While many early ethnographers included interpretive commentaries about visions and the vision quest, there is only one important recent interpretation, in Lee Irwin’s *The Dream Seekers: Native American Visionary Traditions of the Great Plains*. Unfortunately Irwin’s book, for all of its innovative insight, falls into the pattern just described. It is not an analysis of new data but merely rehashes the old ethnographies, presupposing their authority and veracity, but this time using modern psychiatric and neurological investigations of human dreaming as an interpretive device for understanding the vision as a sleep-state experience. This leads Irwin to place the Plains visionary experience under the more general category of dreaming. It should be clearly emphasized here that the vision as experienced in American Indian communities is not invariably, nor even usually, a sleep-state phenomenon, but is often experienced while one is awake.

It is a common theme in the professional literature to see the vision quest as definitive evidence of the radical individualism of Plains Native people. Nothing could be further from reality; in fact just the opposite is true. There is always a symbiotic relationship between the person engaging in the fast and the community to which she or he belongs, even though the ceremony involves the deeply personal sacrifice of rigorous fasting and prayer over several days. The vision itself certainly is a deeply personal experience, and the learning that comes from the experience affects the life of that one person directly. The effort expended in such serious fasting (total abstinence from food and liquid) is obviously a personal commitment and a personal trial. Moreover, the adult faster may have decided on the undertaking either by personal direction from the spirit world or because of some personal crisis. Or the person may have made an entirely voluntary choice to engage in the ceremony as a distinct personal moment to engage in prayer and to seek some spiritual communication that might provide that person’s life with meaning, direction, and even personal spiritual power. Yet in each case the person undertaking the ceremony understands the benefits that also accrue to the communal whole. Whatever personal power the faster may gain is ultimately intended to serve the interests of the community.

One quintessential sign of the communal nature of the vision quest is the common practice in Lakota and other communities for the people to greet the faster with a handshake and a thank-you for the faster’s accomplishment as she or he completes the ceremony. In a typical vision quest, moreover, the community or some part of the community participates in preparing the person to engage in the ceremony. There may be teachings that need to be shared and even preliminary ceremonies that have to be performed. Then through the duration of the fast the community will constantly be conscious of and in prayer for the one who is actually performing the ceremony in isolation.

A short word must be added with respect to the great appeal of this particular ceremony to non-Native adherents of New Age movements and practices. The vision quest is traditionally a ceremonial act performed by a single person in isolation, but always as a part of a particular community and acting for the good of the whole. Given that personal power and assistance is sought from the Mysteries for the ultimate benefit of the whole community, when a non-Native New York City resident flies off to South Dakota, for instance, to perform the rite of vigil on a Lakota reservation under the guidance of a Lakota spiritual leader, one must wonder what close community of political and spiritual existence has made such rigorous claims on this person’s spiritual strength and why he or she has chosen to make the rite so far away from his or her community of residence. From a Native American perspective, this particular performance of the rite has little or no meaning, and thus it must be invested with an entirely new and non-Native meaning. Thus, while non-Native rites that are modeled after American Indian vision quests may provide a response to various spiritual urges and needs, and may correlate well with a Euro-American sense of individualism, ritual practices of that sort bear faint resemblance to the vision quests undertaken in Native communities.

On the other hand, the vision quest, with its resultant access to vision experiences, was and is an egalitarian and democratic phenomenon in American Indian communities. That is, against Albers and Parker (1971), it is a rite that is available to every member of a Native tribal community and was never reserved only for an elite few, such as medicine people or other spiritual leaders, even though certain kinds of medicine power do seem to run in families for a variety of reasons. Indeed, in many tribal communities it was common practice to require every adolescent male to make this rite of vigil as a rite of passage from childhood to adulthood. Georges Sioui, among others, correctly notes that the vision quest might be required of males but was always equally available to females, for whom the exercise would not be mandatory simply because of the privileged status of women in most Native tribal communities.

Historically then, all males in many Native American communities would have made a vision quest as a rite of passage before entering into adult responsibilities and possibly community leadership of any kind. Recognized spiritual leaders, on the other hand, would all have engaged in at least one vigil of some length during which they would have received a vision that communicated their specific medicine power, a situation that continues in the present. Moreover, they would usually engage in repeated exercises of the vigil (today this is sometimes done annually), even if for much shorter durations. While this may also be true of other community members who do not receive such medicine visions, the substantial difference in the visioning of these recognized healers is their more open line of communication with those spirit beings who have selected them as interpreters. Thus,

the annual vigil might be an occasion for some new spirit being to introduce itself to the healer and offer a different sort of spiritual power not previously accessible to that healer. This increases the healer's personal repertoire of power to help the community.

At the same time, there is no sense of class stratification embedded in the vision experience, as some contemporary interpreters with a Marxist orientation would suggest. Healers would have been supported historically by the rest of a community because of their inherent practical usefulness to the community, and community gifts served to free them from the pressures of subsistence hunting and the like. Becoming a political leader was not predicated on access to vision power. On the other hand, leadership in Native American communities was spread in such diffuse ways through the community that different sorts of leadership were exercised by a variety of people at any given time. And it needs to be said clearly that questing for a vision was a very egalitarian phenomenon, something that was available to every person.

This ceremony continues today in many American Indian communities and continues in forms that are consistent with the historical practice of the rite in these communities.

TINK TINKER (2005)

VISIONS. Usage of the term *vision* goes back to the thirteenth-century Italian theologian Thomas Aquinas, who first used the word to refer to a "supernatural" manifestation. It describes a religious experience that involves seeing and, frequently, the other senses as well. The quality of the experi-

ence suggests that the content of the perception is real, a direct, unmediated contact with a nonordinary aspect of reality that is external and independent of the perceiver. "[Vision] is very real," says Lame Deer, a medicine man of the Sioux nation. "It hits you sharp and clear like an electric shock. You are wide awake and, suddenly, there is a person standing next to you who you know can't be there at all" (*Lame Deer, Seeker of Visions*, New York, 1972, p. 65).

The explanation that visions are due to imaginings, pseudoperception, or errors of perception is an expression of the cultural difference between the visionary and the present-day Western psychologist in their views concerning the nature of reality, a topic that would stray too far afield here. But a stand should be taken against those psychiatrists who clinically equate vision with hallucination. In hallucination the content of what is reported is something to which nothing real corresponds; it is a delusion. For the health professional the presence of delusions is a sign of insanity, and in an application of the so-called pathology model of religious experience, visionaries are classified as mentally ill—a diagnosis often imputed to shamans. Yet in clinically healthy subjects visions dissolve spontaneously (as will be seen below), and, what is even more important for the institutionalization of the visionary experience, they can be induced and terminated ritually. This cannot be said of the hallucinations that are associated with insanity. Furthermore, one should be wary when encountering references to dreams in religious contexts. Semantically, the English word *dream* includes the notion that its content does not represent anything real. Non-Westerners, however, often set in opposition a dream category that is taken to be "real" or "valid" with one that is considered "ordinary." The latter category includes fleeting, or "invalid," dreams. The dreams referred to in such remarks as "Old Spotted Wolf had a painted lodge, which he was advised to make by the buffalo, in a dream" (George B. Grinnell, *The Cheyenne Indians*, vol. 1, 1972, p. 234), the dreams known from shamanistic traditions of flying, initiation, and dismemberment, and even the many revelatory dreams of the Hebrew scriptures (Old Testament) should all properly be considered visions.

VISIONARY EXPERIENCE. Contrary to commonly held Western views, having a vision is not a singular or rare event. The father of this Western misconception is once more Thomas Aquinas, who held that the human world and the sacred realm are separated by a wide chasm. A report of a vision was therefore indicative of a rare event, something that could take place only under extraordinary circumstances. In reality, visions are known to all societies, and their use in ritual is widespread.

When a type of behavior thus crosses boundaries, irrespective of ethnic or religious divisions, one may have to look to physical rather than cultural reasons. After all, human beings constitute one species only. Humans all have the same kind of body, the same nervous system. And, indeed, countless reports and modern field observations by anthropologists

indicate that, when a person has a vision, certain physical changes occur. In what is popularly called a trance, the pupils may widen, muscles become rigid, and breathing seem shallow. Some visionaries will fall into what appears to be a deep sleep or even a dead faint. In such a trance, as Barbara W. Lex, a medical anthropologist, maintains, two opposing arousals of the nervous system are experienced. Their alternating action produces relaxation, and this accounts for the trance's beneficial effect. Simultaneously, the brain synthesizes β -endorphins (the body's own painkillers), as this writer learned in a study in which the trance experience was induced in a religiously neutral environment. (See Ingrid Müller's M. D. dissertation, University of Freiburg im Breisgau.) These endorphins are thought to be responsible on the biological level for the joy, euphoria, and "sweetness" that are often reported in the visions of Christian mystics. As this writer learned from fieldwork, these physiological changes must be produced before the visions can occur. In some mysterious way, then, the body becomes a perceiving organ for the sacred dimension of reality.

This manner of viewing the visionary event runs counter to another cherished notion inherited from the Middle Ages, namely that humans are dualistic in nature, consisting of a body and a separate soul. Rather, it seems to modern science that human beings are biopsychological systems. This view echoes ideas put forth by Galen, a Greek physician of the second century CE, who contended that mind and matter are different aspects of the same stuff. In other words, not the soul but the entire human being is having the vision.

The ritual trance, or ecstasy, as an altered state of consciousness, is responsible for even basic perceptions of a non-ordinary quality. "Hearing" voices is not plain hearing. Those who experience voices can readily distinguish them from ordinary speech. "I do not hear it in so many words," explained a German university student who reported being possessed by demons and hearing Jesus and Mary speaking to her; "I am given to know." (See Felicitas D. Goodman, *The Exorcism of Anneliese Michel*, New York, 1981.) "Seeing" also takes place on a different level. As a blind !Kung San explained, the great god kept his eyeballs for him in a little pouch, giving them to him only during the medicine dance; and when the dance was over, he had to return them to the god. That is, he could see only while in trance. A changed quality is also reported during experience with an incubus—that is, when a spirit has sexual intercourse with a human being. In classical Greek tradition such sexual contact might make a diviner out of a woman, as happened when Apollo "raped" Cassandra. The Inquisition endlessly quizzed women accused of witchcraft concerning intercourse with Satan. When given the chance, these women testified that this was not like making love in ordinary reality.

Under certain circumstances, about which very little is known, clinically healthy human beings may inadvertently create the necessary biopsychological preconditions for a visionary experience—that is, they may "stray" into it. When

this happens, as this writer found during fieldwork observations of a millenarian movement in the Yucatán, in Mexico, a regular pattern will assert itself, which, if experienced in its entirety, will take about thirty-five or forty days. The trance episode is apparently most intense at the beginning, and what is seen by participants during this time typically is white. The man who started the Yucatán millenarian movement initially saw white demons. A woman from another apostolic congregation in the same area saw "white angels on white horses galloping by, carrying white flags, very, very white." From the New Testament it is known that when the women went to Jesus' tomb, whatever they saw there—an angel, two angels, two men, or one young man—the vision was bathed in dazzling light, white as snow. The initial vision of Kotama, the founder of Sūkyō Mahikari, one of the "new religions" of Japan, was of a white-haired old man standing in a white cloud. The next phase of the trance is characterized by a gold or orange glow: The Yucatecan apostolic saw burning candles; Kotama's old man was washing clothes in a golden tub. Finally, there is a "double" vision, with ordinary and nonordinary perception overlapping. The Yucatecan went to the cathedral in Mérida and saw a procession of priests whose heads were those of demons. The woman from the other apostolic congregation saw a big Bible fastened above the entrance to the hospital where she was taken. The prophet Muḥammad watched the angel Gabriel astride the horizon, and no matter which way he turned, the angel was always there on the horizon. The widely reported voices are probably also part of this last phase in many instances, as another superimposition of a visionary (i.e., auditory) perception on the ordinary environment. Kotama's episode, for instance, concluded with a voice telling him his new name and giving him instructions. Eventually the vision dissolves, leaving only ordinary reality as the perceptual field.

Not everyone goes through the entire visionary sequence. It is possible to stray into it anywhere along the way. But whether complete or not, its extraordinary and impressive character can result in a conversion experience for the visionary and if the social configuration is right, religious innovation follows. According to legend, the Buddha's enlightenment came at daybreak after a sequence of visions in which he saw first all his own rebirths, then other beings dying and passing into the five destinies of existence, and finally the chain that bound all beings to continued, recurrent death and rebirth. Muḥammad's prophethood was heralded by a complete visionary sequence. First he experienced "true visions" resembling the brightness of daybreak. Several days later the angel Gabriel came to him with a coverlet of brocade (gold?) with some writing on it and commanded him to read it. Still later, Muḥammad beheld Gabriel on the horizon. A hundred years ago Wovoka, the Ghost Dance messiah, told of his vision that, "when the sun died, I went up to heaven and saw God and all the people that had died a long time ago. God told me to come back and tell my people they must be good and love one another, and not fight, or steal, or lie. He gave me this dance to give to my people." And in

this century, the cargo cults of Melanesia have been characterized by spontaneously occurring visions. Leaders of various cults have told of hearing voices, seeing lights, and meeting native gods and fairylike beings of the forests and waters. They have spoken, too, of journeys to heaven (an idea borrowed from Westerners) and of visits to the Hiyoyoa, their own otherworld.

While these spontaneous episodes of visionary experience dissolve without the aid of ritual, there is another class of vision in which this is not the case. This is the so-called shamanistic illness, reported predominantly in Asia but also in Africa, North America, and, sporadically, other areas as well. Medical anthropologists suspect that in some instances the triggering mechanism may be biochemical, for example, resulting from a socially prescribed change in nutrition, but such causes cannot often be pinpointed. Its onset is variously signaled by high fever, swelling of either the limbs or the entire body, prolonged unconsciousness, and inability to eat; at times, there is also an indomitable urge to flee into the wilderness. These changes are preceded, accompanied, or followed by visions. The condition, which may linger for years, is classed not only as an illness but also as a sign that the sufferer is destined, singled out by an agency of the sacred ranges of reality, for a future as a religious specialist. Cure is effected by a ritual that is usually initiatory in nature.

One example among many comes from the German ethnographer Peter Snoy. In his book *Bagrot* (Graz, 1975), Snoy tells of a Yeshkun shaman from the Karakoram Mountains (part of the Himalayan system). When this man was about twenty he was walking home one day when suddenly he saw five fairies dancing in the fields. They did not talk to him, but the next day he had the unconquerable urge to run away into the mountains to join them. He started raging, and five men finally managed to tie him up. He was kept tied up in his house for a whole year, and the fairies visited him several times each day, descending through the smoke hole and singing and dancing for him. Eventually, the man's village arranged an initiation feast for him. A goat was sacrificed, and he drank its blood, which the fairies told him was milk. And for the first time he danced, performing what is in his society an important part of shamanistic séances. Subsequently, the man worked as a healer and diviner.

Reporting from Africa, the British social anthropologist Adrian Boshier, in "African Apprenticeship" (in *Parapsychology and Anthropology*, New York, 1974), tells the story of Dorca, a Zulu *sangoma*, that is, a diviner and healer. For three years, Dorca was sick in bed. During this time her spirit left her body every night, and she saw many things and visited places where she had never been. One night in a vision her dead grandfather came to see her. He told her that he liked her very much and that his spirit would enter her body so that she would be able to help her people. She refused, but spirit *sangomas* came to her every night, showed her beads and herbs and a feather headdress she was to make, and sang her a song that she was to learn. Finally her grandfa-

ther's spirit threatened to kill her if she continued to resist. Her mother thereupon took her to the house of an aunt who was also a *sangoma*. There Dorca sang the spirit song and danced for many hours. This was the beginning of her training as a *sangoma*.

In most non-Western societies, visions are an integral part of religious ritual. As Lame Deer says, "By themselves these things [rituals] mean nothing. Without the vision and the power this learning will do no good" (1972, p. 13). It is understandable, therefore, that such societies cannot rely on the fortuitous occurrence of visionary experiences but need ways for inducing them.

Many strategies for inducing visions utilize rhythmic stimulation. Inuit (Eskimo) ritual specialists use drums, as do various Siberian shamans, for whom the drum represents the magic horse on which they ride to the beyond. Such stimulation is so effective that by merely shaking a gourd rattle and using traditional postures, a visionary experience can be induced in volunteers in a religiously neutral environment. (See this writer's article "Body Posture and the Religious Altered State of Consciousness: An Experimental Investigation," *Journal of Humanistic Psychology*, 1984.) Other methods involve sensory deprivation, as used by the Shakers and by the Spiritual Baptists of Saint Vincent Island in their mourning ritual; isolation and fasting, as practiced by the Oglala Indians and other societies; and fasting and self-mortification, as in the initiation ritual of the Plains Indians, during which adolescents seeking a vision would fast, bathe in icy streams, and crawl naked over jagged rocks in order to acquire a guardian spirit. Christian mystics employed similar strategies. The German monk Suso (Heinrich Suse, c. 1295–1366), for instance, was able to achieve several visions daily for a period of about sixteen years by fasting extensively and by sleeping in a tight undergarment through which nails protruded into his skin.

Even intense concentration in combination with nothing more than certain breathing techniques may bring about visions, as has been learned from the Chinese Daoist philosopher and mystic Zhuangzi (369–286? BCE). Zhuangzi told of a master called Ciqi, who "sat leaning on his armrest, staring up at the sky and breathing—vacant and far away." The changes wrought in him were striking to his companion, who asked, "What is this? Can you really make the body like a withered tree and the mind like ashes? The man leaning on the armrest now is not the one who leaned on it before" (quoted in *Poetry and Speculation of the Rg Veda* by Willard Johnson, Berkeley, 1980, p. xxvii). Ciqi explained that by virtue of this change he was able to hear the piping of the earth and the piping of the heavens.

Other societies employ a number of different psychedelics to achieve visions. The use of such drugs goes back to antiquity and is widely distributed geographically. Mushrooms such as the fly agaric (*Amanita muscaria*) were probably known to Mesolithic Paleosiberians (about 8000 BCE). Mesoamerica and South America are particularly rich in plants

that contain the requisite alkaloids, and many societies there utilize them ritually. But there are also reports of their religious application from every other continent. At first glance, the use of psychedelics seems to represent an easy way of achieving visions, and for this reason many North American Indians reject them. As Lame Deer said contemptuously, "Even the butcher boy at his meat counter will have a vision after eating peyote" (1972, p. 64). Actually, though, matters are not quite that simple. Many of the substances bring about an undifferentiated condition of intoxication, and seeing the right vision requires training. Thus Gerardo Reichel-Dolmatoff, in his book *Amazonian Cosmos* (Chicago, 1971), discusses the use of *Banisteriopsis caapi* by the Desana Indians of South America. He tells that during intoxication, the Desana religious specialist needs to learn to see the Milky Way as a road, the hills and pools as communal houses of the spirits, and the animals as people. Those who are unable to go so far in their visions see only clouds and stones, "and the birds laugh at them." In another instance reported by Reichel-Dolmatoff, during a communal rite of the same society, the men take the drug, and the priest, who has abstained, talks them through their visions.

FORMS OF VISIONS AND TYPES OF SOCIETY. It appears that, cross-culturally, the neurophysiology of visionary experience remains the same. Neither does the form in which it is expressed vary much, if one contemplates only the religions of a particular type of society, of agriculturalists, for instance. However, salient differences appear when comparing the religious expression of one societal type with that of another, that of agriculturalists, for example, with that of hunters. There are, of course, syncretic patterns, for societies change, and so do their religions. But it is still possible to recognize certain fundamental forms.

(In the following passages, the "ethnographic present" is used in giving examples from non-Western societies, although in many instances the rituals mentioned have fallen victim to Western conquest and aggressive missionizing.)

Visions of hunter-gatherers. The way of life of the hunter-gatherer is the most ancient and venerable of all human adaptations. Humans' antecedents were hunters and gatherers for a million years or more before any cultivation of the soil was introduced. In such societies that are still extant, visionary experiences are varied, involving a highly sophisticated use of religious trance. Hunter-gatherers understand the ordinary and the nonordinary aspects of reality to be closely intertwined, indeed to coexist in time and space, as one Pygmy elder from the Ituri rain forest expressed it. All adult men can easily switch from seeing ordinary reality to seeing its nonordinary aspect, having learned to do so early on, usually during initiation rites. In the sacred range a man can see the "spirits," that is, the nonordinary aspects of stones, mountains, waters, and winds, of plants, insects, and animals. He sees the spirits of the unborn, one of which he has to take to his wife before she bears his child. The spirits of the dead gather around when a feast is being prepared or

during a medicine dance, and they need to be invited to take part. An individual spirit of a dead loved one may appear to teach a man or a woman a new song, game, or ritual. A murderer's essence may loiter at the tomb of his victim, and beings of curious shape may warn the living of danger. If they penetrate someone's body, they make him ill by leaving behind a bone, visible to the healer, who will remove it in a curing ritual by sucking it out. People also tell of seeing strange neighbors, such as the "no-knees" of the San, beings who catch the sun as it sets and kill it. After the sun has been cooked, the no-knees eat it and throw its shoulder blade to the east, where it rises once more.

The most spectacular institutionalized visionary experience of hunter-gatherers, however, is the spirit journey, a perfect expression of the hunter's life way, in which individual initiative is of paramount importance. The Pygmies embark on this journey by "crossing a river." On the "other side," they may visit the realm of the spirits of the dead, where everything is reversed but still as orderly as is earthly existence. For the !Kung San of the Kalahari Desert the great god used to let down a cord from the sky by which he allowed the medicine man to climb up to visit him. Nowadays, however, during the medicine dance, medicine men send their spirits out to fly into the veld while their bodies lie lifeless, for there is nothing to hold them up. They might see the spirits of the dead there, or the great god, or perhaps they go because they need to order a lion to stop disturbing people by roaring at night. An Australian medicine man takes a postulant up to the sky by assuming the form of a skeleton and fastening a pouch to himself into which he places the postulant, who is reduced to the size of a very small child. Sitting astride a rainbow, the medicine man pulls himself up with an arm-over-arm action. When near the top, he throws the young man out onto the sky as part of his initiation. An Inuit shaman will swim muscle-naked through rock to the underworld in order to seek out Tornassuq, the earth spirit, and inquire of him the reasons for recent misfortunes of his band. Other spirit journeys, as told of by North American Indians, are undertaken to recover a lost soul, whose absence makes its owner sick.

Visionary experiences serve many important functions within hunter-gatherer society. On the individual level, a vision bestows well-being and strength as well as power to speak impressively, to cure and to divine, and to protect the group against danger from the outside. For the community, visions are a part of many rituals. A spirit journey, for example, is an important communal event. When an Inuit shaman starts out on his trip, the entire village is present, and all are there when he comes back to tell of his adventures. Among the Salish, a tribe of North American Indians, the dramatization of the journey in a spirit canoe in quest of a lost soul is a most impressive performance. What was perceived in a vision is represented on cave walls, or on rocks, painted on bark, or carved in bone for all to see. For a while, such innovative iconography will be confined to the originat-

ing group, but unencumbered by written tradition, it eventually diffuses to neighboring bands and even to the wider cultural area, continually reinvigorating religious life.

Visions of horticulturalists. About ten to twelve thousand years ago human beings began growing some of their own food instead of merely collecting it. The areas cultivated were no more than gardens, hence the name *horticulturalist*. Horticulturalists also continued hunting, some extensively, others less so, depending on the ecology of their respective region. While European tradition retains no memory of the hunter-gatherer past, the horticulturalist way of life is reflected in recorded history. What is known of the Celtic, Germanic, and Greek societies clearly indicates their horticulturalist character. Societies of this type survive in Southeast Asia and, especially, in Mesoamerica and South America. Their members' visions have much in common with those of hunter-gatherers, but not all horticulturalists learn the behavior. Instead, there is a more or less pronounced tendency for religious specialists to assume the spiritual role that is performed by all male hunter-gatherers.

The spirit journey of the hunter-gatherer has undergone significant permutations in various horticulturalist societies. Their legends tell of full-fledged spirit journeys like those of the hunter-gatherers: of the Teutonic god Óðinn (Odin) who travels the earth, of a famous medicine man of the South American Guaraní who calls on First Woman in her maize garden in the mythical East. But horticulturalists cannot explore such distant ranges with impunity. Just as Orpheus cannot retrieve Eurydice from the underworld, no Amazonian Akwe-Shavante can ever visit the village of the spirits of the dead, although some have had offers from the spirits of friendly departed relatives to take them there. Instead, horticulturalists undertake a lesser experience, an actual journey that culminates in the desired vision. Initiates of the Eleusinian mysteries of ancient Greece descended into caves; the Huichol Indians of Mexico travel over land in search of peyote; adherents of Shinto climb Mount Fuji. Even the North American Indians' vision quest and their search for the guardian spirit is of this nature. The spirit journey may also be entirely vicarious, as when the Brazilian Yanomamö Indians send their friends, the miniature *hekura* spirits who live under stones and in mountains, to enemy villages to eat the souls of the children there. (See Napoleon A. Chagnon, *Yanomamö: The Fierce People*, New York, 1977.) Visions are given shape in paintings on rock and in carvings, embroidery, and clay. They invest the practitioner not only with personal stature but also with power that leads to success in curing, hunting, and war, all in the service of the community.

Visions of nomadic pastoralists. Nomadic-pastoralist societies appear in a number of different adaptations. Some such societies arose from hunters who had attached themselves to wild herds of animals, such as reindeer, or from hunters who had acquired pet animals, such as horses, which had expanded into domesticated herds. Other nomadic-

pastoralist societies arose as extensions of agriculturalist societies, and still others developed in which only the men are pastoralists, while the women cultivate the soil. The visionary experiences of nomadic pastoralists correlate with the differences in their origins.

Among reindeer herders, for instance, such as the Evenki of northern Siberia, the hunter's richly appointed sacred dimension is still preserved, although it is accessible only to the shaman. In his visions, the shaman constructs the fence that surrounds his clan's territory and protects it against enemy shamans. He communicates with the ruling spirits, the "masters" of waters, mountains, forests, and species of beasts. In his spirit journeys he guides departing souls to the lower world, at which time he must ask the mistress of that world for permission for the soul to enter. He also travels to the upper world, where he calls on Grandfather Spirit and the supreme spirit ruler of all animal and plant life as well as on the spirits of the sun, moon, stars, thunder, clouds, sunset, and daybreak. He even knows the way to the storehouse of the unborn, which is guarded by Bear. In addition, he masters the art of the vicarious spirit journey by swallowing his helping spirits and then sending them out to hunt down a disease spirit or fight an enemy shaman. He is healer and diviner, and the marvelous ritual dramas of his visions were, until their destruction by Soviet authorities, at the heart of his society's social life.

Traditions die hard, however. The Hungarian horse nomads have been cut off from their own cultural area in Inner Asia for over a millennium. By the year 1000 they had been converted to Roman Catholicism, and their economy changed radically. Yet to this day they retain a clandestine shamanistic tradition, with one *táltos* (shaman) fighting the other in visionary battles, and with "women of knowledge" who are able to see the spirits of the dead.

In passing to a discussion of nomadic-pastoralist societies with important ties to agriculture, this article leaves the visionary world of the hunters entirely behind. The Nilotic Dodoth, for instance, whose women garden while the men tend the cattle—a pattern found only in Africa—have but one god. This god is so remote and vague that little is known about him. He communicates with humans by such messengers as shooting stars, and no shaman ever visits him, although his worshipers send him sacrificial oxen. The most important ritual specialist among the Dodoth is the diviner, whose oracles have a literal quality: "[Lomotin] would see it raining in a dream, then see a red ox being sacrificed and he would know, when he awoke, that the sacrifice of such an ox would bring rain. He was uncannily right" (Elizabeth Marshall Thomas, *Warrior Herdsmen*, New York, 1965, p. 173).

For the Tuareg, nomads of the Sahara and nominally Islamic, God (Allāh) is equally a distant overseer, who sends the spirits of Islamic saints as messengers, or angels, who are often identified with lightning. In a faint outline of pre-Islamic religion, Tuareg men have dealings with spirits called

kel asouf, which attach themselves to their hair, help them divine, and are seen doing battle with each other.

The messenger complex is reminiscent of Judeo-Christian tradition, and, indeed, both Judaism and Islam have their roots in nomadic pastoralism. Angels as messengers abound in both the Hebrew scriptures and the New Testament, from the one that spoke to Hagar, the mother of Ishmael, to the heavenly host who announced the birth of Jesus and the white-haired angel wearing a golden girdle who appeared to John according to the *Book of Revelation*. Muḥammad's numerous contacts with the angel Gabriel have been mentioned before.

Spirit journeys are reported both of Moses and of Muḥammad, with the former, for instance, going up Mount Sinai and there encountering God, and the latter rising through the night, ascending to heaven, and conversing with God. Traces of these journeys are even contained in the New Testament, as in *Matthew* 4:1–3: "Then Jesus was led into the desert by the Spirit to be tempted by the devil. And he fasted forty days and forty nights and afterwards he was hungry. And the tempter came to him."

The spirit journey was later taken up by the Islamic Ṣūfī mystics. The first one of these to give a personal account of such experiences was Najm al-Dīn (c. 1145–1223), the famous mystic and teacher of the city of Khorezm, an important center of learning at the time. Among the many mystic experiences he reported are visions of Muḥammad as well as numerous spirit journeys. (See *Die fawā'ih al-ḡamāl wa fawātiḥ al-ḡalal des Naḡmuddīn al-Kubrā*, translated by Fritz Meier, Wiesbaden, 1957.) Kubrā's spirit journeys were not metaphorical but were entirely real to him. He experienced the sensations of being lifted off the ground into the air, of being borne aloft by angels, and of flying. It was not his body that flew but "he himself, his heart or holy spirit, which leaves the body through a hole on the right side, opened by the formula of contemplating God." Once in heaven, he encountered God's properties at various locations, and while passing them he incorporated them into his being. Kubrā, who traveled widely and who carried Classical Greek and medieval Christian ideas back with him to Inner Asia, no doubt also knew about the Jewish mystics of his time, such as Mosheh ben Naḥman (Nahmanides) and perhaps also of the Italian friar Francis of Assisi.

By the early thirteenth century, however, mysticism was no longer part of European popular culture but was, rather, an enterprise of the intelligentsia, who induced mystical experiences for personal enlightenment. In fact, Moses ben Naḥman was criticized for having made mysticism accessible to the masses, because it gave rise to visionaries, who supposedly were followed blindly by the credulous. Thomas Aquinas's premise that visions are a rarely occurring bridge between the human and the divine must be seen in this context. Barely two generations later, Suso warned some nuns not to attempt any mystic experiences, although he himself had extensive visions. Once, while in a faint, "it seemed to him in

a vision that he was being conducted to a choir, where the mass was being sung. A large number of the heavenly host was present in that choir, sent by God, where they were to sing a sweet melody of heavenly sound. This they did, and they sang a new and joyous melody that he had never heard before, and it was so very sweet that it seemed to him that his soul would dissolve for great joy" (*Briefbüchlein*, translation by this writer). The mystics soon found themselves in opposition to orthodoxy in all three monotheistic traditions, and within the century both Franciscans and Ṣūfīs were being executed for blasphemy. The pagan traditions of popular culture, with its legends of a wild huntsman and witches' sabbaths, deteriorated without institutionalization or support from the larger society, eventually to be wiped out by the Inquisition.

Visions of agriculturalists. As humans turn to tilling ever larger open fields and to the consuming task of exerting control over their habitat, the institutionalization of the visionary experience disappears entirely, and even spontaneous occurrence is suppressed because of its perceived threat to the written tradition. It is difficult, for instance, to gain recognition for a new shrine from the Vatican authorities, because claims of "genuine" visions are rarely credited. The predominant experience in the religions of large agricultural societies, such as Chinese popular religion, Christianity, and Hinduism, is instead spirit possession.

The urban adaptation. The situation in modern urban centers is similar to that in agriculturalist religions. Large urban movements such as pentecostalism or Umbanda, an Afro-Brazilian healing cult, as well as some Japanese "new religions," rely on possession. If visions occur at all, they usually come about outside the religious context, as was the case with the near-death experiences investigated by the physician Raymond A. Moody, Jr.

In general, it seems that as human beings develop various adaptations to their habitat beyond that of hunting and gathering, the frequency and rich variety of visionary experience in their world begins to diminish. Indeed, this reduction appears to be in inverse proportion to their control over the habitat, for as control over ordinary reality increases, the grasp on the sacred dimension as it is expressed in visions starts to slip away. In the spirit journey the initiative belongs to humans; in spirit possession humans are manipulated. Institutionalization of the visionary experience causes it to dissolve even faster—in the West, ending with the mystics. Since the biological capacity described earlier remains intact, however, a resurgence of all modes of ecstasy may be seen as more leisure time becomes available in the postindustrial era. Tendencies toward such a development are evident in the countercultures of both the United States and Europe.

BIBLIOGRAPHY

A well-written biography of Francis of Assisi incorporating much recent research is Adolf Holl's *The Last Christian*, translated by Peter Heinegg (Garden City, N. Y., 1980). The *Complete Works of Saint Teresa of Jesus*, 3 vols., translated and edited by E. Allison Peers (New York, 1946), contains illuminating accounts of the mystic experiences of Teresa of Ávila. In the section entitled "Interior Castle" she describes her pioneering attempt to protect her nuns from the Inquisition by pointing to illness as a possible cause for visions. Hans Peter Duerr's *Dreamtime* (Oxford, 1984), reviews the prehistory and later struggles of pagan religion in Europe that involved contact with the sacred dimension, with special regard to the role of women. The footnotes in particular contain a wealth of interesting material. An excellent study of Sufism is Annemarie Schimmel's *Mystical Dimensions of Islam* (Chapel Hill, N. C., 1975).

Carlos Castaneda's work, especially *The Teachings of Don Juan: A Yaqui Way of Knowledge* (Berkeley, Calif., 1968) and *A Separate Reality: Further Conversations with Don Juan* (New York, 1971), whether entirely reliable ethnographically or not, still represents a graphic description of the feel of altered states of consciousness. For an unimpeachably authentic view of American Indian visionary experience, *Black Elk Speaks* (1961; reprint, Lincoln, Nebr., 1979), as told by the holy man of the Oglala Lakota through John G. Neihardt, the poet laureate of Nebraska, remains unsurpassed. The anthropologist Michael Harner, in *The Way of the Shaman: A Guide to Power and Healing* (New York, 1980), provides instructions for self-experimentation on the basis of what he learned in his fieldwork with Indian societies of South America. The interest of the counterculture in such experiments is reviewed in Tom Pinkson's study *A Quest for Vision* (San Francisco, 1976). A readable collection of case histories of near-death experiences was put together by Raymond A. Moody, Jr., in *Life after Life* (New York, 1975).

Revised Bibliography

VIṢṆU. In the age of the *R̥gveda*, India's oldest religious document (c. 1200–1000 BCE), Viṣṇu must already have been a more important divine figure than it would appear from his comparatively infrequent appearances in the texts. He is celebrated in a few hymns, of which stanzas 1.22.16–21 came to be a sort of confession of faith, especially among the Vaikhānasa Vaiṣṇavas, who adapted them for consecratory purposes and for invoking the god's presence and protection. These stanzas eulogize the essential feature of the character of the Vedic Viṣṇu: namely, his taking, from the very place where the gods promote human interests, three steps, by which he establishes the broad dimensional actuality of the earthly space in which all beings abide (see also *R̥gveda* 1.154.1 and 3, etc.). His highest step is in the realm of heaven, beyond mortal ken. Thus, his penetration of the provinces of the universe, in accordance with the traditional Indian interpretation of the character of the original god as the representative of pervasiveness, must be considered a central feature in the vast complex of ideas for which the name of the early Viṣṇu stood.

Virāj, the idea of extending far and wide the female principle of creation and the hypostasis of the universe conceived as a whole, came to be one of Viṣṇu's epithets. Being essential to the establishment and maintenance of the cosmos and beneficial to the interests of humans and gods, his pervasiveness obtained ample room for the former and divine power for the latter. To the sacrificer, who ritually imitates Viṣṇu's three strides and so identifies with him, the god imparts the power to conquer the universe and attain "the goal, the safe foundation, the highest light" (*Śatapatha Brāhmaṇa* 1.9.3.10). Viṣṇu's pervasiveness also manifests itself in the central cosmic axis, the pillar of the universe, whose lower end is visibly represented by the post erected on the sacrificial ground. This axis reaches the earth in the center or navel of the universe, putting the cosmic levels into communication with each other; it thus provides a means of traveling to heaven as well as a canal through which heavenly blessings reach humanity. In this navel is located the sacrifice with which Viṣṇu is constantly identified.

In the *R̥gveda* Viṣṇu is Indra's ally and intimate friend. In the later Vedic Brāhmaṇa literature, two *R̥gvedic* myths connected with Viṣṇu, or with Viṣṇu and Indra, are further developed so as to become, like two other myths, the seeds of some of the god's *avatāras*. After Indra slew a boar that kept the goods of the *asuras* (antigods), Viṣṇu, (i. e., the sac-

rifice) carried the animal off, with the result that the gods obtained the goods of their enemies. This boar, then identified with the creator god Prajāpati, is also said to have raised up the earth (*Śatapatha Brāh.* 14.1.2.11); in course of time Viṣṇu fuses with Prajāpati, and in the *Mahābhārata* (3.142.56, Bombay ed.) it is he who saves the overcrowded earth by raising it up. The great fish (*Śatapatha Brāh.* 1.8.1) that delivers Manu, the first human, from the deluge appears later as a form of Brahmā (*Mahābhārata* 3.185) and becomes in the postepic Purāṇas an *avatāra* of Viṣṇu.

A conglomeration of religious currents contributed to the development of post-Vedic Viṣṇuism. In the centuries before the beginning of the common era, Viṣṇu fused with several divine, mythical, and heroic or legendary figures. Among them are (1) the primeval cosmic man (Puruṣa), embodying the idea that creation is the self-limitation of the transcendent person (*R̥gveda* 10.90), which became the keystone of Vaiṣṇava philosophy; (2) the creator god Prajāpati; (3) Nārāyaṇa, a divine figure featured in the narrative of three ascetics who do not succeed in beholding him because this is a privilege of those who follow the path of *bhakti* (*Mahābhārata* 12.321ff.); and (4) Kṛṣṇa, who in the *Bhagavadgītā* (*Mahābhārata* 6.23–40) teaches, in human shape, how to combine a socially normal life with a prospect of final liberation. Although the names of these figures, when borne by Viṣṇu, came to represent particular aspects of his character and activities, they often also continued to indicate the principal persons of sometimes almost independent mythical themes. This plurality of names also helped to overcome incongruities caused by the fact that Viṣṇu is both the supreme being and a deity responsible for particular duties and activities: “the only [triune] God, Janārdana [Kṛṣṇa], is called Brahmā, Viṣṇu, and Śiva, accordingly, as he creates, preserves, or brings to an end” (*Viṣṇu Purāṇa* 1.2.62).

In the epic period (c. 500 BCE–200 CE) Viṣṇu definitely assumed that aspect of the godhead that he holds up to the present day, that of preserver and protector of the world, lord and ruler of all. Yet many of his names and epithets continue to refer to character traits proper to a great god in the mythological sphere. Moreover, the deeds and characters of parochial gods, especially those of Indra, are transferred to him. Whereas in the *R̥gveda* he is not credited with warlike activities of his own but rather assists Indra in his encounters with demons, he is already at an early date described as fighting and killing antagonists who, like Jambha, the disturber of sacrifice, were in older versions slain by Indra.

In the extensive postepic Vaiṣṇava literature many mythical episodes are inserted to show that God, when devoutly worshiped, is willing to appear in one of his forms in order to help or protect his devotees. For instance, in the story of the two demons Madhu and Kaiṭabha—who in the older version (*Mahābhārata* 3.194) intimidated Brahmā and in the later version (*Jayākhya Saṃhitā* 2.45ff.) stole the Veda so that the world fell to a bad state—the gods and demons praise Viṣṇu, who by his supernormal knowledge restores the

Veda and who, after a battle of many thousands of years, kills the demons with a body consisting of *mantras* that represent his *śakti* (superempirical creative power). From this story originates his epithet *Madhusūdana*, or “destroyer of Madhu.”

Viṣṇu is usually depicted as a four-armed, dark blue young man bearing in his hands a conch (an auspicious object that represents fertility and is supposed to strengthen the divine powers), a discus (his invincible flaming weapon), a mace, and a lotus (which, rising from the depths of the waters, evidences their life-supporting power). He wears the miraculous jewel Kaustubha (which emerged from the churning of the ocean). The characteristic curl of hair on his chest is called the *śrīvatsa* (“favorite of the goddess Śrī”), and characterizes him as the universal sovereign. These mythological attributes are often used as aids to devotion. The mere presence of Viṣṇu riding the eagle Garuḍa, the theriomorphic manifestation of his nature and energy, suffices, in myth, literature, and plastic arts, to subdue the demoniac serpents.

In the post-Vedic period Viṣṇu’s consort is known by two names, *Śrī* and *Lakṣmī*; originally these were two different goddesses, the former representing fortune and prosperity, the latter being closely connected with the ripe corn. Like Viṣṇu, *Śrī*-*Lakṣmī* is eternal and omnipresent. Associated in every possible way with the lotus symbol, she is said to have risen from the ocean to preside over earthly welfare. It is with the Goddess in such form that Viṣṇu is united in all of his incarnations: He, “the husband of *Śrī*,” is the creator; she, creation; she is the earth, he, its support; he is one with all male beings, she, with all female beings; and so on. In mythical imagery, *Lakṣmī* never leaves Viṣṇu’s side. In later Hinduism, she is, as Viṣṇu’s *śakti*, the instrumental and material cause of the universe, God himself being the efficient cause. Indissolubly associated with each other, they constitute the personal *brahman*, also called *Lakṣmī*-*Nārāyaṇa*. Nevertheless, they are distinct: She alone acts, but everything she does is the expression of his wishes. *Lakṣmī* also makes an appearance in various mythical stories under different names (*Mahālakṣmī*, *Bhadrakali*, etc.). Many of these denote special aspects of Prosperity (*Śrī*-*Lakṣmī*); some appear, as companions of Viṣṇu, as the goddesses Victory (*Jayā*), Renown (*Kīrti*), and so on. While his alliance with his second consort, *Bhūdevī*, the Earth, stamps him as a bigamist, Viṣṇu’s relations with many incarnations of his spouse are often characterized by youthful passion, reckless adventure, and human—often too human—emotions. He ravishes *Rukmiṇī*—even though she has been intended for *Śiśupāla*, whom he beheads—and marries her (*Mahābhārata* 2.37ff.); soon she is said to be an incarnation of *Śrī*, destined to marry Viṣṇu-*Kṛṣṇa* (*Harivaṃśa* 104ff).

In his supreme and at the same time triune character, Viṣṇu, the Lord and highest Person, the unmanifest primordial principle, absorbs the universe at the end of a *yuga* (age of the world) by successively becoming the glowing sun, the scorching wind, and a torrential rain (*Matsya Purāṇa* 1.67).

When the world has again become the undifferentiated water from which it once arose, Viṣṇu—according to some, together with Lakṣmī—sleeps on a thousand-headed serpent called Śeṣa, “the remainder” (because it represents the residue that remained after the universe and all its beings had been shaped out of the cosmic waters of the abyss), or Ananta, “the endless one” (who, symbolizing eternity, is identical with the ocean out of which the world will evolve as temporal existence and ultimately also with Viṣṇu himself). With the serpent and the ocean upon which this animal floats, Viṣṇu then constitutes the triune manifestation of the single divine cosmic substance and energy underlying all forms of phenomenal existence. During his sleep the world is “thought,” nonexistent. When he awakes, he engages in meditation for its recreation. A lotus grows from his navel, and on this flower is born the demiurge Brahmā, who creates the world. Then, while residing in the highest heaven (Vaikuṅṭha), Viṣṇu in the form of Puruṣa preserves the world until it is once again ripe for dissolution.

The development of many myths and mythical narratives attests to Viṣṇu’s adaptability and versatility. For instance, the older sources (*Mahābhārata* 1.16ff.) state only that Viṣṇu-Nārāyaṇa advised the gods and the *asuras* to churn the ocean in order to acquire from it *amṛta*; then, in the form of an anonymous woman, he recovered this drink of continued life from the *asuras*. Later versions relate his appearance as a fascinating young woman, Mohinī (“the deluding one”), tricking the *asuras* and distributing the *amṛta* among the gods.

In innumerable tales attesting to the popular belief in Viṣṇu’s intervention in the vicissitudes of individual lives, the mythical element is no less mixed up with legend than in the many hagiographic compilations, which, like devotional literature in general, reactivate the power inherent in the mythical stories. Invocation of the god’s protection is therefore often accompanied by a reference to one of his great exploits or important mythical aspects. Thus Kṛṣṇa-Viṣṇu, who made the gods happy by slaying Kaṃsa (*Mahābhārata* 2.13.29ff.), will no doubt prove a competent and reliable helper. Hearing the holy story of the *Rāmāyaṇa*—the heroic deeds of Viṣṇu descending to the earth to save humankind—is said to be a dependable way to long life, moral purity, and good fortune (*Rāmāyaṇa* 7, final chap.).

Synthesizing its theology, philosophy, mythology, and religious practice, Vaiṣṇavism distinguishes five forms of God:

- (1) God in his transcendent form with the six attributes: omniscience, activity based on independent lordship, ability, force, virtue combined with energy, and brilliant self-sufficiency.
- (2) The *avatāras*, in which God sends forth his Self to save the *dharma* (order, stability) and humankind and to protect the good and destroy the wicked, evidencing his

providential concern with humanity as a whole. However full of the wonderful and miraculous, the *avatāra* myths represent Viṣṇu as an essentially human character whose actions are within the limits of human understanding.

- (3) The emanations (*vyūha*) of his power, namely, Vāsudeva (Kṛṣṇa), Saṃkarṣaṇa, Pradyumna, and Aniruddha (Kṛṣṇa’s brother, son, and grandson), which, like the *avatāras*, represent an attempt at maintaining a fundamental monotheistic principle while incorporating manifestations of his being. This is also an attempt to harmonize theology with mythology and philosophy, for by assigning to these figures functions in a systematic explanation of the universe, theologians can account for Viṣṇu’s part in its creation, preservation, and absorption.
- (4) The immanent God, the inner ruler.
- (5) The *Mūrti* (image or statue), God’s most concrete form.

VISUAL CULTURE AND RELIGION: AN OVERVIEW

If the word *culture*, as Raymond Williams once pointed out (Williams, 1976, p. 76), is among the most complicated words in the English language, what can anyone hope to achieve by clapping the word *visual* in front of it? Not surprisingly, the use of the term *visual culture* among scholars of art, film, and media is quite varied. For many it simply refers to forms of imagery beyond the pale of traditional fine art, such as film, mass-produced prints, and advertisements. For others the term signifies something procedural: the method of study or the set of questions and themes that occupy a particular body of scholarship. For yet others the term marks a significant turn in the practice of art history, which involves pedagogical as well as political commitments that depart from traditional art historical practice. No discipline takes images with the single-minded seriousness of art history, and because art historians have been prominent in debating the use of the term, a review of developments in that discipline is a helpful way of approaching the definition of visual culture. From there it will be possible to consider the implications of visual culture for the study of religion.

VISUAL CULTURE AND ART HISTORY. The rise of interest in popular culture, film, women's studies, ethnicity and race, and sexuality challenged the dominance of traditional scholarship in the humanities, which was historically invested in the canon of fine art and literature. For a long time art historical interpretation had also avoided political interpretation of images and had largely ignored contemporary imagery, especially mass-produced imagery, because it lacked the craftsmanship of fine art. Nor did it accommodate the categories of genius, professional artist, and masterpiece or the criteria of museum value that dominated the discipline and its canon of fine art. But during the 1960s and 1970s art historians and art critics who were engaged by contemporary art's disavowal of traditional tastes or the celebration of political critiques of established authority in cultural and social affairs became interested in issues of reproduction, the conceptualization of viewing as a social and psychological act, and the ways of seeing that shaped the meaning of images. The social history of art sought to situate works of art within the ideological constructions of class and gender that were inseparable from any act of representation.

By the 1980s a rising tide of scholarship in art history had begun to explore canon formation, gender, sexuality, and the art of marginalized cultures, races, and ethnicities. A "crisis in the discipline" was discussed in professional forums, and the first instances appeared of what came to be known as the "new art history" (Rees and Borzello, 1988). Of special importance was the application of deconstruction, semiotics, and psychoanalytic theory (of greatest influence were the writings of Jacques Derrida, Roland Barthes, and Jacques Lacan). Practitioners of the new art history were intrigued by the visual construction of power relations, which they conceptualized as the "gaze," the visual field that evaluates space and object as intelligible forms.

Work in the 1980s and 1990s also explored the nature of representation, often in connection with the discussion of postmodernism and inspired by the oracular writing of Jean Baudrillard. A number of important studies during this time complemented the social history of art with greater attention to audience and reception, finding an important connection to the interest in the gaze and the visual construction of reality. At issue was the status of art history, the authority of its claims, its autonomy from the prevailing interests of the elite that controlled cultural institutions, as well as a host of questions about the nature of representation.

The reflection on ideology, the nature of vision, the gendered gaze, and the constructedness of representation led some art historians to greater awareness of the audience and its role in the interpretation of art. Prominent theoretical studies in the sociology of art assisted art historians along this line of thinking. Anthropological studies have produced ethnographies of image users. David Freedberg's *The Power of Images* (1989) problematized for art historians the capacity of images to incite fear and desire among viewers, for whom the appeal of images was not a matter of taste or connoisseurship but their ability to act upon people, other images, or the viewer's own desires and anxieties. Freedberg's book and several other studies in the next years helped art historians redefine the scope of art history. The study of response (Freedberg, 1989; Elkins, 2001) and reception (Heinich, 1996; Doss, 1999) decentered the traditional focus of the discipline as the discourse on images to a discourse on the use and conceptualization of images.

The 1990s and early 2000s witnessed a surfeit of publications under the new rubric of "visual culture" (Evans and Hall, 1999; Sturcken and Cartwright, 2001; Bryson, Holly, and Moxey, 1994; Mirzoeff, 2002). Generally speaking, scholars have made use of the term to designate the subject of their interpretation as well as the method or interpretive framework on which they have relied. But the definition of visual culture (not to mention its value) remains contested ("Visual Culture Questionnaire," 1996). Perhaps the most common meaning of the term is the most simple and least helpful: visual culture is whatever traditional art history does not do—film, advertisements, cartoons, tattoos. Another approach improves modestly on that one: visual culture is any treatment of imagery or of viewing imagery that is especially mindful of such concepts as the gaze, gendered practice of viewing, postmodern accounts of representation, and so forth. A third, common definition identifies visual culture as distinctly modern, as the product of modernity or postmodernity, as the hypervisual world of simulacra and mass-produced images whose principal purpose is propaganda for state and commerce, which, in radical political economy, are regarded as the same thing. Such a view ignores the ancient power of images in human culture and assumes a presentist perspective and one that tends strongly to reduce images to a means of persuasion. Those who criticize visual culture as an approach to studying imagery argue that the term is inca-

pable of clear definition and is inclined to level artistic quality in a reading of images that regards distinction as unacceptable because it is elitist (“Visual Culture Questionnaire,” 1996).

DEFINING VISUAL CULTURE. None of the definitions listed above is strongly compelling. And none of them offers much of substance to the study of religion. Indeed religion plays no role whatsoever in the great majority of visual culture studies cited above. Art historians who identify their work as the study of visual culture have largely concentrated on revisionist analyses of major works of art, the visual construction of gender, the cultural politics of imagery, and the dynamics of the gaze. All of these are quite applicable to the study of religious visual culture, but because many art historians assume that post-Enlightenment modernity is characterized by secularization, religion is considered vestigial and reactionary and therefore uninteresting. By contrast, the following definition of visual culture seeks to offer a way of interpreting images that will contribute to the understanding of religion. Given the dominance of art history as a discipline in the discussion over the last two decades of the twentieth century, the definition of visual culture outlined here is grounded in the development of art history. Defining the term turns on differentiating studies according to the object of their scrutiny.

As it was practiced for much of the twentieth century, art history focused on considerations of style, subject matter, patronage, and the meanings to be derived from these coordinates. Such an approach privileges the visual object—the painting or sculpture—as the principal concern, as the object of explanation. Iconography and stylistic analysis are the primary tools of this approach and serve well to scrutinize the work of art as a highly intentional object, one bearing the intent of the artist, the impress of the artist’s visual tradition, and the aims and preferences of the patron, whether prince, collector, church, or state. This manner of analysis preserves the artist as a genius, a skilled maker who endows the work with a supreme intention, a meaning to be excavated by the art historian and matched to the material evidence of the image as the definitive meaning of the work.

