatwick airport to check on a few things. Jeeps were on their way by ship, two-dozen Hueys also on the high seas. The remainder of the Huey's would go via Il76 transport or C5 galaxy, rotors removed.

I rang Ngomo. 'All set, my friend?'

'We are ready. The men move to Goma in three days, there to Haiti.'

'Good luck.'

I rang Mac. 'How's the weather?'

'Not so warm, but a lot of people working up a wee sweat today.'

'Busy there?' I toyed.

'Aye, you could say that,' he quipped. 'Staff back from Darfur and checking their supplies. Rifles going as well?'

'Peacekeepers, to stop looting and rioting. They're just like the peacekeepers already there. Only not so peaceful.'

'God help the fucking looters! When do we deploy?'

'Day or so. Those from afar are heading to you to group, like the Indonesians. Australians, New Zealanders, and the rest are heading

to Hawaii to form up, and the Chinese will fly direct in their 747s. Their jeeps went by boat a week ago, so they'll be going through the Panama Canal by now. Anyway, you best get back to it.'

'Be at it all night,' Mac grumbled. 'There're flights coming in from all over. Zimbabwe teams just landed, some from Burundi, all over the fucking place.'

'You can practice your diplomatic skills.'

'Aye, bollocks.'

Stood on the ground floor of the HQ building, and chatting to national representatives, I welcomed a team of French army officers, eventually finding them desk space; there was little left. Michelle sorted out their communications, as well as some food from the canteen.

We chose not to stay that evening, giving up the HQ building apartments to a few of the visitors, and opened our own mini-command centre in the basement, a handful of people monitoring the situation for us and producing reports. All nations reported their kit check status and the total numbers of rescuers available for the deployment – less people off sick or injured, and itemised equipment that was unserviceable. But at this stage we wished only to check kit availability and numbers of warm bodies, grouping some of them together to cut travel costs. The teams from the smaller nations had flown to their regional training centres and extra kit had been issued where necessary. But the busiest groups by far were the logistics people; they had more pallet-tonnes to move than all previous deployments put together.

Food and water was my assigned area, and I was using that well practised technique known as "overkill". I had previously ordered a million three-litre water bottles made, before shipping them to the Dominican Republic, where they were now being filled with spring water and loaded onto pallets. Also in the Dominican Republic, my teams from the DRC corporation were buying up biscuits and tinned food by the tonne, moving the provisions west to the border with Haiti. From the US, I had bought a ship full of wheat, the cargo now being offloaded at Port Au Prince docks and being transported to a central storage area near the main airport, an area that one of our friendly NGOs had set up.

The first of the Rifles had landed, three hundred of them, and were now busy erecting a tented city near the grain stores, as well as clearing land ready for imminent expansion. Fences were being torn down, tracks laid ready, connecting to the airport. At dawn, I read a report that confirmed the advance RF party had landed, Doc Graham

and his team; they would set-up a tented area to the east of the main airport perimeter. Problem was, the camp would be a bit bigger than the Haitian President may have anticipated – but only by a factor of ten or so. Maybe twenty. Thirty at a push.

In my office, I called my team together and discussed the Haitian deployment, since most of my team were involved in some form or other. Our airline had cancelled a number of domestic flights around Africa, and our aircraft now ferried African rescuers up to Mawlini. At Mawlini, the Alpha teams and command staff were preparing to fly over to Goma hub for an onwards flight in one of our 747s.

My corporation guy was organising plastic bottle supplies for the next few months, and my new liaison to Media One Inc - formerly my liaison to Pineapple – was busy monitoring all Caribbean news outlets for comments on the deployment. So far, there were few column-inches dedicated to the subject. Finally, my liaison to the nightclubs was busy organising fundraisers for a quake that had not yet struck. The first would be advertised on the 13th, a series of charity galas.

With that done, I boarded the coach, finding most of the “M” Group representatives already on board and waiting my arrival with a slow handclap and rude comments. They would be helping their own nationals as usual.

At Mapley, we received a quick update from Bob, that of logistical movements overnight, plus news of the arrival of the first few British reservists here. Those reservists continued to trickle through the gate all day long, kit checked and issued, the first group of a hundred put onto a coach for Gatwick airport that evening. The UK Alpha and Bravo teams had already set-off for the airport, and should be on their way to Cuba by now, our jeeps due to be docking there tomorrow, the ships containing the Hueys due there tonight. Hal and his team of mechanics should be landing today, I remembered, and seeing what the ocean journey had done to our old ladies. We had allowed several days for their testing – just in case.

By the end of the second day we had landed ten aircraft full of tents at Port-au-Prince airport, with another three hundred Rifles to erect them. Meanwhile, the Haitian President had gone on national TV and announced that we were predicting a quake, and that his government were taking civil defence precautions just in case. Our people on the ground reported no reaction from the population, who had more immediate problems to worry about – that of their daily struggle to survive in the slums.

On the third day we landed sixteen aircraft and another three hundred Rifles at Port-au-Prince airport, the tented city growing rapidly, the airport workers scratching their heads as to why so many tents were being erected in the distance. Barbed wire arrived by truck from the Dominican Republic and was duly strung around the massive new camp, a camp that already offered tents for ten thousand people, yet held only a thousand.

On the fourth day, RF teams started to arrive in Cuba. After their long flight, some travelling for twenty-four hours, our rescuers were all shown to tented accommodation and allowed two days to adjust and to acclimatise. The British Alpha team, having re-grouped in Cuba, flew over to join Doc Graham and to create the main headquarter tents, signs erected: HQ tent, canteen, stores, and toilets. One sign displayed "Mawlini's rooftop bar: four thousand miles that way". The field cookery unit arrived in Haiti shortly after them and set-up, soon servicing the thousand people already there with warm meals.

With that box on the list ticked, Doc Graham began Operation Dispersal. Trucks loaded with tents, followed by trucks loaded with barbed wire, followed closely by trucks loaded with Rifles, ventured out to the three pre-arranged sites and began creating tented cities, fencing them off, all the while curiously observed by the locals. The standing blue-helmeted UN contingent also scratched their heads. We had our first tent stolen that evening, plus grain stolen from a store.

An initial batch of ten jeeps were readied and tested in Cuba, put on a ferry with their drivers and dispatched to Port-au-Prince, aiming to dock at night and to drive inland unseen. Meanwhile, more wheat was offloaded and moved toward the airport storage areas, along with the first deliveries of my food and water. Some of that would go towards the hungry mouths already in country, most towards the indigenous population.

Day five registered a spark of press interest in the Caribbean, plus a spark of annoyance in the UK, as we continued to ignore them. We knew that if the British press asked certain questions we'd regret giving certain answers, so we delayed the interviews as far as we could.

The residents of Port-au-Prince were now curious about all the aircraft landing at their normally quiet airport, the daily tally now topping twenty, tents and food stocks being moved out to eight dispersal sites and stored ready. Thirty miles south west of Port-au-Prince a camp had been created, a field suitably large enough to

accommodate the Hueys, helicopter landing zones marked into the grass. A fence was thrown up, a hundred tents pitched, the locals scratching their heads at the strange activity.

Day six saw three hundred rescuers land at the airport and take up residence in the tents, Doc Graham's team allocating them tasks. Many rescuers were immediately dispatched to the dispersal areas, the first batch of white jeeps now to be glimpsed driving around the capital. The airport authorities took delivery of several refuelling trucks, a compound created for them well away from anything else, ten trucks sat idle and waiting a useful function. In Cuba, at the main RF base, some six thousand rescuers were now in the varying stages of arrival, kit check, rest, or being made ready to fly over to Haiti. Hal and the pilots had been busy, and white Hueys were now buzzing about the island and being thoroughly tested. Happy with his old ladies after their ocean cruise, Hal sent six to the US base at Guantanamo to be refuelled, the pilots flying on at night to Haiti and landing south west of the capital.

Day seven saw the Hueys being made use of, the population now glimpsing them overhead moving stores to the dispersal sites, the curiosity amongst the locals growing. That day, Jimmy decided that we couldn't put off the British press any further and agreed an interview in the communications centre. Three TV crews were patiently waiting, plus a handful of old hacks with notepads. We sat behind a desk and indicated that we would make a statement before fielding questions – so long as the questions were related to Rescue Force.

Jimmy began, 'As you're already aware, Rescue Force is making ready for a major deployment to the Caribbean island of Haiti, where we're predicting an earthquake to occur in a few day's time. As is typical with Rescue Force, we've moved our people into place ahead of the expected earthquake so that we're ready on the ground to help immediately. As we speak, we're creating camps and building up supplies. That process will continue over the next few days, till all of our people are in place and sat waiting ready. OK, questions.'

'How many people are you sending?'

This is a full deployment.'

'How many people is that?'

'In this case, some thirty thousand staff.'

The press collectively paused. 'Thirty thousand?'

'Yes.'

'What ... kind of quake are you expecting?'

‘We’re expecting a substantive quake to strike Haiti.’
‘What Richter scale?’
‘I couldn’t relate it into that scale.’
‘But you’re expecting a large quake?’
‘Yes, we’re expecting a large quake.’
‘How many casualties do you expect?’
‘Up to half a million.’
‘Is this the largest ever Rescue Force deployment?’ they asked.
‘This is the largest deployment to date.’
‘Larger than the Boxing Day tsunami?’
‘Yes, more than five times bigger than that.’
‘What sort of damage do you expect?’
‘We expect the damage to be extensive. Beyond that, it’s hard to quantify.’
‘Who else will be involved with this? Will the British Government be sending people?’
‘The RAF will be assisting, the French Army are sending five thousand soldiers, and the US Navy will be heavily involved.’
‘What if the quake doesn’t happen?’
‘Then I’ll have spent a lot of money for nothing.’
‘How much is this costing?’
‘Two point two *billion* dollars.’
They blinked. ‘Two billion dollars?’
‘Plus whatever the various governments will donate.’
‘The two billion, that’s your money?’
‘Yes.’ Jimmy stood. ‘Now, we’re busy, so we’ll organise another press conference tomorrow or the next day.’

The cat was out of the bag, off and running. That evening, reports came in of people in Haiti packing up and leaving; they were finally taking notice. And as they were packing up, three thousand Rifles landed, occupying the tents made ready for them. All were armed with pistols and rifles. Jimmy commented, ‘From this point on, I run Haiti.’

Day eight saw the US Navy arrive in force, their grey ships visible offshore, their hospital ship’s big red cross visible through the early morning haze as dock workers observed the unusual scene. Jimmy gave the order, ‘Move in.’

The French contingent landed, soon directed to their tents. As that was happening, two hundred Rifles took up station around the Presidential palace, tents erected on the lawn, whether the President liked it or not. Further Rifles moved out to secure the dispersal sites, all armed. From Cuba, rescuers flew in all day long, and the

remaining Hueys made the sea crossing, the second squadron of ten helicopters now grouping at the airport. Doc Graham dispersed the food and water as it arrived, out to the campsites, smiling when a batch of parachute bottles arrived.

These we had developed years earlier, packs of food and water that could be dropped from a Huey, a small parachute deploying to break the fall. They were now made in Goma, at a plastics factory, and we now delivered hundreds of tonnes of them to Haiti.

The Haitian President called that night, concerned about a great many things, not least the ring of soldiers around his palace. Helen took the call and interpreted, Jimmy telling our gracious host to look at the small print of the document he signed, that everything was as described, going to plan and OK. We cut the President short, and hung up.

With the revelations that we had made to the press being digested, a small army of TV crews and old hacks jumped onto planes to the Dominican Republic, hoping to be on the ground when the quake struck. They were beaten to it by the RF Chasers, the mad bunch who loved to be in a disaster as it unfolded. In Cuba, meanwhile, many of the European reservists that had been called up were finishing a few days of intensive training.

On day nine, all remaining rescuers were ordered across to Haiti, flights landing at Port-au-Prince every twelve minutes. The tented city, once devoid of suitable occupants, was now bursting at the seams, teams allocated dispersal areas and sent off in hired local buses. The US Army landed at the airport, mobile air traffic control equipment made ready, their own tents now erected. Another two thousand Rifles touched down, dispersed straight away, the remainder of our RF jeeps landing by ferry. In total, thirty-five Hueys were now available, plus a hundred and fifty jeeps.

The surgical teams had also landed that day, large tents now being erected at the dispersal sites. Their set-up time was typically the longest, beds needing to be erected and screwed together, lights fitted, equipment checked and laid out ready. A full surgical team needed two days at least to make ready. At the airport, British, French, Chinese, Cuban and American military surgical units landed, each moving to an existing hospital and setting up in the grounds. The inconvenienced hospital administrators were placated with cold hard cash. That and a look at the Kenyan Rifles stood guard.

Day ten saw the world's press reporting from a busy Port-au-Prince, as well as from Mapley, the communications room now

packed out, Helen and Trish kept busy. I helped out with canned drinks and chocolate for the press, but kept away from questions of super-drugs and “M” Group meetings. I even had one persistent hack thrown out.

Day eleven saw a full turn out command meeting in the aptly named Command Room. Jimmy began, ‘Are all teams on the island?’

The last were due to land in an hour, the Cuban base now quiet. And the Cubans reported six of their own field hospitals set-up and ready, they had even delivered a handful of babies. The British military medics had treated people from a house fire and a bus crash, and the French had also delivered a few babies.

Jimmy threw his hands into the air. ‘You’re not supposed to start till I say go!’

Everyone laughed, most looking very tired now, especially poor old Bob Davies.

Jimmy continued, ‘OK. Tomorrow is the first day that Crusty thinks may be a quake day, so tonight I want you all to get eight hour’s rest, and plenty of food. That’s an order. In the morning, continue to move supplies into place, but have the teams rested. From tomorrow afternoon, I want jeeps going around the city, advising people to work and sleep outdoors; offer them free food and drink as an incentive.

‘The President of Haiti will make an address in a few hours - he’s going to close schools, and a few hospitals. The patients will move to our tents at the hospitals – just in case. Besides, the care they’ll get in our tents is a lot better than the fucking hospitals! OK, anything outside of the plan that we need to consider.’

Bob said, ‘The Canadian Army wish to send a medical team, as do the Germans, Israelis, Australian Army and a few others.’

‘Fine, but tell them to get a move on. Ask Doc Graham to arrange dispersal sites for them.’

Bob added, ‘Americans have landed twenty helicopters at the airport. We weren’t expecting them.’

‘More the better,’ Jimmy said with a shrug. ‘What’s the tally of bodies?’

‘Thirty-two thousand,’ Bob reported. ‘Plus ten thousand US Marines on standby.’

‘Then I guess we’ve done everything we could.’

Bob added, ‘We have vials of the super-drug out there, to treat the wounded.’

Jimmy nodded. 'Good.' He faced the group. 'We wait on the morrow, good people. Get some rest!'

We collected the "M" Group representatives and headed back, Cookie preparing a special meal, and we made use of the dining room for a change.

'No exposure problems so far,' Jack ventured as we sat down to eat.

'Tomorrow, our jeeps will go around Port-au-Prince, especially at dusk - just as the quake strikes,' Jimmy explained. 'And, three weeks from now I'll move many rescuers to Chile, where a nasty quake will strike, and the level of suspicion will rise.'

'My wife still doesn't know anything,' Jack put in.

'Get her some dirty videos,' I dryly suggested, getting a look.

'My parents do not know what I do,' Michelle admitted.

'And I've lied to my new wife,' Keely unhappily reported.

'My parents will fuss,' I admitted.

'Does Shelly ask difficult questions?' Han asked me. 'She asked me about various websites that detail our activities.'

'I've explained that the sites are not true,' I replied, and she's probably too young to be worried by it all. She's on Bebo under a false name; Helen Keely.'

'Why my name?' Keely mock protested.

'She thinks you're a spy,' Helen said.

'Look who's talking!' Keely retorted.

'You do come across as shifty,' Helen told Keely, a glint in her eye.

'Thanks, Marta Hari,' Keely carefully mouthed.

'Oooo,' I let out.

'Play nice, children,' Jimmy encouraged. 'Or there's no desert.'

'Might I ask, what does the future hold for this group?' Han put in.

'More of the same, but more security, and fewer trips to local restaurants,' Jimmy informed us. 'This estate was built with a purpose in mind.'

'A very nice prison,' Helen quipped.

'That, and a suitable abode for a group such as this,' Han noted. 'The Germans wish to send a representative, as do the Indians.'

'No, it will always be just you lot; the damn house is busy enough as it is,' Jimmy insisted. 'Besides, after exposure they'll all want a representative here.'

'Will it cause problems, with this lot being favoured?' I asked.

‘Yes,’ Jimmy replied. ‘But I had expected to lose Keely before now.’

‘Lose me ... how?’ Keely asked, looking worried.

‘Through disagreements with the White House.’

‘So things are ... better than planned?’ Han nudged.

‘There’s no point in knowing the future, just to repeat it,’ Jimmy pointed out.

‘You caused a stir at that military hospital in New York,’ Keely commented. ‘Brought back half a dozen off the terminal list. You’re popular in that place at least.’

‘And the assassin?’ Han risked, a topic that had been avoided so far.

Jimmy faced him. ‘I’m dealing with it. In fact -’ He checked his watch. ‘- there should be three hundred Pathfinders landing on distant shores right about now.’

‘What!’ people gasped. ‘Where?’

‘Colombia.’

‘The Colombians wanted you dead?’ Jack puzzled.

‘No, Venezuela ... wanted me dead.’

‘Why?’ they asked.

‘Oil!’ Keely stated.

‘Yes, oil. And the lowering of its price,’ Jimmy explained. ‘That, plus their ruler’s connection to a certain group of Belgian mining corporations that lost out to me – and are still a bit pissed at me. They’ve been whispering in his ear.’

‘So why are the Rifles in Colombia?’ Keely asked.

‘They’re going to clean out the FARC rebels once and for all.’

‘That’ll put them on the Venezuelan border,’ Keely noted.

‘Yes, and if any Venezuelan soldiers should approach the border, they’d tangle.’

‘I thought we were trying to avoid conflict in the area,’ Jack queried.

‘We’re trying to avoid *American* conflict in that area. No one said anything about the Rifles. And the Pathfinders are acting as a private mercenary army, hired for cash from the Kenyans after lengthy negotiations with the Colombian Government – who could always argue that the Rifles went too far.’

‘A proper proxy war,’ I put in.

‘I’ll need to update Washington on that,’ Keely cautioned.

‘You may all do so, now that they’ve landed – and cannot be stopped.’

‘And the timing?’ I asked with a grin.

‘Timing? My lad, timing is everything,’ Jimmy smugly stated.
‘The world will be watching Haiti,’ Helen realised.
‘Crafty bastard,’ I commented.
‘If Chase knows who tried to kill you...’ Keely warned.
‘He won’t invade,’ Jimmy insisted. ‘And right now, the FARC have no idea what terror lurks in the jungle. And I mean ... terror!’

Day twelve

We didn’t drive over to Mapley as I thought we might. Instead, we caught up on other things, the businesses and Africa. But by mistake, I received a report from Yuri on the progress of the coffee shops in Russia. I was staggered to see that there were now nine thousand of them, spread right across Russia, many in small towns. The farmland we ran produced the milk for some of the shops, plus meat and cereal crops that they used. Several regional warehouses had been set-up to receive the raw products necessary to supply the shops, distributing thereafter the finished buns and cakes.

And the coffee, it came from Cuba by boat in large quantities and cost very little. That meant our bottom line was looking very healthy, profits in the millions. We were even selling advertising space on the walls of the coffee shops. It gave me an idea. I found an expert, and asked about coffee and cotton growing in the Congo. The answer was ‘yes’ - in some areas. Since the DRC was such a large area, it offered many types of soil and terrain, spread across varying altitudes, some with their own microclimates. I got the corporation on it: I wanted coffee and cotton grown locally. A cheeky email came back asking about slaves, and ships to the new colonies in the Americas!

That afternoon, the weather was pleasant for January, and I went for a walk, but well wrapped up. It was the calm before the storm, and the thing that annoyed me the most about the idea exposure was the thought of not being able to influence Africa anymore. Then I stopped and consider – why not? Even if they know about us, would that alter things? Kimballa wouldn’t withdraw his support, he’d probably think it cool. I walked all the way down to the house, considering that I could carry on as before.

At the house I found Abdi and his team visiting, as well as Ngomo. That meant a war council. After a tea in the diner, Jimmy led us down to the basement, a large map of Colombia stretched out and weighted down. Turns out that thirty Somali Pathfinders were involved, hence Abdi's interest, and Jimmy detailed their current position. So far, they had killed anyone who spotted them, including a few civilians, and no mention of them had been made in either Colombia or Venezuela. They had landed near Paramo, northeast of Bogotá, split into five groups, and were busy searching jungle valleys for FARC guerrillas as they moved northeast towards the Venezuelan border, a very long hike. Re-supply was by scheduled parachute drop, and only a few in the Colombian Government knew about it.

There was also the small matter of the mission creep. The Colombians were under the impression that a hundred and twenty Rifles had landed, not three hundred, and that they would act as eyes and ears only, an intelligence gathering force. Jimmy had stretched the mission a little. And this little campaign was about to make military history with the first ever use of small EMP weapons in the field, plus outlawed laser rifles that blinded enemy soldiers. I wondered just how many laws and conventions we were breaking.

With our African visitors gone, we sat and watched the TV news, awaiting the quake. It would strike around 10pm GMT, so we'd have a long wait. But, given the size of the deployment, there was little else that we could concentrate on. "M" Group representatives could be seen walking the grounds

Later that night, Jimmy called me at the house. 'It's started. Get some rest, we'll drive over in the morning.'

Ten minutes later, the news was full of the quake, live pictures being fed back. At midnight, Helen and I were still glued to the TV, our white jeeps seen attending injured people. We glimpsed the Rifles helping out, as well as manning street corners, interviews given by Doc Graham and others. We'd put twenty years into Rescue Force, so if they didn't have it right by now they'd never have it, I considered as I went to bed. In the morning, the news was of total devastation, not a building left undamaged, and mass casualties. The footage showed our rescuers crawling into collapsed buildings, others handing out food and drink.

'My bottles,' I pointed out, no joy in my voice.

Hueys could be seen over the city, parachute packs drifting down, kids grabbing the packs as they landed. French soldiers were now on

the streets, the Presidential Palace badly damaged, images relayed of surgical tents, patients being attended on camp beds outdoors.

At 7.30am we sent the girls off to school, and joined Jimmy in the office. 'It all going OK?' I asked.

'As expected,' he flatly answered. 'And on the other matter, the Pathfinders were busy. They stumbled across a camp of some two hundred FARC. They used the EMP to knock out radios, blinded the sentries with lasers and knifed them, then earnestly killed every last rebel, liberating twelve hostages. I think they struck gold first time out and got the FARC leadership – or part of it. They've injected the hostages with the drug, given them food and weapons and arranged a pick-up.'

'Won't they talk about the Rifles?'

'Not if the government gets to them first; they'll claim the credit. And now the Pathfinders are moving northeast. But after this success I doubt they'll find many more rebels till they hit the Venezuelan border.'

'Why not pull them out?' I ventured.

'They were never there for the FARC,' Jimmy coldly stated.

The coach awaited, Big Paul riding shotgun today, and we headed out of the top gate, taking a different route just in case. Meanwhile, the Colombian Government had received a signal about where to find the hostages. They flew in by helicopter and "rescued" the men, claiming a great victory over the FARC, still no mention of the Rifles.

At Mapley, the press were now out in force, the base just about empty except for the snappers and scribblers, and the attending police. Ignoring the press for now, we entered the HQ building and found a tired Bob Davies, an oddly quiet Bob Davies. We sat opposite him.

'Someday,' Bob began, throwing down his pen, 'you'll have to tell me how you do it, since I doubt Crusty could find the key to his own front door without help, let alone predict quakes with this level of accuracy. I get a hundred letters a week from eminent scientists that dispute the technology, some of them have been friends for years through the UN.'

'How do *you* think we do it?' Jimmy toyed.

'I don't know, and that's a worry. And I don't know how you make electric cars that don't stop, or drugs that cure everything. And let's not forget the small issue of being shot three times at close range, and some miracle fucking drug that heals gunshot wounds overnight!'

‘Yeah, but besides all that, how are things with you?’ I lightly asked.

He eased back. ‘I’ve never figured you two out - the money you have - and you spend it on us. And two billion for a deployment? I lose a lot of quality sleep trying to make sense out of you pair.’

‘Best give up then,’ I suggested. ‘You’ll give your dear lady wife a more restful night.’

Jimmy had been brushing fluff off his trousers. Now he lifted his gaze and asked, ‘Bob, do these things affect your desire to continue to sit in that chair?’

‘A little; I hate what I don’t understand.’

‘As do most intelligent people,’ Jimmy agreed. ‘You know, I was considering bringing you into the inner circle some years ago, because we need you in that chair – and have no desire to lose you.’

‘Inner circle?’ Bob queried.

‘“M” Group,’ Jimmy stated.

‘So it is some sort of secret group,’ Bob considered.

Jimmy glanced at Helen and me. ‘You’re not stupid, Bob. How do you think I predict quakes, the stock markets, wars, and other events?’

‘You’re psychic?’ Bob toyed.

‘No, and I don’t believe in such crap,’ Jimmy informed him. We waited.

Bob took in our faces. ‘Any of the claims on those websites true?’

‘Some, yes.’

Bob held his hands wide, a plea for assistance.

Jimmy said, ‘There’s only one logical way to know that an event will occur, and that’s if you witnessed it previously.’

‘Witnessed ... something that hasn’t happened yet?’

‘Hasn’t happened for us yet,’ Helen put in.

‘He’s well over a hundred years old,’ I told Bob. ‘He’s immune to all diseases known to man, he heals very quickly, and he knew you’d be in that chair a very long time ago.’

‘OK, now you’re worrying me. A hundred years old?’

‘And then some,’ Jimmy added.

‘And if you shot holes in him, he’d just get right back up,’ I added, enjoying Bob’s expression.

Helen added, ‘The reason that many of the world’s leaders listen to him ... is because he knows exactly what the future holds.’

‘How *can* you know?’ Bob asked Jimmy.

‘Because he’s been there,’ I toyed.

Jimmy nodded. 'How else would I know exactly when a quake would strike?'

Bob stared back at us.

Helen said, 'It's not complicated, Bob. He's a time traveller.'

'A ... time traveller,' Bob repeated, staring back wide eyed. He swallowed. 'So what was on that website was true.'

'Yes,' Jimmy acknowledged. 'So now you need to join the dots to get the big picture, hidden in the detail: time traveller, world leaders, Rescue Force designed to respond to bad quakes. Why would the world go to so much effort as to build a time machine, and send me back.'

Bob considered his response. 'A ... future quake, a big one?'

'Several,' I put in. 'The kinds that would change the course of history.'

'You ... can't stop them?' Bob puzzled with a frown.

'No,' Jimmy admitted. 'I can't stop them. But, with a track record of accurately predicting quakes, I might just convince enough people to evacuate certain cities in time. Cities with millions of inhabitants.'

'Jesus,' Bob let out. 'When?'

'That's classified, and if you were to accidentally disclose what you know then the world's intelligence agencies might just want to shoot you full of holes,' Jimmy explained. 'And you don't heal as well as little old me.'

Bob took a moment. 'A lot of people have taken shots at you over the years. Why, if you're so useful?'

'Because they wish to use the knowledge I have of the future for their own simple economic gains,' Jimmy lied.

'As well as political gains,' I added. 'World politics: best not get involved.'

'And now that I know, am I in danger?'

'It's due to come out within a few years, or less,' Jimmy explained. 'Maybe a lot less. So you're only in danger if you talk about it between now and then.'

'Will you ... be talking?' Helen asked Bob directly.

'Like fuck. I have a family.'

'Thanks for that,' Helen quipped. 'I do too.'

'How long?' Bob asked. 'Till the big one?'

'Five years to the first one, eight to the second,' Jimmy answered. 'And both will cause extreme economic problems. One will hit Europe, one America. Followed by a series of pandemics that will kill hundreds of millions.'

'The drug!' Bob realised.

‘He’s not stupid,’ I quipped, facing Jimmy.

‘I hired him for his keen intellect,’ Jimmy told me with an assertive nod. Facing Bob, Jimmy added, ‘Do you think we can move on, and fix Haiti, Mister Davies, before we fix the world?’

Bob responded, ‘We were right there in the streets when the quake hit, giving first aid inside of five minutes. Given what happened, they’re getting the best care, but there’s not a building left undamaged. Rebuilding will take a decade at least.’

‘That’s a UN problem more than ours, although I will be heavily involved there for a long time. We need to save as many lives as we can this week, get the tented cities going, then start with the bulldozers. Nothing more complicated than that.’

‘I can handle it,’ Bob said defensively.

‘I know,’ Jimmy replied. ‘I saw you do it before.’

That was a revelation, Helen and I exchanging looks; Jimmy had done this all before. We always figured as much, but had never discussed it openly, Helen’s pet theory being that Jimmy could jump back and forth. I knew that was wrong because he got messages; if he could jump he wouldn’t need messages. My theory was that he was stuck here, a one-way trip. I didn’t ask him, because I knew what he would say - the same as with the Russian coffee shops: no!

We left Bob to worry about things temporal and supernatural, and attended the baying hordes of the press corp. Helen diligently issued facts and figures, whilst Jimmy and I split up. I took CNN, he took the BBC, and we sat in quiet side rooms, ties adjusted.

‘Paul,’ the lady began with. ‘How is the rescue deployment progressing?’

‘It’s still early days as far as building searching goes, but many people heeded the warnings and remained outside of their homes. Unfortunately, the damage was extensive, and across a third of the country, with almost every building being damaged. The dead and wounded figures will still be high, but not as high as they may have been.’

‘And what of the infrastructure?’

‘There’s no water or electricity, no phones working for the local people or the government, but we figured on that and have food and water stockpiled ready, more arriving each day from stores we built up in the Dominican Republic. We’ve allowed for enough supplies to feed all those in the affected regions, and distribution has already begun.’

‘How many rescuers are there on the ground?’

‘About thirty thousand, plus soldiers.’

‘And the American military?’

‘Your Navy is offshore with a hospital ship, helicopters, and your Marines are there in force. And your Army technicians are running air traffic control at the main airport.’

‘What has this operation cost to mount so far?’

‘We sold our shares in Pineapple Music and other companies and diverted just over two billion dollars to the fund.’

‘That’s your own money you’re using?’

‘Yes,’ I said with a polite smile. ‘It does no good to just sit in a bank somewhere.’

‘What’s the next step in the reconstruction process?’

‘A long haul ... of demolishing and rebuilding almost every structure.’

‘And how’s Jimmy?’ It was an odd question.

‘Just as big and ugly as ever,’ I said as I stood, terminating the interview. I found Sky News and repeated much of the detail before allocating time to Al Jazeera and Russia Today, Euronews and France24. Jimmy gave the Chinese national network twenty minutes, lots of praise for the Chinese rescuers, who made up the largest single national contributor of warm bodies. In the command centre, I found a room full of buzzing people, sixty conversations going on at once.

‘A Huey has crashed,’ I was informed; one dead, several injured. I scanned the names, finding that Ratchet had been piloting, but was still alive. Well, with that many helicopters running that many sorties this was always a possibility.

Our reconstruction ship had arrived, a ship with many large cranes, and a crew of hairy-arsed builders that were now tasked with clearing the docks and repairing the wharfs. I grabbed an NGO manager that I recognised, and asked about work details. His people were hiring unemployed Haitians, which was just about all of them at the moment, issuing coloured hats and t-shirts, then paying the new recruits to clear streets and load rubble into trucks. It kept the local people gainfully employed, gave them money for food, and cleaned the place up. His target was to hire twenty thousand locals.

Sat having lunch with Helen, we watched the images coming out of Port-au-Prince, recognising a few of the people being interviewed. We even glimpsed Hal and Hacker, Anton and Cassie taking a TV crew around the main hospital. The various world leaders pledged aid money, and the UN Secretary General landed. He did, however, drop the hint that UN aid would be channelled through Rescue Force.

The next day we caught images of our builders at the port, their cranes lifting debris out of the water, men with jackhammers breaking up damaged roads and concrete jetties. It was all proceeding in a very orderly and planned fashion. Repairmen were filmed hanging off telegraph poles, locals employed to assist, and a convoy of trucks were filmed arriving from the Dominican Republic, enough concrete and breezeblocks to rebuild thousands of buildings. Po had ships waiting offshore, stuffed full of those plastic buckets that were a housewives delight – millions of them. Also queued up offshore were ships from West Africa full of cut timber, another ship loaded with cement, a third loaded with plastic sheeting from the DRC. Jimmy had been busy in the planning stages and everything needed was at hand, just as soon as the port was cleared.

On the third day I caught a TV talk show from the States that questioned how we knew about the quake, and the advance preparations, some guy making claims about clairvoyants. Shit, if this was the best they could come up with, I thought. I had spent so long worrying about exposure that this was something of an anticlimax. News then reached me that the British Magestic, an actor come tarot reader that gave predictions to the tabloids, was claiming credit for the earthquake predictions. A journalist then asked if we'd be suing him. No, was my answer, and I refused to be drawn it, walking off with a hidden grin. Some elements of the press grabbed the idea, the idea that we would not take legal action, and that it may mean that Magestic was the source of the predictions.

I had hardly relayed the story to Helen and Jimmy when we received a call from Sykes: a senior French politician was claiming that French presidents, past and present, had taken advice from Jimmy and a power clairvoyant named Magestic.

‘Always plant a big lie behind a small one,’ I quipped. ‘It was a good idea, to create the myth of Magestic,’ I told Jimmy.

‘Why thank you, young man.’

Later, when the press asked about these latest revelations, I denied any knowledge of Magestic, but did so with a smile. The story ran in the tabloid comics, not least because the British Magestic was one of their own, with a premium rate line that you could call to get your horoscope. Jimmy then set in motion something that would light a fire under the tabloid Magestic. He rang the man and told him to predict a major quake in Chile in a month, a cool twenty-five thousand pounds handed over.

In the days that followed, I adopted a cynical attitude to the press, and in some ways I hoped to be exposed, to have it over and done

with. When they asked about Magestic I made jokes, but never refuted the claims of others. I enjoyed teasing the press, the worst elements of which were using their imagination to come up with all sorts of weird stuff. The only unhappy people were our lawyers, chomping at the bit to sue someone, but being held back. That Friday, we cheekily held a Magestic Night at the club, the Red Room stuffed full of gadget manufacturers and computer suppliers, all displaying their futuristic technology. We even had a few clever robots offering drinks.

When Jimmy was asked by a well-known lady presenter, a forty-year-old frump, what he was predicting, he replied, 'I'm seeing you and me in a hot tub, followed by night of dirty sex in elevators and in stairwells, leaving smudging fingerprints wherever we go.'

She stumbled so much she couldn't continue the interview. And the French politician, he was now being laughed at.

Unfortunately, the detail of the Colombian Army's rescue of their hostages was leaked, questions asked at to why many of the rebels seemed to have had their throats slit, several being mutilated, testicles cut off. Several bodies had also been found with hands cut off. The Pathfinders, meanwhile, were hiking northeast, killing anyone holding a weapon, and removing the ranks of the FARC. Since bodies were hidden, the Colombian press were none the wiser; they could hardly report the sudden disappearance of secretive rebels that hid in the jungle as a matter of chosen career lifestyle. As the world concentrated on Haiti, the Pathfinders approached the Venezuelan border, and I grew worried.

The weekend after Haiti hit the news, we locked ourselves away in the house and tried not to concern ourselves with the outside world. I spent time with girls, playing computer games that they beat me at easily enough. Then a piano suddenly appeared in a room in the basement, Shelly now having lessons. Helen played, but it had been a while, and so practised when Shelly was not around. Then we discovered that Jimmy played, and played well.

He explained, 'I was once stuck in a hotel for two months or so. They had a piano, and the lady I was seeing was a music teacher.' He shrugged. 'There was little else to do.'

On the Monday morning, a Pathfinder officer turned up with a secure satellite communications set. A dish was placed on the roof, wires run down to the basement, where Jimmy and I now studied a map of the Colombian/Venezuelan border.

Jimmy tapped the map, the Colombian side of the border. 'They're finding many small pockets of FARC here – groups of no

more than twenty, and well worn trails. When the rebels fail to report, their colleagues across the border should come looking for them. Hopefully.'

'Are there many of them?' I asked.

'A few thousand, but spread around Colombia, most holding down regular jobs and donning the combats at the weekend. A few bombs had gone off as reprisals for the loss of their leadership.'

'And the plan?'

'To remove as many of the FARC as possible, then cross the border to annoy the nice man running Venezuela.'

'Annoy him ... how much?' I asked, glancing at the Pathfinder officer.

'A great deal, hopefully,' Jimmy replied.

Quietly concerned, I returned to my office, and to my real work, that of building up African GDP. Studying reports, I could see that the corporation had taken some of my words literally, and had constructed thirty-six small dams across streams and rivers, aerial photographs attached. Fishing was becoming something of an industry. They even had teams at the fish farms releasing fry into the dammed river sections to boost stocks. On the larger rivers, those typically used as transport highways, nets were being used to catch fish stocks and dump them upstream in the dammed sections.

Cotton was now being planted in certain hillside locations, coffee plants imported and seeded, and the sugarcane acreage was increasing rapidly with grants from the corporation. East of Gotham City, a new suburb had been created from five thousand self-assembly homes, roads improved and free buses provided. Gotham City was witnessing its first traffic jams.

Gotham City's zoo was now an attraction in itself and drawing in a thousand visitors a day, many local schools sending their kids along on a regular basis. Tourists staying at the lodges, and seeing animals in the wild, could now view them close up, their children playing with the young from most every species.

In the north of our region, close to the principle oil fields, a number of small dams had been constructed many years earlier for hydroelectric projects. I now insisted that the lakes behind the dams be populated with fish fry and the locals given access. If the water was just sat there, we'd make use of it.

The water bottling stats were now staggering, my plastic bottles filled with spring water and transported all around the arid regions north of the DRC and Uganda. One report I read seemed a bit cynical, but made me smile anyway.

An existing NGO had been encouraging displaced peoples in the northeast of Uganda to build their own homes, a lengthy process tackled a few hours a day – when the people were not busy tilling the fields. Our people had simply driven in hundreds of self-assembly homes, wood and plastic, and set them up in a day. The finished homes were handed over, food and water left inside for their new occupiers. I was sure that the aim was not to show anyone up, but the NGO in question was not happy. That and the fact that their government level financial support now came through us.

Our plastic factories now made seats that looked like garden furniture, shelving units, even tables. Mosquito nets were now being fashioned from synthetics and handed out around Africa by their millions. The downside was that they burnt well, and quickly, so smoking in bed was an issue for the unwary. We now made our own plastic buckets, and they could be seen everywhere, along with three-litre containers of banana and tomato concentrate.

In cities of Nairobi, Kigali, Harare, Kinshasa, Dar es Salaam and Mogadishu, subsidised electric buses could be seen on most routes, including cross-country routes. America had Greyhound, Britain had National Express, and Africa now had Central African Buses, our comfortable electric buses covering journeys of hundreds of miles. With the 2010 football World Cup in South Africa nearing, we offered them fifty electric buses and they jumped at the chance, planning on running the buses free for spectators.

When I mentioned the buses to Jimmy, he said, ‘If a man in a village can get to a town – and cheaply – then he can work and support his family.’

Inspired by the oracle, I went straight back to my office and budgeted an additional sixty million pounds for the smaller versions of the buses, each costing us thirty thousand pounds new from China. Our region would see buses reaching the villages, all of them. And Jimmy’s brother, Steffan, was proving to be a practical man. As soon as a short section of new track was completed he would order passenger trains to run back and forth along it, tickets subsidised. Small stations were created at every town, and I had images of him creating meticulously detailed models first. When I sent him a joke email about it, he sent me back an attachment, a photo of a huge room with a map of central Africa laid out, the train track visible, the hills and valleys modelled to scale, the mines and roads labelled – and in great detail by the look of it. I laughed; he had made a scale model first.

That week, when I received a copy of the corporation's income and reserves, I could see that they were running out of things to spend money on. We were making so much from the mines and the oil we couldn't spend it fast enough. I sat with Jimmy, and we agreed to boost neighbouring countries. Companies from Uganda, Rwanda, Burundi, Malawi and Zambia were tasked with more roads and new rail track, contracts totalling three billion dollars issued. And they were in US dollars; everything these days was in dollars around central Africa.

I then tried an idea on Jimmy that I thought was a bit outlandish. 'How about more people in the economic cooperation group, like a mini-parliament?'

'That idea ... is about ten years ahead of time. But, since we've moved forwards so many things, we may as well move on it. Create a large building in Gotham City, a thousand offices, and make a start.'

That evening, sat on the sofa at home, I doodled designs for the new building. Shelly sat and peeked at my scribbling, then went off to draw a picture of her own. Just before her bedtime she showed it to me on, her drawing covering an A3 sheet of paper, the detail as amazing as the rest of her drawings. Her design looked a bit like a cross between the Pentagon building, and Po's hotel in Hong Kong. Basically, a sloping Pentagon building with balconies and hanging gardens.

She pointed. 'Each room has a window, and the rooms inside all have balconies for people to sit and have lunch, or to meet outdoors – because its very warm in Africa. And in the centre is a garden and fountain for people to walk around. And up on the roof is more garden and people can walk all the way around.'

I showed Helen, both of us impressed. With Shelly in bed, I walked over to the house and showed Jimmy the drawing.

'It's not far away from the one I would have suggested. Fine, do it.'

Returning to my house, I opened Shelly's door and sat on the bed. 'Jimmy likes your picture, so we'll make the building in your design. Well done.' My daughter was delighted.

The next day I welcomed Rolf into my office, an office that he had built, and I showed him the picture. 'You design it, but our people in the region will build it.'

'Great detail, but do they actually have kangaroos in Africa, Paul?' he asked with a cheeky grin.

I examined the picture. 'Ah, well, that was Shelly. And no penguins either, please.'

With Rolf gone, after a tea and catch-up, I grabbed my corporation guy and pored over maps of Gotham City and the surrounding area. We decided to keep the new building away from tall apartment blocks, since they would dominate it. Given that the people working in the building would be the more affluent residents of the city, we decided to position it north of the golf course and not too far away from Spiral One. There was a natural low in the terrain, so some of the building would be hidden from the golf course. We pencilled in new roads, a new park, a lake, a new up-market housing estate, and a plush new external gym with a car park. We were happy with the plans and sent them by courier down to Goma.

But then Jimmy cautioned me, 'Use European administrators, Germans and Swiss, not too many Africans - or the corruption will be endemic. Put offices in there for the European Union, for the Americans, the Chinese and others. Then, when we're ready, advertise the top jobs, but allow the nations to vote on them. You'll need a transport minister - roads and rail, agriculture minister, defence, police, refugees. But start with making it all about business and trade, and expand from there.'

I deliberately hinted to Keely what we were planning, Hardon Chase on the phone the next day.

'Paul, are you creating a pan-African parliament?'

Resisting a smile, I said, 'That's a long-term goal, and a wish. First we need to get them cooperating.'

'But the senior positions at this new building will be pan-African?'

'Yes; Transport Minister, Defence Minister, etc.'

'A common Defence Minister? You ... think that's possible?'

'Yeah, just a matter of time.'

'And an economic tie-up?' Chase risked.

'That's a way down the road. We'll get them co-operating on the easy stuff first, like a Tourism Minister.'

'Can I ... put a mission in this building?'

'Sure, more help the better. And I see you've moved into the airfield we set-up for you.'

'Air transport command have set-up home there,' Chase explained. 'Apparently, the fuel is cheap.'

'I'll let you know when the new building is ready,' I offered.

Jungle war drums

Haiti was winding down, and teams were being withdrawn, although we'd have a large permanent presence in the country. Crusty belatedly predicted the quake in Chile, and Rescue Force collectively said, "What the fuck?" Teams were tasked with a brief rest in Cuba, re-supply, and a move down to Chile. And many British teams were now keenly reading their Magestic horoscopes in the tabloids.

Meanwhile, things on the Colombia border were about to turn nasty. The Pathfinders had killed many rebels and cleared a large area of mountainous jungle. As expected, a trickle of fighters had crossed the border from Venezuela in search of missing comrades, and duly been ambushed. The Venezuela authorities then accused the Colombians of being aggressive on the border, whatever the hell that meant. The Colombians confirmed that they had no soldiers in the area, and no reports of even so much as a shot being fired. The bodies of the FARC guerrillas were all being hidden, the evidence removed, and journalists moving into the area found it all quiet, not least because the pathfinders had slipped across the border.

When I studied their new position on the map I was concerned; the international ramifications were huge. Jimmy was as confident as ever, and hinted at a plan, and not to worry. I went off and worried about his plans.

Inside the Venezuelan border, the Pathfinders descended towards an isolated mine, some twenty miles from the nearest town. And this mine, it was run by a certain Belgian group.

Just before dawn, two days later, an EMP device was made ready, aimed at the mine buildings and fired. It made no sound, and unless you saw its coloured lights diminish you wouldn't even know that it had fired. As per Jimmy's instructions, it was smashed up and buried in the jungle, each device a once-only shot.

In the mine buildings, hungry workers were wondering why the kettle no longer worked. With all the of the mine's workers and staff conveniently grouped, some still in bed, the Pathfinders moved forwards, secure in the knowledge that a distress call would not be issued.

Dorms were opened with boots, grenades tossed, 7.62mm rounds sprayed. Inside of six minutes no workers or managers were left alive, their attackers dragging off bodies. The mine offered a nice

deep pit at its centre, the bodies now tossed into it. When done, the Pathfinders grabbed bulldozers from the bowels of the quarry – the machines still functioning, and covered over the bodies with hundreds of tonnes of rubble. Those same bulldozers were then employed to destroy everything of value at the mine. Finally, a bulldozer dug a hole into the access road, some five hundred yards from the mine's main, and only, entrance.

The commander on the ground hid some of his men near that access road, the rest allowed to shower – warm water available, to eat the plentiful supplies and get some rest in a bed for a change, blood stains ignored. That first day of occupation, no visitors came down the road, and the soldiers were all allowed a good six hours sleep in rotation, warm beds keenly occupied as other soldiers returned to duty.

The next morning, a supply truck trundled along the dirt road, halting at the hole. The driver and his mate jumped down and inspected the obstacle to their progress, cut down a second later. With the bodies hidden, the soldiers drove the truck around the hole as best they could, and keenly re-supplied themselves.

Two hours later, with the day warming up and the morning haze lifting, a local official drove his jeep towards the mine, checking on the loss of contact. He and his companion also drew up at the obstacle and inspected it, cut down and dragged toward shallow graves. Their jeep was navigated around the hole and into the mine, gainfully employed to patrol the outer perimeter of the large facility.

As dusk fell over the jungle, signalled by an increase in animal calls, a two-vehicle police patrol approached. This time, as they stepped down, two of the officers were isolated and hit with laser weapons, taking a few seconds to lose their vision. The police puzzled their colleague's behaviour, helped them back into the jeeps and drove away.

Stood listening to the Pathfinder officer relay the detail to us in the basement, I puzzled the actions as well, Jimmy not being very forthcoming.

The following morning, as dawn rose over the damp jungle, the moisture steaming off the vegetation, three police jeeps approached. But this time they had a man dressed in a chemical suit and respirator. The local police, for reasons known only to themselves, suspected a chemical leak as the cause of the blindness – and whatever fate had befallen the workers at the mine. They halted at the hole in the road, checked the man's suit, and watched as he plodded forwards down the track. Strangely enough, the man failed

to return to them. The police waited for an hour, frustrated, a second man donning a mask and walking forwards, radio in hand. He also failed to return, the provincial town police stood scratching their heads as to what to do next.

Now they had a half-decent idea, and called for an aeroplane from the nearby strip. The Cessna flew over the mine and reported no sign of anyone, but a lot of damage; there were no bodies and no movement. It was all very odd. But not as odd as the Cessna now corkscrewing down to earth, impacting the jungle nearby and bursting into flames.

EMP one point, Cessna 172 no points.

Three officers risked the mud of the jungle and fought their way towards the smoke. The men remaining at the jeeps lost radio contact, and after an hour decided that retreat was the better course of action. They turned around and drove off to report the facts.

The following morning, a convoy of the local soldiers approached the mine, three jeeps and a truck loudly announcing their approach. The hole in the road had, quiet naturally, filled with water overnight. The lead jeep assumed that it was a puddle and did not slow down, soon sinking and hitting the far edge of the hole, its driver and passenger propelled through the windscreen. The jeep behind hit its breaks, skidded, and nudged the prone vehicle in front. Men jumped out, weapons ready, defensive positions taken up, much shouting disturbing the creatures of the jungle.

Ten minutes later, the officers realised that it was not a trap, and dragged the jeep out of the water, their men attended for serious head injuries. Those men were driven out, around the truck. With thirty armed soldiers to hand, the commander led a patrol forwards. At the entrance to the mine, the Pathfinders employed the lasers and blinded six men in alternating positions along the line of the approaching platoon. And then just waited.

Men screamed, begged for help, and the commander withdrew his men, now convinced that there was a deadly chemical in the air; a deadly chemical that was not killing people, just making them blind somehow. The vehicles turned around and drove off to report the strange happenings at the mine. The Rifles returned to the huts, food downed, showers taken, sleep grabbed.

At dawn the next day the distant drone of a heavy helicopter could be heard through the mist covered jungle canopy, the Rifles hidden in either the huts or the nearby jungle. Glimpsing an Mi8 helicopter approaching, the EMP was not used. The Mi8 was good old-fashioned Russian technology, military technology, and

controlled by wires rather than electric servers. It over-flew the mine, circling many times before finally landing. Soldiers in gas masks stepped down, waving detectors about for five minutes. They cautiously stepped forwards and checked the nearby empty offices, returning to the helicopter.

At this point, the pilot made a mistake; he opened his side window and peered out through his gas mask. Seeing the opportunity, a Kenyan sniper fired twice in quick succession, killing pilot and co-pilot. At the sound of gunfire, the Rifles opened up, the Venezuelans now caught on the ground or sat in the helicopter's doorway being cut down, Kenyans rushing forwards to shoot the remaining men sheltering inside the helicopter. With the rotors still whirring, the Pathfinder commander called over two officers familiar with the Mi8. The Venezuelan bodies were loaded into the back of the helicopter, pilots and all, the Kenyan officers taking the blood-spattered controls. Four additional Pathfinders were positioned in the rear of the helicopter before it lifted off.

Ten minutes later, the residents of the local town peered up toward a grey sky, to see the Venezuelan Army Mi8 approaching at around a thousand feet, a common enough sight. But once over the town, the helicopter started to rain down bodies, the skydivers slamming into cars, crashing through roofs, or just splattering onto the tarmac roads. Local residents were now being startled by uninvited Venezuelan soldiers bursting headfirst through their roofs and landing on their dining room tables. Panic broke out. Returning to pass again, the helicopter now at rooftop height, the men in the back fired down at the streets below, killing and wounding many. The panic widened.

Two miles short of the mine, the Mi8 put down at a widening of a crossroads, and was abandoned intact. The soldiers ran back to the mine as the reports of this incident reached the press in Caracas, and the country's President; blindness, rumoured chemicals, the disappearance of the workers and the police, and now the Army shooting up a town and dropping bodies from a great height. It was all very odd, so reinforcements were dispatched, an elite army unit of some three thousand men.

A team of Pathfinders were now dispatched toward the town with an EMP. At dusk they stepped off the access road and moved across country, approaching the town from a high ridgeline. As dawn threw a grey light over their target they hid themselves in dense undergrowth and waited, binoculars used to scan the town below, their satellite phones used for communications. They soon observed

a convoy of green Venezuelan Army trucks pulling up in the main square, some thirty vehicles in total. The Pathfinders readied the EMP, hid their own phones behind the ridge, and fired at the town centre. The device was duly smashed up and buried as activity in the town below was keenly observed. Venezuelan Soldiers could now be seen stood around fiddling with radios, or attending trucks that had stopped, others that would not start. Wheels were being kicked. For the worried townsfolk, there was the additional strange occurrence of all TV's shutting down, radios not working, and the landline phones were out.

Stood in the basement, Jimmy said to me, 'No army can move without communications, not even a mile. Never forget that lesson.'

Back in Venezuela, down in the town, old ladies were observed crossing themselves and praying; the Bermuda Triangle had descended on their provincial mining town. The Kenyans on the ridge packed up and jogged back to the mine through heavy rain. As they approached their own positions they stopped and lifted green torches, three green flashes issued, three red flashes returned. They entered the mine, in need of warm food and dry clothes after giving their verbal report.

In Caracas, the authorities worried over the loss of contact with their men. A plane was dispatched from a nearby base, which flew low over the town and reported the soldiers occupying it as ordered, just not being very sociable and returning calls to HQ. The commander on the ground found a motorbike that still worked, jumped on it and rode through the rain to the next town. Caracas now got its update, its incredible update. Four Star generals scratched their heads and shrugged a lot. An advanced EMP weapon was just about the last thing they may have suspected, even if they knew what one was. More trucks were dispatched, along with armoured personnel carriers. By accident, they had made a smart move, because those personnel carriers were old Russian stock, Cold War era and designed to be EMP proof. That, and they contained no delicate circuit boards.

As Rescue Force made ready for the Chilean deployment, ten armoured personnel carriers belched smoke and trundled into the mining town. The officers of the elite army unit, and a hundred soldiers, mounted up and set off towards the mine, the rain clearing as they progressed.

Laser weapons were created for a specific purpose: blind your attacker head on, but leave him alive so that several of his colleagues would carry him off the battlefield. Hit one soldier, but occupy the

time of four soldiers – plus the attending medics. It was like a sniper shooting an enemy soldier in the leg - it tied up the enemy's resources. Now, the lead vehicle noticed the large puddle just as the driver was robbed of his vision. He hit the brakes and halted, the convoy behind easing up as he declared his loss of sight over the radio. The drivers of the other vehicles were also now occupying a darkened world. Thoughts returned to the rumoured chemical agent, panic gripping the men.

Brave soldiers jumped out and replaced the drivers. The first soldier drove forwards, straight into the hole, and got stuck just as he also lost his sight. Then nothing. No shooting, no further loss of sight. The carriers were awkwardly turned around, revving and belching smoke, and headed back the way they came. But now the puddle in the road ahead of them contained an anti-tank mine. The first carrier set it off, blown onto its side, a large hole in its belly. The convoy halted, their path ahead blocked.

The senior officer ordered the men out and to disperse into the dense green jungle. The men adopted defensive positions, and waited. The officer scoured the lush green vegetation for any sign of movement, but found it all quiet apart from tree frogs and distant animal calls, cursing his unseen enemy. Then he noticed that the man in front of him seemed slumped. 'Corporal?' he whispered. He advanced and nudged the corporal, getting no response. Turning the corporal over, he noticed blood from one eye, and no pulse when tested.

'I can't see!' a man screamed, followed a second later by the pitiful cry of a second man.

A soldier in front slumped, lifeless. The officer had seen enough. He got up and ran down the road, a few soldiers following. At the point at which the officer had set off running he had twenty men on his heels. As he reached the first bend, puffing and sweating, he counted just three remaining.

His men had just been experimented upon by the Rifles, the Kenyans now employing a type of miniature rail-gun, a three inch long subsonic projectile being accelerated by a tubular magnet. It was completely silent, very accurate within thirty yards, and had now been tested with good effect.

The Pathfinders removed the bodies as it started to rain again, checking the personnel carriers. Each carrier was allocated a driver and, as the cover of a damp night descended, they were driven to the Mi8, all neatly parked in row. And left intact.

In the basement command centre I said, 'You're seriously fucking with their heads.'

'Warfare is many things, the last resort of the badly organised being to use brute force. The aim is not to be loud, with puffs of smoke. The aim ... is to achieve your objectives. And right now, no one will be going near that mine for a while.'

'For a decade or two!' I quipped. 'So what now?'

'Now we raise our game, and take the gloves off.'

I didn't like the sound of that.

At the mine, the Pathfinders grabbed a final hot meal and packed up, moving out towards the nearby town. With the rain offering them good cover, they made it to the ridge above the town at dawn. Noticing a group of soldiers at the edge of the urbanisation, stood near a garage, a team was dispatched. Two out of four Venezuelan soldiers lost their sight, the others panicking; whatever was at the mine was now in the town, the news spreading quickly. People packed up and drove off as the day warmed up.

By dusk, hardly anyone remained in the town, just a few stubborn individuals who had locked themselves inside their homes. The Pathfinders slid quietly down into the town. In the main square, handbrakes were released on abandoned trucks, soldiers now pushing the trucks down a natural gradient and toward the outskirts. A mile out of town they halted in a neat line, alternators removed from backpacks, the truck's alternators replaced. Twelve out of fifteen trucks came back to life, the soldiers mounting up. With the weather acting as a suitable deterrent to nosy observers, they set off north in a line, headlights blazing.

Before dawn the next day, the convoy turned off the main road and halted. An innocent lumber crew were in the wrong place at the wrong time, all shot, their bodies hidden. As night came on, the weather cooperated with a nasty storm, the trucks again moving north in convoy.

The Pathfinders commander held up the map of Venezuela and showed it to his adjutant with a torch. 'The map of this country, it looks like a map of Africa. It is a good omen I think.'

They reached their objective before dawn, a sizeable oil refinery serviced by a rail marshalling yard to the north of it. On an isolated side road in the next valley they disembarked, the drivers remaining with their vehicles. The Pathfinders formed up, then split into three groups. The main force now moved onto the heavily wooded hillside, the other side of which lay their next objective. That objective was soon illustrated by the morning's bright sun, the

Pathfinders peering down a valley at a huge oil refinery, seemingly millions of silver pipes going in all directions. They opened tins of meat and settled, sleeping alternately through the day. That day turned out to be warm and rain free, the men well rested for their night's work.

At 11pm they crept quietly forwards, covering a distance of half a mile, and arrived at a dilapidated old fence that offered little challenge. They simply pulled down large sections of it and stepped into the refinery, finding tall silver towers brightly lit with yellow neon lights, the air full of the clanking sounds of unseen machinery and distant working trains. One group approached the refinery's heart, its control room and offices, an EMP destined to make its presence silently felt. Two hundred yards short of a tall office block that housed the brains of the refinery operation, the EMP was silently made ready. Men checked their watches. Where possible, the soldiers ducked behind metal objects, just in case. The EMP operator aimed, and fired his invisible projectile. The lights went out, the background clanking ceasing.

An unusual peace gripped the blacked-out refinery, many puzzled workers wondering why not even their torches were working, let alone their radios. From the shadows, death stalked closer and closer. Train drivers suddenly wondered why they couldn't see, desperate calls let out to colleagues. Pistols with silencers, covered in cloth, found their targets at close range, the ring around the refinery tightening and moving inwards.

Security guards at the main gate fell silently to the ground, their bodies dragged off, the gates they once manned now locked closed. In the control room, dozens of managers and technicians bumped into each other, some using lighters and matches and trying to restart the huge sleeping monster. Doors opened and dark figures moved, death delivered after quiet coughs from pistols. Within an hour, three hundred workers lay dead, even the ladies serving in the canteen - there would be no witnesses. A withdrawal was signalled with a flare fired up into the dark night, the red arcing glow indicating that it was clocking-off time for the Pathfinders. The withdrawal was made in haste, not least because taps had been opened on oil storage tanks, fuel now flooding out. Train tanker carriages had been attended in turn, taps opened.

Fifteen minutes later, stood on the ridge and panting a little, the commander raised a radio detonator and flicked the switch. The flash lit the surrounding valley and the low clouds, visible for miles around. The bang registered a good three seconds later, the refinery

utterly destroyed, the storage tanks ablaze, their angry flames reaching hundreds of feet into the air. With some urgency, the Rifles reclaimed their trucks and set off north along main roads without a care. After all, they appeared to be Venezuelan Army.

The next day Hardon Chase called Jimmy. 'We're getting some strange reports from Venezuela. The people you have hunting down the FARC –'

'I may not have mentioned this before, but the President of Venezuela was behind the attack on me in New York.'

'He was? Directly?'

'Yes. So ... *payback* is what, I think, you Yanks call it.'

'That oil refinery?'

'May have been visited by the Kenyan Rifles.'

'Jesus. And they're claiming a chemical agent was used further south?'

'No, but advanced technology was employed.'

'How ... advanced?' Chase asked.

'Ten or twenty years ahead of what your boys have to play with. But don't worry, I'll brief your guys on it after this ... advanced field test.'

'And if the soldiers are caught?'

'There would be a bloodbath. But they won't, hopefully. Keep your eye on Puerto Cabello tomorrow night.'

In Venezuela, the Pathfinders brazenly drove north along main roads, plenty of fuel found aboard their trucks when they had been pinched. As night fell the heavens cooperated, opening with a torrential downpour. They pulled into an isolated petrol station. The garage's bored night staff were surprised to see black soldiers walking in, even more surprised when pistols were levelled at them. The trucks refuelled in turn, the contents of the garage shop pilfered and handed out. The last soldier, waited on by the last truck, placed a charge on the lid of the underground petrol reservoir - and ran like hell. The trucks pulled away to the bright incendiary flash of what was left in the reservoir.

Driving all day, the convoy approached the industrial outskirts of Puerto Cabello as an amber sun disappeared behind the western horizon. The commander checked his watch. 'If they're on time, we have five minutes. Slow down.'

Outside of the port, a ship manoeuvred slowly towards the outer breakwater, the harbour pilot that had been put aboard it now quite dead and hidden below. At the mouth of the harbour, and facing an horizon of twinkling lights, the ship came to a halt and began to

slowly reverse. Below decks, special generators built up a charge. At the ship's bow, three powerful EMP weapons sat ready, each looking like a stubby cannon. Lead screens were now hastily erected behind them to protect the ship's own delicate systems. The crew stepped back when ready.

With the EMP's charged to maximum capacity, the ship's captain shut down all of his own electronics, circuit breakers pulled. That left just one live switch, which he now threw. Nothing happened for a second or two, nothing visible, no sound. But then he could see the lights fading on the shore, the dark night claiming the town, tall buildings turning from beacons of light to dark shadows on the horizon.

The pathfinders commander lowered his watch and observed the fading of the flickering lights on the horizon, those houses nearby unaffected. 'Could have been a long walk. OK, speed up.'

In the port, the ship manoeuvred itself very slowly to the berth it desired; the Pathfinders had just twenty minutes before it left. Aboard the trucks, the soldiers made ready for the final phase. Charges were made ready, C4 and plastique, timers attached. As they entered the darkened city they turned west, aiming to avoid the city centre, not least because of the gridlock that now blocked its streets.

Passing a petrol station, the commander lifted his radio. 'Last truck, hit the petrol station.'

Driving on, the trucks bright headlights were just about the only illumination on the dark streets, perplexed motorists now stood next to their vehicles, or giving up and walking home. The incendiary light from the burning petrol station illuminated that walk home, but did nothing to reassure nervous pedestrians. With the road junction ahead blocked, the lead lorry slowed, nudged a car and floored it, pushing the car aside and continuing without collecting the other driver's insurance details. Further vehicles had to be nudged aside as the convoy approached the port gates.

The commander lifted his radio. 'Port gates ahead, get ready.'

The men in the back cut holes into the tarpaulin sides, weapons made ready. At the gates, two police officers stood on duty, brightly illuminated by the truck's headlights, but then distracted by a distant explosion. They jumped clear of the trucks, which were not slowing, shot dead a second later by the soldiers in the back, their glass control room showered with rounds. Up ahead, the lead vehicle could see a ship at berth, three green lights displayed on its bridge. It wasn't so much that it displayed the right code, in so much as it was

the only ship with any lights working at all. The trucks halted, the soldiers jumping down and rushing for the gangplank, welcomed aboard by Kenyan Rifles posing as sailors.

With the gangplank raised, the ship pulled away unopposed, not so much as a rubber boat in the harbour with an engine that worked, no phones and no radios functioning. In almost total darkness, they set sail for nearby Haiti, where they would blend into the rest of the Rifles. At the harbour mouth their trucks blew, illuminating the dockside.

In Caracas, meanwhile, a truck trundled along and halted on a hill overlooking the small and congested city. Its driver jumped out and checked what his rear was pointed towards, making a face and shrugging; how the hell was he supposed to aim this damn thing? A second lorry pulled in ahead of him, halting some ten yards in front. The driver mounted up, glanced at his colleague, then threw a switch. Nothing happened, so he threw it again. They leaned out of the windows and craned their necks around, finding the city now in darkness. In the Palace, the President cursed, wondering why he was sat in the dark, his desk phone not working. He soon found that his lighter was the most advanced piece of technology to hand that still worked. The second lorry ran a chain to the first, that vehicle's own electronics now quiet dead, and towed it away.

In Puerto Cabello the CIA observation team dispatched by the White House sat in the dark, candles now lit. 'Was that an EMP weapon?'

'Houses on the hills have lights on,' a man at a window reported. 'And there's a ship leaving port with its lights on.'

'My phone is dead, the landline's dead, and my fucking watch has stopped!'

'It was. Fuck me, that was an EMP blast.'

'Yeah, well any fucker with a pacemaker will have bought it.'

'How do we report it?'

The senior man stood. 'We start walking, looking for a few horses. That mode of transport is not affected by EMPs!'

In Caracas, the US Embassy would have reported the blackout – if it could. Not a damn thing worked, the staff sat in the dark.

Chase was on the phone an hour later, the middle of the night in the UK. 'Jimmy, you blacked out that port! And the whole of fucking Caracas! We can't raise our embassy.'

'Pay careful attention, Mister President, because you've got less than five years before a bunch of college kids do that to New York.'

‘Tomorrow morning I’m kicking some butt. We should be more prepared for an attack like this on us.’

‘I have detectors and defensive systems, I’ll send them to you soon.’

‘Jimmy, the cost to the Caracas?’

‘I’m in a war, Mister Chase, a fight to the finish. Keep that in mind, because I have no problem with cutting off a hand to save an arm. Numbers on a page, detail in a column. And when you consider how many will die in the years ahead, then it’s better I’m here, than dead at the hands of a tin pot dictator. Goodnight.’

When Jimmy told me what he had done I was staggered. ‘You hit a city ... with an EMP blast?’

‘Two cities,’ he corrected me. ‘And the death toll in Venezuela is around a thousand. But no one will be investigating the deaths anytime soon, they have ... other things to worry about.’

‘Like no communications, no phones, no computers working!’

‘You know why I used the EMPs?’ he posed.

‘Mass panic, but no casualties?’

‘No, because the damage done will be assessed by the world, who will then wish to be EMP proof in the future. That could have been a long hard process. I mean, how do you persuade people that EMPs are dangerous?’

‘Two birds with one stone. But ... shit!’

‘Indeed.’

‘So how long before the electronics come back to life?’ I asked.

‘Landline phones and basic household electricity return after a day, mobiles and computers are shot permanently.’

‘There were probably a million mobiles in Caracas,’ I thought out loud. ‘They’ll need to buy some more.’

‘And desk calculators, wall clocks, car radios, fridge regulators, oven timers, a light aircraft or two. The main airport is outside the city, unaffected, and I tampered with hospital electricity so that they’d switch to generator before the EMP hit. I’m not all bad.’

The next day I was up early to check the news, finding just a throwaway line about Caracas suffering power outages. And that was it. Haiti still dominated the news, and now the Chilean deployment was attracting attention, not least from the residents of the target area. They were moving out in their thousands, the news now split between Haiti and Chile, our rescuers filmed landing.

I scoured Reuters, finding little, then Googled the story. I guessed the lack of a story was the lack of working computers in the Caracas. But a day later the story was posted on a few blogs on the web

versions of various American news agencies, including our own, citing the strange power outage in two cities at the same time. One theory was an atmospheric disturbance.

‘Atmospheric disturbance?’ I repeated. ‘What the fuck are you on, people?’

I Googled “Venezuela refinery fire” and found a story in English, eventually, reports now of a terror attack by guerrillas, since the bodies had gunshot wounds. It also ran the story of the strange happenings at the mine in the southwest, suggesting a biological agent had been used. So far, no one had a clue what had really happened and this story was not making it to the mainstream TV minutes.

Jimmy then volunteered a few details that had a bearing. The Pathfinders had killed the FARC on their way to Venezuela, even carrying several severed hands across the border with them. FARC paperwork, radios and rifles, had all been transported, and dropped where they’d be found; the only available clues to the police would point towards the FARC. I should have figured that. Two birds with one stone? This was more like four.

The Chilean quake struck, and the world’s media turned that way, Jimmy quite crafty in his timing of the attack on Venezuela. But one story did catch my attention, that of the Venezuelan President blaming Colombian soldiers and their imperial ally the Americans for the refinery attack. Guess they had not found the evidence, or simply didn’t believe it.

Two days later, a few western commentators put two and two together and concluded that an EMP weapon had been used. Problem was, none of the world’s armies had one, not even the Americans. The story did not make it to the main news, but it grabbed a few column inches in various papers, the Venezuelans now threatening war with Colombia and moving soldiers towards the border, whilst suggesting that the Colombians had paid their own archenemies, the FARC, to attack Venezuela. I had to wonder about their ability to join the dots.

Sykes popped in whilst Jimmy was out, a file in hand offering a damage assessment of Venezuela, his people costing the damage to the two cities at a billion dollars a piece and rising. The economic hardships were causing unrest in Caracas – not so much as a fridge working, and it turned out that the government and local councils there did not make as many backups of their computer systems as they probably should have. The law courts lost all cases, the police lost its national database, and the new Citizen’s Security Database

was wiped. Some elements of the police were now suggesting that an organised criminal gang was behind it. All in all, life in Caracas would be seriously hampered for an estimated ten years, the streets still blocked with cars that would not start.

‘The powers are in a flap,’ Sykes told me. ‘If this technology was used here ... it’d be a disaster. We have bank backups in secure and protected facilities, but the fact is ... we’re not ready.’

‘That was one of the reasons behind the demonstration. You’ve got five years, so be happy.’

‘Those three hundred soldiers went through Venezuela like ghosts - a frightening capability. And some of the weapons they used ... our boffins are struggling to come to terms with them.’

‘Jimmy suggested that - unless changed - an EMP would knock out Frankfurt in ten years.’

‘His hand held devices seem to have a range of about five hundred yards, so I don’t know what use they are on the battlefield.’

‘You need to sneak up and hit a building with them, so they’re only for specialist use. According to Jimmy, you can’t mount them on a plane, or use them at sea during a war. Their main use is against small countries. He thinks the Americans may strike Iran in the future, so he’ll use the EMPs to blind the Iranians first.’

‘In the hands of terrorists, they’d be a great threat. So we’re making plans ... and flapping a lot. The Israelis were utterly terrified when they saw what they could do.’

‘If we give the Israelis one they’ll test it on Gaza. Be no TV that night!’

Jimmy arrived back, just as a convoy pulled in, a collection of American Generals and Admirals.

I exchanged a look with Sykes as our unhappy visitors approached. To the visitors I said, ‘Did the nice man in the White house send you here with his toe up your arse?’

‘Something like that,’ the first man grumbled.

Jimmy led us all to a lounge, drinks organised, an operational post mortem started. Fortunately, he handed over early on the A-Z of EMP defensive systems.

The Admiral asked, ‘If that ship had sailed up to New York, what would have happened?’

‘The good thing about New York, is tall skyscrapers made of steel. That helps. Buildings also block the pulse, sheltering the ones behind. So you’d have seen damage on one side of the island and not the other. And, like London, your banks have basement storage, for fire and theft as much as anything. So records would not have been

lost as badly as in Caracas. But most mobile phones would have stopped, watches, basically anything with a circuit board in it.'

'Is there a defence?' they asked.

'Not one that would be a hundred percent effective. You can help to protect a building, like this house – which is EMP proof, and set-up early warning systems, but that early warning is just a few seconds. It's all in the file.'

'And the other advanced weapons used?' they nudged.

'Blinding laser weapon and miniature rail-guns.'

'Blinding laser weapons are outlawed,' they pointed out.

'I don't think the world's terrorists got that memo,' Jimmy countered.

'And the rail-gun?'

'A miniature; a subsonic projectile designed for Special Forces - as silent as you can get. I'll have a few of each delivered to you.'

'And you developed the technology ... where?' a general probed.

'Can't say,' Jimmy said with a cold smile. 'But I'll give you a clue: in the same place as much of the other advanced technology and weapons that I'm developing – that you don't yet know about.'

They glanced at each other. The same man said, 'In the wrong hands, EMPs could take out New York, or a major US city.'

'It's not in the wrong hands, it's in my hands.'

'And the Russians and Chinese?'

'Will have the very same file as you on defensive measures. And, the first use of it will be in New York in five years, when a bunch of college kids bring down the Stock Exchange.'

'And the other weapons that you're working on?' they nudged.