Skill at formal analysis, detailed knowledge of the history of style and iconography, facility with the vast tools at the art historian’s disposal for such research—iconographical indexes and lexicons, archival collections, museum holdings—form the skills base for competence in this line of inquiry. Art historians proceed by comparing one image under question with the preceding history of visual types in order to determine the relatively unique treatment of the image, positing that every change in its presentation of its subject corresponds to a particular intention of the image maker. The artist’s monograph, one of the standard productions of art history in the twentieth century, develops a narrative of artistic production along the biographical lines of the artist’s life. Juvenilia, professional formation, early work, mature work, and late productions, analyzed largely in terms of style

and subject matter, are the familiar categories of this genre of art historical inquiry. The aim is a definitive edition of the artist’s “oeuvre.” In any genre of art historical inquiry that focuses on the image, stylistic features of the image are customarily considered to be freighted with intent: style is a kind of signature, the imprimatur of the image maker as well as the visual preference of the image’s patron and its primary audience, those who bring to it a visual literacy that maker and patron can presume. With these assumptions and techniques, art historians are able to produce highly detailed analyses of objects, sorting out their histories, makers, and the genres of meaning that proceed from object-centered analysis and interpretation.

Another approach privileges ideas over the object. This approach might be called the intellectual history of art, or the history of ideas about art, or the history of art theory and aesthetics. Whatever one prefers to call it, this avenue of inquiry makes important contributions to the understanding of taste, evaluation, and the interpretation of art. In sum it seeks to delineate the theory of images that informs a particular philosophy, theology, culture, historical moment, or taste. The theory-centered approach may not tell in as detailed a fashion as stylistic or iconographic study why an image looks the way it does, but the intellectual history of art has much to offer regarding why art was valued or not at a particular time, how it was justified or criticized, and how it was interpreted. When conducted by skilled interpreters, this approach enhances studies of art objects by scrutinizing the intellectual schemes that deployed various iconographies, preferred certain styles, interpreted them in a certain manner, and offered rationales for the importance and use of art in the contemporary culture. The intellectual history of art can have everything to do with the history of patronage and the formation of subcultures for whom artistic taste and literacy were definitive. Moreover the history of great interpreters of art—from philosophers like G. W. F. Hegel or Arthur Schopenhauer to important theorists such as Charles Baudelaire or Walter Benjamin—is a special topic of study among intellectual historians of art.

A third approach to the study of the visual arts may be called institution-centered because it scrutinizes the social formations of patronage, art instruction, art criticism, and the many organizations that sponsor and regulate the production and presentation of art, including guilds, museums, galleries, exhibitions, collectors, dealers, and artists’ societies. Art historians and sociologists of art study the ways in which these institutions exert an influence over the training and career of artists as well as the public display of art and the evolution of taste.

Finally, the approach defined here as visual culture takes yet another form. Although it makes important use of and relies on object-centered and theory-centered studies of imagery, the visual culture approach focuses primarily on visual practices, that is, the things people do with images. A practice-centered approach scrutinizes the social siting of images,

the rituals that engage them, behaviors and attitudes toward images, all manner of use, such as devotion and healing, and the power of images as protective devices. Questions of central interest include the migration of images, how they are displayed or hidden from view, the trade or traffic in images, and their hoarding, destruction, and exchange. These queries explore the range of visual practices that help build, maintain, and transform the lifeworlds of those who use them.

Scholars of visual culture are also interested in the ways of seeing that inform images and their reception. Vision is not a passive operation but a creative and constructive one. Seeing orders the world and imposes structures and expectations upon human experience. This is evident in the widely varying systems of composing the visual field in images. Linear perspective, the system privileged in the West since the Italian Renaissance but continually modified and subverted by artists ever since, remains one important perceptual scheme, but one whose artifice and historicity become clear when compared to other models from different parts of the world and different historical epochs.

Methodologically the study of religious visual culture will make use of those procedures that examine the object (iconography, stylistic analysis, archeological analysis) as well as those methods that scrutinize the image's cultural or social function and its reception, including ethnography and sociological methods, such as sample surveys. Scholars of visual culture require the skills of visual analysis practiced by art historians as well as facility with the intellectual history of art and visual theory. Each of those approaches provides necessary interpretive practices to the visual cultural approach because a visual practice presumes a particular theory of the power or efficacy of images and puts an image to work in part because of its appearance and material presence. Examples include Allen F. Roberts and Mary Nooter Roberts (2003); Erika Doss (1999); David Morgan (1998); Donald J. Cosentino (1995); and Sally M. Promey (1993).

THE INTERPRETATION OF RELIGIOUS VISUAL CULTURE. What does the application of this definition of visual culture do for the study of religion? Religion is often defined as a system of beliefs or organized propositions to which believers assent. But this manner of describing religion reduces it to an intellectual dimension of human experience, ignoring the embodied, lived aspects that are much more characteristic of the experience of religion reported by or observed among practitioners. Scholars of religion engaged by the material culture of belief have made this case (McDannell, 1995; Kieschnick, 2003) and have sought to show that objects of everyday use and commercial nature play an important role in the practice of religion. Inexpensive, common objects, such as devotional pictures, commemorative statuary, prayer beads, wall hangings, and photographs of saints or loved ones, participate fundamentally in rituals of memory, devotion, and the formation and instruction of the young.

An important way of understanding religious objects and images is grasping their social or communal function

(Morgan and Promey, 2001, pp. 1–17; Huyler, 1999; Tanabe, 1998; Eck, 1981, pp. 33–43). Another way is narrating their stories, as objects, in the ongoing history of a community or place (Davis, 1997). Still other scholars focus on the community's circulation or traffic of images (Roberts and Nooter Roberts, 2003; Cosentino, 1995) or the importance of cult or devotional images in the public performance of identity (Dean, 1999; Phillips, 1995) or in an extended community or loosely identified cohort, such as admirers of Elvis Presley (Doss, 1999). In every such case the image is not an end in itself but part of a larger fabric of social life. The scholar examines the image as a totem or joint property or shared emblem or ritual artifact or commodity—that is, as part of a social practice. The object of interpretation is not so much an image as the act of using an image, what may be called a visual practice. The image itself is incomplete without its ritual context or practice. Not only is this the case with the need to consecrate images such as statues or icons of Buddha (Kieschnick, 2003, p. 60; Freedberg, 1989, p. 82), but as far as explanation is concerned, the image's meaning is not to be limited to the image itself, such as its style or subject matter.

Because an image gains significance in its circulation, exchange, veneration, and narration, those must each be studied in order to understand the image in situ. And an image's meaning is never fixed or complete but forever undergoing mutation and stratification, as the meandering narratives that Richard Davis relates in his 1997 study of the “lives” of Hindu statuary. Sculptures of Hindu deities were consecrated after having been fashioned, then installed in temples, where they might become well known for their power to act on behalf of petitioners. When Muslims invaded the subcontinent, priests tried to anticipate the destruction of the cult statuary by removing it from the temple, deconsecrating it, and burying it. Sometimes the statues were forgotten where they lay until their rediscovery, when a new chapter in their lives would begin with reconsecration and reinstallation in a temple or, during the British Empire period, their appropriation by the colonial force and exhibition in museums or palaces as ethnographic objects or as trophies. Images created to illustrate an early book on Hindu myth and culture by a British missionary (Ward, 1817–1820) circulated in Europe and the United States, serving as one of the earliest visualizations of Hindu deities. Such images illustrated the Protestant imagination of “pagan idolatry,” which was rudimentary to the Protestant understanding of mission. It is important to understand images in a robust way, as sustaining many, often staunchly rival, cultural perspectives. Images, in other words, are the lens through which cultures perceive one another.

Images are actually deposits, pastiches, thickly sedimented repositories of previous lives consisting of fragments of memory that are made to adhere to one another. This allows them to be forms of resistance as well as subordination. The story of Our Lady of Guadalupe illustrates this dynamic

of imagery. One account written over one hundred years after the apparition was said to have taken place (1531) was produced, according to one scholarly authority, by a Mexican Creole, Miguel Sánchez, whose purpose was to advocate the propriety of *criollismo*, those born in Mexico of Spanish-born parents. An alternative account, the *Nican mopohua*, written at the same time, portrayed the Virgin's revelation as directed to the indigenous population (Poole, 1995, p. 126). Modern advocates of liberation theology and Chicano and neo-Aztec identities have seen Guadalupe as yet another kind of symbol and have relied on the *Nican mopohua* (Brading, 2001, pp. 342–360).

Not only are images historical pastiches, they also frequently integrate other forms of representation. Word and image, for examples, can be made to cooperate in powerful ways in order to avoid proscriptions against imagery that are sometimes enforced by religious traditions that consider the written or spoken word to be the privileged medium of divine revelation and authority. Such traditions include Sikhism, Islam, Judaism, and certain versions of Protestant Christianity, such as Puritanism and other Calvinist sects. As anxious as each of these traditions may profess to be regarding the inappropriateness of visual imagery, each contains abundant examples of devotional and instructional uses of imagery. Recalling the contribution of Islam to their spirituality, Sikhs, for instance, stress the importance of avoiding imagery in worship. Yet images of the gurus and Sikh history abound in temples and in private homes. Among the most interesting figures in the tradition, the man who is portrayed more than any other Sikh, is Gurū Nānak, the founder of the faith and an immensely charismatic leader and teacher, who is shown emanating an aura, his eyelids half closed, his large eyes focused on the blissful state of his soul (Brown, 1999). The image models the visual presence or demeanor of peace that Sikhs recognize in those who have achieved spiritual wisdom. One image of Nānak consists of the text of one of his writings contained in the *Gurū Granth Sāhib*, the collection of hymns and verse that form the central document and authority of the faith. Nānak is his word, his wisdom is manifest in his visual appearance. The intermingling of word and image stresses this unity and both enforces and obviates the injunction against imagery in worship: one sees Nānak and his wisdom, but one sees his word, which one is not allowed to confuse with an image and thereby lose sight of the true goal of the spiritual life (Singh, 1990, p. 12).

The capacity of images to embody teachers, prophets, saints, or deities goes to the heart of the power of images in religious life. Relics and icons are among the most universal features in world religions. In many Buddhist traditions, for example, relics of the Buddha and paintings and sculptures of him form the core practices of devotion among both elite and popular Buddhists. Images are able to incite and direct devotion precisely because they take the place of the holy one, inviting the believer's physical acts of veneration or ado-

ration, which are relayed through the image to the person. Mahāyāna Buddhism has a long tradition of regarding the Buddha's sūtras as his embodiment (Tanabe, 1988). Orthodox and Catholic Christians revere different versions of the image of Christ imprinted miraculously on a veil or burial cloth. Relics are considered especially powerful sacred points where petitions can secure blessing. In such instances images participate in a metaphysical economy of dispensing merit accrued by saints or deities whose good works and holiness are a kind of spiritual capital that can be accessed through the veneration of imagery. In the case of Buddhist visual piety, a common practice among Southeast Asian Theravāda Buddhists is the ritual application of gold leaf to statues of the Buddha. This act is accompanied with prayers for blessing and karmic merit. Children accompany their parents and grandparents on these occasions and are taught the practice.

In addition to encouraging the cultivation of devotional relationships with the saint or deity, images are able to prompt and guide memory as well as creative thought or association. Used on such ritual occasions as marriage, baptism, and rites of passage, images mark the occasion and then commemorate it by virtue of domestic or public display thereafter. Images are also commonly exchanged or given as gifts on these occasions, signifying important relationships and status within family, clan, or community. If they serve to shape and secure memory and therefore operate as conservative devices, images can act as generative engines of creative or figurative thinking. Tarot cards are a good example of this, as are maṇḍalas in meditative visualization. On these occasions, images invite associative processes of thinking that are virtually unlimited. Images such as those on tarot cards provoke association and suggest narratives. Because they literally assert nothing, images invite interpretation. Their ambivalence urges a proliferation of conjecture and association. The result in the case of visual imagery, as well as in literary imagery in such apocalyptic literature as the *Book of Revelation* or the figurative language in such sacred poetry as the *Psalms* or allegory as in the *Song of Songs*, is an open-ended generation of interpretive possibilities. The text or image can be made to mean virtually anything, allowing a fit to be tailored to any occasion or situation. Images and texts like this offer powerful creative resources to religious traditions. It is evident in traditions as diverse as various astrologies or the Yi Jing's system of divination or the Hasidic practice of numerology in which the numeric value of scriptural words discloses deeper levels of meaning. Many religious traditions, or popular subcultures within them, practice sortilege, the apparently random selection of a passage in a book such as the Bible or the Qur'ān, which is then read as an oracle speaking to the person who selected it. In every case chance is incorporated into a material practice that reduces open-ended possibility into a suggestive prompt. Chance is transformed into a revelatory process.

CHALLENGES TO THE STUDY OF RELIGIOUS VISUAL CULTURE. The place of images in religious study is fascinating in part because of the flurry of misconceptions associated

with images, many of which hinge on the idea that images mark an inferior religion or an inferior subculture within a religion. The study of religion is often hampered by prevailing notions like this, which garner an appearance of authority but are often ideological mirages, conjured to serve particular interests. For instance, it is a commonplace that Islam, Judaism, and Protestantism do not engage in religious uses of images. Another such commonplace is that religions that do employ images do so only at the level of popular piety. The “higher” forms of Buddhism, Hinduism, and Christianity are sometimes said to eschew any role for imagery. Misleading claims like these need to be traced to their sources in order to recognize the cultural work they are intended to perform. All of these assertions originate in polemic: Protestant polemic against Catholicism; an academic elite’s polemic against popular, devotional religion; a Buddhist elite’s polemic against popular practice; the polemic of the Brahmanic revival against Hindu “polytheism,” and so forth. Any study of the visual culture of religion must anticipate this especially tenacious feature of scholarly and theological discourse. Moreover one does well to avoid the art historian’s tendency to focus exclusively on objects and the religion scholar’s traditional emphasis on doctrine, philosophy, or theology. The aim inspiring the study of the visual culture of religion is deeper understanding of the lifeworlds that religious peoples construct and sustain in their visual practices and in the aesthetic imagination that envisions their worlds or those they seek to create.

DAVID MORGAN (2005)

VISUAL CULTURE AND RELIGION: OUTSIDER ART

One of the defining characteristics of the emergent academic field of visual culture studies is its insistence on a methodological principle of complete inclusion. Everything within the realm of visual objects and practices is worthy of consideration—especially imagery traditionally neglected or felt to be outside the purview of “classical,” “fine,” “canonical,” or “high art.” Those who are concerned about all that has been ignored and devalued in the domain of image making have a special affinity for the maverick and controversial movement called contemporary folk, grassroots, self-taught, vernacular, or outsider art. Outsider art has no easily definable

stylistic tradition or distinct movement in the conventional art history sense but instead refers to a loose grouping of persons, practices, and attitudes distinguished primarily by their peripheral relationship to elite culture and the mainstream art world. This marginality is largely determined by various psychological (e.g., psychosis, mental-physical disability, or visionary experience) and sociological (ethnic-racial, demographic, economic, class, age, or educational) factors. This unruly field is rambunctious, resisting any consistent definition or nomenclature, a situation that has given rise to an almost incessant and, at times, tedious, “term warfare.”

The current vogue for the terminology of “outsider art” in the English-speaking world originates from the title of the British scholar Roger Cardinal’s 1972 book, which roughly translated the expression *Art Brut*. Art Brut was first used by the French avant-garde artist and cultural critic Jean Dubuffet (1901–1985) (Danchin, 2001). For Dubuffet, Art Brut was art that expressed raw creativity and imagery supposedly uncontaminated by bourgeois culture—an art perhaps best found within mental wards. Cardinal and others expanded on Dubuffet by using the “outsider” terminology in neo-romantic ways that eventually embraced a motley assortment of artists and practices. In addition to psychotic, mediumistic, spiritualist, and children’s art, outsider art—especially in North America—came to include naive, folk, tramp, African American, prison, Hispanic American, vodou, tattoo, yard, and circus artwork done by persons often self-taught in the use of artistic methods and materials. The unfettered creativity, obsessive drive, and apparent primitivity of this kind of art are striking. Equally important, however, are the connections with religious experience and practice as seen by the prominence of nonordinary states of consciousness and different kinds of visionary experience, the use of conventional and unconventional religious imagery, and the drive to construct alternative and often strange paradisiacal worlds (Beardsley, 1995).

Outsider art may at times draw upon bits and pieces of the history of mainstream art, but rarely is it self-consciously ironic or concerned with the kind of referential “originality” associated with academic art making (Russell, 2001; DeCarlo, 2002). It is an art that has its own ambiguous inner intentions and private passions. In this sense, outsider artists often strive to communicate something deeply personal, hidden, unseen, or repressed about this and other worlds. There is almost always something more than just “art as art” going on. Moreover, this obsessively intense “something more” often takes various stylistic forms and quirky contents that may be most meaningfully called “visionary,” “spiritual,” “ecstatic,” “revelatory,” or “religious.” The increasing popularity of outsider art in Europe and the United States during the last twenty years or so of the twentieth century appears in fact to be rooted in an almost quasi-religious “quest for authenticity” or “nostalgia for paradise” among a secularized middle-class audience of enthusiasts, collectors, and dealers. Artist and audience in the outsider field often seem similarly

driven by unconscious, and sometimes conscious, motivations that are broadly religious and redemptive (Fine, 2004).

HISTORY OF THE SELF-TAUGHT AND OUTSIDER FIELD OF ART. The diverse history of the self-taught and outsider field is yet to be written (Rhodes, 2000; Hartigan, 1991; Peiry, 2001; Russell, 2001). Aside from some very general associations with shamanistic phenomena, human eccentricity, psychosis, and compulsive image making, the origins of this movement in Western tradition go back to the discovery of primitive culture, art, and religion (in both a tribal and orientalist sense) by the newly conceived human sciences toward the end of the nineteenth century (e.g., psychology and psychiatry, comparative religions, anthropology, folklore studies, and critical-historical disciplines such as art history). The impact and influence of primitivism as both a disturbing and a liberating break with classical traditions established in the Renaissance and the eighteenth century were profound in many different cultural domains at the beginning of the twentieth century. Primitivism was therefore a formative factor in the development of modern art, as seen in the concerns and methods of individual artists, such as Paul Gauguin, Henri Rousseau, Pablo Picasso, and Paul Klee. At the same time, there were clear connections between primitivism and the Dada and surrealist movements (Rhodes, 1994). These associations, as well as the affinity with what would be called outsider art, is seen in surrealism’s passionate interest in a primal creativity rooted in the unconscious mind, in occult or “automatic” forms of religious experience and behavior, and in various disruptive and unconventional artistic practices.

The other major influence on the genre of outsider art was the identification of so-called “psychotic art” after the cataclysm of World War I (MacGregor, 1989). Several groundbreaking psychological studies appeared at this time, the most important of which was *The Artistry of the Mentally Ill* (*Bildneri der Geisteskranken*), written in 1922 by the German psychiatrist Hans Prinzhorn (1886–1933). Prinzhorn focused his attention on the artistic productions of schizophrenics and spent considerable time developing an elaborate expressionist theory of image making that tried to identify a set of basic artistic impulses. Another highly influential German psychotherapeutic study was Walter Morgenthaler’s (1882–1965) *A Mentally Ill Person as Artist* (*Ein Geisteskranker als Künstler*), published in 1921. This work concentrated on the brilliantly obsessive drawings by the Swiss mental patient Adolf Wölfli (1882–1965), now recognized as one of the grand European masters of the outsider tradition of art.

Dubuffet said that he happened to see a copy of Prinzhorn’s book and was haunted by the images. This epiphany eventually led to Dubuffet’s dramatic declaration of Art Brut in the 1940s—a theretofore unrecognized tradition of artistic production in which creativity and image making were theoretically free from the asphyxiating influences of elite culture (Peiry, 2001). Dubuffet’s definition of Art Brut was initially associated with the art of the mentally ill as witnessed

by Prinzhorn and Morgenthaler, but over the years his understanding of the field wavered between dogmatic rigidity and inclusive flexibility—as, for example, seen in the supplemental category of *Neuwe Invention* (Fresh Invention), intended to include artists less radically cut off from mainstream cultural tradition. The Art Brut tradition—and its institutional embodiment in the Collection De L'Art Brut in Lausanne, Switzerland—continues as an increasingly conspicuous aspect of the European art scene.

Self-taught or outsider art in the United States gradually came into prominence from the 1970s through the 1990s in association with various artistic movements and eclectic interests. Perhaps the most important of these movements was the changing nature of what was originally called “folk art,” rural traditions that were becoming more individualistic, eccentric, and aesthetic in their methods and subject matter. These transformations within the realm of contemporary folk art were already evident in early exhibitions of naive and primitive folk art in the 1940s and 1950s (Janis, 1999) and then even more significantly in the later work of rural craftspeople, such as the Kentucky wood-carver Edgar Tolson (1904–1984) (Arderly, 1998). Another important trend emerged from the maverick interests and curatorial philosophy of Herbert Hemphill (1900–1900) at the new Museum of American Folk Art in New York City (Hemphill and Weissman, 1974; Hartigan, 1991). Hemphill boldly stretched the parameters of folk art to include, within the jumbled cultural situation of the last quarter of the twentieth century, all manner of strange and forlorn artistic production.

In the 1980s several innovative art dealers on the margins of the mainstream New York art world, most notably Phyllis Kind, who was originally based in Chicago, daringly started to exhibit European Art Brut along with various homegrown talent. These exhibits included such artists as the Chicago Imagists; newly discovered psychotic masters, such as Martin Ramirez (1895–1963) and Henry Darger (1892–1973); and a number of so-called “contemporary folk artists” from the American South, such as the amazingly prolific, self-taught visionary preacher-painter Howard Finster (1916–2001). During this same period, there was also an increasing awareness of numerous environmental works by compulsive creators around the world (e.g., Ferdinand Cheval [1879–1912] in France, Simon Rodia [c. 1879–1965] in North America, and Nek Chan in India) and, ever since the groundbreaking show in 1982, *Black Folk Art* at the Corcoran Gallery in Washington, D.C., an increasing recognition of the rich tradition of self-taught African American artists (e.g., Bill Traylor [1854–1947], Sam Doyle [1905–1986], Jimmy Lee Sudduth, Thornton Dial, Mose Tolliver, Purvis Young, Charlie Lucas, Gregory Warmack or Mr. Imagination, and Lonnie Holley).

By the early 1990s these movements had awkwardly coalesced into the field called self-taught/vernacular/outsider art. During the late 1990s and after the beginning of the

twenty-first century, there has been an increased outpouring of exhibitions, catalogs, articles, and books. These developments were mirrored by a growing number of organizations, journals, and cultural institutions—including the emergence of a lively but sporadic secondary market of auctions and trade fairs (Maizels, 2002). Unfortunately most of the published discourse about self-taught and outsider art has been largely within the popular genre of pretty picture books replete with potted anecdotal biographies of the artists. There is still very little serious commentary on self-taught and outsider art, especially from multidisciplinary and cross-cultural perspectives that comparatively and critically analyze the artists and artworks with an eye to artistic quality, cultural embeddedness, and historical significance. The field of self-taught and outsider art also raises many interesting but largely unexplored questions about the nature of intense visionary experience, psychosis, and artistic creativity as related to religious traditions, such as shamanism, mysticism, and other forms of ecstatic cult practice.

SELF-TAUGHT AND OUTSIDER ART AND RELIGION. Self-taught and outsider art frequently expresses specific religious belief systems by using traditional, eclectic, hybrid, or even wildly strange imagery. Examples from the spectrum of religious iconography and intention are seen in the mostly conventional Protestant evangelical apocalypticism of Myrtice West's paintings, which are based on the *Book of Revelation*, the idiosyncratic religious allusions in Saint OEM's art (Eddie Owen Martin, 1908–1986), the pop cultural appropriations in Howard Finster's scrappy “messages” from God and Elvis, and the dark distortions of Roman Catholic themes in Henry Darger's illustrations of cosmic conflict involving “little girls with penises.” Outsider art's early association with madness, ecstatic experience, spiritualism, mediumship, conspiratorial occultism, and syncretistic religion also indicates that there are many connections with, to borrow from William James, the “varieties of religious experience”—that is, states of extraordinary and visionary consciousness, obsessive practice, and unusual imagery on the margins of mainstream or organized religious traditions. Witness, among many possible examples, the detailed divine cosmology constructed by Wölfli, the “Bible code” imagery seen in Norbert Kox's work, or the architectural spiritualism pervading Achilles Rizzoli's (1896–1981) meticulous drawings. Another very evocative but controversial, example of these associations is the apparent allusion to various “Africanisms” or fragmented or creolized aspects of traditional African religious forms seen in African American art (Thompson, 1984). Finally, self-taught and outsider art involves specific stylistic features (such as a penchant for compositional *horror vacui* [the avoidance of empty space], a juxtaposition of image and word, an emphasis on sign as subject, and thematic repetition), the use of cast off or recycled materials, and a tendency to construct monumental assemblages and environmental works that often have religious and visionary significance.

Even more provocative than these associations with conventional and unconventional forms of religion are the suggestions in outsider art of deeper links between religious and aesthetic experience. Most broadly, art and religion deal with imaginative creations that are felt or sensed to surpass (emotionally, spiritually, essentially, or aesthetically) the merely material or rational. The underlying conviction for both is that there is some experienced dimension of meaning, sacredness, power, sublimity, or beauty in or beyond the surface of things. Art and religion—and in a heightened way, outsider art and visionary experience—are therefore overlapping interpretive categories that partially name or define certain important aspects of human experience, expression, and practice in both a quotidian and extraordinary sense. To some extent it seems that all religious behavior originally draws on visionary experience and involves aesthetically expressive practices of making invisible spirit or meaning visual and therefore memorable and real in persons, things, and actions. Indeed effective religion is (perhaps) always artistic in its expressive ways and ritual means, whereas the most powerful art (perhaps) always manifests some real ecstatic motivation and performative intensity. One should look then to what is artistic in religious practice and to what is experientially and practically religious in art. Both art and religion involve the basic everyday human drive for order. Both refer to the possibility of feeling “in place” and seeing “something more” within and behind the changing surface of things (something unexpected, something strange, something special, something sacred). And it is this kind of creative “meaning making” that is related to the imaginative “world building” or “making special” aspects of religion and art (Dissanayake, 1992; Morgan, 1998).

Significantly the special synergy of artistic and religious experience and expression seems particularly vivid within the field of self-taught and outsider art. Whereas most people are relatively content to live within the fractured and often depressing worlds given to them, outsider artists, who in their art compulsively—ecstatically construct new self-identities and elaborate artistic environments, are those few brave, tormented, and virtuosic souls who are driven to transgress the confining boundaries of all conventional worlds. Their special romantic, nostalgic, or primitive appeal is that they are primordial creators, inventors, or world makers in a rough and unexpected sense. These marginalized and often psychologically wounded artist-healers can be metaphorically placed in a lineage embracing the Paleolithic shaman, tribal blacksmith, trickster-fool, medieval mystic, Renaissance magus, and romantic artist. All have that conjoined religious and artistic ability to make their visions real and therapeutic for others.

VISUALIZATION SEE BUDDHISM, SHOOLS OF; DAOISM; MEDITATION

VITAL, ḤAYYIM (1543–1620), noted Jewish mystic. Ḥayyim Vital was born in Safad, the Galilean town north of Tiberias that was the site of an important renaissance of Jewish mystical activity in the sixteenth century. His teacher in rabbinic subjects was Mosheh Alshekh, who ordained him as a rabbi in 1590. In 1564 he became a student of Mosheh Cordovero, the most important teacher of Qabalah (Jewish mysticism) in Safad before the arrival of Isaac Luria. When Luria came to Safad in 1570, Vital became his chief disciple, the role for which he is best known.

Following Luria's death two years later, Vital was one of several disciples who assembled a written version of the master's teachings, since Luria himself had recorded almost nothing on his own. Vital's corpus, the *Shemonah shé arim* (Eight gates), is the most detailed version and the main one in which Lurianic teachings were circulated widely from about the year 1660. During his lifetime Vital sought to guard Luria's teachings jealously and to assume authority as the sole legitimate interpreter of his master's ideas. Thus in 1575 he secured the pledge of twelve of Luria's former disciples to study Lurianic teachings only with him, as well as a promise not to reveal more of Luria's doctrines than Vital wished. Such tactics were rooted partly in Vital's conviction that he alone was capable of explaining Luria's work, as well as in personal rivalries among Luria's disciples. In any case, this study fellowship lasted only a short time, for in 1577 Vital moved to Jerusalem where he served as a teacher and head of a school. In later years he lived again in Safad and in Damascus, where he died in 1620.

Besides his work as a teacher of Lurianic ideas and practices, Ḥayyim Vital composed a number of qabbalistic treatises on his own. He wrote a commentary to the *Zohar*, the classical text of thirteenth-century Qabalah, based upon the teachings of Mosheh Cordovero, to which he subsequently added notes in accordance with Luria's ideas. An interesting and important treatise intended to appeal to a wide audience is Vital's *Shá arei qedushah* (The gates of holiness). This book presents Vital's cosmological and anthropological views, culminating in an account of the process by which an individual might achieve a state of prophetic illumination. An adept, according to Vital's four-part program, must repent for all sins, meticulously observe all religious obligations, practice acts of purification such as ritual baths and the wearing of clean clothes, and enter into a state of perfect silence and solitude. Following these preparatory exercises the soul begins an ascent to its personal source in the divine realm as the adept meditates upon the ten *sefirot*, the divine qualities of personality that characterize the qabbalistic system. Successful contemplation results in various experiences of mystical inspiration, including having a revelation of the prophet Elijah.

Vital also composed a diary, *Sefer ha-ḥezyonot* (Book of visions), which reveals his interest in all manner of magic and esoterica. Here Vital discloses his youthful enthusiasm for alchemy, which he later lamented, as well as his habit of visit-

ing fortune-tellers and magicians in order to learn about the past history of his soul and promises for the future. *Sefer ha-ḥezyonot* also records his rich dream life, in which Vital communicates with various teachers and sages.

BIBLIOGRAPHY

The biographical details of Ḥayyim Vital's activities are found in Gershom Scholem's *Kabbalah* (Jerusalem, 1974), pp. 443–448, and Scholem's *Major Trends in Jewish Mysticism* (1941; reprint, New York, 1961), pp. 254ff. Vital's theory of prophetic illumination, as presented in his book *The Gates of Holiness*, is detailed in R. J. Zwi Werblowsky's *Joseph Karo* (London, 1962), pp. 65ff. An interesting technique of contemplation that Vital taught is examined in my article "Recitation of *Mishnah* as a Vehicle for Mystical Inspiration: A Contemplative Technique Taught by Ḥayyim Vital," *Revue des études juives* 141 (January–June 1982): 183–199. For a study of the religious climate in which Vital worked, see my book *Safed Spirituality: Rules of Mystical Piety; The Beginning of Wisdom* (New York, 1984).

LAWRENCE FINE (1987)
Revised Bibliography

VIVEKANANDA was the religious name of Narendranath Datta, or Dutt (1863–1902), a leading spokesman for modern Hinduism and neo-Vedānta in the late nineteenth century, and the founder of the Ramakrishna Mission in India and the Vedanta Society in the West.

LIFE. Narendranath came from a Bengali family, *kāyastha* by caste, that since the early nineteenth century had improved its social status through the process of westernization. Narendranath's great-grandfather had clerked for an English attorney in Calcutta, while his grandfather took the vow of *saṃnyāsa* (renunciation) and abandoned his family shortly after the birth of his son, Vishwanath, who would be Narendranath's father. Vishwanath became a prosperous lawyer in the Calcutta High Court. The Datta home was a cosmopolitan one, in which the worlds of Bengali Hinduism and Indo-Muslim culture merged with European learning. Vishwanath knew Sanskrit and Arabic, enjoyed the poems of Ḥāfīz, and read the Bible and Qur'ān for pleasure. Narendranath received schooling in both Bengali and English, eventually earning his bachelor's degree in 1884. Narendranath had a prodigious intellect; he loved to read, ranging over Sanskrit texts, English literature, philosophy, and history. His reading in the cultures of ancient Egypt, Rome, the Muslim world,

and modern Europe all provided insights into the trajectory of Indian history and contributed to his understanding of the relationship between East and West. Later in life he would elaborate these conclusions in a well-known Bengali work, *Prācya o pāścātya* (East and West).

During his college years, Narendranath belonged to the Brāhmo Samāj, a reformist movement begun in 1828 by Rammohan Roy (1772–1833) that promoted a vision of Hindu monotheism and rejected such practices as image worship and renunciation. Narendranath approved of the Brāhmos' rationalism and concern for social service, but he could not accept their repudiation of *sannyāsa*, a path for which he—like his grandfather—felt some affinity. In the 1870s the Brāhmos found themselves torn between the relative importance of social reform, emphasized by Sivnath Sastri (1847–1919), and devotional worship, promoted by Keshab Chandra Sen (1838–1884). While Narendranath shared Sivnath's goals, he also found himself drawn to Keshab's eclectic spiritual vision. After 1875 Keshab began visiting a little-known holy man named Ramakrishna (1834/6–1886), a celibate devotee of the goddess Kālī, a man unlearned in a formal sense but wise in religious experience. Narendranath first met Ramakrishna in 1881. Although impressed by the depth of Ramakrishna's renunciation and spiritual attainments, he was disturbed by Ramakrishna's image-oriented worship of Kālī and his apparent lack of social concern. While Narendranath believed in the formlessness of God, Ramakrishna urged him to meet God in person by worshiping Kālī.

Official accounts say that at their first meeting Ramakrishna took Narendranath aside and said to him, "Lord, I know you are that ancient sage, Nara, the Incarnation of Narayana, born on earth to remove the miseries of mankind." Narendranath was reportedly "altogether taken aback" by this and concluded that Ramakrishna was a madman (*Life*, 1989, vol. 1, p. 76). At the same time, Narendranath was captivated by Ramakrishna; here was a man who claimed to have seen God and who spoke of religion as something real to be experienced directly. Nevertheless, such mystic talk was far removed from the safety of Narendranath's rationalism.

Unable fully to come to terms with Ramakrishna's views, Narendranath withdrew periodically during his college years to immerse himself in Western philosophy and science, as well as in Indian music, for he excelled as a singer. Narendranath's singing affected Ramakrishna deeply, and he pursued Narendranath as someone who had the potential for spiritual greatness.

In 1884, Keshab died; two months later, Narendranath's father died. Keshab's death meant his followers were deprived of the spiritual charisma that united them, while the death of Vishwanath plunged Narendranath's family into financial ruin. Narendranath, at twenty-one, had to abandon his plans to go to England to study law. There were lawsuits within the family over property. In such a context,

the loss of two father-figures plunged Vivekananda into the depths of spiritual uncertainty. In 1885 he accepted Ramakrishna as his *guru* and began a period of intensive religious training that lasted until Ramakrishna's death in August 1886. During the intervening months, Ramakrishna brought Narendranath to a personal experience of Kālī that he considered his pupil's final test.

The origins of the Ramakrishna Mission lie in the final months of Ramakrishna's life, when he nurtured Narendranath's spiritual development and prepared for his own death. Ramakrishna asked Narendranath to look after the welfare of the disciples, but left no explicit instructions beyond saying, "Keep my boys together" and "Teach them" (Williams, 1989, p. 325). Official accounts report that just before his death Ramakrishna transferred his spiritual powers to Narendranath, saying, "by the force of the power transmitted by me, great things will be done by you" (*Life*, 1989, vol. 1, p. 182). With his passing, Narendranath was left to make sense of the powerful mystical experiences induced by his master and to ensure that the other disciples lived up to the master's ideal of renunciation. The precise date for the emergence of the monastic movement differs "according to the perspective of the chroniclers" (Pangborn, 1976, p. 98). Some choose the day in January 1886 when Ramakrishna distributed ochre robes to the disciples; some choose Christmas eve of that year, when Narendranath led the disciples in a vigil of renunciation around a bonfire; others emphasize the day in January 1887 when the disciples held a fire ceremony at which they adopted monastic names, prefixed by the title *swami* (Skt., *svāmī*, "master"). Narendranath would initially be known as Swami Vividishananda, though this would change.

Narendranath taught the disciples as best he could for several years, yet he remained uncertain of his own religious views. In 1890 he set off from Calcutta with nothing but a staff and begging bowl on an extended pilgrimage throughout India, during which he attempted to reconcile the philosophical and devotional insights of Ramakrishna with the social concerns of the Brāhmo movement. Internally, he sought realization of the absolute; externally, he sought knowledge of India and the world. This search would eventually take him far beyond India, though India remained the focus of his patriotic spiritual vision. When he heard that a World's Parliament of Religions was to be held in Chicago in the autumn of 1893, Narendranath conceived a plan to seek Western material support for the revitalization of Hinduism and in return to share Hindu spiritual insights with the world. He obtained travel funds from the *māharājā* of Khetri, who suggested he adopt the religious name *Vivekananda* (Skt., "he whose bliss lies in discerning knowledge"). With his patron's support and a new monastic name, he left for the United States.

Although Vivekananda was not the only Hindu representative at the World's Parliament of Religions in Chicago, he was the most dynamic. In contrast to the learned disserta-

tions by other Hindu speakers, Vivekananda gave a powerful argument for the universal truth of Hinduism, which he claimed was grounded in experience, not dogma. “The Hindu religion does not consist in . . . attempts to believe a certain doctrine. . . but in realizing,” he claimed (*Complete Works*, 1964, vol. 1, p. 7). His lectures brought him widespread attention in the press and numerous speaking engagements. Having attracted a dedicated group of Western followers, he shifted his plans from raising money for India to creating a worldwide religious movement based on the eternal truths of Hinduism. With that purpose, and with his new Western disciples as the core, he founded the Vedanta Society in New York in 1895. He soon had chapters in London and Boston, for which he summoned two swamis from India to help direct their work. The mission to the West was well under way by the end of 1896 when Vivekananda left for India to begin the second phase of his program.

Vivekananda’s arrival in India early in 1897 with a group of Western disciples was treated by the Indian press as a triumphal return, but not all Hindus were happy with his aggressive proselytizing of Westerners or with his unorthodox ideas. Ramakrishna’s former disciples, whom Narendranath had left seven years earlier, were themselves uncertain how to respond to Narendranath-turned-Vivekananda and his Western disciples. They were even more uncertain when Vivekananda revealed his plan to turn them into a band of modern *sannyāsins* dedicated to social service (*sevā*), a plan he claimed Ramakrishna had intended.

Vivekananda’s dynamism and persuasive powers carried the day; the disciples were won over to his program of *sevā*. To implement this program, Vivekananda instituted the Ramakrishna Mission on May 1, 1897, organizing the monks in a new Ramakrishna Math (Skt., *matha*, “monastery”). In 1898, with money from Western disciples, he purchased a site on the Ganges near Calcutta for a center to house what would become the Ramakrishna Math and Mission. The worldwide organization was established by 1899, at which point Vivekananda turned over the active work of the movement to his Indian and Western disciples. After visiting friends in the United States and Europe from 1899 to 1900, Vivekananda returned to India in semiretirement. He died on July 4, 1902.

TEACHINGS. In less than forty years of life, and in less than ten years of intensive effort, Vivekananda redefined India’s relationship to the West, prescribing Hindu spirituality as the antidote to Western materialism. Vivekananda’s teaching was not the Hinduism of the orthodox, nor was it the reformed monotheism of the Brāhmos. In its eclectic universalism it shares much with Keshab Chandra Sen’s spirituality, yet its spiritual fountainhead lay in the mystic insights of Ramakrishna.

Vivekananda taught the virtues of what he called “Practical Vedānta,” a universal Hinduism that combined practical work for the world with the quest for ultimate union with the One. Put simply, Practical Vedānta teaches that while

humans may proclaim *śivo’ham*, “I am God,” this very insight also obliges them to acknowledge the truth of *daridra nārāyaṇa*, “God dwells within the poor.” Thus, nondual insight provides an ethical imperative for social service. With fiery rhetoric, Vivekananda exhorted listeners to “Arise, awake, and stop not till the desired end is reached” (*Complete Works*, 1964, vol. 3, p. 318). He called upon his followers to promulgate a manly religion that would have the energy and courage to overcome India’s discriminatory caste practices and interreligious strife. Such would be true service to Ramakrishna’s Divine Mother as embodied in India herself.

By adopting Vedānta as the essence of Hindu spirituality, Vivekananda built upon a revalorization of Vedānta that had begun with Rammohan Roy and the Brāhmo movement. However, Vivekananda’s neo-Vedānta combines Brāhmo worldliness with the mysticism of Ramakrishna, which Vivekananda understood in terms of the classical system of nondual philosophy known as Advaita Vedānta. Scholars debate whether Ramakrishna viewed himself as a Vedāntin; the case can be made that his nondualism was more Tantric than Vedāntic. What is clear is that Vivekananda’s Practical Vedānta represents a creative transformation of Ramakrishna’s teaching. Some argue that the officially sanctioned neo-Vedānta of the Ramakrishna movement reflects the impact upon Vivekananda of Western reconstructions of Advaita Vedānta as found in influential writers like Arthur Schopenhauer and Paul Deussen. Others view Vivekananda’s concern with social service as a result of his exposure to Christianity and modern Western thought as a young man. The influence of Brāhmo thought must also be acknowledged. Clearly the genesis of Vivekananda’s teaching lies in a context of cultural change in which competing Hindu philosophies like Vedānta and Tantra were actively converging with Western norms of egalitarianism, positivism, and rationality, as well as with Orientalist constructions of Hinduism and Indian culture more broadly.

LEGACY. Vivekananda’s teaching of the universal truths of Hinduism and his example of a selfless love for the Indian people had an immense impact on modern Hindu discourse and apologetics in the early twentieth century, gaining appreciation and reinforcement from figures like Mohandas Gandhi (1869–1948) and Sarvepalli Radhakrishnan (1888–1975). One of his greatest legacies may be seen in the place accorded to religious experience (*anubhava*) within modern Hindu thought. As we have seen, to Vivekananda, experience was the source of truth, not books or dogmas; “until your religion makes you realize God, it is useless” (*Complete Works*, 1964, vol. 1, p. 326). For Vivekananda, it was Hinduism’s genius to have discovered the deepest truths of yogic experience through the teachings of Vedānta. In Radhakrishnan and other early twentieth-century Hindu apologists, this neo-Vedānta appeal to experience would be elevated to the very core of religion itself, providing colonized Hindus with a powerful strategy for responding to Western, Christian denunciations of Hinduism. Indeed, the neo-Vedānta evoca-

tion of India's spiritual wisdom became something of a spiritual rallying cry for nationalist mobilization.

Recognizing the degree to which the Indian nationalist movement came to be couched in Hindu idioms, scholars have raised questions regarding Vivekananda's responsibility for the subsequent development of more aggressive forms of Hindu chauvinism and for the increased polarization of Hindus and Muslims. The question is both legitimate and complex. On the one hand, Vivekananda's Vedāntic universalism does carry an implicit claim for the superiority of Hinduism; on the other, he regularly praised the spiritual ideals of Islam, the possibilities for Hindu-Muslim cooperation, and the need for religious tolerance more broadly. If Vivekananda's name and message are occasionally used to promote the idea that India is a Hindu nation, this is perhaps a case of unintended consequences, a reminder us of the complex dynamics of religion and politics in the colonial and postcolonial context.

In a similar fashion, feminist scholarship has encouraged the exploration of issues of gender, power, and identity as these are manifested in the life and teachings of Vivekananda and the Ramakrishna movement. Himself a spiritual seeker drawn to a celibate *guru* with a visceral fear of women and heterosexual contact, Narendranath toured the West as the dynamic and alluring Vivekananda, whose colorful silk robes and turbans captivated women in audiences from Boston to Pasadena. Indeed, he attracted a number of devoted women disciples in the West, such as Christine Greenstidel, Marie Louise, and Margaret Noble. Noble, who adopted the name Sister Nivedita, was very close to Vivekananda, traveling extensively with him in India and participating in his broader attempt to Indianize the notion of womanhood in the service of mother India. Such relationships, when set over against Vivekananda's rhetoric of masculinity, provide fruitful ground for exploring the gendering of nationalist projects, as well as the limitations imposed on women agents by this very process. As with Vedānta and Hinduism, the legacy of Vivekananda with respect to issues of gender and Indian identity is a complex and fascinating one.

BIBLIOGRAPHY

Details of Vivekananda's life and career were compiled in two volumes by his followers as *The Life of Swami Vivekananda, by His Eastern and Western Disciples*, 6th ed. (Calcutta, 1989). Older biographical studies by disciples and enthusiasts include Swami Nikhilananda, *Vivekananda: A Biography* (New York, 1953) and Romain Rolland, *The Life of Vivekananda and the Universal Gospel*, 6th ed. (Calcutta, 1965). Amiya P. Sen provides a brief, unannotated biography in *Swami Vivekananda* (New Delhi, 2000), while Rajagopal Chattopadhyaya scrutinizes received accounts in *Swami Vivekananda in India: A Corrective Biography* (Delhi, 1999). For a critical interpretation, see Narasingha P. Sil, *Swami Vivekananda: A Reassessment* (Selinsgrove, Pa., 1997). These may be compared with Tapan Raychaudhuri's sketch of

Vivekananda in *Europe Reconsidered: Perceptions of the West in Nineteenth-Century Bengal* (New Delhi, 1988). Early scholarly studies of Vivekananda's career and philosophy include George M. Williams, *The Quest for Meaning of Swami Vivekananda* (Chico, Calif., 1974) and, "Svami Vivekananda: Archetypal Hero or Doubting Saint?" in *Religion in Modern India*, edited by Robert D. Baird, 2d rev. ed. (New Delhi, 1989), pp. 313–342. The essays in *Swami Vivekananda and the Modernization of Hinduism*, edited by William Radice (New Delhi, 1998), explore Vivekananda against the backdrop of education and socioreligious reform, while Gwilym Beckerlegge, *The Ramakrishna Mission: The Making of a Modern Hindu Movement* (New York, 2000) provides perspectives on several critical issues. Vivekananda's relationship to the broader Ramakrishna Mission received early attention in Cyrus Pangborn, "The Ramakrishna Math and Mission: A Case Study of a Revitalization Movement," in *Hinduism: New Essays in the History of Religions*, edited by Bardwell L. Smith (Leiden, 1976), pp. 98–119. In the wake of postcolonial studies, the question of Vivekananda's relationship to Indian nationalism, communal politics, and Hindu universalism has been revisited by Shamita Basu in *Religious Revivalism as Nationalist Discourse: Swami Vivekananda and New Hinduism in Nineteenth-Century Bengal* (New Delhi, 2002) and Brian A. Hatcher in *Eclecticism and Modern Hindu Discourse* (New York, 1999). For Sister Nivedita's view of Vivekananda, see her *The Master as I Saw Him* (Calcutta, 1910), while issues of gender are explored in Indira Chowdhury, *The Frail Hero and Virile History: Gender and the Politics of Culture in Colonial Bengal* (New Delhi, 1998); Parama Roy, *Indian Traffic: Identities in Question in Colonial and Postcolonial India* (Berkeley, 1998); and Kumari Jayawardena, *The White Woman's Other Burden* (New York, 1995). For Vivekananda's writings, the standard source is *The Complete Works of Swami Vivekananda*, 8 vols., 14th ed. (Calcutta, 1964). Vivekananda's scriptural hermeneutics are investigated in Anantanand Rambachan, *The Limits of Scripture: Vivekananda's Reinterpretation of the Vedas* (Honolulu, 1994).

THOMAS J. HOPKINS (1987)

BRIAN A. HATCHER (2005)

VLADIMIR I (d. 1015), founder and saint of the Russian Orthodox church. Vladimir (Volodimir, Valdimar?; meaning "he who rules the world") was the Varangian, or Scandinavian, prince of Kiev who established Christianity in the lands of Rus' and is thereby recognized as the founder of the Russian (and Ukrainian) Orthodox church. According to the legends recorded in the Russian *Primary Chronicle* (c. 1111), Vladimir, in his search for a religion for his pagan people, was courted by Latin Christians from the West as well as Jewish Khazars and Muslim Bulgars. He chose Greek Christianity when, the chronicle declares, his ambassadors reported to him after visiting the Cathedral of the Holy Wisdom (Hagia Sophia) in Constantinople: "We knew not whether we were in heaven or on earth. For on earth there is no such splendor or such beauty. . . . We cannot forget that beauty" (quoted in Dvornik, 1956, p. 205).

Vladimir married the Byzantine princess Anna and was baptized, with the Byzantine emperor as his godfather, by the bishop of the Greek city of Kherson, whose clergy came, at Vladimir's command, to christen the Kievan peoples in the Dnieper River in the year 988. Vladimir was partly motivated in his choice of religions by the political, military, and economic advantages of an alignment with the Byzantines, and he is also considered to have been influenced by the baptism of his grandmother Olga, who had become Kiev's ruler in 945 upon the death of her husband, Igor. Olga was a committed Greek Christian baptized in 957, perhaps in Constantinople with the empress Helen as her godmother.

Russian legends magnify the radical change in Vladimir after his conversion and the establishment of Christianity in Kiev, both in the prince's personal life and in his public policies. He is said to have abolished torture and the practice of capital punishment, an unheard-of action for his time and one allegedly opposed by the Greek bishops. He also gave up his five wives and hundreds of concubines (the *Primary Chronicle* speaks of eight hundred) in favor of monogamous fidelity to his Christian bride. He publicly desecrated statues to Perun and the other local gods and constructed a new cathedral for his Christian bishop. He also introduced the use of the Slavonic language into church worship, using the literary language developed a century earlier by the Greek missionary brother-saints, Cyril and Methodius, for their Slavic converts in Moravia and Bulgaria. The introduction of this language is considered to be the single most important factor in guaranteeing the Christian unity and development of the various peoples under his rule.

Vladimir was succeeded by his son Iaroslav the Wise (1036–1054) after a bloody war between Vladimir's sons from 1015 to 1036, during which his son Sviatopolk, who was ultimately defeated by Iaroslav, killed two other younger sons, Boris and Gleb. Boris and Gleb, who, in order to save the lives of their followers, refused to enter into battle against Sviatopolk, became the first canonized saints of the Russian church, known in tradition as the "passion-bearers." Vladimir, with his grandmother Olga, is a canonized saint of the Russian Orthodox church with the liturgical title of "equal to the apostles" because of his role in Christian conversion.

BIBLIOGRAPHY

The Russian *Primary Chronicle* contains the story of the reign of Vladimir and the beginnings of Christianity in "the land of Rus'." The Laurentian text has been translated by Samul Hazzard Cross and Olgerd P. Sherbowitz-Wetzor as the Medieval Academy of America's Publication no. 60 (Cambridge, Mass., 1953). A critical study of Vladimir's time focusing on the conversion of the Kievan peoples is provided in Nicolas de Baumgarten's *Saint Vladimir et la conversion de la Russie* (Rome, 1932). This work contains 310 bibliographical items. A general study of the period is given in Francis Dvornik's *The Slavs: Their Early History and Civilization* (Boston, 1956). This work contains an extensive bibliography.

THOMAS HOPKO (1987)

VOCATION is a divine call or election, of a revelatory character, addressed to religiously gifted or charismatic personalities. It forms the first phase of their initiation into an often unwillingly accepted intermediary function between human society and the sacred world. Unlike functionaries with a special, well-defined religious task in a given group or culture (such as priests or even heads of families and elderly men, who bring offerings and give religious instruction), vocation is often felt by persons outside or on the fringe of the established institutions, whose charismatic and often abnormal psychic character makes them appear as prophets, founders or reformers of religion, saints, or shamans. Those called, therefore, often make their appearance in periods of social turmoil or crisis. Sometimes they start a new religious movement that implies a break with the past, or else they exorcise illness, famine, or drought, which destabilize personal or social health.

Vocation is experienced as divine revelation through various media (voices, visions, and dreams, exceptional accidents, severe illness, absentmindedness or insanity, and attacks of epilepsy), and it is sometimes accompanied by special cosmic phenomena such as a solar eclipse, an earthquake, or lightning. It usually provides the persons "called," often after initial resistance and unwillingness, with special knowledge and missionary zeal for the rest of their lives.

A true prophet was the Iranian Zarathushtra (Zoroaster), who probably lived at the beginning of the first millennium BCE and was called by his god, Ahura Mazda, to preach the coming of his reign. Zarathushtra's prophecy is characterized by an intimate personal relationship with his god and a highly moral and intellectual tone. It was Zarathushtra "who first thought the good, spoke the good and did the good, . . . the first revealer" (*Yashts* 13.88). Although of a wealthy aristocratic family, his vocation brought him into poverty, permanent conflict with the established priesthood, and even exile.