'You'll be made aware of them at the right time. And before then I won't be putting them in your arsenal, just in case I don't get along with the next incumbent. But I will give you a clue. Future problems, terrorist and military, look more like EMPs than dropping conventional bombs. You need to think outside of the box, gentlemen. And whilst you're doing that, I'll develop the defences and countermeasures ready ... for when you've stopped thinking.

'And, thinking on, you and I will cooperate on using EMPs against small countries in the years ahead. A kind of ... humane way to fuck-over a country. I've even shipped one to Afghanistan, and as we speak the electronics in Kandahar are dying, denying them their communications. You see, gentlemen, there are more ways to stop someone in their tracks than bombing the hell out of them.'

'Could an EMP pulse device be fitted to a plane?'

'Only if you don't like the pilot and crew,' Jimmy quipped.

‘Could one be dropped like a bomb?’

Jimmy smiled widely and pointed at the man. ‘In large numbers, in 2025, denying the terrorists their communications.’

They glanced at each other, and made notes.

‘And the battlefield application?’

‘Against an enemy that’s prepared ... modest at best. You could fire at a valley ahead of you, knocking out their comms over a distance of a mile or two, then advance your soldiers. Best dropped from a plane and fired-off at five thousand feet, hitting an area a mile or two wide. Remember, they work best through air, not through buildings or trees, something that your predecessors knew all about at the height of the cold war. Problem is, you’ve hardened your tanks against EMPs, but not your New York skyscrapers – which will be the target.’

‘How’s your embassy in Kinshasa?’ I asked them.

‘Everything went off for half an hour, then came back,’ a general informed me. He faced Jimmy, ‘Why can’t that technology put on a plane?’

‘You could only use it if your own troops were not close by, so it would be no good where the fighting was concentrated. And you would not use a pulse weapon from an aircraft platform, you would use an alternating frequency device. And you’re missing something. Aircraft ... EMP devices to jam ... other electronics?’

‘Jam another aircraft?’

Jimmy made a face. ‘You’d have to be close enough to see it, so you would have loosed off a missile well before that time. Come on, thinking caps on.’ He waited. ‘Countermeasures?’

‘Jam an incoming missile?’

‘You win a cookie. The technology jams anything with a circuit board, including a missile, which would then fly off course.’

They keenly made notes.

‘So, if an F14 is sending that signal out its rear, no missile could hit,’ an Air Force general speculated.

‘Correct, but his wingman might have something to say about it. Think ... terrorist.’

‘Placed on a commercial airliner?’ the same man puzzled.

‘Yes. If the airliner is locked on, then the EMP frequency device switches on for five seconds. Then, not locked on. And, with a limited range, it won’t screw up nearby air traffic control or other aircraft.’

‘But the next generation of jets could EMP toward a missile?’

‘Until such time as those making the missiles make them EMP proof. You’ll then develop a stronger pulse, and they’ll have to go back to the drawing board. At the end of it, the jet’s countermeasures are stronger than the missile’s EMP shield could ever be. Such EMP countermeasures will remove flares and chaff on fighters, but you’ll remain vulnerable to ground controlled missiles, or those fired front on. Anyway, in a few weeks we’ll all pop over to Israel and test fire a few devices. Fix a date for after the parades.’

‘Parades?’ they asked.

‘Returning Rescue Force heroes,’ Jimmy proudly explained.

An hour later we waved goodbye to our guests, a long way to come for a short visit.

‘I like Chase,’ Jimmy oddly stated as we turned back in.

‘Why?’

‘Because he sent that lot over, and next week he’ll have EMP defences set-up. Can’t argue with that. Problem will be the Israelis.’

‘They’ll use the technology.’

‘A minute after I ask them not to,’ Jimmy said with a sigh.

‘So where we holding the parades?’

‘I thought Rome for the Euro teams, Hong Kong for the Far East teams, Gotham City for the Africans, Cuba for the Americas.’

‘Together or split?’ I asked.

‘We’ll attend them all together; Rome, Goma, Hong Kong then Cuba.’

Michelle appeared in the office doorway. ‘Moment,’ she asked and we followed her to the corridor. ‘Six Belgian mine managers have been arrested in Africa, on bribery and corruption charges.’

Jimmy told me, ‘They work for the company behind the attempt on me.’

Michelle added, ‘Also, three men arrested on terrorists charges in France. They have made confessions, admitting the attempt to kill you, and that Venezuela and Belgium were involved. It will make the news in hours.’ She walked off.

‘Good job I bet the downside of their stock,’ Jimmy commented.

‘That an end to it?’ I asked.

He shook his head. ‘That spider has many legs.’

‘Will the Venezuelans figure out the attack?’

‘They will if I tell them,’ Jimmy said before he walked back into the office.

A week later, a Russian delegation visited Venezuela and offered a much-needed loan, and signed a joint venture oil deal at the same time. They also expressed their concern at the evidence of

Venezuelan involvement in the attempt on Jimmy, gently suggesting that it may have an affect on future relations. The Venezuelan President had received a gentle slap on the wrist by the Russians, but a loud message from Jimmy, the Russians hinting that he was behind the attack.

I found that foolish of Jimmy, since I figured the Venezuelans wouldn't learn any lesson, and would probably attack us further. I was being naïve again; that was exactly what Jimmy wanted, and had planned for.

We packed our bags and flew to Rome a week later, the weather good for a parade as most European leaders gathered, a drive-by and fly-by arranged, all European teams partaking. It was good to be popular for a change, and everywhere we went we were applauded and thanked.

After three days in Rome we flew down to Goma hub, meeting all of the African leaders, most of whom were booked into the golf hotel and enjoying the course. And here we couldn't have been more popular. Some three thousand African rescuers paraded down the main avenue, watched and waved at by deep crowds, a meeting of African leaders held later in the conference centre.

One of our own 747s flew our party directly to Hong Kong – which included Doc Graham and Bob Davies, another parade and another reception. But we did, at least, get a few relaxing days at Po's hotel. We ferried a few of the Hawaiian team home, refuelling in Honolulu before flying direct to Havana, our hotel booking having been made before we left for Rome. The Cubans had planned on a large parade, and Jimmy had planned on the Venezuelan intelligence services making an attempt on us. As our plane touched down, a boutique hotel – the one we were booked into, exploded, three senior Venezuelan agents killed by their own bomb.

Jimmy had just put Caracas on a collision course with the Cuban authorities, a dozen Cubans killed at the hotel, including police officers. And somehow, Jimmy had caused the Venezuelan's timer to go off as soon as the bomb was being made live.

For the benefit of the parade, the Cubans hid the incident, moving us to another hotel. The parade went off without a hitch, and we flew over to Haiti a day later, a scheduled meet with the Haitian President and his team. Unfortunately for the man, Jimmy wanted him and his corrupt cronies gone; they were already stealing aid money. Two Venezuelan agents, back-up to the Havana bombing, had been picked up by PACT agents in a boat off Cuba. Drugged, the men now sat in a car in Port-au-Prince. As the President's vehicle passed

nearby, a second car blew, killing the President, a second device roasting the two Venezuelan agents, but not their ID cards.

The news was not good for Caracas, Havana now livid, the US and UN investigating. And the media got all the facts, the details of the attack in Havana leaked. Ignoring the bombing, we toured many of the tented cities, and met the rescuers stationed in Haiti for the long term, before flying off towards London.

Jimmy said, 'The wedge between Caracas and Cuba was necessary. It wasn't quite planned that way, I had to adjust a few things, but ... I'm a few years ahead of schedule.'

'A tick in the box?' I asked.

Jimmy nodded. 'One more off a long list.'

Part 11

Old scores

With the media discussing the Venezuelan attempt to kill us, and the media buying our side of things, the war of words heated up. America, and a few other countries, labelled Venezuela as a terrorist state, as did a few around Central America. They worked on the basis of the evidence presented by the Cubans – of all people, coupled with that of the UN and French Army investigators in Haiti. Venezuela counter claimed, by suggesting that Jimmy had turned off the lights in Caracas and destroyed mines and oil refineries, at a time when some of their own police were blaming the FARC. Since the Venezuelans seemed to be trying to justify their attempts on Jimmy, they just made themselves appear guilty of the car bomb attacks – which they denied.

Jimmy then did an odd thing. He nagged the Cubans to meet with the Venezuelans, and for them try and sort out their relationship with their southern neighbours, for the Cubans to act as honest brokers and to mediate in this mini-crisis. The Cubans took the advice and agreed to meet the Venezuelan President and his team in Havana, the accused to bring their evidence with them, although that would again point towards their motivation to attack us.

The Venezuelan President took off in a small jet and headed north, but contact was soon lost with the plane as it headed toward Havana, wreckage discovered offshore the next day. As soon as I heard, I had images of a ship or two picketed along that stretch of the Caribbean, an EMP or two pointed upwards. When I confronted Jimmy about it he denied any involvement. The black box recorder would never be found, and that ended an episode.

The Venezuelan public suggested that either Colombia, America or Cuba had shot down the plane – an oddly matched trio of co-conspirators, the wreckage recovered so far suggesting that the plane impacted the water intact and with no signs of missile damage. Elections would now be held for a new president.

Spring neared, and the media were just crazy. Not crazy with exposing us, nor crazy about us, just plain crazy, the stories getting stranger by the day. Jimmy now unleashed the dogs of solicitors that we retained and warned the various British papers about the silly stories. In the States, we let loose the lawyers on several commentators who suggested we had been active in Venezuela,

suing for substantive sums. First, our accusers would have to prove the entry and exit of the Rifles, their transport to and from the area, evidence of their involvement at the mine and refinery, then complicity in the outages in Caracas and elsewhere. Since the Venezuelan police chief was publicly voicing his opinion about the FARC and criminal gangs, those accusing us would have a hard time justifying their claims.

Our one weak link was the Colombian Government and Army, some of who knew about the insert of the Rifles. But they were not about to admit any of it.

One news group offered to settle out of court, but we were putting a large number on the settlement, aiming to make it hurt. In parallel, a group of American and European experts had concluded that an EMP weapon had been used, and would stick by it in court. Unfortunately for our accusers, the experts also agreed that they were not aware of anyone perfecting the technology – short of detonating a nuclear device in orbit, but suggested that the USAF or NASA may have developed one – and detonated it in orbit over Caracas. That did nothing for their case in the States.

We jumped on a plane and headed to New York to keep up our charm offensive, the risk of exposure seemingly firmly buried beneath a mountain of rumour - and complete nonsense. At this rate we'd never be exposed. At the airport we were met by an FBI protection team, thirty officers, most of whom were heavily armed. Hardon Chase was not about to take any more chances, not least because of Jimmy's miraculous return from the dead still attracting column inches in American papers.

In New York, we reclaimed my apartment, Cat watching the girls in the UK, and made ready for a chat show. Helen dressed up smart-sexy, looking gorgeous, and we headed around to the studio, to be filmed in front of a live TV audience. That fact made me a little nervous, since the public were all being a little weird these days. They either sent us their life savings, proclaimed Jimmy as the messiah, or wanted us dead for some reason or other best known to themselves. And that was the reserved British public. The American public were just downright crazy.

Cliff Taylor, our host, had interviewed us twice before and I felt reasonably sure that he would not ambush us. That and the fact that he knew what our American lawyers might do to him. We stepped out to a loud applause, but I could not tell if they were being polite, or genuinely liked us. The three of us eased down onto large sofa,

facing the host at a bit of an angle so that audience, and the folks at home, could see us.

When the applause had eased to a quiet background crackle, Cliff said, 'Ladies and gentlemen, we have with us tonight: Jimmy Silo, Paul Holton, and Helen Holton – for those who've just arrived back on this planet. So Jimmy, what planet *are* you from?'

Jimmy smiled. 'I'm a big fan of Star Trek, as you may know, and I love the idea of people living aboard spaceships in ordered societies.'

'You think you could live on the Starship Enterprise?'

'I could, definitely. I've always loved travel and exploration, long journeys to new places.'

I resisted a smile.

'How many air-miles do you three clock up?'

'Too many,' I mock complained. 'But we take the girls with us when we can.'

'Do you holiday together?'

'Not always,' I replied. 'But there are some benefits to having Jimmy along; he watches the girls if we want to get away for a while.'

'You have a full time nanny?'

'We do, but the girls like their Uncle Jimmy,' I explained.

'Helen, how do you cope with work and motherhood?'

'Well, the girls are ten and eight - and well behaved, so they're not usually a problem. They're in school during the day, and are quite happy to study in the evenings.'

'What are they into now?'

'They've gone off Harry Potter, they've seen the films too often. They're now both into their music studies, and even compose a few of their own simple tunes.'

'You all live on a big estate, so plenty for them to do?'

'Yes, plenty,' Helen agreed. 'The main house has a pool and gym, a piano room, and the grounds have rivers, ponds, a paddock and a small zoo.'

'A zoo?'

'A large shed with hamsters, rabbits, and an owl.'

I cut in with, 'But the girls haven't yet figured out why their four male hamsters became eight!'

The audience laughed. The host said, 'I think maybe one was not male. So, Jimmy, I hope you don't mind, but you were shot three times. What was the story there?'

‘Many years ago ... we moved into Africa, and helped to stamp-out corrupt western mining companies exploiting the Africans. To date, they’ve made ten or more attempts to kill us for what we did.’

‘And what did you do – that they’re mad about?’

‘We left all the profits in Africa, and paid taxes to the Africa nations. Before us, western mining companies simply took the ore without paying for it, ignoring the poor people.’

Cliff shook his head. ‘That’s terrible.’ He raised his head to the back screen. ‘We have a picture of what your city in the jungle looked like. Before -’ They displayed a strip of savannah, the volcano visible in the distance. ‘- and after.’ They displayed Gotham City’s tall apartment blocks.’

The audience collectively sighed, and said ‘wow.’

‘How much have you spent on that?’

‘Hard to say,’ Jimmy answered.

‘But everything you earn is put back into Africa, or to charity, yes?’

‘Yes,’ Jimmy agreed.

‘So how much – in total – have you earned and given to charity?’ Cliff pressed.

‘If you include all of our re-investment back into Africa over the past twenty years, then around thirty-eight billion pounds, about fifty billion dollars.’

The audience gasped.

‘Fifty billion dollars? That’s what you earned – and could have paid yourself?’

‘Yes,’ Jimmy said with a nod.

‘What’s that as a percentage of total earnings?’

‘Ninety-nine point five percent,’ Jimmy answered. ‘I have less than thirty million in my personal account.’

‘Wow. And you Paul, do you keep a little back for Helen?’

I smiled. ‘I have to, I’m married.’

‘Helen, what do you spend money on? Do you like jewellery? Fast cars?’

‘Neither. I have my house, the girls, my work. I don’t need anything else, and I certainly wouldn’t spend money on lavish trinkets. We live simply.’

‘Apart from the huge estate.’

Helen explained, ‘Some thirty people live there, staff that work for us or with us, so it’s more like living in a working hotel.’

‘My office,’ I began, ‘is half a mile away from my house, still inside the grounds, but full of my staff; the estate was built for them

more than us. Jimmy lives in an apartment no bigger than the room I had in college.'

'I'd heard that. Jimmy, why the small apartment?'

'What else do I need? My life is not in the house, it's ... out there somewhere.'

'And the man who shot you here? Who was he working for?'

'He was working for a Belgian mining company, who the authorities there have now raided, arresting the key suspects. But he was funded by the former President of Venezuela.'

'And that's the bit I don't understand. Why was that crackpot involved?'

'He fully believed that I lowered oil prices by developing African oil fields, and avoiding joining OPEC.'

'And all us motorists really hate you for that,' Cliff joked, the audience laughing. 'And the January Rescue Force deployment, you sold your shares in Pineapple Music to pay for that?'

'Yes,' Jimmy answered. 'And shares in a few other businesses.'

'And paid two billion dollars to have all those rescuers on the ground?'

'Yes, an expensive deployment.'

Cliff started to clap, soon joined by the audience. 'Ladies and gentlemen, two billion dollars to help the people of Haiti.' The three of us felt awkward, at least I did. 'And now you're involved in electric cars?'

'Yes, we're keen to help with global warming and the energy crisis.'

'And these new electric cars, what's different about them?'

'You can drive for five hundred miles on a ten dollar top-up,' Jimmy explained.

'Five hundred miles ... on a ten dollar top up? Where can I get one?'

'You can't,' I said. 'Your oil industry is trying to stop them being imported here, and they've bribed a few senators.'

'The cars can't be bought here?'

'No, and may be banned for many years,' I added. 'Meanwhile, the people of China and Europe are driving around for nothing. I have one on the estate, I use it to go back and forth each day. In six months I've not topped it up, and it produces no pollutants harming the environment.' I had done my political speech bit.

'In Africa,' Jimmy began, 'we have electric buses that are free for the passengers, routes all over our region.'

‘Amazing, truly amazing. Is your hospital there still full of my friends and colleagues?’

The audience laughed.

‘Yes,’ Jimmy said with a smile. ‘Many stars of yesteryear heading for a shot.’

‘An expensive shot!’

‘Yes, but it all goes to Rescue Force.’

‘Talking of charity drives.’ He faced the back screen again. ‘Ladder 142, come in please.’

The screen came to life, revealing firemen in uniform, the former cancer patient mid-screen. He shook his bucket. ‘We’ve had a fundraiser for Haiti, and raised twenty-five thousand dollars.’

‘Thank you, Ladder 142,’ Cliff offered. ‘Rick, you wanted to say something to Jimmy.’

‘Jimmy, your drug saved my life in hospital, and you saved me again when you put yourself in the way of that gunman.’ His wife and daughters walked into shot, and I wanted to get up and run out. It took all of my strength to remain there, and to remain composed. Then the daughters thanked us. God, could it get any worse, I wondered. It was the longest ten seconds of my life.

With the image gone the audience again applauded, and I forced a polite smile, wanting to be somewhere where they were shooting at me.

‘Jimmy, the Manson drug, is it really as good as they say? Is it the elixir of life?’

‘The drug stimulates the bodies own natural release of stem cells, and those types of cells help children to grow and adults to heal. As we get older, that process slows down, the drug simply speeding it up. It simply makes use of what a baby has: that strong replacement of cells each day that’s missing in us adults.’

‘And it halts the ageing process?’

‘I’m forty-five years old,’ Jimmy posed.

‘And you look thirty, if that. And the gunshot wounds you received?’

‘They healed very quickly because of the drug.’

‘Do you need top-ups to this drug?’

‘No, one injection in a lifetime is enough. But if you’re injected late in life you don’t age backwards. Best to have it when young, because you stay young.’

‘I think, maybe, there’ll be a few more people flying to your clinic.’

‘If people wait, it will be cheaper in the future. I hope. Besides, the drug is not wise for everyone. You need to exercise a lot to keep the weight off, because an increased appetite is a side-effect; the body craves more protein to rejuvenate itself.’

‘Any other side-effects?’

‘You sleep less, alcohol doesn’t affect you as much, cigarettes are not as addictive, but your pecker gets *much* bigger.’ Our host, and the audience laughed. ‘Just kidding. The main side effect is a concern for the sporting industry, because you become much fitter. A few athletes have taken it and got themselves banned. In fit young people it has a dramatic effect, allowing them to run all day long without tiring.’

‘I read a report - I have it here - a report from the American Medical Council. It suggests that – in American alone – the drug will save four million lives this year alone.’ The audience applauded. Cliff continued, ‘Worldwide, the UN says that figure will be thirty million.’

When they had stopped clapping, Jimmy said, ‘A lot of people have made a fuss about the affectionately titled “M” Group meetings. Well, one of the things that the leaders in that group did was to have faith in the drug, and to assist my research. Hardon Chase had faith in it shortly after coming to office, and assisted with hidden finance through Africa. Without his input, that drug may not have made it into the public domain.’

Oh dear, I thought, the Russians and Chinese would be on the phone later.

Jimmy continued, ‘And the cheap equipment that your hospitals now benefit from - that comes from factories in Africa that Hardon Chase funded with US taxpayer dollars.’

‘Why keep it secret?’

‘Because your Congress is full of idiots with their own agenda, many of whom didn’t want the projects pushed forwards. The research had to be done in secret to get around some of the Congressmen in the pockets of the drug companies. Hardon Chase invested a few billion dollars in Africa, and I deliberately misdirected that money towards the drug, the hospital equipment, and now the electric cars – and Chase knew. Hardon Chase’s legacy will be a cost saving to the US taxpayer in the trillions. And at the end of the day, they’re the people he works for, not big business. Whoever gets in after Chase will inherit so many cost savings he won’t know what to spend the money on.’

‘I’m a Democrat,’ our host admitted, ‘But I would vote for Chase.’

‘It’s not the party that matters - it’s the person. And that person needs the guts to stand up to those around him, and to big business – for the sake of the voters.’

I was starting to see where this was going, and hid my grin.

‘So what’s next for team Silo?’ our host asked.

‘We’ll be busy on a new pan-African cooperation group this year,’ I said. ‘And I’m trying to extend our buses to remote villages around Africa.’

‘And Rescue Force?’

‘Are all fast asleep,’ Jimmy said, making everyone laugh. ‘They deserve a rest!’

Off air, I was pleased with the way it went, very pleased. Exposure? Fuck ‘em, I thought. We just introduced the blood, and the “M” Group to the world, and made them both seen quiet innocuous. Anyone trying to reveal the “M” Group now would not be taken seriously, and the blood was out there; the websites about us had nowhere to go. We had just described the drug on global television, and justified the activities of the “M” Group. Wow!

There was a time when such revelations would have been just that; revelations. But now they were accepted facts, like microwave ovens or iPhones. I left that interview an inch taller, feeling good about life, and constantly surprised by Jimmy. How often I had doubted him in recent years.

We were escorted around to the club, and I enjoyed a relaxing evening of celebs and singers – many having been injected, no one wanting to bitch or moan at me. The club was no longer ours, it was on the Pineapple balance sheet, but our faces still fitted. I had a great evening, I felt good, and Helen had never looked better.

But in the morning, Jimmy dropped a bombshell. ‘You and Helen have two years left. You’re due to split then.’

I was stunned. ‘Everything between us is ... fine,’ I argued.

‘It takes two, and people change,’ Jimmy said with a sigh. ‘And ... I know what happens. Sorry.’

I had to sit down and stare at nothing for ten minutes. When Helen suggested shopping, something she knew I hated, I agreed for a change. I took my wife shopping, angry at the world in general and Jimmy in particular, but trying to be as nice as I could to my wife. I even splashed out on a little jewellery for her, despite what we had claimed the night before.

Back at the apartment, I found Jimmy scanning the American papers. ‘Got a minute? Or ten.’ He lowered his paper. ‘Let’s take a walk.’ I led Jimmy out, telling Helen we’d be back in fifteen minutes. In the building’s large and plush foyer, I directed Jimmy to a seat, asking the security detail to give us some space. So far, Jimmy had not commented. ‘Things between us ... are fine.’ I meant between Helen and me, and keenly waited a reply.

Jimmy took in the ornate ceiling cornice. ‘They say ... that our personalities are formed by age sixteen, and that our childhood scars us for life. It ... forms deep groves, and establishes what we like and don’t like. Those likes and dislikes are masked in middle age, and come back later; we return to our roots. The boy who liked to play toy soldiers likes to read military books when he retires.

‘Helen ... was not a happy child, which is why she took up the odd career that she did, and that just made her even more unhappy, more ... angry with the world. When you provided her with a home and a family you distracted her from that foundation, you papered over the cracks and turned her head away from the mirror. And, since then, she *has* found genuine happiness, and you’ve done a good job as husband and father. The problem ... is that as the years go by she’ll start to slip back toward her real self. And that real self is not so attractive.’

I sat listening, but not commenting.

Jimmy continued, ‘You may feel - you may argue, that the past eleven years have changed her, changed her for the better, and you’d be right – it has. But you’re on borrowed time, because as soon as the girls become more independent - and it’s just the two of you - she’ll slip back towards being the person she was, the one angry with the world. And, unfortunately, being a virtual prisoner in the estate hasn’t helped. People shooting at us hasn’t helped either.

‘She deeply loves her family life, yet deeply resents the fact that she’s caught up in all this. Fact is, it could not have happened any other way. If she hadn’t come to spy on us, then you wouldn’t have married her. And if you’d not married her, then you wouldn’t have two beautiful daughters, and you would not have had the stability that I needed for you to develop. Raising the kids, and being married, has given a few extra elements to your personality that are necessary for later, for when I’m not here.

‘When I say *not here*, I don’t mean getting myself killed. If things work out OK in 2025, or the preparations are as good as I’d like them, then I’ll be ... returning to where I came from. After that, or even before, you will – in an ideal world - take a larger role. So

whether I'm shot or not, you'll be running your own show at some point. And what you're doing in Africa at the moment is great training for a wider political role. So, it needed to happen this way, because I could never see an alternative. And Shelly has a role to play, something of a paradox.

'I hate to admit it, but your marriage and your family life has been one very big training exercise for you, an important part of the plan towards fixing 2025. And that objective ... is one for which I would sacrifice anyone, or any thing.'

I stared at my shoes. 'Could you fix it? Me and Helen?'

Jimmy sighed. 'I could help to prolong it for the sake of the girls.'

'And when the time comes?'

'You'd move into your old apartment, and still spend lots of time with the girls, so don't worry about that. She's not about to jump the fence, and you'd still work together.'

'That ... seems a bit odd from this angle. I mean ... if we break up, it'll be for a reason. To then work together?'

'You'll understand more at the time. And, I'll do what I can to keep you together. But let me ask a simple question: do you still have sex every night?'

I considered my answer. 'Well, no.'

'There'll come a time when you're happy to have her there - in bed with you, but just can't turn over and do what you used to. For some couples that's not a problem. Anyway, you have a few years, so make the most of it.'

We took the lift back up.

I hardly slept that night, and the next morning we flew down to Washington aboard a private jet, Hardon Chase more than keen to see us.

In the Oval Office, Chase pointed at a trolley. 'We got tea and beer, so you Brit's can't whinge.'

'Took long enough,' I quipped. I made the teas for Helen, Jimmy and myself, asking the Chief of Staff if he wanted one.

'So,' Chase began. 'You're working hard at raising my approval ratings. They're the highest ratings since Reagan sat down with the Russians, by the way.'

'We do what we can,' Jimmy responded.

'Cut the crap, Jimmy. What are you up to?'

'You need to beat up the banks more. So now you have a bigger stick to hit them with.'

'I thought we were more or less on top of them?' Chase puzzled.

‘Not where we should be, and the mortgage market is heating up; too many applications are being passed, and quite fraudulently. Kindly jump on it, or my next speech will take twenty points off your ratings.’

‘I’ll order an investigation, and tightening. Again,’ Chase sighed.

‘And spend some money on low cost units,’ Jimmy encouraged. ‘I’m going to build more houses - here and in the UK - to assist, but they take time.’

‘What are we aiming at?’ Chase asked.

‘Prices are rising by twenty-two percent, but we need fifteen percent to stop future problems. You don’t need to raise rates, just enforce the mortgage regulations. Make an example of a few people before I do.’

‘And the cooperating banks?’ Chase nudged.

‘Four are on board, the others in the spotlight, and there’s no imminent danger,’ Jimmy reported. ‘But you only need a small correction in house prices to have them hurting.’

Chase eased back in his chair. ‘There are a lot of folks not happy about you helping those four banks. Especially overseas.’

‘Well, if you did your job properly then I won’t have to,’ Jimmy curtly pointed out. ‘Why not split off the retail banks from the investment arms?’

‘This is a Republican Administration, Jimmy; non-interference, market forces, etc.’

‘Then I’ll interfere when necessary, and you’ll bail out BNK. That means nationalisation, which should be abhorrent to a *Republican Administration*. And then you’ll have people telling you that capitalism – and the free market economy - doesn’t work.’

‘We’re keeping an eye on them, and they know it,’ Chase offered.

‘You’re due to give a speech in New York soon, so kick them hard,’ Jimmy firmly encouraged.

‘I could get Shelly to kick them in the shins,’ I offered.

‘How is she?’ Chase asked. ‘Haven’t seen her for a while.’

‘Growing rapidly,’ I said. ‘She does a lot more with her time than I did at that age; I hung around on street corners getting into trouble. Our girls play musical instruments, ride ponies, use the computer - they never seem to have any free time.’

‘It’s a different world,’ Chase noted. ‘So, when will that new pan-African parliament building be ready?’

‘Six months or less,’ I replied. ‘We’re building quickly, and it’s a simple enough design.’

‘Shelly’s design,’ Helen put in.

‘Yes?’ Chase queried.

‘She drew a building and Jimmy approved it,’ I explained. ‘Although Shelly’s drawing did have kangaroos and penguins in the grounds.’

‘We conducted a survey after your TV interview,’ Chase informed us. ‘And most people accept the drug and the “M” Group, and don’t see anything sinister in either. Anyone trying to expose the inner workings would hardly make the papers.’

‘A carefully crafted lie,’ Jimmy agreed.

‘You think exposure is still a possibility?’ Chase asked.

Jimmy said, ‘I’ve muddied the waters a great deal, so unless a senior official goes public we should be OK for a few years more.’

That seemed to attract Helen’s interest; I could see the look on her face out of the corner of my eye.

Chase got back to Africa. ‘So what do you see this new parliament doing?’

I answered, ‘More of the same, just more organised. We’ll advertise for ministerial level jobs, and let the national leaders vote on the candidates. We’ll start with a Tourism Minister, an Agriculture Minister, and a Minister for Cooperation.’

‘And a Minister for the Rifles,’ Jimmy added. ‘Then a Minister for Refugees, plus one for innovation and technology. After that it’ll grow into a full cabinet, with sought after well-paid jobs.’

‘And the final goal?’ Chase nudged.

‘It’ll have teeth, and influence,’ Jimmy stated. ‘Block buying power, block military power, and block economic power.’

‘The way the DRC is going, it’ll join the G20 group of nations in ten years,’ Chase pointed out. ‘And the combined co-operation group could do that sooner.’

‘It’s cash rich, but needs sustainable industries,’ Jimmy pointed out. ‘Problem is, it’s too far behind the rest of the world to ever be the next Taiwan. So oil and ore will always dominate, but I’ll develop the internal markets as much as I can.’

‘And by 2025?’ Chase asked.

‘Africa should be a hell of a counter-force to the Brotherhood. Instead of the Brotherhood moving south and capturing land, we’ll move north and take it from them. Overall, the region is a good six years ahead of where I thought it would be, and Paul is doing a great job of maximising the growth. He keeps them busy.’

‘We’ll release our own super-drug in a month,’ Chase informed us.

‘Which version?’ I asked.

‘The Chinese model. We’ve struck a deal with a pharmaceutical company here, and the inner methods will be kept secret. They’ve found a way to mass-produce it, they’ve even done a better job of it than the Chinese.’

‘Your pharmaceutical companies way ahead of them,’ Jimmy pointed out. ‘But don’t forget the agreement: don’t sell in Asia or Africa.’

‘We’ll sell it here for now, and take a very big chunk out of the health bill. I’m planning a new round of tax cuts.’

‘Why not save some for a rainy day?’ I asked.

‘Well, that as well,’ Chase reluctantly agreed.

‘That would be a better use of the money,’ Jimmy firmly nudged. ‘If the countries out there held fewer dollars, it’ll help in the future.’

‘I’ll look at it,’ Chase offered, but I had to wonder what was really going through his mind. My mind was elsewhere as well.

Back in New York, we met those bank bosses that we were friendly with, and plotted a major scam, one that would hurt BNK. Jimmy did not give them all of the details, he simply suggested that there would be a currency squeeze, and for them to buy and sell when he indicated. In the meantime, he asked them to reduce their holdings of Euros.

A Greek tragedy

A month after meeting with President Chase, Jimmy said it was time to bust up BNK and a few others. But the timing was out of Jimmy’s hands; that involved others. Those others got a nudge, and finally sat down for a chat. At the end of the chat they left Jimmy to execute the plan, but were not happy with it - and would never admit to it.

The next day, the French and Germans were reported to be unhappy with Greek debt, rumours of the Greeks misleading the European Union. Someone Stateside then released a few very accurate figures, suggesting that Greece, as well as Portugal and Spain – the Club Med countries – were all in trouble. The Euro took a dip. It was not a massive dip, but nonetheless a dip against the dollar. I observed it in my old apartment, waiting ready behind three Forex screens.

BNK were involved in the rumours and the subsequent squeeze according to Jimmy, the bank colluding with a few of their hedge fund buddies. Fact was, Greece was genuinely stretched, but not by as much as they would have been without Jimmy having interfered in the markets years earlier. BNK ran a trading arm, like most banks, and that trading arm had decided that anyone betting the upside of the Euro-Dollar trade was onto a losing bet. Under normal circumstances, they would have been correct.

On the second day the Euro slid further, with additional unconfirmed reports leaked. I waited patiently and observed, checking my watch. The Greek bourse had fallen, but I had bet the downside heavily through BNK themselves two days ago. I now reversed strongly, which must have been a surprise to the computer at their end, no humans involved in these automated trades. I then made the computer's day by heavily betting the Euro to rise against the dollar. A human trader may have questioned my sanity, and possibly figured that something was amiss. Either that or they'd rub their hands at the idiot wasting his money.

I now had a billion dollars bet on the upside through various accounts, and through several Swiss exchanges I bought Euros with our stronger Dollars, most of which were Hardon Chase's investment dollars for Africa. It was a bit cheeky. It was also a risk, but not as great a risk as that inherent with options or stocks, the movement between the currencies always being small.

The French, German and Greek Governments then released a joint statement, suggesting that a minor liquidity and debt blip had been dealt with, and followed up with a report that Greece had just taken receipt of a twenty billion dollar loan from China, a ten billion dollar loan from Russia, and further twenty billion Euros from France and Germany. They made it clear that there was no problem at the Greek amphitheatre. The tragedy would be played out, but just by the actors.

The Euro rallied against the dollar, BNK and others scrambling to get out of their positions, and stunned by the news. I was joined in my old apartment by New Dave, Israeli banks having been involved in today's action. We had reversed our trades on the Greek bourse, and were now making a killing off BNK's trading arm, the foolish traders not placing the bets in the open market. They had been tipped about a Greek/Euro fall, and so assumed the up-bets to be folly. As for my Forex futures trades, BNK had no choice but to wait, and to see me take their money. By close of play I, and others in on the

deal, had taken six billion dollars off BNK and their co-conspirators, a bad day on the markets.

And my two billion dollar profit? I bought six thousand electric cars and four hundred electric buses, asking for them to be shipped to Athens, the Greek Government already expecting them. In addition to that, six of our oil tankers were dispatched to Greece, the oil a gift that would be kept secret. My medical factories switched delivery to Greece, enough supplies of medical durables to keep them going for five years. And China delivered vials of the super-drug, to lower Greek medical bills further.

We had done as much as we could for now, the finances of Greece nowhere near a crisis. The behind-scenes-crisis with Greece's European partners, the ones it had lied to with the help of BNK, would rumble on.

The news of the currency squeeze hit two days later, a rumour that BNK was in trouble. They had made a bet, a strong one-way bet against the Euro, and now their trading account had a deep hole in it, a year's profit wiped out. Chase called. BNK had borrowed from the New York Fed, short-term loans, but not a great rate. Jimmy leaked the full details of BNK's woes to the financial media and, given the remarkably risky nature of their one-way trade, Ritter was replaced. What could have been a Greek tragedy had been dealt with using everything at our disposal, and in a coordinated ballet.

Unit 402

The President of Senegal was not a popular chap, not with his own people, nor Jimmy. Unit 402 were sent in, the timing critical.

The President of this poor West African nation had spent a great deal of money on a large statue perched atop a small hill, something to rally and inspire the population. That population was struggling to make a living, and they displayed no appreciation for communist-style edifices. A day after the huge statue had been completed, it was blown to pieces, so much explosive used that bits of it travelled half a mile. The President was not a happy bunny. He blamed all sorts of dissident groups, and his police cracked down, the usual suspects rounded up, the crackdown widely reported in the African Times.

Turns out, the old boy objected to his harsh treatment in the African Times, and called Kimballa a few names, saying that it was his doing. Well, that was just rude. Unit 402, still in Senegal, made a few additions to the President's official car. The following morning, as the Presidential convoy left the President's private residence and journeyed towards parliament, his car blew up.

The people of Senegal rejoiced in the streets, and Kimballa made a few rude comments of his own, not at all concerned that he was a suspect. Unit 402 withdrew from Senegal, no evidence left behind.