Further important material is provided by the reports on the vocation of the prophets of Israel and other chosen persons, as told by themselves or contained in the historical books of the Hebrew Bible. The prophet Isaiah tells about his vocation which took place in a vision in which he heard the voice of the Lord:

In the year that King Uzziah died I saw also the Lord sitting upon a throne, high and lifted up, and his train filled the temple. Above it stood the seraphim, . . . and one cried to another and said, Holy, holy, holy is the Lord of hosts. . . . Then said I, Woe is me! for I am undone; because I am a man of unclean lips. . . . Also I heard the voice of the Lord, saying, Whom shall we send, and who will go for us? Then said I, Here am I, send me. (*Is.* 6:1–8)

Seeing visions, hearing voices, and being filled with a divine spirit are the most frequent media through which the prophets of Israel received their vocation to preach the word and will of their God, whose appearance often has ecstatic charac-

ter. Their activities are sometimes accompanied by miracles, as in the story of Elijah and the priests of Baal (*1 Kgs.* 18), where Elijah brings down the fire of the Lord from heaven and performs the role of rainmaker, bringing a period of serious drought to its end. Like most of the other prophets of Israel, Elijah was in strong opposition to the religious establishment and practices of his time.

In the New Testament, Jesus' baptism in the river Jordan, during which he saw the heavens open, the Spirit descending like a dove upon him, and a voice from heaven saying: "Thou art my beloved Son, in whom I am well pleased" (*Mk.* 1:9–11 and parallels), is a traditional vocation with the fixed elements of a vision, the Spirit, and a voice immediately followed by the temptation in the wilderness, which forms Jesus' initiation into his public role, again in opposition to the Jewish establishment of his days. The persecutor Saul became the apostle Paul through a vocation consisting of a vision of heavenly light, a voice calling to him, and a temporary blindness. After three days he was cured and filled with the Holy Spirit (*Acts* 9). The vocation initiates a process of rebirth, making Saul into the second founder of Christianity.

Mani (b. 216 CE), the founder of Manichaeism, received his first vocation at the age of twelve when an angel appeared to him like "a flash of lightning," ordering him to leave the community in which he was reared. The angel was sent by the King of Light and in Manichaean sources is called the Twin or the Paraclete. It was a kind of heavenly double that guarded him during his youth, showed him many "visions and sights" and appeared again to him "in great glory" when he was twenty-four years old. The Twin revealed to him all the mysteries of the world: "what my body is, in what way I have come, . . . who my Father on high is, . . . the boundless heights and the unfathomable depths." The spirit sends Mani, who is very hesitant about his vocation, out into the world to proclaim his saving message, promising him: "You, then, expound all that I have given to you. I shall be your ally and protector at all times." Here again the first vocation is followed by a period of mental preparation in close relationship with the spirit, who functions as a guarding spirit and eventually brings about the revelation of perfect divine knowledge.

Muḥammad, the prophet of Islam, obtained his vocation (in 609 or 610 CE when he was about forty years old) after a long period of mental crisis and growing unhappiness with religious practice in his birthplace, Mecca; as a result, there ensued serious conflicts with the local tribal establishment and his eventual departure (*Hijrah*) for Medina in 622 CE. The Qurʾān contains some scanty allusions to the Prophet's vocation, which took place in a nocturnal vision, perhaps at Jerusalem, in which he saw Allāh or the angel Gabriel, who gave him the essence of the Qurʾānic message (*sūrah*s 17:1, 53:1–18, 81:19–26). Muḥammad was so confused that he believed himself mad. Later Islamic tradition developed this theme into the legend of Muḥammad's nightly ascension to heaven and descent with the heavenly Qurʾān.

The history of Christianity and its various offspring shows a wide variety of vocations of saints, reformers, and prophets. Joan of Arc (1412–1431) received a vocation as a little girl in a garden. She heard a loud voice and saw a brilliant light and the archangel Michael escorted by a legion of angels. Michael the Archangel announced the arrival of Saint Catherine and Saint Margaret, who urged her to help the French king and save France, a task she accepted after long hesitation.

Most nativistic cults and messianic movements that are the result of an acculturation conflict are initiated by the vocation of a prophetic leader, involving a remarkable amalgam of elements from the old and the new religion. Such is the case in the Shaker religion in the northwestern United States and in the Ghost Dance movement among the North American Indians. The second wave of the Ghost Dance was initiated by the Indian laborer Wovoka in 1890. During a solar eclipse he had an attack of fever and heard his fellow tribesmen make a loud noise to drive away the monster that devoured the sun. Then he had the following vision:

When the sun died, I went up to heaven and saw God and all the people who had died a long time ago. God told me to come back and tell my people they must be good and love one another and not fight, or steal or lie. He gave me this dance to give to my people.

Other less peaceful messianic movements also began with the vocation of a prophet. W. W. Harris of Cape Palmas in Liberia was jailed in 1912 because his preaching was suspected of inciting rebellion against the Liberian government. In a nocturnal vision the angel Gabriel appeared to Harris and called him to become the prophet of Africa; thus began his very successful missionary travels along the west coast of Africa, which lasted for two years.

Also well-known is the vocation of the shaman, which forms the first phase of a long and difficult initiation into this ecstatic religious function that mediates between the world of the spirits and the world of men. Shamanism occurs all over the world, but principally in northern and Inner Asia and in North America. The vocation of the future shaman manifests itself in a significant change of behavior, in mental illness, hallucinations, epileptic attacks, strange accidents or ordeals, in all of which the activities of the guardian spirit are experienced. A shaman of the Yakuts in Siberia told how he became ill at the age of twenty, saw visions and heard strange voices, and struggled with the spirit for nine years. In the end he almost died; finally he began to be a shaman, and his illness was cured. The vocation of the shaman is in almost all cases associated with an initiatory sickness that brings him to the threshold of death, often resulting in a complete disintegration of his personality, which is then re-integrated in the initiation. It is a process of death and rebirth. The future shaman sometimes sees in dreams or visions his head chopped off, his body reduced to a dismembered skeleton or boiled in a kettle, symbols belonging to archaic cultural patterns in which the myth of life out

of death is predominant. The powerful symbolism of the shamanic vocation as the initiatory phase of a process of rebirth is the most profound expression of the meaning of every vocation: being called and reborn into a new condition of life in order to minister to and save fragile human lives with the help of the divine world to which the vocation gives entrance.

BIBLIOGRAPHY

A comprehensive study of the various forms of vocation is still lacking. William James's *The Varieties of Religious Experience* (New York, 1902) remains basic for the correct understanding of the psychology of the divine call. For the phenomenon of the Hebrew prophets and related persons, see Erich Fasher's *Prophetes: Eine sprach- und religionsgeschichtliche Untersuchung* (Giessen, 1927) and Johannes Lindblom's *Prophecy in Ancient Israel* (Philadelphia, 1962). Arthur Darby Nock offers an excellent introduction to the early Christian and Hellenistic world in *Conversion: The Old and the New in Religion from Alexander the Great to Augustine of Hippo* (Oxford, 1933). For vocation in messianic movements, see Peter Worsley's *The Trumpet Shall Sound: A Study of "Cargo" Cults in Melanesia* (London, 1957); Bengt M. Sundkler's *Bantu Prophets in South Africa*, 2d rev. ed. (London, 1961); Wilson D. Wallis's *Messiahs: Their Role in Civilization* (Washington, D.C., 1943), a general work; and I. M. Lewis's *Ecstatic Religion* (Harmondsworth, 1971). For the various forms of shamanistic vocation, Mircea Eliade's *Shamanism: Archaic Techniques of Ecstasy*, rev. & enl. ed. (New York, 1964), is fundamental. Eliade's *Birth and Rebirth: The Religious Meaning of Initiation in Human Culture* (London, 1958) is a good introduction in the complex field of vocation and initiation.

Revised Bibliography

VODOU is a sometimes misleading, but nevertheless common, name for the religious practices of the majority of Haitians. Outsiders have given the name Vodou to the complex web of traditional religious practices followed in Haiti. Only recently, and still to a limited extent, have Haitians come to use the term as others do. Haitians prefer a verb to identify their religion: they speak of "serving the spirits."

A mountainous, poverty-stricken, largely agricultural country of approximately eight million people, Haiti has a land area of 10,700 square miles and occupies the western

third of the island of Hispaniola, which it shares with the Dominican Republic.

This is where Caribbean Vodou began, but Haiti is not the only place Vodou is practiced. Vodou is also a central part of everyday life in Haitian diaspora communities in New Orleans and Santiago, Cuba, both products of the upheaval caused by the Haitian Revolution (1791–1804). More recent political and economic struggles in Haiti have also led to Vodou communities in New York City, Miami, Montreal, and Paris.

In Haiti, *vodou* originally referred to one ritual style among many in their syncretic religious system, the style most closely connected to Dahomey and the Fon language. The word *vodou* is derived from the Fon *vodun*, which means "god" or "spirit." *Hoodoo* is a related term from the same Fon word, yet, in the United States, it is almost always used as a derogatory term that focuses on black magic spells and charms.

Sensationalized novels and films, as well as spurious travelers' accounts, have painted a negative picture of Haitian religion. Vodou has been depicted as primitive and ignorant. Vodou rituals have been described as arenas for uncontrolled orgiastic behavior, and even cannibalism. The same writers stir up fear of Vodou and suggest that if whites get too close to a Vodou ceremony terrible things could happen. These distortions are attributable to the fear that the Haitian slave revolution sparked in whites. Haiti achieved independence in 1804, and thus became the first black republic in the Western Hemisphere at a time when the colonial economy was still heavily dependent on slave labor.

In Vodou there are three (not always clearly distinguished) categories of spiritual beings: *lemò*, *lemistè*, and *lemarasa* (respectively, "the dead," "the mysteries," and "the sacred twins"). While certain Vodou prayers, songs, and invocations preserve fragments of West African languages, Haitian Creole is the primary language of Vodou. Creole is the first and only language of more than one half the population of Haiti. It has a grammatical structure familiar to speakers of West African languages and an eighteenth-century French vocabulary mixed with a smattering of English words and expressions.

Although individuals and families regularly serve the Vodou spirits without recourse to religious professionals, throughout most of Haiti there is a loosely organized priesthood open to both men and women. The male priest is known as an *oungan* and the female priest is a *manbo*. There is a wide spectrum of Vodou ritualizing. There are individual acts of piety, such as lighting candles to petition particular spirits, and elaborate feasts, sometimes lasting days and including the sacrifice of several animals as part of the meals offered to the spirits. Energetic singing, dancing, and polyrhythmic drumming accompany the larger rituals. In the countryside, rituals often take place outdoors, on family land set aside for the spirits, and there is often a small cult house

on that land where the family's altars are kept. Urban Vodou rituals tend to take place in an *ounfò* ("temple"). Urban altars, dense with sacrificial food and drink, sacred stones, and chromolithographs of the Catholic saints and other images, are maintained in *jèvo* ("altar rooms") off the central dancing and ritualizing space of the temple, the *peristyl*. In the cities, those who serve the spirits also tend to keep more modest altars in their own homes.

The goal of Vodou drumming, singing, and dancing is to *chofe*, to "heat up," the situation sufficiently to bring on possession by the spirits. As a particular spirit is summoned, a devotee enters a trance and becomes that spirit's *chwal* ("horse"), thus providing the means for direct communication between human beings and the spirits. The spirit is said to ride the *chwal*. Using the person's body and voice, the spirit sings, dances, and eats with the people and also deals out advice and chastisement. The people in turn offer the spirit a wide variety of gifts and acts of obeisance, the goal being to placate the spirit and ensure his or her continuing protection.

There are marked differences in Vodou as it is practiced throughout Haiti, but the single most important distinction is that between urban and rural Vodou. Haitian society is primarily agricultural, and the manner in which peasants serve the spirits is determined by questions of land tenure and ancestral inheritance. Urban Vodou is not tied to specific plots of land, but the family connection persists in another form. Urban temple communities become substitutes for the extended families of the countryside. The priests are called "papa" and "mama"; the initiates, who are called "children of the house" or "little leaves" refer to one another as "brother" and "sister." In general, urban Vodou is more institutionalized and often more elaborate in its rituals than its rural counterpart.

AFRICAN INFLUENCE. Haiti's slave population was built up in the eighteenth century, a period in which Haiti supplied a large percentage of the sugar consumed in Western Europe. Vodou was born on sugar, sisal, cotton and coffee plantations out of the interaction among slaves who brought with them a variety of African religious traditions, but due to inadequate records, little is known about this formative period in Vodou's history. It has been argued by Haitian scholars such as Michel-Rolph Trouillot that the religion did not coalesce until after the revolution, but others suggest it had an effective presence, particularly in northern Haiti, during the latter part of the eighteenth century. James G. Leyburn in *The Haitian People* (1941) and Carolyn Fick in *The Making of Haiti* (1990) argue that Vodou played a key role in the organization of the slave revolt.

Among the African ethnic groups brought to Haiti as slave laborers, the most influential in shaping Haitian culture, including Vodou, were the Fon, Mahi, and Nago from old Dahomey (the present Republic of Benin), those who came to be known as the Yoruba (Nigeria), and Kongo peoples (Angola, and the Democratic Republic of the Congo).

Many of the names of Vodou spirits are easily traceable to their African counterparts; however, the spirits have undergone change in the context of Haiti's social and economic history. For example, Ogun among the Yoruba is a spirit of ironsmithing and other activities associated with metal, such as hunting, warfare, and modern technology. Neither hunting nor modern technology plays much of a role in the lives of Haitians. Haiti, however, does have a long and complex military history. Thus, the Haitian spirit Ogou is first and foremost a soldier whose rituals, iconography, and possession-performance explore both the constructive and destructive uses of military power, as well as its analogues with human relations—anger, self-assertion, and willfulness.

Africa itself is a powerful concept in Vodou. Haitians speak of Ginen ("Guinea") both as their ancestral home, the Guinea coast of West Africa, and as the watery subterranean home of the Vodou spirits. Calling a spirit *franginen*, ("fully and completely African") is a way of indicating that the spirit is good, ancient, and proper. The manner in which an individual or a group serves the spirits may also be called *franginen*, with similar connotations of approval and propriety.

ROMAN CATHOLIC INFLUENCE. For the most part, the slaveholders were Catholics and baptism for slaves was mandatory by French law. Many have argued that slaves used a veneer of Catholicism to hide their traditional religious practices from the authorities. While Catholicism may well have functioned in this utilitarian way for slaves on plantations, it is also true that the religions of West Africa from which Vodou was derived, already had a tradition of borrowing the deities of neighbors and enemies alike. Whatever Catholicism represented in the slave world, it was most likely also used as a means to expand Vodou's ritual vocabulary and iconography, thus helping captive laborers function in a nominally Catholic world. In 1804, immediately after Haiti declared its liberation, the Catholic Church withdrew all of its clergy from the new republic. Yet Catholicism survived in Haiti for fifty years without contact with Rome and it did so through the imitative ritualizing of a Vodou figure known as *prêtsavan* ("bush priest") as well as the competitive market for healing charms and talismans that was kept going by defrocked Catholic priests and the self-appointed "clergy" who ended up in Haiti in the early nineteenth century.

Catholicism has had the greatest influence on the traditional religion of Haiti at the level of rite and image rather than theology. This influence works in two ways. First, those who serve the spirits call themselves Catholic, attend Mass, and undergo baptism and first communion. Because these Catholic rituals at times function as integral parts of larger Vodou rites, they can be even directed to participate by their Vodou spirits. Second, Catholic prayers, rites, images, and saints' names are integrated into the common ritualizing of Vodou temples. The *prêtsavan* is an active figure in Vodou. He achieves his title by knowing the proper, that is the Latin or French, form of Catholic prayers.

Over the years, a system of parallels has been developed between the Vodou spirits and the Catholic saints. For example, Dambala, the ancient and venerable snake deity of the Fon people, is venerated in Haiti both as Dambala and as St. Patrick, who is pictured in the popular chromolithograph with snakes clustered around his feet. In addition, the Catholic liturgical calendar dominates in much Vodou ritualizing. Thus the Vodou spirit Ogou is honored in Haiti and in the Haitian diaspora on July 25, the feast day of his Catholic counterpart.

Bondye, “the good God” is identified with the Christian God, and is said to be the highest, indeed the only, god. The spirits are said to have been angels in Lucifer’s army whom God sent out of heaven and down to Ginen. Although the Vodou spirits may exhibit capricious behavior, they are not evil. Rather, they are seen as intermediaries between the people and the high god, a role identical to the one played by the so-called lesser deities in the religions of the Yoruba and Fon. Bondye is remote and unknowable. Although evoked daily in ordinary speech (almost all plans are made with the disclaimer *si dye vle* (“if God wills”), Bondye’s intervention is not sought for help with life’s problems. That is the work of the spirits.

Both the Catholic Church in Haiti and the government of Haiti have participated energetically in the persecution of those who serve the Vodou spirits. The last “antisuperstition campaign” was in the 1940s, but clerical and upperclass disdain for the religion has persisted much longer. In the twentieth century, Catholic clergy routinely preached against serving the spirits, and those who served them remarked, “That is the way priests talk.” Many Catholic holy days have a Vodou dimension that church officials routinely manage to ignore.

For years Catholicism was the only religion in Haiti with official approval. Thus, the degree to which Vodou has been attacked, oppressed, tolerated, or even encouraged through the years has been largely a function of local politics. Presidents Dumarsais Estime (1946–1950) and Francois Duvalier (1957–1971) stand out from other Haitian heads of state because of their sympathy with Vodou. Jean-Bertrand Aristide, who was first elected president in 1990, was also a supporter of Vodou; in fact he changed the balance of religious power. On April 5, 2003, President Aristide fully recognized and fully empowered Vodou as a Haitian religion that could legally exercise its influence throughout Haiti according to the constitution and the laws of the republic.

VODOU SPIRITS. The Vodou spirits are known by various names: *lwa*, a common name with an uncertain origin; *sen*, “saints”; *mistè*, “mysteries”; *envizib*, “invisibles”; and more rarely, *zanj*, “angels.” At some point in the development of Vodou the spirits were sorted into *nanchon*, “nations.” The *nanchon* at an early point in their development appear to have functioned primarily as ethnic slave categories. The majority of the nation names are easily traceable to places in Africa: Rada, Ibo, Nago, Kongo. Later, however,

these so-called nations became religious categories, diverse ritual styles of drumming, dancing, and honoring the Vodou spirits.

The Rada spirits (named after the Dahomean principality Allada, once a busy slave depot) comprise a collection of ancient, sweet-tempered, wise, and usually patient *lwa*. Then there are the fiery and powerful Petwo spirits. The origin of the name “Petwo” is contested, but the strong Kongo influence is not. The home of the Ogou, also hot spirits, is the Nago *nanchon*, a Dahomean name for Ketu Yoruba. Most big feasts end with the playful Gede, inveterate rule breakers, who insist they are a *fami* (“family”), not a *nanchon*. In rural Vodou, a person may inherit responsibilities to one or more of these *nanchon* through maternal or paternal kin. Familial connections to the land, where the *lwa* are said to reside in trees, springs, and wells, may determine which particular spirits are served. In urban Vodou, there are a few important spirit *nanchon* that make their appearance, according to seniority and importance, in most major rituals. In Port-au-Prince, two *nanchon*, the Rada and the Petwo, have emerged as dominant largely by absorbing other *nanchon*. Rada and Petwo spirits contrast sharply. The Rada are *dous*, “sweet,” and the Petwo, *cho*, “hot.” When an individual, family, or temple is described as ritualizing in a mode that is *Rada net* (“straight Rada”), a great deal is being said about how that person or group functions socially as well as ritualistically. Each spirit has drum rhythms, dances, and food preferences that relate to its identifying characteristics. For example, Danbala, the gentle Rada snake spirit, is said to love *orja*, thick sugary almond syrup. His devotees perform a graceful spine-rippling dance called *yanvalu*. By contrast, the Petwo rhythm played for rum-drinking spirits is energetic and pounding, and the accompanying dance is characterized by fast, strong body movements.

THE VODOU VIEW OF PERSON. In Vodou teachings the human being is composed of various parts: the body, that is, the gross physical dimension of the person who perishes after death, in addition to two to four souls, of which the most widely acknowledged are the *gwo bonanj*, and *ti bonanj*. The *gwo bonanj* (“big guardian angel”) is roughly equivalent to consciousness or personality. When a person dies the *gwo bonanj* lingers, and immediately after death it must be protected because it is most vulnerable to capture and misuse by sorcerers. During possession, it is the *gwo bonanj* who is displaced by the spirit and sent to wander away from the body, as it does routinely during sleep. The *ti bonanj* (“little guardian angel”) may be thought of as the spiritual energy reserve of a living person and, at times, as the ghost of a dead person.

Each person has one special *lwa* who is their *mèt-tet*, “master of the head.” (The top of the head and the back of the neck are places where spirits may enter and leave.) The *mèt-tet* is the most important *lwa* served by a particular person and it reflects that person’s personality to some degree. A Haitian whose family serves the spirits may inherit spiritu-

al responsibilities to a deceased family member's *mèt-tèt*. That is a big responsibility, but there are also things that can be gained. If the *mèt-tèt* is conscientiously fed and honored, good luck and protection from both ancestor and *lwa* will be gained. In addition to the so-called masters of the head, most people who serve the spirits have a small number of other *lwa* with whom similar reciprocity has been established.

Unlike Catholic saints who are usually known through formulaic hagiography, Vodou *lwa* have richly developed histories, personalities, needs, desires, character strengths, and flaws, and even taste in food and drink. Because the *lwa* are fully developed characters and interact so intimately with *vivan-yo*, "the living," the practice of Vodou also functions as a system for categorizing and analyzing human behavior, in the individual and in the group. One of the characteristics of virtually all Caribbean African-based religions is the great amount of care given to analyzing social behavior and dealing with the results of that behavior.

VODOU AND THE DEAD. Cemeteries are major ritual centers in both urban and rural Haiti. The first male buried in any cemetery is known as Bawon Samidi. Bawon's wife (or sister) is Gran Brijit, the first woman buried in the cemetery. Most cemeteries have a cross for Bawon either in the center of the cemetery or near its gate. Lakwa Bawon ("Bawon's Cross") marks the site's ritual center. Lighted candles and food offerings are left at the base of this cross. People stand with their hands on the cross praying aloud. Rituals for healing, love, or luck performed in rural cult houses or urban temples are not considered complete until physical remnants of the "work" are deposited at crossroads or at Bawon's Cross, which is itself a kind of crossroads marking the intersection of the land of the living and the land of the dead.

Haitians who serve the *lwa* usually make a clear distinction between the dead and the spirits. Yet a few of the ancestors, particularly if they were exceptional people when alive, actually evolve into spirits or *lwa*. Jean-Jacques Dessalines, Toussaint L'Ouverture, and John Kennedy have all been reported making cameo appearances through possession in Vodou ceremonies. The group of spirits, known as the Gede, have Bawon as their leader and are spirits of the dead as might be expected, but they are not ancestral spirits. Instead, they stand in for the entire community of human beings now deceased and in this context, Gede's crude comic performances make some sense. They are designed to bring the haughty to their knees and convince them that in the end, human beings all face the same fate. The Gede are inclusive, with no limits, and therefore almost any image will work on a Gede altar. Statues of the Buddha, LaoTzu, King Kong, St. Gerard, and Elvis Presley have all been sighted on Vodou altars. In and around Port-au-Prince, the capital of Haiti and its largest city, the Gede are the object of elaborate ritualizing in the cemeteries and Vodou temples during the season of the Feast of All Souls, Halloween.

The Gede are not only spirits of death but also boosters of human sexuality, protectors of children, and irrepressible social satirists. Dances for Gede tend to be boisterous affairs, and new Gede spirits appear every year. The satirical, and often explicitly sexual, humor of the Gede levels social pretense. The Gede use humor to deal with new social roles and to challenge alienating social structures. Through possession-performance, they not only appear as auto mechanics and doctors, they also critique government bureaucrats, military figures, and Protestant missionaries.

VODOU CEREMONIES. In some parts of rural Haiti, the ideal Vodou ceremony is one that serves the spirits as simply as possible because simplicity is said to reflect discrete but strong spiritual power, the African way of doing things (Larose, 1977). In practice, rural ritualizing tends to follow the fortunes of extended families. Bad times are often attributed to the displeasure of family spirits. When it is no longer possible to satisfy the spirits with small conciliatory offerings, the family will hold a large drumming and dancing feast that includes animal sacrifice. Urban Vodou, by contrast, has a more routine ritualizing calendar, and events tend to be larger and more elaborate. Ceremonies in honor of major spirits take place annually on or around the feast days of their Catholic counterparts and usually include sacrifice of an appropriate animal—most frequently a chicken, a goat, or a cow.

In both rural and urban settings, a rich variety of ceremonies meet specific individual and community needs: For example, healing rites, dedications of new temples and new ritual regalia, and spirit marriages in which a devotee is wed to a spirit usually of the opposite sex and must pledge sexual restraint one night each week, when he or she receives that spirit in dreams. There is also a cycle of initiation rituals that has both public segments and segments reserved for initiates. The latter include the *kanzo* rituals, which mark the first stage of initiation into Vodou, and those in which the adept takes the *ason*, the beaded gourd rattle symbolizing Vodou priesthood. Certain rituals performed during the initiation cycle, such as the *bule zen* ("burning the pots") and the *chirè ayzan* ("shredding the palm leaf") may also be used in other ritual contexts. Death rituals include the *desounen*, in which the soul is removed from the corpse and sent under the waters of Ginen, which is followed by the *wète mò nan dlo* ("bringing the dead from the waters"), a ritual that can occur only after a person has been dead for one year and one day. Herbal good-luck baths are routinely administered during the Christmas and New Year season. Elizabeth McAlister's 2002 book on Rara has convinced scholars, in the habit of dismissing Rara as an entertaining aspect of Carnival, of the deeply religious character of these irreverent parades that pour from the Vodou temples into the cemeteries and streets during the Catholic Lent.

Annual pilgrimages draw thousands of urban and rural followers of Vodou. The focal point of these Catholic-Vodou events is often a church situated near some striking feature

of the natural landscape that is sacred to the *lwa*. The two largest pilgrimages are one held for Ezili Danto (Our Lady of Mount Carmel) in mid-July in the small town of Saut d'Eau, named for its spectacular waterfall, and one held for Ogou (St. James the Elder) in the latter part of July in the northern town of Plain du Nord, where a shallow, muddy pool adjacent to the Catholic church is dedicated to Ogou.

VODOU AND MAGIC. Serge Larose (1977) has demonstrated that magic is not only a stereotypic label that outsiders have applied to Vodou, but also a differential term internal to the religion. Thus an in-group among the followers of Vodou identifies its own ritualizing as "African" while labeling the work of the out-group as *maji* ("magic"). Generally speaking, this perspective provides a helpful way to grasp the concept of magic within Vodou. There are, however, those individuals who, in search of power and wealth, self-consciously identify themselves with traditions of what Haitians would call "the work of the left hand." This includes people who deal in *pwen achte* ("purchased power points"), which means spirits or powers that have been bought rather than inherited, and people who deal in *zonbi*. A *zonbi* may be either the disembodied soul of a dead person whose powers are captured and used for magical purposes, or a soulless body that has been raised from the grave to do drone labor in the fields. Also included in the category of the left hand are secret societies known by such names as Champwel, Zobop, Bizango, and Zanglando. In Urban settings in the late twentieth century secret societies began to operate as if they were a branch of the Mafia, but their deep history is quite different: They once represented religiously enforced rural law and order. The secret societies were groups of elders who used their power not for personal gains but to enforce social sanctions. For example, Wade Davis (1985) says that *zonbi* laborers were created by secret society tribunals who voted to use *zonbi* powder against a sociopath in their community.

The "work of the left hand" should not be confused with more ordinary Vodou ritualizing that can have a magical flavor, such as divination, herbal healing, and the manufacture of *wanga*, charms for love, luck, or health, or for the protection of the home, land, or person. Much of the work of Vodou priests is at the level of individual client-practitioner interactions. Theirs is a healing system that treats problems of love, health, family, and work. Unless a problem is understood as coming from God, in which case the Vodou priest can do nothing, the priest will treat it as one caused by a spirit or by a disruption in human relationships, including relations with the dead. Generally speaking, Vodou cures come about through ritual adjustment of relational systems.

VODOU IN THE HAITIAN DIASPORA. Drought and soil erosion, poverty, high urban unemployment, and political oppression have led to massive emigrations from Haiti in the last half-century. Vodou has gone along with the Haitians who, in search of a better life, have come to major urban centers of North America. In New York, Miami, and Montreal, the cities with the greatest concentrations of Haitian immi-

grants, Vodou ceremonies are carried on in storefronts, rented rooms, high-rise apartments, and basement storage areas. North American rituals are often somewhat truncated versions of their Haitian counterparts. There may be no drums, and the only animals sacrificed may be chickens. However it is possible to consult a manbo or oungan in immigrant communities with ease, and the full repertoire of rituals can be followed there, in one form or another. Even the pilgrimages are duplicated. On 16 July, rather than going to the mountain town of Saut d'Eau to honor Ezili Danto, New York Vodou practitioners take the subway to the Italian-American Church of Our Lady of Mount Carmel in East Harlem.

BIBLIOGRAPHY

Alfred Metraux's *Voodoo in Haiti* (New York, 1959) is a complete and accurate, if not sympathetic, treatment of Haitian Vodou. Melville J. Herskovits's *Life in a Haitian Valley* (New York, 1937) is an early and popular ethnography of the Mirebalais Valley located fifty-five kilometers inland from Port-au-Prince. Herskovits worked there during a period when Vodou influence had been significantly repressed by Christian missionaries and consequently he saw it as a dying religion. Maya Deren, dancer and filmmaker, wrote a rich and insightful work on her encounter with Vodou, *Divine Horsemen: The Living Gods of Haiti* (1953; reprint, New Paltz, N.Y. 1983). In addition, Harold Courlander's *The Drum and the Hoe: Life and Lore of the Haitian People* (Berkeley, Calif., 1960) provides much helpful information about Vodou and its larger cultural contexts. It is especially good on music. To greater and lesser extents all of the above works are outdated. Donald Cosentino's, *The Sacred Arts of Haitian Vodou* (Los Angeles, 1995), a selection of essays by leading Haitian scholars and also the catalog from Cosentino's highly successful exhibition of the same name, is the richest and most diverse academic work on Vodou. A classic article by Serge Larose, "The Meaning of Africa in Haitian Vodou," can be found in *Symbols and Sentiments: Cross-Cultural Studies in Symbolism*, edited by Ioan Lewis, 85–116, (New York, 1977).

The most complete, although not necessarily the best, history of Haiti and Haitian Vodou is still James G. Leyburn's *The Haitian People* (1941, rev. ed. with a new introduction by Sidney Mintz, New Haven, 1966). Joan Dayan's *Haiti, History, and the Gods* (Berkeley, Calif., 1998) brings postmodern analytic skills and fresh archival work to her gendered account of Haiti's revolutionary history. Carolyn Fick's *The Making of Haiti: The San Domingue Revolution From Below* (Knoxville, Tenn., 1990) makes a carefully researched and convincing argument that Vodou played a significant role in Haiti's revolution and did so from the beginning. Michel-Rolph Trouillot, who argues that Vodou came together only in the first half of the nineteenth century, does a brilliant job in *Silencing the Past: Power and the Production of History* (Boston, 1997) of problematizing other versions of Haiti's taken-for-granted history.

Anne Greene's *The Catholic Church in Haiti: Political and Social Change* (East Lansing, Mich., 1993) provides important in-

formation about the role of Catholicism in Haiti, as does Terry Rey's *Our Lady of Class Struggle: The Cult of the Virgin Mary In Haiti* (Trenton, N. J., 1999). Leslie G. Desmangles's *The Faces of the Gods: Vodou and Roman Catholicism in Haiti* (Chapel Hill, N.C., 1993) explores the syncretism dimension of the relationship between Vodou and Catholicism. Robert Ferris Thompson's *Flash of the Spirit: African and Afro-American Art and Philosophy* (New York, 1981) contains the best analysis yet done on the specific African retentions within Haitian Vodou.

A handful of scholarly works cover new areas in Vodou scholarship. E. Wade Davis opened the world of the secret societies in *The Serpent and the Rainbow* (New York, 1985) and *Passage of Darkness* (Chapel Hill, N.C., 1988). Elizabeth McAlister's *Rara: Vodou Power and Performance in Haiti and the Diaspora* (Berkeley, Calif., 2002) changes the relationship between Vodou temples and Carnival, and thus, to some extent, between the sacred and the secular. My own work, *Mama Lola: A Vodou Priestess in Brooklyn* (Berkeley, Calif., updated edition, 2001), provides an extensive case study of Vodou in diaspora.

VOODOO SEE VODOU

VOTIVE OFFERING SEE VOWS AND OATHS

VOWS AND OATHS. With the vow to accomplish something, a person dedicates himself to the task wholly.

Whoever takes an oath to accomplish something is required to answer for it, for he has named himself or some one of his belongings as a pledge of his commitment and is thus bound by his very life, his honor, and his property.

Vows and oaths therefore affect a person's whole being; they put one's very existence in pawn. There is a distinct difference, however, between an oath and a vow: a vow is merely a personal promise, whereas an oath is a promise made before some institutional authority. In taking an oath, a person not only assumes an obligation but also becomes liable to prosecution; the state and society have an interest in his act. Oaths serve as objective guarantees of what is promised. Swearing to tell the truth, one guarantees that what one says is true. Oaths are self-endorsing.

The practice of oath taking by which a person places his very life at risk is an extremely ancient one. It is an institution of coercion, "the most powerful coercion known to primitive man" (Thurnwald, 1925, vol. 2, p. 39). Oaths are encountered among all peoples and in all cultures. They are a primal symbol of religion.

Because they are absolutely binding by nature, and because they are subject to both misuse and overuse, oaths are nevertheless looked upon with some suspicion in the fields of ethics, politics, and jurisprudence. They have to be judged in themselves, in relation to the particular substance of the promise they contain and the nature of the guarantee, as both tend to vary considerably depending on the level of the given culture and the conventions of the applicable code of law.

GIVING AND RECEIVING—AN INSTITUTION OF LIFE. In the archaic scheme of things, objects of barter, things that must be paid for, are not simply goods but rather gifts. They establish a substantial bond between giver and receiver, for the latter is obligated to provide something in exchange for the gift. Such exchange affects the social position of the participants: it turns the giver into a receiver and makes of the receiver a giver.

In this economy of mutual giving, the objects exchanged have both an objective and a subjective significance; they not only create the partnership, they also serve to insure it. They are subject to recall. They give rise to rights and obligations. They are pledges.

Vows and oaths have the same archaic structure. They create and solidify partnerships based on reciprocal giving. One swears by specific things, and in the exchange these pledges become extremely important. They guarantee the peace, subjectively and objectively. The bond of order they establish is affirmed in the oath itself, so that the oath, like the things by which it is sworn, is part blessing and part curse: it obligates one to a bond, and binds one to an obligation.

In many languages the word for "oath" is somehow associated with fate. The Assyrian *mamuti* translates as "oath," but it also means "obsession" and "curse." The related term

tamitu is also used for “oath,” but in addition it can refer either to a divine oracle or the question put to the god (Pedersen, 1914, p. 2). Clearly one is oneself possessed by what one possesses. Property can have a fatal power.

The Arabic word *bai‘* translates as both “purchase” and “sale,” but it also means “covenant.” The exchange of wares, accompanied by ceremonial gestures of bonding such as reciprocal touching and shaking of hands, confers certain rights and obligations to both parties. One sells a certain object, but one also sells oneself. The bond linking buyer and seller is an oath. Implicit in the word *bai‘* are both the sealing of a compact and an exchange of oaths (ibid., pp. 52–58). The former secures the connection, while the latter constitutes “religion” (from *religare*, “to tie fast”) in the truest sense, bondage to the gift of life. The Anglo-Saxon verb *swerian* (“to swear”) suggests something of the magic in such a bond, for at one time it meant to recite mystic charms and spells in a strange, singsong kind of chant. Old Frisian *swera* meant simply “to sing”—in the service of religion.

Oaths in early Germanic times were not only a religious rite, they were themselves the religion. An oath was an *actus religiosissimus* in the truest sense (Lex, 1967, p. 24). The Middle High German word for “oath” contains the Indo-European root **it* or **lig*, meaning bond. An oath is an added confirmation, an absolute guarantee, of the word and intent of the person swearing, and it is also the fetter that binds him to the truth. The Latin term for “oath” is *ius iurandum* (“sworn law”). Oaths were firmly established legal instruments with statutory force: “An oath is an assurance backed by religious sanctity; and a solemn promise given, as before God as one’s witness, is to be sacredly kept” (Cicero, *De officiis* 3.104). The oath of allegiance was known as the *sacramentum*.

The things one swears by are pledges, and the promises to which one binds oneself in swearing by things are oaths. With the specific things to which he appeals, a person guarantees that to which he has committed himself. They can be demanded of him; they become objects for litigation. Greek mythology (according to Hesiod) speaks therefore of the oath as the offspring of contention. It issues from conflict over things to which one is obligated, namely heaven and earth, life and death, gods and men. The obligation to them is binding, and the bond with them brings with it obligation. The very earth avenges itself on the perjurer, for with his oath he has placed it in pawn. The Greeks speak of having to pass through the portals of the oath, for *horkos*, their word for “oath,” designates a separate space before which one has a sense of dread (*aidōs*), a border region. The strongest oaths of all were those sworn on the bank of the Styx, the underworld stream whose waters expose the guilty and cleanse the innocent of false accusations.

Oaths are a divine judgment. The good and evil that they decide between amount to fortune and misfortune. Hence one speaks of eating and drinking one’s oath. It either confirms or threatens one’s very existence.

Oath taking may entail trial by fire, duels, symbolic destruction of specific objects, or hypothetical self-condemnation. The Maasai of East Africa bite off a few blades of grass, then exclaim: “May this grass prove poisonous to me if I have lied before God!” (Lasch, 1908, p. 80).

The reciprocal giving and taking in the economy of barter is something that serves to solidify society, for the one who gives also has a right to receive. Gifts are therefore challenges: they bind the receiver to the giver; they are what establishes a compact with him. They are an opening ceremony. While they serve to guarantee the fulfillment of oaths, they also anticipate the fulfillment of a vow, which is not a pledge to the past, but to the future. A vow presumes a compact that is yet to be. Votive gifts are only down payments on future covenants. They serve as symbols in the here and now of future fulfillment, and they have personal meaning. They give objective reality to a subjective religion.

Like votive gifts, magical rites and animal and human sacrifice are typical examples of such objectivization. So are the conjuring of rain in Arizona, New Mexico, and southern Europe, and so were temple prostitution in the Near East, cult chastity among the Romans, continence in preparation for specific tasks (as in war vows), or the habit in Latin countries of placing votive offerings in the form of garments and models of healed limbs on altars and temple walls. Popular faith abounds with customs of this kind. In them, promises take the form of gifts, and gifts serve as promises, concrete expressions of personal religion.

VOWS AND PERSONAL RELIGION. Gifts initiate the reciprocity of giving and receiving, and they have been used for that purpose since archaic times. They have personal importance, for the promises they imply must be kept only if the gifts are found acceptable.

Vows are promises of the same kind. Whether they are fulfilled is not a matter for the law but rather hinges on the person governing the giving and receiving. Nothing is given that is found unacceptable, and nothing is accepted that cannot be given. All involuntary vows are invalid. All voluntary ones are valid provided they satisfy the controlling authority, the religion, under which they are made. The same authority has the option of annulling them.

The Bible, Judaism, Christianity, Islam, and Buddhism all limit the use of vows. They have rules applying to the pledges of individuals as well as those of whole groups, such as communal orders and sects.

The terms for *vow* in the Bible are the Hebrew *nazir* and the Greek *euchē* (“prayer”). There a vow is an unconditional pledge of special submission to Yahveh. The Nazirite, or the man who has made such a vow, must refrain from drinking wine (*Nm.* 6:3), cutting his hair (*Nm.* 6:5), and coming into contact with a corpse (*Nm.* 6:6). The charismatic warrior Samson is an example of such a man (*Jgs.* 13ff). What distinguishes a person under such a vow is not his asceticism but rather his symbolic strength, his total commitment to the ad-

vancement of Yahveh's cause. This same vow is met with in the New Testament as well: Paul had placed himself under one (*Acts* 18:18) even before the Jerusalem congregation required it of him (*Acts* 21:23–24). Such a vow can be either for life or for only a specified period.

The Talmud and Mishnah treat all kinds of vows, that is, vows of abstinence as well as vows of consecration, under the single rubric of *nedarim*, "vows" (*Ned.* 3.4). They advise that any such pledges be restricted as much as possible to basic religious practices. While admitting their usefulness as insurance of unconditional compliance with sacred obligations, the Jewish texts warn that vows must not be undertaken lightly and add that they have only limited validity when made by minors.

Christian vows consist of promises to obey the so-called gospel counsels: poverty, chastity, and obedience. They are taken in the various monastic orders and are implicit in their rules. Affirmation of the counsels is a sign of the Christian's calling within the church to give himself to God, to preach the gospel, and to personify the Lord's dominion. It constitutes an anticipation of heavenly existence. By referring to the calling and thereby underscoring the voluntary and charismatic aspects of monastic life, this article deliberately skirts the notion of ascetic self-indulgence and personal gain rejected by Luther in his Reformation tract *De votis monasticis*. There is such a thing as an unconditional pledge that is of necessity only temporal and is therefore not binding for all eternity.

The Qur'ān and the six canonical works of the *sunnah* warn against excessive use of vows (*nudhūr*; sg., *nadhīr*) and make quite clear just what the nature of such pledges ought to be. According to the earliest thinking, they are best related to the basic religious duties and devotions, the intensity of which they tend to heighten. Thus one might vow to pray at specified places and times, to fast on unusual occasions, to undertake pilgrimage to shrines other than Mecca, or—most important of all—to provide additional, voluntary alms. Moreover, it is acceptable to vow to free slaves or to be especially attentive to fellow Muslims, to visit the sick, to attend services for the dead, and to accept invitations to weddings. Restrictive vows, entailing abstinence from certain foods, celibacy, extreme penance, and professions of contrition, are not considered binding. They are rejected for the simple reason that a person who presumes to declare forbidden what is generally allowed is no different from the one who allows what is in fact forbidden. Therefore the Qur'ān explains that monasticism is an innovation "that was not instituted by God, one that was only invented by the generations before you" (*sūrah* 57:27).

In the broadest sense, vows are unconditional promises to do something specific—good or evil. In the narrower sense, they are unqualified pledges to do good, not evil, and as such they are directed solely to God. Often they are cast in hypothetical terms: one "promises to do this or that under the condition that this or that is forthcoming" (Gottschalk,

1919, p. 30). Muḥammad is supposed to have said that a vow does not hasten anything and cannot forestall anything. However the miser's vow makes him better, for essentially he tells God: "Give, that I may give—*da ut dem!*" (*ibid.*, p. 4).

Vows encourage the fulfillment of obligations and the accomplishment of certain tasks. War vows and vows of revenge are clear examples of this; they enlist self-sacrifice and deprivation in the cause of securing just retribution. The *bodhisattva* vow of Mahayana Buddhism consists of the promise not to wish to enter *nirvāṇa* until all creatures have been released from the cycle of rebirth and have attained perfection. It first appears in the legend of the Buddha Amitabha in the second century BCE, and it continues to characterize the aspirations of major sects in China and Japan. It is the key to the salvation doctrine of Amida Buddhism. For if one gives what one receives, so does one receive what one gives. In promising to wait for salvation, one finds salvation in the waiting. Such a vow has cosmic significance. It constitutes sacrifice and self-denial.

OATHS AND THEIR INSTITUTIONAL FORMS. Oaths have both a constitutive and an instrumental force. They convey the truth of an assertion, but they also serve as a means whereby it can be determined whether or not that assertion is true. They confirm a promise, and at the same time provide by their very form proof positive of the accuracy of its content.

The instrumental nature of oaths becomes particularly apparent when a judicial system becomes detached from the life of the community, when state and culture are no longer one and the same. In such cases, oaths no longer reveal their constitutive force. In a state trial they function as legally binding proofs. They are one method of arriving at the truth in legal proceedings, and as such they take on regulative importance.

The ritual of oath taking takes numerous forms. In every case there are strict rules governing the behavior of all participants, the rights and obligations of the person swearing, and the specific form in which he pronounces and confirms his pledge. There is a mystique associated with the taking of oaths, one that was especially pronounced in the Indo-European cultural sphere. An obsession with form is typical of such rites, each role being carefully prescribed. An oath could miscarry if for some reason it was impossible to observe strict conventions in the swearing of it.

These conventions applied not only to the person taking the oath but also to his oath-helpers. The use of witnesses is characteristic of the Germanic peoples and is in fact unique to them. They might be members of the oath taker's family or men with whom he has sworn brotherhood. They were not obliged to confirm the substance of his assertion but only to attest to this credibility. Once his oath had been taken, they were called upon to swear—by twos, threes, sixes, or twelves—that it was "pure and not forsworn."

Such oaths of purification could still count for naught in the event of so-called *eidschelte* (ON, “oath challenge”). If the accused chose to force down the raised hand of the person swearing, a duel had to be fought to decide the issue.

The spot where an oath could be sworn, its wording, and all of the attendant gestures were strictly prescribed. The setting was called the *malstat* (“justice site”), *dingstat* (“trial site”), or *richtstat* (“judgment site”). This was where the community regularly gathered for its *Þing*, or legislative assembly, and it was here that sacrifices were offered to the gods and trials were held. An oath circle would be inscribed on the ground and the person swearing required to stand inside it. Under no conditions could he leave the circle or even place a foot outside its perimeter until the ritual was ended.

The wording of oaths differed considerably depending on the authority before which they were sworn and the persons or objects serving as pledges. A man might swear by his sword, his threshold, the plank of his ship, his wife and children, his own life, or one of the gods. The oath taker was required to stand and recite the *argumentum iuramenti*, called the *eidstab* (“oath stave”), in a clear voice and without assistance. On occasion the phrases might first be spoken by either the judge or the accuser, then repeated word for word by the accused. This type of oath was known as a *gestabter eid* (“directed oath”).

While swearing, the oath taker had to be touching his pledge with his free hand. It was this physical contact “that established the supernatural bond of the oath, the *mysterium iuramenti*, and gave it its magical force” (Brunner, 1906–1928, vol. 1, p. 257). If the oath was sworn by a god, such contact was accomplished through substitution. An animal was sacrificed to the god and the so-called *eidring* (“oath ring”) dipped in its blood. The oath taker then took hold of the ring with one hand while raising the other. Local custom dictated how many of the fingers of his raised hand were to be extended, whether two, three, or all of them.

Everyone participating in the rite had to perform his role in accordance with fixed rules. No distinction was made between the miscarriage of an oath and outright perjury. Form and content were considered one and the same. If one of the oath-helpers swearing overstepped the margin of the oath circle by a fraction of an inch, forgot a portion of the formula, used a wrong word, lowered his hand too quickly, or failed to touch the pledges as required, the oath was useless and the guilt of the accused was established. It was clear that he had perjured himself, and he was required to leave the settlement in dishonor, stripped of all communal ties. Later it became customary to punish a perjurer by chopping off either the fingers he had used in swearing or his entire hand.

In Germanic law a man’s whole life might hinge on his oath. Depending on its force in a trial, he could be either saved or doomed. Oaths of fealty and vassalage have the same constitutive importance, as does the citizen’s oath of the Middle Ages. The Swiss *Eidgenossenschaft* (“sworn confedera-

cy”) takes its strength from the constitutive force of the citizen’s oath, and the country’s civil code is based on it.

There are, however, a number of traditions in which oaths are accorded only instrumental importance. This is the case in Greek rhetoric, Roman and Islamic law, and in the various modern judicial systems. For them an oath is not proof in itself but only a means of proof. It can be of assistance in determining the truth, yet it is not considered the truth itself.

In Roman civil cases the oath “occupies a less important position than in Germanic ones, for while in the latter it is a statutory right of the accused that regularly takes precedence over other proofs, in the former it only appears at the request of the adversary or the judge when there are no other means for bringing the truth to light” (Bethmann-Hollweg, 1864–1874, vol. 2, p. 573). It serves as a kind of confirmation, strengthened by the fact that God is called to witness it. Here the form and content of oaths, their religious and legal significance, and their ethical and political aspects are distinctly separate.

The ancient writers produced numerous logical, rhetorical, philological, philosophical, and theological treatises on the problem of intent in oaths (*restrictio mentalis*), on the meanings of their terms and their differing connotations, on the degree to which an oath is binding depending on the rank of the deity by which it is sworn, and on the question of how frequently oaths may be required. They speak of sophistic oaths, in which the sense and the wording differ, of involuntary oaths (unlike Plato and Aristotle, Democritus considered all oaths to be valid, even involuntary ones), and finally of the proper form for the naming of pledges. One reads of Rhadamanthys’s struggle against the misuse of oaths and of Herakles’ effort to do away with them altogether. The Hippocratic oath sworn by physicians has a venerable tradition, surviving as it does into the current time. Always there have been disputes over just what one ought to swear upon (as in the oath of allegiance or loyalty oath) and the degree to which one commits oneself (oaths of office, oaths of vassalage, the oath to the Führer).

In the Bible, oaths are treated in both their constitutive and instrumental senses. The Lord swears an oath by himself (*Dt. 29:9ff.*). That oath is the basis of the covenant with Israel, and he is bound and obligated by it. But for it, he would not have stood behind his chosen people and liberated them from bondage. That divine oath has constitutive force even for God himself. Men are permitted to swear oaths only as long as they call upon God in doing so, but they have not always observed this restriction. Hence Jesus’ admonition not to swear at all (*Mt. 5:34–37*). Oaths are to be sworn before the Lord as God; they are not suited for the reinforcement of an intention that does not relate to him (*Mt. 23:16–22*). Jesus rejects the instrumental use of oaths. He nevertheless admits them when they serve to reaffirm the promise implicit in the Lord’s name (*Mt. 5:33*). He also admits affirmation in the form of “Yea, yea,” “Nay, nay.” (*Mt. 5:37*).

This rule is applied by the early Christian church both positively (*Heb.* 6:13–19) and negatively (*Jas.* 5:12). Swearing is permitted, yet oaths are still rejected. Meanwhile the oath had come to serve in an instrumental sense as a confirmation of faith. In 251 CE the antipope Novatian required an oath of allegiance from his followers; he was the first pontiff to do so. Later it became customary for bishops and teachers to take oaths of office, Christian significance was given to the fingers extended when swearing, and oaths were sworn on the Gospels and on relics.

One persistent problem has been whether priests ought to be required to swear oaths to secular authority, as in the oath to the emperor in antiquity, to the Republic during the French Revolution, or to the Führer under National Socialism. The Reformation rejected papal oaths. Various Christian sects—Anabaptists, Jehovah's Witnesses, Mennonites—refuse to take oaths of any kind.

ELMAR KLINGER (1987)

Translated from German by Russell M. Stockman
Revised Bibliography

VRIES, JAN DE (1890–1964), was a Dutch folklorist and historian of religions. Jan Pieter Marie Laurens de Vries was born in Amsterdam on February 11, 1890, and died in Utrecht on July 23, 1964. In 1926, de Vries was appointed to the chair for ancient Germanic linguistics and philology (comprising also Indo-European comparative grammar) at the University of Leiden. Among the numerous positions he held was the editorship of the fifth edition of Winkler Prins's *Algemene Encyclopedie* (General Encyclopedia; 16 vols, 1932–1938); this function occupied him for the entire period of publication. He established also a famous series of classical Dutch literary works, "Bibliotheek der Nederlandsche letteren" (1938–), sponsored by the Society for Dutch Literature and the Royal Flemish Academy of Language and Literature. Internationally famous as a Germanist, he became known in even wider circles as a folklorist. During the 1930s he pleaded fervently and often that the study of folklore (*volkskunde*) be considered a separate discipline, after having already championed the subject in congresses of philologists. The interest in the creativity of the *volk* (from which during this part of his life he excluded the intelligentsia and the urban proletariat, a view evinced in *Volk van Nederland*, published in 1937, which was a work by various authors that de Vries organized and edited, and of which he wrote a major part) was no doubt in tune with some scholarly and general interest fostered all over Europe at the time.