It was, technically, the first African leader that Jimmy had directly assassinated, and openly admitted to in our circles. And these days I didn't care. My mind was still on Helen, and I was angry at the world. I understood Jimmy's motivation, and I'd not go back in time and swap the my girls for anything, but I was mad at him anyway. I was also now mad that he had informed me; it may have been better not to know. At least these next few years would have been lived through with a sense of optimism, not pessimism.

That evening, I went around the main house, ready to have another go at Jimmy, and there had been a few of those in recent weeks. I found him in a lounge, watching TV with Han.

'Can I have Jimmy for a while?' I asked Han.

Our polite Chinese houseguest stood and bowed, withdrawing.

'Still mad?' Jimmy asked, focused on the TV.

'There must have been a reason you told me, instead of just letting me ... well, let it happen.'

Jimmy took a moment. 'In Vietnam, when the young soldiers arrived there, they were afraid - yet youthfully optimistic. But then they mixed with the soldiers who had already been there for a while, soldiers who had become disillusioned. The optimism went, and the fear grew, growing into terror. When their friends were killed, that terror was focused. But, as time went on, that fear became a resentment ... of fear itself, and slowly evolved into anger towards the enemy. They then wanted to go out and kill those that had frightened them, and eventually did so, becoming better soldiers. But that anger was also directed toward the indigenous population, hence the shooting of civilians.

'Then, once the soldiers returned home, they went through a difficult adjustment, many suffering post traumatic stress disorder. And, finally, years later, some old men went back to Vietnam for a holiday, walked the same fields as they did in their youth and met Vietnamese veteran soldiers, coming to peace with what had happened, and how they felt about it.

‘You see, having experienced a wide range of emotions, you can look back in later years and rationalise them, and you can recognise them in others, and in yourself.’ He finally faced me. ‘The more time you spend thinking about it, the more you’ll get back to Vietnam for a holiday. It would have been easier for those old veterans to deal with the war in their youth if they had the benefit of foresight at the time. For most people, it’s very difficult to look forwards a few years, then to look back and judge yourself on live events, or events just about to happen. We have to go through them to understand them.

‘Right now, you’re going through the break-up in your mind, a better place to do it than here in this house, shouting and screaming, moping around, and being a great big pain in the arse when I need you at your desk. So this is a dry run, a dry run that’ll help a great deal when the real thing happens. So, think ... till you’re at peace with it.’

I heaved a sigh and walked home. Thinking.

Angola

Angola shared a long border with the DRC, and hosted the dated Unita rebel group, a group that Jimmy had oddly avoided up to now; he had always insisted that the time had to be right. They had not crossed the border or caused us any problems, rightly terrified of the Congolese Rifles.

So I was interested when, one fine Monday morning, Ngomo turned up with two officers. We put him in one of the palatial rooms, but he complained straight away, wanting a smaller room. We gave him an apartment. Hell, he would have been happy sleeping on the floor. In the basement, we huddled around a map of Angola, numerous coloured annotations already marking planned deployments.

‘Unita rebels have crossed the border,’ Ngomo reported.

‘Daft of them,’ I quipped.

‘Yes, so now we must act,’ Ngomo insisted. ‘I have spoken to President Kimballa and he has assigned me the task.’

‘You mean Jimmy gave you the task,’ I corrected him.

‘A loyal soldier must always go through channels,’ Ngomo said defensively, but with a grin.

‘So what’ll you do?’ I asked.

‘Hunt them down like dogs and kill them all,’ Ngomo stated.

‘Should have figured that,’ I quipped. ‘So why now?’

Jimmy said, ‘Angola has mines that should be part of our group, and a rail route I want to improve.’

‘But they go through Unita held territory,’ Ngomo added.

‘And the Angolan Government?’ I asked.

‘Is pulling back all of its forces, happy to see us assist,’ Ngomo explained. ‘We have five thousand soldiers ready.’

‘Take a week then,’ I said.

‘A month, just to be thorough,’ Jimmy corrected me. ‘And, we’ll practise a live airborne insert, even a high altitude parachute insert of Pathfinders. It’s hardly necessary, but good practise.’

‘And afterwards?’ I asked, studying the map.

Jimmy drew a line from our southern oil region, across Angola and to the coast.

‘It’s shorter than the Tanzanian route,’ I noted.

‘And plenty of mines to get involved with.’ He faced Ngomo. ‘How are the three mines run by that Belgian company?’

‘Ah, not good, sir. Unita rebels blew them up.’

‘Unita are on their arse,’ I pointed out. ‘They couldn’t blow up a statue.’

The officers laughed. An hour later the signal was sent; the Rifles were off to war, our Hercules aircraft carrying its deadly cargo of Pathfinders, our Chinooks transporting the Rifles.

The African times ran the story in the morning - that of the Unita rebels crossing the border with the DRC, and Kimballa ordering the Rifles to move in, a request to move in that was echoed by the Angolan Government itself. It was all above board and legal, an above board and legal massacre of downbeat and disorganised starving Unita rebels.

Back at my desk, I found a dozen new files to scan. The first displayed photographs of standard apartment blocks, lots of them. They each stood four storeys high, offered twenty apartments per floor, and typically displayed a shop on the ground level. I scanned the attached note, realising that the corporation had decided to standardise apartment building to save money, and to make construction easier; using the same builders over and over.

I initialled the cover letter and suggested that they build them in each town with a population over a suitable size. I closed the file and

forgot about it as Helen stepped in. 'You're not allowed to criticise my filing system,' I joked.

She came around and sat behind me, and I swivelled my chair to face her. 'I came up with an idea, and Jimmy said to discuss it with you, dear.'

'Work ... idea? Dear?'

'Yes. Dear. Jimmy was never keen to waste too much money on remote villages because they don't add much back into the overall GDP. But, we are producing more teachers than we can find work for, and police officers as men leave the Rifles. So I suggested that they combine.'

'Have the children taught at gunpoint?' I toyed. 'Yes, I can see that. Harsh, but fair.'

She gave me a look. 'Build a standard school, with a small house attached for the teacher, a second house attached for the police officer, then stick one in each village. A third small house, or apartment, would then be used by Rescue Force, because Jimmy has just ordered a massive push around Africa.'

'Sounds very efficient; a schoolroom with three apartments tagged on. And if they were all the same design, they'd be easy to re-produce. I've just signed off a similar project with apartments.'

'So you can draw up the plans for the schools and produce a few prototypes. Earn a living for a change!'

'I'm doing more now than ever. Glad when I get home!'

'There's something else. The girls are being taunted a bit by their friends over certain websites, and the kids these days use websites when they're six!'

'What do you think?' I asked. 'Have a word with the headmaster?'

'Jimmy said to bribe them.'

'Bribe the headmaster?' I puzzled.

'No, the kids in their class.'

'Ah, right. Well, they're ten. Won't be as hard as the "M" Group. Leave it with me, I'll organise a school trip to the zoo.'

'Sounds reasonable.'

With Helen gone, I called the school's headmaster. They had a few days off coming up, and could stretch to one or two more. When I gave him my suggestion he was surprised, but would put it to the other parents of the pupils in the classes that Shelly and Lucy attended.

'Ten years old,' I said to myself. 'I'll beat the crap out of them.'

A week later, we accompanied twenty-two children and most of their parents, flying out of London on a direct flight to Goma. I had said a zoo, just not which one. We spent the first night in the airport hotel, the parents and guardians enjoying the bar and facilities, hitting the zoo in the morning. I had cleared out most of the other visitors well in advance, and we had the run of the place, cuddly balls of fur keenly stoked by the children. They hand-fed many of the animals, rode on the backs of a few, and by teatime the rabble were mostly worn out.

The next morning we packed up and drove to a nearby lodge, also cleared out of guests – who were compensated or moved elsewhere, and we had the place to ourselves. By now the kids were competing with each other to see who could name which animal, and all stared through binoculars at the savannah. A Rescue Force Huey flew in that afternoon, as arranged, and took many of the excited kids for a spin.

The following day I split the boys and girls. The girls went back to the zoo, the boys to the Congolese Rifles base with their fathers. Those that had asked to attend this outing were now lying down beside instructors and blasting paper targets with M16 rifles. I was once ten, and I knew what these lads wanted. They all got a ride in an armoured personnel carrier, and practised their mine clearing, re-joining the girls for the evening meal.

On day four I arranged a coach to the man-made lake for a few hours of fishing, tackle already set-up and waiting. A few monsters were hooked, landed with a bit of assistance, a crocodile spotted.

On day five we flew over to Mombassa, and to River View beach hotel, the kids screaming in the water ten minutes after booking in. The grown-ups sheltered from the sun around the beach bar as the kids bonded in a way that they never could in a schoolyard. The bravest boys and girls had a go at scuba diving, some of the parents joining them, whilst Helen and I just watched contentedly, cold beers aplenty. We sat talking parent stuff with the others.

Day six saw a brief trip to the small zoo behind the hotel, a flight up to Mawlini after lunch. Booked in, I took everyone to the rooftop bar of the RF hotel, the kids on tiptoes to peer out at the famous base. Plenty of aircraft and helicopters were coming and going, the boys suitably excited.

With an hour or two of daylight left, we took a coach into the desert, soon witnessing an Mi24 roar past and bomb a nearby range. The kids loved it, their parents terrified. Not to leave out an educational element to the trip, we journeyed on to a nearby oil

derrick, where a spokesman for the oil company gave a lecture on oil and tested the kid's knowledge of things fossil and geological.

The following morning we spent an hour with Rescue Force, crawling over jeeps and examining bits of equipment, before a splash in the pool and a barbeque lunch. We showed the group the Cassie film after lunch, the lecture theatre air-conditioned, followed by the film of Hal's life in the evening. At the end of that film the man himself stepped in, the kids asking questions about jungle horrors - and shooting people. I kept Mac away from the kids; the youngsters were not ready for him yet. I was not out to scare them.

We flew directly back to London the next day, luxury coaches transporting sleeping kids and parents back to Wales, just one last task. The following Monday, with the kids back in school, Jimmy went to visit, many of the boys keen to meet him. A week later I asked Helen how things were in school, getting back an affirmative smile.

Then Jimmy called me down to the main office. 'What the fuck did you do, numb nuts?'

'Do? With what?'

'Did you sanction two hundred million pounds on new apartments?'

'No.'

'Apparently, you did.' He thrust the file towards me.

I read the detail. 'I said for them to build these apartments in towns over a certain size.'

'What size?' Jimmy loudly questioned.

'That ... I left to them.'

'They've commissioned four hundred and sixty!'

'Ah. Well, that I did not sanction. Directly. Is it too late?'

'Well,' he sighed. 'They've ordered the construction and hired people, ordered the materials.'

'How many would have been appropriate?' I asked.

'Less than that! But, I guess a full five years worth can be done now; they won't be wasted. Problem is, the builders will be busy for a year, then laid off. Better to have spread it out.'

'I'll check how it happened,' I offered. 'Oh, and they've broken ground on the new parliament building.'

Meanwhile, the Rifles were clearing out Unita rebels in Angola, and I had even more work to do all of a sudden, Angola now being my patch as well. I sent Steffan Silo a note, asking him to review its rail link for our use. On the map, I noticed an airport near the existing rail line, a place called Luaua. I faxed the Angolan

Government and asked if I could develop the airport and surrounding area. They agreed, not least because it was in the middle of nowhere. Not wanting to make another mistake, I showed it to Jimmy on the map.

‘Yes,’ he said. ‘I would have suggested it. Base for the Angolan Rifles, when they’re formed.’

I contacted the French company that had handled the design of our other airports, and asked them to fly someone down to Luaua Airport as soon as they could, to make an assessment and to report back.

Steffan Silo then sent me a series of digital aerial photographs of the airport in question, the guy just as psychic as his brother. Turns out that Steffan had already reviewed the rail link, and had commissioned a pilot to fly the entire length of track, a special camera taking still images every two seconds from six hundred feet; they could be flicked through on a computer. I scanned the images, soon realising that the airport was basic, to say the least.

The Angolans agreed for an advance party of Rifles to make a home there, and I ordered thirty of our self-assembly homes to be shipped. RF DRC were ordered to open a small clinic at the airport straight away, and I asked for a facilitator from Forward Base to be sent down on rotation, his task being to develop the local infrastructure.

Meanwhile, psychic Steffan Silo had ordered the shipment by train of a team of his own to Luaua airport. That team journeyed down the train track in question, their carriages loaded with self-assembly huts, tents, supplies and communications equipment. They arrived at the same time as the French airport designers, the locals bewildered by the attention they were now receiving, tents and huts soon sprouting everywhere, the Rifles creating a camp for themselves.

When Ngomo noticed the outpost he queried it. When he discovered my plans he asked if it could be used as a helicopter base, being re-supplied by train. I agreed, and some of the Hueys being used in the Unita campaign set-up happy home there, Steffan Silo organising a weekly supply run of fuel and heavy equipment. This small project now held my interest, because it reminded me of Mawlini all those years ago. I then noticed just how many people Steffan was employing nearby, and queried it.

Turned out that he had gangs, hundreds of men, following a special train that measured kinks in the track. The kinks slowed trains and wasted fuel, so his teams would nudge the track left or

right, up or down, depending on what the computer instructed. And now that we aimed to utilise the track all the way to the coast, his teams would go all the way to the coast as well.

Time moving on

Jimmy handed me an Apple iPad one day. 'That's what computers look like in the future.'

The iPad was like a tablet, a large version of an iPhone; touch screen, branching hierarchical menus.

He added, 'You use them as phones as well.'

I held the large tablet to my ear. 'Seems a bit odd.'

'Two way video. In the future, Helen will have a plastic sheet on the kitchen wall, two foot square. When you call, she touches it and it comes to life, two-way video communications. In the future, holding a phone to your ear will seem odd to people; they talk face to face, and body language comes back into fashion. These iPads - you can use them as a keyboard, linking several together. One is a screen, one a videophone, one an open spreadsheet. The large computer monitors you see today will all be gone inside of five years.'

'What about small phones?' I complained.

'There're still available if you don't want to lug one of these about, and miniaturised further into lapel badges like Star Trek. Voice activated, it has a booster unit in your pocket. Now you Google what you want, but in the future it's mostly voice activated and interactive, and 3D video gets interesting. You have three thin plastic screens, each one three feet square; one in front, two on the sides. Could even have one above or below you. You then watch Jurassic Park and scare the crap out of yourself. They're also great for flight simulator games; when you peer left and down you can see what's actually below you on the left. And when you've finished you just roll them up and stick them away. Technology has been driven by kid's games for decades; it's no different in the future.'

'What's shopping like in the future?'

'It's mostly online, because people will always go for the lazy option. You choose what you want online and it gets delivered. And you can have a repeat order, making small adjustments when needed. It's already available in a few places.'

I played with the iPad for hours, glimpsing the future. At home, Shelly grabbed it and flicked through apps for an hour till I tickled her and grabbed it back. There were, apparently, iPads waiting for us all in the office; Jimmy had bought fifty. Within a week I was reading reports from my sofa, or reading the news. Progress.

The sleeping giant awakes

I took a call from Coup, Mawlini base now being visited by a Japanese group. Up to now, the Japanese had shown no interest in Rescue Force, despite Japan suffering all manner of natural disasters and quakes. Now they wanted to meet with us to discuss Rescue Force, which was fair enough. I told Coup we'd talk to them, and he went off to see when and where they'd like to meet. He came back on fifteen minutes later, asking if their Prime Minister himself could pop in and see us when in Europe next week. I was a little surprised by that, but agreed. Down at the main office, I informed Jimmy.

Jimmy heaved a breath, and stared at nothing for a moment. 'The giant awakes. And early.'

I exchanged a look with Helen and Sharon.

'OK,' Jimmy said. 'We'll meet.'

'Is there ... a problem?' I asked.

'A coin has two sides,' he enigmatically stated.

The following week, the Japanese Prime Minister met with the British Prime Minister in London – a scheduled meeting, then flew down to us in our Agusta helicopter, bringing with him a team of six. Sykes had a few extra police officers patrolling the grounds, just in case.

I didn't know any Japanese phrases, and greeted our guest with a simple head-bow and English words, the Prime Minister speaking a little English. In the lounge, I introduced him to Jimmy and Helen, drinks organised before I closed the door and eased down.

'Thank you for seeing us,' the Prime Minister offered, heavily accented. The rest would be in Japanese, and translated. 'We are interested in joining the Rescue Force group of nations, but we have other matters that we would like to discuss – if you are amenable to discuss them.'

Jimmy took a moment. 'Other matters?'

'Such as protein markers for algae.'

I puzzled that with a heavy frown.

‘You may speak openly in this group,’ Jimmy encouraged him.

The Prime Minister glanced at Helen and myself. ‘Our scientists have dedicated a great deal of time to studying the phenomena that is Jimmy Silo.’

Oh dear, I thought.

‘We have obtained the super-drug, the Manson drug, an electric car, and have studied everything you have ever done – in great detail.’

This sounded familiar.

‘And what have you discovered?’ Jimmy toyed.

‘The characteristics of a protein marker in your blood that matches perfectly that of a genetically modified algae that exists only in a Japanese laboratory, and was created two years ago – despite the marker being in your blood for much longer than that. We have also noted that our theoretical future ideas for electric battery technology are already incorporated into your electric car. Our scientists were astounded, in that you have solved the problems that they have only just theorised about, and we lead the world in this technology. They are certain that such industrial research exists nowhere on this planet.’

Oops.

He continued, ‘We have, naturally, examined all websites detailing claims about you, some of which seem to fall in line with our own theories.’ He waited.

‘Did you have a question, Prime Minister?’ Jimmy nudged.

‘Are you who we think you are?’

‘Yes.’

The visitors exchanged looks. ‘And your age?’ the PM asked.

‘A figure that would shock you,’ Jimmy answered, Helen and I exchanging discrete looks. We wanted to know that as well.

‘Your purpose here?’

‘To help.’

They considered that.

‘Help with ... earthquakes?’

‘To help ... with many things. For mankind to survive intact beyond 2030 would require a miracle of biblical proportions.’

That caused a stir with our guests. ‘You seem to have favoured certain nations?’ they delicately pointed out.

‘A teacher, in the school yard, need concern himself first and foremost with those children that cause problems, bully others, or

fight amongst themselves. The well behaved children need less attention.'

They digested that.

'Will Japan be struck by a major quake before 2030?'

'No.'

'And our role in the future?'

'Not enough. Like Germany, you sit back and do too little to affect world politics ... when you should be more involved.'

They exchanged looks. 'And what ... preparations should we be making for the future?'

'You can help by developing better nuclear reactors, and more efficient hydro-electric generators, plus alternate fuels. Anything that lessens the world's dependency on oil is a good thing – for us all.'

'May we have a liaison here?'

'No. I will tell you what you need to know, when you need to know it. Unlike others, yours ... is an easy path to follow.'

'We are willing to assist you.'

'Have you reverse engineered the battery technology?' Jimmy asked our guests.

'We believe we could.'

'Then put all of your energies into it, and move away from oil as fast as possible, selling electric cars when you can. That will help me.'

They seemed agreeable with that. 'And the drug? It was developed for a purpose?'

'Of course. But diseases in the future will adapt, millions will die,' Jimmy explained. 'Dedicate time to research in SARS, Swine Flu, and that family of viruses.'

'Is there more we can do to cooperate with you?'

Jimmy lifted an iPad. 'The future of computers, and of phone communications.' He placed it down. 'In a month or two I'll visit Tokyo, and give you directions for technological advancements.'

With the Japanese gone, Jimmy called an "M" Group meeting of house representatives. 'We've just had a visit by the Japanese Prime Minister and his team. They put two and two together ... and came up with the truth about me, not least because they recognised that some of the technology I use came from them – at least from them in the future, ideas sat on the drawing board at the moment.'

'The electric car battery?' Keely asked.

'Theirs,' Jimmy agreed.

'And the drug?' Jack asked.

‘United States Air Force,’ Jimmy answered.

‘Will they be a problem?’ Han asked.

‘No, they’re keen to help. But, they’re already trying to reverse engineer the electric battery. Since they have the early designs for it – and the right scientists, it won’t take them long.’

‘Will they expose you?’ Jack asked.

‘No, never,’ Jimmy firmly stated.

‘Will they be useful?’ I asked.

‘If they work on certain technologies, then yes.’

‘How will their economy fair against ours?’ Han asked, and I had been waiting for that question.

‘They’ll stand still, you’ll grow strongly.’

That seemed to appease Han.

‘So, all round, nothing to worry about,’ Keely concluded.

‘No, so update your governments. Japan is now “M” Group, they’ll be at the next meeting.’

Marko and Yuri came to visit the next day, talk of a new upmarket nightclub that they had created in Gotham City. Their mines were progressing well, and their interests in Russia were prospering. Chatting in a lounge, Jimmy floated the idea of increasing food sales in the coffee shops.

‘Why not create a restaurant chain?’ Yuri asked.

‘Restaurant, or fast food bar?’ Jimmy asked. ‘Many of these coffee shops are in small towns, and the people don’t have a lot of money.’

‘MacDonaldski,’ I put in.

‘Why not,’ Marko argued. ‘We have the beef and the bread!’

‘I think it’s a good idea,’ Jimmy agreed, causing me to study him, trying to figure out what he was up to. Really up to. He suggested a name, the Russian word for “Beef”. The outlets would be “Beef Café” in Russian. He made one odd suggestion, in that they should also sell frozen burgers.

‘Won’t they be hard to eat, sat in the café?’ I testily asked.

‘They can be taken home to heat later,’ Jimmy explained. ‘Many Russian housewives would do that, instead of sitting and eating, and the Russians don’t like to walk and eat.’

Marko and Yuri agreed. The project had a go ahead, our beef production set to be increased. Jimmy then suggested that the abattoirs near the main farming area produce the beef for the burgers in their finished form, that our facilities produce the bread for the buns; basically that they create the ingredients for the burgers and

freeze them. Some would be sold over the counter, the rest heated and sold as with a normal burger bar. It all seemed harmless enough.

Our Russian company, running the coffee shops, would now be tasked with the burger bars as well, opening near the coffee shops were possible. Distribution centres would be common, truck delivery common, and the cost savings huge.

Jimmy then mentioned that Russians read a great deal, especially in the winter. They had one of the world's highest book-reading rates, second only to Iceland. Marko suggested books in the coffee shops, Yuri admitting that he had considered a chain of bookstores.

Jimmy said, 'Such a bookstore should offer new and second hand books, and those that you can rent for a dollar or less. New, used, and rental.'

Yuri was keen, the set-up costs low, and those costs could be kept low with centralised bulk buying.

Jimmy added, 'Some shops may have three of a book, others none. They can swap them when needed. All in the family.'

Now I was very curious as to what the bugger was up to. He offered extra investment for the books and burgers, and the projects would move forwards, Yuri offering to recruit a management team. Yuri also mentioned the arrival of a thousand electric cars in Moscow, taxi drivers adopting them in large numbers, the Russian Government now keen to adopt the technology, selling its oil abroad instead of to its own citizens. Three electric buses were also in the city and on trial, much fanfare over their arrival.

Many Muscovites had already both seen and used the buses in Africa whilst attending a safari holiday, we had made sure of that. So the arrival of the buses caused a lot of interest, fond memories from those who had enjoyed safaris with us. To date, that was over thirty thousand Russians, their annual exodus to the sun now topping some five thousand a year, most being routed through Goma hub direct from Moscow.

Marko and Yuri had seen a need for more hotel space in Gotham City, and so had commissioned a new hotel complex, southeast of the airport and towards the lake. It would concentrate on Russian tourists, and would be built like a holiday hotel, a circular three storey building surrounding a central pool. They aimed to build a berth on the lake and offer boat trips and party ships. Progress; tacky Russian holidaymaking had reached Gotham City.

Whilst on the topic of boats, Jimmy mentioned that he had arranged for two large ferries to be transported to Lake Tanganika in pieces and assembled by a German company. They would transport

up to four hundred people, and would run continuously up and down the vast lake. Albeit slowly. When I questioned the speed of this mode of transport, Jimmy explained that journeys would be cheap, could be taken overnight – rooms and beds offered, and that the roads to our mines in the southeast were not good.

With our Russian guests still at the house, our hospital director turned up with his assistant. We now ran hospitals in Gotham City, Nairobi, Kinshasa, Mombassa, Dar es Salaam, Mogadishu, Sierra Leone, Liberia and Guinea. We had concentrated on geographical locations where the hospitals could either be a benefit, or would be widely used by a populace with a few quid to spare. Future hospitals were planned in Zambia, Burundi, Malawi and Zimbabwe.

In the Americas, we now offered hospitals in Rio De Janerio, Brasilia, Equador and El Salvador, a new hospital being built from the ground up in Haiti.

Our director nagged about his supplies, since we had diverted some of our cheap supplies to Greece and Spain. We agreed to look at production levels, but could not produce much more without annoying the Chinese. Well, not much more for western countries; Africa was a different matter. I made a note to increase Africa production and distribution.

Despite the low cost of treatment at our hospitals they were showing a profit, not including capital costs or start-up costs. The fuel to run their generators was low, the supplies low-cost, the Cuban medics cheap, and most hospitals had the free use of twenty or thirty RF doctors keeping their skills sharp. Our director gave us an hour-long presentation, and we asked questions, getting opinions instead of the usual facts and figures.

Jimmy told him, ‘I want all of the countries in the cooperation group to have a hospital as fast as possible, then I want secondary cities in those nations to have clinics. Leave the nations outside that group for now. When the new parliament building is finished there’ll be a pan-African Minister for Health, paid by us. These hospitals will only be a small part of his remit, but I’d like him to start with one in each country.’

‘I’d answer to him?’ our director delicately enquired.

‘In the same way as you’d answer to Kimballa,’ Jimmy explained. ‘It’s their country, and you’d cooperate. You’re private business, they’re government – and they license us.’

‘How’s the health tourism?’ I asked.

‘The core African health tourism is still growing, the hospital in Goma is kept busy, and the regional hospitals are at a steady capacity.’

‘The number of people flying to Goma hasn’t reduced?’ I puzzled.

‘No, there’s still a large catchments area for Goma, made larger by cheap flights. The other hospitals might cause that to ease off in time. Besides, industrial accidents are rising with the rise in factories, so that keeps us busy.’

‘Is the health and safety record poor?’ I asked.

‘Not really. There’s a lot of new building work, and new factories,’ our director explained. ‘It’s the nature of the work in a large industrial area – always a crushed toe or broken arm.’

Jimmy put in, ‘I’ve started to put Rescue Force teams into factories - for basic first aid. Good practise for new staff.’

An hour later we concluded, the man off to visit family in the UK, and we organised a formal house meal that evening for Yuri and Marko.

The next day, I scanned a report from Somali; the storage of nuclear waste. At an isolated stretch of the coast a new breakwater had been built, and a deepwater dock now stretched out into the Indian Ocean. Waste ships berthed, serviced by a specially built train. That train took its deadly cargo inland twenty miles, the track splitting a dozen times toward individual underground storage areas.

That detail was not what caught my attention. What caught my attention was the money that the Somalis were making, and that the various governments were happily paying. The project had only been up and running for three months, but it had earned two hundred million pounds so far. Dumping nuclear waste seemed to be an expensive business. And Somali was cheap in comparison!

Three reports later, I picked up a sheet that detailed continuing al-Qa’eda attacks on Northern Somalia. It also explained that almost a hundred “X-Rays” had been neutralised near the nuclear plant. Reading on, I could see that rebels from Yemen, not card-carrying members of al-Qa’eda, were being caught in Northern Somalia. Concerned, I went and found Jimmy.

‘If the unhappy chappies crossing over to Somalia are from Yemen, then how long till Abdi fights back?’ I posed.

‘He’s already in talks with the Yemen Government, talks that would allow him to move into the hills of Yemen and clear the fighters out,’ Jimmy admitted.

‘That a good thing?’ I questioned.

Jimmy made a face. 'It's not ideal, but it would reduce the fighter's numbers. That - in itself - is good, because in 2013 and the years after they'll kick off more. We can deal with it then, or now.'

'I thought you were leaving it to the Saudis?'

'They'll not cross the Yemen border,' he scoffed. 'Besides, this could be argued to be a local issue, Somali and Yemen are neighbours; the west can't be blamed.'

'And if the fighters are not cleared out?' I pressed.

'They won't bother the west, but they may try piracy in the Suez Canal. Yemen runs out of oil in two years, water shortly after, then it becomes a failed state. That could go either way, but I'm not propping them up. I was waiting for them to rattle the Saudis for some cash.'

'But Abdi won't wait.'

'No,' Jimmy said with a sigh.

The next day, several squadrons of Cobras, Hueys and Mi24s landed at Scorpion Base in Somalia, up from Kenya. The Kenyan Pathfinders followed them, and six thousand Somali Rifles began a period of mountain warfare training. We were going to war in Yemen, whilst five thousand Rifles were still mopping up Unita rebels in Angola.

In the weeks that followed, I went through a strange daily routine. I had been trying to spend more time with Helen and the girls, but I was also enjoying my work. I would arrive at work early, and work hard to try and clear my desk so that I could leave early. But that usually meant that, after lunch, I'd have cleared the urgent stuff and would then find a new project to look at. That new project would catch my interest and I'd be there at 5.30pm, suddenly cursing and rushing home, and getting home flustered. My secretary had taken to calling me on her way home and asking if I had left yet.

I had then modified my approach and began taking work home with me, Helen and the girls often involved with Daddy's homework. I would describe something I was working on and they would make useful comments. Mostly. The girls occasionally wanted to feed and house all poor people, till I pointed out that we couldn't. Many an evening we would be sat with the TV turned down low, the girls on their computers or reading quietly, and I'd ask Helen for her input.

My dear lady wife did a good job of curbing my excesses. That, and she asked Jimmy the next day about things and then told me later. It would have been easier to share an office with Jimmy and

just ask him everything, but I wanted to do most of it myself. Besides, he was busy staring at walls, plotting and scheming.

Lobster

Sergeant Nbeki was affectionately known as “Lobster” because he had once asked for it in a Mombassa café, being laughed at by his men. Dressed in drab green fatigues, he now kissed his wife and children goodbye, and drove his jeep around to Mawlini field from the Rifles married quarters. He checked again his kit as the dawn light fought its way in through the windows of his office. Ready, he checked his watch and stepped out to a dark blue herringbone sky, an emerging yellow glow to the east signalling the start of a crisp new day.

His team of seven men stood around their heavy rucksacks, weapons slung over shoulders, a last cigarette enjoyed before a long flight.

‘What did I do ... in the previous life ... to deserve you lot,’ Lobster grumbled.

‘You must have been a sinner, Sarge,’ a man joked as a bus pulled up, hissing to a stop.

The men boarded the bus, labouring with their heavy packs, heads counted. The count was not necessary, because Lobster knew every man from years of training and fighting together; he could feel their presence, not having to look for them. With Lobster perched in the open doorway, the bus trundled the short distance around to a waiting C130 Hercules, a whiff of aviation fumes and the roar of engines welcoming them. With one pack on their backs, one cradled in their arms, they walked up the loading ramp and into the rear of the plane, took up seats near their comrades, and adopted personalised routines for both passing the time, and dealing with uncomfortable rides in Hercules aircraft. Lobster adjusted his ear-defenders, reached into his backpack and pulled out a tatty booklet of puzzles. Safari: find twenty-five hidden animal names. He readied his pen.

Four hours later, they landed at a hot and dusty airstrip in sight of the Red Sea, the Saudi border just a few miles to the north of them.

Lugging their heavy kit, they claimed two waiting jeeps as Lobster found the command post, and his unit Captain.

‘Is this Angola?’ Lobster asked as he entered.

His Captain shook his head. ‘Lobster, you’re two thousand miles away from where you should be. Again.’ They attended a map with three other NCOs.

The Captain tapped their position on the map. ‘The Yemen Government forces have pulled right back, so as soon as you cross the line ... everyone is fair game. Drive to RV Alpha and leave the jeeps. After that it’s mountain goat country. You’re patrol route is along the border for twenty miles and back, seven days. Easy, my wife could do it.’

‘I’ve met your wife, sir,’ Lobster commented. ‘And with these heavy packs - I wish she was coming along.’

The men laughed, dismissed to their assignments. Lobster mounted up, craning his neck around to the other jeeps. When ready, he placed on his sunglasses and waved them forwards, four jeeps in the column. He loaded and cocked his weapon; this was now a live operation.

Two hours later, after snaking ever upwards through mountain passes, the air thinning, they found their mark on the map, a convenient sheltering overhung under which to leave the jeeps, the natural formation offering them plenty of cover for a defensive position. They scanned the immediate area with a keen eye, employed their binoculars for ten minutes, then settled for a sleep before nightfall.

Lobster opened his bag of tricks, pulling out a new device. He believed that it had been developed in the west, knowing nothing of autistic Kenya kids in Shanghai. He plugged in the battery on this green device, the size of a mobile phone, and placed in an earpiece. Stepping away from the jeeps and to the edge of a precipice, he switched on his new toy, two beeps signalling that it was working, a dial lighting up.

Pointing the device like a Geiger-counter, he slowly swung it around, the device bleeping faintly as it was pointed down the valley. He read the scale, the printed scale informing him that whoever was using a radio or phone on that particular bearing was many miles away. He turned around and aimed the device up the valley, the machine eliciting three separate bleeps on three separate, but close bearings. Estimated range: four miles.

Returning to his men, he switched the device off. ‘We have some trade northeast. Four miles out, three separate groups.’

His fellow sergeants scanned the map as they rested in the shade. 'Do we go to them, or are they coming to us?'

Lobster tapped the map. 'We'll get above that village and see who's about.'

At dusk, with the men rested and fed, they heaved on their heavy packs, checked weapons, put in their ear microphones, and placed one foot in front of the other. Three separate groups of four men set out into the cool night, a gap of fifty yards between them. Using night-sights and the new EM scanner, they were never in any danger of being surprised.

At a crossroads, two miles further up the hill, they left one team behind, that team now hiding itself in the rocks above the junction, and discovering a convenient cave. They would wait. Lobster led his team onward, leaning forwards to march with his heavy backpack. A mile short of the village he turned off the road and began climbing up a slope, followed by the second team a hundred yards behind. Nudging over a ridge, his sweat cooled by a stiff breeze, Lobster peered down at the distant village, a handful of dim house lights visible. Turning around, he signalled his men into the rocks, to hide their kit and to camouflage themselves.

As his second in command pulled level, Lobster scanned the village with his night-sight. 'No movement, some trucks,' he whispered. He lifted his new toy and switched it on, swinging it back and forth. 'Ten or more independent signals. Two strong signals, so they're in use, many low signals.'

'It's an active cell,' his comrade suggested. 'Too much chatter for a small village.'

'Time to see what they do when I show them Baby,' Lobster said with a grin. From his backpack he pulled out an EMP device, this one even smaller than the one he had employed in Venezuela. 'No one leaves Baby in the bag,' he joked, his second in command shaking his head. Lobster eased over the ridge to be away from his own equipment, made ready the throwaway device, and fired at the village below. Back in his original position, he switched on the EM scanner and found nothing. 'No TV tonight! No Baywatch!'

Pointing down the slope with an arm, Lobster said, 'See that outcrop and small ridge above the road? Take that position ready for the morning. Now that their radios don't work they'll go visit their relatives to talk.'

'Will the device stop their cars?'

'No, not unless close. It's only good to fuck up small radios.'

Lobster sat enjoying a tin of salty British Spam as the sunrise illuminated his lofty perch, the valley below still shrouded in darkness. He noticed movement in the village. Through his binoculars he could see two jeeps about to leave, the rear of the first containing four armed men. Reaching to his chest, he took hold of his radio control and depressed it three times quickly. Two seconds later he repeated the signal, his men getting ready.

Studying the terrain that the village access road followed through the valley, he figured that the villagers would receive the echo reports of any shots fired. He lifted his hand, talking into a microphone on his wrist. 'Team Two: get down to the road and use silencers and laser; you have five minutes. Get close to them.'

Now covered in camouflage netting, Lobster leant over a rock and observed Team Two break cover and scamper down the slope, kicking up dust before hiding behind rocks just five yards above the road. Weapons were adjusted, silencers fitted, a laser made ready. The soldier with the laser ran ten yards along the road and ducked between rocks, nestling under a bush.

To his left, Lobster could see the jeeps approaching, the drivers in no particular hurry. And their windows were open. His own team readied their sniper rifles to support their colleagues below.

The driver of the first jeep slowed a little as the gradient of the road increased - and he got the right gear. And at this early hour he was not wearing any sunglasses. The crosshairs of the laser followed the man's rugged features. As two faces became distinct, the sounds of the jeep engines growing, the laser operator fired twice, then immediately aimed at the men in the rear and fired, soon focusing on the driver of the third vehicle. And not a sound had been issued by the weapon. It took an additional two seconds for that man's face to come into view. The laser again silently discharged, robbing the man of a working retina.

The first jeep eased to a halt, much shouting coming from within, the driver and passenger soon stepping down and shaking their heads, a hand to their eyes. From the nearby rocks, delicate coughs bent them double, men in the back already slumping. Twenty rounds had been fired before the Pathfinders were up and running at their prey. At close range, they fired into each slumped fighter. It was all over.

Their radios came to life. 'Put the bodies in the jeeps, drive the jeeps down to the steep gorge we passed and push them over,' Lobster ordered. 'Earn your bloody breakfast!'

Lobster eased back and opened his water bottle, taking a swig. Glancing back toward the village, he could see another jeep being made ready and raised his binoculars. A DSHK fifty calibre anti-aircraft machinegun was being checked over. Reaching into his jacked pocket with some urgency, he grabbed his aircraft radio. 'Any bird near grid 112?' He waited. Nothing. 'Any bird near grid 112?'

'Ground 112, this is Mike-Whiskey-One-Niner, receiving.'

'Mike-Whiskey-One-Niner, I have trade; Duska on a jeep.'

'Ground 112, approaching from the southeast. Do you have visual?'

Lobster lifted his binoculars, eventually locating an angry Mi24 stalking his way. 'Mike-Whiskey-One-Niner, keep coming on that heading, two miles, village in your one-o'clock position. Building with red carpet hung out to dry, right side, Duska on jeep, over.'

Focused on the DSHK now, one hand on his radio and one supporting his binoculars, Lobster could hear the dull drone of the approaching helicopter. So could the DSHK operators. They reversed the jeep and threw a sand coloured cloth over it.

'Cheeky!' Lobster depressed his radio transit button. 'Mike-Whiskey-One-Niner, update on trade. Building, red carpet outside, east side of building, alley, Duska camouflaged, over.'

'Ground 112, roger. On attack run.'

The sound of the helicopter grew, resonating around the valley, soon the crackle of rocket fire, flashes on the ground visible before the explosions registered a few seconds later, echoing several times about the valley as if the hill themselves were growling at being disturbed this early.

Lobster waited for the smoke to clear, peering through his binoculars. The jeep was on fire, the building demolished. 'Mike-Whiskey-One-Niner, good hit, thanks, and good day.' He switched to his patrol radio. 'Get some food, some sleep. We move out at dusk.'

Returning to his tin of Spam, Lobster eased back against a rock and stared down the valley, sure that he could see a slither of the distant Red Sea through the morning haze.

I drove the girls to school, Big Paul now in the back because Lucy liked to sit up front and would not move for him when asked. It added a smile to the school run. Back in my office, I scanned post-it notes and email printouts, soon behind my computer and opening emails.

The basic design for the universal African village school had been agreed and several prototypes built, the UN keenly observing our progress. An image came attached to the email, and it showed a two-classroom schoolhouse appended by a two-storey building at one end. The ground floor of that domiciliary building was split between a police office and a Rescue Force office, the upstairs providing two small apartments. Since they offered two rooms and several beds each, I guessed that Rescue Force would double up with someone. Then I noticed an RF tent in the corner of an image. It seemed that the RF presence was not full-time.

I approved the design and agreed a modest fifty buildings, but in the DRC only.

The next email was from Jack at the house, simply a link to a website. I clicked the link and opened a news blog, soon reading about Caracas – and the horrific aftermath of the EMP.

Most of the modern fridges there had stopped, their contents spoiled, but not just in households. Food stocks in the supermarkets were spoiled as temperature controls failed. When people had finished the rapidly warming contents of their fridges, they ventured out on foot to find additional sustenance. Tins were OK, packets of dried products, but all dairy produce and frozen goods were ruined overnight. It did not help that shop tills were not working. In local abattoirs, the cooling systems cut out, the produce spoilt. Butchers soon closed shop.

The banks had been closed when the EMP struck, and none had opened in the morning, none of their electronics working; wages could not be paid, savings could not be drawn. The angry citizens of Caracas began throwing things at immobile police cars, and more mobile police officers. No radios or mobile phones worked, although a few landlines had come back to life.

The army had moved onto the streets in force, not pleasing the hungry citizens. Those citizens were all denied entry to their usual places of work since very little equipment was functioning. Those angry and hungry citizens had time on their hands, and leant over balconies complaining to their neighbours, or throwing things down at the police and soldiers below.

By the third day, hunger was an issue, rioting and looting a growing problem, soldiers having shot a few protestors. The government had brought in food and water from other cities, the army flying in radios that worked. The meagre supplies were not enough, the rioting grew, and people either walked or cycled out of Caracas, joining buses in nearby towns as they headed toward

relatives in other cities. With streetlights not working in the evenings, or any other lights, crime rose, and citizens took to shooting at dark shadows, soldiers returning fire.

By day six, the government had brought in enough food for those stubborn citizens that remained, although half the city had walked out. Cars and lorries from other areas moved into the city and a bus service re-started. Some old cars had continued to work after the EMP blast, but would not re-start once halted. People had no work to attend, no shops were open, no banks functioning, but they had a few buses with which to move around.

Seven days after the EMP strike, mains electricity had been restored to all, lights were on, landlines functioning in most places. But few air conditioners worked, unless they were older and simpler models. TVs and radios would have to be replaced, since they were now useless, as were mobile phones. And the cost was placed in the billions.

As I read the detail, I wondered how New Yorkers would cope with an EMP blast. A note at the bottom interestingly listed the loss of fridges as one of the main complaints of the residents of the city.

Under the cover of night, Lobster led his men out on what would be a long six-mile march around tight trails, stopping and checking for activity every few hundred yards. By the following dawn they were tired and hungry, finding a deep gorge to hide in. A man climbed up the gorge side to act as lookout as the remainder cooked a well-earned meal.

At dusk they moved out, rested and fed, and soon picking up radio chatter ahead. Moving across a gentle rise, through waist high bushes, they happened across a major gathering in the valley below. No lights were visible, but the radio detector was going crazy. The men dropped their packs and crawled forwards.

Through his night sight, Lobster could make out a hundred men, two-dozen jeeps, several DSHK, and two tanks under netting next to a compound. He lifted his aircraft radio. 'Any bird near grid one-one-four?'

'Ground 114, this is Romeo-Alpha,' came an American accent. 'What's your pleasure?'

'Rome-Alpha, I have principal trade, requesting a principal strike. We have a hundred soldiers, jeeps, tanks and Duska, over.'

'Ground 114, standby. Birds flocking together.'

A full six minutes later, the radio came back to life. 'Ground 114, this is Romeo-Alpha. How's the trade?'

‘Romeo-Alpha, trade is plentiful. I’m marking my position with a strobe light now. Standby.’ Lobster’s second in command set-up the signal, visible only from above. ‘Rome-Alpha, we are lit. I repeat, we are lit. Trade is eight hundred yards northeast, in the valley below. Approach from the southeast, along the valley. Tanks behind north wall of compound, Duska spread around, so reception could be warm, over.’

‘Ground 114, we’re three minutes out.’

From their raised position, Lobster and his men could soon hear a distant rumble, the growing sound of heavy helicopters. Observing the small army below, the Kenyans could now see men running around and hiding. The Duska made ready, but the tanks remained immobile.

Lobster raised his aircraft radio. ‘Ground 114 to all birds, Duska are ready for a warm welcome, tanks not moving. Duska are positioned on west of valley, main body of men in gully to rear of central compound, fifty yards beyond it. Tanks behind compound walls on east of valley, over.’

‘Standby,’ crackled back. ‘Ground 114, starshells, close your eyes.’

‘Starshells!’ Lobster shouted. ‘Close your eyes, look away.’

The first Mi24 roared in and fired a dozen airburst starshells, their formula designed by Jimmy. Night turned to day, night vision lost, men on the ground temporarily blinded as the flares drifted down. The night sky, behind the starshells, was now invisible to the men on the ground, who fired up at random. The First Mi24 banked east and turned, its colleagues opening up on the well-lit valley floor, aiming at the DSHK to the west, their priority targets.

The DSHK fired off at random, lines of red tracers streaking outward, soon pounded by airburst fragmentation rockets and ground detonating high explosives. The roar grew, helicopters and exploding ordnance, the west of the valley well and truly pounded as six Mi24s attacked in turn.

When night reclaimed the valley, Lobster and his men lifted up and peered down through their night sights. Lobster lifted his radio. ‘All birds, this is Ground 114. Duska to west have ceased firing, Duska on the east ridge is still working. Tanks are now moving. Fighters have RPGs, over.’

The Mi24s returned for a second strike, carpeting the valley with a rippling line of flashes. Missiles streaked towards the Duska, Lobster figuring that they were from an unseen Cobra. From behind him, Lobster could hear a swish and a roar as a missile flew

overhead, soon impacting a tank head-on. A second missile passed close overhead, destroying the second tank as rockets rained down on the fighters taking cover in the gully. A third pass, and the unseen helicopters turned for base.

‘Ground 114, damage assessment, over.’

‘Ground 114 to air boss. Two tanks destroyed, twelve jeeps, five mounted Duska, sixty soldiers. Out.’ He lifted up. ‘C’mon. Time to police-up the valley.’

Five hours later, Lobster could not find a living soul in the valley, and stood panting as the sun tried to put in an appearance. He pulled out his water bottle, took a giant gulp, and splashed his face, staring down at the lifeless remains of a hundred fighters. His second in command limped forwards, helping another man.

‘What happened?’ Lobster softly enquired, the energy gone from his voice.

‘Grenade thrown by a wounded man. Caught us both.’

From the opposite direction, another two men approached, one being helped along.

‘Broken ankle,’ the able-bodied man reported.

The final men approached from the north, all now bound with field dressings and limping along.

‘What a sorry bunch we are,’ Lobster let out, looking over his men. Shaking his head, he lifted his aircraft radio. ‘Ground 114 to any bird.’

‘Ground 114, with is Romeo-Ten. Copy, over.’

‘Romeo-Ten, Ground 114 needs med-evac, over.’

‘Ground 114, two Hueys inbound. How are the natives?’

‘Romeo-Ten, natives are all dead, over.’

Two minutes later, two green Hueys swept up the valley, flaring and setting down quickly, four soldiers bursting out of each and adopting covering positions. Lobster led his men forwards. Slowly. The helicopter crews picked up their backpacks from the hillside, Lobster soon stepping down at field headquarters, walking through a dust storm with his head down.

His Captain stepped up to him. ‘How are your men?’

‘Out of service, sir. They all picked up minor wounds when we cleared the valley.’

The two of them observed medics run forwards, helping the wounded men towards a surgical tent.

‘And the valley?’ the captain asked as they followed the men.

‘Two tanks destroyed, twenty jeeps, five or six Duska, and a hundred men killed, sir.’

‘A good tally,’ the captain commended. ‘Well done. Get cleaned up, write-up your report. If I don’t have it today - I’ll send my wife around to see you.’

“M” Group London, May, 2010.

The British elections had come and gone, and if you weren’t paying attention you could have missed it. Unlike US elections, the British elections were more of a debate between gentlemen, a rare cross word. Since the incumbent had served three terms already, and held a lead in the polls of twenty percent, the opposition Conservative Party did not put up much of a fight.

Attending this “M” Group meeting in London was, technically, the old British Prime Minister, since the Queen would not swear him in for a week or two yet. The only other change was the attendance of the Japanese Foreign Minister and his team. The man looked a bit bewildered, not least because he had received his briefing - his revelation of the future, two days earlier. That was enough to spoil anyone’s week. He now took in the faces as the existing leaders welcomed and jibed each other, simple gifts exchanged, our Japanese member feeling a bit like the new boy in school.

When the leaders had settled, Jimmy began with, ‘Welcome again to the “M” Group, and I hope that you all had a good ash-free flight – except the British Prime Minister who, despite driving here, is flying high enough with his election victory.’ The various leaders congratulated our new Prime Minister, who was still the old Prime Minister.

‘This will be my last term,’ the British Prime Minister announced. ‘After this term ... I’m retiring.’

‘And I’m sure that *no one* ... will be glad to see the back of you,’ Jimmy quipped, causing a few smiles. ‘Moving on, I would like to welcome the Japanese Foreign Minister and his team. As you are all aware, Japan is now part of the “M” Group, since they realised that some of the technology that I employ as a completed product is currently sat on their drawing boards. I have stolen some of their technology, technology that they would have developed in the years ahead.’ To the Japanese Minister he said, ‘And no – you won’t be

getting any compensation. To begin with, may I ask the Chinese and Russians how their negotiations are proceeding with Iran?’

The Russian Prime Minister, who used to be the President, and who would become the President again, began, ‘The Iranians have agreed to a deal. They will cooperate with us, and France, and will receive enriched uranium fuel rods.’

‘Well done, and thank you,’ Jimmy offered.

‘Will they honour that agreement?’ Ben Ares asked.

‘For many years more than they would have done otherwise,’ Jimmy explained. ‘They will return to their desire for a nuclear bomb around 2015.’

The Japanese asked, ‘Should we use the nuclear waste dump in Somalia?’

‘By all means,’ Jimmy encouraged. ‘It was designed with you all in mind. Somalia has the wide open spaces, you have the waste. Ship your waste across. And whilst we’re on waste, I’ve been working with the Russian Government for several years on cleaning up the numerous nuclear powered submarines left rotting along Russia’s Arctic coast. Russia may lay claim to that section of the Arctic, but at least it won’t glow in the dark now. Much of that waste has been transported to Somalia, much needed revenue for the Somali economy.’

‘Whilst on that topic, now may be a good time to discuss the advanced technology employed at the dumpsite. You see ... the waste is not just dumped. It’s opened up, and the rods are allowed to react with each other in a process that both captures the escaping radiation into the surrounding material, but also diminishes the residual radiation of the rods themselves. After 2025, no one will be digging them up to play with. Besides, they end up being buried under a million tonnes of rocks.’

‘OK, moving on, let’s talk about EMP weapons, and the defences against them -’

The Germans interrupted with, ‘We would like to protest their use in Venezuela.’ The French agreed, as did the Indians.

Jimmy took a moment. ‘Some lessons ... need to be learnt the hard way, and it was not a simple decision to take. First, the Venezuelan President wanted me dead, and we all know what’s at stake. If it’s a case of ... kill everyone in Venezuela to keep me going till 2025, then I would do so, and will do so in the future. I will never let anything stand between me ... and preparing mankind for 2025, so kindly keep that in mind. Second, it was necessary for

you all to see the damage. In just under seven years, Frankfurt will be hit by a powerful EMP.'

That woke up the French and Germans.

'The lesson was meant to be a very loud lesson, so that you all look at the dangers. Unless you're ready, future terrorists – and others – will wipe out your cities.'

'We're getting ready,' Chase put in. The Chinese, the Russians, the British and the Israelis echoed that.

Jimmy added, 'The German Government should cost-up the damage to Frankfurt, and plan accordingly.'

The Japanese asked if they would be targeted by an EMP. 'Yes,' Jimmy told them. 'Unless we change the way things go. Within seven years there will be a handheld device designed to interfere with aircraft controls, but those devices will contain a stored charge that can be scanned for. And whilst on EMP weapons, I made a number of miniature weapons available to our Israeli friends, and they successfully tested one at a Hezzbulah rally recently. The podium microphones stopped working, along with ten thousand mobile phones. And, as we speak, EMP weapons are being employed in Yemen to disrupt the communications of the fighters - with great effect.'

'And the outcome in Yemen?' Ben Ares asked.

'It will run out of oil soon, then water, then become a troublesome failed state, affecting that region. The UN should be nudged towards helping out.'

'Will their terror groups travel out?' Ben pressed.

'Only so far as Somalia, and those that do will not live long.'

'Is there a solution to Yemen?' Chase asked.

'Yes. Give them lots of money to sit around doing nothing, a kind of UN welfare. I won't be spending money on them.'

'You spent money on Somalia,' Chase countered.

'Somalia has a strategic use, and resources to pay their way. Yemen doesn't. If you want to help, knock yourself out. There's then the other fifty countries around the world in the same situation as them, many in Central America - if you're feeling generous, Mister President.'

He waited, Chase not pushing the matter. Jimmy glanced at his checklist. 'Next, the number of tourists visiting Africa from Europe has reached a plateau, so I will be laying on extra flights from Russia, as well as starting flights from Shanghai. I would like to see the Chinese Government encouraging safari tourism. It will be

subsidised. I will also be laying on extra flights from America, from Washington, Philadelphia, and also from Toronto in Canada.'

Jimmy checked his list. 'As an aside to that, does any nation wish to have any additional factories or mines in Africa?'

'Should we be involved there?' the Japanese asked.

'It's not a high tech area,' Jimmy pointed out. 'They need what you produced twenty years ago, not plasma TV screens. I would, however, appreciate any surplus or cheap radios, TVs, or computers. That goes for all of the developed nations here.'

'Are we not developed?' the Indians quipped.

'You, sir, are trying to send a man to the moon ... when you still can't send a man to the village.'

The Indians didn't seem to like that. 'You don't agree with our space programme?'

Jimmy took a moment. And time stopped. 'In the decades ahead, certain scientists will discover a way of reaching other worlds, worlds just like this one, but without rockets.'

The room erupted into a million questions, and a dozen conversations all at once. I was shocked as well, and glanced at Helen. It took a few minutes to settle everyone.

'You saying we don't need a space program?' Chase loudly complained.

'I'm saying ... that there is another way.'

The Chinese asked, 'In the future, is this method successfully used to explore other worlds?'

'It will be,' Jimmy answered, all of us again shocked. 'There will now be a one hour recess for people to ... digest this.' Jimmy led us out, the ramifications of this latest revelation being huge.

The money invested in space technology was astronomical, as were the tax dollars earmarked for future ventures. This altered the world in one sentence, but as we walked along the corridors of the conference centre we were using, I had to wonder how they'd justify scrapping their space programmes. Or if they would?

In a side room, we poured teas and coffees, soon cornered by the British Prime Minister.

'Jesus, Jimmy!'

'I didn't make the world, or the future. Don't shoot the messenger.'

The Prime Minister was shocked. 'Travel to other worlds! My God!'

Jimmy then made another revelation. 'When they programmed the time machine they got their sums wrong. They opened a portal to

what they thought was Canada, 1960. What they saw was definitely not Canada in 1960.'

'And they sent people through?' I asked.

'I've said as much as I intend to, for security reasons. It was necessary to get the idea out there, the idea that they don't need to waste money on expensive rockets.'

'They're going to think you're a fucking alien now!' I quipped.

'Well I'm not. I was born here, on boring old Earth,' Jimmy countered.

Shaking his head, the Prime Minister walked off, Chase striding in and sitting as we eased down. We blew our hot teas.

'Christ, Jimmy. Other worlds! NASA will join that long queue of people wanting to shoot you!'

'Which is why I keep a lot of things to myself,' Jimmy pointed out.

'The Space Shuttle retires soon,' Chase mentioned. 'How long before this news is out there?'

'2015, or thereabouts,' Jimmy explained. 'So delay spending what you can.'

'The next generation shuttle is already on the drawing board. It's budget will be discussed in Congress soon enough, and debated in the media!'

'Then you'd best start thinking of reasons not to go to Mars,' Jimmy told him.

'So this new technology,' Chase wondered out loud. 'It could get us to Mars?'

'No.'

'No?'

'But it will allow colonisation of other places. Besides that, I don't know that much about it.'

'Hah!' Chase said as he eased up. 'After this, no one Stateside will be believing in old mystics called Magestic, not that they do now.'

With Chase gone, we sipped our teas in silence for a minute.

I asked, 'Was it ... wise to get that out there now?'

'I had three reasons to bring forward the date,' Jimmy stated. 'One was to stop them wasting money on Mars. Otherwise, as we get towards 2025, they'll waste a fortune on technology that's no good against terrorists.'

'It'll turn the world on its head if this gets out,' Helen cautioned, and my wife seemed as nervous as I felt.

‘They all accept that someone invented the drug, and now it’s out there,’ Jimmy pointed out. ‘If you went back twenty years and showed someone an Apple iPad they wouldn’t think it witchcraft, they’d love it. Someday soon, a NASA scientist will theorise about something outlandish ... and people will accept it. The time machine that I made use of was on the drawing board in the 1960s. It got built, because after World War Three it was a hope – and no one gave a shit about consequences. And after the war, people worked for their supper, there were no wages. Scientists were cheap!’

‘I don’t think that’ll catch on with the modern day NASA staff,’ I firmly pointed.

Back in the meeting, the mood was odd, but not an unfriendly odd. Jimmy began, ‘I will not be discussing the other-worlds matter for some years, and you need to all maintain security – tight security. What I will say, is that scientists alive today, working at NASA, already have the ideas, and that those ideas have been there for decades. There is nothing magical ... about the technology.’

‘We develop it?’ Chase asked, seemingly pleased with that.

‘It ... is most likely to be developed after 2025, after a disaster, and as a desperate measure. Prior to that, the expense will not be justified, and some of the world’s *believers* will have issues with it, causing unrest. There would also be extreme issues about who may develop the technology, and control it for their own benefit. So I will say this: don’t waste your money looking for it, because there is a key piece missing that only I know of, something that you will never discover.’

‘How could that be?’ Chase argued. ‘We’re bound to figure it out.’

‘The key scientist, with the key information to make the breakthrough, is in my care. I will act as his guardian, so that no nation has overall control.’

‘We accept that,’ the Chinese and Russians put in. The rest were not so sure.

‘Ladies and gentlemen, I have been the guardian of a great deal information for a long time. The circumstances have not changed, whether it be an earthquake or a space craft.’

‘That is true,’ the British Prime Minister put in.

Chase then said an odd thing. ‘I would like the British Prime Minister to increase Mister Silo’s security, and the same for all other nations when he visits.’

Leaders exchanged looks.

Jimmy asked, ‘Touching. But is that to keep me safe, or in line?’

‘Safe of course,’ Chase insisted.

I was suspicious of Chase’s motives, but I could not put my finger on why. We spent an hour on EMP defences, all nations now having all of the relevant documents to hand, Jimmy explaining that he would fry their embassies around Africa at random, just to test them. France and Germany asked questions about Greece, and all nations made offers to help, large and small.

In the afternoon session, we got off things extraterrestrial, and more down to earth.

Chase banged a fist, but not hard. ‘You almost destroyed BNK!’

‘Did I?’ Jimmy questioned. ‘They bet the Euro to fall against the Dollar. That move could have just as easily gone against them from a number of other factors, such as European Central Bank intervention.’

‘That is correct,’ the Germans pointed out.

‘And the money you made?’ Chase pushed.

‘All diverted to Greece, the subject of the attack by BNK – who lied about Greek finances.’

‘A fair but painful lesson,’ the Chinese Premier put in, earning a look from Chase, the Japanese a little bewildered still.

‘And the US taxpayer loaned them money, it was not a gift,’ Jimmy pointed out. ‘I explained before: the worst excesses of your banks need to be curbed. If not by you, then by me.’

Chase sighed. ‘Are the banks where they should be?’

‘No, not even close,’ Jimmy replied, Chase looking exasperated.

‘Then we will, *again*, look at the matter,’ Chase reluctantly agreed.

‘And keep looking at the matter each and every year, because they have short memories,’ Jimmy suggested. ‘The British Prime Minister should also be aware that I will ... *bust up* certain British banks. I would, naturally, only be able to do that if they take large risks on directional trades. Perhaps the new Prime Minister could get through the honeymoon period quickly, and have a look at UK banks.’

‘We skipped the honeymoon in favour of a week with the Italian Prime Minister,’ the PM sarcastically stated. ‘After five honeymoons, four in office, I’ve grown cynical.’

After the session had broken for the day, the aides met for a chat whilst the leaders headed off to hotels and embassies. We were staying in the old apartment, Big Paul and his mates babysitting the place after checking at length for bugs. The formal evening meal turned out to be an informal meal at the Chinese restaurant in our

club, political aides and security attending the Indian restaurant. When the various leaders had finished their meal, they occupied three rooms, the aides scuttling back and forth, questions asked, comments made, ideas floated – or shot down.

Much of the talk was of the war in Yemen, the UN trying to broker a peace, not that either side wanted a peace. The fighters were disappearing quickly, but the Yemen populace were up in arms and rioting in the streets, protesting at their own government, as much about jobs and fuel costs as anything else. Jimmy and I spent time with the Japanese in turn, explaining the previous history of “M” Group meetings and procedures. What everyone really wanted to talk about, that of the concept of travel to other worlds, had been banned by Jimmy.

It was unfortunate timing that the Japanese had attended their first meeting at a time when Jimmy made probably his biggest revelation to date. They were still digesting it, and still seemed stunned by it, more so than time travel itself.

I cornered Chase. ‘So what’ll you do with NASA?’

‘As Jimmy is probably already aware, they have a top team looking at all things Silo. There’s still a great many that believe in time travel, so we’re spending some money on that, and they think the blood helps with long space journeys. Guess they’d have to rethink that. So they’ll not be that surprised by this latest news. Well, they’ll crap themselves, but then do the geek bit and go off and try and figure it all out.’

‘You think they’ll resist cuts?’

‘Not if they have another toy to play with,’ Chase suggested with a grin. ‘Besides, I’m the tax cutting President, so I’ll tag NASA onto my tax-cut list. Already got a few senators leaning that way, your Senator Pedersen amongst them.’

‘You’ll have to use Russian rockets to get to the space station,’ I pointed out. ‘A bit embarrassing for you.’

‘Yeah, well that was a NASA screw up. And the re-useable shuttle has cost more than if we used rockets. Fucking egg heads!’

‘Still, your use of Russian rockets is good for international relations,’ I said with a glint in my eye before walking off.

The morning session was mostly about Japan, and what it could do to cooperate and integrate with the others on “M” Group matters. The French, German and British Governments then signed deals with China to import electric cars and buses, but only a two-year deal. After that, we suspected, they would pinch the technology.

I had wondered about the German desire for electric cars, when they had such an important car export market of their own. Jimmy explained that people buying nine thousand pound electric cars were not in the same league as people buying twenty-five thousand pound BMWs and Mercedes. And Jimmy hinted that there would be a future BMW with an electric engine; a big, powerful, and show-off BMW with an environmentally friendly engine. Seemed wrong somehow.

The Russians had struck their own deal with China, a joint car plant or two already in progress. And America still showed no interest in the cars, despite the fact that other manufacturers electric cars were already available in the states.

We broke at 3pm and went our separate ways. On the coach, on the way back, Han had a question, a formal question, and it sparked a debate.

‘Will other worlds be colonised?’

‘Yes,’ Jimmy answered.

And the next question I expected.

‘By who ... will they be colonised?’ Han asked, everyone now keenly attentive.

Jimmy stated, ‘I would never share the key technology to open a portal ... until such time as we had a system of world government. But, in answer to your real question, it would be very difficult for any nation to benefit from moving back and forth through a portal. You could not move heavy equipment or large numbers of people, so what use is a colony? They may live happily elsewhere ... but why?’

‘To get away from this place,’ I said.

Jimmy turned to me. ‘That is one circumstance in which I would release the technology.’

‘Escape from here after a disaster,’ Jack noted. ‘How many people could go?’

‘Not many,’ Jimmy admitted.

Some very strange scenarios were fielded on the way home, Jimmy not adding much to the debate. He did, however, say that future travel to other worlds would not result in meeting aliens. That stopped us all dead, and caused even more wild speculation.

I greeted the girls, twice, because they were engrossed in a game on their computers. I then offered to cut the electricity, and they pretended they had missed us.

‘So,’ Shelly began. ‘How was the boring old “M” Group meeting?’

I wagged a warning finger; she was ten, going on thirty.

A long way off, a C130 Hercules landed back at Mawlini, Lobster stepping down with his heavy pack. Little was said by the tired men as a bus took them around to the armoury, weapons checked and handed back, spare ammo and specialist equipment handed in. When done, Lobster joined others in a jeep, driven around to the married quarters in silence. Lobster climbed the stairwell to the second floor, to his apartment, and knocked the door. His eldest daughter, eleven years old, opened up and welcomed him back. Lobster dumped his rucksack by the door and slumped down, unlacing one dusty boot whilst his daughter attended the other.

Barefoot, Lobster padded across the cool marble floor and into the kitchen, being hugged by his wife. A beer waited on the table. Lobster lifted it and sipped, moving through to the balcony and to a seat facing the base, the roar of distant aircraft disturbing his peace. He sipped his beer, sighed, and stared out across the desert towards the Rifles base. Ten minutes later he was dozing in the sun, his beer half finished, his wife used to the routine. Lobster's rucksack was already unpacked, his clothes in the washing machine.

A very British summer

British summers tended to consist of a great week in May, making everyone optimistic – especially the weather forecasters, followed by a typically damp July and August, rain keeping the foreign tourists miserable – and in museums and castles instead of on the beaches.

With the next seven days forecast to be good, I took the family up to the castle in Scotland. We had to share its facilities with two-dozen RF staff that acted both as extra security, and great babysitters. The girls didn't really need babysitting, they were generally more sensible than me, but it was nice to have people around to keep an eye on them.

Shelly had picked up the chunky RF manual on basic training and read the whole thing in a day, soon asking intelligent questions of the medics. And they never tired of answering them.

With the water warmish - if you had a wetsuit, and calm enough, we took Shelly out in a zodiac when the dolphins were spotted. She

donned her goggles and sat waiting for fifteen minutes. When the dolphins were finally spotted we moved into the path of the pod and waited, Shelly judging the entry time. She dived in and disappeared, coming up for air next to a dolphin, the two of them seemingly swimming in tandem. We caught some of the action on video, but she was never on the surface long. When she got too far away we went after her and I had to impose a time limit, or she would have followed them out to sea, never to be seen again.

Back aboard, our little dolphin was shivering, despite the wetsuit, and we towelled her down on the way back, listening to her describe the pod from her human-fishes-eye view.

The weather held, and we enjoyed five good days, Shelly having jeep-driving lessons, the seat moved forwards and a cushion provided. Still, she got the hang of it - eventually, and RF could pay for the damage to various fences and cars.

September saw a return to our hotel in Canada, a group holiday, the weather more predictable here. We fished, we canoed, and we ignored the outside world, little talk of work or “M” Group matters. I would sometimes sneak away from Helen and use my iPad to check reports, not wanting to spoil the holiday with talk of work, but I missed my reports.

The UN were up in arms about the conflict in Yemen, that was now a former conflict in Yemen. The death toll amongst the hill fighters was high, many villages without their men folk, only young boys and old men left. The Somali Rifles had behaved like Somalis, and been thorough. Still, no new fighters would be coming out of the hills for a while. A few dozen al-Qa’eda operatives had been captured and “questioned”, leading to further arrests.

No new attacks had taken place in Somalia, no al-Qa’eda attacks for many months. Many Arab fighters had travelled to Yemen to volunteer their services for the cause, and had all been killed – a satisfactory outcome. Since the Somalis were Muslim, and defending themselves, I had to puzzle what their “cause” was. The Yemen conflict was now a memory, northern Somalia quiet.

Before leaving Canada we dropped in on their RF unit, based west of Toronto, and met the troops, some of whom were rotating back down to Haiti. They gave me an update.

‘Your people started to bulldoze houses, whether the owners liked it or not. People complained at first, but then they got their homes rebuilt for free and moved back in. And the new houses were made out of proper concrete, stuff that won’t crumble in a quake. They also made sloping supports in corners for extra strength.

‘Where the homeowners were dead they built two storey apartment blocks, and placed needy families inside. There are a hundred gangs of builders, and they pull down a house in a few days, and put another one up in ten days. There’s got to be a couple of thousand new houses back up; streets are clean, tented cities are disappearing. Outside of Port-au-Prince, your people are building apartment blocks with hundreds of rooms in. And the orphanage north east of the city? That has thirty thousand kids in, some with parents alive – but no money. I reckon that in two years it’ll all be done.’

‘What’s the crime rate like?’ I asked.

The man gave me a look. ‘Robbers are shot dead on sight, UN not happy. Your people built a big prison out of town, that’s got ten thousand in it already. Police and soldiers on every street corner.’

‘They’re not short of people, they’re short of hope. So we remove the bad people, and nurture the good people.’

‘Got no argument from me,’ the man offered. ‘My father worked in the Congo before you got there. He could tell you a thing or two about what it used to be like. If a girl was gang-raped, the attackers might be made to give her father a chicken or two. Now they’d hang them all. He’s eighty now, my father, and we took a safari down there. When we landed at Goma hub he thought it was Nairobi. For the first day he checked the map a lot.’

‘Progress,’ I quipped.

Gold

Our region of the DRC produced a great deal of gold, and we had made a great deal of money by selling it. Jimmy now ordered that our bank keep a reserve, a large reserve. Fort Knox was built near Gotham City, above it a new glass office block for the bank. This would be its third move.

I flew down with my team in October. From my room at the hotel I peered out at two distant glass towers, the second being the handiwork of Marko and Yuri. Their new nightclub was on the twentieth floor, and named “Club Twenty” for obvious reasons. That evening, over a meal, Yuri then informed me that it was named after a place in Malta called Club 22, which occupied the twenty-second floor of a tower block. I guess it was a Russian thing.

Later that evening, he showed me around the club, the establishment closed to the public on a Monday. His new offices were situated below, along with the offices of many Russian companies involved in the region. Seemed like they all wanted to stick together.

In the morning I viewed the vaults at our bank, steel doors two feet thick guarding the numerous stacks of gold ingots. In a separate room ran parallel rows of shelves, and on them rested blue velvet bags of uncut diamonds, also kept off the market to keep prices stable. Taking the lift up, I found offices for five hundred people, all busily occupied.

Our bank now offered close to a hundred convenient branch offices in the region, an additional sixty spread around Africa. Inside our region they acted as wage distributors. Cash would be dispatched from the vaults below, all dollars, and to the various town branches. There, mine managers would draw the cash and pay their staff, typically cash-in-hand at the end of a working week, few of the locals making use of a bank account. Once spent in local shops – and bars, the dollars would wind up back with the bank and the process would start over again.

Doing business here, for the mines, was now straightforward, and cheap and efficient international money transfers were facilitated. Foreign workers, and those locals with a few dollars to hold, had accounts at the bank and made good use of them. We even offered a good rate of interest for deposits.

Having met the bank bosses, and many of their staff, my security detail whisked me around to the new cooperation group building. It was just about complete, and recruitment was advancing at a pace. The nearby gym was finished and in use, a new row of restaurants being sampled by locals, the newly laid avenues being earnestly cleaned today by a small army of locals.

I accepted a yellow hard hat and followed in the chief architect, otherwise known as Rolf. ‘You wangled a trip down here. Are we paying for that?’

‘I designed the damn thing.’

He led me inside, through the main glass doors and to a reception area that reminded me of the UN building in New York. This foyer did, however, have airport style security. Past reception, Rolf pointed out two large staff canteens. And by “staff” he meant the workers, not the political appointees. We took the stairs up five flights and to the roof, finding workers tending soil and bedding plants. Shelly would be happy.

Facing the centre of the vast building, it reminded me of the American Pentagon from the point of view of basic shape, the staggered levels reminding me of Po's hotel. Below us, five sections of five storeys sat facing each other, but each advancing storey was smaller than the one below, creating a pyramid effect. Someone on the top balcony could see five balconies below, and if they were drunk and fell over they'd only hit the balcony below.

Rolf pointed down. 'The centre will have a pond and benches. There are five sets of lifts, five sets of stairs. The ground floor offices, below us, have been set aside for the maintenance staff and building stores, the rest are all up for grabs. Up here, you can walk all the way around, as you can on each floor. Bit of a walk though, you might want golf carts.'

'Fuck 'em. They can work some weight off.'

'There are small canteens in each section, one for each twenty offices. There are two formal restaurants inside, on floor below us, and toilets for every ten offices, showers on each floor. And all the principal offices are en suite, thirty of them. There's a video conferencing centre, a press centre, a crèche.'

'A crèche?'

'All mod cons,' Rolf commented. 'Electric car and parking place for most workers, chargers set-up ready.'

'There'll be a free bus service as well,' I put in. 'Just need to find some warm bodies to put in the place.'

'Space for three or four thousand people easily,' Rolf noted. He led me back down.

'Many of the staff who're now over at Forward Base will come here, plus others from some of the offices dotted around here.'

Jimmy joined me the next day, and the hard work and horse-trading began. The leaders from all of the cooperation group countries arrived, occupying the conference centre. They had all been made aware of the new posts that were available, had been asked to suggest candidates – those people not currently gainfully employed elsewhere, and would have a chance to vote.