Unlike most scholars, de Vries had a career and lived in a time of history in which one's true colors could not always be kept concealed. After World War II, he was dismissed from his position at the University of Leiden because of his

stance and his acts during the war. Under German occupation (1940–1945) he had served as vice-chairman of the Kultuurkamer (the body whose approval was required for any artistic or literary production). In the summer of 1940, shortly after the German invasion, he wrote a pamphlet, *Naar een betere toekomst* (Toward a Better Future), that promulgated his antidemocratic views and hailed the newly opened way toward a world in which the individual would be subordinate to a more encompassing, national structure. He published with National Socialist publishers, worked for a National Socialist journal, and by the end of the war even became a “sympathizing member” of the Schutzstaffel (SS). Many of de Vries’s readers, and especially his students, have observed a mystifying inner contradiction in him.

No doubt, there is a conflict that is at the same time an essential ingredient in his work. De Vries was not only an industrious scholar but a very critical mind, a man who despised the crowd, yet longed for a truly harmonious community, which he thought was reflected among ancient Germanic and Norse tribes. Solitary, romantic in his tastes, and of superb intelligence, he seemed blind to the vulgarity of Nazism, to which he committed himself with a fatalistic faithfulness, even seeing its impending defeat, and all the while incapable of realizing the harmony with people for which he longed. It is quite remarkable that de Vries’s scholarly work does not show any feature of Nazi ideology or any of the kitsch it spawned. He pursued his scholarly goals unabated during, and also after, the war.

After his retirement in 1955 from a position as secondary schoolteacher in Dutch literature that he held for seven years, he wrote an impressive number of important books. Among them are his *Kelten und Germanen* (1960); *Forschungsgeschichte der Mythologie* (1961), in which his admiration for romantic impulses in history stands out clearly; and *Nederlands etymologisch woordenboek* (1963–1971). The best-known handbook of Germanic religion is the second edition of his *Altgermanische Religionsgeschichte* (2 vols., 1956–1957). De Vries is among the foremost scholars who recognized the importance of Georges Dumézil’s work. Throughout his career, however, de Vries maintained his own originality and erudite, critical competence in details. For instance, he points out the lack of clear evidence in Germanic sources for the existence of secret men’s societies, yet, with implicit as well as explicit criticism on theoretical models employed by others, he demonstrates various other specific expressions of socioreligious cohesiveness.

BIBLIOGRAPHY

Important works by de Vries that have been translated into English include *Heldenlied en Heldensage* (Utrecht, 1959), translated by B. J. Timmer as *Heroic Song and Heroic Legend* (London, 1963), and *Godsdiensts-geschiedenis in vogelvlucht*, translated by me as *The Study of Religion: A Historical Approach* (New York, 1967) and later reissued as *Perspectives in the History of Religions* (Berkeley, Calif., 1977).

Other important untranslated works by de Vries include *Alt-nordische Literaturgeschichte*, 2 vols. (1941–1942; rev. ed., Berlin, 1964–1967), *Het sprookje: Opstellen* (Zutphen, Netherlands, 1929), *Keltische Religie* (Stuttgart, 1961), and *Kleine Schriften* (Berlin, 1965).

Further biographical information about de Vries can be found in my article “Jan de Vries (1890–1964),” *History of Religions* 5 (1965): 173–177, and in P. J. Meerten’s article “Jan de Vries,” *Volkskunde* 65 (1964): 97–113.

KES W. BOLLE (1987)

VRNDĀVANA is both a mythical site, mentioned in the Purāṇas, and a town in modern India that is one of the most important Hindu pilgrimage centers of North India and the focus of much religious activity. As a sacred locality known in scripture, Vṛndāvana is ancient, but as a town it is comparatively new.

MYTHICAL SITE. Vṛndāvana (literally, “sacred basil grove”) is described in the Purāṇas, most notably in the *Bhāgavata Purāṇa*, as a beautifully forested land associated with the cowherd god Kṛṣṇa. According to the *Bhāgavata Purāṇa*, Kṛṣṇa was born in the royal city of Mathura, but to avoid slaughter by his wicked uncle Kāṁsa his father secretly took him across the Yamuna River to the cowherd settlement of Gokula, where he passed the early years of his infancy. Kāṁsa soon learned of Kṛṣṇa’s whereabouts, however, and began to send various demons to destroy him. When the danger grew too great, the cowherds who had taken in Kṛṣṇa moved to a new site—the beautifully forested land of Vṛndāvana—and there set up an idyllic village. In the land of Vṛndāvana, Kṛṣṇa charmed the elders of the village with mischievous pranks and frolicked in the forest herding cattle with his young companions. Most important, though, it was in the forests of Vṛndāvana that Kṛṣṇa would meet with the adolescent *gopīs* (cowherdresses) of the village under the autumn moon for love trysts. Kṛṣṇa’s passionate affairs with the *gopīs* have been elaborated on extensively since medieval times, and one *gopī* in particular—Rādhā—rose to the position of Kṛṣṇa’s favorite. The intimate relationships exemplified between Kṛṣṇa and his lovers in Vṛndāvana came to symbolize the human’s true relationship with the divine. For the practicing Vaiṣṇava, Vṛndāvana is an eternal world, a heavenly paradise that the liberated soul achieves after ultimate success.

MODERN-DAY TOWN. The modern-day town of Vṛndāvana (also known as Brindavan) is located on the west bank of the Yamuna River, about eighty miles south of Delhi and forty miles north of Agra, and is situated in the modern Indian state of Uttar Pradesh. Vṛndāvana can best be understood, however, by viewing it as part of Vraja (Braj), a distinct cultural region, complete with a distinct language (Vrajabhāṣa, or Brajbhāṣa) and history, defined by its association with the Kṛṣṇa myth. Through complex historical developments of the sixteenth century, this region came to be identified as the

very land where Kṛṣṇa actually lived long ago. The town of Vṛndāvana, in particular, was built on a site identified as the forest where Kṛṣṇa met with Rādhā and the other *gopīs* for their nightly trysts.

The historical development of Vṛndāvana was due primarily to the disciples of the Bengali saint Caitanya (b. 1486 CE), who came to be known as the Gauḍīya Vaiṣṇavas. The “reclaiming” of the sites of Kṛṣṇa’s exploits on earth was a cherished dream of Caitanya. Although the saint himself visited the area surrounding Vṛndāvana only once, he had sent before him a close disciple named Lokanātha Ācārya and then later, a group of theologians known as the Six Gosvāmins of Vṛndāvana. The establishment of Vṛndāvana as an important religious center is chiefly the work of this group of theologians, especially two brothers among them, Rūpa and Sanātana Gosvāmin. These brothers were to have the first of the magnificent temples of Vṛndāvana built in the sixteenth century with the help of wealthy rajas of Rajasthan. They were also responsible for establishing the location of many of the sites associated with the Kṛṣṇa myth and for creating a center of Vaiṣṇava learning in Vṛndāvana.

Three other Vaiṣṇava sects were involved in the development of Vraja culture that took place in and around Vṛndāvana, namely, the Rādhāvallabhas, the Vallabhācāryas, and the Nimbārkas. Vṛndāvana continued to grow and develop as an important center for all Vaiṣṇavas, and with the construction of a large Śrī Vaiṣṇava temple in Vṛndāvana in the mid-nineteenth century, all major sects of Vaiṣṇavism came to be represented in Vṛndāvana.

Today hundreds of pilgrims flock into Vṛndāvana daily, their numbers increasing substantially during the four monsoon months when, as legend has it, all other pilgrimage sites come to reside in Vṛndāvana. These pilgrims come to walk the very land trodden by Lord Kṛṣṇa and to see the natural objects transformed by his contact. They come also to see Kṛṣṇa in another important form—as an image (*mūrti*) residing for the benefit of his worshipers in the many famous temples of Vṛndāvana. But most important, they come during the rainy season to see the numerous plays staged all over Vṛndāvana that depict stories of Kṛṣṇa and his intimate companions. Vṛndāvana continues to thrive—many new temples are being constructed today—making it a living center of traditional Hindu culture.

BIBLIOGRAPHY

William G. Archer’s *The Loves of Krishna in Indian Painting and Poetry* (New York, 1957) remains one of the best introductions to the Kṛṣṇa myth. See especially chapter 3 for a good (if brief) description of Kṛṣṇa’s exploits in Vṛndāvana. The best sourcebook for the modern-day town of Vṛndāvana is still Fredrick S. Growse’s *Mathurā: A District Memoir*, 3d rev. ed. (Allahabad, 1883). Although this work is now quite dated, it provides detailed descriptions of the history and

temples of Vṛndāvana. Charlotte Vaudeville’s article “Braj: Lost and Found,” *Indo-Iranian Journal* 18 (1976): 195–213, is useful for understanding the cultural condition of the area surrounding Vṛndāvana before its development by the Vaiṣṇava Gosvāmins. For a good description of the Kṛṣṇa dramas of Vṛndāvana, see Norvin Hein’s *The Miracle Plays of Mathurā* (New Haven, Conn., 1972) and John Stratton Hawley’s *At Play with Krishna: Pilgrimage Dramas from Brindavan* (Princeton, N. J., 1981).

Revised Bibliography

VRTRA, whose name is probably derived from the Sanskrit verbal root *vr*, meaning “hold back, restrain, envelop,” is a serpent slain by Indra in the *Rgveda*. This act, which is Indra’s most famous, most important, and most frequently mentioned achievement, is the subject of several complete Rgvedic hymns (notably *Rgveda* 1.32 and 10.124). Vṛtra had coiled around a mountain, preventing the waters from flowing down; Indra pierced him with his thunderbolt and released the waters. This act has many symbolic resonances: slaying the dragon, releasing the waters or rains, bringing the ambrosial *soma* down from heaven or the mountains (an act that Indra is elsewhere said to accomplish by stealing it, on the back of an eagle), conquering the enemies of the invading Indo-Aryans (for Vṛtra is called a *dāsa*, or “slave,” the name given to the indigenous non-Aryans), creating the world out of the body of the slain dragon, or rescuing it from the dragon who had swallowed it. The thunderbolt of Indra is a cloud, which, as a phallic symbol, is a source of seed as well as rain; Vṛtra is a cloud pierced in his loins or his bellies; and the cows to which the waters are compared are also rain clouds. Vṛtra, who is depicted as a serpent or as a dragon whose arms and legs Indra has cut off, is a symbol of danger, constriction, drought, and loss. The battle is waged with magic as well as with physical weapons; Indra uses magic to make himself as thin as a horse’s hair, and Vṛtra uses magic to create lightning and fog. Indra wins, of course, and the hymns end on a note of affirmation for Indra’s victory.

The killing of Vṛtra was closely associated with the killing of other demonic enemies, particularly Triśiras Viśvarūpa (the “three-headed, many-formed” son of Tvaṣṭṛ, the artisan of the gods), Namuci (“don’t-let-go”), and Ahi (the Serpent, perhaps just another name for Vṛtra). Vṛtra is the younger brother of Triśiras, created by their father to take revenge upon Indra for the killing of Triśiras. This my-

thology is elaborated in the Brāhmaṇas (c. 900 BCE), where it is said that when Indra killed Visvarupa he cut off his three heads, which became three birds; Tvaṣṭṛ performed a sacrifice to create Vṛtra. Namuci is a demon whom Indra is said to have killed with foam (*R̥gveda* 8.14.13); later, Indra kills both Vṛtra and Namuci with foam at the juncture of day and night (*Taittirīya Brāhmaṇa* 1.7.1–7), when he had promised Namuci that he would kill him neither by day nor by night, neither with anything dry nor with anything wet (*Śatapatha Brāhmaṇa* 12.7.3.1–2). In the *Mahābhārata* (5.9–13), Indra kills Vṛtra alone by tricking him in this way. The cosmogonic implications of the killing of Vṛtra are spelled out in the Brāhmaṇas: Vṛtra lay covering all the space between heaven and earth until Indra killed him (*Śatapatha Brāhmaṇa* 1.1.3.4–5); when Indra killed Vṛtra, Vṛtra said to him, “You are now what I was; now cut me in two” (ibid., 1.6.3.1–17).

The killing of Vṛtra, particularly when combined with the accessory acts of killing Trisiras and Namuci, fits a pattern that has strong resonances in other Indo-European mythologies. In the Avesta, Thraetaona kills a three-headed demon and sets free the cows that have been imprisoned. In Greece, Herakles kills the three-headed Geryon, and the Roman Hercules kills Cacus, the son of Vulcan (who is, like Tvaṣṭṛ, the blacksmith of the gods). Þórr (Thor), Indra’s parallel in Eddic literature, kills the World Serpent. And in a more general way, Vṛtra can be assimilated to all the dragons killed by all the great heroes—to Python slain by Apollo, to the dragon killed by Saint George, and so forth.

As Indra’s powers diminished during the period of transition from the *R̥gveda* to the Brāhmaṇas, the killing of Vṛtra was no longer regarded as an act that he could accomplish in single combat. Other gods help him (*Aitareya Brāhmaṇa* 2.3.5), or he uses the power of sacrifice rather than brute force (*Śatapatha Brāhmaṇa* 2.5.4.1–9); finally, as with Namuci, he hedges with words to break his treaty (ibid., 1.6.3.10). In the *Mahābhārata*, Indra is so overpowered by Vṛtra’s superior magic and prowess that the demon can be

slain only with the aid of Śiva (who creates a fever in Vṛtra) and Viṣṇu (who places his own power in Indra’s thunderbolt). Moreover, even after killing Vṛtra, Indra is so weakened and defiled (polluted by the sin of brahmanicide for having killed Vṛtra, a priest) that he runs away and hides in a lotus stalk; still the fury (*kr̥tyā*) of brahmanicide incarnate seizes Indra until Brahmā distributes the sin among fire, water, the trees, and the celestial nymphs, and purifies Indra with a horse sacrifice (*Mahābhārata* 12.272–273).

Thus the ancient myth of the dragon whose body is dismembered to form the world (as Tiamat’s body does in the Mesopotamian myth) is transformed into an epic myth in which the sin of the warrior who kills the dragon is dismembered, as it were, to provide the substances that guarantee the fertility of the world. In either case, it is, ultimately, the dragon that is the source of that fertility; the darker side of creation and the sin that inevitably arises in dealing with it, rather than the hero and his virtue, is the source of life.

VULVA SEE YONI

W

WACH, JOACHIM [FIRST EDITION] (1898–1955), German-American historian of religions. Wach was born in Chemnitz, Saxony, and died while vacationing in Orselina, Switzerland. He was a descendant of Moses Mendelssohn, a lineage that affected his life and career both positively and negatively. His paternal grandfather, the noted juriconsult Adolph Wach, married Lily, the daughter of Felix Mendelssohn, the composer. His father, Felix, married Kathe, granddaughter of the composer's brother, Paul. Young Wach was early exposed to music, literature, poetry, and both classical and modern languages. After two years of military service (1916–1918), Wach enrolled at the University of Leipzig, but in 1919 and early 1920 he studied with Friedrich Heiler at Munich and with Ernst Troeltsch at Berlin. He then returned to Leipzig to study Oriental languages and the history and philosophy of religion. For a time he came under the spell of the enigmatic poet Stefan George, whose writings spoke of a heightened sense of “experience,” through which one perceives the multiple threads of the tapestry of life as a transparent whole. Wach received his Ph.D. degree in 1922 from Leipzig with a thesis entitled “The Foundations of a Phenomenology of the Concept of Salvation,” published as *Der Erlösungsgedanke und seine Deutung* (1922).

When Wach started teaching at Leipzig in 1924, the discipline of the history of religions (*Religionswissenschaft*), still in its infancy, faced serious dangers. On the one side, its right to exist was questioned by those who insisted that whoever knows one religion (i.e., Christianity) knows all religions; on the other, its religio-scientific methodology was challenged by reductionist psychological and social-scientific approaches. Thus in his habilitation thesis, *Religionswissenschaft: Prolegomena zu ihrer wissenschaftstheoretischen Grundlegung* (1924), Wach insisted on the integrity and autonomy of the history of religions, liberated from theology and the philosophy of religion. He emphasized that both historical and systematic dimensions are necessary to its task, and he argued that the discipline's goal was “understanding” (*Verstehen*): “The task of *Religionswissenschaft* is to study and to describe the empirical religions. It seeks descriptive understanding; it is not a normative discipline. When it has understood the historical and systematic aspects of the con-

[©Erich Lessing/Art Resource, N.Y.] .

crete religious configurations, it has fulfilled its task" (p. 68). His *Religionswissenschaft* is still regarded as a small classic in the field.

Wach's agenda centering on understanding led him to produce a three-volume work on the development of hermeneutics in the nineteenth century (*Das Verstehen*, 1926–1933). The first volume traced the hermeneutical theories of such major figures as Friedrich Schleiermacher, G. A. F. Ast, F. A. Wolf, August Boeckh, and Wilhelm von Humboldt. The second volume dealt with theological hermeneutics from Schleiermacher to Johannes von Hofmann, while the third volume examined theories of historical hermeneutics from Leopold von Ranke to historical positivism. Understandably, Wach felt it absolutely necessary to establish solid hermeneutical foundations for the history of religions.

Wach was convinced that the history of religions (*Religionswissenschaft*) should not lose its empirical character. He felt that C. P. Tiele and P. D. Chantepie de la Saussaye had failed to make an adequate distinction between the history of religions and the philosophy of religion. He was critical both of those who started with philosophy and developed science and of those who started with science and moved toward philosophy. In his view, the history of religions lay, rather, precisely between the two. In this respect he followed Max Scheler, who posited a "concrete phenomenology of religious objects and acts" between a historical study of religions (a positive *Religionswissenschaft*) and the essential phenomenology of religion (*die Wesensphänomenologie der Religion*). According to Scheler, this intermediate discipline aims at the fullest understanding of the intellectual contents of one or more religious forms and the consummate acts in which these intellectual contents have been given. It was Wach's conviction that an inquiry such as Scheler envisaged could be carried out only by employing the religio-scientific method of *Religionswissenschaft*.

Wach's reputation for erudition attracted many students to Leipzig. However, his productive career there came to an abrupt end in April 1935. The government of Saxony, under pressure from the Nazis, terminated Wach's university appointment on the ground of his Jewish lineage, even though his family had been Christian for four generations. Fortunately, through the intervention of American friends, Wach was invited to teach at Brown University in Providence, Rhode Island, where he stayed until 1945. His adjustment to the new environment was by no means easy; he was especially anxious about his mother, sister, and brother, who were suffering under the Nazi tyranny. From 1945 until his death ten years later, Wach taught the history of religions at the Divinity School of the University of Chicago.

Wach always asserted that the method of the history of religions must be commensurate with its subject matter, that is, the nature and expressions of the religious experience of humankind as that experience has been unfolded in history. Following his mentor, Rudolf Otto, Wach defined religious experience as the experience of the holy. Throughout his life,

he never altered his views on the basic structure of the discipline: its twin tasks (historical and theoretical); the centrality of religious experience and its threefold expressions (theoretical, practical, and sociological); and the crucial importance of hermeneutics. But Wach emphasized three different methodological accents in three successive phases of his career.

During his first phase, Wach was preoccupied with the hermeneutical basis for the descriptive-historical task of the discipline. He was greatly influenced by the philological hermeneutics of August Boeckh, who defined the hermeneutical task as "recognizing" that which had previously been "cognized," that is, as articulating what has been recognized in its pristine character, even to the extent of "reconstructing" in its totality that which does not appear as a whole. Accordingly, Wach insisted that the historian of religions must first try to assimilate that which had been recognized as a religious phenomenon and "reproduce" it as one's own. Then he must observe and appraise that which has become one's own as an objective something apart from oneself.

During his second phase, Wach attempted to develop the systematic dimension of the history of religions by following the model of sociology. In Wach's view, the sociological (systematic) task of *Religionswissenschaft* had two main foci: (1) the interrelation of religion and society, which requires an examination, first, of the sociological roots and functions of myths, doctrines, cults, and associations, and, second, of the sociologically significant function and effect of religion in society; and (2) the study of religious groups. In dealing with religious groups, and especially with the variety of self-interpretations advanced by these groups, Wach employed the typological method. As he stated in his *Sociology of Religion* (1944), he was convinced of the need to develop a closer rapport between *Religionswissenschaft* and other disciplines, especially with the social and human sciences. In this sense, his *Sociology of Religion* was an attempt to bridge "the gulf which still exists between the study of religion and the social sciences" (p. v). Yet the ultimate aim of his sociological (systematic) study of religion was "to gain new insights into the relations between the various forms of expression of religious experience and eventually to understand better the various aspects of religious experience itself" (p. 5).

During the third phase, Wach's concern for an integral understanding of the various aspects of religious experience and its expressions led him to reassess not only the relationship of *Religionswissenschaft* with the social sciences but also its relationship with normative disciplines such as philosophy of religion and the various theologies. After Wach's sojourn in India, where he delivered the Barrows Lectures at various universities in 1952, this concern became more pronounced. It was, in fact, one of the key motifs of his lectures on the history of religions sponsored by the American Council of Learned Societies in 1954. Increasingly the vocabulary of "explaining" (*Deuten, Erklären*) came to be used side by side

with that of “understanding” (*Verstehen*) in his lectures. Wach shared his dream of pursuing a new grand synthesis for the study of the human religious experience, a sequel to earlier works such as *Religionswissenschaft* and *Das Verstehen*, with friends during the Seventh Congress of the International Association for the History of Religion, held in Rome in the spring of 1955. But death came that summer and robbed him of this venture.

BIBLIOGRAPHY

Among Wach’s important contributions to the study of religion are *Der Erlösungsgedanke und seine Deutung* (Leipzig, 1922) and *Das Verstehen: Grundzüge einer Geschichte der hermeneutischen Theorie im 19. Jahrhundert*, 3 vols. (1926–1933; reprint, Hildesheim, 1966). Neither of these works has been translated into English. The following books by Wach are available in English: *Sociology of Religion* (Chicago, 1944), *Types of Religious Experience: Christian and Non-Christian* (Chicago, 1951), and the posthumously published *The Comparative Study of Religions* (New York, 1958) and *Understanding and Believing: Essays* (New York, 1968).

Treatments of Wach’s thought include the following: my “Joachim Wach et la sociologie de la religion,” *Archives de sociologie des religions* 1 (1956): 25–41; Kurt Rudolph’s “Joachim Wach,” in *Bedeutende Gelehrte in Leipzig*, vol. 1 (Leipzig, 1965); my “Verstehen and Erlösung: Some Remarks on Joachim Wach’s Work,” *History of Religions* 11 (1971): 31–54; and Rainer Flasche’s *Die Religionswissenschaft von Joachim Wach* (New York, 1978).

JOSEPH M. KITAGAWA (1987)

WACH, JOACHIM [FURTHER CONSIDERATIONS].

True to his highly cultured family background, Joachim Wach remained a passionate devotee of music, literature, and the arts throughout his life. This devotion dovetailed with his scholarly interest in religions. During his years as a student at Leipzig, where he majored in the history of religions and minored in philosophy of religion and “Oriental” studies, his friends included poets, musicians, and dancers, in addition to scientists and physicians. After taking his doctorate, he spent two years studying at the University of Heidelberg, where he attended lectures by the eminent historian and literary scholar Friedrich Gundolf (1880–1931), who had a lastingly influence on Wach. It was during those Heidelberg years that Wach became associated with the poet Stefan George (1868–1933), who, with his famous circle, or *Kreis*, of disciples (including Gundolf, one of Wach’s closest links to the group), aspired to create a new world and culture of pure, sublime art. The most significant aesthetic commitment of his life, Wach’s allegiance to the George-*Kreis* is thought to have been largely the source of his lasting concern with the problem and mission of understanding (*Verstehen*), and to have stamped his whole personality for life (see Flasche, 1978, p. 14).

There is abundant lore about Wach’s lifelong active interest in literature and the arts. During his years as professor

at the University of Chicago (1945–1955), he was known for listening as he worked to recordings of music by his ancestor Felix Mendelssohn, and for being able to quote from memory lengthy passages from the verse of Goethe, Schiller, and other classic German poets. Nonetheless, the bearing of his aesthetic reflections upon his formation as a historian of religions is generally underappreciated. In this respect he was not alone among some of the most influential mid-twentieth-century comparatists of religions. To him, as to Gerardus van der Leeuw, would apply what Joseph Kitagawa once said of Mircea Eliade, namely, that he had a passion for culture (*paideia*) in the Greek sense of the word. As with van der Leeuw, the accomplished poet and musician, and Eliade, the celebrated novelist and short-story writer, Wach’s passion for *paideia* meant that his vocation of studying and interpreting a universal range of religious phenomena was complemented by, and inextricably related to, a rich variety of aesthetic concerns.

Presumably, the influence of the George-*Kreis*, especially through Gundolf, was among the chief factors that led Wach from the outset of his career to liken the investigation of religions to the contemplation of literature and the arts. As the *Kreis* is thought to have instilled in Wach a preoccupation with hermeneutics, so is it clear that Gundolf’s ideas about the relation between the artist and the artist’s work stimulated Wach’s thinking about the relation between religious experience and the various forms of religious expression (practical, theoretical, and sociological). Wach opined that the great experiences from which all religious traditions originate “exist for others only in the degree to which they are expressed and where there is genuine religion, it will necessarily be expressed” (Wach, 1958, p. 59). He ascribed this idea to C. P. Tiele. However, it also calls to mind the claim in Gundolf’s classic biography *Goethe* (1922) that, while the artist’s experience (*Erlebnis*) may be superficially distinguishable from the artist’s work, the artist exists only insofar as he “expresses himself” (*sich ausdrückt*) through the work (p. 2).

Wach associated the study of religions with the study of the arts as early as in his Habilitation thesis *Religionswissenschaft* (1924), known in translation as *The History of Religions*. Dismissing the common notion of understanding as empathy (*Nachfühlen*) or imitative experience (*Nacherleben*), and characterizing understanding instead as “an entirely spontaneous, productive act,” he contends in this work that to interpret a religion or a work of art requires no consideration of its originator’s “psychological condition” (Wach, 1988b, p. 111). While he followed Wilhelm Dilthey in likening the interpretation of a religion to that of an art work, Wach discounted the common analogization of having a religious sense to possessing an ear for music. Inasmuch as he dismissed the assumption that persons who profess no religious faith or confession are “religiously unmusical” (p. 115), he differed from Max Weber. The latter considered some people, including himself, to be “religiously unmusical,” and cast them as antithetical to the religious “virtuoso”

(a term adapted from musicology). Wach instead remained in harmony with the theory of Rudolf Otto, contending that “humanity, by nature, is attuned to religion,” and therefore: “The study of music knows that there is no such thing as an unmusical person; such a person often lacks only the training and development of an ear for music. It would be good, too, if historians of religions would realize that a poorly developed religious sense never means that such a sense is lacking altogether” (p. 115).

Of all the arts, Wach invoked poetry the most extensively to illustrate his notion of understanding. To counter a common misinterpretation of Dilthey’s view of the relation between experience (*Erlebnis*) and understanding, he contended that the possibilities of human experience are not limited to the totality of a person’s external experience of life (*äussere Lebenserfahrung*): one need not have been in love, waged battle, or grown old to understand a lover, a general, or the aged. Poets afford practical illustrations of, and in some instances reflect theoretically upon, the fact that external experiences (*Erfahrungen*) can be presaged by internal experience (*inneres Erleben*). This is not to deny the formative bearing of external experience upon poetry. In probing the theoretical ramifications of this problem of imagination (*Phantasie*), experience (*Erlebnis*), and poetry, Wach was well aware of Dilthey’s observation that poetic creation invariably originates from “life-experience” (*Lebenserfahrung*). Like Dilthey, who qualified that “only those moments of [the poet’s] existence [*Dasein*] that disclose to him one of life’s characteristics possess a deeper relationship to his poetry” (quoted in Wach, 1988b, p. 218n.), Wach emphasized that what ultimately matters for poetry is what the poet makes of external experiences through inner, imaginative power: “It is by imagination that experiences first bear fruit. To an amazing degree, imagination may supplement experiences and even substitute for them” (Wach, 1988b, p. 113).

Such reflections were germane to Wach’s conception of his *religionswissenschaftlich* enterprise. His distinction between life-experiences and what the poet imaginatively makes of them harks back to Aristotle’s distinction between history as that which conveys particular truths (telling what happened), and poetry as that which conveys universal truths (telling what might happen). Much as Aristotle viewed poetry as something graver and more scientific than history (see *Poetics* 1451a–b), so Wach deemed *Religionswissenschaft* to be hermeneutically more sophisticated than the positivist, historicist approach to religion. While the historicist was preoccupied with thoroughness of arbitrarily selected data, Wach urged the scholar of religions “to determine by comparison and phenomenological analysis if anything like a structure can be discovered in all these forms of expression, to what kind of experience this variegated expression can be traced, and, finally, what kind of reality or realities may correspond to the experiences in question” (Wach, 1951, p. 30).

Wach indicated how his pondering of poetry informed his conception of his scholarly vocation. In his view, the nov-

elist Thomas Mann’s idea of the poet’s yearning (*Sehnsucht*) “signified the soul’s inner ability and readiness to transcend itself,” a task the soul accomplishes through the imagination: “For imagination allows ideas to be grasped, feelings to be felt, and realms of the soul to be traversed that actual experience [*Erfahrung*] could never teach the poet” (Wach, 1988b, p. 113). In this respect the poet resembles the scholar, whose “interest is stimulated by the appearance of a great personality, of significant processes, or of a tragic event” (p. 113). Given the same “inner affinity” as that between the poet and the poet’s object, “the person who wishes to understand enters into a mysterious communication with the object of study that allows him to penetrate to its core” (p. 113). With an imagination thus aroused, the person feels drawn to seek a broader, deeper, more precise understanding of the object of interest, and “yearns to develop further those dispositions of the soul that have not yet been realized. Thus, the limits of the empirical personality are expanded” (p. 113). This analogy between poetic yearning and the aroused scholarly imagination anticipates Eliade’s well-known construal of literary creation and aesthetic imagination as cognitive, epistemological instruments useful to the scholarly enterprise.

Although Wach often appealed abstractly to the categories of “poet” and “poetry,” sometimes particular works by specific literary artists proved revelatory to him as a historian of religions. For example, he found Friedrich Hölderlin’s poetic depiction of the bond between Empedocles and Pausanias to exemplify the typical master-disciple relation (Wach, 1988a, pp. 15–16, 19, 22), and his essay on “religious existence” in Fyodor Dostoevsky’s novels praises the German Catholic theologian Romano Guardini for revealing in those texts the “groundlines of a Christian anthropology” (Wach, 1934, p. 196). Wach’s *Sociology of Religion* (1944) is replete with allusions to prevalent symptoms of the interplay between religions and the arts, such as the “aesthetic finish” of Trobriand magic; the priestly fostering of sacred song, music, dance, and literary and visual arts; Australian Aboriginal totemic practices; and certain rituals associated with prophets. However, Wach elsewhere qualified that the practical, “activistic” orientation of religious experience, involving “an imperative, a commitment which impels man to act,” distinguishes it from “aesthetic experience, of which it shares the intensity, and joins it with moral experience” (Wach, 1951, p. 33).

BIBLIOGRAPHY

Among the studies by Wach that reflect his interest in the arts are his essay “Religiöse Existenz: Zu dem Dostojewskij-Buch Romano Guardinis,” *Zeitschrift für Missionskunde und Religionswissenschaft*, 40th issue, 7th installment (1934): 193–201; *Sociology of Religion* (Chicago, 1944); *Types of Religious Experience: Christian and Non-Christian* (Chicago, 1951); *The Comparative Study of Religions* (New York, 1958); *Essays in the History of Religions*, edited by Joseph M. Kitagawa and Gregory D. Alles (New York, 1988a); and *Introduction to the History of Religions*, edited by Joseph M. Kitagawa and Gregory D. Alles (New York, 1988b), the first part of which con-

stitutes a translation of Wach's Habilitation thesis *Religionswissenschaft: Prolegomena zu ihrer wissenschaftstheoretischen Grundlegung* (Leipzig, 1924). Wach's undated paper, "Stefan George (1863–1933): Poet and Priest of Modern Paganism," was published posthumously in his *Understanding and Believing: Essays* (New York, 1968), pp. 11–29.

Aside from Rainer Flasche's *Die Religionswissenschaft von Joachim Wach* (New York, 1978) and the other secondary sources cited in the bibliography to Kitagawa's entry on Wach above, two pertinent studies include Flasche, "Joachim Wach (1898–1955)," in *Klassiker der Religionswissenschaft von Friedrich Schleiermacher bis Mircea Eliade*, edited by Axel Michaels (Darmstadt, 1997), pp. 290–302; and Eric Ziolkowski, "Wach, Religion, and 'The Emancipation of Art,'" *Numen* 46 (1999): 345–369.

ERIC ZIOLKOWSKI (2005)

WAHHĀBĪYAH. An Islamic renewal group established by Muḥammad ibn ʿAbd al-Wahhāb (d. AH 1206/1792 CE), the Wahhābīyah continues to the present in the Arabian Peninsula. The term *Wahhābī* was originally used by opponents of the movement, who charged that it was a new form of Islam, but the name eventually gained wide acceptance. According to the teachings of Ibn ʿAbd al-Wahhāb, however, the movement is not a new Islamic school but, rather, a call or mission (*daʿwah al-tawhīd*) for the true implementation of Islam. The Wahhābīyah often refer to "the mission of the oneness of God" (*daʿwat al-tawhīd*) and call themselves "those who affirm the oneness of God," or *muwahhīdun*.

HISTORICAL BACKGROUND AND CONTEXT. Renewal movements have deep roots in Islamic experience. The Qurʾān and the *sunnah*, or normative practice of the prophet Muḥammad, provide standards by which the belief and actions of Muslims in any age can be judged. A strict interpretation of these fundamentals has often provided the basis for an active call for reform. The Wahhābī call is one of the most famous of these so-called fundamentalist movements. Specifically, it can be seen as a continuation of the strict Sunnī tradition associated with the Ḥanbalī school of law based on the teaching of Aḥmad ibn Ḥanbal (d. 855 CE).

Aḥmad ibn Taymīyah (d. 1328) was a Ḥanbalī scholar whose works have had a major influence on the thinking of fundamentalist advocates of renewal. He became well known for his opposition to devotional innovations and popular religious customs not specified in the Qurʾān or *sunnah*. His preaching against even established scholars made his work controversial, while his polemical skills made him popular.

The core of his teaching was the "science of the oneness of God" (*ʿilm al-tawhīd*), which stresses the comprehensive nature and unity of the Islamic message. Rationality, mystic intuition, and the legal prescriptions are seen as parts of a single whole. Ibn Taymīyah rejected claims by Islamic mystics that "the law" and "the [mystical] path" were somehow separate. He also stressed that independent interpretation

(*ijtihād*) by scholars was possible, although subject to clear rules. He actively opposed what he considered innovations in devotional practices, such as the visitation of the tombs of famous figures. In these and other themes Ibn Taymīyah provided a basis for later Sunnī fundamentalism, including the Wahhābīyah.

The Ḥanbalī school did not gain a mass following in the Islamic world, but groups of Ḥanbalī scholars had local influence in some regions. One such region was the Najd in central Arabia, where the Ḥanbalī tradition continued in towns with established families of Ḥanbalī teachers. Nevertheless, the local lifestyle in the Najd did not reflect a fundamentalist spirit. People commonly believed that trees and rocks possessed spiritual powers and that the graves of holy men were places of special holiness. Such a society contained many elements that Islamic fundamentalists view as manifestations of polytheism (*shirk*) and the ignorance of the pre-Islamic era (Jāhiliyah).

Najd was not unique in the eighteenth-century Islamic world. While Islam had flourished in the strong empires of the fifteenth and sixteenth centuries, by the eighteenth century, compromises with local religious customs and ineffective political organizations led Muslims from West Africa to Southeast Asia to call for Islamic renewal. The Wahhābī movement emerged at the very center of this world.

HISTORY OF THE MOVEMENT. Wahhābī history can be divided into three periods, in each of which the movement is associated with the establishment of a state as well as a community of believers. While the call has been Wahhābī, the state in each case was based on leadership by the Saʿūd family.

The era of Muḥammad ibn ʿAbd al-Wahhāb. Muḥammad ibn ʿAbd al-Wahhāb, born in the central Arabian town of al-ʿUyaynah in 1703, traveled and studied widely. In the process, he developed a belief in the need for purification of Muslim beliefs and practices, and this belief became his life's mission.

At first the mission took the form of preaching opposition to popular religious practices and Shiʿī Islam, in Basra and eastern Arabia. Returning to his homeland to continue this call, he initially won some support from the ruler of al-ʿUyaynah, but the vigor of his purification efforts soon aroused opposition, and he was forced to leave.

Ibn ʿAbd al-Wahhāb then went to al-Darʿīyah, where the ruler was Muḥammad ibn Saʿūd. In 1744 the two men formed an alliance that became the basis for both the subsequent Saudi states and the Wahhābī movement. The ruler and the teacher worked together in the creation of the first Saudi-Wahhābī state.

The deaths of Ibn Saʿūd in 1765 and of Ibn ʿAbd al-Wahhāb in 1792 did not stop the expansion of the mission or the state. Political leadership remained in the hands of the Saʿūd family, while the family of Ibn ʿAbd al-Wahhāb, subsequently called "the family of the shaykh," or Āl al-

Shaykh, maintained a position of intellectual leadership in the later history of the state and movement.

By the beginning of the nineteenth century, the Saudi-Wahhābī community controlled most of the Arabian Peninsula and the holy cities of Mecca and Medina. This central position and attacks on Ottoman territories in Iraq and Syria brought a reaction, however: The Ottoman sultan ordered the governor of Egypt, Muḥammad ‘Ali, to use his newly reformed army to defeat the Wahhābīyah. In 1812, the Egyptian army took Medina and in 1818 captured the Saudi capital of al-Dar‘īyah. With this defeat, the first phase of Wahhābī history came to an end.

The second Saudi-Wahhābī state. The Egyptian army did not remain long in central Arabia, and Saudi leaders soon reestablished their state with a new capital at Riyadh. Key figures in this restoration were a grandson of Muḥammad ibn Sa‘ūd, Turkī (d. 1834), and his son Fayṣal (d. 1865). Although smaller than the first, the new state restored the political and religious mission of the original one. An important part of the Wahhābī heritage is the work of administering and consolidating a functioning fundamentalist state in the nineteenth century.

In the last quarter of the nineteenth century the Saudi ruling family divided, and in the conflicts that followed the death of Fayṣal, other Arabian chieftains began to take control of Saudi lands. By the 1890s, the leaders of the Sa‘ūd family were forced into exile and the second state came to an end.

The twentieth-century revival. The third period of Wahhābī history began in 1902, when a young Saudi prince recaptured Riyadh. This man was ‘Abd al-‘Azīz ibn ‘Abd al-Raḥman, often called Ibn Sa‘ūd (1879–1953). ‘Abd al-‘Azīz reconquered many of the lands of the first Saudi state in a series of bold diplomatic and military moves. The final steps came in the 1920s when, among other areas, Mecca and Medina again came under Saudi-Wahhābī control. Although geographic expansion stopped during that decade, the new Wahhābī state continued to develop.

The twenty-first century state is based on the pillars of Saudi leadership and the Wahhābī mission. ‘Abd al-‘Azīz consciously adhered to Wahhābī teachings, and the official constitution of the state is the Qur’ān. The “family of the shaykh” and the learned teachers play important roles as advisers and legitimizers of the state. At first they were important in administration but later were active primarily in traditional education and legal interpretation. A key to early Saudi military success was the creation of the Ikhwān, tribal soldiers organized in special settlements as warriors for the faith. A critical transition in the development of the state came in 1929, when the Ikhwān unsuccessfully revolted against the pragmatism of ‘Abd al-‘Azīz’s policies. Because the Wahhābī program is identified with the Saudi state, state policies represent an important definition of its mission. Thus the pragmatic style became characteristic of the

Wahhābī movement during the twentieth century. In the spectrum of Islamic reform movements, however, the Saudi state continued to reflect a fundamentalist orientation.

Since the consolidation of the Saudi monarchy, the predominant tone of the Wahhābīyah has evolved significantly. Generally, fundamentalism works to change the existing social order. It is not a conservative style. However, the success of ‘Abd al-‘Azīz and his successors in creating a relatively prosperous state has favored a more pragmatic and conservative policy. While still within the tradition of Ibn ‘Abd al-Wahhāb, the twenty-first century version of the Wahhābī mission works within the framework of a modernizing state.

A major factor in this development is the impact of Saudi oil revenues. Exploitation of oil resources began during the lifetime of ‘Abd al-‘Azīz, and Saudi Arabia became a major oil-exporting state under his sons and successors, Sa‘ūd (r. 1953–1964) and Fayṣal (r. 1964–1975). Saudi policy in the early twenty-first century is designed to implement the fundamentalist call in a wealthy and modernizing state. An example is Fayṣal’s ten-point program presented in 1962, which, like subsequent policies of Fayṣal’s successors, Khālīd (r. 1975–1982) and Fahd (r. 1982–), affirms that a modernizing state can be based on the Qur’ān and the *sunnah*.

BASIC IDEAS AND CONCEPTS. Despite the development of a more pragmatic ideology, the basic concepts of the Wahhābī program have remained quite constant. The oneness of God, or *tawḥīd*, is the fundamental concept in Wahhābī writings. It is an affirmation of the comprehensive nature of the statement “There is no god but [the one] God.” *Tawḥīd* means that the political and economic realms are as much subject to God as are the realm of creeds. Any action or belief that seems to recognize ultimate authority or spiritual power in something other than God becomes polytheism.

In the eighteenth century the concept of *tawḥīd* provided the basis for opposition to saint worship and other popular religious customs. In the consolidation efforts of the nineteenth century, *tawḥīd* formed the logical basis for the legal decisions and religious positions of the scholars in the state ruled by Turkī and Fayṣal. In the twenty-first century pragmatic fundamentalism of the Saudi state *tawḥīd* provides an Islamic basis for comprehensive planning and a Muslim orientation to all aspects of policy.

A second basic concept is *ijtihād*, or independent informed reasoning, which directs a person with the proper training to base opinions on direct analysis of the Qur’ān and the *sunnah*. The analyst using *ijtihād* is not required to accept the conclusions of the great medieval scholars. In fact, blind adherence to the teachings of such scholars could be regarded as polytheism.

The Wahhābīyah have not carried the emphasis on *ijtihād* to the extreme of rejecting all medieval Islamic scholarship. Instead, they have stayed within the Ḥanbalī tradition but have felt free to go beyond its limits at times. In the

thinking of Ibn ʿAbd al-Wahhāb, this flexibility opened the way for a more vigorous rejection of Sufism (mysticism) than is found generally among the Ḥanābilah. It also allowed the shaykh more freedom in developing the Islamic policy of the first Saudi-Wahhābī state and in later years has given the Wahhābīyah some freedom in adjusting to the changes of the modern era.

A different set of concepts involves aspects of life that the Wahhābīyah reject, including innovation (*bidʿah*), idolatry or polytheism (*shirk*), and sinful ignorance (*jāhiliyyah*). These concepts are in counterpoint to the positive positions involved in *tawhīd* and *ijtihād*. The opposition to innovation is not simply a rejection of all change. After all, the Wahhābī movement began with the call for major changes in society. The Wahhābīyah oppose innovations for which a justification cannot be found in the Qurʾān or the *sunnah*. In this way many medieval devotional practices were rejected as “innovations.” At the same time, the exercise of *ijtihād* can provide justification for changes that fall within Islamic limits.

Idolatry and sinful ignorance represent a violation of *tawhīd*; they are the identifying features of the real nonbeliever. In the early days of the Wahhābī mission, opposition to idolatry and ignorance focused on concrete issues such as saint worship, veneration of trees and stones, and ignoring explicit Qurʾanic commands. In the twentieth century these concepts have been expanded to include ideologies that are viewed as atheistic (such as communism). Originally in Islamic history the so-called Age of Ignorance or Jāhiliyyah was the period before the time of Muḥammad. However, in modern fundamentalist thought, the concept of Jāhiliyyah has been broadened to include willfully ignoring the guidance for human life given in the Qurʾān and the *sunnah*. Such defiance makes people nonbelievers to be opposed by Muslims of the Wahhābī tradition.

GENERAL IMPACT AND SIGNIFICANCE. The establishment of the Saudi-Wahhābī state in the Arabian Peninsula represents the most concrete heritage and impact of the Wahhābī movement. Since the eighteenth century the Wahhābīyah have represented the spirit of fundamentalism in the central lands of Islam, establishing the tradition of a community based on the Qurʾān and the *sunnah*. However, the significance of the movement goes beyond the state. In the rigor of their attachment to the renewal mission, the Wahhābīyah have provided an example of what was and is possible. The implementation of the call for renewal contributed to the general spirit of fundamentalism in the eighteenth century. Some Muslims were directly inspired by Wahhābī teachings while others were affected more by their general effort. The fame of the Wahhābīyah spread to such an extent that by the nineteenth century almost any movement of rigorous fundamentalist reform came to be called a “Wahhābī movement.”

The Wahhābīyah are the best-known example of a Muslim movement calling for strict recognition of the oneness of God, with all of the social and moral implications of

that belief, and advocating the reconstruction of society on the basis of a strict and independent interpretation of the fundamentals of Islam. This message helped to inspire movements ranging from holy wars to modernist rethinking of medieval formulations. Following the Shīʿī fundamentalist revolution in Iran in 1979, the Wahhābī movement as represented by the policies of the Saudi state became a more conservative influence in a context of more radical Islamic revivalism. However, the Wahhābī mode of activist renewal also became identified with many of the militant Islamic movements of the early twenty-first century. As happened in the nineteenth century, “Wahhābī” came to be the term used to describe terrorist and militant groups as well as puritanical advocates of Islamic renewal. Both as the followers of the specific movement that developed in the Arabian Peninsula and as the adherents of movements of the “Wahhābī-type,” the Wahhābīyah have had and continue to have a significant role in the modern history of the Islamic world.

BIBLIOGRAPHY

There are a number of important primary sources for the teachings and history of the Wahhābiya. Of particular interest are the numerous works of Muḥammad ibn ʿAbd al-Wahhāb, but few of these have been translated. His works are listed in an important biographical study, ʿAbd Allah al-Ṣalīḥ al-Uthaymīn’s *Al-Shaykh Muḥammad ibn ʿAbd al-Wahhāb, ḥayātuhu waḥikmātu* (Riyadh, n. d.). A large collection of legal decisions and letters by a number of important nineteenth-century Wahhabi leaders is contained in *Majmūʿat al-rasāʾil wa-al-masāʾil al-najdiyyah* (Cairo, 1927). Two important histories are ʿUthmān ibn Bishr’s *Kitāb unwan al-majd fī tarīkh Najd* (Mecca, 1930) and Ḥasan ibn Ghannām’s *Rawḍat al-afkār* (Bombay, 1919).

Major secondary sources include the works of H. St. John Philby, a close associate of ʿAbd al-ʿAzīz Ibn Saʿūd; see, for example, *Arabia* (New York, 1930). For the Ḥanbalī background, the standard work on Ibn Taymīyah and his impact is Henri Laoust’s *Essai sur les doctrines sociales et politiques de Taki-d-Din Ahmed ibn Taymiyya* (Cairo, 1939). The life of Muḥammad ibn ʿAbd al-Wahhāb is covered in the biographical study by al-Uthaymīn. The life and thought of Ibn Abd al-Wahhāb and the subsequent movement’s impact is discussed in Natana J. Delong-Bas, *Wahhabi Islam: From Revival and Reform to Global Threat* (New York, 2004). The second Saʿūdi-Wahhābī state is described in R. Bayly Winder’s, *Saudi Arabia in the Nineteenth Century* (New York, 1965). For the twentieth century, there are many studies dealing with specific aspects of the movement, such as John S. Habib’s *Ibn Saʿūd’s Warriors of Islam* (Leiden, 1978) and Christine Moss Helms’s *The Cohesion of Saudi Arabia* (Baltimore, 1981), which contains an excellent summary of Wahhābī teachings. A useful general survey of the history of the movement and of the three Saudi states is Alexei Vassiliev, *The History of Saudi Arabia* (New York, 2000).

JOHN O. VOLL (1987 AND 2005)

WAKANDA SEE POWER

WALĀYAH, or *wilāyah*, an Arabic verbal noun derived from the root *wly*, carries the basic meanings of “friendship, assistance” and “authority, power.” A fundamental notion of Islamic social and spiritual life, the term is used with a complex variety of meanings related to the function, position, authority, or domain of authority of a *walī* (pl., *awliyāʾ*; “next of kin, ally, friend, helper, guardian, patron, saint”); a *mawlā* (pl., *mawālī*; “cousin, close relation, ally, client, patron, master”); or a *wālī* (pl., *wulāh*; “administrator, governor, ruler”). It appears in Persian as *valāyat*, *vilāyat*, and in Turkish as *vilayet*.

A distinction is often made between *walāyah* and *wilāyah*, with the latter form generally preferred to convey the meaning of “power,” “authority,” or “domain of authority” (e.g., a political subdivision of a country). However, the vocalization is not normally indicated in the texts, and the classical Arab lexicographers are not unanimous on this point.

QUR’ANIC USAGE. Although the verbal noun *al-walāyah*, thus vocalized according to the standard text, occurs only twice in the Qur’ān (surahs 8:72 and 8:44), other derivatives of the root *wly* are found in more than two hundred instances. Most frequently, the verbal forms *wallā* and *tawallā* are used, in the sense of “turning” either one’s back or face—properly or metaphorically speaking—toward somebody or something (e.g., a hostile army, a sacred place, a prophetic message; God himself “turns to” or “takes care of” the pious, as in 7:196 and 45:19).

The nominal forms *walī* and *mawlā* are used, without apparent distinction, for the two partners of a close social relationship, such as kinship and alliance, but also for those of the God-human relationship. A *walī* or *mawlā* can claim certain rights of inheritance and has certain duties or responsibilities to assist an ally against enemies, in such cases as the retaliation for unjust killing of kinsmen (*wilāyat al-dam*; see 17:33). Inheritance and assistance expected of a *walī* may also be of a spiritual kind, as in the Qur’anic version of the birth of John the Baptist, which seems to echo a messianic idea implicit in the Judeo-Christian background of that theme: Zacharias, having no (natural) son and fearing therefore the claims of his *mawālī* (secondary heirs, perhaps priest colleagues), asks God to give him a “noble offspring” (3:38), a “*walī* from thee, who will be my heir and will inherit [prophethood?] from the family of Jacob” (19:5–6).

Similarly in 4:75, but without the notion of kinship and inheritance, the oppressed (Meccan Muslims), left alone after the prophet Muḥammad’s emigration, ask God to bring them out of “the city of the unjust” and to provide for them “a *walī* from thee and a helper [*naṣīr*] from thee” (see also 17:80). According to 41:28–31, the enemies of God will dwell forever in the fire, whereas the angels will descend

upon the righteous as their “friends [*awliyāʾ*] in this life and the next,” so that they shall have no fear; indeed, according to 10:62, the “friends of God [*awliyāʾ Allāh*, i. e., the pious] shall have no fear”—a verse frequently quoted in Šūfī manuals.

God’s unique position as the most powerful friend and helper (*walī naṣīr*) is one of the major themes of Qur’anic preaching, and several verses make it clear that those who “turn away” (e.g., 9:74) and/or “are lead astray by him” (e.g., 18:17) have no *walī* (42:8) or *mawlā* (47:11), that is, no one to turn to for help or guidance. The same message is also conveyed by the parable of the rich but impious owner of the two gardens and his poor but godfearing companion (18:32ff.), which closes with one of the two Qur’anic verses in which *al-walāyah* actually occurs: it is the rich man who ends up the loser in spite of the prosperity of his gardens and the power of his clan, for, “Ultimately, the *walāyah* belongs to God, the Truth!” (18:44).

While this verse gives an idea of the prophet Muḥammad’s attitude during the early stages of his career as a religious “warner” at Mecca, the other verse in which *al-walāyah* occurs (8:72) reflects the situation immediately after his emigration (Hijrah) in 622 CE from Mecca to Medina, where he began to organize his new community. The verse defines the relationship between three groups of believers (Muslims) in terms of *walāyah*: (1) those who emigrated and “fought on the path of God,” (2) those who gave them asylum (in Medina) and helped them, and (3) those who did not emigrate. The first two groups, who came to be known later as the emigrants (*muhājirūn*) and the helpers (*anṣār*)—the nucleus of the future Muslim community (*ummah*)—are, according to this verse, allies or friends of each other (*awliyāʾ*); but “as for those who believed but did not emigrate, you have no *walāyah* with them [or: you should disregard their *walāyah*] until they emigrate!”