The first post was that of cooperation group chairman, a top political job that rotated every two years. Jimmy nominated the popular former Prime Minister of Ghana, and the group voted him in. His office would be the first to be completed. I hoped the plumbing worked.

Next came candidates for the post of Agriculture Minister. Each of five men gave a short speech, a man from Kenya voted in. He was followed by the nominations for Minister of Women's Rights who,

quite rightly, would be a lady. Five female candidates loudly lectured the assembled men, fingers wagged, a loud lady from Kinshasa voted in. The post for Economic Development Minister went to one of ours from Forward Base. Following him came a Minister for Technological Development, his job to get the Internet working around Africa. He was followed a Minister for Hospitals. That post was not the same as the Minister for Health, which was more about village health.

They voted a Zambian man into the post of Minister for Roads and Railways, and another Kenyan for the important Defence Minister position. I thought Ngomo or Abdi might want that job, but neither applied. The Foreign Minister, the face of Central Africa to the world, was a half-caste New Yorker that had been born in Liberia. He'd carry the flag abroad.

After lunch, they voted on junior positions, everything down to waste disposal, recycling, water reclamation, hydroelectric projects, farming, orphanages and tourism. By the end of the day, some sixty people had been hired, due to take up office as soon as they had a suitable office to take up, and some furniture to sit on. Many would use offices around Gotham City for now.

One Minister asked if he could hire his wife as a secretary. Jimmy offered to have him shot, and no one else asked about employing relatives. What the Ministers did not yet realise was that we had hired two hundred European administrators, and that they would be rotated every once in a while. We had also hired a firm of Swiss accountants to check the books, and Germans to run the building. There would be no corruption or theft.

That evening, all of the new employees met again at conference centre. Jimmy took to the podium and welcomed them all, and gave some pointers for projects, the detail of which would be expanded upon. He then laid down the law.

Salaries would be paid by us, directly into an account in our bank. Expenses were claimed through the Swiss, in writing. Anyone fiddling their expenses would be taken out and shot. People laughed, but could not tell if he was being serious. Men that touched their secretaries would be dismissed, men that had sex with their staff would be sacked, men that abused their positions would be sacked. People who accepted bribes would be imprisoned.

'Any questions?' he finished with, his audience silent, sat wide-eyed. 'You're in the job ... to set the standards, to lead by example, to refine the image of Africa. If you get caught with your hand in the till - I'll cut that hand off. If you do a good job, it's a good wage for

life. For the first year you can claim half of your rent for living here. You could also apply for a mortgage to buy a property here. You'll all have an electric car and a driver/bodyguard, a former member of the Rifles. You may use your own cars, but you must use the bodyguard we assign you. That guard will live with you if you have a large enough house.

'Your medical bills are all paid if you use our hospitals, dental bills are covered. You'll get twenty days a year paid holidays, and all travel costs are covered. You may stay at our hotels and safari lodges free of charge for visits. You may not live in such places.

'Now, your first task will be to make contact with your opposite numbers in each government department of the countries involved. So the new Minister for Farming would meet each Agriculture Minister in each country to find out what they're working on. Your job is then to see how cooperation between the countries can improve what they're doing, to bring us problems and requests, and we'll then see if we can help.

'Always keep in mind that if we buy in bulk, and work pan-African deals, then we can get better deals and better prices. It's also about distribution. Some countries have plenty of oil, some have none – but they may have farmland or mines. It's about ... spreading the resources evenly around, whilst not seeming to be a communist state. We're not in the business of telling African politicians to do things. We talk, we listen, we ask, and we persuade.'

We spoke to many of the new appointees individually as champagne was offered, and I figured that I would have a lot to say to them all; these people would now tackle much of what I had been tackling from my office. I could see that I would be a regular visitor to the new building.

A week later, with the offices finished, the plumbing working, furniture to sit on, the new Ministers moved in. Joining them was a European Union delegation, an American mission, plus Russian and Chinese liaisons. Jimmy had said to hold back many offices, since others would wish to take-up residence in the future. The African League was not allowed in, nor OPEC.

A block of sixty offices had been taken up by our corporation staff, and Kimballa had grabbed ten offices. This was, after all, his country. Pan-African Counter Terrorism gained an office and a new political liaison, the Rifles would have an office, as would our police force. Old offices around Gotham City would now be made use of by others, Forward Base seeing a re-shuffle of office space, some given over to the Congo Rifles and Rescue Force.

During the flight back, Jimmy explained that I would need to re-organise my involvement in the region and its projects; these new appointees were now tasked with much of that work, and they would have their own ideas. I was a little deflated by the suggestion, but Jimmy pointed out that it was both my idea to start the virtual government, and that it would have happened this way in time.

Busman's holiday

Back in the UK, Jimmy came up to the office two days later and we advanced through many of my current projects, assigning most of them to the new ministers, the relevant files sent down to the new building, which had already attracted the title of Goma Pentagon. My desk was soon looking tidy – I could see the wood, and I was concerned. It was almost as if I was out of a job, and it was my own dumb idea that had caused this. A week into the new pan-African government I had handed over just about all of my projects, and was now relegated to checking up on their work. Reports and requests started to come in and I either agreed, denied or simply commented.

It was the kind of transformation from manager to chairman, and I now ran my eye across reports and initialled them, but did not get into the detail. In some ways it was similar work, but I had less to do, getting home early most days or popping down to the house for lunch. The finances of CAR and the corporation were still under my control, so I had, in effect, become the Finance Minister for the cooperation group.

But the first time I made a half-hearted comment to Jimmy that I had more free time, he gave me a dozen new projects, including the electric cars and busses. I was duly tasked with getting them into every country in the world. Oh, I thought. Was that all? Have that done before lunch. But now, instead of just spending money to solve problems, I had to persuade people, a novel approach for me.

I started with the Club Med countries, delivering samples of the electric buses to cities in Spain and Portugal, demonstrating them to local council officials, and listing their benefits. The buses green credentials were clear for everyone to see, and the cost savings were huge. Still, people sat in them, stared at them, read the literature and said they would get back to me. My sales skills were lacking somehow, and I had to puzzle the lack of immediate take-up.

Not to be disheartened by it, I bought controlling shares in a bus company based in Malaga, ordering fifty buses from China using a loan for the company supplied by our bank. We trained the drivers, which took an hour, set-up the charging stations at several motorway service stations along the Costa del Sol, and rolled out the stock, subsidising the tickets. I allowed all students and pensioners to travel free for three months, and by the end of the first week the local Spanish were visiting relatives along the coast in their thousands. Tourists took journeys up and down the coast, day trips from their hotels, and we pinched airport transfer business.

My greatest triumph that month was a tie-up with a major tour operator. They had thousands of coaches that journeyed back and forth between airports and hotels. Pale Brits would be picked up at the airport, sunburnt Brits would be dropped back a week later. Given the subsidies available to buy the coaches, and the extremely low running costs, they grabbed as many as they could afford. And when they could afford no more I offered them coaches on lease at great rates, practically giving them away.

Flying back from a meeting with them in Palma, Majorca, I tallied my figures and realised that I might soon total twenty-two thousand coaches around the Club Med countries. Back in the UK, I moved directly to the other tour operators and pointed out that they were now greatly disadvantaged by their competitors. I held four meetings, and secured deals for another twenty thousand coaches, the first of which would run from the UK down to Spain.

At that point Jimmy stopped me, and asked that I get European coachbuilders involved, a change of tactic caused by political pressure. I approached a German company, and they were keen to talk, they even had a few new designs already on the drawing board. I furnished them with the specifications of the large coach battery and its electric engine, and they were sure that they could build a chassis for it easily enough. I ordered four batteries and four engines from China, free for this coachbuilder to experiment with, and left them to design a European coach that housed a Chinese battery, whilst helping to protect European jobs.

This was my first indication of problems to come. The various European governments all sung the praises of electric vehicles, but also wanted to safeguard the jobs of their workers. In the UK, I took the indirect approach, and decided that our PM could fuck right off. I bought a controlling stake in a coach company, imported a dozen coaches and ran them along motorway routes free of charge, seats reserved online, first come first served. It caused a storm of interest,

then a storm of protest from the main coach carrier. I invited that carrier to my office and made it simple.

‘You can adopt electric coaches, and I’ll help, or I’ll take all of your routes. Have a biscuit with your tea.’

They collectively swallowed, then agreed to meet my very pleasant demands. They contacted their British coachbuilder and we worked a deal similar to that with the Germans. In the meantime, I altered the ticketing rules for the free buses to pensioners only.

In South Africa, everyone had been impressed with our electric coaches during the World Cup. I sent the South African Government a letter and they responded positively, interested in rural and long distance routes. Being the politically correct individual I now was, I suggested that their own coachbuilders make the buses, and that we would lease them the batteries and engines. They readily agreed, and the first batch of fifty units arrived in November.

Meanwhile, a Canadian carrier contacted me and expressed an interest. The first ten units were shipped over to Toronto, their target being the long distance routes - those that used the greatest fuel and showed the greatest cost savings overall. Our coaches could top six hundred miles on a charge.

Bracketing the States, my next client was Mexico. The authorities in Mexico City had bought twenty coaches in October, and had been running them around the city for a month. Their report was interesting, stating that the weary commuters of their city noticed no difference, but when asked - thought the coaches quieter and smoother. Those same commuters had been amazed, when told by officials taking a survey, that the bus was electric. It had made the news, and Mexico ordered over a hundred coaches, their coachbuilders taking delivery of more than five hundred battery units.

As Christmas approached, Jimmy asked me to tackle certain countries, and senior coach salesman Paul Holton turned back towards Europe, to Eastern Europe. I placed batches of ten coaches on trial in Latvia, Estonia, Lithuania and Poland. They were left to be experimented upon by the various coach companies. But it soon became apparent that what most nations desired were the hard to reproduce batteries, and it became a matter of the sale of batteries, not coach bodies.

Jimmy then took the world forwards with one giant lurch, at least he would for certain countries. A scooter appeared at the house one day, an electric scooter. I placed on a helmet, turned it on, pushed

off and accelerated. It had been a while. The dogs were soon barking at me as I whizzed, very quietly, around the grounds.

Back at the front of the house, Jimmy explained. 'They cost fuck all, and go five hundred miles on a charge.'

'Italy!' I said. 'Bella, bella, jump on my scooter!'

Taking Helen for a romantic break, security in tow, we flew down to Rome, a batch of fifty scooters waiting for us. With much fanfare, and the Italian Prime Minister presiding, we issued the keys to students who had both applied for them, and won their tickets in a lottery, finally paying for them. We cut a red tape and the scooters shot off, very quietly.

To Italian TV, I explained, 'They cost three thousand Euros, and you can travel for five hundred miles on one charge. That charge costs no more than ten Euros, and many colleges will offer it free.'

The whole of Italy was staring at my TV image. Not to be politically incorrect, I agreed that the scooters be imported only by licensed scooter manufacturers and re-sellers. After all, we had enough problems without the Italian mafia after us.

Helen and I enjoyed our December break in Rome, and by time I returned home the Italian public had ordered some thirty thousand scooters. But Shelly had met us at Cardiff airport, and was being nice. We suspected that she had broken something. At the house, Jimmy barked at Shelly, who confessed to pinching the electric scooter from the garage, and riding it so fast she lost control and ended up in the lake. Jimmy gave her a bucket and cloth and told her to clean the cars, Helen letting our daughter know just how unhappy she was; young girls and fast scooters did not mix. That and the fact that our daughter drove like an Italian!

After a damp Christmas at the house, New Year saw us fly down to Barbados. We whiled away a great deal of time on Pebbles Beach, which had no pebbles at all - just lots of brilliant white sand. We scuba-dived off the beach with our girls, viewing a few contemporary wooden wrecks - the oldest no more than forty years old, then joined boat diving trips to the reefs. Both of our girls were competent divers, fearless under the water, and thought nothing of taking off masks and adjusting them, or even swimming without them.

With our boat anchored near a reef, Shelly placed on her small goggles and dived in, astonishing divers on the reef below by swimming past them at speed in her dolphin style, staying down for four minutes or more at a time. When friendly instructors saw her they would offer her their reserve regulators, and she would tag

along for a few minutes, buddy breathing. She was as much of a curiosity as the colourful fish and slow moving turtles.

Tall now, up to my shoulder, she was towering over the other girls in her class - as Jimmy said she would. Lucy was also tall for her age, and we quietly hoped that their surge in height would soon slow down. We did not want a pair of six-foot daughters!

Shelly's height, her looks and budding curves, had started to attract boys in the years above her. She was, apparently, very popular, but showed little interest in boys as she neared eleven. So we were surprised when she appeared hand in hand with an American lad on holiday, a thirteen-year-old lad.

I had no idea what to say. 'Got a job, son?' I asked, Helen shooting me a look.

He frowned at me. 'I'm in school, sir.'

His parents were at our hotel and he dragged them over, the couple a bit surprised to see just who their boy was dating. They joined us for a drink as the young couple wandered off. The kids didn't need a chaperone, they had two tall Barbados police officers in tow. Armed officers. I asked the father, Steve, what he did.

'Realtor.'

'That's an estate agent in England,' I pointed out.

'Palm beach,' he added.

'Bit of a busman's holiday?'

'Busman's ... what?'

'It's a saying. Like a coal miner having a holiday in a mine shaft.'

'Ah. Well, Palm Beach is a lot like this place. You got the sun and the sand.'

'So why the trip here?' I asked.

'We're just about to buy a small place here, apartment block, six apartments. We'll then let them out to the tourist trade.'

Jimmy clambered out of the pool with Lucy and walked over, our guests a bit shocked. Jimmy had that effect. With tracksuit now on, Jimmy joined us, greeting the couple. Lucy sat on his knee and scanned the strange faces.

'Got more than just the one lad?' I asked. 'We're trying to marry-off Lucy.'

'Dad!'

'No, just the one,' the father answered.

They joined us for the evening meal, our daughters and their lad sharing a table with Big Paul, who was at their level. Well, what kids wanted to eat with their boring old parents? The next day, and those that followed, Big Paul acted as chaperone, which worried us,

and we only saw the kids at breakfast and evening meal. It wasn't a bad deal, it gave us some peace, but we grilled Big Paul each evening to see what they had been up to.

Eating out, at the Ship Inn, St. Lawrence Gap, we made ready for New Year's Eve, many of the locals out. Our daughters danced between tall locals, Shelly with her new boyfriend, Lucy with another girl of her age that she had befriended. I tried to keep an eye on them, but received Helen's elbow a few times. After all, there were twelve plain-clothes police officers on hand, the building surrounded.

After ringing in the New Year, we walked as a group along the main tourist trap of bars and restaurants, chatting to locals and tourists alike. Back at our hotel, we all joined the ongoing party. At 2am I found myself with Jimmy, sitting on the hotel's beach beds, beers in hand and facing the black ocean.

'They're growing up fast,' I reflected, glancing up at the stars.

'Got to let go at some point.'

I sighed. 'Was hoping not to.'

'I had a kid.'

I took a moment. 'The girl in Canada?'

'No, the daughter of a lady doctor in Africa. An ... accident.'

'What happened to her?'

'Don't know. I ... left her behind.'

'Does it bother you?' I risked.

'It surprises me that it doesn't bother me more. I think ... I've seen too much death. I sometimes think that I should care more, other times I think I care too much. It's the dance -'

'You and your other self,' I finished off. 'When to fight, and when to be kind. I learnt with the electric cars ... that there are many ways to achieve your aims, the first and obvious one not being the best way. If it was a planet of androids it would be different, but we have to pander to the human condition, to play politics, to make people think that the idea was theirs.'

'You're learning.'

'And sometimes you just need to shoot someone,' I put in. 'Talk won't do it.'

'I once had someone tell me ... that the people should make their own choices. They'd make mistakes, but they would be their mistakes, and that I shouldn't interfere.'

'So what did you do?'

'I shot him.'

We both laughed. 'It does cut a long conversation short,' I noted.

‘You know, if they ever built a time machine – I mean again – they’d never agree on who to send through, or what that individual’s remit would be. That’s why I made the choice. Right or wrong, it was my choice.’ He sighed. ‘But, given what’s going to happen, I couldn’t make it any worse.’

‘You mentioned before, that if you fixed it – you’d go?’

‘Yes,’ he reflected with a sigh. ‘Back to where I came from.’

‘That place doesn’t sound like a barrel of laughs,’ I nudged.

‘No, but the fight there isn’t finished. I have ... unfinished business.’

I puzzled that in my drunken state, Lucy stepping up and sitting on me. ‘God you’re heavy. You’re not three years old anymore, young lady.’

She faced Jimmy. ‘Why do they say that you’re dangerous?’

‘To some people ... I am dangerous,’ Jimmy told her. ‘In Africa, girls of your age are attacked by grown men, and I ask the police and soldiers to kill them. Many people don’t think that’s right.’

‘Why?’ she innocently asked.

‘In England, if a man commits a crime, the police investigate, arrest him, and he has a solicitor and a fair trial. In many countries that’s not possible, because there are no police, or the police will accept money, or because the culture is different. In Africa, there’s not much law, so you have to be hard with people. You remember Karl?’

‘Yes.’

‘He was killed by a man shooting at your father. I found the man who tried to kill your father, and I was not very nice to him. That’s why people are afraid of me.’

‘But you don’t hurt good people,’ my daughter protested.

‘No, I don’t hurt good people,’ Jimmy agreed. ‘Not if I can help it.’

‘Why don’t you have children?’ she asked.

‘I’m still practising,’ Jimmy told her before she walked off, deep in thought.

We rejoined the group half an hour later, in need of fresh beers, Helen giving me an odd look. At the bar she closed in on me.

‘The lad’s mother asked me why Jimmy was not married. Lucy was right there, and told the woman that he was still practising!’

I laughed.

‘I’ve never been so embarrassed. Good job were leaving tomorrow.’

In the morning, Shelly gave the lad her Facebook details, making me feel ancient. At that age I could just about write. Heavily tanned, we boarded the flight and headed back, a new year and a few new challenges ahead. My mind was on electric buses, but Jimmy had a directive for me. He wanted me to link-up a group of principal towns around Gotham City, and develop them. The two farthest towns were two hundred miles apart. In British terms, that was coast to coast. In DRC terms, that was a bus ride to the next town.

January, 2011

With the estate covered in snow, Jimmy handed me a file detailing a desalination plant in Jordan. It was nearing completion, would be oil powered, and I needed to divert my plastic bottles towards it. The Jordanian authorities had readily agreed to a number of experimental desalination plants near Aqaba. Some utilised plastic pipes, others consisted of glass sheets, some were powered by solar panels, and a large facility was being constructed from our osmosis rocks. That facility would be thirty yards across and nine hundred yards long in its first phase.

Jimmy had upset the Israelis by supplying subsidised oil to the Jordanians, the oil destined for this specific project. When they used typically Israeli diplomatic language, Jimmy suggested that they build their own plant; he'd supply them oil, and I'd supply plastic containers. They accepted the deal, which surprised me. It was like my two girls: don't give one without the other. Fact was, Jimmy was happy that the Israelis wanted a new plant, and I guessed that he gave the Jordanians one first to piss off Ben Ares, the process of appeasement being important in Israeli politics.

Yemen would also be receiving a new desalination plant, paid for by the Saudis in a move to try and calm the country. Since the end of hostilities, the one-sided hostility of the Somali Rifles towards the hill fighters, the Saudis were being helpful to Yemen, throwing a little money at the problem. And Prince Ali Bin Something had met with an accident. So much for his injection of the blood.

I had just sorted out plastic bottles for Jordan when Jimmy handed me a sheet of figures.

'The Chinese have paid us our cut of the electric cars, the drug, the Zanzibar oilfield, and some other stuff. The Russians have paid

me for a few things they owed on, and Chase has invested more money from his health savings. I've also diverted all CAR income for a year to expand the regional production.'

'Couple of quid in the kitty,' I noted.

'And I just worked a deal with Kimballa, a five year tax break.'

'Huh?' I puzzled.

'For the next five years we'll keep all the tax earned in the DRC, plus his cut of the profits. He's got enough money to last forever, so we'll use it to grow the region. Bottom line is what you can spend in the next twelve months.'

'Looks like a hundred and seventy-five billion pounds,' I queried.

'Yep. So spend it.'

I stared at him. 'Spend all that lot? On what, for fuck's sake?'

'On developing the region. Technically, we should allocate it to the Ministers in Goma, but that would be no fun for you. Besides, they'd be tempted to waste it. I'm off to China, Hong Kong and Tokyo for two weeks, so have fun.'

'You taking my wife?' I asked as he headed towards the door.

'No, so get her involved with the spending. Women like to shop.'

With Jimmy gone, I called an "M" Group meeting the next day, Han absent. 'OK. I have some money to spend on African development, but I'm also trying to be politically correct. I want each of you to contact your governments and ask them if there's anything that you think you should be selling to us. In particular, ask about old military equipment or civil aircraft. To start the ball rolling, Michelle, I want twenty Airbus A320s, so let your President announce it – whilst making it appear that he worked the deal.'

Everyone laughed.

'Keely, I want four new 747s, so let Chase know. And can you get me an up-to-date list of second hand kit, like Hueys. OK, does anyone have any immediate items they think they want to sell us?'

'Do you want a few Nimrod aircraft?' Jack asked.

'No, they're crap.'

'Why do you think I offered them!' Jack quipped.

A day later, Keely handed me a printout, a long list of military hardware that had seen better days. With him sat opposite me, I read down the list.

'OK, twenty Hueys for Somalia, plus all the usual spares. Two Hercules for Somalia, Kenya has enough. Ah, A10 Warthogs!'

'Ground attack aircraft, anti-tank,' Keely put in.

'I want ten for Somalia, ten for Kenya, spares, technicians and training.'

Keely made a note.

‘F15s? You’ll sell us F15s?’

‘Sure, they’re export models. Lots of them out there.’

‘Excellent. I want ten for Kenya, ten for Forward Base. Let’s not give them to Somalia yet.’ I read down the list. ‘A destroyer?’

‘Got a heap of small destroyers going cheap,’ Keely encouraged.

‘They are cheap. Do they work?’ I challenged.

‘They’re good for ten or twenty years, but the electronics are cold war era.’

‘I’ll take five of them at these prices, but we’ll need instructors.’

‘Got them, no problem.’

‘Then I’ll give two to Kenya, three to Somalia, and we can patrol the Horn and the Straits for the next ten years.’ I read on, a finger on the items. ‘81mm mortars, I’ll take the three hundred tubes you have listed, and the ammo. Rest I’ll think about.’

‘Got some short range radars that could be useful,’ salesman Keely nudged. ‘Shore based, they can spot aircraft and ships.’ He pointed them out, the units coded.

‘Range?’

‘A good thirty miles each. And ... they’re mobile.’

I made a face. ‘I’ll take twenty units, spares and instructors.’

‘You’ll need decent radios, long distance, so the operators can report back. There’re fifty listed.’

I nodded my agreement. With Keely gone, I sent the news of the deliveries to our Defence Minister, his job to relay it to the various parties. He emailed me back, Tanzania asking about warships. They offered to go fifty-fifty, Keely adding three additional destroyers to the list.

Thinking about our region of the DRC, I contacted the head of our airline, Central African Airlines, and asked him to order an additional twelve Dash-7s for internal use. I informed him of the new A320 aircraft and asked that he petition for additional city-to-city routes, the new 747s be to employed along additional transatlantic and Chinese routes.

Michelle offered up four old maritime patrol aircraft. I was interested, because Africa had a long coastline and we operated many offshore oilfields. They were a steal, so I took them, instructors and spares included. Ivan offered a list of military hardware, but I already knew what I wanted.

‘I want sixty tanks for Somalia, forty for Kenya, two squadrons of Mi24, one each for Kenya and Somalia. I want an additional sixty

thousand AK47s, and a shit load of ammo. Oh, best add forty armoured personnel carriers.'

Many of those AK47s would be issued to our police force, some of whom already carried them, most making do with pistols in urban areas. Village police officers would carry AKs for added firepower, and for visual deterrent effect.

After lunch with Helen, I dragged her back to my office, and we discussed various projects that we considered worthy of extra money. She favoured the standardised village schools. I was in agreement, and the existing rollout schedule was increased four fold, but moving out from Forward Base in concentric circles. Charity begins at home.

We discussed education, especially adult education, and I went through channels for a change, giving the new Education Minister a sizeable budget whilst asking him to increase adult literacy. Ebede college still produced a great many teachers, all employed directly by us, and I sent Anna a note, explaining a greater budget. She came right back with a request for more money for the orphanages. I had to question why they were short of money.

Turns out that they were not short of money, but that locals wanted their kids to attend the orphanages, the kids receiving free meals. I asked her to go and meet with the new Education Minister, because the orphanages were evolving into schools, and increased his budget further, twice in one day.

The aforementioned meeting took place the next day in Goma, Anna roping in our new Orphanages Minister. They came up with a plan, a kind of cradle-to-grave approach, where kids entered an orphanage, were joined by others as it became a school that turned into a college, whilst offering some evening classes for adult literacy. Each establishment would need a police officer or two, and schools and orphanages would range from small village outposts, to establishments as large as Ebede.

Anna then emailed me and asked about school nurses. Since the kids had all been injected, I found myself surprised by the heading when I opened the email. She meant for rural areas, the nurse acting as a basic medic for an isolated area. I said that I would prefer the candidates to undergo rescue force training, and to fall under that umbrella. That agreed, Anna contacted Coup at Mawlini and asked when she could put two thousand nurses through basic training.

Coup was straight on the phone to me. I explained, 'They would undergo basic training, then work in rural schools, only returning to you once a year for a check-over. Use Forward Base.'

‘If they’re any good ... we can pinch them?’ Coup asked, now a great deal calmer.

‘Sure. And they’re available for large deployments if necessary.’

Bob Davies came on the next day, Mawlini somehow two thousand trainees larger. I repeated the story, and calmed him, but with a grin. Turns out that Coup had wound up Mac by suggesting they would all be arriving the following week.

That evening, watching the TV with Helen, the girls on their computers, a programme about satellites came on.

‘Satellites,’ I said. ‘Satellite TV. We launch a TV satellite over Goma, and offer programmes; news, sport, movies.’

‘Got a large audience,’ Helen noted.

‘What time would it be in New York?’

‘Now? Late afternoon.’

I selected Blake Carrington on my phone. ‘Ted, Paul Holton. Listen, thinking of a satellite TV service in Central Africa.’

‘Been thinking about that ourselves.’

‘Got a proposal?’ I firmly nudged.

‘Yes, I’ll send it over.’

‘Ball park figure ... to put a satellite up?’ I asked.

‘Forty million dollars for a ten channel satellite.’

‘Consider this a firm nudge. I’m interested, especially in a new channel that’s controlled from Goma.’

‘Could be up and running quickly. Satellite companies send me stuff every week – they have a few cancelled orders laying around on the launch pad. Cheap if you use the French launcher in South America.’

‘Get back to them, see what deal we can get. Thanks.’ I returned to Helen. ‘Pan African TV.’

‘Paid advertising revenue would cover some of the cost, if not all.’

I rang our Pan-African President, Errol Chamba from Ghana. ‘Mister President, sorry to disturb you. You weren’t asleep, were you?’

‘No, no. It’s nine o’clock here.’

‘Do me a favour, and assume that we’ll launch a satellite TV service for the region. Kindly have a look at offices, studios and people for a new TV service, starting with news and current affairs.’

‘A very interesting idea.’

‘Not least because you would be on it most days! Thanks. Goodnight.’

Blake Carrington came back on the following afternoon. He had grabbed a satellite that someone else had failed to pay for, and it could be launched in two weeks. I told him to stick it right over Goma; it would transmit a test page till ready. He then indicated that it offered twenty-four channels, and how about separate language channels. So long as we controlled it, I didn't care.

President Errol received an email from me, asking that offices in the Goma Pentagon be grabbed for the TV service, and to move ahead quickly with studios and offices, and to start recruiting suitable staff. He had a communications officer, and got the man on the job.

That set me to thinking. Not so much about propaganda, but about what programmes we might like to see on the new service. I contacted a small production company and invited them down. With two men and two ladies ranged in front of me, I began, 'We're creating a satellite TV channel in the Congo, and there're a few programmes that I'd like made. Nothing fancy, just basic documentary type programmes. What would a typical one hour programme cost?'

'Up here, typically a quarter of a million.'

'Oh.' That seemed a lot. I glanced at the sheet I had, a sheet of their company details. 'OK, let's get down to it. Your company is worth little more than a million in assets, turnover of four million a year, yes?'

They were on the spot, and surprised by my approach. 'Well, yes.'

'Here's a suggestion. I buy seventy-five percent of your company for ... three million based on turnover and assets. You keep a quarter of the shares, you get a good wage, and I give you more work that you could cover in a lifetime.' I eased back. 'Think about what we did to Pineapple Music.'

The main man said, 'I own the shares, with my wife.'

I held my hands wide. 'Looking to stay small?'

'Well, no, not really. What ... what would we be making?'

'Dozens of documentaries, on topics that I would choose, many around Africa. You'd be flat-out busy. Things like ... pollution, fish farms, Rescue Force, politics and wars. And some news work.' I waited.

'Yes, I ... think we'd be interested. Can we get back to you?'

'Sure, but don't take too long, I'll be taking to others next week.' I thanked them and showed them out.

Back at my desk, I glimpsed a new report, our hotels in Goma nearing their capacity on occasion. I ordered two new hotels, both to offer five hundred low-cost rooms. Thinking on, and studying an aerial map of Goma, I ordered a third hotel to be built, this one next to the Pentagon, and for it to five star quality. When Yuri found out he asked to handle it, meaning that he would build and run it. I was interested in capacity, nothing else, and gave him the go ahead. His other hotel, near the lake, was doing well, stuffed full of Russian tourists sunning themselves.

Someone then informed Radisson SAS of the new hotel projects, and they asked to build one. That was odd, because we would never have refused them. It was odd that they had not offered before now. I offered them a grant towards building the hotel, provided that it was at least three hundred rooms. They came back with an offer to build a six hundred room monster of a hotel, the other side of the conference centre, a shape that resembled a Canadian Maple leaf. I signed it off.

That proposed new hotel then brought a complaint from the corporation, a complaint that Goma risked power outages in the future. Horrified by that, I sanctioned an additional oil-fired power station, whilst asking about further hydroelectric dams. Such dams were possible, but none within thirty miles of Goma. Conscious of the fact that oil-fired power stations were not very eco-friendly, I offered the Rwandans a new oil-fired power station on their side of old Goma town, so long as they sold us electricity. It was a done deal, and our region of the DRC reduced its carbon footprint, albeit done in a cynical manner. I justified my actions by telling people it was to create jobs in Rwanda.

Fresh from harming the ozone, I emailed Steffan Silo and asked what he could achieve with more money, and could the Angola train route be speeded up. His email indicated that he was already shipping ore that way, but that the process would benefit from an expanded port facility on the coast and a container operation. I asked how much money was needed.

He estimated sixty million pounds to expand the dockside and to bring in better container cranes. I offered him a hundred million pounds, and asked that the route and the port be made suitable for the needs of the next twenty years, some of the money be used at the Luaua airport.

I was always happy to give Steffan money; he was one of those people that accounted for every penny. He also beat people up on price and got us good deals. Within an hour he sent back a graphic,

the image indicating four marshalling yards on the route, in addition to what would be built at the port, a diagram attached. Inside the borders of the southern DRC, new stretches of track would fork off and stretch out several areas. The main track already touched the northern oil areas and ran within twenty miles of Forward Base.

It now appeared that Steffan planned a branch line to Forward Base, another to Goma hub, touching the southeast corner of the city. It would mean that goods could now be exported via Angola in addition to Tanzania and Kenya. The Angolan rail journey was the same distance, but it would mean that European and American cargo ships would benefit by picking up goods on the west of Africa.

That evening, after dinner, I asked, 'What is it that Africa needs the most?'

'I'd say education, but we got that covered. And you can't educate people in a year or two, it's a long process.'

'Health won't have an immediate effect on GDP, and we're doing what we can there,' I commented.

'Housing?' Helen posed.

'If we build houses, the workers are gainfully employed till the houses are finished, then out of work again. Construction is a fickle thing. Besides, we've already earmarked a shit load of money for new apartments in the DRC – and that project employs a hell of lot of people.'

'So what industries produce good jobs, and stable jobs?' Helen thought out loud.

'Well, mines and oil for one, but they're growing as fast as they can, short of skilled workers.'

'What's the aim for 2025?' Helen asked.

'Soldiers, with a suitable GDP behind them to support a long deployment.'

'Do we have enough soldiers?'

'Too many,' I suggested. 'We need them in 2025, not now. Can't recruit them now and sit them in barracks for fifteen years. Besides, former soldiers – working in the police and elsewhere – can be called up.'

'Then maybe we're doing enough. We just need to wait.'

I lifted my eyebrows. 'The old man told me to spend the money this year, so it must be for a reason.'

'For a sustainable economy, Africa needs an internal market as well as an export market. We've got the mine and oil exports, and they're growing. So that leaves the internal market.'

I sighed. 'That takes time. The mineworkers have money, most don't. There's a hell of a class-led financial gap in many places.'

'It'll filter down, as in any society,' Helen assured me.

The next morning, I hovered around my desk, again frustrated. Returning to a valuable source of information, as well as inspiration, I picked up the Goma trade fair magazine. One article detailed South African wines. I called the agriculture professor I used in the region and asked about soil conditions for wine.

'Perfect,' he said. 'In several areas.'

'Import a shit load of vines and set-up a ... you know, wine industry.'

'Will do. Goma volcanic vintage!' he joked.

'What else grows well in our region?'

'Bananas - as you know, coffee is doing well, sugar beat doing well, and any kind of vegetable in the greenhouses.'

'How are they doing?' I asked.

'Great. Production grows each year, and they grow some real monster vegetables.'

'How much is sold?'

'All of it.'

'What's stopping you expanding it?' I asked.

'More hours in the day!'

'Hire some extra staff, I'll OK it. How much more could you produce without wasting it?'

'Could increase ten fold and not waste it, Paul. No shortage of hungry mouths around here.'

'Fine, increase the acreage all you want, I'll sanction the money. Just get on with it.' I hung up and emailed the corporation, sanctioning the expansion.

Not wanting to upset our new ministers down at the Pentagon, I contacted them all and asked for ideas and suggestions, things that they could spend money on.

At 3pm I knocked off, early for a change, wandering into the main office. 'Ladies,' I offered Helen, Sharon and Sharon's daughter – now back from her travels and looking much older, less innocent somehow.

'No work?' Sharon asked as I sat and observed them.

'I'm paid to think,' I told her, getting a look.

'Do you still trade the stock markets?' Sharon's daughter asked.

'Now and then,' I commented.

'Do they have that in Africa?' she naïvely asked.

I stood, raised a finger as an idea hit me, and rushed out. Back in my office I called the head of our bank. 'I think its time we had a stock exchange in Goma, and a metals futures market, ore contracts. What do you think?'

'There's a small stock exchange in Kinshasa, a futures exchange in Lagos that handles a lot of oil and ore.'

'Got a paper and pen?'

'Fire away.'

'I want a purpose-built building, a modern stock exchange, with several floors for futures contracts. I want buyers and sellers to have offices, good communications links. I want us to help with liquidity, and a decent gold market, diamond market, and anything else we deal with.'

'Should put us on the map,' the man enthused.

'I want to steal the trade from Lagos, and make ours the biggest and the best exchange in Africa. And I want the ground cut on that building tomorrow.'

'Could attract a lot of jobs.'

'Jobs ... how?'

'Traders and bankers – they're all high paid jobs. With them would come a quality service sector; executive apartments, nice cars, a casino.'

'A casino? What a good idea. Anyway, fast as you can, send me your plans, get the corporation on it.'

Googling Las Vegas casinos, I picked one I liked and called, getting through to the manager, and wondering if he was old school mafia. Turned out he was a Mormon.

'How can I help?'

'I'd like to open a casino in Goma, but I know nothing about casinos. So I was looking for someone to run it, a joint venture.'

'We offer a franchise service, and a management service, plus equipment rental and security staff.'

'Sounds good.'

'How big a casino are you thinking of?'

'Well, I've no idea. But we get a lot of politicians, conventions, trade fares. There're a lot of rich Russians in the area, and we're about to open a stock exchange, so lots of young lads in pink shirts and a few quid. I guess I would want it to handle ... what, five hundred people at least. But we get a lot of tourists passing through, waiting for planes.'

'We could offer a design and building service, then a full management service.'

‘Fine, but we have our own builders here. So if you design it, we’ll build it, you kit it out and help run it.’

‘What about shows?’

‘Shows?’ I asked.

‘Tom Jones.’

‘Ah, shows for the punters. Yes, sure, room or two at least.’

‘I’ll assemble a team and ready a contract. They’ll come to you, and you can select layouts.’

‘Great. But I’m in Britain, so email me when they’re due to land and I’ll arrange transport.’ I gave him my email details and phone number.

I was pleased with myself. A stock exchange and a casino; they would attract the high earners. We already offered quality hotels, listed a top quality golf course, a nightclub, and many restaurants. We also possessed a world-class zoo, and the surrounding area was dotted with quality lodges. Our tall apartment blocks housed quality abodes and penthouse suites. All we needed now was a marina.

I fought the image away, then smirked. Grabbing the map, I could see the canals that led from the nearby lake and our own artificial lake. But what would Jimmy say? I went and found Helen. ‘We can dig extra canals, for boats, very cheaply. If we built a small dockside, little sailboats could park up, next to it a bar or two. What do you think?’

‘It would be nice. Water features always make a city look better.’

‘You don’t think Jimmy would whinge?’

‘No, it adds quality to the place, its cheap, the tourists will like it.’

I called Yuri, finding him in Moscow. ‘Yuri, that hotel of yours by the lake – I was thinking of building more canals, but with boats for the tourists, and a marina.’

‘A marina?’ he keenly asked.

‘Yeah; water, boats, cafes, restaurants, apartments nearby.’

‘I would be interested, Marko too. How about we go fifty-fifty?’

‘OK, I’ll draw up some plans and send them to you.’

There was only one thing to do. I grabbed Shelly and gave her several large sheets of A3 paper and a map of Gotham City. ‘You remember Cardiff Bay, with the shops and boats?’

‘Yes.’

‘Well, we’re building something like that in Gotham City. Why don’t you draw a design.’ I marked on the map where it would be, and left her to it.

Three hours later my daughter returned, several sheets in hand. The first was a map of the city, the new marina positioned southeast, a large canal linking it to the lake. She had come up with an amphitheatre design, people in bars and restaurants all facing a central circular marina. From that central area, three small canals spread out, widening to further small marinas. This was not one marina, but a main marina, feeder canals and three small marinas.

Around the main marina she had detailed concrete wharfs, cafes laid out, people strolling. Behind the cafes ran a line of two storey bars and restaurants, behind them a row of four storey apartments with balconies facing the main marina.

Along the edges of the canals, the walkways continued, a mile down to the lake, concrete piers jutting out some four hundred yards into the lake itself, pencil sketches of people fishing. But my daughter had not finished there; she had canals snaking deep into the city in several places.

I pointed at them. 'What are these for, babes?'

'People visiting can take a boat to the cafes. People on holiday.'

'Good idea,' I admitted. They linked Yuri's hotel to the marina, so that would please him. They also reached towards the new Radisson hotel, and the back of the conference centre. I tapped a large building. 'What's that?'

'Mum said there would be a casino.'

'Ah, good position. Right, now photograph it and email the image to me. I'll send it to Goma.'

'How much do I earn?' Shelly risked.

'We'll name it after you,' I told her, messing up her hair.

I sent the image to Yuri, then down to the corporation - asking them to make a start on the canals, but to line them all with concrete, or they'd be overgrown with plants and mosquitoes. I also started a drawing of my own, that of the new stock exchange and its accompanying offices, the buildings sat on a large waterway that reached toward the lake and connecting to the main marina. When done, I scanned the image and attached it to an email, sending it to our bank CEO: Gotham City, the Venice of Central Africa!

When Jimmy returned I showed him the sketches. 'Good,' he commented, as if he had anticipated them. 'But you need pumps to keep the water at the top of the canals fresh, or it will stink. You'll also need to extend the waste pipe from the sewerage plant, or it'll stink. And a filter in the main marina itself, or -'

'It'll stink,' I finished off. 'And the stock exchange?'

'Would have happened eventually.'

‘And the design?’ I pressed.

‘Yes, it’s good. Water features always help. When this is all done we’ll try and attract some clever young men; give McKinleys an office down there. And, at the end of the day, that’s what Africa needs. It needs a bit of a buzz to attract the entrepreneurs, and they create jobs.’

‘That land north of River View, Mombassa, would make for a good marina,’ I suggested.

‘Sure. Good for the area - for jobs, and good for tourism.’

I gave him a rundown of everything else I had bought or budgeted for, and he had no objections.

‘Don’t let it stress you, it takes time,’ he reassured me. ‘And right now our area has a growth figure of twenty-five percent a year. Work on the agriculture projects, because Africa needs exports. Zimbabwe is quite capable of feeding half of Africa, so give them a nudge.’

‘How was China?’ I probed.

‘Cold.’

‘Anything ... interesting happen?’

He took a moment, glancing out of the window. ‘Started a few new projects, next year’s technology.’ And he revealed little more. ‘Oh, you might want to involve Po in the Mombassa marina, maybe the one in Goma as well. And the People’s Republic will start work on a new port just south of Mogadishu, links to the DRC along the rail track. They’ll also get involved in the port in Angola.’

‘Anything I should be looking at?’

‘Keep pushing the electric technology. Get ex-president Harvey on it, and ex-president Art Johnson. Let them earn their bloody keep.’

Going backwards

I had either spent, or earmarked, around ten percent of the available budget. With Yuri and Po putting in money, I was going backwards, now with even more money to spend. That led to a radical approach. Following the lead of Hardon Chase, and considering the citizen’s own spending power, I raised all wages in our region by ten percent, those of people we employed directly.

My thinking was simple. If people had more money they would spend more money, and that would develop a service sector and boost internal markets. Thinking now like a politician, I remembered the dull UK election, and images of our Prime Minister that was - and who now is - visiting small business starter units. I took the plans for the business parks around Gotham City, and ordered them built in each of a hundred small towns around the DRC, northern Zambia, Burundi and Malawi.

That did not amount to a great deal of money, so I sighed and increased the project to an additional hundred towns, adding blocks of small offices to the estates. My corporation liaison suggested that the project would employ forty thousand people to build, the same number again to employ when ready, but that some would move across from other jobs.

Thinking on a grander scale, I put out to tender ideas for hydroelectric dams around the region. Steffan Silo came back with a few ideas. It seems that you did not need a wide dam to create a water pressure to turn a turbine, you needed a tall and slim one, and he pointed me towards a hydroelectric project in Wales, north of our house. I tracked it down on Google and found a small lake at the top of a hill, a long pipe down the inside of the hill, and a turbine at the bottom. Water pressure was a factor of height, not width.

The DRC offered plenty of mountain ranges and tight gorges, all scaring a rain soaked land. After all, they did not call it the rain forest for nothing. Steffan pointed towards German made turbines, and hinted that we had more than enough steel for the required pipes. What would be left would be a gradient. I studied the map, checking contours of hills to the west of Gotham City, an impenetrable land of parallel gorges where the earth itself seemed to have been squeezed together. I found a high lake fed by rainwater, its natural outlet being a waterfall in a tight gorge.

I cut-and-paste the image off Google Earth and attached it to an email, along with Steffan's suggestions. Unfortunately, each of the turbines seem to be only suitable to power a single apartment block, perhaps two. Fortunately, there were a great many high gorges and waterfalls, the area completely uninhabited. From the German manufacturer, I ordered six turbines straight away. Our existing factories were not geared up for pipes of this size, so I had to eat humble pie and order them from our competitors, the Nigerians.

Informing Steffan of what I was proposing, he said that six turbines wired end-to-end should be able power Gotham City easily enough, something about the efficiency of the set-up compared to a

single unit. Room for growth, I figured. Thinking on, I could see that a large part of our region contained steep gorges, the bane of our road builder's lives. That nudged me towards three turbines for Gotham City, and a great deal more for the region, especially northern Zambia.

Unexpectedly, a team from the German turbine factory flew over the next morning, emailing me en route. They were on their way - and could they see me please?

'I like Germans,' Jimmy commented when I told him. 'Their preciseness to detail.'

We welcomed them into the house at noon, leading them to a lounge. Without any prompting, they held up an A3 chart, and gave us the ABCs of hydroelectricity. Helpfully, they told me just how much pipe was required, exactly what diameter, and what height of water. Seems that little more than a hundred metres of water at forty-five degrees could drive their turbines. The lake at the top, the reservoir, was only needed to maintain a steady flow, and that in some cases they had turbines working without reservoirs, simply tapping fast flowing water.

They keenly offered to send a team to the region to assist, to conduct surveys and to co-ordinate the installations. A smaller turbine, with a two-foot pipe reaching up seventy-five yards, could power a village of a hundred abodes, provided that it was the usual mix of domestic electric bulbs, fridges, radios or TVs. If it was just a case of electric bulbs in rural African villages, the smaller turbine could power six hundred abodes.

I ordered a hundred of the smaller turbines as a first test, and a further twenty of the larger turbines. They then asked the obvious question of how much electrical wire, and did we want bulbs? Off the top of my head I suggested that they allow for two or three hundred huts in each village, but a thousand or two in the small towns.

I was thinking small. Jimmy piped up with, 'How about we tackle northern Zambia?' To our visitors he said, 'We'd like an additional sixty larger units for Zambia. Now, what do you have that can power a small factory, or indeed a large factory?'

'You will need three or more of the larger units working in concert, a water height of two hundred fifty metres at one point five metre pipe, three separate pipes.'

'And would that run a typical plastics factory?' Jimmy asked.

‘Yah, no problem. With that configuration we can power five thousand houses with all utilities. And in the night time, we can pump some water back up the hill.’

‘Pump water back?’ I queried with a frown.

‘You have the electricity generated at night, but no use, so we switch to a pump that sends water up. It can also be ... that you stop the water flow down, but not such a good idea to always stop and start.’

‘At night,’ Jimmy began. ‘Can the charge be diverted along high power lines to local towns or other factories?’

‘Yah, of course, we do this in many places. We have automatic switching gear we manufacture.’

‘Then we’d like you to look at that as well,’ Jimmy told them. ‘If this all works well, we’ll look at a second order of a further two hundred units.’

It was worth the trip for them, and they left looking like happy German salesman.

With the Master Race gone, Jimmy said, ‘I have the kids in Shanghai working on a more efficient turbine, low cost long life light bulbs and efficient heating units. In time, we’ll swap out some of their turbines and try the others.’

‘So why order this lot?’

‘To keep the German Government happy,’ he said with a shrug.

Back at my desk, the result of my request for ideas from the ministers was a large pile of printed emails, enough to keep me busy for a week. I sighed, glanced at the first page, made a tea, then finally sat.

The first suggestion seemed to be waffle about youth programmes and creating good citizens. I scanned it, one line catching my attention: cadets. I lifted up and stared out of the window, then turned, staring at the page. Cadets. Army Cadets: ten year old boys that would be twenty-five years old in 2025. But was I being premature?

The orphanages already ran cadet movements, both Army Cadets and Rescue Force cadets, and both programmes helped get the kids ready for adult life in either chosen service. I emailed back our Defence Minister and agreed to fund two thousand huts, spread across the region, and that the Rifles would supply instructors. I then suggested that camps be run during school holidays, especially the summer holidays, to regional centres in each country, again using the Rifles. We’d take boys as young as ten, the upper age limit being eighteen. And we’d inject them all.

Contacting Ngomo, I told him that I wanted his patronage as Honorary Colonel in Chief of the pan-African cadet movement, jointly with Anna at Ebede. Anna would make sure they learnt the “good citizen” bits that our Defence Minister had mentioned. She also had a head start, having run such programmes for fifteen years or more.

The next email was from the Health Minister, but seemed to detail the same subject matter, making me puzzle why the hell the Health Minister was involved. Reading on, it seemed that Africa had a great many errant boys and girls just hanging around, neither in school nor working, but trying to earn a crust in rubbish dumps or mines. Now I was following. But my idea –my solution - seemed a little outlandish, if not downright illegal.

I called Jimmy. ‘Jimmy, kids in rubbish dumps. My first thought would be a kind of orphanage, but one with a fucking high fence and guard dogs. They have lessons, whether they like it or not, get fed, and discipline is tight.’

‘And your second thought?’

‘That the fucking UN would be all over us!’

‘In most African nations it is - as in the west - illegal for a child not to be in school, or to be working under sixteen.’

‘So ... we’d be enforcing the law. And forcing them to have three good meals a day.’

‘You would. And fuck the UN.’ He hung up.

I emailed back the Health Minister. ‘Please liaise with the Orphanages Minister, and Anna at Ebede. We’ll create orphanages with high fences and guards, and enforce attendance for kids that wander the streets. A first step would be a residential school that they may attend voluntarily. If not, they would be forced to attend. I suggest this programme start in the DRC, in each large town, rolled out to Kenya and Tanzania. Substantive funding is available.’

The next suggestion was easy enough, a request for more computers in schools. We already had a programme running in Europe and America whereby second hand computers found their way to us. I faxed the South Korean embassy and asked for information on surplus microprocessor chips, old chips, and computer base units. We didn’t need the latest computers, just basic word processing. That fateful fax would lead to a batch of twenty thousand computers, each unit costing us less than a hundred pounds. They would give a teenager gamer in the west a heart attack with how slow they were, but they were all that the kids in Kenya needed.

The third suggestion lit up my face. ‘How about we assist African football youth hopefuls with more regular tournaments, prizes and trophies?’

I could not type fast enough. ‘Please arrange several tournaments at Goma, of teams from all over our region, 16-18, 18-21, etc, and pay for their travel and hotels. Create suitable cash prizes for teams and individuals. Please televise it. Afterwards, make the tournaments twice yearly. I am happy to fund internal youth leagues in all countries in our region.’

That was followed by an email from the TV production company I had offered to buy. They would sell. I got the accountants on the case, but in the meantime emailed them back. ‘Can you send teams down to Goma to create a series of one-hour documentaries. They could be two hour if you like. First, the growth of Goma hub, then fish farming, then the new parliament, the cadet movement, the orphanages – please visit Ebede in Kenya, the story behind the banana and tomato concentrates, the growth of the northern rail line link, a story about the new German hydroelectric turbines, and anything else you can think of. But absolutely no criticism of African politics. Be neutral. And any animal programmes are great. And fishing.’

The next email suggestion was just as far away from creating jobs as the football tournaments, but I loved it. ‘How about a golf tournament with a big prize, to attract world class golfers.’

With a smile, I send back. ‘Yes, offer a million pounds in prizes, and run them three times year in Goma and River View, two weeks apart so that people can attend both. Wait till the new hotels are finished in Goma.’

The following ten emails almost sent me to sleep, I could hardly figure a reply. I had asked for what the minister would spend money on if they had it. Maybe I worded it badly, since the suggestions seemed to be all over the place, and not focused on regional advancement or job creation. Either that, or the people we hired were crap. Jimmy though they were all fine, so was this a case of them being good at tackling the problems under their noses, but not thinking outside the box?

I finally found a suggestion that made some sense, especially to the more devious side of my nature. The Junior Defence Minister suggested a combined Officer Training College. I wondered if he was thinking what I was thinking, in that army officers often ended up in power – sometimes by force.

Wondering if the guy was being smart, or simply thinking of pan-African cooperation, I readily agreed to fund a new college at Forward Base, places for thousands of officer cadets. I contacted Sykes and asked him to assist in finding some former British Officers to help run it. And that innocuous request led to a far-reaching shift in NATO policy. And Russian military policy. And Chinese.

When I mentioned to Jimmy the new officer training college he smiled oddly and folded his arms. I puzzled that, but explained what I had in mind.

‘Great idea,’ he commended. ‘And influencing future leaders – excellent thinking young man.’

‘But...?’

‘Oh, nothing,’ he said with a grin.

I spent all night trying to figure out what was wrong. Helen racked her brains as well.

The next afternoon, Hardon Chase called me. ‘Paul, this officers college in the Congo, you doing it to influence future leaders?’

‘That was never the intention,’ I lied. ‘I was thinking of a common army in the future.’ I should not have said that.

‘What?’

I realised what I had just said. ‘You know, the Rifles.’

‘They’re not a common army!’ Chase pointed out. ‘Anyway, we thought we’d *assist* with the college.’

‘You knock yourself out, and assist all you like – it’s all innocent cooperation.’ Now I sounded like I was lying, even to myself.

‘We will,’ he threatened. ‘I have a team on it already. Is the British Army sending down instructors?’

‘Yes, lots of them,’ I said. Then I changed the course of NATO with a comment that I had not thought through. ‘Thinking of sending soldiers down as well, you know, desert and jungle training.’

‘Ready for 2025?’ Chase asked.

‘Sure,’ I said. ‘Where better to train?’

‘And the Russians and Chinese?’

‘No interest at all,’ I said, and I still sounded like I was lying.

‘See you soon.’ He hung up, and I realised what I had done, almost.

I found Jimmy. ‘Hardon Chase thinks that college is to influence future leaders.’

‘It is.’

‘Well, yeah, but I think he got the impression I was being evasive.’

‘You probably were.’

‘And I hinted that UK soldiers would train there, ready for 2025, trying to put him off the scent.’

‘Oh dear.’

‘What’ll he do?’ I asked.

‘He’ll consider that US forces should be desert and jungle trained ahead of 2025, and nudge US units that way.’

‘And ... that seems fine,’ I puzzled.

‘Sure, we desire that they be desert-trained ready, but not quite yet. Still, young soldiers training now will be NCOs in 2025.’

‘And so...?’ I nudged.

‘Every fire starts with a spark, and every chess game won - started with a single pawn moved.’

‘So ... what have I done?’ I puzzled.

‘You moved a pawn, that will greatly assist with world peace.’

I stared at him. ‘OK, now I’m confused ... and my head hurts.’

‘You’ll figure it out. And give that college a good budget. Let the officer cadets fly light aircraft, helicopters, parachute, the works. I want that college to be a guarantee of a great career. Make it a three year course.’

‘Three years?’ I questioned. ‘Sandhurst Military Academy is forty weeks odd.’

‘They have to study as well. Some will be graduates already, but most will be eighteen at entry. It’s Africa. For the graduates, it could be two years. But what we’re aiming at, is that someone leaving is not just on par with his western counterpart, but better.’

‘Fair enough. Still don’t see what the fuss is all about.’

‘Let it unfold,’ Jimmy said with a grin.

Forward Base

With the move of many of our facilitators up to the Goma’s Pentagon building, office space and apartments were available in Forward Base, some grabbed by Rescue Force and others. I informed them of the officer training college and they halted plans to move things around. Ngomo was given overall control of the project, and he already knew what he wanted to achieve. He made a quick visit to Forward Base and drew up designs for lecture theatres, barracks and additional classrooms. Besides that, he had all he

needed to hand; a large army base, an airfield, firing ranges, gym and pool, hills and jungle nearby.

He duly ordered a larger Married Quarters for overseas instructors, apartments for visiting instructors, and a hotel for visitors, family or otherwise. All Congolese officer cadets would attend from September. Zambia signed up, Burundi, Malawi, Somalia and Tanzania. Ngomo's own country held out, because they had a fine college and a fine tradition in Kenya. Sierra Leone and Liberia signed up after they figured out that it would be a good thing – and free, and Zimbabwe joined after a short review. The September intake would be full, if not bursting at the seams. Extra barracks were hurriedly built, extra classrooms, some two thousand entrants due to start the course. The corporation nudged additional warm bodies to Gotham City and freed up an admin building or two.

Sykes had found twenty former Army officers, the men willing to work at the college for a few months a year, plus a few retired British NCOs that were specialists in certain technical subjects. They would be joined in August by American instructors, plus British and American civilian lecturers. That led to a quick review by the British and American Governments, who now assigned serving members of their armed forces to the college.

An American Army Colonel turned up at the house a few days later, unexpected. I showed him to the diner and got him a coffee.

'Long way for a chat,' I commented.

'On my way to Forward Base,' he explained.

'To do what? Teach at the college? It ain't open yet!'

'No, I'll be at the base occupied by Air Transport. We're expanding it to include an infantry training depot.'

'Goma hub is good for a visit, but your boys will need to behave - the cops are all ex-Rifles.'

'That's why I'm here. We intend to put our guys through jungle and desert training, Rifles style.'

'Well, it's never going to quite the same,' I commented.

'Why?' he defensively challenged.

'They start at seventeen, the discipline and training harsh, and they see a lot of action. Can you teach that?'

'It's a good point,' he conceded. 'Which is why I'm here. We can't reproduce that, but we've been ordered to go as far as we can to match them.'

Jimmy stepped in, placing down a stack of files, the officer standing. Jimmy waved him down as he sat. 'So, Rifles training, eh?'

‘Yes,’ the Colonel agreed.

‘I’ve arranged for a large base to be created in the north of Somali, a second near Mawlini. They’ll both be able to handle three thousand men at a time, and you’ll need to pay the Somalis and Kenyans a few dollars for upkeep.’ He handed over a thick file. ‘Desert, mountain and jungle. My ... suggestions. We’ll also assign you officers and NCOs to assist, and we have a variety of weapons for you, plenty of ammo. I’ve outlined a sixteen week programme with two breaks for R and R. Will they all be injected?’

‘Yes, the basic drug, some with the stronger version,’ the Colonel reported.

‘They’ll need it,’ Jimmy cautioned.

‘The first batch through will remain as instructors,’ the Colonel explained. ‘Help to refine the course.’ He paused. ‘I’m security cleared, sir. May I ask if the course you’ve outlined is ... based on future events?’

‘It is,’ Jimmy confirmed. ‘The course contains civilian control and marshalling techniques, riots, roadblocks, and bomb detection and disposal. In the years ahead it’ll be extended.’

With the Colonel gone, I said, ‘I thought they’d be too proud for training alongside the Rifles.’

‘If ... events had not been altered, they’d be fighting in Afghanistan and learning useful things about desert and mountain warfare, as well as counter-terrorism. They’re not, so I have to give them the benefit of what they should know by now. I’m just thankful that Hardon Chase is pushing the training.

‘The problem, is that western soldiering styles are designed for the survival of our troops, not the maximum inflicted casualties on the enemy. When our soldiers are shot, their colleagues stop and help, pulling back. To win, you need to ignore the wounded and keep pressing forwards the attack. The Rifles know that, but they don’t teach that at Sandhurst yet.’

‘The Americans be ready before 2025?’

‘Depends on who gets into the White House. Fifteen years is a long time.’

‘I’m still not seeing anything odd about the college, or this new training,’ I pressed.

‘That’s why they pay me the big bucks,’ he said as he left.

On my way back to my house I noticed Jimmy standing alone on the edge of the grass, staring down towards the main gate. I drew level with him. ‘Intruders?’

‘No,’ he softly replied. ‘Just thinking.’

‘About what?’

‘I’m going to make myself unavailable for a few days. Tonight, have your family eat in the diner, and if anyone should ask about US soldiers in the Congo, be ... obtuse.’

‘OK,’ I reluctantly let out.

‘You know why I started the student flights programme?’

‘So that the current-day business leaders would have travelled over to Russia when students, and now they know that the Russians are not so scary ... and just like us. Only poorer. Apart from the very rich ones.’

‘You have learnt well, Grasshopper,’ he joked. ‘And the easiest way to get someone to do something is...?’

‘Tell them not to.’

‘I’ll be back in a few days. And, if you don’t screw it up, the entire world will lurch forwards and take a giant leap, a full five or ten years early.’

I lifted my eyebrows. ‘No pressure then.’

Big Paul pulled around the corner in a Range Rover. Jimmy jumped in and drove off, leaving me staring down at the gate. I surprised Helen and the girls by insisting we eat in the diner, something we rarely did these days. Our girls often ate there after being told off, it was their sulk zone – where they knew they’d get sympathy from the household gang. We claimed a booth and surprised Cookie.

‘How’s the food in this joint?’ I loudly asked, Michelle and Jack already eating. Jack had a wife that cooked, he just didn’t like her cooking much.

‘Cooker broken?’ Cookie asked us.

‘Having a rest,’ I told him. ‘Four full English breakfasts with extra everything,’ I ordered, surprising Helen and the girls. We were on a health kick at the moment, greasy food banned.

Michelle eventually asked about the US Army Colonel.

‘They’re setting up a base in our region. Infantry training.’

‘What kind of ... base?’ she gently nudged.

‘They’re learning how to fight in the jungle and desert. A programme that Jimmy set up.’

‘Jimmy set it up?’ Jack asked. ‘He ... designed it?’

‘Yep, long course, lots of detail.’ Helen and the girls ate quietly, wondering what I was talking about.

‘This course,’ Jack pressed. ‘It was designed to fight against *you know who?*’

Shelly faced him. 'You're not some sort of spy type, are you Uncle Jack?'

Jack smiled. 'No, my dear, I tend the rose garden.'

'I think the answer to your question ... is yes,' I told him.

'So why now, and why America?' Michelle probed.

'Because when the time comes you'll not be there, they will,' I toyed, making it up as I went along. 'They'll be the spearhead troops.'

'Makes sense,' Jack agreed.

I could see Michelle's grey matter working away.

'Jimmy's off on a secret trip for a few days,' I slipped in. 'In case you're trying to reach him.'

'We can practise French conversation,' Shelly suggested to Michelle.

Shelly had grown up not liking Michelle, but now that my daughter was blossoming she found Michelle a role model. There was also some jealousy of Michelle, because she spent time with Jimmy, and Shelly idolised Jimmy.

'I'd like that,' Michelle offered.

Helen shot me a look. She spoke perfect French, but what child wanted lessons from her mum!

Han came to my office the next day, his first time ever. 'Am I disturbing you?'

'Never, always have time for you. Apart from when I'm asleep.'

Han gave me a look over the top of his glasses. 'I was interested in this new venture, the training of American soldiers in Africa.'

'Sorry, I'm too busy to talk,' I joked.

Han sat down anyway. And stared at me. 'Since Batman is away, I will have to make do ... with Robin.'

'You're supposed to say: since the organ grinder is away, I'll make do with the monkey.' He stared at me. 'Jimmy is teaching the Americans, some of them, how to fight the Brotherhood.'

'And when was that decision taken, might I ask, Monkey Boy?'

I smiled widely. 'Only a few weeks ago.' I held my hands wide. 'They haven't even started yet.'

Han stood. 'Would you happen to know ... why this has come about?'

'Jimmy thinks that they'll be the spearhead force in the desert.'

'Not the Rifles?'

'I'd guess both, at some point. Middle East is a big place, and the Rifles will operate in the South. That was the plan the last time we discussed it – was it not?'

Han bowed his head and left, leaving me grinning. I figured I knew what Jimmy was up to and gave him my theory when he returned.

‘No,’ he said, deflating me.

‘Did I screw it up?’

‘No, you did well.’

I went off to start drinking heavily.

That following week, Jimmy came up to the office and we opened a map of the DRC, our corporation guy with us. ‘Let’s order six new oil-fired power stations for the south and southwest, and plenty of high voltage cabling and towers. But let’s award contracts to European companies to keep the politicians here happy; British, French and German. Hydroelectric projects are good in some areas, less effective in others.

‘OK, the local councils in each of our towns are quite good these days, and they know what each town needs. So let’s give them a bigger budget, a capital investment grant for buildings, roads, sewers, and industrial parks.

‘Next, let’s have a look at Africa’s image, and employ extra people in each major city to clean it up, including some of those outside the zone. Start with Nairobi and Mombassa, Dar es Salaam, Mogadishu and Kinshasa, and lets employ an army of out-of-work people to clean up.

‘Next, we need to look at traffic, and traffic cops. The roads are often terrible, and they all drive like Italians. But, if we made sure that every car was roadworthy ... there’d be none left. So let’s think about more traffic cops in our region tightening up on the worst excesses, and let’s invest in more traffic lights, roundabouts and bypasses. We aim to create jobs, and we could hire twenty thousand traffic cops straight away – many of who could drive electric cars.

‘OK, electric buses; we’re not even scratching the surface. There have to be a million clapped-out old buses trundling around Africa belching smoke. We have less than a thousand. So let’s organise a massive rollout, concentrating on the cities; city centre to suburbs and back for the daily commute to work.

‘That port we’re developing in Angola, Lobito, turn it into a major city. Stick a frigging marina in it, apartments, the works. There are two airports nearby, so enhance them. I think that area will be an important hub in the future, very important. And drop a few hints that it’ll be a major commerce centre in the future – through the African Times. Po and Yuri should be interested. Oh, and our TV channel goes live in a few days; Central African News.’

He stood. 'Pack a bag, we'll pop down tomorrow. We can view the large muddy hole that will be a marina some day.'

I got to work and set the directives, as well as allocating money – the easy part. And I still hadn't spent a fifth of the budget available. The last thing I did before leaving was to order two thousand electric scooters for Kenya, a move that many people would live to regret.

Landing at Goma International Airport, I could see building work in the distance and pointed it out to Jimmy.

'Extending the airfield a bit. Again. It's years ahead of schedule and suffering growing pains.'

We booked into the golf hotel, its rooftop bar identical to that of River View in Mombassa. Meeting with the hotel's manager, and his team of European and American marketing experts, they explained the preparations for the golf tournament. Without any nudging from us, they had organised an Africa tournament first, a top prize of a hundred thousand dollars. That would be followed a month later by an open world tournament, top prize half a million dollars. They explained to us that any well-known player could stay at our hotels for free. Generous of them. From now on, Gotham City would be witness to at least eight tournaments a year, of some description.

Jimmy then suggested, 'Hold a charity tournament, for Rescue Force, where any world leader can play. They have to contribute ten thousand dollars to Rescue Force to enter.'

'Does our Prime Minister play?' I thought out loud.

'Hardon Chase plays,' Jimmy mentioned.

'I can just see him on the green – with his thirty bodyguard scuffing up the grass!'

The new marina was as described: just a muddy hole in the ground, several cranes in position. It was bordered by another muddy hole, that of the new casino.

'I've ordered another marina,' Jimmy informed me.

'Where?'

'You know the valley between Spiral One and Two? In there. A canal will reach down towards the lake, but it'll need sections of road to be bridged. No big deal. That will then take the canal all the way around the back to the Pentagon, where they can make another small marina with cafes for the staff to lunch at.'

'The Venice of Africa,' I commented.

'I've asked that all building rainwater run-off be channelled through the canals, or they'll stink a bit.'

We drove the short distance to Senator Pedersen's tower, taking the elevator to the top floor, the building security letting us onto the

roof. Perched under a mobile-phone mast in a stiff breeze, we stared out at our creation.

‘It’s grown a bit,’ I quipped, peering down at the marina’s building site. The Pentagon building looked nice from this angle, and Spiral I and II reminded me still of the Los Angeles hills. ‘Why have the airport smack in the centre?’

‘Only suitable place for it; alternate site was six miles down the road. Besides, it adds a buzz to the place, and they don’t fly at night too much.’

Facing the other way, I could see the boulevard stretching out towards the sprawling hospital complex, the vast university next to it. I pointed. ‘Is that a church?’

‘Yes, I funded it after people complained. There are a few small chapels in the shanty towns, but the rich locals wanted one.’

I could see the winding road towards old Goma town, now dotted with houses, estates and factories.

A local official stepped out to us. ‘Sorry to disturb you, sir, but I thought that this would be a perfect time to discuss Mister Yuri’s proposal for a public viewing site here.’

‘Great idea,’ Jimmy commended. ‘But fence it all over so that no one can jump. There are four lifts, so make one dedicated to coming up here, and don’t let people use the stairs. We don’t want the tourists disturbing people who live here.’

‘It would be 10am to 4pm, sir.’

‘Fine. Thank you.’

The man handed us a tourist guide before he left. I opened it and read, ‘Zoo, Spa hotel, Golf complex, inland lake, shopping centre, safari lodges, safari trips, helicopter rides. Well, the marinas will improve the city attractions. But how about a monster shopping centre?’

‘Yuri and Marko are planning one, next to the casino. It’ll be aimed at the tourists, but this place has a few millionaires living here already. And with the golf tournament crowds, the shops should survive all year round.’ He pointed. ‘You see the lakeside – I’m planning on developing the whole thing, a mile or two each way, lots of canals and marinas. The new stock exchange will be further down, next to it a glass fronted office block, next to that more apartments.’

‘Will this place be your legacy?’

‘I don’t think of it in those terms. It’s a laser light show for Africa, to attract business.’

Listening to “The Girl from Ipanema”, the lift took us slowly back down to ground level, a helicopter waiting for us at the airport. Our security boarded a second Huey, a thirty-minute flight made to Big Paul’s fish farm.

Flying over it, I could see a million sparkling channels through the dense green foliage. It was as if the bushes themselves were growing out of a vast lake. ‘What’s the current acreage?’ I asked through the headset.

‘I think he said fifty thousand acres. There are a dozen of these now, many smaller ones that the locals run.’

Our Huey touched down in the parking forecourt of a large factory made from clad steel panels, the management lined up ready. Away from the Huey, we shook hands with the manager, and he led us inside, and to the strong whiff of fish. Workers in plastic aprons and headgear attended numerous conveyor belts, large boxes of ice everywhere.

The manager lifted a finished pack of fish, vacuum packed and frozen. It didn’t appear any different to that found in British supermarkets; except that these were fresh water fish, and destined for local consumption. There were no Cod here.

‘How far do they get shipped?’ I enquired.

‘As far as Nairobi, in frozen train cars,’ the manager explained.

‘Frozen train cars?’ I queried.

‘Mister Steffan Silo brought them from abroad, sir. The train goes once a week through Burundi, Tanzania and to Nairobi.’

‘Where does most of it go?’ I asked.

‘Most is consumed in the country, sir, but we are developing an export market; Zambia and Uganda.’

With our nostrils complaining, we toured the factory like electioneering politicians, before flying a short hop across to one of the vast greenhouse projects. There I recognised a face.

‘You were in Shanghai?’ I whispered.

‘Yes, sir. My wife and family are now with me here. Come.’ He keenly led us to a greenhouse, I had to stop and laugh.

Pointing, I said, ‘What the fuck are those?’

‘They are marrows, sir. Big ... marrows.’

I banged a fist onto a marrow as big as myself.

Jimmy said, ‘Africa has very fertile soil, plenty of water and rain. It’s a great place to grow things like this.’

‘How long did that take to grow?’ I asked our guide.

‘That is one season – nine months. Then they are harvested, cut up and packaged nearby.’ He led us to the next greenhouse, where

tomatoes, too fat to be supported by their own stems, lay on wooden slabs. And these tomatoes looked like red footballs.

I tried, and struggled, to lift one. 'Shit.'

'That single fruit can fill two three-litre containers,' our guide keenly explained.

'Why haven't I seen any reports about these?' I asked of our guide.

'We don't advertise the work here, sir.'

'No shit.'

He showed us giant potatoes and a variety of vegetables, before leading us onto a bus for a short ride to another steel-clad factory. Or at least it looked like a factory from the outside. Inside, our nostrils were again assaulted. We climbed up a flight of steel steps as a group, and peered down at large pens.

Stunned, I pointed. 'What the fuck is that?'

'It's a pig, sir.'

'A pig? It's a fucking elephant!' I stared down at a pig the size of a car, lying on its side.

Jimmy explained, 'They're growing six hundred pound pigs, which have all been injected with the drug. And, unlike humans, their offspring all have the blood. Problem is their legs.'

'Not strong enough to stand?'

'Not in the last six months of growth. But then they're turned into bacon.'

'Is that ... ethical?'

'Aim is to feed Africa, not to be ethical,' Jimmy retorted.

We clattered along a raised metal gangway, hundreds of super-sized pigs slumbering in the pens below us, either eating, or feeding their piglets. At the opposite end off this stinking shed, we stepped down and crossed into a second shed, this time it was our ears being assaulted - by a roaring clucking sound.

'Super-sized chickens?' I asked.

'Nope, just regular ones,' Jimmy explained. 'But their feed has been altered to an optimum. They grow quicker and produce more eggs. Now that the feed formula is right we'll build a hundred of these sheds, and the pigs have just gone into production, the vegetables being first canned six months ago.'

Over the noise of the chickens, I asked, 'How will this affect our food production?'

'Four fold.'

'Four fold? We ain't doing too badly now.'

‘Africa is a very big place, with many dark corners. We’re not making that much of a difference, not yet. Besides, the next decade will see a doubling of the population and the growth of internal markets. Consumer spending will grow, a middle class will grow – more luxury goods bought from the west.’

‘And the carbon footprint?’

‘Will grow, but be offset by hydroelectric projects and electric buses.’