Traditional interpretation of this verse refers to a ceremonial “brothering” (*mu’ākhāh*) supposed to have taken place between the emigrants and their Medinese helpers. This event was to cancel the old ties of *walāyah* linking the emigrants to their blood relations back in Mecca; this radical measure was, however, later abrogated or modified through verses 8:75 and 33:6, which state that blood relations are “closer [*awlā*] in the Book of God.” Regarding this “brothering,” W. Montgomery Watt suggests that “Muḥammad was prepared to use the kinship principle to increase the cohesion of his religious community in Medina” (“The Charismatic Community in Islam,” *Numen* 7, 1960, p. 84). However, since it is not clear who “those who believed but did not emigrate” were in the first place, the ties of *walāyah*, to be ignored “until they emigrate,” may have been those of friendship or alliance rather than kinship, as is also suggested by the parallel passage 4:89.

At any rate, emigrants and helpers were the “true believers” (8:74), and “those fighting” (*mujāhidūn*) were definitely placed in a higher rank than “those sitting” (at home), ac-

ording to 4:95–4:96. Clearly, the new charismatic community of true believers was an alliance of those following the Prophet and was directed against his opponents. Further, it should be noted that these opponents were also seen as forming such an alliance of “*awliyā*’ of each other,” whether they were “the disbelievers” (8:73), “the hypocrites” (9:67–72), “the unjust” (45:19; 6:129), or “the Jews and Christians” (5:51). As is well known, the new Muslim community was patterned after the model of the nation of Abraham, but with Abraham as neither Jew nor Christian (see 3:64–68). The Jews in particular are frequently challenged in the Medinese surahs, notably to prove their claim to be “the exclusive friends of God” (*awliyā*’ *Allah min dūn al-nās*, 62:6–8; 2:94–95).

Walāyah as a socioreligious concept seems indeed exclusive: one turns either to the right or to the wrong side, and the two sides are always engaged in battle: “Those who believe fight on the path of God, while those who disbelieve fight on the path of al-Ṭāghūt; thus, fight against the *awliyā*’ of Satan!” (4:76). (*Al-Ṭāghūt*, perhaps derived from Ethiopic *ṭā’ōt*, “idols,” is used for Satanic powers and often applied to tyrants or unlawful rulers, especially in Shī’ī interpretations.)

God and his antagonist(s) lead their respective allies or friends their way: God as the “*walī* of the believers” leads them from darkness to light, whereas the disbelievers, who have al-Ṭāghūt as *awliyā*’, are led by them from light to darkness (2:257). The world seems to be divided into two antagonistic groups: the party of God (*ḥizb Allāh*, 5:56) and the party of Satan (58:19), but the party of God, that is, “whoever turns to [or follows, *yatawallā*] God and his messenger [the prophet Muḥammad] and those who believe,” is winning (5:56), while “whoever takes Satan rather than God as *walī* is surely going to lose!” (4:119). As though the divine *walāyah* were spread among the charismatic community, verse 5:55 states that “Your *walī* is only God, his Messenger, and those who [truly] believe, who perform the prayer and give alms, bending the body.” Thus, unlike the purely God-oriented *walāyah* of the “poor companion” of Mecca, the Medinese *walāyah* seems to be the charisma of the party of God, in which the person of the Prophet himself plays the central role. Though never elevated to divine status, this role of the Prophet is stressed in the later parts of the Qur’an generally; it culminates in the solemn pledge of allegiance (*mubāya’ah*) made to him in lieu of God in 628 at al-Ḥudaybiyah (surah 48:9–10). The ceremonial contract of allegiance (*bay’ah*) made with his successors—caliphs, imams, and later also Ṣūfī shaykhs—all of whom would claim *wilāyah* of a certain kind, was to reiterate this charismatic basis of Islam symbolically.

LEGAL USAGE. A trace of the pre-Islamic kinship principle may be seen in the fact that the Qur’anic commandments preserve the blood feud in restricted form, namely, as a right of the victim’s *walī* to kill the murderer personally (17:33). In Islamic law, this particular right of the *walī*, which is

known as *wilāyat al-dam* or “*wilāyah* of blood,” is one among other forms in which the requital (*qiṣās*) may be exercised.

Sunnī laws of inheritance, which were elaborated in the second Islamic century by the jurist al-Shāfi’ī (757–820), generally follow Arab tradition. The primary heir is the *walī* as the nearest male agnate in descending or ascending order (‘*aṣabah*’); but shares (*farā’id*) are also provided for secondary heirs in accordance with the Qur’anic dispositions in surah 4:7ff. Under certain conditions, the inheritance of a manumitted slave goes to his former owner, who has become his patron (*mawlā*) and is counted as such among the agnates according to Shāfi’ī law. A similar kind of legal kinship was presumed in the early Umayyad period between non-Arab converts to Islam and their Arab patrons, who “adopted” them as clients (*mawālī*).

Al-Jurjānī (1339–1413) defines *walāyah* as legal kinship (*qarābah ḥukmīyah*) resulting from either manumission or “adoption.” *Wilāyah*, on the other hand, he defines as the legal power “to carry through a decision affecting another person, whether the latter wishes or not.” The notion of *wilāyah* as legal power is not, as such, Qur’anic but was probably developed from the early second century AH onward in two different, though not unrelated, social spheres: family law and political thought.

Family law. The Qur’anic laws of inheritance are laid down in 4:1ff., together with general rules and indications concerning marriage and the gift of the bridal dower to the brides (or wives), as well as the protection of the goods of orphans and fair treatment of the mentally weak (*safīh*), who should be represented by their *walī* in legal matters (2:282). A number of specific legal responsibilities of a *walī* regarding brides, orphans, minors, and otherwise legally incompetent persons (*safīh*) were eventually defined as a kind of guardianship or trusteeship. Among these, the most important socially is undoubtedly the “guardianship of marriage” (*wilāyat al-nikāḥ*), the office of the bride’s nearest relative, her *walī*, who must give her in marriage by contractual agreement with the bridegroom. The *walī* may refuse consent or, as *walī mujbir*, force his ward into marriage under certain circumstances. According to Joseph Schacht, the *wilāyat al-nikāḥ* was not, as a legal institution, “originally as self-evident as it became later,” and “marriage without a legal *walī* continued the easygoing practice of the pre-Islamic Arabs” during the early Islamic period (Schacht, p. 182f.).

Political thought. *Wilāyah* in the sense of political authority and sovereign power refers first of all to the authority of the “successor of the Messenger of God” (*khalīfat rasūl Allāh*), that is, the caliph, who is to be obeyed (*muṭā’*) as leader or guide (*imām*) of the Muslim community and as “commander of the faithful” (*amīr al-mu’minīn*). Although there is fundamental disagreement between Sunnī and Shī’ī Muslims concerning the nature and scope of this authority, and the persons invested with it, both refer to the same *locus classicus* to justify their claims: “Obey God and the Messenger and ‘those in command’ [*ūlī al-amr*] among you!” (surah

4:59); it is therefore called *wilāyat al-amr*. This usage of *wilāyah* should be seen in relation to the development of the charismatic alliance of those who “follow [*yatawallā*] God, the Messenger, and the [true] believers,” or the party of God (5:55–56).

The question of who “those in command” were and how the alliance was to be preserved after the death of the Prophet was, perhaps not surprisingly, the primary concern of the early opposition parties. Among these, there were notably those who sided with Muḥammad’s paternal cousin (*mawlā*) and son-in-law through Fāṭimah, ‘Alī ibn Abī Ṭalīb (d. 661), known as the party of ‘Alī (*shī‘at ‘Alī*), later simply known as the Shī‘ah, and those known as the dissidents (*khawārij*, Khārijīs). The early Shī‘ah seem to have assumed that ‘Alī was entitled to inheritance from the Prophet not only as his kin but also as his “emigrant brother”; his preeminent position is thus unique.

But the kinship principle alone was evidently not sufficient to guarantee ‘Alī’s exclusive right to what came to be known as *wilāyat al-amr*: it had to be completed by the principle of designation. This was made possible thanks to an inherent ambiguity of the term *mawlā*. According to a famous *ḥadīth* (prophetic tradition), the Prophet had made the following declaration at a solemn meeting after his last pilgrimage to Mecca and shortly before his death: “Am I not closer [*awlā*] to the believers than they are to themselves? . . . He whose *mawlā* I am, ‘Alī is his *mawlā*! God, befriend the one who befriends him [*wālī man wālāhu*], and treat as an enemy the one who treats him as an enemy!” (see also surah 33:6). The earliest sure evidence for an interpretation of this *ḥadīth* as asserting ‘Alī’s *wilāyah* or right to be obeyed is found in the *Hāshimīyāt* of the pro-‘Alid poet of Kufa, al-Kumayt ibn Zayd al-Asadī (680–743). ‘Alī, however, was elected caliph only after the assassination of ‘Uthmān, the third of the four Rāshidūn (“rightly guided”) caliphs in Sunnī Islam. ‘Alī’s caliphate was overshadowed by civil war, and he was himself assassinated by a Khārijī.

In the heresiographical literature the Khārijī movement is associated with the doctrine that anyone, “even an Abyssinian slave,” could serve as imam as long as that person was found to be a true believer. As may be seen from the earliest available Khārijī (Ibādī) texts (of uncertain date, between AH 70 and 150), a distinction between the “imams of truth” and the “imams of error” was essential to their doctrine, with the understanding that the first were to be obeyed as “*awliyā’* of the believers” and the second to be fought as unbelievers. The Khārijīs also developed the principle of *walāyah* in the sense of “associating with” or “following” (*muwālāh*, *tawallī*) prophets and “true believers,” and its correlative, “dissociating” or “freeing oneself” from the opposite powers (*barā’ah*, *tabarru’*). Exactly the same double principle (later known in Persian as *tawallā* and *tabarrā*) was adopted by the Shī‘ah, but with the essential difference that the true believers to be followed were necessarily ‘Alī and subsequent imams issuing from his “holy family” (*abl al-bayt*, *āl Muḥammad*).

The assassination of ‘Alī, far from helping the Khārijī cause of Muslim “integralism,” led to its very opposite. The successful Umayyads established the dynastic principle in the Sunnī caliphate and introduced the practice of the designation of the heir apparent (*walī al-‘ahd*) by the reigning caliph. Although the authority of an Umayyad caliph was hardly religious in nature, he was considered not only “successor of the Messenger of God,” but also “representative of God” on earth (*khālīfat Allāh*), a Qur’anic phrase that refers specifically to David as God’s “viceroys among men” (38:26) and that continued to be applied to the caliph well into the Abbasid period.

The dissatisfaction of the religious community with Umayyad worldliness, as well as the hopes of the Shī‘ah, helped, among other factors, to bring about the so-called Abbasid Revolution in the Eastern caliphate. The descendants of Muḥammad’s paternal uncle al-‘Abbās were presented as members of the “providential family”; they showed, once in power, a marked zeal for religious affairs. The ‘*ulamā’* (religious scholars) were now elaborating a Sunnī doctrine of *wilāyat al-amr* in close collaboration with the caliph. Harūn al-Rashīd is addressed by the jurist Abū Yūsuf (d. 798), a disciple of Abū Ḥanīfah, as “*khālīfah* of God on his earth,” to whom God has “delegated the command” (*tawliyyāt al-amr*) and “given a light” to guide the subjects through clarification of the law and its enforcement. At the same time, Abū Yūsuf also strikes a Ṣūfī note. He exhorts the caliph to fulfill the duties of his high office and expresses the hope that God will not “abandon him to himself” (i. e., to his human weakness); that he will, rather, take care (*yatawallā*) of him as he takes care of his friends (*awliyā’*), “given that he is the [ultimate] *walī* in the matter.”

During the later Abbasid period, when the real power was no longer exercised personally by the caliph, he was still considered the representative or guardian of the law (*walī al-shar‘*). According to al-Māwardī (975–1080), it is the religious law itself that requires entrustment of all matters or delegation of general authority (*wilāyah ‘ammah*) to the elected or designated imam from the Quraysh, that is, the Abbasid caliph. The caliph in his turn delegates authority (*tawliyyah*) to viziers, military commanders, governors, and judges, so that all public functions (*wilāyāt*) emanate in theory from the authority entrusted to him and are legally validated by it. But al-Ghazālī (1058–1111), recognizing that the caliph has no longer the military power (*shawkah*) to defend religion, justifies the transfer of this legal authority to the Seljuk sultan or king (*pādīshāh*). Al-Ghazālī argues, with traditional Persian wisdom, that “religion [*dīn*] and kingship [*mulk*] are twin brothers in need of each other”; in effect, non-Arab sultans and kings were now to play the role of the “shadow of God on earth.”

SHĪ‘Ī CONCEPTS. Contrary to the Sunnī acceptance of *wilāyah* as a state-building idea, the mark of Shiism is *walāyah* as devotion to ‘Alī and “the imams from the house of the Prophet,” that is, descendants of ‘Alī who are consid-

ered imams. Despite several unsuccessful ‘Alid attempts to seize power, or perhaps because of them—the martyrdom of ‘Alī’s second son Ḥusayn (d. 680) is an important aspect of Shī‘ī Islam—imams of various lines of descent became the focus of a veneration that went far beyond the charismatic alliance of surah 5:55–56, from which “orthodox” Shī‘ī doctrine nevertheless takes its pedigree: in effect, it became the apotheosis of the imam. In this process, through which Shiism became the major receptacle of messianic hopes and gnostic ideas in Islam, converts (*mawālī*), especially those of Iraq, seem to have played an essential role.

The transfer of *wilāyah* from Muḥammad to ‘Alī was understood as part of a more general *Heilsgeschichte*, a universal process of revelation to be completed by the imams as inheritors of the hidden (*bāṭin*) substance and knowledge of previous prophets, Arab and non-Arab, or as a process of transmigration (*tanāsukh*) that leads up to the final revelation of truth and justice with the coming, or return, of “the one who stands up” (*al-qā’im*, probably the gnostic *hestōs*). Despite the repudiation of the more extremist ideas of their enthusiastic followers (*ghulāt*) by the imams themselves, and although the imams are not placed above Muḥammad’s law according to standard Shī‘ī doctrine, its major dogma insists that only the transfer of *wilāyah* from Muḥammad to ‘Alī and subsequent imams makes Islam the “perfect religion” (surah 5:3). In fact, *walāyah*, as adherence to the imams and as recognition of their mission as the true “holders of the [divine] Command” (*ūlī al-amr*) and the exclusive possessors of the true meaning of the Qur’an and the “knowledge of the hidden” (*‘ilm al-ghayb*), remains the key to salvation, without which no pious act of obedience to God (*tā’ah*) is truly valid. It is for these reasons that *walāyah*, and not the profession of monotheism (*tawḥīd*) as in Sunnī Islam, appears as the principal “pillar of Islam” in the classical collections of Shī‘ī traditions, both those of the Ithnā ‘Ashariyah, or Twelvers (e.g., al-Kulaynī, d. 940), and those of the Fatimid Ismā‘īliyah (e.g., Qāḍī al-Nu‘mān, d. 974), who follow a common line of imams up to Ja‘far al-Ṣādiq (d. 765).

The concrete meanings and functions of *walāyah*, however, were quite different in the two cases. Contrary to the generally quietist or neutral attitude of the Twelvers, the Ismā‘īliyah were politically active and succeeded in establishing, by the end of the third century AH, a Shī‘ī counter-caliphate in North Africa and later in Egypt that constituted a serious challenge to the Abbasid order. For the function of *walāyah* in this process, it seems significant that the Fatimid campaign in North Africa is seen in Ismā‘īlī sources (Qāḍī al-Nu‘mān) as a parallel to the prophet Muḥammad’s emigration (Hijrah) from Mecca to Medina: just as the Qur’anic emigrant fighters are placed above those sitting at home, the front fighters of the Fatimid agent Abū ‘Abd Allāh al-Shī‘ī (d. 911) are distinguished as *awliyā’* from the ordinary (Ismā‘īlī) believers (*mu‘minūn*). The Fatimid caliph, referred to as *walī Allāh* and imam “of the time,” was evidently seen in the role of the Prophet himself. He was not only the

political head of a counter-caliphate, but also the spiritual center of an esoteric hierarchy, the *da‘wah* (lit., the “call” or “mission”), initiation into which was expected to provide gradual access to gnosis (*‘ilm*)—a cause that al-Ghazālī feared would undermine Islam from inside.

From the point of view of an Ismā‘īlī missionary (*dā‘ī*) such as Qāḍī al-Nu‘mān, *wilāyah* was indeed much more than the legal foundation of the imamate: standing esoterically (*bāṭin*) for the true knowledge (*ḥaqīqat al-‘ilm*) bestowed primordially on Adam and inherited by prophets and imams, it is the very foundation of the sacred history of prophecy itself and its necessary fulfillment in the imamate. According to the grand *dā‘ī* al-Mu‘ayyad fī al-Dīn al-Shīrāzī (d. 1077), prophets and imams, each in their time, are the examples of “absolute human being” (*al-insān al-muṭlaq*, the gnostic Anthrōpos). As the prophet Muḥammad is the Seal of the Prophets (surah 33:40), so the final (?) imam of resurrection (*qiyāmah*) is the Seal of the Imams (*khātam al-a‘immah*).

The idea of the imam in Twelver Shiism, by contrast, is marked by the “occultation” (*ghaybah*) or absence of the twelfth imam, believed to have “disappeared” in AH 260 (873/874 CE); at his return (*raj‘ah*) at the end of time he will “fill the earth with justice as it is now filled with injustice.” In the absence of the imam, the ‘*ulamā’* assumed authority in theological and juridical matters much like their Sunnī counterparts before; they insisted, however, on the presence of the infallible (*ma‘ṣūm*) Hidden Imam as a “grace necessary upon God” (*lutf wājib*) that would validate their consensus (*ijmā’*). Gnostic Shiism, alien to the rationalism of the ‘*ulamā’*, reappears within Twelver Shiism by the fourteenth century in a Ṣūfī form. Sayyid Ḥaydar Āmulī (d. after 1385) interprets Ibn ‘Arabī’s doctrine of the “two seals of *walāyah*” in terms of Twelver Shī‘ī imamology, with ‘Alī as the “seal of absolute *walāyah*” and the twelfth imam as the “seal of particular Muḥammadan *walāyah*”; *walāyah* itself is both the “inner dimension of prophethood” (*bāṭin al-nubūwah*) and the transcendental vocation of humankind, or the trust offered (*al-amānah*, *sūrah* 33:72).

At the same time, Ṣūfī orders such as the Ṣafawīyah and the Kubrawīyah gradually turned Shī‘ī, possibly as an indirect result of the Mongol invasions. The Ṣafawīyah, supported by Türkmen “tribal Shiism” and claiming descent from the imams, became even “extreme Shī‘ī”; once its leaders assumed rule of Iran (with Shah Ismā‘īl I in 1501), they introduced Twelver Shiism, in a form hardly compatible with “orthodox” Shī‘ī doctrine, as state religion; their prayer carpet (*sajjādah*), symbol of the dignity of the Ṣūfī *shaykh*, or Ṣūfī *wilāyah*, became the symbol of the quasi-divine throne of Persia (*qālī‘ah-i salṭanat*). Their success also brought about, perhaps paradoxically, the establishment of a real Shī‘ī “clergy” and its eventual politicization. For the first time in Twelver Shī‘ī history, the rationalist (Uṣūlī) school of the clergy formally acknowledged in 1817/1818 a division of labor between the ‘*ulamā’* and the rulers—a long-

established Sunnī practice—claiming general viceregency (*wilāyah* ‘*āmmah*) of the Hidden Imam for themselves, against the more traditionalist ideas of the Akhbārī school, and against the Ṣūfis.

The very complex religious, social, and political situation in nineteenth-century Iran is also highlighted by the tensions between the majority of the clergy and the Shaykhī school, who developed a mystical concept of the “perfect Shī‘ah” on the basis of Akhbārī traditionalism and the philosophy of Mullā Ṣadrā (d. 1640). In the Shaykhī scheme, the imam presides over the realization of an individual’s vocation in the realm between matter and spirit, or the *mundus imaginis* (‘*ālam al-mithāl*), not over the realization of a political project.

It should be noted that the leader of the Islamic Revolution of 1978–1979, Ayatollah Khomeini, made a fundamental, albeit theoretical, distinction between two kinds of *wilāyah*: that of the learned jurist (*wilāyat al-faqīh*), called relative *wilāyah* (*wilāyah i‘tibārīyah*) and that of the traditional imams of the prophetic house, called real or creative *wilāyah* (*wilāyah takwīnīyah*).

ṢŪFĪ CONCEPT. *Walāyah/wilāyah* is also a key concept for Sufism; indeed, it is the very principle of Sufism itself according to al-Hujwīrī’s eleventh-century systematic exposition of its doctrine, the *Kashf al-mahjūb* (Unveiling of the Veiled). Yet once again, two notions appear to be involved. To use the typological distinction made above between “Meccan” and “Medinese” *walāyah*, one might suggest that the spiritual attitude of early Sufism, with its ideal of poverty (*faqr, darvīshī*) and reliance upon God (*tawakkul*), is more in line with the former. The Khorasani saint Ibrāhīm ibn Adham (d. 776), quoted by the reputed teacher of most of the Baghdad Ṣūfis, the theologian al-Muḥāsibī (d. 857), puts it succinctly this way: “If you wish to be God’s friend [*walī*] and care that he loves you, then leave this world and the next and do not heed either; free yourself from both and turn your face to God, so that he turns his face to you!”

A number of prophetic traditions, often in the form of *ḥadīth qudsī* (non-Qur’anic “words of God” transmitted by a prophet), suggest that there are indeed such friends of God. As with the Qur’anic notion of *awliyā’*, there is a certain ambiguity as to whether these friends of God are human or angelic beings. “Approaching [God] and approached by him,” they have reached such a stage that God says: “I am his ear by which he hears, his eye by which he sees, his tongue by which he speaks, his heart by which he understands”; even the prophets will envy them at the Day of Resurrection. No tradition refers to them by name; indeed, according to a famous tradition, they are hidden “under God’s tents, unknown to anyone but him.” On the other hand, they are reminders of God for people and stand under his special protection: whoever turns against them, turns against God. “Marvelous is their story, and they know marvelous stories. The [heavenly] Book stands through them, and they stand

through it; the Book speaks through them, and they speak through the Book.”

Many of the traditions regarding these “friends of God,” the first comprehensive collection of which is found in Abū Nu‘aym al-Iṣbahānī’s *Ḥilyat al-awliyā’*, are attributed to pre-Islamic prophets, especially Yahyā ibn Zakariyā (John the Baptist) and Jesus. This may suggest a gnostic origin; some are clearly of a mythological nature. According to the tradition known throughout the Ṣūfī literature as the *ḥadīth* of ‘Abd Allāh ibn Mas‘ūd, there are 355 or 356 such figures, upon whom life and death of all nations depends: 300 “whose heart is after the heart” of Adam; 40 who are in the same relationship to Moses (or Noah); 7 to Abraham; 5 (or 4) to the angel Gabriel; 3 to Michael; and one to Seraphiel (Iṣrāfīl, the angel of resurrection). If one of them dies, God substitutes for him one of the next lower class. The substitutes of the lowest class (the 300) are taken from the common people (*al-‘āmmah*). The single one is commonly called the “pole” (*quṭb*) or the “rescue” (*ghawth*), while terms such as *abdāl* (usually for the 40 or the 7) and *ṣiddīqūn* (see surah 4:69) refer either to a class, or to saints generally, like *awliyā’*.

Wilāyah, then, is the special charismatic quality of a Ṣūfī, that which enables him to be the subject of miracles or, more precisely, charismata (*karāmāt*). The classical Ṣūfis, especially the Khorasani school, were divided over the question of whether *awliyā’* should themselves be aware of their sainthood and whether the charismata should become public knowledge. For Bāyazīd al-Baṣṭāmī (or Biṣṭāmī, d. 875 or earlier), the *awliyā’* should be hidden like the “brides of God”; he was extremely critical of public shows. By contrast, Tirmidhī al-Ḥakīm (ninth century), the reputed founder of the Ṣūfī doctrine of *wilāyah*, dismissed such restraint as a subtle form of self-consciousness. According to the definition of Tirmidhī’s contemporary and disciple Abū ‘Alī al-Juzjānī (which became more or less authoritative), a *walī* is “in oblivion [*fanā*]” of himself but subsisting [*baqā*] in contemplation.” Other well-known definitions distinguish an “active” from a “passive” aspect (al-Qushayrī), or a *walāyah* of “lordship” (*sūrah* 18:44) from a *wilāyah* (?) of “love” (al-Hujwīrī).

Typical connotations of Ṣūfī *wilāyah* are “insight into the hidden” (*al-‘ilm bi-al-ghayb*, Tirmidhī) and control of souls (*taṣarruf*), psychognostic and pedagogic abilities, and the power to drive Satan away. Medieval Ṣūfī “saints” are famous for having the power to help the Muslim armies, and to intercede (*shafā‘ah*) on behalf of the sinners. In postclassical Ṣūfī texts, *walāyah* or *wilāyah* generally refers either to the highest mystical stage that may be attained or to the authority exercised by a Ṣūfī master, or to both at the same time. Najm al-Dīn Kubrā (d. 1221) identifies its highest stage with the experience of divine creative power (*takwīn*). By contrast, his followers in the late thirteenth and early fourteenth centuries, receptive to Shī‘ī ideas but not yet themselves Shī‘ah, notably ‘Alā’ al-Dawlah al-Simnānī (d. 1336), emphasize the double experience of the prophet Muḥammad—his *walāyah* or mystical experience and his

nubūwah or prophetic authority—as a necessary model for their own double experience of mystical attainment and Šūfī authority.

One of the major theoretical problems discussed in Šūfī circles from the beginning was the exact nature of the relationship between the *awliyā* and the prophet Muḥammad, that is, between the Šūfī and the prophet Muḥammad. The imam Jaʿfar al-Šādiq is quoted by Abū Nuʿaym as follows: “Whoever lives in the ‘outward’ [*zāhir*] of the Messenger [Muḥammad] is a Sunnī, and whoever lives in the ‘inward’ [*bāṭin*] of the Messenger is a Šūfī.” In the Qurʾanic commentary of the Šūfī Sahl al-Tustarī (d. 896 in Basra), the heart or spiritual reality of Muḥammad is seen as the divine element enshrined in him and the source for the illumination of human hearts; his pre-Adamic Light-nature (*nūr Muḥammad*) is the source of the prophetic ancestors of humankind, and of “those desired [by God],” that is, *awliyā*.

Divine *walāyah*, on the other hand, is conferred directly on the elect, who are also those who have the right understanding of God and of the Qurʾān, according to al-Tustarī. The fact that the Prophet is “the *walī* of the believers” (suraḥ 5:55) means only that he was notified (in this world) by God to befriend those whom God had befriended (or elected) in the first place. There does not seem to be an essential distinction in al-Tustarī’s view between prophets generally and *awliyā*, although *šiddīqūn* occupy a lower rank; the charismata of the *awliyā* are signs (*āyāt*) of God’s power, and al-Tustarī himself claims to be the “proof of God” (*ḥujjat Allāh*). The Baghdad Šūfī Abū Saʿīd al-Kharrāz, (d. 890/891), on the other hand, polemizes against “certain Šūfīs” who “place the *awliyā* above the prophets.” For al-Kharrāz, prophecy is a grace additional to *wilāyah*, since prophets are *awliyā* before they become prophets. The *awliyā* are always placed under a prophet known by name, on whose behalf they call people to God, and their charismata are clearly of a secondary nature in comparison with the signs that are given exclusively to prophets.

Tirmidhī goes a step further in elevating the status of Muḥammad the lawgiving prophet, while at the same time elevating his own status: on the one hand, *awliyā* and ordinary prophets rank lower than lawgiving prophets, among whom Muḥammad is unquestionably the greatest. All parts of prophecy are united in him; he is perfect in this sense, and impeccable (*maʿṣūm*). But his being “the Seal of the Prophets” means just this, not that he was the last in time, Tirmidhī insists. There is also a mysterious “Seal of the *Awliyā*,” to be sent by God at the end of time. Tirmidhī often uses Shīʿī (although not necessarily Ismāʿīlī) language, but clearly not with a Shīʿī intention: he explicitly denies that the “family of the Prophet” is the “kinship family.” But the danger of a confusion with the Ismāʿīlīyah was evidently felt by al-Hujwīrī, who, writing in the mood of the “Sunnī Revival,” omits the doctrine of the Seal from his summary of Tirmidhī’s teaching. Yet it was brought to light again, and enriched with elements of a breathtaking complexity, by Ibn

ʿArabī (1164–1240), the real master (*shaykh akbar*) of subsequent Šūfī thought. Ibn ʿArabī summarizes his concept of the relationship between the two Seals with the following proposition: “The Seal of the Prophets, considered from the point of view of his own *walāyah*, is toward the One who seals the *walāyah* in the same position as all other prophets and lawgiving messengers are toward him, for he is *walī*, lawgiving messenger, and prophet.” But *walāyah* itself is divided into two, and, accordingly, there are two Seals of *Walāyah* in the shaykh’s doctrine: Jesus, Seal of “General *Walāyah*, and Ibn ʿArabī himself, or his spiritual reality, Seal of “the Particular Muḥammadan *Walāyah*.” This doctrine, provocative as it sounds, is, however, balanced by the self-evident necessity for both Seals of *Walāyah* to follow the law of the Seal of Prophecy; and everything is placed under the primordial “reality of Muḥammad,” also called “reality of realities,” or the *logos*.

BIBLIOGRAPHY

There is no single text in which all the aspects of *walāyah* are discussed in detail. For Qurʾanic usage of the term, the passages cited in the text should serve as a guide. Willi Heffening’s “Wilāyah” in the first edition of the *Encyclopaedia of Islam* (Leiden, 1913–1934) focuses on the legal usage; Joseph Schacht’s *The Origins of Muḥammadan Jurisprudence* (1950; reprint, Oxford, 1979), an invaluable work, contains much important information on the legal aspects of *walāyah*.

Walāyah in the sense of political authority is discussed in Dominique Sourdel’s “L’*autorité califienne dans le monde sunnite*,” in *La notion d’*autorité au Moyen Âge: Islam, Byzance, Occident**, edited by George Makdisi et al. (Paris, 1982), pp. 101–116. An assessment of al-Ghazālī’s ideas on political authority can be found in Henri Laoust’s *La politique de Ghazālī* (Paris, 1970) and W. Montgomery Watt’s “Authority in the Thought of al-Ghazālī,” in *La notion d’*autorité au Moyen Âge**, already cited, pp. 57–68.

The Shīʿī concept of *walāyah* as a “pillar” of Islam is discussed by Henry Corbin in his *En Islam iranien, aspects spirituels et philosophiques*, 4 vols. (Paris, 1971–1972), a comprehensive work in which much valuable information on Šūfī concepts can also be found. See also Uri Rubin’s “Prophets and Progenitors in the Early Shīʿa Tradition,” *Jerusalem Studies in Arabic and Islam* 1 (1979): 41–66; Wilferd Madelung’s “Authority in Twelver Shiism in the Absence of the Imam,” also in *La notion d’*autorité au Moyen Âge**, pp. 163–173; Saïd Amir Arjomand’s *The Shadow of God and the Hidden Imam* (Chicago, 1984); Mangol Bayat’s *Mysticism and Dissent* (Syracuse, N. Y., 1982); and, for recent developments, Murtaza Muṭahharī’s *Wilāyah*, translated by Yahyā Cooper as *The Station of the Master* (Tehran, 1982).

Walāyah in Sufism is discussed in detail in al-Hujwīrī’s eleventh-century *Kashf al-mahjūb*, translated by Reynold A. Nicholson as *Kashf al-Mahjūb: The Oldest Persian Treatise on Sufism*, 2d ed. (1936; reprint, Lahore, 1976). See also Tor Andrae’s *Die person Muhammads in lebre und glauben seiner gemeinde* (Stockholm, 1918); Ignác Goldziher’s “Saint

Worship in Islam,” in his *Muslim Studies*, vol. 2, translated by C. G. Barber and S. M. Stern (Chicago, 1973); Gerhard Böwering’s *The Mystical Vision of Existence in Classical Islam: The Qur’ānic Hermeneutics of the Ṣūfī Saḥl at-Tustarī* (Berlin and New York, 1980), pp. 149ff.; Bernd Radtke’s *Al-Ḥakīm at-Tirmidī: Ein islamischer Theosoph des 3.19. Jahrhunderts* (Freiburg, 1980), pp. 85–86; and my *Nūruddīn Isfarāyīnī: Le révélateur des mystères* (Paris, 1986).

HERMANN LANDOLT (1987)

WALDENSIANS. The Waldensians, also called the Poor Men of Lyons, originated with Pierre Valdès, or Peter Waldo, a wealthy merchant of Lyons, France. The dates of his birth and death are not known, nor is his exact name. The name Peter was given to him later by his followers, probably to stress his affinity with Peter, first of Christ’s disciples. About 1170 Valdès was converted from his worldly life after hearing the story of Saint Alexis, who on his wedding day abandoned his bride and all his worldly possessions to become a pilgrim. The account led Valdès to seek the advice of a priest on how he, too, could obey God and become perfect. The reply he received was the same text from *Matthew* (19:21) that Francis of Assisi was to come upon forty years later: “If you wish to be perfect, go, sell your possessions, and give to the poor, and then you will have treasure in heaven; and, come, follow me.” Valdès acted on the injunction, and took to a life of wandering poverty and preaching, living on alms, in emulation of Christ’s life on earth.

He was soon joined by others, among them priests who translated into French passages from the Bible for the group’s use in preaching. Vernacular translations from the Bible were one of the Waldensians’ hallmarks. Before long their unauthorized preaching alarmed the local clergy, and the archbishop of Lyons ordered them to cease. Valdès refused, with the reply that was to be the central Waldensian tenet, that God was to be obeyed before humans (a reference to *Acts* 5:19).

The Waldensians decided to take their case to the pope, Alexander III, and a party of them traveled to Rome for that purpose. They arrived during the Third Lateran Council in 1179, were heard, and their beliefs were examined. Alexander confirmed their vow of poverty, but he also, in effect, confirmed the archbishop of Lyons’s ban on their preaching by declaring that they could preach only if they first gained the permission of the local clergy. That, however, was not enough for Valdès; he continued to preach, and although he made a profession of faith before a synod at Lyons in 1180, he and his followers were excommunicated in 1182 or 1183. At the Council of Verona in 1184, where the first concerted attack on heresy was begun, the Waldensians were included among the heretical sects condemned, a condemnation to be repeated many times during the next three centuries.

The Waldensians are the classic case of popular piety become heresy. What had begun as one more attempt, not uncommon in the twelfth century, by a few individuals to re-

turn to evangelical principles, ended outside the church. The Waldensians differed in that they, alone among these groups and individuals, were neither absorbed into a religious order nor eventually disappeared as a sect, but survived the Middle Ages to become one of the new reformed churches—albeit a small one—of the sixteenth century. They did so, in part at least, because, of all the heretical sects, they remained closest to the teachings of the gospel which they sought simply to preach and practice without theological or metaphysical overtones. Theirs was above all a moral and spiritual Christianity. In that there were strong similarities between Valdès and Francis of Assisi. But where Francis and his band were accepted both by the local church hierarchy and by the pope, Innocent III, Valdès was not, and he rebelled. Even so, there is no evidence that he ever departed from the church’s teachings, and every indication that during his lifetime he devoted himself to combating heresy, especially that of the Cathari. The closeness of the Waldensians to orthodox belief is suggested by the reconversion of two groups under Durand of Huesca and Bernard Prim in 1207 and 1210, and their formation into separate religious orders by Innocent III to oppose the Cathari.

That was probably the period when Valdès died. By then the Waldensians had spread from Lyons into Languedoc and northern Italy as well as into Germany, in due course extending into central Europe. They became the nearest thing to a popular counterchurch, with their own congregations and priests and their own religious forms. But they did not operate as a single church. That was due partly to circumstances and partly to their popular, almost exclusively lay, character. In 1205 there was a schism between the Lombard Waldensians and those from north of the Alps, the followers of Valdès. The Lombards had instituted their own sacraments and ceased to lead the life of wandering preachers but lived in towns and by manual labor. The followers of Valdès maintained their original pattern of mendicant preaching and poverty. The Lombards elected their own head, whereas for Valdès only Christ could be the head. Despite a further attempt to heal the split in 1218 and some degree of contact, the two different wings went their own ways.

The Waldensians were the one genuinely popular heresy (before the Hussites) who drew their support from artisans and peasants. Although they had their base in the cities, especially in Lombardy, they were also of the countryside, especially north of the Alps and in the Alpine valleys of Piedmont, where geography protected them. Cohesion was maintained by the Waldensian priests, often called the “perfect,” an analogy with the Catharist perfect but having a very different character. The Waldensian perfect, especially north of the Alps—and by the fourteenth century the Waldensians had in effect become a northern phenomenon, with their main strength in Germany and central Europe—were preachers acting as Christ’s apostles as Valdès had done. But now they acted clandestinely. They visited individual Wal-

densian believers and administered their simplified version of the sacraments. In return they were supported by the believers materially, sometimes by a voluntary tax or payment. Otherwise, the ordinary Waldensian led an ordinary life, earning his living and observing outward obedience to the Roman church. That may well have involved less of a conflict than among the ordinary Cathar believer. The difference between being a Waldensian and an orthodox Christian was less one of belief than of adherence to the Waldensian perfects, regarded by the Waldensian believers as Christ's true representatives. The opposition between them and the Roman church was the main source of Waldensian belief as it developed after the death of Valdès.

The Waldensians claimed that they were the one true church to whom the apostolic succession had passed after the so-called Donation of Constantine, which gave to the pope headship of the western Roman Empire. Although a forgery, the Donation was believed to be true until the fifteenth century, and the Waldensians were not alone in treating it as the cause of the Roman church's decline. From it they argued that the Roman priests were not true priests and, following Valdès, further held that any man, and, indeed, woman, pure in spirit and in the quality of his or her life, was a priest and ordained by God. Like the Cathari, the Waldensians accepted women as perfect, although there seems to have been a decline in the number of female perfect in the fourteenth century. Once adopted, those Waldensian beliefs became irreconcilable with those of the Roman church. The Waldensians also came to reject the Roman church's sacramental forms and most of its prayers and ceremony, including prayers for the dead, a belief in purgatory, or the very need for churches. In their place they had their own modified spiritual forms of baptism (and only for adults, not children), confession, and marriage. At the same time, true to the literal interpretation of Christ's own gospel teaching, they rejected all nonspiritual activities, including the swearing of oaths, the exercise of legal authority, the waging of war, or the taking of life.

In all those ways they sought to obey God rather than human authority by turning away from the laws of the Roman church to direct communion with Christ through God's word in the Bible. Their influence is to be seen upon the Hussites.

GORDON LEFF (1987 AND 2005)
Revised Bibliography

WALDMAN, MARILYN ROBINSON (1943–1996), was an American-born historian of religion with unusually strong commitments, knowledge, and convictions regarding Islam and Muslims. Born in Dallas, Texas, Marilyn Robinson Waldman was of Eastern European Jewish descent. Following undergraduate studies in African history at Radcliffe, she studied Islamic and African history at the University of London (1964–1965) and earned a PhD in Islamic history at the University of Chicago, where Marshall G. S. Hodgson was her most influential teacher. In her work, she combined clarity and toughness of mind with humanity and humor. She loved to find laughter where she could.

Though her life was cut short by cancer at age fifty-three, Waldman established a remarkably prolific record as a speaker, traveler, teacher, consultant, organizer, and university administrator. She was famously active in the American Academy of Religion, the American Society for the Study of Religion, the American Institute of Iranian Studies, and the World History Association. Additionally she served on the editorial boards of numerous journals and consulted on curriculum and program reform for a number of schools. At The Ohio State University (OSU), where she spent her entire professional career, she served on literally dozens of committees and held appointments in the Department of History, the Middle East Studies Program, and the Center (later Division) of Comparative Studies in the Humanities, an experimental interdisciplinary unit that she directed for several years and, in large measure, reinvented.

Professor Waldman's radical reconfiguration of the Center of Comparative Studies is telling of her broader intellectual concerns. Though staunchly committed to a strong presence for religious studies in the public university, she took the bold step of rejecting familiar arguments about the autonomy and "irreducibility" of religion, and thus argued

against the need for an autonomous department of religion. She worked to establish an alternative institutional structure that would fully integrate the comparative study of religion with the comparative studies of literature and science, and indeed all versions of human inquiry. Committed to this truly interdisciplinary vision, she invested the same passion, vigor, and skill and the same quality of attention, care, and time in nurturing the Center as she did in raising her family or growing her garden. Overcoming much resistance, she shaped Comparative Studies according to her vision of a “meandering mainstream,” a phrase that served as the title of her inaugural address to OSU’s College of Humanities in 1988. She urged that comparison be embraced, not avoided; in fact, she regarded comparison as not just an academic exercise, but a ubiquitous human activity, a strategically deployed, socially consequential undertaking in which people are constantly involved. Though her vision has proven difficult to sustain, she regarded such a non-conventional academic unit as Comparative Studies to be not just an option but a necessity, and fought for its integrity and continuation when it was threatened by the wave of restructuring at Ohio State in the early 1990s.

Deeply concerned to find ways of framing the study of religion that avoided the problems of essentialism and reification, Professor Waldman was impressed by the claim that the category of *religion* is created for the scholar’s analytic purposes through imaginative acts of comparison and generalization. In a plenary address at the Midwest American Academy of Religion (1990) she reminded her audience that “religion” is a word that the people whom scholars study do not use, or at least do not use in the way scholars do; in short, religious studies does not have a fixed or fixable object of its attention. Accordingly, she advocated what she termed “stipulative definitions” of religion, which would allow for adjustment or change over time. In her view, religion is neither a thing, nor even a phenomenon, but rather a construct that, imagined by scholars, provides, among others things, “an angle of vision” or a “take” on human beings’ ways of living in the world.

Of special concern for Marilyn Waldman were the connections between religion, power, and authority, most notably in relation to prophethood and religious leadership. In fact, informed especially by years of studying Islam, she explained in the same plenary address (1990) that,

Given my own research, I would say that the imagination and study of religion focuses us on strategies for dealing with power and authority that rely on the ability to perceive and/or generate paradoxes, disjunctions, contradictions, conflicts, competition, and discontinuities, and to make sense of them, and in making sense of them, to make connections not otherwise possible. . . . Perhaps the most fundamental paradox of all is the insistence on establishing human priorities on the basis of an extra-human source and standard. . . , that is, an insistence on distinguishing special from ordinary, and degrees of specialness and ordinariness, up

and down the line, not just a focus on ultimate concern which has been the basis of many efforts to define religion. All sorts of other paradoxes flow from this one.

Given this set of interests, among Dr. Waldman’s primary and enduring concerns was to bring Islam out of its marginal position in the academic study of religions. In a 1989 address to the North American Society for the Study of Religion (NASSR) entitled “Islam and the Comparative Study of Religion” she noted that Islam has seldom played a prominent role in the theorizing of the broader history of religions. In her view this was a missed opportunity for both Islamicists and comparativists, especially those like herself with special interests in religious leadership and prophethood; but once again she argued that the situation might be rectified by “reconsidering how we do comparison.” Providing an early formulation of what she would term comparison via “catchments” in her final book project, *Power and Prophecy*, she argued for the creation of heuristic contexts of comparison wherein scholars, including scholars of Islam, could carry on a kind of hypothetical conversation or, as she wrote, operate with “an extra-language that will allow speakers of other languages to converse with each other in new ways.” Ever mindful of the ways in which uncaredful comparative strategies could reify and distort the specifics of Islamic history, she insisted that “Above all, I want my system to be fluid and tentative, to be able to account for the historical changes and momentary variation of internal systems of thought.”

With the Iranian revolution, Marilyn Waldman’s enduring historical and theoretical concerns about Islam were intensified and widened into more practical concerns. Her efforts to put her knowledge of Islam into more general circulation led her to cultivate a second career as a public speaker on issues of broad general concern; in all, she gave more than five hundred community presentations. The titles of some of her public lectures give a sense of how she projected her academic interests into the wider community: “Human Rights and Islamic Law” (1980), “Women Leaders: Why Are There More outside the U.S.?” (1989), “Behind and beyond the Gulf War” (1992), and “Islam in International Affairs” (1993).

This sense of obligation and her relentless efforts “to carry our knowledge into the wider world” earned her the 1992 Richard Bjornson Distinguished Service Award from the Ohio Humanities Council. As she stated in her acceptance speech, she believed in “disseminating the public significance of academic scholarship as widely as possible.” Her public scholarship, she said, improved her academic scholarship, “not just the other way around.” In 1987 she addressed Ohio State’s summer commencement and in 1989 she served as guest lecturer on OSU’s Alumni Association tour of Egypt. The Islamic Council of Ohio recognized her in 1989 for her efforts to advance public understanding of Islamic history.

If scholarship is judged by the questions it stimulates rather than the answers it provides, then Marilyn Waldman

was a true scholar, for in her effort to fight stereotypes, she thrived on raising questions and complicating them through comparison. Underneath all of her pursuits was her desire to get to the heart of what it means to be human. “For me,” she said, “it’s not just a question of *whether* we survive, but *how* we survive, and what human possibilities we open up for ourselves in the process” (“The Meandering Mainstream: Reimagining World History,” OSU Inaugural Address, 1988). She believed, as she wrote in the preface to her final book, “the commitment to cross-cultural interpretation is a moral act, a practical necessity, and an intellectual challenge; the circumstances of our time make it possible for us to address all three, and unwise to neglect any of them” (2005). A quote from Spinoza, which she had pinned to the bulletin board outside her office, sums up her investments, both personal and professional: “I have made a ceaseless effort not to ridicule, not to bewail, nor to scorn human actions, but to understand them.”

BIBLIOGRAPHY

The Exemplary Faculty Award that Marilyn Waldman received from OSU’s College of Humanities (1996) attests to the delicate balance she negotiated in the ways that she imparted her knowledge and understanding. Her enduring influence probably owes more to the people she affected in conferences, meetings, and classes than to her published writings. Nonetheless, the following titles are worth consulting, as they reflect the scope and depth of her thinking.

The Islamic World, which she coedited with William H. McNeill (Oxford, 1973; reprint, Chicago and London, 1983), contains translations of representative works by Muslim writers from all periods of Islamic history. *Toward a Theory of Historical Narrative: A Case Study in Perso-Islamicate Historiography* (Columbus, Ohio, 1980) challenges prevailing practice in Islamic historiography by undertaking a multifaceted analysis of a single text, *Tārīkh-i Bayhaqī*, written by a tenth-century premodern Muslim historian. It urges historians to abandon traditional attempts to deduce supposed historical realities from historical narratives, and argues that such narratives should be seen rather as part of a history of images and representations of the past.

Together with her colleague Richard Bjornson, Marilyn Waldman conceived and edited the series *Papers in Comparative Studies*, which explored issues of fundamental human concern from a variety of disciplinary and cultural perspectives. For example, *Religion in the Modern World*, edited by Waldman and Hao Chang (Columbus, Ohio, 1984), explores the relationship of religion to modernity; *Rethinking Patterns of Knowledge*, edited by Waldman and Bjornson (Columbus, Ohio, 1989), straddles fields such as medical research, mathematics, environmental engineering, zoology, psychology, history, literature, religious studies, and the performing arts; *The University of the Future: Problems and Prospects*, edited by Waldman and Bjornson (Columbus, Ohio, 1990), comments on the relationship of higher education with government and corporate America; *Judaism and Islam: Fostering Understanding*, edited by Waldman and Helena Schlam (*Jewish Education News*, 13[1], Columbus, Ohio, 1992) and *Muslims and Christians, Muslims and Jews: A Common Past*,

a Hopeful Future, edited by Waldman alone (Columbus, Ohio, 1992), offer a clear, nontechnical, and accessible public scholarship; and *Understanding Women: The Challenge of Cross Cultural Perspectives*, edited by Waldman, Artemis Leontis, and Mügé Galin (Columbus, Ohio, 1992), investigates the study of women, advocacy for women, and women themselves around the globe, touching on issues of colonialism, Orientalism, racism, modernization, and feminism.

At the time of her death, Dr. Waldman was working on yet another re-visioning of her thoughts on religion, authority, and comparison, under the working title of *Inviting Prophets and Entertaining Comparisons*. In this study of religious leadership, prophecy, and prophethood, comparison figures large as both subject and method. She uses the theme of “privileging communicator” to help her meditate on the benefits and perils of cross-cultural comparison, category formation, and the role of perspective in constructing knowledge in *Power and Prophecy: A Comparative Study of Islamic Evidence* (Cambridge, Mass., 2005).

MÜGÉ GALIN (2005)

WALĪ ALLĀH, SHĀH. Shāh Walī Allāh (AH 1114–1176/1703–1762 CE), Quṭb al-Dīn Aḥmad, was born in a village called Phulit in the district of Muzaffarnagar and was raised in Delhi under the close supervision of his father, Shaykh ‘Abd al-Raḥīm, an erudite scholar-educator, Ṣūfī, and accomplished jurist, and one of the compilers of *Fatāwā-i ‘Ālamgīrī*, a major work on Ḥanafī *fiqh*, commissioned by the Mughal emperor Awrangzeb (r. 1658–1707).

Walī Allāh memorized the entire text of the Qur’ān by the age of seven; studied the texts of the Qur’ān and *ḥadīth* (prophet’s sayings); and was initiated into three Ṣūfī orders, the Chishtīyah, Qādirīyah, and Naqshbandīyah, by his father. In 1719, after his father’s death, Walī Allāh assumed the responsibilities of full-time teaching and the running of Madrasah-i Raḥīmīyah, founded by his father. He traveled to Mecca and Medina for pilgrimage in 1730, stayed there for fourteen months, studied *ḥadīth* and Islamic law with prominent Muslim scholars belonging to the Mālikī and Shāfi‘ī schools of law, and was initiated to the Shaṭṭarīyah and Shādhilīyah Ṣūfī orders. These experiences proved to be a catalyst in expanding Walī Allāh’s intellectual horizons. The most productive period of his intellectual output started after his return to India, resulting in forty-one major and minor works on wide-ranging topics, including biography, ethics, law, metaphysics, mysticism, and sociopolitical issues that confronted the Muslims of his period.

Walī Allāh was an heir to the intellectual and theological heritage of such Indian Muslim thinkers as Maulana ‘Abd al-Ḥakīm Sialkotī (d. 1657), Shaykh ‘Abd al-Ḥaqq Muḥaddith Dihlawī (d. 1648), Naqshbandī master Khawājah Baqī-billāh (d. 1603), and his teachers in the Hijāz. His scholarship reflects the influence of many of the ideas of his predecessors; however, he differed from them in his integrative and analytical approach to various branches

of the Islamic sciences, and he devised methods to reconcile conflicting opinions. In his writings he demonstrated that *ḥadīth*, *fiqh*, Qurʾān, *sunnah*, *taṣawwuf*, and Islamic history were all indispensable for the proper understanding and practice of Islam. He asserted that legislative interpretations ought to be compatible with the needs of a given period, and that jurists ought to express their independent opinion freely.

Walī Allāh lived during a period of rapid decline of Muslim political power. He was convinced of his divinely ordained role in Indo-Islamic society and embarked upon a comprehensive plan for religious renewal of the Muslim community. A serious thinker of the eighteenth century, Walī Allāh took upon himself the role of *mujaddid* (renewer and purifier of faith) of the twelfth century AH, a master of time (*qāʾim al-zamān*), and the pivot and head of the mystical hierarchy (*quṭb*). As a *mujaddid* he was concerned about practical ways of directing and enriching the tradition of scholarship and developing leadership for the community. He was especially interested in training the *ʿulamāʾ* (singular *ʿālim*, a traditionally educated Islamic scholar) by devising proper curricula and by spelling out a method of writing Qurʾanic exegesis in *al-Fawz al-Kabīr fī Uṣūl al-Tafsīr* (written in Persian), rather than writing glosses over the exegeses. With the rise of Shīʿī political power in Northern India, Walī Allāh stressed the importance of proper understanding of classical Islamic history in *Izālat al-Khafaʾ ʿan Khilāfat al-Khulafāʾ* (written in Persian) and *Qurrat al-ʿAynayn fī Tafdīl al-Shaykhayn* (written in Persian). These two books were written not to reject Shiism, but to curb the spread of “innovation [*bidʿah*] of Shiism,” which had created doubts on the legitimacy of the caliphate of the first four caliphs (632–661) in the minds of the Sunnīs. Based on reasoned discussion, Walī Allāh dealt with controversial issues in *Izālat al-Khafaʾ* (vol. 1, pp. 8–9). He argued that these caliphs played a crucial role in: (1) the compiling of Qurʾanic text and practicing the Qurʾanic ordinances; (2) establishing *ḥadīth* as a systematic source of Islamic law; and (3) developing the judicial process and juridical ordinances. To deny the key role of the caliphs in the history of Islam, in his view, amounted to destroying the very foundation of Islamic religious sciences.

Above all, in his monumental work *Hujjat Allāh al-Bālighah* (written in Arabic), Walī Allāh integrated the spiritual and material domains of human life; the dynamic and evolutionary relationship of human beings, life, and the universe; and the relationship of metaphysics, politics, and economics. His emphasis on the need to exercise independent reasoning on religious issues (*ijtihād*), his stress on the benefits of making the Qurʾanic text available to the community through translation (a controversial move at that time), and his belief in the power of the prophet Muḥammad’s sayings and his practical model (*sunnah*) to reform communal behavior and morals made Walī Allāh the forerunner of the modernists and reformers of the nineteenth and twentieth centuries.

Madrasah-i Raḥīmīyah served as an institution of learning and research for the *shāh* and his descendants for over a century and half. Walī Allāh’s career as a full-time educator lasted twelve years, until 1730, when he left for Mecca for *ḥājj*. During his absence and after his return, he assigned teaching responsibilities to a few of his pupils who were trained as teachers, while he himself concentrated on writing works of lasting value. After Walī Allāh’s death, his son ʿAbd al-ʿAzīz and his younger three brothers not only managed the *madrasah* but also brought about changes in the methods and content of instruction. They maintained high standards of scholarship, took interest in social and political issues much like their father, and saw the number of students increase from thirty-five during Walī Allāh’s period to many thousands drawn from across India. This institution reached new heights in prominence under the leadership of Muḥammad Iṣḥāq (d. 1845), who succeeded his maternal grandfather, ʿAbd al-ʿAzīz, after his death in 1824.

SHĀH WALĪ ALLĀH’S LEGACY. Although today Walī Allāh is ranked as the most influential thinker of the modern period, he was not well-known in his lifetime, even in his home country of India. His works did not become the core of the curriculum even in his own *madrasah*, and they were not discussed, critiqued, or annotated by his progeny, as was the practice in traditional schools. His ideas, however, became attractive to modernists, reformers, and traditionalists of diverse schools of thought about three generations later. The prominent reformers and thinkers of the nineteenth and twentieth century, such as Aḥmad Khān (d. 1898), Iqbāl (d. 1938), and Mawdūdī (d. 1979), among many others, acknowledged their indebtedness to Walī Allāh. At the beginning of the twenty-first century, with Islam becoming a world religion, reference to Walī Allāh’s works is a symbol of legitimacy for thinkers and organizations in Indo-Pakistan and abroad.

A comprehensive study of Walī Allāh's life and times with the author's slight subjective slant; for an annotated chronological listing of Walī Allāh's works, see pages 220–228; for a discussion of teaching methods and curricula in the eighteenth century, see pages 358–378.

SAJIDA S. ALVI (2005)

WALKER, JAMES R. (1849–1926) was a physician with the Indian Service of the United States government who became an important scholar of Native American religion. He was born near Richfield, Illinois, on March 4, 1849. He joined the Union Army in 1864 at the age of fourteen and was eventually assigned to the U.S. Sanitary Commission to care for the sick and wounded during the Civil War. Walker resumed his schooling after he returned to Illinois at the end of the war and earned the degree of Doctor of Medicine from Northwestern University Medical School in 1873. He joined the government's Indian Service in 1877 and first served as a physician at Leech Lake Indian Reservation in Minnesota. In 1893 he was transferred to the Colville Reservation in Oregon, in 1896 to the Indian Industrial School at Carlisle, Pennsylvania, and later in 1896 to the Pine Ridge Reservation in South Dakota. It was at Pine Ridge that Walker developed a lifelong interest in the Lakota (Oglala Sioux) Indians and ultimately became one of the foremost scholars of Lakota religion, preserving a multifaceted documentary record as important to the Lakota people themselves as to academic researchers.

When Walker arrived at Pine Ridge, he found that health conditions were abysmally low. Tuberculosis afflicted almost half the Lakota population, particularly children. The Oglalas had no confidence in white doctors, preferring to rely on their medicine men (traditional religious healers). While Walker at first felt antagonistic toward the medicine men, he soon realized that if he could win them over he would have powerful allies in combating the disease. He learned that they attributed the symptoms of tuberculosis to a worm eating away the patient's lungs. By mounting sputum samples from infected individuals on slides and inviting the medicine men to examine them under a microscope, Walker was able to demonstrate to the medicine men that their theory was correct, although the "worms" were many times smaller than they had believed.

On this common ground Walker was able to gain the cooperation of the medicine men in imposing sanitary precautions to control the spread of tuberculosis. His interest in the Lakotas' medical and religious systems grew. He decided that to be effective as a physician on the reservation, he himself must become a medicine man. In the fall of 1896, some of the leading medicine men at Pine Ridge told him, "We have decided to tell you of the ceremonies of the Oglalas. . . . We will do this so you may know how to be the medicine man for the people" (Walker 1980, p. 68).

Walker's scholarly investigations intensified after 1902, when he met Clark Wissler, an anthropologist from the American Museum of Natural History in New York. Wissler was collecting objects for the museum and recording ethnographic notes. He recognized in Walker a kindred spirit and invited him to collaborate by recording vital statistics for physical anthropology studies and undertaking studies of traditional children's games, mythology, and religious ceremonies. These activities occupied Walker for the remainder of his life.

Walker's method of data collection was to transcribe interviews, commission drawings and written texts in Lakota, and make sound recordings of songs on a graphophone, which was a device invented in 1886 that could record sound waves directly on a wax-coated cylinder. He relied on a few close consultants—Short Bull, who had been a leader of the Ghost Dance; George Sword, who wrote down many texts in Lakota and served as Walker's mentor; Thomas Tyon, who wrote texts and functioned as an interpreter—but also recorded material from more than thirty other individuals.

The study of the Sun Dance, the central Lakota religious ceremony held each summer as a ritual for renewal, was a particular challenge for Walker since the dance had been banned by the Office of Indian Affairs and was no longer performed. Of necessity Walker had to reconstruct the ritual and its meanings on the basis of interviews with the medicine men and others who had participated in the ceremony. This aspect of Walker's work complemented a series of studies of the Sun Dance among Plains tribes sponsored by the American Museum. The unparalleled richness and comprehensive-

ness of Walker's account of the Oglala Sun Dance, in comparison to other monographs in the series (Wissler 1915–1921), reveals his unique degree of insight into American Indian religion.

Published in 1917, Walker's "Sun Dance and Other Ceremonies of the Oglala Division of the Teton Dakota" situated the ritual in its fullest social, philosophical, and religious contexts. He laid out the common people's understanding of the ritual and of the religious system it represented, then outlined the esoteric knowledge of the medicine men. The meaning of each ritual detail was explicated with references to sacred myths. To structure the description, Walker synthesized all of his data to produce a systematized account that might be considered an instructional manual for performing the Sun Dance. In the process of compiling his systematic account, he eliminated the inconsistencies that were so apparent in his interview notes. He appended accounts of the Hunka (adoption) and Buffalo (girl's puberty) ceremonies, together with some brief philosophical and religious texts, an important interview with a medicine man named Finger, and a series of longer myths and tales.

Walker retired from the Indian Service in 1914 at the age of sixty-five and moved to a ranch in Colorado. By then, most of the medicine men with whom he had worked had died. In 1916 he completed writing his Sun Dance monograph; two years later ill health forced him to retire to Wheatridge, a suburb of Denver. Much of his time in Wheatridge was devoted to writing an Oglala mythology about the creation of the world and the origin of human beings. Walker used the same method as before, systematizing conflicting versions. The many overlapping drafts that survive attest to his struggle to synthesize all he had learned about Lakota religion. He died on December 11, 1926, leaving the mythology unfinished.

Walker's work is valued in the early twenty-first century not only for his own writings, but even more for the mass of interview material and other manuscripts that he left behind. Three volumes of documents have been published (Walker 1980, 1982, 1983) that have become primary sources for the study of Lakota religion. The often conflicting and very personal voices recorded in these documents add nuance and richness to Walker's syntheses. They are part of his legacy, a historical record of an American Indian religion remarkable for its detail and depth of insight. The record of his studies fulfils the commitment he made to the medicine men that their knowledge would be preserved in writing, "that future generations of the Oglalas should be informed as to all that their ancestors believed and practiced" (Walker 1980, p. 47).

RAYMOND J. DEMALLIE (2005)

WANDJINA. Australian Aborigines traditionally believed that a person's spirit existed before entering the human life-cycle and that it survived after bodily death. Life-spirits were identified as originating in a number of mythological beings, of which those called *wandjina* were important in central and northern Kimberley, with the mythical snake Ungud and other animal spirits playing less significant parts.

Identification of a person's life-spirit, or conception totem, was revealed to his or her father or to another senior male of the group during a dream. Dream communication with the mythological beings played a significant role in Aboriginal religion, for although the events of the creation period, or *lalai*, were generally known, the present state of the beings was of ongoing significance, and that could be revealed only through the dreaming process. The father-to-be was entitled to identify the origin of a life-spirit, but in other circumstances, a specialist, or *banman* ("dreamer"), could communicate with the mythological beings. Life-spirits of *wandjina* origin came from the clouds, (that is, the sky) to live in water. They entered the mother-to-be either directly or through food gotten from water: for example, fish. In his dream, the father would see the spirit and identify its place of origin, from which he could deduce the mythological being who then became the conception totem. One Aborigi-

nal man summarized the sequence of events as follows: "Our fathers found us in the form of fish or turtles, but the Wandjina is our real father. He put us in the water from the sky. . . . We came from heaven through the water by dreams." The life-spirit is regarded as a reincarnated *wandjina*, and a person whose spirit is so derived will speak in a way that indicates continuity of the (mythological) past and the present.

The *wandjina* are depicted in paintings on the walls of caves. On approaching these shrines, Aborigines call out to the *wandjina* to announce the arrival of visitors. If this is not done by a person with the correct status, the spirits become upset and take revenge on the Aborigines. Sometimes Aborigines perform a ritual in which smoke from green branches is held beneath the paintings. Similar gestures are made as placatory gestures at the end of mourning ceremonies.

Many of the paintings are spectacular. The *wandjina* are anthropomorphic in form and are usually larger than life size. Individual figures may be as large as six meters long. Against a whitened background, the figures are painted in red ochre and black charcoal. The faces and heads are emphasized, with large eyes (usually black, sometimes also engraved) and haloes around the heads. On these haloes, and projecting from them, may be radiating lines. A curious feature of each face is the absence of a mouth, although the nose is invariably present. The *wandjina* may be represented by a face only, but often the whole body is shown. The shoulders are always white, and there is a small shieldlike motif high on the chest. The body is filled-in with a dot or short-dash pattern, and body ornamentation is indicated by waist and arm bands.

In Aboriginal mythology, the *wandjina* are said to have lived during the creation period. They came from the sky or the sea, traveled a short distance (usually), and then transformed themselves into the paintings. For the most part, the *wandjina* set examples of disruptive behavior, seducing others' wives and quarreling among themselves. All myths about the *wandjina* share one central action, in which the *wandjina* round up the Aborigines and slaughter them with lightning and flood because two Aborigine boys have offended them by torturing an owl, their sacred bird. Other episodes are purely local in significance. The paintings, are the transformation of the living spirits into a new form. Their general human appearance is unmistakable, and Aborigines identify many of the features in the paintings as human characteristics. In these interpretations, the haloes are hair, the lines radiating from the heads are feathers, the dots on the bodies are body paint, and the bands around the waists and limbs are body ornaments. However, the human model is not the only one the Aborigines use in interpreting the paintings. *Wandjina* may take the form of clouds, and so the paintings may be interpreted as depicting the spirits in cloud form. In this case, the eyes are seen as dark patches of cloud, the haloes as the edges of clouds, the radiating lines as lightning, and the dot patterns as falling rain. Yet another model for inter-

pretation is the owl, the bird sacred to the *wandjina*. Attention is then drawn to the round white faces, the large eyes, and the presence of beaks but the absence of separate mouths. In this interpretation, the body decoration represents the dappled markings of an owl's breast feathers.

The *wandjina* are often referred to as "the rainmakers." Toward the end of the dry season, when the heat has intensified, Aboriginal men who have *wandjina* as their conception totems may sing songs and perform rituals which are intended to entice the *wandjina* to send rain and alleviate their condition. Kimberley receives monsoonal rains starting in late December. Their arrival is a dramatic event. In the weeks preceding the arrival of the "wet," there are local showers and spectacular displays of lightning. With the rain come the banks of cumulonimbus clouds, which change shape rapidly and appear to have a life of their own. In them, the Aborigines see the *wandjina*. The call to the spirits, made in the songs and rituals, has been answered.

The rain that the *wandjina* bring is recognized by the Aborigines as a major factor in the fertility of the land. By the end of the dry season, when the Aborigines have burned off all the grass, the earth is parched and hot. Nothing grows, and animals hide from the heat. When the rains come, the earth, which is itself alive, drinks. Plants flourish. Animals emerge from their hiding places. To shelter from the rain the Aborigines build huts of bark or thatch or move into caves. Where the caves are painted, the figures on the walls appear brighter: In many cases, the painters have used huntite, a hydroscopic mineral, as the pigment for the white background, and so there is a noticeable change in the hue of the paintings when the humidity intensifies. As the wet season progresses, there may be flooding. The *banman* then must try to reduce the rain through further songs and rituals. These songs narrate episodes in the mythology of the *wandjina*.

Physical evidence implies that the *wandjina* have been repainted many times. Aborigines say that the original figures came into existence when the spirits transformed themselves into the paintings, and that the role of the Aborigines in the past has been restricted to maintenance. Some of the pigments are quite unstable in the presence of the high humidity that prevails during the wet season, and for this reason regular maintenance would always have been necessary. The custodian of a painting might invite a noted artist to carry out the restoration, in which case a payment of goods to the artist would have been required.

The *wandjina* are seen by the Aborigines as fertility gods. By sending rain, they ensure the survival of life on earth. More directly, by sending the life-spirits for humans, they ensure the continuity of human life. The enormous powers of the *wandjina* can be seen in the displays of thunder and lightning that precede the monsoon and in the rains themselves. If provoked, the *wandjina* could use their powers to destroy life as they did in the mythological past. Through the rituals performed at the caves, through the songs, and, especially, through the mechanism of dream-

communication, Aborigines have traditionally sought to influence the *wandjina* and thus to gain for themselves some measure of control over the natural world.

I. M. CRAWFORD (1987)

WANG BI (226–249 CE) was the scion of an important Shandong clan with great intellectual ambitions and “over eighty members” who reached the highest echelon of power in the preceding Han dynasty (206 BCE–220 CE). The collapse of this dynasty resulted in the division of the country into three competing states, as well as the collapse of the state-sponsored and privately sponsored educational system, together with the authority of official teaching. It was chance that put arguably the richest and most intellectually diverse manuscript library to survive the conflagration and civil war of the collapsing Han dynasty into Wang’s possession. His talents thus flourished during a rare and short moment in history, a time when philosophical originality and iconoclasm were much appreciated and youthful genius was revered. Wang Bi was spurred on by a rich and open competition, and a government reform project that was guided from 240 to 249 CE by He Yan (d. 249), a man considered by his contemporaries to be the ultimate *arbiter elegantiarum*, as well as a brilliant philosophical debater. The closure of the project came with a coup and the execution of its leaders in 249, the same year in which Wang Bi, just twenty-three years of age, died in an epidemic.

In a reaction to the bookwormishness of the Han scholars, Wang Bi rediscovered the warnings of such philosophical writings as the *Laozi* (*Dao de jing*), the *Analects* (*Lunyu*), and the *Book of Changes* (*Zhouyi*) about the inability of definitory

language to deal with the necessarily unspecific root of all specificity. This root was thus linguistically “dark” (*xuan*), and the entire philosophical enterprise around Wang Bi was therefore later called *Xuanxue*, the “scholarly exploration of that which is dark,” rather than being associated with any of the traditional philosophical “schools.” In this philosophical, rather than school-dominated, enterprise, the appropriation of different texts by the different schools was rejected, and so was their habit of ranking their own founder highest. In *Xuanxue*, Confucius ranked philosophically higher than Laozi because—by not writing a book but only editing what became the “classics” and allowing his *verba et gesta* to be recorded by his students (*Analects*)—he proved himself superior in understanding the philosophical problem of language.

Xuanxue scholars reread the classics as writings that made conscious and sophisticated use of a flawed instrument—written language—because it was the only way to preserve the sage teachings of old. These works thus had to be viewed as pointing beyond themselves, and they received their unity not from the textual surface, but from their elusive common object. Wang Bi outshone his contemporaries in the philological brilliance and consistency of this type of “commentary of meaning,” and his commentaries on the *Laozi* and the *Book of Changes*, together with an essay each on their structure, have time and again found copyists and sponsors, so that they alone of the plethora of commentaries written by his peers survive to this day, together with fragments of his commentary on the *Analects*.

Wang Bi extracted from these classical texts a political philosophy that was rooted in ontological analysis. The teachings of the “schools” about political strategies aimed at bringing about and maintaining social order lack a dialectical understanding of the dynamics of the relationship of the ruler to the people. Wang Bi argued that rulers following these teachings end up bringing about the very chaos they are trying to overcome. Only by going back to the fundamental dynamics prevailing between the “one” and the “many” can the laws be found that govern the dynamics between the one ruler and the multitude of the people. Wang Bi thus explores the ontological question of the necessary features of that by which the entities (“the ten thousand kinds of things”) are, and by which they are in a regulated and orderly fashion. This exploration of the “one” provides the basis to determine the features and acts necessary for a ruler to secure social and political order. The “one” of the ten thousand kinds of entities can only be the “one” by being their—and their regulated order’s—condition of possibility, and by not specifically interfering with the regulated order of the remaining entities. Otherwise, the “one” would only be another entity among the multitude. The emulation of this non-interference (*wuwei*) by the ruler in his relations with society thus becomes a philosophical imperative. Given the ruler’s theoretically absolute powers and the common-sense assumption that their active use will be instrumental in establishing order, Wang Bi’s proposal is philosophical by

being counterintuitive, while its necessity is shown by the evident presence of chaos.

The thirty-year civil war ending Han rule (at great loss) was a timely reminder. In any given historical situation, however, the vicious circle between a ruler's efforts to establish order and the counterproductive dynamics these efforts set in motion is already in operation. The ruler's generous encouragement of some virtuous persons provokes the resentment of those not so favored; his use of surveillance machinery to ward off evildoers calls forth a rise in the arts of dissimulation. Accordingly, an actual historical ruler must not just "maintain" order, he must "bring back" society ("the hundred families" from the historically real chaos to find rest and order in his *wuwei*. *Wuwei* thus is a proactive policy of projecting the non-use of the absolute powers of the ruler through a public performance of this non-use; projections of "simplicity," "uncouthness," "dumbness," "femaleness," and the pointed abolition of state surveillance (an eyesore for many intellectuals in a state of *Wie* during Wang Bi's time) are some of the particular proactive forms of "non-interference" that Wang Bi extracts from the texts he analyzed. In this manner, the ruler will erase his own function as the point of orientation of all social competition, with the consequence that the hundred families will fall back to their "natural" station. Then the self-regulating mechanisms come into play in the same manner as they do in nature, where, as Wang Bi writes, "heaven and earth do not make grass for cattle, but cattle still eat the grass." The implied addressee of Wang Bi's philosophy is the ruler, and the quest is for the philosophical bases of social order. Philosophical questions are only pursued to the point where relevancy for the political application ceases.

Wang Bi's *Commentary to the Zhouyi* entered the canon in the seventh century, and it influenced all later commentaries on this text. His *Commentary to the Laozi* had a similar impact. His commentarial method is characterized by an insistence on internal coherence, a refusal to randomly impose terms or methods to solve problems of consistency, and full attention given to clues within the texts that help determine the appropriate manner of reading these texts.

RUDOLF G. WAGNER (1987 AND 2005)

WANG CHE SEE WANG ZHE

WANG CHONG (27–100? CE), critic and skeptic who proposed naturalist explanations for the relation between Heaven and man. Born into a poor family in Guiji (in modern Zhejiang), Wang studied in the Imperial Academy but then held office for a brief period only. Most of his life he lived in seclusion, devoting himself to writing. He wrote three works, *Zhengwu* (The conduct of government), *Lunheng* (Critical Essays), and *Yangsheng* (On the cultivation of life). Of these only *Lunheng* has been preserved.

According to Wang himself, the spirit of his *Lunheng* may be summed up in one sentence: he detests what is fictitious and false. The fiction that Wang detested most was the theory of "mutual response between Heaven and man," which had dominated the mind of Han China since Dong Zhongshu had first propounded it 150 years earlier. According to this theory, aberrant natural phenomena (such as floods or the appearance of strange creatures) were omens, Heaven's comments on man's behavior. Wang wholly rejected this teleological cosmology, arguing instead that the Way of Heaven is one of spontaneity (*ziran*) and nonactivity (*wuwei*). "Heaven," he wrote, "does not desire to produce things, but things are produced of their own accord; Heaven does not desire to create things, but things are created of themselves." Because he defines Heaven in terms of spontaneity and nonactivity, Wang's philosophy usually has been characterized in modern times as naturalistic, even though he was traditionally classified as an eclectic (*zajia*).

Wang's definition of Heaven led him to a thorough denunciation of all theories that claimed conscious interactions between Heaven and man. He compared man's place in the universe to a louse in the folds of a garment: if a louse cannot, by its actions, affect the movements of the man who wears the garment, then how can a man who lives on the earth's surface affect, much less cause, by his actions, the movements and changes of Heaven? For this reason, it is simply false to suppose that a causal relationship exists between auspicious or calamitous natural events on the one hand and good or bad government on the other. All the seeming coincidences between natural phenomena and human actions must be understood as pure chance.

Another area of Wang's philosophy that has been influential is his conception of life and death. Several of his essays are devoted to a vigorous refutation of the popular belief of his time that the soul can survive the body. He maintained that a man's soul exists within his body and that at death, when the body decomposes into dust and earth, his soul also disintegrates. He used a famous metaphor to illustrate this body-soul relationship: human death is like the extinction of a fire; when a fire is extinguished, its light ceases to shine, and when a man dies, his consciousness also ceases to exist. To assert that the soul survives the body is like saying that

the light survives the fire. Wang also argues against the existence of ghosts, another form in which the human spirit was believed to survive the body. According to Wang, since all accounts of ghosts report that like living persons they wear clothes, and since clothes certainly have no souls that can survive decomposition, how then can ghosts be seen with clothes on? In taking this atheistic position, however, Wang follows the Confucian rather than the Daoist tradition. In the Daoist thought of Han times, the soul leaves the body at death and returns to its "true home," where it continues a mystical existence.

Writing against the predominant beliefs of the day, Wang was indeed a bold thinker in his attempts to demolish a great variety of unfounded superstitious beliefs. But in other respects he was very much a product of his time. He accepted without question some of the fundamental assumptions of the yin-yang dualism and the theory of the Five Elements. He shared the contemporary view that life, whether cosmic or individual, arises out of the interaction and combination of the basic vital forces (*qi*) of yang and yin, and all things are made up of the five elements of wood, fire, soil, metal, and water. What essentially distinguishes Wang's cosmology is the absence of a cosmic purpose.

In Wang's naturalism is also grounded his theory of predetermined fate. Success or failure in the life of an individual or even of the whole state is, according to Wang, determined by what he called "fate" (*ming*). Fate, to Wang, controlled even precise areas of life. He held, for example, that a man's longevity, intelligence, social position, and wealth is fixed at birth by the kind of *qi* with which he is endowed. Order or disorder in the state is also predetermined. Thus Wang did assume a connection between celestial phenomena and human fate. However, he interpreted auspicious or calamitous natural events merely as signs of a predetermined fate, not purposive expressions of Heaven's pleasure or displeasure.

Wang was relatively obscure during his life, but his *Lun-heng* was rediscovered in the early third century and paved the way for the growth of neo-Daoist naturalism during the Wei-Jin period (220–420).

YÜ YING-SHIH (1987)

WANG CH'UNG SEE WANG CHONG

WANG FU-CHIH SEE WANG FUZHI

WANG FUZHI (*zi*, Erhnung; *hao*, Chuanshan; 1619–1692), a Neo-Confucian philosopher. Now recognized along with Huang Zongxi and Gu Yanwu as one of the major thinkers to emerge in seventeenth-century China, Wang was almost unknown in his own lifetime outside of a small circle of followers in his native Hunan. He devoted his life to the task of revitalizing and restoring the cultural heritage and political autonomy of a Confucian China whose decline and fall, culminating in the overthrow of the Ming dynasty and the Manchu conquest, left him a virtual refugee in his own country. He was only thirty-one when in 1650 his patriotic foray into the political arena of the court of the Ming pretender Yungli ended in temporary imprisonment as a result of factional strife. Thereafter he had to content himself with propounding his ideas in a prodigious number of works, none of which was published during his lifetime owing largely to the fiercely anti-Manchu sentiments and politically subversive theories expressed in them. Nevertheless, as he himself declared, "With my country ruined and my home destroyed, I set forth my opinions for posterity . . . In the future there will arise those who will carry on the task." In the late nineteenth and early twentieth century, however, such historical and political writings as his *Du Tongjian lun* (On reading the *Comprehensive Mirror*), *Song lun* (On the history of the Song dynasty), *Huangshu* (Yellow book), and *E-meng* (Strange dream)—all published for the first time in 1865—fired the imagination of patriotic reformers and revolutionaries who regarded Wang as a prophet of modern Chinese nationalism. Tan Sitong, Zhang Binglin, and Mao Zedong all acknowledged him as a source of inspiration.

The same patriotic fervor that has attracted modern Chinese originally impelled Wang to undertake a radical reappraisal of the whole history of Chinese civilization. What had gone wrong? What were the remedies?—these were the two questions that inspired and informed all Wang's studies, which spanned the whole range of traditional Chinese scholarship. In typical Confucian fashion, however, his central concern was ideological: what had gone wrong with the transmission of the Confucian tradition, and what constituted the true development of orthodox Confucianism? This concern was shared by many scholars at the close of the Ming dynasty, particularly by those associated with the Donglin Academy who, reacting against Buddhist influences and contemporary tendencies in the school of Wang Yangming, tried to give Confucianism a new direction. Wang Fuzhi admired their efforts to encourage scholar-officials to abandon the selfish pursuit of personal fulfillment and absolute truth and commit themselves to a social and political program in which moral philosophy was applied to contemporary realities. In-

deed, as a young man he was certainly influenced by them. But whereas these scholars tended to arrive at various compromises between the Cheng-Zhu tradition and the more moderate forms of the Wang Yangming tradition, Wang Fuzhi went further. He came to the conclusion that the moral decline of China could be traced to Sung times, when the Cheng-Zhu school had first turned away from the “true doctrines” of Zhang Zai (1020–1077).

Although there had been some revival of interest in Chang’s thought among Wang’s contemporaries, Wang went so far as to declare himself a latter-day disciple of the Song philosopher, according him precedence over Zhuxi (1130–1200), whose systematization of the Confucian tradition in a grand synthesis (incorporating certain of Chang’s ideas in the process) had created the Cheng-Zhu school of Neo-Confucianism, the dominant orthodoxy until the twentieth century. Wang, however, proceeded to elaborate his own extremely coherent philosophical system on the basis of his Sung mentor’s cosmology. He adopted Chang’s concept (itself a refinement of such early Daoist naturalist views as found in the first-century-CE *Lunheng* of Wang Chong) of a universe that consisted of one vast mass of ether (*qi*) in a perpetual state of flux, agglomerating to form objects and dispersing to return to the “void” of apparent nonbeing as its *yin* and *yang* aspects interacted. Wang explicitly rejected the Cheng-Zhu school’s doctrine on principle (*li*) and ether, which entailed a dualistic approach both in its basic metaphysics and in its treatment of human nature. For Wang there was no duality: principle lay within the ether, and all ether was principle. His monistic conception of the universe led him to attack both Zhuxi’s attribution of evil to the physical nature and his consequent rejection of human desires.

Wang held that nothing was inherently evil: evil arose simply as excessive or incongruous activity in natural encounters within the movement of the organic whole. Man’s vital role as an integral part of this dynamic universe was to ensure its harmonious functioning through cultivating himself and ordering human society. To fulfill this role required an understanding of the universal processes; these could be observed at work in the course of history and in codified form in the ancient divinatory classic the *Yi jing* (Book of Changes). Zhang Zai too had set great store by this text, but his treatment of the archetypal patterns and symbols of the *Changes* had been mystical, the expression of his ideas poetical—as in his influential *Ximing* (Western Inscription)—and he had paid little attention to history. Wang’s approach was altogether more analytical, rational, and pragmatic—even utilitarian. Wang’s emphasis on variable factors of time and place and prevailing conditions in determining what was appropriate, and hence, in a morally ordered universe, right, led him to make a critical evaluation of political institutions throughout Chinese history and to formulate his own proposals for reform based on radical changes in the system of land-tenure and taxation. In contemporary China Wang has been admired, patriotism apart, as a major contributor to the

native tradition of philosophical materialism and as a historian critical of the old society.

BIBLIOGRAPHY

The most comprehensive edition of Wang’s works is the *Chuanshan i-shu*, published by the Tai pingyang bookstore (Shanghai, 1933); a facsimile edition was published in Taipei in 1965. A full bibliography of secondary sources in Chinese, Japanese, and Western languages can be found in my “Wang Fuzhi and his Political Thought” (Ph.D. diss., Oxford, 1968). Liu Zhijisheng’s appendix to *Wang Chuanshan yanjiu can kao liao* (Changsha, 1982) includes a comprehensive list of recent studies on Wang both in and outside China. For additional studies, see Tang Junyi’s *Zhongguo zhexue yuanyun: yuan jian pain* (Hong Kong, 1975) and my essay “Wang Fuzhi and the Neo-Confucian Tradition,” in *The Unfolding of Neo-Confucianism*, edited by Wm. Theodore de Bary (New York, 1975).

IAN McMORRAN (1987)

WANG YANGMING (1472–1529), literary name, Wang Shouren; the most influential Confucian thinker in Ming-dynasty China and one of the most important scholar-officials in Chinese history. Wang’s intellectual impact on East Asian culture and his transformation of the spiritual orientation of the Confucian tradition in China made him one of the greatest philosophers of the relation between knowledge and action in any age or culture.

Born to a prominent gentry family in the Yangtze River delta, Wang was subject as a youth to great social pressure to excel in Confucian learning. Hagiographical accounts relate that in his early teens Wang startled his teacher when, in response to the teacher’s admonition that the most important thing in life was to study hard in order to pass the examinations with distinction, Wang said: “To learn to become a sage is of the utmost importance.” Wang’s competitiveness with his father, who had himself won highest honors in the triennial metropolitan (*jinshi*) examinations, and his rebelliousness against the conventions of the time led him to the pursuit of a spiritual path characterized by Daoist and Chan practices. His failure to pass the metropolitan examinations three times before he succeeded and his dissatisfaction with the vulgarity of other officials after he eventually obtained an official post further enhanced his determination to search for an alternative form of life.

Wang is noted for his lifelong quest to understand the mind and nature. His biography records that on his wedding day he became so absorbed in conversing with a Daoist priest about prolonging life through nourishing the vital force in one’s body that he did not return home until the next day. At an early age he began a traditional education grounded in the Confucian classics, but he also studied military affairs, literary style, Buddhist philosophy, and Daoist technique of longevity. In 1492, intent on putting Zhu Xi’s (1130–1200) doctrine of the investigation of things (*gewu*) into practice,

he devoted himself to the study of the principle (*li*) inherent in things by meditating in front of a bamboo grove for seven days. His abortive attempt to understand Zhu Xi's assertion that personal knowledge can be acquired through an understanding of external phenomena compelled him to probe the internal resources of his own mind-and-heart (*xin*).

Wang started his official career at the age of twenty-eight. His primary goal in life, however, was to become an exemplary teacher so that he could share his intellectual insight and spiritual quest with friends and students. In fact, it took him some time to come to terms with his role as a scholar-official. While cultivating the Daoist arts of overlasting life in a cave near his home, he contemplated forsaking the world altogether. It was only after he had fully convinced himself that his longings for his father and the grandmother who had raised him were irreducible human feelings, necessary for the survival and well-being of the human community, that he decided to return to society permanently in order to transform it from within.

One of the most important events in this initial stage of his official career was his friendship with Zhan Ruoshui, the disciple of the eminent Confucian master Chen Bosha (Chen Xianzhang, 1428–1500). Wang sealed a covenant with Zhan to promote true Confucian learning, the kind of learning that stresses an experiential understanding of the body and mind. Such learning they clearly differentiated from the study of the classics for the sake of passing the examinations.

Wang advocated his first doctrine, “the unity of knowing and acting,” shortly after his decision to return to society. According to his famous dicta, “knowledge is the beginning of action; action is the completion of knowledge” and “knowledge in its genuine reality and earnest practicality is action; action in its brilliant self-awareness and refined discrimination is knowledge,” have become defining characteristics of Wang's philosophy of mind, what Wing-tsit Chan refers to as his dynamic idealism.

However, far from being a speculative thinker who made no attempt to put his ideas into practice, Wang described his doctrine as the result of a hundred deaths and a thousand hardships. Indeed, he once almost lost his life when he protested against a powerful eunuch. For this, the emperor had him flogged forty times at court and banished to a small postal station in a remote mountainous area in present-day Guizhou. However, it was there that he experienced enlightenment and developed a unique approach to Confucian learning that emphasized the learning of the body and mind.

A salient feature of Wang's thought is his inquiry into the internal landscape of the mind as the center of moral creativity. This emphasis is predicated on a vision that encompasses both the ontological reality of Heaven and the social reality of human relationships. In his philosophy, which is religious as well as ethical, self-cultivation is a holistic process of learning to be fully human. Wang argued that self-

cultivation begins with a critical understanding of one's selfhood, but he remained fully within the Confucian tradition in placing the self at the center of relationships. Thus, for Wang the quest for self-knowledge necessarily involves active participation in the human community.

The Confucian idea of the human is not anthropocentric. Rather, humanity in its full realization here signifies an anthropocosmic reality often symbolized by the notion of the unity of people and Heaven. This realization requires that we as humans respond to the ultimate source of creativity, namely, the way of Heaven (*tiandao*). Thus, Wang's second important doctrine is “the preservation of the heavenly principle and the elimination of human desires.” Human desires are egoistic demands and private, selfish ideas. The true self, which is not only the deepest source of moral creativity but also the heavenly principle (*tianli*) inherent in our nature, is an open system. It extends horizontally to the human community as a whole and, simultaneously, it reaches upward to Heaven. Therefore, the unity of people and Heaven is not merely an idea but an experienced ethico-religious reality.

Wang's attempt to integrate heavenly principle (ontological reality) and human relationships (social reality) in the moral creativity of the self (subjectivity) is well articulated in his third and most mature doctrine, often translated as “the extension of the innate knowledge of the good” (*zhi liangzhi*; Chan, 1969, p. 656). Actually, the doctrine can well be stated as the full realization of our primordial awareness, an awareness that we are capable of self-perfection. This doctrine may be regarded as a creative interpretation of the classical Mencian thesis of the goodness of human nature. Following Mengzi's notion that the moral feelings of the mind-and-heart are humanity at its best, Wang insisted that the uniqueness of being human lies in our ability to perfect ourselves through self-effort. The reason that some of us have become sages (the most genuinely realized humans) is because inherent in our heavenly endowed nature is our great body (*dati*), which never ceases to guide us toward the highest excellence of humanity. Wang underscores this dimension of Mengzi's teaching by adding the verb *zhi* (to extend, to fully realize) to the original Mencian term *liangzhi* (innate goodness or primordial awareness), thus transforming it into an active, dynamic, and creative principle of self-cultivation.

Wang formulated his interpretation of the Confucian way by wrestling with Zhu Xi's balanced approach to Confucian learning. Briefly stated, Zhu Xi held that moral development could only be attained through the simultaneous activities of dwelling in the spirit of reverence (*jing*) and investigating the principle inherent in all things. Wang, however, maintained that establishing the will to be good must be the focus of moral self-cultivation: neither the pursuit of empirical knowledge in and of itself nor the psychology of being serious and respectful will automatically bring about a good moral life.

In maintaining that the primary purpose of moral education is to establish in ourselves that which makes all hu-

mans great Wang aligned himself with Zhu Xi's intellectual rival, Lu Xiangshan (Lu Jiuyuan, 1139–1193). This concept that the quest for moral creativity begins with self-awareness was criticized by fellow Confucians as being Buddhistic, but Wang himself never doubted the authenticity of his Confucian message. He conscientiously defended the content and method of his teaching by reference to the very books chosen by Zhu Xi to represent the core of the Confucian tradition. Since the thirteenth century, the Four Books—the *Lunyu* (Analects), the *Mengzi* (Mencius), the *Zhongyong* (Doctrine of the Mean), and the *Daxue* (Great Learning)—had served as virtual scripture for the educated elite in East Asia. Wang's challenge to Zhu Xi's interpretive authority was only partially successful, but the mark that he left on the overall design of Confucian education in indelible. His celebrated *Daxue wen* (*Inquiry on the Great Learning*), which recapitulates the major themes in his philosophy, has become one of the most frequently cited treatises on Confucian humanism.

Inquiry on the Great Learning was written in 1527, roughly a year before Wang's death. It addresses the Confucian's ultimate concern, forming one body with Heaven and earth and the myriad things, with great sensitivity:

That the great man can regard Heaven, Earth, and the myriad things as one body is not because he deliberately wants to be so, but because it is natural to the humane nature of his mind that he do so. Forming one body with Heaven, Earth, and the myriad things is not only true of the great man. Even the mind of the small man is no different. Only he himself makes it small. (Chan, 1969, p. 659)

Wang uses a descending scale of human sensitivity to depict the ordinary human responses to a variety of situations that easily evoke sympathetic feelings in us: encountering a child about to fall into a well, hearing pitiful cries and encountering frightened birds and animals, seeing plants broken and destroyed, seeing tiles and stones shattered and crushed. The feelings of alarm, commiseration, pity, and regret aroused in us vary in their emotional intensity, but indicate that fellow human beings, animals, plants, and stones all form one body in our primordial awareness.

This seemingly romantic assertion of the unity of all things is actually predicated on an ontological vision rooted in classical Confucian humanism. What Wang advocated was a representation of the Mencian thesis that if we fully realize the sprouts (*duan*) of humanity in our minds and hearts, we can experientially understand our human nature; if we understand our nature, then we know Heaven. Knowing Heaven, in the perspective of Wang's *Inquiry on the Great Learning*, is to regard Heaven, earth, and the myriad things as one body, the world as one family, and the country as one person.

Yet this explicit emphasis on commonality and communality was not abstract universalism. On the contrary, a major contribution of Wang's philosophy is its subtle appreciation of concrete personal experience in moral self-

cultivation. Wang's insistence that only through polishing and disciplining in actual affairs of life can one learn the art of being human suggests a strong existential quality in his teaching. Wang himself, as a witness to his own teaching, acquired much practical knowledge: he concerned himself with local administration, legal cases, and military tactics. In fact, he was the only civilian official to be awarded a military lordship because of his unusual meritorious achievements in suppressing a rebellion that could have fundamentally changed the history of the Ming dynasty.

The Yangming school, known as the Yomeigaku in Japan, has profoundly influenced modern East Asia. The spirit of the samurai, which emphasises firm purpose, self-mastery, and loyalty, and the dynamic leadership of the Meiji Restoration in 1868 were partly Wang Yangming's gifts to Japan. In China, reformers such as Liang Qichao (1873–1929) and Tan Sitong (1865–1898), revolutionaries such as Sun Yat-sen (1866–1925), and philosophers such as Xiong Shili (1885–1968) and Liang Souming (b. 1893) have all been inspired by Wang's legacy, the *Chuanxi lu* (Instructions for Practical Living), which consists of his dialogues with students, scholarly letters to friends, and several short essays.

TU WEI-MING (1987)
Revised Bibliography

WANG ZHE (1112–1170), also known by his clerical name, Zhongyangzi; Daoist master of the Jin period (1115–1234) and founder of the Quanzhen sect. The third son of a great landowner in Xianyang, Shaanxi province, Wang received a Confucian education and entered the district school in Xianyang at the age of twenty. Following a disagreement with his teacher, however, Wang was denied permission to sit for the civil service examination and had to settle for success in the less prestigious military examination. Although at first enthusiastic about a career in the military, Wang grew discouraged by his failure to advance in rank and resolved to abandon the military for a life of seclusion on Mount Zhongnan. He practiced Buddhism for a time, but in the sixth month of 1159 he received secret oral teachings from Lü Chunyang and Zhong Liqian. Thereafter, he converted to Daoism and was ordained a priest (*daoshi*).

Accounts of Wang's career as a Daoist emphasize the ascetic character of his practice. On one occasion he is said to have slept on ice; at another time he dug a hole two meters deep in which to meditate, naming this austere cell "the grave of a living corpse." In 1163 he filled in this hole and built a small hermitage in the village of Liujiang, where he began to proselytize his newly attained religious faith. These efforts won him few converts at first, however, for he was regarded as little more than a madman. In 1167 he burned the hermitage and journeyed alone to Shandong province, where Ma Danyang of Ninghai became his disciple. Thereafter, in contrast to his experience in the Shaanxi region, many potential disciples came forward. Of these, Wang chose six to receive his transmission. With Ma Danyang they were called the Seven Perfected Ones of Quanzhen Daoism. Wang was successful in organizing five Daoist societies in the northern coastal area of Shandong. These include the Sanjiao Jinlian Hui (Golden Lotus Society of the Three Teachings) and the Sanzhai Pingdeng Hui (Equality Society of the Three Teachings). Following his success in Shandong, he decided to return to his home in Shaanxi. He set out with Ma Danyang and four other disciples but died en route at Kaifeng in Henan province.

The Quanzhen school drew upon Confucianism, Daoism, and Buddhism, the so-called Three Teachings, for its doctrine and practice. With a strong affinity for Chan practices, it emphasized meditation, clerical itinerancy, and non-reliance on the scriptures. The teachings of this school are summarized in Wang's *Lijiao shiwu lun*. Wang Zhe was also an accomplished poet. Even today his anthologized poetry,

especially the *Zhongyang quanzhen ji* and the *Zhongyang jiaohua ji*, are highly regarded.

KUBO NORITADA (1987)

Translated from Japanese by James C. Dobbins
Revised Bibliography

WAQF. The Arabic term *waqf* (pl. *awqāf*) denotes in Islamic law the act of founding an endowment, the endowment itself, and also the endowment institution. A synonym, mainly used by Mālikī jurists, and hence in North Africa, is *ḥabs*, *ḥubs*, *ḥubūs*, *ḥabīs* (pl. *aḥbās*). The literal meaning of both roots is "stop," "block," or "suspend." In the context of the endowment institution, these terms refer to the legal situation of the property (*al-'ayn*), which by the act of endowing is blocked from taking part in any commercial transaction, while its yields (*al-manfa'ah*) are devoted to charitable purposes.

The *waqf* is conceived of as a continuous, voluntary charity for the sake of Allāh and his religion. The founding of endowments is highly recommended to believers, and they are promised rewards for their meritorious acts in the hereafter.

For a long time, studies of the Islamic endowment institution centered on its legal aspects. In the last few decades of the twentieth century, a large number of scholars turned their attention to economic, social, political, and cultural aspects of the *waqf*. Discrete studies revealed the true dimensions of the institution, its actual working, ways in which the letter of *waqf* laws was made to coexist with the requirements of real life, the broad spectrum of purposes financed by endowments, and their impact on the public sphere and on the discourse between rulers and society. A great deal of traditional wisdom concerning the *waqf* was questioned, and differentiation was introduced into general statements traditionally accepted and repeated over and over again. Moreover, new insights were gained on a variety of other subjects, such as gender relations, urban studies, and many economic, social, and cultural aspects of the regions studied. A true picture thus emerged of the central importance of the endowment institution as a means for financing Islam as a society and as an integrative institution of the community of believers (the *ummah*) in the premodern era.

The origins of the endowment institution are traced traditionally to early *ḥadīths* (traditions deriving from the

Prophet and his companions). The rules governing endowments were elaborated in the course of the eighth and ninth centuries. Modern research points to either the Byzantine *piae causae*, ancient Arabic customs, or pre-Islamic Iranian law as the main inspirations or influences on the legal form of the *waqf*.

Waqf law is an integral part of the *sharī'ah* (the sacred law). Application of the law, and difficulties and conflicts arising from it, have thus been handled by the '*ulamā'* (the *sharī'ah* specialists), who alone were qualified to interpret the laws. The law covers every aspect of the *waqf* and differs in detail according to the schools of law and even within one school. Major elements of the law concern the beneficiaries of endowments, their administration, and the type of property that may be constituted as *waqf* and its legal status.

An endowment enters into effect immediately upon its foundation (unless it is a testamentary *waqf*). It is considered irrevocable by most jurists and must be perpetual. A valid purpose for the benefit of which the proceeds of an asset can be endowed is defined as *qurbah*; that is, anything likely to bring the founder nearer to God. This very broad definition includes contributions toward the general welfare of the community of believers, as well as care for the family or other individuals. The founder of an endowment is thus allowed almost complete freedom to determine its beneficiaries. The founder can designate a general charity of his or her choice as immediate beneficiary of the endowment. The *waqf* would then be referred to as *waqf khayrī* (charitable endowment). Alternatively, the founder can designate a succession of beneficiaries, the primary and intermediary of whom are either specific members of the founder's family or other individuals, male or female. The endowment would then be described as *waqf ahlī* or *dhurrī* (family *waqf*). However, families are not conceived of as permanent. Since no endowment is valid unless it is perpetual by nature, the founder has to name, as ultimate beneficiary, at the end of the chain of family members, the poor or a general charity (*khayrī*) of an equally permanent character. A third kind of endowments—*waqf musharak*—consists of a combination of *ahlī* and *khayrī* elements.

Endowments soon became by far the most popular form of voluntary charity in Islam. They were made by all strata of the population—rulers, high officials, men and women, rich people as well as people of modest means. Endowed assets covered considerable proportions of all kinds of properties in every Muslim town, as well as vast agricultural areas. They included large as well as modest properties. Endowments benefited individuals and groups, such as family members, freed slaves, and other individual Muslims, members of professional guilds, inhabitants of specific neighborhoods, groups of common origin, the poor in general, or the poor belonging to a specific social groups, even groups of animals. They were also the principal vehicle for financing public services, political and economic interests, including the religious cult, education and learning, welfare and health ser-

vices, municipal services, colonization, urbanization, and economic infrastructure. The scope of voluntary charity in Islam, the purposes it served, and its importance in the public sphere thus reached proportions beyond what was common in other civilizations.

Non-Muslims living under Muslim rule (*ahl al-dhimmah*) could and actually did found *waqfs*. Their beneficiaries had, however, to qualify as *qurbah* according to both Islam and the founder's religion. An endowment by a non-Muslim in favor of his offspring, of the poor of his religious community, the poor of his church, synagogue, or neighborhood, or the poor in general, was valid under these rules. Endowments by a non-Muslim to benefit a mosque or in favor of a synagogue, a church, priests, or monks were invalid. Ways were found, however, to circumvent these limitations so that non-Muslim religious establishments could benefit from endowments.

Charity, piety, and the hope for recompense in the world beyond were the ideological motivations for founding endowments. Several, more practical reasons are mentioned in the literature to explain the proliferation of endowments in the Muslim world. Political reasons, such as enhancing their prestige and securing local support, followers, or clients, were found to have been at the root of endowments by rulers, governors, high officials, and local notables. Circumvention of the inheritance laws was a major motive for establishing *waqfs*, particularly, though not exclusively, among the common people. Islamic inheritance law divides the estate among a very large number of heirs. Disposition by testament is limited to one-third of the estate and may not be made in favor of a legal heir. Testamentary endowments had to follow these rules. Regular *waqfs*, that is, endowments that enter into effect immediately on their pronouncement, put no restrictions on the founder as far as the beneficiaries or their shares are concerned. The natural inclination to determine who will inherit one's property could, thus, be satisfied. Moreover, according to Abū Yūsuf—one of the founders of the Ḥanafī school of law, whose rulings have been widely followed—founders can name themselves as first beneficiaries of their endowments, and thus enjoy the income from the property as long as they live. This regulation prompted people belonging to the Malīkī school of law, particularly in Algeria and Tunisia under Ottoman rule, to establish their endowments with a Ḥanafī *qādī* and according to Abū Yūsuf's ruling. Moreover, contrary to inheritance, the endowment kept the property intact, dividing among the beneficiaries the income thereof only. It could thus secure a regular income to the founder's descendants in generations to come. Modern research put differentiation into some of the traditional, sweeping arguments, which listed the protection of property from confiscation or exemption of endowments from taxes as motivations for founding *waqfs*. Endowments were shown not to have been immune from confiscations. They were, in fact, subject to taxation, unless special exemption was granted by the authorities.

Founders of endowments are free to appoint a succession of administrators (*nāzir*, *mutawallī*, *qayyim*) to their *waqfs*. The first administrators are frequently the founders themselves (according to the Malīkīs this invalidates the endowment). When no administrator is provided by the founder, the *qāḍī* appoints one. The necessary qualifications of administrators, the limits of their freedom of action, and the circumstances in which they can be dismissed are all laid down in the law. Administrators are entitled to about 10 percent of the income from the endowment under their control. They are responsible for the maintenance of the property, renting it out, and distributing the proceeds among the beneficiaries according to the provisions laid down by the founder in the endowment deed (*waqfiyyah*). Major institutions financed by endowments, such as those benefiting large mosques, soup kitchens, or the poor of the holy places of Islam, were, however, handled differently. All endowments whose beneficiary was one of these institutions were lumped together to form the patrimony of that particular institution. The political authorities usually had either direct or indirect say in the appointment of their administrators and hence also in some matters concerning their management and the distribution of their income. Administrators of family and public *waqfs* acted under the *qāḍī*'s supervision, who alone was entitled to approve extraordinary transactions. *Qāḍīs* in the Ottoman Empire were assigned specific duties concerning public foundations: they audited the administrators' financial statements, assisted in preparatory works preceding major repair and maintenance works on *waqf* properties, and kept a watchful eye on the administrators appointed by the Ottoman center.

Basically, only immovable property of a permanent, eternal nature that yields a usufruct (*manfa'ah*) can be endowed. There are, however, some exceptions, such as horses and weapons for holy war; movables that follow endowed property (trees, slaves, animals, agricultural tools), books, various utensils, and *mīrī* land in the Ottoman Empire, whose ownership (*raqabah*) belonged to the state (these endowments were called *waqf ghayr ṣabīḥ*). The most notable exception are cash *waqfs* (*waqf al-nuqūd*), which were widespread, particularly in the core lands of the Ottoman Empire.

Among classical jurists, opinions differ as to the ownership of the endowed property. Many jurists hold that upon endowing the asset, ownership is transferred to God. Others claim that it is transferred to the beneficiaries or remains with the founder; neither, however, has actual rights of disposal. All jurists agree that once the property is endowed it becomes inalienable and is thus withdrawn from any commercial transaction. It cannot be sold, mortgaged, or the like. Moreover, no long-term or permanent leases are allowed in principle, for fear that they would eventually lead to the loss of the asset to the *waqf*. Administrators of endowed property were thus left with one option only for engendering profit from assets under their control—letting them for a short period, usually limited to one year for urban properties and three

years for rural ones. In time, two main ways were, however, devised by jurists in order to overcome economic problems arising from the rule of inalienability: long-term or perpetual leases (differing in some details and known by different names in various parts of the Islamic world; for example, *hīkr*, 'anā', *ijāratayn*, *khulū* or *mursād*, *inzāl*, *jalsah*) and exchanges (*istibdāl*, *mu'āwadhah*) of endowed assets. (The Shāfi'ī and the Shī'ī schools do not allow *istibdāl*; in the other schools, conditions governing exchanges vary slightly.) These transactions were allowed only in very exceptional circumstances, when the property was dilapidated and there was no other way for the *waqf* to secure income from the asset. Each such case had to come before the *qāḍī*, who, before approving the proposed transaction, examined all elements of the contract and made sure it was in the best interest of the *waqf*.