Needing to be away from the smell, we exited the shed and walked around the outside, chatting to the mad scientist from Ebede as we progressed. Turns out that his buddy worked on the chicken feed, another working on fertilizer from volcanic ash – which we had a shit load of just laying around, right next to Gotham City. They planned on selling the chicken feed formula around the world, for which they’d get a cut. Very entrepreneurial, I considered. They also planned on selling the fertilizer around Africa and the wider world.

Flying back, I spotted dozens of shimmering patches of land, fish farms for locals. Now that I knew what to look for, I also spotted steel-clad sheds dotted about.

Through the headsets, Jimmy explained, ‘I’ve arranged for many of the fish nurtured here to be released in Lake Tanganika, as well as millions of fish fry. There’s a unit set-up to do just that. And certain waste foods get chopped up and dumped into the lake, like waste bread. The fish stocks are booming. As they are in the river sections you dammed off. And the UN, they’re installing greenhouses in remote villages, giving the locals some training, seeds and fertilizer. Already a few little agricultural industries going on in the deep jungle.’

‘How long till the world hears about the secret stuff here?’

‘Soon, because our exports are growing at a fantastic rate. Those frozen train carriages – we’ll need a lot more. We have refrigerated trucks, but they’re not cheap. I’ll arrange for British beef cattle to be brought down, and we’ll get started on developing a beef surplus soon enough. The world will notice when Africa starts turning away grain ships - and starts selling food!’

At the hotel, sat in the rooftop bar with a cold beer, I idly commented, ‘Those pigs had all sorts of technicians. They trying to make them even bigger?’

‘No, they’re trying to make us a few quid.’

‘Huh?’

‘They’re experimenting on the pigs, trying to make them slimmer.’

I puzzled that with a heavy frown, and a wry smile. ‘You genetically altered them to be huge, now you want them slim?’

‘What would it be worth to the world if you could pop a pill and lose twenty pounds?’ Jimmy asked, a glint in his eye.

‘As much as the drug itself, if not more!’

‘I don’t have the exact formula - I just know where to look. So, they’re looking.’

‘Why pigs?’

‘Because they’re close to humans, and we can’t experiment on humans.’

‘Could never not develop the stuff they gave you - to keep people slim?’

Jimmy smiled. ‘No, that would be a contradiction. Besides, *they* developed the drug to enhance soldiers, not for cosmetic reasons. And their research has never been repeated successfully, because the original scientists were desperate. Necessity ... *was* the mother of invention.’

Central African Television, aka Silo TV

On the third day we toured the Goma Pentagon building, a great many offices now in use, desks already cluttered. The place already looked lived-in. Secretaries had brought in flowers in plant pots and balconies were blooming, most having plastic garden furniture and tables.

We toured the various ministers, getting around to less than half of them that first day. We discussed their ideas, needs and desires, then gave them our own. We agreed budgets and projects, directions, and listened to their gripes and moans. Seems that politicians blowing hot air was not just a western practice.

It took all of the second day to get around to those we wished to meet, and by the end of it I was tired, if only mentally. I also made a mental note to recommend Unit 402 to shoot some of these pedantic politicians. And we were paying their wages! Hippos came to mind when dealing with some of them. At the end of that day I seriously needed a beer, or five.

‘How hard can it be to run a country?’

‘Well, most countries have around half a million people working at it full time, so don’t get frustrated when you can’t do their work all in one go.’

In the morning, we dusted off our best suits and headed to the new TV station, the building equipped with the latest technology and gadgets. They gave us the tour, nice of them considering that we paid for everything, and we watched an interview from behind glass screens, a debate about religious unrest in Chad. That done, it was our turn.

We sat and made ready, microphones attached by a nice young lady presenter, from Nigeria of all places. They counted down, despite the fact that it was not live.

‘Mister Silo, Mister Holton, welcome to Central African News,’ she began with.

‘Thank you for having us,’ Jimmy offered, an odd statement given that we owned the damn show.

‘May I start by asking how the new pan-African parliament is working out?’

‘It’s early days, but they’re already working hard on many new projects, across a wide range of subjects.’

‘In some ways, it is an outlet for your ideas, and your funding.’

‘Yes,’ I agreed, ‘But we would prefer that Africa makes its own decisions. We would then simply guide projects where we thought it was necessary. We listen to ideas and proposals from the various ministers, and then try to help get them implemented where we have influence.’

‘Can you give us an example?’

‘Sure. The Health Minister brought up the matter of truant children working in rubbish dumps, or working underage. So we’re now looking to extend our orphanage programme to include enforced orphanage.’

‘Enforced orphanage?’

‘If we find young children risking their lives and their health working in unsanitary places like rubbish dumps, we’ll remove them by force to a nearby orphanage, clean them up, feed them and educate them – whether they or their parents like it or not.’

‘You would ignore the parents wishes?’

‘What parent wishes their children to work in a rubbish dump?’ I challenged. ‘We would obviously work with the government and police of the various countries, but I am happy to enforce education.’

‘Mister Silo, what are your views on the recent conflict in Yemen?’

‘No country should suffer terrorism at the hands of a neighbour. Somalia had been attacked for many years by rebel fighters operating out of the hills of Yemen, but they finally snapped. The problem is the terror group known as al-Qa’eda, who encouraged the Yemen fighters to attack northern Somalia. That group claims to fight the west in the name of Islam, but Somalia is an Islamic country. Where is their credibility?’

An hour later we were still at it, a great many questions answered, many topics discussed. Our segment was not due to go out as one large lump, but to be cut and edited into smaller sections and dropped into other programmes when necessary.’

Wandering around, we found small studios where our own words were being turned into subtitles, in twelve languages, including French and Portuguese, which were still spoken in large parts of Africa.

After lunch, a TV crew accompanied us to the top of the tallest tower, and we gave a documentary style talk about the planned building work below us. With interviews from all of the sixty ministers, our new TV news service had plenty of material; they’d not be short of air-minutes. Our documentary company had already finished four simple programmes and were busily editing upstairs. We sat with them.

A young British editor explained, ‘This is about the fish farms and the greenhouses. We’ve caught the process of the greenhouses from oil in the ground, to the refinery, to the plastic factory, and finally the crop planting.’

‘Keep it simple,’ I said. ‘Most people watching can’t even write.’

In the control room, we found two Americans from Blake Carrington’s company, of which we owned just under fifty percent. Displayed across a large wall were twenty-two channels currently being broadcast. Eight seemed to be the news, in a variety of languages. Four seemed to be football, two cartoons, two old movies, and the rest were showing African-made sitcoms.

‘Do we have any sponsors?’ I asked.

‘Queued up ready, but we’re not running the ads yet,’ they reported. ‘Another couple of rooms needed to cut them ready, account executives hired.’

‘Where you living?’ I asked.

‘Rockerfella Centre,’ the man answered with a grin.

‘Rockerfella?’ I repeated.

‘That’s what we call it. The tall tower, which is also called Tower Twelve, Tall Dozen, the Scraper; depends on who you talk to. But if you tell a taxi driver you want The Tall Tower they know.’

‘How you finding the city?’ Jimmy asked.

‘Cheap,’ they said. ‘Even the expensive stuff!’

The first man explained, ‘We play golf - and use the bar at the course, the restaurants up Spiral One or Two, or the new ones at the Pentagon. Looking forward to the casino and marina.’

‘Been on a safari yet?’ I asked.

‘No time, been hectic setting up. But we will soon. Haven’t been to the zoo yet either. I liked the designs for the stock exchange area, so I’ll move there when it’s ready. Chicago boy you see; towers and rivers.’

‘Going to buy when I can,’ the second man put in. ‘Property around here rises thirty percent or more a year!’

‘We’ll be starting on Spiral III soon,’ Jimmy told them. ‘Further up into the hills, upwards of three hundred houses, some millionaire pads. And the people we employ can get a hundred percent mortgage at three percent.’

‘Don’t forget to cover the golf tournaments,’ I told them as we left.

Back at the hotel, they were showing our news channel on screens in the foyer and bar. I even glimpsed myself, but not from today’s interview. A file was waiting for us at reception, and Jimmy glanced at it as we headed towards our rooms.

‘Have a look,’ he said outside my room, and I stepped in with it, surprised to find a bodyguard on the balcony.

He stepped toward me. ‘I wait outside the door, sir.’

‘Do you always wait in the room?’ I puzzled.

‘Yes, sir. No room of you can be empty. When the maid come - I look, sir. And I look for the bug and the bomb.’

‘Oh, OK. Thanks’

I grabbed a chair and glanced at a series of sketches of the new marina. It would have a number of different theme bars and restaurants. I saw an Indian, Thai, Chinese, Creole, French, Italian, Spanish, British – although I couldn’t figure what they’d serve, an American diner, an American steak house, a fish restaurant and a few others. Beneath them would be Ye Olde English Bar, French Bar, Italian café, ice cream parlour, a wine bar, techno bar – neon lights, retro bar, jazz bar, piano bar, karaoke bar, and many daytime café’s for the wandering tourist with a few dollars to waste. This marina would be my kind of place.

At the evening meal I asked Jimmy about the guy in my room.

‘My new rule: no car or room left alone, just in case. Room maids are carefully watched.’

‘Any specific threat?’

‘One, but they’re being quiet. They may have even given up.’ He did not explained who “they” were.

The rooftop bar contained a sprinkling of ministers, and we chatted for hours, a few good ideas floated. The sun dipped behind Spiral II, the dying amber light reflected off the tower block windows. It was a nice spot to have a city.

Sat quietly chatting, I heard a distant rumble.

‘That was a bomb,’ Jimmy said, standing. He stepped quickly to the nearest bodyguard and told him to use his radio as other men closed in, the rooftop guests concerned.

‘A bomb in old Goma town, Rwanda side, many dead, sir.’

Jimmy lifted his phone. ‘Bob, Jimmy. Been an explosion in old Goma town. I want Rescue Force Congo fully mobilised, and surgical teams from Mawlini.’ He dialled again, to PACT. ‘This is Silo. There’s been a bomb attack in old Goma town. I want roadblocks in Rwanda, every five miles. Close their borders, same for Uganda, and get Kenya checking everyone. The bombers didn’t fly in.’

‘Should we go?’ I asked.

‘And do what?’ Jimmy curtly asked.

Ministers closed in to discuss the turn of events, many making calls, the rooftop now a mini-command centre. Fifty soldiers had turned up within minutes, and the sky was now full of the roar of Hueys heading east over the lake, both Rescue Force and Congolese Rifles. I figured on at least twenty Hueys and two Chinooks.

The head of PACT turned up, the local police chief and the head of the Congo Rifles in tow. Jimmy led them to a quiet table.

‘They could have placed that bomb here, if they wanted to hurt me,’ Jimmy began. ‘Assuming that it’s not a gas main.’

‘Early reports say a truck bomb,’ the head of PACT reported.

‘So why there?’ Jimmy thought aloud. ‘Someone ... knows that I have a city here, but that someone is so stupid that they think my base is Goma town, even on the Rwanda side. Either that, or the bomb went off early.’

‘We have a lot of officers on the border,’ the police chief pointed out. ‘A truck bomb would not be easy to get through. The drivers, they must have business here.’

‘Then the bombers are stupid,’ Jimmy surmised. ‘Which could be al-Qa’eda.’ He pointed at the head of PACT. ‘I want Kenya, Tanzania and Somalia on full alert. Lock down everything.’

When the man returned to us, Jimmy asked, ‘If you were to look at a map, and you were the truck driver, how would you escape?’

‘It’s a thousand miles to any coastline!’

‘They couldn’t fly,’ I put in.

‘They’d have to drive out, in another truck, to avoid suspicion,’ the head of PACT suggested.

‘Concentrate on the Ugandan/Rwandan border, but ask the Tanzanians and Kenyans to lock their western borders down tight.’

The man stepped away again.

When Jimmy’s phone went it was Bob Davies. ‘Jimmy, there’s got to be three hundred dead in that town, fires raging.’

‘Are we on top of it?’

‘Those that we found alive should make it. Surgical teams on their way, many being transported to your hospital there.’

‘Does that hospital know?’

‘Yes, they’ve got a triage area set-up, doctors returning to duty. Mawlini’s Alpha Team is airborne, be with you inside the hour.’

‘Might find people in the rubble. Keep me updated. Thanks.’ Jimmy faced me. ‘That bomb was crude. Hitting African civilians won’t affect my operations.’

‘Then it was terror they were after,’ the police chief stated.

‘Al-Qa’eda do their homework,’ Jimmy commented. ‘This lot didn’t.’

The army chief took a call. Returning to us, he said, ‘Roadblocks every ten miles across this region, sir. As far as Kinshasa.’

Kimballa called, concerned, followed by various heads of states, and finally Abdi.

Abdi asked, ‘Did my war in Yemen cause this?’

Jimmy replied, ‘We don’t know yet. But if was to do with Yemen they would hit you, not here.’

‘We have closed all access points, roadblocks everywhere,’ Abdi reported.

‘Thank you, my friend. We’ll talk tomorrow.’

Shelly called me, concerned; it was all over the British news. I reassured her that we were alright, and I spoke with Helen for ten minutes, through a background drone of heavy helicopters as our Chinooks ferried the wounded to our hospital.

At midnight, most of the ministers and guests had disappeared, leaving officials, ourselves, and the bodyguards. Food was brought

up to us and we ate under the stars as reports came in. At 1am we journeyed together in an electric bus to the hospital, stepping through bloodstains, the reception area crammed with injured people being treated. Fortunately, there were not too many kids; the bomb had gone off at night.

The senior Cuban surgeon stepped out to us, blood on his gown. 'We are saving who we can, but we have all operating theatres full, some people being operated on in wards. Twenty have died, maybe a hundred will be saved.'

'Thank you, doctor,' Jimmy offered him.

'Thanks to your drug we can work all night, no problem. And we are injecting the burns patients, giving them hope.'

It was an odd statement, the first time I had heard it. Medics were telling us they could work all night because they had received the drug. Was this the future?

Ratchet walked in, helping his co-pilot. I stepped up to him and assisted. 'Did you down a bird?'

'No, a house blew, hitting us in the nose glass. Fucking great fire burning over there, all the shanty houses going up.'

With the co-pilot being seen by one of his own colleagues, an RF nurse, I lifted my phone and dialled Rudd. 'Rudd, sorry to disturb you —'

'I've just seen it on the news. You are OK?'

'Yeah, yeah, fine. Listen, those self-assembly homes we give out: I want five hundred delivered to the Rwandan side of Goma as fast as possible.'

'No problem, we have many I can divert. Leave it with me.'

I dialled Mawlini, getting a duty officer. 'It's Paul Holton. Listen, I want a reconstruction crew in Goma tomorrow, couple of hundred people. Thanks.' Turning, I was surprised to find Anton and Cassie, backed by a solid wall of white uniforms.

'Where do you need us?' she asked.

'Surgeons back there, rest to do triage when the choppers land, few in here.'

Cassie barked orders, the solid white mass splitting up. I stepped outside and into the dark night as a Chinook approached. It flared, blasting me with av-gas scented air, its rear already down. RF staff piled off, met by their colleagues, forty casualties helped out, most able to walk. Forty; that had to be tipping the load balance for the helicopter, I considered. The RF staff rejoined the heavy beast, the Chinook pulling away with its ramp down and disappearing over the lake.

As I stood there, I was suddenly very proud of Rescue Force, and proud of the way that the emergency services here had responded; the people of Goma were getting the best care. There was then just the small matter of the cause of the bomb, which may have been us.

Hardon Chase called, and I gave him the details, no suspects so far. As the sun threatened to rise over Rwanda we were in the rooftop bar having breakfast. Then we got a break, a lorry stopped heading towards Uganda; two Sudanese on board, their papers false.

‘Sudan?’ I queried.

‘At some point,’ Jimmy speculated, ‘their President must have figured out how and why he took such losses – assuming that it’s the Sudanese President and not a faction. Or even al-Qa’eda. And there’s always the possibility that the bombers were just paid fools.’

‘Meaning ... someone completely different could have been behind it.’

‘Well, someone who can’t read a fucking map.’

‘PACT going to interrogate the suspects?’ I asked.

‘Being flown over. In fact, should be there by now. After breakfast we’ll fly over to Goma town.’

As we flew across the lake, a few Chinooks and Hueys passed us heading the other way, the operation ongoing. We landed next to other Hueys, a field acting as a transport hub, and walked forwards with our bodyguards, the men now kitted out in camouflage clothing and heavily armed. We commandeered an RF jeep, its driver told to take us to the bombsite, and we weaved slowly through a mix of local traffic and other RF jeeps. I could see local people walking around as if in a daze, some carrying their belongings on their heads and walking out of town, children trailing along behind.

Pulling up near to the destroyed truck, we stepped down onto a scorched mess of wood and brick. Nothing much was standing for a hundred yards in any direction, just a few brick chimneys. Hundreds of RF staff now lifted wooden and metal sheets, searching for survivors, a few locals being treated on the roadside for minor wounds.

The ground commander walked up to us. ‘Done what we can,’ he reported, his uniform blackened. ‘No one found for hours.’

‘I have some of those self-assembly homes on the way,’ I told him. ‘Put them up nearby. Everyone who lost a home – gets a new one.’

Progressing further through the debris field, being careful where we stepped, I could see what was left of the truck, forensics guys now poring over it.

One stopped and faced us. 'Simple device, manual time, mining dynamite used.'

'Can you identify the dynamite's manufacturer?' Jimmy asked.

'Found a few sticks undamaged, got the name all over it. Sudanese.'

Jimmy and I exchanged a look. 'The timer?' Jimmy pressed.

'Kindergarten time,' the man reported. 'Simple, but effective.'

Returning to the golf hotel, Jimmy ordered that airport security be scaled down, and that tourists not be inconvenienced. We snatched two hours sleep, washed and changed, a TV interview – or ten – to handle. The world's media had travelled overnight, flights from several capitals coming direct to Goma airport. The Pentagon building offered a communications suite, and we now made good use of it. Two hours later I needed a beer, having said the same thing many times over to different TV crews – including our own!

Our own news channel was full of the story, images from the scene augmented with images from the hospital, plenty of images of RF staff. In total, some four hundred RF staff had been called out, the RF reconstruction crews now landing and driving over to Rwanda. Self-assembly houses had been diverted from around the region, and were being filmed arriving. I was in my hotel room, getting updates from our own TV news channel. Somehow, they had film of me at the hospital.

When the head of PACT rang us, it was to relay what the interrogation had revealed. The men did not work for the Sudanese Government, but for an oil group. Jimmy questioned that, because most of the oil companies in Sudan were not state owned, but foreign. The oil company was, apparently, aggrieved about being cheated by us, and PACT now had names and details, which they were investigating.

'Someone we cheated?' Jimmy puzzled, easing back. 'Or someone who lost out to us.'

He rang the CEO of CAR, asking if we had ever made competitive tenders against any Sudanese companies. An emphatic no came back. Besides, we didn't make tenders - we favoured the political route. It was a mystery. He asked the CEO to find out if any Sudanese companies had asked for deals in Somalia, Kenya or Tanzania.

The CEO came back on fifteen minutes later, stating that a Sudanese oil company had tried to get access to Somalia before the Darfur conflict. They were interested in the region near Mawlini. Well, a truck bomb would not get near Mawlini, so Goma had been

their target, we realised. But why not hit Kenya - we had hotels there? We put all of our interests in Kenya on alert, just in case.

Later that day, Sykes came on. 'Paul, that Sudanese oil company, it has shares owned by the President and his family.'

'That's naughty. And a bit personal.'

'Are you about to do anything stupid?' Sykes asked.

'Probably. Keep digging on the company. Thanks.' I told Jimmy.

He made a face, and stared out over the golf course. 'Not making a lot of sense. He's not stupid, he knows we'd strike back. So what would a bomb achieve?' Jimmy called the CEO of CAR again. 'Who's lost out to that Sudanese oil company lately?'

'Rumour has it that a Nigerian company lost out in Southern Sudan because of bribes paid.'

'I don't care what you have planned for today, I want all your top staff finding out what they can about that story, and anything else going on in that region. Get back to me. Thanks.' He faced me. 'A Nigerian oil company lost out to the Sudanese oil company behind the bomb.'

He rang PACT. It turned out that the paymasters of the two bombers were not previously known to either man as employees of the Sudanese oil company, they were from Chad. And the bombers were simple lorry drivers being offered a lot of money.

'Nigerian oil?' I queried.

'They've been trying to get into the Congo for years. They still petition Kimballa every frigging week.'

The next call was Unit 402. Baby was coming out of the bag, and we were extending our stay.

In the morning, we flew over to Goma town again, this time to help erect new homes. TV crews were out in force as we took off our shirts and pitched in, seriously ruining trousers and shoes that were unsuitable for this type of work.

At 3pm, drinking from a water bottle handed to me by an RF crew, I pointed at a few odd people. 'Who are they?'

'No idea,' came back.

Then I could hear American accents, so I wandered over, sweaty and grubby.

'Oh, my, your Paul Holton,' a woman said.

'Yes. And you are...?'

'We were on holiday in one of your lodges when we saw the news, so we came over to help out.'

‘Oh. Well ... thanks. Good of you. But don’t get a splinter, please.’ When I next glanced their way a TV crew was filming their earnest efforts to assist. Guess they’d make the news.

At 5pm we flew back, suitably filthy, filmed re-entering the golf hotel.

The head of PACT joined us as we sat down to a meal some thirty minutes later, scrubbed up now. ‘Some odd news from Lagos. Seems that the building that housed a certain oil company lost its electricity. And phones, and mobiles, and all their computers died.’

‘You know how dodgy their electricity is,’ Jimmy quipped.

‘We looking at Sudan for this?’ the man asked.

‘Not unless we wish to make use of the opportunity it affords.’

‘Meaning,’ the man nudged.

‘That Sudan will be a pain in the future, whereas Nigeria will be an ally – baring certain individuals.’

‘Strike while the iron is hot,’ the man commented.

‘Might not have to,’ I suggested. ‘Do the press know yet?’

‘About the bombers? No.’

‘Revealing their nationality will harm Sudan, let alone anything else,’ I mentioned. ‘It’ll drive a wedge.’

‘Abdi might act alone,’ Jimmy cautioned. He faced the head of PACT. ‘Film the two men ready, please.’ The man left us. Jimmy faced me and said, ‘There’s a terror group that will come out of Sudan, but not for ten years or so. If we weaken Sudan, they may appear early, and attack Somalia, who would probably get the blame for any attack on Sudan. But, Somalia would absorb and kill them, which is part of why I built up Somalia. It may also help to split off Southern Sudan, a real prize – one that I haven’t pushed so far.’

He took a breath. ‘Make a few calls, bet the upside of oil.’

I headed off to my assigned task as the details of the bombers were released, an immediate and loud call for vengeance around our region, a call by the people themselves, Abdi true to form and condemning the Sudanese President. And the poor old Sudanese President was getting it from all sides; Russia, China, America, and Europe.

‘It’s nice to see,’ Jimmy commented.

‘What is?’ I puzzled.

‘African unity. Was a time when they wouldn’t think of the other nations as brothers – they’d be more likely to go to war with each other.’

We hopped onto a late night flight back to London, and left the row to simmer. This row, however, had plenty of TV news minutes,

images of the dead and dying, the two bombers, their dynamite from Sudan. The evidence was compelling, the condemnation loud – and from coast to coast around Africa. Our new TV news service had been tried in battle, millions of Africans watching the story unfold. And we had the exclusive.

I hugged the kids at the house, although they generally resisted these days, or ran away. At the same time, three oil executives in Nigeria disappeared, never to be seen again. They were followed by two gentlemen from Chad, who would never get to spend their ill-gotten gains.

Jimmy gave a great deal of thought to Sudan, and we talked it through several times, weighing up the pros and cons. He finally decided that 2025 was the key objective, and the Sudanese terror group should be put on a collision course with Somalia. He labelled it as a betrayal of Somalia, but we had a war to win.

Later that night, all of the bridges over the White Nile blew, truck bombs being employed. No one was hurt, but the citizens of Khartoum now faced a round trip of a few hundred miles to see the in-laws, or to get to work in the mornings. At the same time, Sudan's long and lonely oil pipeline to the Red Sea blew in ten places, the repair time estimated at six months.

Oil prices spiked and I made a few quid, diverting most towards old Goma town, where I planned a few new apartment blocks where a large hole now lay. From the ashes, old Goma town on the Rwandan side would grow. And rapidly.

The French and Germans were horrified, sure that the damage in Sudan was down to us. The British PM was also not impressed, but Hardon Chase offered to bomb Khartoum. The Russians and Chinese benefited from the loss of Sudanese oil and just didn't give a shit, the Indians placated with sales of Chinese oil from Zanzibar.

Meanwhile, the Pathfinders arranged for a shipment of canoes, along with a lot of rope, to be sent to Khartoum anonymously, just to be rude. Not understanding the joke, the innovative and practical people of Khartoum employed the canoes and rope to go back and forth across the river, causing much mirth in Pathfinder circles.

Part 12

An independent Scotland

Jimmy was no big fan of the idea of Wales or Scotland becoming fully independent from England. Both of these countries now ran their own parliaments, but with limited powers. What they did have plenty of, were nationalistic politicians that believed they could do a better job of it. Well, all politicians thought that till the time came, and then screwed up just like the rest.

The case for Scottish nationalists was that Scotland had North Sea oilfields, even if those oilfields were in the dying throes of their life. They believed that Scotland could, and should, be a small and rich nation based on that oil presence. That was a belief and a hope, not a certainty. The Scottish National Party, the SNP, wanted to break away from Great Britain, after which all would be rosy north of the border. Forget the fact that they had one of the lowest life expectancies in Europe, a high obesity rate, and even higher alcohol and drug rate, plus large estates full of unemployed people.

Jimmy voiced an opinion on the matter, without wishing to get involved with local politics. The SNP, however, wished to debate the matter, after Jimmy had used a few hard words to describe them. He had likened them to Nazis, and those were the printable comments.

When asked by a journalist if he would debate the matter with the SNP, Jimmy replied, 'They would walk out of the interview, they certainly wouldn't answer my questions. Their belief in their ability to run an independent Scotland is just that – a belief with no substance. They have no plan for what they'd do after independence, other than ask Europe for money.'

The blue touch paper had been lit. A senior figure in the SNP agreed to debate the matter, and we travelled up to London on a fine June day. I aired caution, but Jimmy said that it was an issue that needed airing. The SNP's candidate, Mick Chandler, refused to shake Jimmy's hand in the studio. We were off to a good start. Helen and I sat in a side room to observe the taping of the show.

Once the adversaries had tested their microphones, Jimmy kicked things off, the interview technically his, the questions his, although he came with no prepared notes. 'Mister Chandler, may I call you Mick?'

'Sure,' the man conceded, amicable now that the cameras were on.

'Mick, why do you desire an independent Scotland?'

Straight forward enough so far.

‘All countries should be independent. Scotland used to be independent, the union with England was forced upon us.’

‘True, and I agree with you, but in most cases I’d rather see countries coming together than splitting apart. What role would you see for the European Union?’

‘An independent Scotland would be part of the European Union, it’s something that we’re very much in favour of.’

‘So you’d give up being told what to do by London in favour of being told what to do by Brussels?’

‘Countries within Europe have far greater freedom –’

‘And some have far greater unemployment, and a low standard of living. European Union membership does not guarantee a great quality of life. Talk to the Portuguese, the Greeks or the Baltic States, they’re in Europe – and struggling, as well as now questioning the benefits of membership. It’s not all rosy.’

‘No, but Scotland has great potential, and we’re starting from a more modern industrial base –’

‘And you think you have North Sea oil.’

‘We *do* have north sea oil, something that we should have benefited from over the past forty years.’

‘How?’

‘The oil revenue should have come to us.’

‘Did you pay the billions it cost to explore the North Sea? Did you pay the billions it cost for the oilrigs to be built and operated? The revenue you would have received is far lower than you might expect, because you would have had to allow in foreign oil companies – to do what you could have never afforded.’

‘It would still have been better than what we did receive,’ Chandler countered.

‘Really? Scotland has been a large net receiver of British taxes since the last war, the English subsidising you. You’re top-heavy with unemployed, operating an old industrial base that has been left behind as the world has moved on. How will you balance the shortfall between taxable income and your social bill?’

‘By re-organising our industrial base and workforce with money from North Sea oil.’

‘OK, let’s assume that North Sea oil lasts longer than I think it will, and that London hands over to you tens of billions of pounds worth of oil rigs and refinement plants without a fight – or would you nationalise the refineries – a breach of EU law?’

‘We would not nationalise the refineries, they’re run by private companies like BP and Shell.’

‘So you’d just grab the oil rigs, also owned by BP and Shell?’

‘No, no private property would be grabbed.’

‘So you would just take your cut of the oil revenue, as London does now.’

‘Yes, as the proper owners of the oil,’ Chandler agreed.

‘OK, so on day one of an independent - a supposedly richer Scotland, the English military withdraws, closing all bases in Scotland, a loss of some thirty thousand well paid jobs. How will you cope with those jobs losses.’

‘Why would the bases close?’

‘Because apart from Germany and Cyprus - with their particular histories - England does not keep military bases in other EU countries, especially not when they’re fighting over North Sea oil. So I’m pretty sure that all military bases would close and move south, a massive loss of jobs and taxable income for you.’

‘It would be an adjustment to be considered at the time.’

‘Are you saying that you haven’t thought through independence properly?’

‘Not at all –’

‘Then answer the question. What will you do when all military bases close?’

‘We’ll adapt and carry on, new jobs in new industries.’

‘And if Russian bombers strayed close to Northern Scotland? Who would scramble to meet them?’

‘An independent Scotland would be part of Europe, and within its defence treaty –’

‘The European Union doesn’t have a defence treaty, so you’d be on your own to start with. And English jet fighters would not scramble to aid you, no more so than they would for Southern Ireland. They might for Denmark or Norway, because they’re members of NATO. Would an independent Scotland be a part of NATO?’

‘It’s something we would consider at the time –’

‘Again, you have not thought it through. Yes or no, part of NATO or not? Because if you are a part of NATO then you’d be expected to maintain a suitable army, navy, and your own air force; all very expensive items. You can’t be NATO in name only; it’s a two-way street. You’d be happy to have a US bomber base in Scotland?’

‘No, we’re not in favour of having US bombers in Scotland.’

‘So you’d not get NATO entry, and you’d be defenceless. Fine, you’re choice. Moving on, what’s your definition of a Scottish national – someone with the right to reside there?’

‘They would have to be born in Scotland, as with any other country.’

‘So if Scottish parents working in England have a baby, it would not be Scottish or allowed to live there?’

‘It would be allowed, because the child’s parents are Scottish.’

‘And if one parent was Scottish?’ Jimmy asked.

‘That would have to be decided.’

‘Again, you haven’t thought it through, you’re guessing what you’ll do.’

‘Not at all –’

‘So one parent – allowed to reside or not?’

‘It would be decided in proper debate, since we don’t have that issue yet.’

‘You already offer free university places, England doesn’t. Would a child of a single Scottish parent be allowed to get a place?’

‘Again, that would be debated when the problem arises.’

‘And English people living in Scotland, could they send their kids to university there free of charge?’

‘If the child was born in Scotland.’

‘Could an English citizen - already working in Scotland, who becomes unemployed after independence, claim benefit there?’

‘That would depend on their status, and the years they had paid national insurance in Scotland.’

‘Fair enough. And the five million people, either Scottish – or with a Scottish parent, currently living in England and Wales – they’d no longer qualify to claim benefits or tax credits in England, and would need a new passport, obtained in Edinburg, and would need to exchange pounds to Euros when they popped home for a visit, passports shown at the border.’

‘The adoption of the Euro is something we would decide at time, given the economic circumstances.’

‘Given that it may be just a few short years away, perhaps the people of Scotland deserve to know now. Scottish pounds or Euros?’

‘I’ll not be drawn on it.’

‘How would you organise Scottish people living south of the border, returning to be registered for new passports?’

‘That’s a logistical process that we would plan for.’

‘Do you think England would expel them?’ Jimmy asked.

‘Why would they?’

‘They’d become non-citizens of England as soon as you declare independence. Their British passports would be void, no use to travel abroad. So they’d all have to travel to Edinburgh to get fresh passports, proving their heritage – where they could. Could a Scottish person born in England have an English passport, but live in Scotland and claim benefits?’

‘Again, it would be looked at.’

‘Right now there are five million people watching this programme who’re wondering where they stand. Do they not have a right to know?’

‘I won’t be drawn on theoretical scenarios –’

‘It’s not theoretical, they’re sat watching. And what of people who consider themselves Scottish, but whose parents were born in England, do they get passports? Surely not.’

‘You muddying the waters with small detail.’

‘That’s the problem with two countries that have been intertwined for hundreds of years: where do you draw the line? Who is Scottish, and gets free tuition fees, and who doesn’t qualify? The population of Scotland is around three million, a sizeable minority being English, or born in England. There are then five million people who could claim a Scottish passport, and if they chose to move back you’d have to support more than twice the population, and all the benefits, tax credits and health service.

‘Truth is, there are more Scottish people and their children living and working in England than there are in Scotland itself. Their taxes go to London, not to you, now or afterwards. And if the break with England was acrimonious then you could have a lot of people being made redundant south of the border. Your businesses would also need to pay export duties when trying to sell their goods south of the border. You could end up with a great many unemployed people on your hands.’

‘These are all things that our parliament would debate –’

‘You may not have a choice. Some of those choices would be made for you by England, where most of your citizens live and work. The London Government may wish to limit the number of foreign workers. But let me ask you this? If the Scottish economy was not doing well, would you consider it OK for Scottish people to look south of the border for work?’

‘They enjoy that right and freedom under EU law.’

‘And if Scotland was doing better than it is now, under your excellent leadership, would English citizens be allowed to take the good jobs north of the border – as they do now?’

‘They have that freedom.’

‘So, not much would change really under your excellent leadership. The economy would be the same.’

‘Not at all, we aim to make far reaching changes –’

‘For the benefit of Scottish citizens, creating jobs that the English can then come up and take. All your hard work, and you’ll be creating jobs for well qualified English graduates. Unless you wish to state here and now that job protectionism will take place ... illegal under EU law.’

‘Under EU law ... we would not practise job protectionism.’

‘But you’d like to, otherwise why improve the Scottish economy for some else’s benefit. So, once independent, you’ll use North Sea oil revenue to create a Scottish utopia, with all the good jobs going to the English, Welsh and Europeans. Very kind of you, very ... charitable.’

‘It would not work out like that –’

‘So you *would* protect jobs?’

‘That may be an option.’

‘Which would be reciprocated by London, and five million Scots would have to move north, walking all over the flowers of your new utopia ... and destroying your economy. If you have ever wondered why there are so many immigrants in England, it’s because things here are pretty good. If you do a good job for your citizens, then that very porous EU border will be open to people moving north and absorbing all the extra wealth that you’ll create for your own *Scottish* citizens. So why bother? The better you do, the more immigrants you’ll have to cope with. North Sea oil revenue will be assisting them, not you.’

‘If immigration was an issue then we’d look at it.’

‘Not under EU law you wouldn’t. And if you’re out of Europe you’re then you’re on your own, no money from London or Brussels. Would you be begging the IMF for loans?’

Chandler offered Jimmy a flat palm. ‘We’ll be a member of the European Union, with all citizen rights protected.’

‘Then you’ll be working for nothing, because the better you do the more immigrants – and English - you’ll attract. Thank you, Mick, you’ve clarified in my mind what a charitable group the Scottish are.’ Jimmy reached across and shook the man’s hand, and stood.

Leaving the studio I said, ‘They’re fucked either way.’

‘That’s the thing about the European Union, a sharing of responsibility and wealth. You can’t get ahead without sharing it around.’

‘What’ll happen now?’

‘Now, their angry citizens will wish to protect Scottish jobs, which will help to refine their approach. Their politicians can’t be seen to be protecting jobs, but don’t dare not protect them. I just introduced them to the real world of European politics: damned if you do, damned if you don’t, and damned if you sit and think about it.’

‘You ... going to get involved in the future?’

‘Not really, it just pisses me off – regions wanting to break away, thinking they can do a better job of it. You’ve got the nationalists in Northern Ireland, Czechoslovakia split in two, northern Italy wants to break away from the south. It’s all bollocks. The politicians there, they’re like heart surgeons saying to a patient: we’ve not done this before, but we’re hopeful.

‘If, and when, the world economy goes to shit, lots of regions will break away and put up roadblocks, starting with Texas, Alaska and Hawaii.’