For a long time, criticism of the endowment institution, by both Muslim and Western writers, focused on the administration of public *waqfs*, its inefficiency, neglect of the endowed properties, and particularly on abusive practices on the part of administrators, rulers, and governors, who frequently enlisted in their manipulations the assistance of corrupt *qāḍīs*. Allowing for the proliferation of long-term or perpetual leases and exchanges of good and undamaged properties came under particularly heavy fire. Indeed, modern studies have documented the dismemberment of *waqfs* as a result of such corruptive practices. However, other discrete studies have shown that inefficiency, neglect, and embezzlement were neither inherent to the system, nor necessarily the rule. Instances were documented attesting to careful and dynamic management of public endowments, rational use of their funds, and the introduction of policies that, by means of a flexible interpretation of *waqf* laws, catered to the economic and social needs of the population and at the same time secured the interests of the *waqf*.

In the course of the nineteenth century, institutional reforms were introduced in both the Ottoman Empire and Egypt with a view to concentrating endowments under governmental supervision. An important by-product of these reforms was the publication of semi official codifications of *waqf* laws. Attempts were made under protectorate and mandatory rule to further improve the management of *waqf* properties. Much more radical steps were taken by colonial regimes, for instance the French in colonial Algeria. With the establishment of modern states in the Middle East, and particularly after the overthrow of monarchical regimes in some of these states, public criticism of the *waqf* increased. It now centered around the most basic characteristics of the institution and their incompatibility with economic development, budgetary policy of a modern state, and the social and political objectives of the new regimes. Consequently, reforms in *waqf* law were undertaken, particularly in the course of the second half of the twentieth century. Administration of endowed property was concentrated under special governmental ministries. In some countries (e.g., Turkey, Egypt, Syria,

and Iraq) reforms amounted to the nationalization of public *waqf* properties, the total or partial abolition of family endowments, and, in some cases, prohibition of their establishment in the future. Former *waqf* lands were distributed as part of agrarian reforms. Various, less radical reforms in the law pertaining to endowments were introduced in other countries (e.g., Kuwait, the United Arab Emirates, and Yemen).

Semi official codifications of the Hanafī *waqf* law are: Muḥammad Qadrī Pāshā, *Kitāb Qānūn al-ʿAdl wa-al-Inṣāf lil-Qadāʾ alā Mushkilāt al-Awqāf*, 3d ed. (Bulaq, Egypt, 1902); and Ömer Hilmi, *A Gift to Posterity on the Laws of Evqaf*, translated by C. R. Tyser and D. G. Demetriades, 2d ed. (Nicosia, Cyprus, 1922). A good introduction to broader knowledge on the subject, including an extensive bibliography, can be found in R. Peters et al., “Wakf,” in *The Encyclopaedia of Islam*, new edition, vol. 11, pp. 59–99 (Leiden, 2000). A detailed bibliography on the subject can also be found in Miriam Hoexter, “*Waqf* Studies in the Twentieth Century: The State of the Art,” *Journal of the Economic and Social History of the Orient* 41, no. 4 (1998): 474–495. Special issues of the following journals are dedicated to the *waqf* and include a number of important studies on the subject: *Journal of the Economic and Social History of the Orient* 38, no. 3 (1995); and *Islamic Law and Society* 4, no. 3 (1997). Edited volumes comprising essays on the *waqf* are: *Le waqf dans l'espace islamique: Outil de pouvoir socio-politique*, edited by Randi Deguilhem (Damascus, 1995); and, with emphasis on the modern period, *Le waqf dans le monde musulman contemporain (XIXe–XXe siècles): Fonctions sociales, économiques, et politiques*, edited by Faruk Bilici (Istanbul, 1994). For the role of *waqf* in the public sphere, see *The Public Sphere in Muslim Societies*, edited by Miriam Hoexter, Shmuel N. Eisenstadt, and Nehemia Levtzion (Albany, N.Y., 2000), particularly the following articles: Haim Gerber, “The Public Sphere and Civil Society in the Ottoman Empire,” pp. 65–82, and Miriam Hoexter, “The Waqf and the Public Sphere,” pp. 119–138. On the contribution of the *waqf* toward alleviating poverty, see several articles in *Poverty and Charity in Middle Eastern Contexts*, edited by Michael Bonner, Mine Ener, and Amy Singer (Albany, N.Y., 2003).

AN OVERVIEW
INDO-EUROPEAN BELIEFS AND PRACTICES

WAR AND WARRIORS: AN OVERVIEW

For the purposes of this article, war may be defined as organized and coherent violence conducted between established and internally cohesive rival groups. In contrast to numerous other modes of violence, it is neither individual, spontaneous, random, nor irrational, however much—like all varieties

of violence—it involves destructive action, even on a massive scale. Being a complex phenomenon, war has multiple dimensions that are deeply interrelated, chief among them being economic, ideological, and social factors.

Of these, perhaps the most obvious and important (at least according to the majority of modern analysts) are the economic factors that precipitate war, war being the most extreme form of competition for chronically scarce resources, such as women, territory, movable wealth (including livestock), and/or the labor power of subjugated populations. One must note, however, that scarce and valued resources are not exclusively of a material nature, prestige being a crucially important example of a nonmaterial resource that is highly desired and that figures prominently in warfare. It is possible, in fact, to speak of a prestige economy that exists not only side by side but intimately interwoven with the material economy of any given people, and warfare provides a convenient means of reaping rewards in both. Thus, for instance, success in raiding was requisite for a Crow warrior to advance his position, for this provided him first with goods—above all, horses—that not only enriched him but also could be used to place others in his debt through a process of redistribution. Further, raiding furnished the successful warrior with a set of heroic deeds of which he could boast on regular, formalized occasions, thereby further elevating his standing in the group. Success in battle also opened up religious prerogatives for him, insofar as many important and prestigious ritual roles were reserved for those who had accomplished specific, highly regarded feats of war, such as touching coup, winning horses, killing an enemy, or leading a successful raiding expedition.

Indeed, accomplishments in battle provide a common means, in many cultures and periods in history, whereby individuals can seek to elevate not only their own individual prestige above that of their peers but also that of their group above others (conquered rivals, as well as those who remain outside the fray). Thus, for instance, among the Jalé-speaking peoples of highland New Guinea, the performance of stereotyped, formulaic songs is a prominent part of every public celebration. These songs, which preserve the memory of past warfare, are a crucial element in the local prestige economy as well as a stimulus to further conflicts, for they celebrate the glory of the group that sings them, while also heaping derision upon their foes:

The man Wempa will never eat again,
nor will Alavóm ever eat again.
But we live to see the sweet potatoes roast,
The sweet potatoes from Wonge and Tukui (Koch,
1974, p. 85)

One may observe similar processes in the well-wrought poetry of praise for successful warriors and blame for those who are less than successful (e.g., Hector's rebukes of Paris), which figures prominently in the Homeric epic. Moreover, the heroes depicted there are presented as acutely self-conscious with regard to issues of prestige, as is evident, for

example, in Sarpedon's speech just prior to the Trojan assault on the Greek camp, an assault that leads to his death. Here is related a description of a warrior, himself the son of Zeus, weighing the relative value of the material and nonmaterial rewards of combat and setting greatest stock on the winning of a prominent and enduring reputation. In the last analysis, the pursuit of such a reputation—elsewhere called “undying fame” (*kleos aphthitos*)—becomes nothing less than a quest for immortality, although, ironically, it is a quest that regularly costs the quester his life. Among the most interesting aspects of this passage, however, is the absence of any tension or contradiction between the warrior's pursuit of material gain (booty, also land and privileged banquet portions) and his pursuit of glory. On the contrary, one sees an effective coalescence of the material and the prestige economy, encompassed within an ideology and a poetics that decidedly emphasize the latter:

Glaukos, why is it you and I are honoured before others
with pride of place, the choice meats and the filled wine
cups

in Lykia, and all men look on us as if we were immortals,
and we are appointed a great piece of land by the banks
of Xanthos,

good land, orchard and vineyard, and ploughland for the
planting of wheat?

Therefore it is our duty in the forefront of the Lykians to
take our stand, and bear our part of the blazing of
battle,

so that a man of the close-armoured Lykians may say of
us:

Indeed, these are no ignoble men who are lords of Lykia,
these kings of ours, who feed upon the fat sheep
appointed

and drink the exquisite sweet wine, since indeed there is
strength of

valour in them, since they fight in the forefront of the
Lykians.

Man, supposing you and I, escaping this battle
would be able to live on forever, ageless, immortal,
so neither would I myself go on fighting in the foremost
nor would I urge you into the fighting where men win
glory.

But now, seeing that the spirits of death stand close about
us

in their thousands, no man can turn aside nor escape
them,

let us go on and win glory for ourselves, or yield it to
others. (Homer, *Iliad*, trans. Lattimore)

The assignation of prestige to deeds of valor (the etymological connections between *valor*, *valiance*, and *value* are significant, as are those between *virtue* and *virility*) is but one means whereby ideological factors influence warfare, albeit a tremendously important one. No less important is the way in which other ideological constructs supply the means necessary to persuade individuals to join in combat, providing them with motivation sufficiently great that they are willing to risk their lives, even in situations (as is true for the vast

majority of warriors over the course of history) wherein they stand to reap quite little in the way of personal gain—material or immaterial—from even the greatest of military successes.

It is in this fashion that religion has played a most important role in war throughout history, and the examples of religious justifications that have been used to legitimate even the most tawdry of struggles are legion. Among these must be noted calls to convert the heathen (as in the Christian Crusades and more recent European wars of colonial expansion); promises of a favorable afterlife for warriors who die in battle (as within Islam, Shintō, or among the ancient Aztec, Germans, and others); and ethical dualisms whereby warfare is cast as an unremitting struggle between good and evil (as in ancient Iran or the modern United States).

Among the most contemporary students of war, ideological factors are generally viewed as subordinate or epiphenomenal to material ones, religious and other forms of legitimation being understood as the convenient or even necessary means that serve to mask or mystify the acquisitive competition that is the primary motivation for armed conflict. Others, however, have challenged this view, particularly with regard to warfare in the ancient and preindustrial world, where (in their view) religious motivations played a much more powerful and directly causal role. A favorite example cited by adherents of this position is the case of Aztec warfare, which they claim was pursued above all else to obtain the victims necessary for the performance of human sacrifice, the central ritual act of the Aztec empire. Such a line of analysis, however, has been rendered untenable by the most recent studies of Aztec sacrifice, which reveal it to have been not an act of transcendent religiosity performed for its own sake and at any cost but, as John Ingham has cogently argued, an expression and an instrument of the same drives for wealth, power, and prestige that prompted Aztec warfare and imperial expansion in general. In Ingham's words:

Whatever else it may have been, human sacrifice was a symbolic expression of political domination and economic appropriation and, at the same time, a means to their social production. . . . The sacrificing of slaves and war captives and the offering of their hearts and blood to the sun thus encoded the essential character of social hierarchy and imperial order and provided a suitable instrument for intimidating and punishing insubordination. (Ingham, 1984, p. 379)

In this case, then, and others like it, one must conclude that, far from having been the ultimate cause of war, religion was intimately bound up with other causal factors more familiar to the world of *Realpolitik*.

Beyond the material and ideological factors, there are also powerful social factors that must be taken into account. Briefly, two social conditions are necessary for the occurrence of war, given the definition proposed above (“organized and coherent violence conducted between established and internally cohesive rival groups”). First, a given group of individu-

als must understand themselves as a group; that is, they must be bound together in some abiding fashion by sentiments, traditions, kinship ties, institutions, residence patterns, language, and the like. Second, they must understand members of some other group (“the enemy”) as radically alien to them, outsiders to whom they are not connected and with reference to whom they need not refrain from violence. As the Jalé put it in a striking proverb: “People whose face is known should not be eaten.” Moreover, prior to the outbreak of hostilities or at the very least shortly thereafter, this same set of conditions—internal solidarity coupled with external alienation and hostility—will prevail on the other side as well.

In short, warriors must be persuaded not only to risk their own lives but also to take the lives of others, and not merely random others but those whose otherness is most radically marked. Involving organized and relatively large-scale lethal violence as it does, warfare always poses serious ethical problems within the already thorny set of issues surrounding homicide. As a starting point, it must be noted that humans kill one another for many reasons and under many sets of circumstances, and all groups possess certain norms regulating how such killings are to be regarded and judged. Sometimes they are defined as murder (i. e., illicit homicide); in other instances they are not, for there are conditions under which the taking of a life is legally, morally, culturally, and/or religiously sanctioned or even (this is particularly relevant to the case of war) celebrated.

A fundamental concern in such adjudications, and one infinitely more complex and malleable than is ordinarily acknowledged, is the question of whether the victim(s) or would-be victim(s) of a given homicide are truly human. In any number of instances (e.g., infants, slaves, prisoners, outlaws, heretics and other social deviants, the aged and infirm, etc.), an individual may conveniently be defined by the killer (and the community that passes judgment upon the killing) as something less than human: a “monster,” a “beast,” a “vegetable,” and so forth. Patterns of verbal abuse, in fact, whereby such persons are referred to as animals, rotting matter (“garbage,” “trash”), and the like, regularly accompany and assist the lethal redefinitions whereby it is established that effecting the death of such an individual is a permissible or even a worthy act.

Nor is it only individuals who may be defined as somehow less than human and thus freely killable. On the contrary, social borders are regularly constructed and maintained such that entire groups of others (“aliens” in the fullest sense of the word) are regarded thus by their neighbors and enemies. Such a state of affairs is evidenced, for example, in the frequent occurrence of self-referential ethnonyms by which a given people denote themselves as “humans,” implicitly (and in many instances, explicitly) relegating all others to the category of nonhumans—nonhumans who may, moreover, be freely killed as the occasion arises.

An instructive case is that of the Yanoama of the Amazon Basin, who not only call themselves “humanity” (the

meaning of their name) and all others “lesser subhuman beings” (*nabä*) but carry the process still further: Members of one Yanoama village habitually accentuate the minor differences of dialect (or the like) that separate them from residents of other villages, then they deride the others for being less than fully *Yanoama*, which is to say, somewhat subhuman. Relations between Yanoama villages are always tense, partly as a result of this pattern of marking social borders and partly as a result of pronounced competition over women, for it is the goal of all Yanoama males to retain the women of their village while obtaining those of other villages through marriage or war. The central value of Yanoama life is *waiteri* (“fierceness”). To survive in this fiercely competitive atmosphere, a village must ally itself with others to resist the aggression of still others. As a means of overcoming the suspicions that normally prevail between villages, allies seek to bind themselves to one another through trade, marital exchanges, and reciprocal feasting, but the process is never a simple one. To form an alliance is to signal weakness, and allies, sensing this weakness, press ever-increasing demands for women as a condition for the alliance’s continuation. Alliances thus often end in enmity, in warfare, or in an act that the Yanoama view as the ultimate form of fierceness and violence, being a parody and an inversion of the fragile festivals of intervillage solidarity: that is, a treacherous feast in which the male guests are all slaughtered and their women taken.

Again, with regard to the radical nature of social boundaries in situations of conflict and war, one may note the case of the Anggor in western New Guinea. As Peter Birkett Huber reports, each Anggor village “can be considered a cosmos in itself, an autonomous and essentially harmonious moral system confronted by a uniformly hostile, dangerous, and chaotic outside world. Violence between these villages is consequently not a form of policy or a distinct kind of political situation, but an inescapable feature of man’s existential condition” (in Nettleship, Givens, and Nettleship, 1975, p. 620). Most violence perpetrated by residents of one Anggor village on those of another takes the form of sorcery, but revenge expeditions are ultimately organized and battles ensue in which Anggor warriors venture out from their homes to confront chaos itself and, by means of this confrontation, reassert the solidarity of their group and the order of their cosmos by inflicting retaliatory deaths on their enemies outside.

Although these are somewhat extreme cases, they are by no means unique, and all warfare involves sociopolitical suspensions of the ethical, whereby the otherness of the enemy is radically accentuated, a situation that permits and legitimates their victimization. War is, in truth, that situation in which the killing of other people on a grand (or even total) scale is rendered not only licit but requisite, even glorious, by virtue of the fact that they belong to a rival group to whom ethical norms do not extend, the enemy having been effectively defined as subhuman or even nonhuman.

Yet another example of these principles is found in the shields that form a crucial part of a warrior’s equipment

among the several Dayak peoples of Borneo. In general, shields function not only as an important implement of defense in warfare prior to the introduction of gunpowder but also as a movable social border that separates one's self, one's group, and that territory in which one feels some measure of security from the enemy. In an advance, shields mark the incorporation of conquered territory, booty, and prisoners into one's own group; in retreat, they mark the group's contraction, as land, stragglers, and the fallen are left outside. In the classic warfare of the Zulu, for instance, and in other powerful kingdoms of southern Africa, rival armies assumed formation in lines opposite to one another, each warrior holding a five-foot rawhide shield in front of him with his left arm. Standing behind this row of shields, the opponents exchanged insults with one another, verbal combat (in the forms I have discussed) preceding physical. Thereafter, the regiments closed, and each one tried to break through the enemy's walls of shields. Finally, when an army felt itself defeated, its members dropped their shields in token of surrender, whereupon the battle would cease. What was signified in this action was that the vanquished group renounced the social borders that they had previously maintained, thereby relinquishing their independence and accepting incorporation as a subjugated part of the victors' polity.

Dayak shields are used in similar fashion and bear similar significance but are remarkable for the iconographic content of the designs painted and carved upon them. Most noteworthy is the bifurcation of design, for on the inside of most Dayak shields—that is, the side facing toward the bearer—is the image of two protective ancestral figures; on the outside is a snarling monster. The import of the ancestors is not hard to judge; being the founders of the bearer's social group, they define that group and represent it. Insofar as there are others who descend from these same ancestors, the warrior has comrades who will take up arms together with him to defend their group against outsiders (i. e., those descended from other ancestral lines). The group's sense of identity and solidarity are thus nothing more than the sentiments called forth by the image of these ancestors, and it is such sentiments—much more than the wooden shields—that provide protection and security in battle and beyond.

The monsters on the outer face of Dayak shields are more difficult to interpret, however, for they are susceptible to multiple readings. On the one hand, these ferocious figures, marked most prominently by bulging eyes and exaggerated fangs, would seem to represent the enemy, particularly when considered in juxtaposition to the ancestral figures. Accordingly, one may posit a series of correlated binary oppositions, the effect of which is to dehumanize the enemy (in fashions similar to those discussed above) and thereby render his killing licit:

Inside: Outside::
 Ancestors: Monsters::
 Own Group: Enemy::
 Protection: Menace::
 Solidarity: Hostility::

Deaths Suffered Deaths Inflicted

:

must be avenged constitute revenge

Killings illicit: Killings licit or even requisite

In light of such observations as this, this writer is inclined to propose certain revisions to a classic text of Simone Weil, her justly celebrated meditations on "The Iliad, or The Poem of Force," written in 1940, shortly after the fall of France to Nazi arms and also after her own combat experience during the Spanish Civil War. In this essay, reflecting on death in battle, particularly as described in this epic, Weil came to define force as "that *x* that turns anybody who is subjected to it into a *thing*," going on to observe, "exercised to the limit, it turns man into a thing in the most literal sense: it makes a corpse out of him. Somebody was here, and the next minute there is nobody at all; this is a spectacle the *Iliad* never wearies of showing us" (Weil, 1983). To be sure, there is a power and a grandeur in so stark a formulation, yet, given what has been outlined above, particularly regarding the nature of social borders in warfare and those patterns of dehumanization whereby an enemy is defined as subhuman, non-human, and/or monstrous, one must reject the idea that it is force itself, acting as some sort of quasi-personified agent, that "turns a man into a thing." Rather, the process is quite the reverse, and one can say with more justice and precision, *pace* Weil, that it is only when human actors come to regard others as "things" that they become capable of employing force, particularly lethal force, against them. Force here only completes that process of "turning into a thing" that begins in the sentiments and social patterns of human subjects.

To return to the Dayak shields, however, there is more that can be said. Thus far, this article has suggested that the image of the monster may be taken to represent the enemy, as seen through the dehumanizing gaze of the warrior. Such an interpretation, moreover, is consistent with a view of the shields as a marker of social borders, for in this instance one may clearly perceive the tenuous nature of such borders, something that becomes particularly obvious within the situation of the battle, for it is then quite literally only the thickness of the shield itself that separates the ancestral (representation of) community from the monstrous (figure of the) outside, safety from danger, self from other. In addition, there is significant material evidence to support such a view, for in the construction of many Dayak shields the monster images are rendered more grotesque still by the use of human hair as ornament: hair taken from the trophy skulls of slain enemies. Such enemies, having been viewed as monsters, were treated as monsters, and their corpses were used to depict the monsters that they were.

This datum, however, suggests another line of interpretation that may be advanced regarding the complex and polyphonous image of the monster. For it is obvious that the outer side of any shield is directed toward the enemy, especially toward one's immediate adversary in hand-to-hand battle. Further, it is equally obvious that the intended (and

also, one assumes, quite real) effect of such an image is to intimidate or even terrify opponents, for in its very material substance (the actual hair of fallen victims), this shield announces the force, the valor, and also the cruelty of its bearer. It supplies graphic and tangible witness to the fact that he has taken enemy lives in the past and stands ready and able to do so once more. The shield thus displays the bearer's face as seen through the eyes of his opponent or (to put it differently) the face that he wishes to present to all enemies: for he becomes a monster against those whom he regards as monstrous, even as they do conversely to him.

Here is reached the final paradox of war and the warrior: a corollary to the pattern that has been observed whereby one must dehumanize one's enemies in order to employ force against them. In practice, it appears that a warrior must also dehumanize himself before he can become an instrument of slaughter, effectively eradicating such human tendencies as guilt, fear, and compassion. A well-articulated example of this is found in the samurai ideal of "no-mind," this being that psychomental state—cultivated by years of meditation and training in martial arts—in which the samurai's body and arms act as if automatically, with no hesitation born of thought, weakness, or doubt. Elsewhere, warriors frequently speak of themselves as animals: "lions" or "leopards" (East Africa); "two-footed wolves" (India and Iran); berserkers, of "those who wear the bear's shirt" (Scandinavia); or "crazy-dogs-wishing-to-die" (Crow), to cite but a few examples. To these data one might add the fact that Yanoama warriors march off to battle imitating the noises of a host of carnivorous beasts, from insects on up. The war song of the Yanoama is also noteworthy as a supreme statement of the warrior's auto-dehumanization, being entitled "I am a meat-hungry buzzard."

BIBLIOGRAPHY

Not surprisingly, some of the best attempts at academic analysis of the nature and ideology of warfare were made at the time of the Vietnam War. Among the valuable collections that appeared during this period, one should note *Law and Warfare*, edited by Paul Bohannon (Garden City, N. Y., 1967); *War: The Anthropology of Armed Conflict and Aggression*, edited by Morton Fried, Marvin Harris, and Robert Murphy (Garden City, N. Y., 1968); *Problèmes de la guerre en Grèce ancienne*, edited by Jean-Pierre Vernant (The Hague, 1968); and *War: Its Causes and Correlates*, edited by Martin A. Nettleship, R. Dale Givens, and Anderson Nettleship (The Hague, 1975). A slightly later work, and in a different vein, is *The Warrior Tradition in Modern Africa*, edited by Ali A. Mazrui (Leiden, 1977). Special attention should also be given to Pier Giorgio Solinas's "Guerra e matrimonio," in *Potere senza stato*, edited by Carla Pasquinelli (Rome, 1986), pp. 21–47.

Among the most important case studies are those drawn from Melanesia, which, given the relatively late date of "pacification" there by colonial authorities, provided an extremely informative field for gathering data. Here, one ought to note Klaus Koch's *War and Peace in Jalémo: The Management of*

Conflict in Highland New Guinea (Cambridge, Mass., 1974); Andrew P. Vayda's *War in Ecological Perspective* (New York, 1976); and M. J. Meggitt's *Blood Is Their Argument: Warfare among the Mae Enga Tribesmen of the New Guinea Highlands* (Palo Alto, Calif., 1977). Other valuable case studies include Peter Birkett Huber's discussion of the Anggor in *War: Its Causes and Correlates* (cited above), pp. 619–661; Napoleon A. Chagnon's essay on the Yanoama in *War: The Anthropology of Armed Conflict and Aggression* (cited above), pp. 109–159; and Fred W. Voget's "Warfare and the Integration of Crow Indian Culture," in *Explorations in Cultural Anthropology*, edited by Ward H. Goodenough (New York, 1964), pp. 483–509.

John Ingham's study of Aztec sacrifice is found in his "Human Sacrifice at Tenochtitlan," *Comparative Studies in Society and History* 26 (1984): 379–400. A brief discussion of the Dayak shields is W. Münsterberger's "Die Ornamente an Dayak-Tanzschilden und ihre Beziehung zu Religion und Mythologie," *Cultureel Indië* (Leiden) 1 (1939): 337–343. Simone Weil's essay "The Iliad, or The Poem of Force," translated by Mary McCarthy, can be found in *Revisions: Changing Perspectives in Moral Philosophy*, edited by Stanley Hauerwas and Alasdair MacIntyre (Notre Dame, Ind., 1983).

Revised Bibliography

WAR AND WARRIORS: INDO-EUROPEAN BELIEFS AND PRACTICES

As Georges Dumézil, the leading contemporary expert on comparative Indo-European mythology, long ago demonstrated, war gods and the ideology that is associated with them played an extremely important role in the pantheons of most, if not all of the early Indo-European-speaking societies. To cite several well-attested examples: the ancient Indic war god Indra, by far the most prominent of the Vedic divinities, the ubiquitous Roman god Mars, the Greek war god Ares, and the Norse god

Þórr (Thor), thunderbolt-wielder *par excellence* and the most popular of the ancient Scandinavian divinities. Moreover, heroes and demigods, like Arjuna, Herakles, Siegfried, Cú Chulainn, Arthur, and Achilles, all occupied important positions in their respective traditions. Indeed, like most pastoral nomads, modern as well as ancient, the ancestors of the Greeks, Hittites, Aryans, Celts, Germans, and so forth, seem to have regarded warfare as a fundamental fact of life and to have held both the war band and its collective representations in high esteem.

THE INDO-EUROPEAN MÄNNERBUND. As Stig Wikander pointed out (1938), the *Männerbund*, or war band, was clearly among the most important of ancient Indo-European

social institutions. Examples of this phenomenon are legion, from the *ksatriya* caste (or class, at least in the earliest period) of traditional India to the ancient Germanic *comitatus*. Moreover, the presence of such a social stratum—that is, a class of military specialists whose prime purpose was to exercise physical prowess, either in defense of the society or in order to conquer new territory—was a uniquely Indo-European phenomenon. Armed with the shaft-hole battle-ax, among other weapons, and propelled by the light, horse-drawn battle chariot, this warlike elite greatly facilitated the spread, beginning around 3500 BCE, of the several Indo-European communities from the Proto-Indo-European homeland in what is now southern Russia to the territory associated with this widespread language family in historic times.

AMBIVALENT ATTITUDES TOWARD THE WARRIOR. Nevertheless, despite his importance in the scheme of things, there seems to have been a deep-seated ambivalence in the Indo-European attitude toward the warrior, if not toward warfare, and this, too, is reflected in the belief system. On the one hand, the war leader, or **reg*, from which Latin *rex*, Sanskrit *rāj*, Old Irish *rig*, and so forth, derive, together with his war band, was generally regarded as the immediate secular authority, and his commands were typically obeyed without question. On the other hand, the *rex*, *rāj*, and so forth, was everywhere subordinate to—or at least no more prestigious than—the priests or holy men (e.g., the Indic brahmins, the Celtic druids, the Roman *flamines maiores*). And it is clear that ultimate sovereignty was vested in this most sacred of the ancient Indo-European social strata. Moreover, one finds everywhere a tension between the two classes in question, a sense that although the warrior was vital to the survival of the community, he was nevertheless a thoroughly ambivalent figure and prone to commit random acts of violence or treachery against nonwarrior members of his own society when not engaged in fighting external enemies. Indeed, throughout the ancient Indo-European-speaking domain one repeatedly encounters such concepts as *furor* (Latin) and *ferg* (Old Irish), as well as the Norse image of the *berserker*, all of which are expressions of what was believed to be the warrior's inherent (and, on occasion, uncontrollable) ferocity.

Thus, the role of the warrior, and especially the warrior-leader, was steeped in paradoxes. He was at once at the apex of the social order and a potential threat to that order. Indeed, the contradiction here, which is reflected throughout Indo-European religious beliefs, is inherent in the profession of arms: it involves a social institution dedicated to the destruction of society. What follows is, in the main, a survey of these warrior-related beliefs, as interpreted by Dumézil.

THE IDEOLOGY OF THE SECOND FUNCTION. According to Dumézil, the ancient Indo-Europeans conceived of the world and their relationship to it in terms of three fundamental, hierarchically ranked ideological principles, or “functions.” In descending order, the so-called first function

includes the social and supernatural manifestations of ultimate sovereignty and is typically manifested in a pair of divinities, such as the Vedic divinities Mithra and Varuṇa, the Norse gods Tyr and Óðinn (Odin), and so forth, as well as in the priestly social strata mentioned above. The final function, or third function, reflects the sum total of activities and beliefs relating to the mass of society, the maintenance and promotion of fertility, physical well-being, and so on. However, it is the intermediate function, or second function, which includes the social, religious, and mythological manifestations of the exercise of physical prowess, that is of concern here, for it contains the ideology underlying the Indo-European conception of warfare and warriors.

As has been noted, that ideology is inherently ambivalent, for the canonical representations of the warrior figure are two in number. One is the apotheosis of the chivalrous warrior, the warrior who for the most part confines his violent behavior to the battlefield and does not habitually attack “civilians.” This figure is perhaps best reflected by the aforementioned divinities Indra, Mars, and Þórr, as well as in the Indian epic hero Arjuna, and, at least to an extent, in the Greek figures Herakles and Achilles. The other representation of the warrior is diabolical in nature; the emphasis here is on unpredictability and sheer nastiness. Examples are to be found in the Vedic figure Vāyu, who is equated with the wind, especially the ill wind that blows up suddenly out of nowhere and does indiscriminate damage; the Norse anti-hero Starkaðr; and the aforementioned Greek divinity Ares, whose companions were Deimos (“fear”) and Phobos (“fright”). Thus, the warrior has both a “light” and a “dark” side to his nature.

In several recent works, chief among them the second volume of the *Mythe et épopée* series (1971), Dumézil has suggested that this “dark/light” dichotomy can be detected throughout Indo-European ideology. That is, certain divinities are more remote from man, more unpredictable, and therefore “dark” in character (e.g., Varuṇa as well as Vāyu in the Indic tradition), while others, like Mitra and Þórr, are closer to humans and therefore “light” in character. Thus, the distinction between the two types of warrior figures, which almost certainly is rooted in a perception of social reality, may be but one example of a much more deep-seated Indo-European ideological theme.

THE THREE SINS OF THE WARRIOR. However, even the most chivalrous of Indo-European warrior figures, divine as well as heroic, sometimes manifest “dark” traits. Typically, this involves the commission of three “sins,” one against each of the three ideological functions. The best example, perhaps, can be seen in the ancient Indic traditions about the recalcitrant behavior of the otherwise “light” divinity Indra. In *Mahābhārata* 5.9.1–40, Indra slays Viśvarupa, the monstrous, three-headed son of Tvaṣṭṛ, who has been threatening the divine community. However, as Tvaṣṭṛ is chaplain to the gods, his son is by definition a divine brahman, and Indra has therefore committed an act of brahmanicide, an unpar-

donable sin (and act of rebellion) against the first function and its representatives. Later, Indra is confronted by the warrior demon Namuci with whom he had earlier sworn a pact of eternal friendship. As that pact contained the promise not to kill Namuci with anything either wet or dry, Indra forges a weapon made of foam—which, in the eyes of the ancient Indians at least, was neither wet nor dry—and, when the unsuspecting demon's attention is diverted, he decapitates him. This, of course, is a sin against his own function, as the slaying was done by trickery, rather than in a fair fight. Finally, the god assumes the form of a man called Gautama and, so disguised, has intercourse with the man's wife. This is an abuse of the ideology of the third function, that is, Indra performs an illicit act of procreation.

As a result of these transgressions, Indra progressively lost his first function, majesty, or *tejas*; his second function, physical prowess, or *bālam*; and his third function, beauty, or *rūpam*; all of which, as Wikander and Dumézil have demonstrated, were eventually reincarnated in the offspring of the epic hero Paṇḍu (Yudhiṣṭhira, Arjuna, Bhīma, Nakula, and Sahadeva). The important thing here is that, from the standpoint of the Indo-European ideological system, Indra had by these acts clearly demonstrated his inherent recalcitrance and therefore his ultimate inferiority to Mitra, Varuṇa, and other representatives of the first function in the divine scheme of things. The lesson, of course, is that warriors, even the best of them, are capable of disrupting the social and natural order and therefore not to be fully trusted.

Another canonical example of the “three sins” can be found in the Greek traditions about Herakles, who (1) refuses to obey his sovereign, Eurystheus, (2) slays a fellow warrior, Iphitos, in violation of what amounts to a truce, and (3) although legally married to Deianira, abducts and then violates Astydamia after killing her father and sacking his city. The third prime example involves the Norse warrior Starkaðr, who sacrilegiously sacrifices his sovereign to the god Óðinn, abandons his cohorts in battle, and, for money, slays the Danish king Olo while he is relaxing in a bath. Still other examples have been noted in the careers of Ares, Agamemnon, Siegfried, Sir Gawain, and Achilles.

As Dumézil puts it, what is the case here is a “drama in three acts,” as it were, and in a very real sense it is a tragedy, as with each “sin” the warrior in question—god as well as hero—loses his powers or his life force. Thus, after violating Astydamia, Herakles is rendered powerless by his outraged wife and eventually causes himself to be burned on a funeral pyre, while Starkaðr commits suicide after killing Olo. The net effect is what amounts to a “cautionary tale”: warriors, even the best of them, are ultimately unreliable, and if their *furor*, and so forth, is allowed to go unchecked, the social order as a whole may very well collapse.

THE KILLING OF THE THREE-HEADED MONSTER. Among the more important themes involving Indo-European warrior figures is the killing of a three-headed monster. As has already been seen, Indra's first “sin” stemmed from such a

slaying. But the theme in question is distinct from that of the “three sins” and needs to be considered separately. Indeed, Indra is by no means the only Indic figure who slays a tricephalus. In *Rgveda* 10.8.8 Viśvarupa's slayer is called Trita-Āptya, or the “third” of three Āptya brothers, and although the figure is sometimes held to be a hypostasis of Indra, there is no clear implication that Trita-Āptya's action is considered a “sin.” The same can be said for the behavior of the onomastically related Iranian figure Thraetaona, who kills a three-headed monster called Aži Dahaka (“foreign snake”).

Other reflexes of this theme can be found in the Greek story of Herakles versus the three-headed figure Geryon, the Norse myth of how Thor bested the giant Hrungnir, who is described as having a “three-horned” heart, the Irish account of the hero Cú Chulainn versus the three sons of Nechta Scéne, and the well-known Roman pseudo-historical account of the conflict between Horatius and the three Curiatii. The last two accounts are, of course, euhemerized, in that the three-headed monster has been transformed into a threefold set of human adversaries (in the Roman version they are a set of Alban triplets). Nevertheless, in the other accounts, the slayer performs the same service to his community: he eliminates a threat to the three fundamental elements of the tradition (i.e., the three functions)—hence presumably the three heads or triple character of the adversary.

But the recalcitrance and, indeed, antisocial proclivities of the Indo-European warrior are also very much in evidence here. In the Roman version, for example, when the victorious Horatius (also the last survivor of a set of triplets) learned that his sister mourned the death of one of the Curiatii—she had been betrothed to him—he slew her in a fit of rage. As a result the Roman hero was forced to walk under a beam to divest himself of his *furor* before returning to polite society. Similar rituals of purification seem to have been characteristic of other early Indo-European societies; indeed the later Roman custom wherein a victorious army had to pass under a “triumphal” arch before it disbanded seems, in light of this evidence, to have been rooted as much in a need to divest the army of its collective *furor* as in a desire to humiliate the war captives that marched in chains behind the general's chariot.

THE WAR OF FOUNDATION. Another widespread Indo-European theme in which warrior figures necessarily play an important part is what Dumézil variously calls “the war of foundation” and the “war between the functions,” that is, a conflict between representatives of the first two functions and those of the third. The best examples come from the Germanic and Roman traditions. In the former, the Æsir, including Óðinn, Tyr, and, of course, Þórr, fight a war with the so-called Vanir divinities, the most prominent of whom are Njörðr, his son Freyr, and his daughter Freyja. As described in the *Ynglingasaga*, the Æsir fight their Vanir opponents to a standstill, and then, in reconciliation, incorporate them into the pantheon, rendering it complete.

Although scholars such as the late Karl Helm have interpreted this myth as a reflection of the conflict that must have occurred between the earliest Germans and the indigenous inhabitants of northern Europe, Dumézil has found a parallel in the Roman pseudo-historical account of the Sabine War, as preserved by Livy and others, and is therefore convinced that the theme is in fact Indo-European. In the latter case, shortly after founding the city of Rome, Romulus and his companions trick their wealthy neighbors, the Sabines, steal their wives and daughters, and then, as part of the truce following an inconclusive war, incorporate the whole Sabine community into the Roman body politic. In both examples, the defeated groups clearly represent the third function—neither the Vanir nor the Sabines were famed for their military prowess, and each was closely associated with fertility and the mass of society—while the victors represent the first two. Indeed, the Sabines eventually came to form one of the three founding tribes of Rome, the Titienses (named for the Sabine king Titus Tatius), completing a triad that also included the Ramnes (founded by Romulus and charged with priestly duties), and the warlike Luceres (reputedly named for the Etruscan hero Lucomon).

Thus, while the Roman version of the theme masquerades as history, it is as mythological in its roots as the Norse account of the conflict between the Æsir and the Vanir and ultimately stems from the same Indo-European mythologem. This conclusion is buttressed by several other examples of what appear to be “wars of foundation”—or at least traditions about an internecine struggle that broadly conforms to the pattern just discussed. One is the Vedic reference to a conflict between “two forces,” or *ubhe vīrye*, that are expressed in the principles later incarnated, respectively, in the *vaisya* (third function) and in the *brahmana* and *kṣatriya* (first and second functions). Another can be found in the Homeric accounts of the Trojan War (e.g., the *Iliad* and the *Odyssey*), as well as in accounts of its aftermath (e.g., Euripides’ *The Trojan Women*). The Greeks, led by Agamemnon and, after he returns to the fray, championed by the famed warrior Achilles, represent the first two functions, while the Trojans, consistently described as possessing vast wealth, are, like the Vanir and the Sabines, almost certainly representatives of the third function. Moreover, the fate of the Trojan women closely parallels that of their Sabine sisters: they are abducted by the victorious Greek kings and heroes.

Yet another possible example of a “war of foundation” can be seen in the Irish accounts of the conflict between the Tuatha Dé Danann and the Fomhoire, which culminated in the Second Battle of Magh Tuiredh. After this battle, the defeated Fomhoiran figure Bres, who together with his kind seems generally to reflect the third function, is incorporated into the body politic created by the victorious Tuatha (first and second functions), rendering it complete.

SWORD CULTS. An important feature that appears in several ancient Indo-European traditions is what can best be de-

scribed as the cult of the named, magical sword. Found among the Celts, Germans, and particularly the North Iranian-speaking steppe peoples (Scythians, Alans, Sarmatians, etc.), the cult seems to have spread westward in the early centuries CE. Perhaps the best-known example here is contained in the medieval tradition surrounding King Arthur’s magical sword, Excalibur. Another example is Roland’s famous sword, Durandel. But as early as the fifth century BCE Herodotus described the Scythian practice of worshiping swords as manifestations of “Ares,” and in the fourth century CE Ammianus Marcellinus described the Alanic custom of thrusting swords into the earth and worshiping them as “Mars.” The modern Ossets, a Caucasian people who have the distinction of being the last descendants of the ancient Alans, still preserve an epic tradition in which magical swords play an important role (see, for example, Dumézil, *Légendes sur les Nartes*, Paris, 1930, pp. 61–63).

Although this theme cannot be documented throughout the ancient Indo-European domain and may well be rooted in the steppe traditions, its subsequent distribution from Britain to the Caucasus renders it a potentially important element in the Indo-European warfare mystique.

THE WARRIOR-DIVINITY AS A FERTILITY FIGURE. To conclude this brief survey of Indo-European warrior figures and the beliefs and practices associated with them, it is necessary to point out that several of the best known of these figures also had strong associations with plant, animal, and human fertility. Mars, for example, in certain of his aspects (e.g., the so-called Agrarian Mars) was regularly worshiped as a fertility figure. The Norse god Þórr was also invoked as an agricultural deity, and his sexual prowess is in some respects as remarkable as his fighting ability. The same can be said for several other Indo-European figures who are otherwise clear-cut representatives of the “second function,” including, as has been seen, the demigod Herakles.

The warrior also has important connections with the principle of sovereignty, that is, the first function. As Dumézil points out, the Indo-European king is everywhere drawn from the warrior elite and must undergo a ritual wherein he acquires symbols of the other two functions as well as those relevant to his own. He thus necessarily becomes a transfunctional (or better, perhaps, a parafunctional) figure. Indeed, all Indo-European royal consecration ceremonies, from ancient India to modern Britain, emphasize this element.

Thus, Dumézil’s conception of this most important component of the Indo-European ideology is much more complex than it might seem at first glance. There was, for example, a *Mars qui praeest paci* and there were *arma Quirini* (that is, armed representatives of the “third function”). Moreover, most of the female warrior figures—such as the Greek goddess Athena, who leaped into existence fully armed from the forehead of Zeus and who was typically portrayed in the costume of a warrior maiden—were also trifunctional figures in that they incarnated divine wisdom and the domes-

tic arts as well as military prowess (cf. the three Irish Macha figures and the triple-figured Hindu goddess Durga). For the most part, however, these fertility attributes seem to have been secondary, and the prime function of figures such as Mars and Pórr, if not Athena, was to ensure military success.

In sum, despite their periodic bouts of antisocial behavior and occasional double-duty as agricultural divinities, to say nothing of their periodic elevation to the transfunctional role of king, the great Indo-European war gods, as well as their heroic counterparts (Arjuna, Achilles, Siegfried, Cú Chulainn, et al.), everywhere occupied a fundamental niche in the belief systems in question. And this niche was paralleled by that occupied by the warrior stratum in the real world of the ancient Indo-Europeans. Although never at the apex of the social or divine pyramid (unless elevated to the kingship), the warrior, mortal as well as divine or legendary, was a figure to be reckoned with, and the ideology associated with his was (and still is) perhaps the most distinctive feature of the Indo-European worldview.

- Strutynski, Udo. "Ares: A Reflex on the Indo-European War God?" *Arethusa* 13, (Fall 1980): 217–231. A discussion of the Greek divinity Ares and the extent to which he commits the three canonical "sins." Methodologically important.
- Strutynski, Udo. "Honi Soit Qui Mal y Pense: The Warrior Sins of Sir Gawain." In *Homage to Georges Dumézil*, edited by Edgar C. Polomé, pp. 35–52. Washington, D.C., 1982. Discusses the extent to which Gawain commits the three characteristic sins of the Indo-European warrior. An important work, as it demonstrates the persistence of this theme into medieval times.
- Wikander, Stig. *Der arische Männerbund*. Lund, 1938. Established the presence of the Indo-European warrior band throughout the ancient Indo-European-speaking domain. Had a tremendous influence on Dumézil's subsequent theories about the Indo-European conception of the warrior class and its mythological reflections.

C. SCOTT LITTLETON (1987 AND 2005)

WARAO RELIGION. The Orinoco Delta, a landscape of swamps, islands, and waterways, is the territory of the Warao. Located between the modern republics of Venezuela, Guyana, and Surinam, the Warao today number approximately sixteen thousand. Heirs to a seven-thousand-year tradition of fishing adaptation, some twenty dialectal subgroups of Warao have been identified (Kirchoff, 1948, p. 869). Warao formerly was considered a linguistic isolate; recent research however indicates certain vocabulary correspondences with the Chibchan languages of northwestern South America (Wilbert, 1970, p. 22). Cultural and dialectical differences exist among the various Warao groups, but they are linked by a system of common beliefs.

Information on Warao religion is derived from three major areas: traditional narrative, cosmology, and shamanism.

TRADITIONAL NARRATIVE. Traditional narrative is clearly cosmogenic in nature in that it recounts the origin of the plants, animals, and spirits that occupy the Warao universe. It also relates the feats of culture heroes, outlines the taboos people must observe, defines the soul, death, and reincarnation, and depicts other realms of being.

Myth explains that in precultural times the Warao lived in the sky, where a hunter's shot went wide one day. While searching for his arrow, the man found a hole. Descending by a rope to the earth, he discovered an abundance of food.

On his return he informed the Warao of his extraordinary find. The other Warao immediately began lowering themselves to earth, until at one point a pregnant woman became stuck in the hole. Only her anus protruded, which became the morning star; or, in another version, her legs extruded, forming the stars in the Big Dipper. Thus some of the Indians were forced to remain behind. On earth, the Warao learned from the spirit of palm leaf fiber that they must suffer and work. And so the first baby was born, the first sickness was inflicted by evil spirits, and the first death occurred (Wilbert, 1970, p. 309).

According to another tale, the sun was originally the property of one man. The world was dark, and men could procure food only with difficulty. One man, hearing the complaints of his wife, decided to send his two daughters in search of the sun. The first failed because she took the wrong turn and was raped by a monster. The second successfully reached the house of the sun's owner, had sexual intercourse with him, and received, as a gift, the sun in a container. Before she left, the man advised the girl not to break the sun. But on the girl's return home, amid the family's rejoicing, a piece of the sun broke off and escaped into the sky.

Aloft in the sky, the sun moved so swiftly through the day that men were unable to procure food. To remedy this situation, the Indians caught a turtle that they presented to the sun as a pet. Now obliged to wait for his slow-moving pet, the sun moved across the sky much more slowly, giving the Warao many hours of daylight in which to fish and to gather food (Wilbert, 1970, p. 311).

In another tale, the origin of the moon is sketched. Every night a young man was having incestuous relations with his two sisters as they slept. Anxious to learn the identity of their violator, the women smeared black genipa juice on their bodies. Waking the next day, they discovered the incriminating dye on their brother. Overcome with shame, their brother flew into space, where he became transformed into the moon. On occasions when the moon turns pink, the Warao believe that it bleeds. They therefore consider all women to be daughters of the moon, because they bleed periodically in menstruation (Wilbert, 1970, p. 63).

With profound sentiment, the Warao narrative also describes the origin of death. At the beginning of the world, the Warao chief warned his people not to sleep that night for they all would be visited first by death and then by a good spirit. To gain immortality, he urged them not to answer the first call but to respond to the second. That night silence reigned through the settlement. Toward midnight a voice was heard. One youth who had fallen asleep woke with a start and answered the first call, the call of death. In fulfillment of the chief's prediction, from that time on all Indians have had to die (Wilbert, 1970, p. 192).

COSMOLOGY. According to Warao cosmology, the earth is a disk floating on water; its crust is fractured by the many waterways of the Orinoco Delta. The sea extends to the hori-

zon, where, contained within a vast gorge, it is bordered by mountains. At the cardinal and solstice points, these mountains soar upwards in the form of petrified trees.

The Warao universe is divided into various realms. The celestial realm is a smaller disk that parallels the terrestrial one. The maximum height of the solstitial suns determines the bell-shaped cosmic vault, which rests on the world's axis. Located to the northeast of the zenith is an ovoid house that is two-storied; the lower level is inhabited by a plumed serpent and the upper level by the Creator Bird, the ancestral shaman and his wife, and four pairs of insects. In the central space of the upper floor the male residents assemble to play a game that perpetuates humanity on earth. At the end of each game the plumed serpent emerges from below to produce a luminous ball. Ropes of tobacco smoke connect the house with the zenith and with the world's axis.

Coiled around the earth disk is a huge marine serpent that controls the tides and is the source of all forms of life. Below the terrestrial-aquatic is the subterranean realm, at the center of which resides the four-headed serpent-goddess of the nadir; her heads, crowned with deer horns, mark the four cardinal directions. The northern seas of the summer solstice are inhabited by the Butterfly God, and the southern seas of the winter solstice by the Toad God. The eastern and western seas are the domains, respectively, of the Avian God of Origin and the Scarlet Macaw. The ancient forefathers, called *kanobotuma*, reside at the four mountains at the cardinal points and once a year visit the Warao. At festival time, the forefathers enter the house of worship in a barrel of roasted palm pith, and, as carved images nailed to a central platform, they participate in the sacred dances of propitiatory ritual in which the Warao implore their gods of origin for protection (Wilbert, 1981, pp. 37–40).

SHAMANISM. Among the Warao common maladies are treated with simple herbal remedies. A serious illness or death, however, is always attributed to the malevolent action or intention of a supernatural agent. Three major types of sickness, and three specialists to treat them, are distinguished. *Bahana*, which results from the introduction of material objects into the body, is cured by the healer *bahanarotu*. *Hoa*, inflicted by plant and animal theophanies, must be attended by a shaman called *hoarotu*. And *hebu*, the possession by an ancestor spirit, is treated by the *wisiratu*, who is the shaman or priest who presides over the house of worship and who acts as the mediator between the *kanobotuma* and the Warao (Wilbert, 1970, p. 24). When someone is sick, all three practitioners assemble to diagnose the illness and to determine which specialist must perform the appropriate ceremony.

At the beginning of the Warao cultural epoch, the primordial shaman ascended to the zenith, called the "bosom of the world," from which radiates a network of paths across the celestial canopy. Deities travel along these pathways, as do Warao shamans in their journeys to other worlds. Amid this traffic, men provide offerings for the gods, and the gods

bestow life and health on humankind (Wilbert, 1981, p. 39).

BIBLIOGRAPHY

As is evident from the above text, Johannes Wilbert is unquestionably the most important contemporary source on Warao religion. The bibliography of his own works supplied at the end of his article "Warao Cosmology and Yekuana Roundhouse Symbolism," *Journal of Latin American Lore* 7 (Spring 1981): 37–72, is comprehensive. Especially useful among these works is *Folk Literature of the Warao Indians* (Los Angeles, 1970). See also less recent publications by Basilio Maria de Barral, *Guaraos guarata: Lo que cuentan los indios Guaraos* (Caracas, 1960), and Henry Osborn, "Textos folklóricos en Guaraos," *Boletín indigenista venezolano* (Caracas) 3, no. 5 (1958): 163–170, no. 6 (1960): 157–173, and no. 7 (1961): 169–189; and Osborn's "Textos folklóricos Guaraos," *Antropológica* (Caracas) 9 (1960): 21–38 and 10 (1960): 71–80. Paul Kirchoff's article "The Warrau," in volume 3 of the *Handbook of South American Indians*, edited by Julian H. Steward (Washington, D.C., 1948), pp. 869–881, provides a general historical account and description of settlement and subsistence patterns. Earlier ethnographic works are Walter E. Roth's "An Inquiry into the Animism and Folklore of the Guiana Indians," in *Thirtieth Annual Report of the Bureau of American Ethnology, 1908–09* (Washington, D.C., 1915), pp. 103–386, and Louis Plassard's "Les Guaraunos et le delta de l'Orénoque," *Bulletin de la Société de Géographie* (Paris) 15 (1868): 568–592. Finally, it should be mentioned that in recent years many articles on various aspects of Warao culture have appeared in the aforementioned Venezuelan journal *Antropológica*, which is published by the Fundación La Salle, Instituto Venezolano de Investigaciones Científicas (Caracas). The Fundación La Salle has also published *Actas I Congreso Warao* (Caracas, n. d.), the record of the First Warao Congress, which was held in Tucupita, Venezuela, 10–12 October 1980.

Revised Bibliography*

WARBURG, ABY. Aby Moritz Warburg (1866–1929) was a German art historian and *Kulturwissenschaftler* (scholar of cultural studies) who developed new concepts in the understanding of the cultural expression of human consciousness and behavior. Although he was not well known during his lifetime and long after that remained a mere name to all but a small circle of art historians, Warburg has gradually become recognized as a major figure in the study of religion. His importance for contemporary research lies not only in

issues connected with iconology; his profound curiosity for both psychology and anthropology allowed him to develop new and successful strategies for deciphering complex and impenetrable imagery, and his interest in the nature of communication and the transformation of the symbolic meaning of signs established him as an exponent of the modern study of symbolism.

Warburg was born in Hamburg on June 13, 1866, the firstborn son of the banker Moritz Warburg and Charlotte Oppenheim Warburg. According to the Warburg legend, Aby Warburg rejected his birthright as his father's successor in the firm at the age of thirteen. He instead demanded not only an allowance according to his financial needs but also the financing of an expensive life devoted to research, which achieved its climax in the public activities of the Kulturwissenschaftliche Bibliothek Warburg (KBW, later known as the Warburg Institute) and the outstanding scholars associated with it.

WARBURG'S WORK. In 1886 Warburg began his studies in art history, history, and archaeology in Bonn at one of the most famous German universities of the late nineteenth century. From 1888 to 1889 he attended a seminar of August Schmarsow in Florence. From the writings of Giorgio Vasari interpreting the rise of painting as an increase in the ability of artists to copy nature, Warburg learned that the artists of the Florentine Quattrocento were not the faithful and dedicated imitators of natural appearance that they were reputed to be. In particular the drapery style of Filippino Lippi and Sandro Botticelli deviated from realism in the addition of swirling garments and flying hair. In his Ph.D. thesis, concerning Botticelli's *Geburt der Venus* und *Der Frühling*, Warburg made a convincing argument for this unexpected observation by uncovering the historical circumstances of its making. He was able to prove that antiquity was visualized with the aid of dynamizing formal additions because the poets and philosophers in the immediate circle of Botticelli's patrons derived a certain mental image from ancient writers who delighted in descriptions of enchanting movement. Only in the High Renaissance was the illustration of imaginary themes as visualized through fantasy developed into a language of idealization that became the typical stylistic idiom of the period.

Warburg's new inclination to explain stylistic elements and their change in psychological terms was partly influenced by his teachers in Bonn and later Strasbourg, where he completed his dissertation. Hermann Usener, whose lectures on Greek mythology Warburg had attended, focused on the problem of mental mechanisms as reflected in the origins of mythology. Influenced by the Italian evolutionist Tito Vignoli and Charles Darwin's *The Expression of the Emotions in Man and Animals* (1872), Warburg was able to trace human expression back to animal reactions deriving ultimately from fear. By interposing an interval of reflection between impulse and action, human beings are capable of turning the uncontrolled reactions of emotion into symbols

of gesture and art. Warburg's monistic psychology of art, however, is not only based on this early theory of stimulus and response, a predecessor of ethology, but also on theories derived from John Locke's associationism, as specified by the German philosopher Johann Friedrich Herbart. According to the historian Karl Lamprecht, one of Warburg's teachers in Bonn, the collective mentality of a society was determined by the character of inherent mental images (*Vorstellungen*) as symbolized in art. Warburg used these new and scientific approaches to get at the mental images that become apparent behind art, literature, and religious ceremonies.

In conveying his program Warburg concentrated mainly on the elucidation of the rather narrowly confined cultural circle of the Renaissance. After his marriage to the artist Mary Hertz in 1897, he moved to Florence (1897–1904) to bring the famous patrons of Florentine art and their concerns to life. The complexity of the Florentine society of the fifteenth century was reflected in the famous works of art commissioned by Lorenzo de' Medici and his circle. At the artists' studios in Florence a new style emerged out of a renewed study of antiquity that contradicted the usually accepted costume realism *alla francese* (French style of representation) that dominated art up to that time. It was not the dismissal of a too earthbound and materialistic fashion in order to reveal the body and its language of passion that puzzled Warburg but the discovery that the artistic loyalties of Lorenzo's circle were by no means undivided. On the contrary, the classical ideal had to overcome a heavy medieval style of calm realism originating in Flanders, and this struggle against strong opposing forces was the reason for the assertiveness and strength of the finally triumphant style *alla antica* (antique style of representation). Antiquity, with its language of passion, therefore could only be welcomed when it helped to squash the tendency toward nonreflective, shallow realism. Without a counterpoise, or in Warburg's terms, without a sense of distance, the same images would lead to empty rhetoric and eventually to the degradation of art.

The classical elements and their change of meaning in particular led Warburg to a line of research that nearly dominated his career after about 1908. The Quattrocento frescoes in the Palazzo Schifanoia depict the Greek planet deities in their typical manner of representation according to medieval traditions of mythology but also the illustrations of fictitious constellations, the Decans, astrological imagery that reached the Renaissance through Arabic sources. Only the High Renaissance succeeded in surmounting the demons of astrology and allocating them to the aesthetic and distanced sphere of pure beauty. The different renderings of the planet gods from medieval disguise to their former Olympian form is a perfect illustration of how primitive anxieties influence people's mental images. From a psychological point of view, the constellations that humans project onto the bewildering quantity of stars and their identification with mythical beings has to be understood as a first step toward orientation in a hostile world. This distance, as acquainted by the power

of reflection, gets lost again if the same images evolve into a mere screen for contemporary fears and wishes.

During that time Warburg's interest in questions of mastering fear with the help of cultural media was not only theoretical. Personal experience with a life-threatening illness and the ubiquitous menace of Jewish existence had frequently led to attacks of anxiety that colored his philosophy of culture. With the collapse of Germany after World War I, Warburg's mind was unable to withstand the threatening impressions, and his referral into psychiatric clinics in Hamburg and Jena became inevitable. Only the skilled Swiss psychologist Ludwig Binswanger finally succeeded in reintegrating Warburg's personality. During his stay at the sanatorium in Kreuzlingen, Warburg struggled to regain clarity by giving his lecture "A Serpent Ritual" to his fellow patients. This lecture was based on a journey he took in 1895 and 1896 to the United States, where he had studied the culture of American Indians at the Smithsonian Institution and in the Indians' genuine Lebensraum on the arid plateaus of New Mexico. The recourse to his visit to the Hopi Indians in 1895–1896, which supplied him with material for later reflection, was significant when considered under different aspects. The study of traditional religion and art, with its primitive and violent emotions, led him back to the supposed origins of culture, where ritual and symbolic processes develop a particular sense of distance, acquired through reflection, that allows the sublimating transformations of frightening impressions into a fragile *sophrosyne* (the antique virtue of self-possession and composure).

During Warburg's illness his assistants Fritz Saxl (1890–1948) and Gertrud Bing (1892–1964) did much more than continue the work of the KBW, which had such an eminent and probably even sacral meaning for their mentor. The library was more than a systematic collection of books shaped for Warburg's special research program; it was the reflection of his thought and mental process. Warburg, who never tired of shifting and reshifting his books in accordance with his actual system of thought, looked upon his library as a fortress against the forces of darkness and hell. In this sense the library, with its ties both to science and to an obscure and demonic world, became a "consecrated space" where the fight against demonic forces in his struggle for clarity derived its greatest strength.

In the years of Warburg's recovery Saxl completed a paper by Warburg on astrological prophesies in the period of the German Reformation. In addition Saxl and Bing began preparations for an extensive project that was planned as a comprehensive study of the results of Warburg's former work. As soon as Warburg's health improved, he and his assistants began to pave the way for the *Mnemosyne-Atlas*, a reflection of the ancient images and symbols as preserved in the collective memory of the European race. According to Warburg's theory, any experience leaves an engram in the nervous system, which acts as a sort of energy storage space. This accumulated energy becomes tangible in paintings and

symbols. In this context the act of painting, as well as the act of symbolizing in ritual, is a process of progress in the sense that it is an attempt to control a threatening energy that is fed by the collective memory of the societies under question. Warburg was not able to finish his life's work. He died in Hamburg in October 1929 at the age of sixty-three.

CONTINUING HIS WORK. Warburg's death, although a great loss for his family, friends, collaborators, and disciples, was by no means the end of the research program he had summoned into existence. During Warburg's illness Saxl had opened the KBW to the public and had transformed the formerly private institution into one of high-level research. It is mainly due to Saxl that an interdisciplinary circle of scholars, including Ernst Cassirer (1874–1945) and Erwin Panofsky (1892–1968), became attached to the Warburg Institute. During their long cooperation Saxl not only looked after Warburg's publications and popularized his research but, together with Bing and Edgar Wind (1900–1971), carried on Warburg's mission and saved the library for generations to come.

Even after Warburg's death and the successful emigration of his library to London, Warburg's former disciples and assistants kept close links to the work and thinking of their mentor. Many of the publications of Bing, Wind, Saxl, and Carl Georg Heise (1890–1979) grew from the distribution and reception of Warburg's ideas. Mainly by elaborating upon and systematizing Warburg's theoretical and conceptual assumptions were they able to acquire new and authentic positions in art history that made them into the leading experts in their subjects. Saxl, first interested in astrological and mythological Scripture, later included ancient religions as one of his main subjects of research. His work *Saturn and Melancholy* (1964), which he wrote together with the skilled historians of art and culture Erwin Panofsky (1892–1968) and Raymond Klibansky (1905–), became influential in future research. Wind, who joined the Warburg Institute in 1928, focused on the Italian Renaissance but was also influential in developing iconography as a method in art history and the history of religions. Ernst Gombrich (1909–2001), a young art historian with close ties to the Viennese school, gained a leading position in the world of art historians by writing the *Intellectual Biography* of Warburg, which has continued to be influential in the reception of Warburg's works. Gombrich's psychological view of art as a mutuality of creativity allowed for a new concept of the history of art that includes prehistorical and non-European art and its iconography. Panofsky, probably the most renowned art historian of his century, became associated with the Warburg circle during his scholarship at the University of Hamburg. His main concern was to safeguard methodological approaches in art history. It was Panofsky who finally established iconology as a method of research and who elaborated upon its theoretical foundation. Chiefly through his synopsis of the manifold disciplines of research, Panofsky was able to carry on the inheritance of Warburg.

INA WUNN (2005)

WARD, MARY. Mary Ward (1585–1645) was the founder of the Institute of the Blessed Virgin Mary, earlier known as the "English Ladies." She is recognized for pioneering the active, unenclosed life for nuns within the Roman Catholic Church, and her institute was the first systematic attempt to adopt for women the Jesuit missionary purpose and governance, with its emphasis on mobility and centralized structure under a superior general answerable directly to

the pope. Traditionally, and in canon law, the members of women's religious orders were enclosed and monastic, a definition that was reinforced by the Council of Trent (1545–1563) as part of its reform of Catholicism. Mary Ward's was not the only contemporary initiative to challenge the status quo, but it was the most far-reaching and controversial—and remained so long after her death. She was convinced that “women in time to come will do much,” but it was not until the aftermath of the French Revolution, in response to a powerful female movement to revitalize Catholicism, that the centralized active model was approved for women, and her vision was fully realized.

Born into a family of minor landed gentry in the north-east of England, Mary Ward was educated at home, where she learned Latin and showed a gift for modern European languages. The Wards belonged to the persecuted English Roman Catholic minority, and Mary was taught her faith by the Jesuit chaplains secretly employed in their households, and by female relatives, several of whom served prison sentences for persistent nonconformity to the established Church of England. A culture of heroism for their faith was evident within the Ward kinship network, most notably when three of her uncles died resisting arrest for their part in the Gunpowder Plot of 1605 to blow up the Houses of Parliament in an attempt at the political restoration of Catholicism.

In the same year Mary rejected a proposal of marriage favored by her father and her confessor in order to pursue a religious calling. She traveled to Stt Omer in Flanders, first joining the Poor Clares and then in 1607 to 1608 successfully founding a new Poor Clare convent in Gravelines for Englishwomen. She seemed settled, but in 1609 she experienced the first of a series of mystical illuminations, which she described as “seeing intellectually,” that determined her subsequent decisions: “there happened to me a thing of such a nature that I know not, and never did know, how to explain. It appeared wholly Divine, and came with such force that it annihilated and reduced me to nothing” (Wright, 1997, p. 3). Understanding that she was to leave the convent to undertake some work willed for her by God, she returned to London. After a second illumination she gathered a group of young women of similar social background who trusted her leadership. In 1610, with the support of the Jesuits and the local bishop, they opened a quasi-religious house in St. Omer giving instruction and teaching girls evangelical activism and prowess. A third illumination in 1611, reinforced by a fourth in 1615, led Mary to understand that her community should adopt, with some adaptations, the constitutions of the Society of Jesus, their *Formula Instituti*. The vision made clear to her that the Society would not approve, as indeed it could not, since its founder had forbidden it to direct the work of nuns.

After 1615 Mary developed her institute, writing constitutions and forming its members as teachers and domestic missionaries for work in England. Between 1616 and 1628 it

expanded, attracting support from leading churchmen and nobility. New houses and schools were opened across the continent: in Liège (1616), Cologne and Triers (1620–1621), Rome (1622), Naples (1623), Perugia (1624), Munich (1627), and Vienna (1627). At the same time it attracted a good deal of hostility, and petitions were received in Rome from Jesuits, English clergy suspicious of the Jesuits, and individuals scandalized by their boldness and public life. New names—“Jesuitesses” and “galloping” or “gadding girls”—were added to that of “English Ladies,” and they were accused of usurping priestly roles.

From the outset Mary sought papal approval for the institute. In 1621 she made a journey of 1,000 miles on foot from Brussels to Rome to present her constitutions to Pope Gregory XV, who, impressed with her character, referred the documents for consultation. But by 1628 the controversy had damaged the institute beyond recovery, so that Mary's re-presentation of her case to Pope Urban VIII in 1629 could not avert condemnation. Individual houses of the institute were firstly warned and from 1628 onwards suppressed by the Spanish Inquisition, culminating in the promulgation of the papal bull *Pastoralis Romani Pontificis* in January 1631 emphatically suppressing the whole institute and leading to Mary's imprisonment on heresy charges.

Although Mary was cleared of heresy by Urban and continued to live in Rome with companions, the remainder of her life was dominated by ill health. In 1637 she returned to England, where she died close to her Yorkshire home on January 20, 1645. Loyal companions slowly restored the institute from a base of strength in Munich under the protection of Maximilian of Bavaria. In 1749 Pope Benedict XIV issued a landmark judgement, *Quamvis Justo*, approving the restored institute's members as active unenclosed religious, provided they worked under local bishops and ceased to claim that their institute had been founded by Mary Ward. It was a further 160 years before another pope, Pius X, rehabilitated her as founder of the Institute of the Blessed Virgin Mary. Interest in Mary Ward grew during the twentieth century and, in the context of changing attitudes, her reputation grew to the point where in 1982 John Paul II extolled this “remarkable Yorkshire woman . . . a pioneer of the active unenclosed congregations for women.”

SUSAN O'BRIEN (2005)

WARLPURI RELIGION. While the boundaries of Warlpiri territory have moved through time, the central-western part of the Northern Territory has generally been regarded as the heart of Warlpiri country. Until they were forced to sedentarize by the Australian government in the early 1940s, the Warlpiri people led an independent hunting and gathering life in an area spreading over approximately 53,200 square miles (137,800 square kilometers). While mandatory sedentarization deprived Warlpiri men and women of their socioeconomic roles as gatherers and hunters, they sustained what continues to give them their *raison d'être*: their connections to the land, their cosmology, and their ancestors. The Warlpiri reside mainly in the settlements of Yuendumu, Lajamanu, Ali-Curang, Willowra, and Nyirripi (and their outstations) and represent the most populous Aboriginal group in central Australia. The fact that most Warlpiri continue to reside on lands they traditionally inhabited accounts in part for the vigor of Warlpiri ritual life.

THE JUKURRPA. When discussing their religion, Warlpiri men and women invoke a key concept: the *Jukurrpa*. The *Jukurrpa* provides the Warlpiri with links to their ancestral past and land, as well as to their ancestors and to each other, reifying contemporary social relations and articulating omnipresent connections at the core of Warlpiri sense of identity (Dussart, 2000). A thorough grounding in the notion of *Jukurrpa* in all its iterations and contexts is necessary to understand the richness of Warlpiri ritual life.

Jukurrpa has often been translated in English as "Dreaming," "Dreamtime," or "Ancestral Times" (Mulaney, Morphy, and Petch, 1997), but these translations obscure rather than explain the richness of Warlpiri cosmology. *Jukurrpa*, as explained by contemporary Warlpiri, has five related distinct and interrelated usages. Contrary to the simplified definitions appropriated by Western "spiritualists" in the 1990s, *Jukurrpa* refers first to an ancestral period during which the world was fashioned by Ancestral Beings who instituted social and religious orders for humans. Although *Jukurrpa* refers to a fictitious past, the Warlpiri maintain that it continues to exist in the present. According to an immutable law, when the *Jukurrpa*, which has always existed, manifested itself, the ground was flat and shapeless. Mythical heroes and heroines emerged from the earth, traveled around the countryside, performed marvelous acts, and continue to live in the *Jukurrpa* (Stanner, 1966, p. 266). Their travels transformed the shapeless ground into features (hills, water-

courses, trees, and so on) and left behind them "ancestral powers." Features in the landscape readily apparent are proof that the *Jukurrpa* is true (*yijardu*) and that its essence is ever present.

The second usage is to designate the whole category of Ancestral Beings. The actions of these legendary beings, who emerged from the earth, shaped the landscape, and performed marvelous acts, are still reenacted by the Warlpiri in their ritual performances. Every spot visited became a sacred site and every sacred site became part of a specific *Jukurrpa* itinerary. Some Ancestral Beings remained near their place of emergence, while others traveled through territories that belong to neighboring Aboriginal groups. In their travels, Ancestral Beings left behind "life forces" (Peterson, 1969, p. 27). The Warlpiri identify three main kinds of life forces: *kuruwarri*, *pirilirra*, and *kurruwalpa*.

The *kuruwarri* are the marks, signs, and designs mythical beings left behind, while the unseen aspect of the *Jukurrpa* is invoked by the use of the word *pirilirra*. *Kuruwarri* and *pirilirra* are complementary categories, with the former referring to the visible (and the latter to the invisible) traces of the *Jukurrpa*. *Pirilirra*, however, has a more specific application: to the "spirit" or "essence" of the individual, a spirit that enters via the semen of the father and the egg of the mother and that localizes itself in the two kidneys. Male and female elements are thus found in every individual. The *pirilirra* is believed to imbue people, Dreaming stories, and the ceremonies that invoke the *Jukurrpa*. It is the potency of *pirilirra* that guarantees the effectiveness of a ritual in the maintenance of the *Jukurrpa*.

The essence of the *Jukurrpa*, called *kurruwalpa*, is associated exclusively with the act of conception. Whereas the *pirilirra* is linked physically to the individual wherever that individual may be, the essence or spirits associated with conception are all site-specific. While a mother is walking along, a *kurruwalpa* will penetrate her—through the womb, foot, or navel—in a fashion that animates the fetus. When the *kurruwalpa* emerges, that particular site becomes known as the conception site of the soon-to-be-born child. Later on, the child will have special rights and ritual obligations over the site and the Ancestral Beings associated with it.

Even though it is often argued in anthropological literature that ancestors (i.e., deceased humans) and Ancestral Beings are fused indistinguishably, the actual relationships between ancestors (*nyurnupatu*) and Ancestral Beings (*Jukurrpa*) are far more complex. It is true that, while telling a *Jukurrpa* story, a Warlpiri person may refer to his or her deceased father as, say, "an Ancestral Emu" (*Yankirri*), implying the *Jukurrpa* Ancestral Being of that name. Such reference is particularly common when the cosmologically constituted connection to that Being can strengthen the narrator's ceremonial and territorial rights associated with the myth of a particular Ancestral Emu. This does not mean, however, that the deceased is instantly folded into, or immediately becomes one with, some larger cosmological force situated in

the *Jukurrpa*. In point of fact, further interrogation reveals that at least two generational levels must exist between the deceased and a speaker for the former to merge fully with the *Jukurrpa*, a process of genealogical amnesia that transforms humans into Ancestral Beings.

The third sense of the *Jukurrpa* employs the term to denote specific narratives or Dreaming stories—as, for example, in the myth of an Ancestral Rain Being—such that not only the Being, but also the *ngurrara* (homes) it created in its travels are referred to as *Ngapa Jukurrpa* (Ancestral Rain Dreaming, or Rain Dreaming). Before returning to their site of emergence, Ancestral Beings may travel far, traversing many other homes (each portion of which represents a particular portion of the itinerary and a particular story) and many other countries owned and overseen by different kin groups, including many who are not Warlpiri. Other Ancestral Beings do not stray far from their site of emergence.

The fourth usage refers to a specific segment of an ancestral itinerary at a given site and its vicinity. One or several songs, designs, and dance sequences are associated with a segment of a Dreaming, which are enacted during ritual ceremonies. The same basic elements of designs, songs, and dances performed by men and women are stylistically arranged according to age and gender that characterize a specific ritual activity.

Finally, *Jukurrpa* is used to refer to nocturnal dreams. When asleep, dreamers may have a dream in which they “see and hear” Ancestral Beings. If the dreamers can remember song(s) sung by the Ancestral Beings as they wake, their dreams, after thorough examination by *Jukurrpa* experts, are usually integrated within an existing *Jukurrpa* itinerary. It is through such dreams that the Warlpiri have learned about (and continue to learn about) the *Jukurrpa*. The Warlpiri maintain that nothing is new, but simply forgotten. The *Jukurrpa* is believed to be immutable, whereas the reality of life is that cosmology and religious order are dynamic.

RITUAL MANAGEMENT. While the *Jukurrpa* has and will always be, humans in specific kin formations have the responsibility to reproduce and maintain it by enacting Dreaming stories in ritual performances as prescribed by the Ancestral Beings. Through the performance of ceremonies, the Warlpiri reaffirm their ties to the land, the *Jukurrpa*, and to one another. This is achieved following specific patterns of kinship—patterns that have been modified since sedentarization. Before being forced to settle, the Warlpiri lived a seminomadic life traveling in small groups of up to thirty relatives and in-laws (like most central Australian Aborigines). They camped for short or long periods of time with either spouse’s families, and they would gather in great numbers with other central desert Aborigines for ceremonial purposes. Ritual activities such as initiations and betrothals usually took place at specific sites along the itinerary evoked in performances orchestrated by groups of kin responsible for the area and the associated *Jukurrpa*. Since sedentarization, ceremonial performances tend to be performed near settlements.

Dreaming stories, sites, and associated rituals are owned and managed along complex lines of subsection and kinship association. The Warlpiri have an Arandic system of kin classification (first identified by Mervin J. Meggitt [1962]). The Warlpiri divide the world into two groups of people: those they are related to and those who are not their relatives. Relationships with kin may be actual (when both parents are shared), close (when they share one relative, even distant), or “classificatory” (when kinship ties are established through land and daily life). The basic egocentric distinctions of the Arandic system are grouped into a set of sociocentric terms known as subsections, which in turn are further grouped into patrilineal, matrilineal, and generational moieties. Each descent group is associated with one or other of the four patri-subsection couples used to identify patterns of land-ownership.

The basic structure of landownership, and by implication ritual transmission and social organization, is constituted along lines of patrilineal descent. A person’s patrimoiety is referred to as *kirda*, while the opposite patrimoiety is referred to as *kurdungurlu*. The real significance of *kirda* and *kurdungurlu* in the organization of religious life and land tenure derives from the more specific uses and the rights associated with them. Generally, a man or a woman inherit rights as *kirda* to more than one country and associated *Jukurrpa*. A *kurdungurlu* is a person who has inherited responsibilities through a matrilineally traced interest. So each Warlpiri person has rights and responsibilities over countries and Dreamings as *kirda* and as *kurdungurlu*. However, acquisition of knowledge and responsibilities to act as *kirda* or *kurdungurlu* for sites and *Jukurrpa* acquired through classificatory kin associations is common and the result of residential alliances developed since forced sedentarization.

A *kirda* is often referred to in Aboriginal English as the “owner” of a *Jukurrpa* and its associated sites. Owners are responsible for the maintenance of the well-being of the land and its people by performing ritual ceremonies. The *kurdungurlu* is like a “manager” of a *kirda*’s Dreamings and associated sites and ritual performances. Reenactment of a *Jukurrpa* by *kirda* requires the surveillance and advice of *kurdungurlu*. The *kirda-kurdungurlu* relationship is, in theory, reciprocal, but in practice (and since sedentarization) this relationship is more often based on alliance rather than on descent.

In all their discussions of landownership, *Jukurrpa*, and ceremonial responsibilities and rights, Warlpiri men and women explain how transmission lines to obtain and pass on religious knowledge in no way restrict the role of either gender in the inheritance or performance of that knowledge. While men and women are identified as *kirda* or as *kurdungurlu* for specific Dreamings and related sites, certain segments along the *Jukurrpa* geospecific itinerary may be shared by both genders, while others are exclusively enacted in men- or women-only performances.

CEREMONIES. The *Jukurrpa* is primarily maintained through the singing, dancing, and painting performed during land-based ceremonies. By enacting their Dreaming stories, Warlpiri men and women resolve conflicts, maintain and restore the health of the land and all that live on it, and uphold their ties to the land, to their ancestors, and to one another. In theory, *kirda* and *kurdungurlu* should never be negligent. If they do not enact their *Jukurrpa* correctly (*junga*) not only the land may become ill, but the people, animals, flora, and resources attached to it are put at risk as well. As one important Yuendumu ritual leader, who passed away and thus cannot be named, explained “if you do not care for country, that country will simply die. We cannot forget our *Jukurrpa* [and our obligations to it].”

Colonial and postcolonial forces have irrevocably changed Warlpiri ritual activities. A number of ceremonies have disappeared, and others have been altered. Regardless, initiation ceremonies with plural motives—such as male circumcision and betrothal, men- and women-only ceremonies, ceremonial cycles performed by both men and women, and rituals surrounding conception, death, love songs, and curing—now form the core of Warlpiri religious activity.

Some of these performances may last weeks, while others are performed in less than half a day. Ritual cycles tend to occur during a specific time of the year, such as during the wet season, which also coincides with Western-style holidays; adults and children are able to participate in these long initiation ceremonies. Other ceremonies, such as women-only performances called *yawulyu*, may occur throughout the year.

Three main distinctions are generally made when identifying who can participate, orchestrate, and witness ritual activities. These distinctions are defined by three ceremonial events: *tarruku*, *wiri*, and *warraja*.

Tarruku events are considered dangerous, potent, and powerful. Only the most senior persons knowledgeable in the specific segments of a *Jukurrpa* can orchestrate *tarruku* performances. *Tarruku* events associated with male initiation cannot be witnessed by women, though senior women are aware of their content and purposes. Others, such as *wiri*, can take place during ceremonies orchestrated by initiated men and enacted by both men and women. *Wiri* performances are considered potent but not as dangerous as *tarruku* events.

Senior Warlpiri men and women use the term *warraja* to refer to ritual events open to all: initiated, noninitiated, non-Warlpiri, and non-Aboriginal people. *Warraja* events are public but remain imbued with the potency of the *Jukurrpa*. These events may be performed by men or women or both.

As in all typologies, the ones for *tarruku*, *wiri*, and *warraja* are at best truncated. Explanations of ritual activities and terms employed to categorize them are done by specific persons for a specific audience. For example, a person who has

not been given the rights to sing and dance in ritual activities because of his or her age could use *tarruku* to designate all ceremonies performed by the senior Aborigines. In brief, many religious Warlpiri terms, such as *tarruku*, *wiri*, and *warraja*, are imbued with supplemental meanings according to the ritual status, age, and gender of who uses them and in front of whom they are used.

Even though Warlpiri men and women unfailingly maintain that the *Jukurrpa* has not changed, they readily admit that their ritual repertoire has undergone transformation since forced sedentarization. Biomedical Western practices have reduced the frequency of birth and health-curing rituals. The performances of love and sorcery rituals, which increased in the early years of sedentarization, are now in decline. While certain ritual activities have faded away, some have been modified and others added to the religious repertoire. Inter-Aboriginal ceremonial cycles described as *tarruku* and *wiri* (which cannot be described here) and *warraja* have been organized since settled life. Creolized ceremonies blending elements of Christianity and Warlpiri religion have emerged and have had a measured impact on Warlpiri ritual life as a whole). Regardless, even though ritual repertoires may be smaller and the duration of performative events are shorter, the vitality of and the importance of the *Jukurrpa* has retained its intensity.

Initiation and conflict-resolution rituals continue to be regularly performed, as they play crucial roles in the production of Warlpiri identity in neocolonial Australia. These ceremonies are usually enacted during school breaks and near settlements to maximize participation and valorize the importance of such events.

RITUAL PERFORMANCES. There are two main groups of ceremonial performances. The first set is associated with rites of passage (initiation, betrothal, and death), and the second includes performances outside elemental ones connected to the cosmological construction of Warlpiri identity.

The main ritual cycle linked to initiation is called *kurdi-ji*. This is a ritual in which men and women perform gender-specific and joint ceremonies and that marks the first stage of a boy's initiation into manhood through the act of circumcision. Warlpiri boys have to undergo this procedure, which is restricted to men when they are between twelve and fifteen years old. It is during *kurdi-ji* that preferred marital associations are sealed between the initiand's family and the future spouse's family, whether the future wife is born or not. After the circumcision of their first son, mothers, if they wish, will be able to begin their ritual career. Mothers give away their sons; sisters dance so their brothers enter manhood; fathers, mothers' brothers, and future in-laws seal their newly articulated kin and spiritual responsibilities. After *kurdi-ji* ceremonies, both male and female participants have acquired sets of kinship obligations as well as spiritual responsibilities.

The young circumcised men, aided by their relatives, will have to go through other initiation ceremonies to be able

to participate fully in their thirties in the ritual life of their settlement. The second stage of initiation is called *kajirri* and *kankarlu*, or “high school” in Aboriginal English (Meggett, 1966; Peterson, 1970). *Kajirri* is associated with a set of Dreaming itineraries and *kankarlu* with others. Young men will be initiated in one or both of these cycles. Their participation will be predicated on their associations with the *Jukurrpa* itineraries evoked, the timing of the events, and their availability. *Kajirri* and *kankarlu* require planning on a grand scale because they demand the participation of Aboriginal people outside Warlpiri territory. They are usually performed only once every few years, and young men in their late teens are strongly encouraged to participate to further their understanding of their *Jukurrpa* and their responsibilities to the land and their ancestors, and to undergo other genital transformation. Young men who have undergone the initiation ceremonies of *kurdiji* and *kajirri* (or its variant, *kankarlu*) can be subincised, a highly restricted surgical intervention. Senior men and women active in ritual life participate in initiation ceremonies and perform gender-specific ceremonies in which they reenact restricted versions of Dreaming stories. Kinship ties among Warlpiri and other Aboriginal families are cemented and reaffirmed during *kajirri* and *kankarlu* events, prompting participants to perform other rituals together.

There are no marriage ceremonies among the Warlpiri, unless future spouses get married in a church as Christians. Betrothal takes place during initiation ceremonies. The ceremonies marking a person’s death are called *malamala*, or “sorry business” in Aboriginal English. *Malamala* ceremonies are performed by a dead person’s relatives. Widows, mothers, and mothers-in-law go to a “sorry camp,” where they are placed under a speech taboo that can last from several weeks to several months (Kendon, 1988). Men conduct “sorry business” but are not put under a speech taboo. Male relatives self-inflict wounds to their bodies to show their sorrow at the loss of their relative. The name of the deceased as well as all words sounding the same are placed under a speech taboo. All individuals sharing the name of the deceased or something that sounds similar are subsequently identified as *kumanjayi*, or “no name” (Nash and Simpson, 1981). All performances of the *Jukurrpa* associated with the deceased are suspended until proper “finishing-time” rituals are conducted to lift the various bans imposed after death. With death, the *pirrirra*, or “essence of the individual,” enters a liminal state identified as *yama* or *marnparrpa*. Since Warlpiri do not regard death as “natural,” male relatives conduct a ritual in which they accuse various individuals of neglectful and malign actions that led to the death of their relative.

Every place and object owned by the deceased is put under taboo, and the ground where he or she walked has to be swept to ensure that the spirit of the deceased does not remain among the living. Plagued with social problems and deadly diseases, the Warlpiri are involved in *malamala* almost on a monthly basis. At the “finish-time” ceremonies,

women are relieved from their speech taboo and other restrictions on remarriages are lifted, as is the ban on enacting the itineraries of the *Jukurrpa* associated with the deceased. Other individuals bearing the name of the deceased can resume the use of the name. The “finish-time” event can take place a few months or many years after the death of the individual whose country is “opened up” again. This process of reintegration has wide-ranging implications, offering insight into the relationship between the living, the dead, and the Ancestral Beings.

The second set of rituals mentioned earlier are the following ceremonial cycles: *jardiwanpa*, *kura-kurra*, *ngajikula*, and *puluwanti*. These are undertaken jointly by senior men and women. These four ceremonial cycles are distinguished by the Ancestral Beings they invoke. Most of the ceremonies are restricted, except for the last night of the cycles when the initiated, both young and old, are engaged in the final steps of conflict resolution. These ceremonial cycles contain a great deal of intra- and intersettlement importance, and their highly valued content is regularly exchanged with neighboring Aboriginal groups.

Since sedentarization, there has been a steady decrease of public performances called *purlapa*. *Purlapa* events are performed only by men and, like most public performances, they proclaim the richness of the *Jukurrpa* beyond the settlement, circulate ritual knowledge, and in the process sustain if not revivify social networks. In this sense, public performance simultaneously functions as a mirror and a projector of Warlpiri culture. Today, women’s public rituals called *yawulyu* play such roles. The transfer of performative responsibility reflects more than the mutability of Warlpiri ceremonial life under postcolonial pressures, as it underscores the gender-specific methods by which sedentarized Warlpiri kin groups sustain their religion and their prestige within and beyond the confines of their settlements.

Yawulyu rituals are only performed by women. These ceremonies can be either restricted or public, and they have plural functions. In their *yawulyu* ceremonies, women enact the myths for which they are *kirda* assisted by their *kurdungurlu*, and most of them are performed in the settlements where the participants live. *Yawulyu* are performed to enhance women’s knowledge of the *Jukurrpa*, sexuality, fertility, well-being, and physical and spiritual growth, as well as to educate non-Aboriginal peoples about the importance of the land and the *Jukurrpa*. Through the performance of public *yawulyu* ceremonies, Warlpiri women have come to play crucial roles as gatekeepers of Warlpiri identity beyond the confines of the settlement.

Church *purlapa* is the Aboriginal English term used for creolized performances merging some components of Christian and Warlpiri religions. Only formally constituted in the late 1970s, church *purlapa* are performed by both men and women. Missionaries representing various branches of the Christian church have long struggled to convert the Warlpiri and have had a small but noticeable impact within certain

settlements. Since the mid-1990s, the younger generations have been far more actively engaged in orchestrating Christian ritual activities, such as church bands.

CONCLUSION. Despite colonial and postcolonial pressure, the *Jukurrpa* as a cultural form continues to provide a fundamental structure to the lives of the Warlpiri people. The *Jukurrpa* cannot change and gives to Warlpiri men and women feelings of continuity in a world of uncertainty. In their enactment of *Jukurrpa* itineraries, the Warlpiri reaffirm their ties to their lands, their ancestors, themselves, and other Aboriginal people. Even though the frequency of ceremonial performances has diminished and the length and site of performances modified, the power of the *Jukurrpa* remains strong. Through their ritual activities, Warlpiri participants demonstrate the importance of the *Jukurrpa* and their land to the world at large.

WATER. In the mythical narratives in which it is frequently employed, the image of water takes on many different aspects. This article shall try to classify its appearances and seek to understand how the diverse functions that it fulfills are ordered.

AT THE TIME OF ORIGINS. Many peoples tell how the world, already created in ancient times, was transformed and became what it is now. According to certain Australian traditions, the earth was originally surrounded by water, and in it were many spirits. Through the action of one of these spirits, the earth grew warm, and the first humans emerged from it. According to the Zuni Indians, a complex network of waterways circulates underground; the first Zuni were born there, at the lowest level. A pair of twins created by the Sun then made them climb to the surface. A pond marks the spot where they finally saw the light of day. A northern Australian myth tells the story of a *dema* (ancestral) deity. After one of his sons struck him with a lance, he threw himself into the sea; there, another of his children drew the lance out of his flesh where it had remained embedded. During the voyage the god then undertook, a spring appeared everywhere he rested. Finally, he plunged into the river Victoria, whose waters he proceeded to stir up until they formed deep branches in the forest; he then disappeared under a rock. From time to time he rises to the surface and causes storms; according to some accounts, he also occupies the region of the rainbow, where rain is formed.

Myths of this type show us water as present in the world from the most ancient times on, but they ascribe to it many

different situations. Whether peripheral to the land or underground, water is first a significant element of the universal order. Sometimes it figures simply as a geographical feature—the sea or a river defining the shape of a country. However, there is something more to take note of. Water can be passive, with a spirit independent of it taking the sole initiative in the act of transformation. And yet water is tied mysteriously to the birth of the first humans or to the destiny of a god, who, after disappearing into its depths, remains bound up with storms and rain. The scope of these differences becomes clear when considering lengthier accounts.

In seeking the origin of all things, many peoples relate how water appeared in the course of cosmogonic events. Their explanations fall into three principal mythic systems. According to the first system, the world is created by a god who remains largely transcendent to it. In this case water, like the entire world, is a product of divine action. According to the Desána of South America, “Sun created the universe. . . . [He] created the earth, its forests and its rivers. . . . He also created the spirits and water demons” (Gerardo Reichel-Dolmatoff, *Desana: Simbolismo de los Indios Tukano del Vaupès*, Bogotá, 1968, pp. 48–49). An African lament evokes “the one eternal God, the creator of the ocean and of dry land, of the fish in the sea and the beasts in the forest” (Louis Vincent Thomas, *Les religions d’Afrique noire*, Paris, 1969, p. 218).

In the second mythic context, the cosmogony takes on the aspect of a genealogy. The first ancestor is an entity whose simultaneously cosmic and divine attributes appear in the proliferation of his offspring. The waters that are then born throughout the generations are themselves generative. In a Greek system, the ancestral Earth gives birth to Heaven and to Pontos, the realm of the sea, composed of salt water. Earth then couples with each of these male principles. The first of the children she conceives from Heaven is Okeanos, a freshwater river, with deep eddies; he becomes the father of all the springs and rivers. Thus the deity who goes beyond the world remains immanent within it: In a way, he is present in the waters.

Finally, spirit may be presented as one of the primary agents of the formation of the world. Take for instance this Bambara myth: Out of the original void and motion a force, and then spirit, come forth. While the principles of things are being ordered, a mass falls and gives birth to the earth. However, a part of spirit arises; this is Faro, who builds the heaven. Faro then falls to earth in the form of water, thus bringing life to it. Dispenser of life, water is a manifestation of the divine spirit itself.

It is, however, in another type of cosmogony that the breadth and diversity of the functions of water become most intelligible. Here, water symbolizes what existed before the unleashing of the cosmogonic process, or the state of the world in the first phases of its history. There are numerous variations on this theme.

1. In its fluidity and elusiveness water may suggest the absence of form, the unsubstantiality and confusion from which the world will emerge. Inert, water has no power; a god or other beings independent of water will be the sole agents of creation. For instance, the following tale was told in the Admiralty Islands. In the beginning, there was nothing but an immense sea; in it swam a great serpent. Wanting a place where he could rest, he said, “Let a reef arise!” A reef then arose from the water and turned into dry land.

Biblical cosmogony illustrates the meaning of water in myths of this sort. The Bible brings together various symbols, including the desert, the void and darkness, the abyss, and the mass of water that the abyss contains and above which hovers the breath of God. This divine breath alone signifies reality. The other images have a negative value, evoking the idea of nonexistence; theologians will see in them a symbol of nothingness. Vedic language can go even further:

Neither Non-Being nor Being existed then.
Neither air nor the firmament above existed.
What was moving with such force? Where? Under whose care?
Was it the deep and fathomless water? (*Rgveda* 10.121.1)

In this question, the image of water alludes to the state of things prior to the distinction between being and nonbeing.

2. Water has no form of its own, but rivers have a bed and the sea has a bottom. This simple fact inspires several myths. Here is a Siberian example:

In the beginning, water was everywhere. Doh, the first shaman, flew over the primordial ocean in the company of some birds. Finding nowhere to rest, he asked the red-breasted loon to dive into the ocean and bring back some earth from the bottom. This the loon did, and on his third attempt, he managed to bring back a little mud in his beak. Doh made of this an island on the original ocean which became the earth.

The original ocean can thus cover some solid element. Moreover, despite its fluidity, water itself has substance; it is itself matter, and may contain suspended matter. In some myths the gods capture this matter or condense it. Thus the *Atharvaveda* (12.1) reads: “[The Earth] was originally a wave in the heart of the Ocean; the Sages went looking for it with their magic.” A Guinean myth tells how Ha made an immense sea of mud and, then, by solidifying the mud, created the earth. According to the *Kojiki*, Izanagi and Izanami drove a lance into the sea that extended below them. When they withdrew it, the salty drops that fell from it solidified and formed the first land: the island of Onogoro. A Greek commentator on the myth of Proteus expresses himself in more abstract terms:

There was a time when all that existed was formless and muddy . . . there was nothing but matter that had been spilled out. A formless inertia reigned until the artisan of all things, having attracted order in order to protect life, imposed its imprint on the world. He disjoined the heavens from the earth, separated the conti-

nent from the sea, and each of the four elements . . . assumed its own form. (Heraclitus, *Homeric Allegories* 64ff.)

In this type of myth, water no longer signifies nothingness; it possesses a true existence. The gods use it, but it remains inert; they alone are active.

3. Very similar accounts, or even variants of the same myth, however, endow water with a certain spontaneity. This is the case in a story told by the Muskogee of North America. Before creation, they say, a vast expanse of water was the only thing visible, and two pigeons flew over the waves. At one end, they noticed a blade of grass growing on the surface of the waves. From this grass the earth gradually took shape, and at last the islands and continents took on their present form. One may also refer to an Orphic Greek cosmogony, according to which the primordial water appears to have been muddy. The matter it contained was condensed to become earth, and then from water and earth was finally born the mysterious god who would engender the cosmic egg. Despite their very different styles, both of these myths share one feature: Something happens in the original waters, without the intervention of any power external to the waters themselves. They therefore possess a certain intrinsic power. Other myths go on to explain the nature of this power.

4. In Hindu cosmogonies, waters are often represented as a receptacle of the divine egg or seed, which grows in the waters, carrying the god full of activity. But they do not give birth to what they carry. “In the beginning, he created only the waters, and then, in the waters, he laid his seed. And this became a golden egg. . . . In this egg Brahmā was born of himself, the ancestor of all living things” (*Mānava Dharmaśāstra* 1.8–9). Auspicious for the development of the divine embryo, such waters fulfill an almost amniotic function. Egyptian mythology has a similar body of water, known as Nun. The primordial water is considered divine. It bears its own name and assumes human attributes. It can speak, and it can form a couple with its feminine double, the goddess Naunet. In Heliopolitan tradition, it is in Nun that the autogenous solar god is born and later rests. There he begins his creative or generative activity, and there, perhaps, the first gods begin their existence.

5. The image of a vivifying water that favors the birth of a god or the growth of an embryo is in fact very close to that of a fecund and procreative water. Some Egyptian texts give the impression that Nun himself engendered the solar god, whom he calls “my son.” Nun has thus been called the “father of the gods.” For a more clear-cut example of an image of procreative water, however, one may turn to the Babylonians. The Babylonians recognized two beings, Apsu and Tiamat, who existed prior to the formation of heaven and earth. They are at one and the same time waters, whose currents, in the beginning of time, mingled in a single mass, and two personified divinities, one masculine and one feminine. Their union produces another divine couple, who in turn will have their own offspring, so that Apsu and Tiamat

become the ancestors of all creatures and, in this sense, the first authors of the cosmogonic process. Greece had a similar system, which Homer has preserved. Simultaneously currents of water and anthropomorphic deities, Okeanos and Tethys couple and give birth; their descendants will include all beings who will constitute, rule, or people the universe.

Essential to the life of plants, animals, and humans alike, water can be identified with the life-bearing forces and with fecundity itself. The regenerative nature can appear in a less biological fashion. One reads in the *Śatapatha Brāhmaṇa* (11.1.6.1): “In the beginning, the waters and the ocean alone existed. The waters had a wish: ‘How shall we procreate?’ They made an effort. They practiced ascetic heating [*tapas*], and so it happened that a golden egg appeared.” This egg contained Prajāpati. Thus not only is water filled with the desire for procreation (*kāma*), it is also capable of truly creative effort and ascetic heat (*tapas*).

When looking at the role water plays in the later phases of the creation of the world, one sees these observations confirmed. Within one and the same cosmogonic system, waters can successively assume attributes that enable one to distinguish different systems within the most ancient phases. For example, it was seen that the embryo of Prajāpati developed in the primordial waters. But then Prajāpati himself undertakes the creation of the waters. In the *Śatapatha Brāhmaṇa* (11.1.6.16–19), Paramestīn, son and hypostasis of Prajāpati, wished to become all things on earth. So he became water. Similarly, Prajāpati will become breath, and Indra, the word. These notions are not contradictory; they represent different stages in creation. Whatever their amniotic qualities, the primordial waters are formless and not especially substantive, since Prajāpati still remains an embryo within them. After his birth, however, the god creates more defined and concrete waters outside of himself. In this way the text shows that the deity penetrates the waters just as he penetrates the entire universe.

Other narratives make simpler distinctions among the successive states of water. If primordial waters are an inert mass, it would be logical for them, during the course of creation, to be influenced by the actions of the gods who rule them. In the Bible, God creates a space in the midst of the original waters, dividing it into two masses, the upper and the lower waters. After creating a solid mass, he then separates that from the lower waters, thereby forming the sea and dry land.

Waters also submit to the demiurgical action in more ambiguous accounts. Here is a Fali (African) myth: One of the first animals, the tortoise, gave the world its first structure by laying out a ditch on the waters. After the first crisis, when rain threatened to submerge all things, the toad—another of the first animals—completed the structure. He separated standing water from running water and opened up a second path for the waters, cutting through the earlier ditch. Thus he divided the world into four parts.

Passive waters can also be mere instruments in the hands of those who confront each other in the course of great cosmogonic battles. In Hindu mythology, the demon Vṛtra holds back the waters and prevents them from irrigating the earth. Indra, who is waging a difficult war against him, is finally victorious and gives life to the world by releasing the waters. Mesopotamian myths are more complex. When the god Enlil decides to destroy humanity, he first holds back the rains and prevents underground waters from reaching the surface. Then, in a second attempt, he unleashes the waters, causing a flood.

Although waters thus appear to be temporarily mastered by the gods who use them, they are not completely inert. Not only do they seem to help Indra in his combat, but they are used by the gods primarily because they have a power of their own. The gods retain them because they are fertilizing; they unleash them because they are destructive.

The life-bearing and generative qualities that have been recognized in some of the primordial waters become manifest in the later phases of the cosmogony. Thus in a later stage of the Sumerian cosmogony, Enki, the Sumerian water god, impregnates Nintur, a goddess close to the earth, by scattering his seed on a riverbank; he then becomes the father of the goddess Nimu. With Nimu he begets Ninkurra, and with Ninkurra, Ottu. Similarly in Greece, whether they be the primordial pair (as in Homer) or be born of Heaven and Earth (as in Hesiod), the river Okeanos and his spouse Tethys have many offspring in the form of springs and rivers; the latter also procreate. In this manner waters contribute to the growth and enrichment of the universe. They also do so in another way: Enki fills ditches, canals, and fallow land with water, thus participating in the organization of the world.

Amma, the Dogon creator god, also has close affinities with heaven and water. His children, the snake-shaped Nommo, who are associated both with water and with the primal word, are the most active and successful agents of the cosmogonic impulse. They contribute to the birth of sexuality and permit the birth of the first ancestors. The latter, who in turn acquire the dignity of Nommo, keep close ties with water. After eating the first dead person, one of them furnishes society with the principles of its structure by vomiting up water—a prefiguration of torrents and ponds, the source of the five rivers, and of the waters of parturition.

Finally, water is sometimes tied more specifically to the birth of humanity. A trout out of water couples with a man from the underground lakes to beget the first clans of the Desána. According to some New Guinea traditions, the *dema* deities once lived under the earth, except for one of them who dug a hole in the ground. The others came out through the hole; then it filled up with water, and fish began to swim in it. After a complex sequence of events the fish became men. Finally, in Greek mythology, men often appear by coming out of a river.

One may now consider instances in which waters are portrayed as destructive. Several examples can be found in the ancient Near East. The Ugaritic Baal, god of the storm and of rain, symbolizes the forces of life. He periodically struggles against Mot, the incarnation of drought and death. He must also combat and conquer Prince Yamm, that is, the sea prince. Because of the gaps in knowledge it is difficult to locate this conflict within the mythical history of the world. So much, however, is certain: Yamm is threatening, and Baal's victory is necessary to the survival of the universe.

Things are clearer in the *Enuma elish*. Troubled by the proliferation and activity of their offspring, Apsu and Tiamat, whose mingled waters had given birth to the most ancient beings of the Babylonian myth, one day tried to destroy their descendants. Apsu, who was the first to try, was quickly conquered by Ea's magic. Ea then built his temple on the waters of Apsu, which were henceforth underground. Tiamat, who tried next, was more formidable, but was killed in the end by Marduk. By blowing into and swelling up the monstrous body of Tiamat, the young god separated the celestial waters from the earth; he opened the way to mountain rivers as he imposed his order on the entire universe. The primordial beings thus appear to want to abolish the agitation that accompanies the rise of the world in order to recover the peace they knew in the undifferentiated state of the first ages. Their inertia proves destructive. Tiamat appears as a monster in the army of monsters she has raised. The original divine waters must be conquered before the organizing gods can accomplish their work by pushing them back to the ends of the world.

WATER IN THE PRESENT WORLD. One again encounters the different qualities, functions, and powers of water when looking at the position it holds in the completed world. Waters are one of the great domains of the ordered universe. Evoking the totality of the world, an Egyptian tale lists the sky, the earth, the domain of night, the mountains, and the waters. The *Rgveda* refers more simply to the sky, the waters, the earth. But despite such seemingly straightforward classifications, water is not thereby reduced to its palpable appearance; it continues to occupy places that are inaccessible to us; it possesses unsuspected qualities and powers.

The cosmic waters. For many peoples waters constitute the limits of the universe. They make up a vast expanse, in the middle of which lies the earth, like an island. They may be divided into two oceans on either side of the world, or they may flow in a river that surrounds the world, like the Greek Okeanos. They also frequently occupy the lower regions of the world in a more or less complex network of waterways underground. Or again, sometimes the entire earth is believed to rest on water. Finally, water is also found in the upper regions, above the heavens. Thus water can surround the world in any of the three dimensions of space. For the Desána Indians, a region bathed in water extends under the earth; water also circulates in the filaments of the Milky Way. In Mesopotamian texts the earth is built on the waters

of Apsu, while the waters of Tiamat occupy the space above the heavens.

Waters can also help to define the center of the world. According to the Fali myth already cited, this center is located at the intersection of two open trenches in the waters. A character from an Iroquois myth runs around a lake to make the earth grow; the earth then develops on all sides under his steps. The great Ugaritic god El dwells at the source of the rivers in the midst of the course of the two oceans. The Guaraní Indians call the original abode of their ancestress the "Gushing Spring." It is the true center of the earth, the true center of the land of their first last father.

Because they occupy highly significant parts of the universe, waters help to define cosmic order. The *Satapatha Brāhmaṇa* says categorically: "The waters are the order of the world" (11.1.6.24). In particular, bodies of water often establish important boundaries. In one widespread image, a lake or river separates the land of the living from the world of the dead. Examples of such a body of water include the river one crosses to reach the Babylonian Land of No Return and the Acheron of the Greeks. Furthermore, just as one must cross the waters to enter the realm of death, one must also cross the waters to enter the land of the living; according to the Ewe people, a child crosses a river when it is born.

Not all peoples make an explicit relationship between cosmic waters and the waters nearer at hand. Several do, however. Thus rains are sometimes believed to come from the celestial waters, and rivers from waters underground, if not from the waters surrounding the earth. Some texts provide more complex images. In a Babylonian poem, springs and rivers arise from the head of Tiamat's corpse; they therefore seem to come from the waters that occupy the upper regions of the world, even if these are near the earth, at the ends of the horizon. In ancient India, the Ganges was thought to descend from the heavens.

Waters and the divine. Wherever they are found, waters are often bound up with divine powers. The Hindu world generally holds them to be goddesses. More explicitly, in other cases, it is the sea, certain rivers, and certain springs that are considered to be gods. People in Vedic India, for instance, sacrificed to rivers. The Tigris and the Euphrates appear in a list of Hittite deities. Rivers are invoked in one Homeric oath.

There is something remarkable about these water deities. They are something more than representations of a purely natural element. Thus while the Egyptian Nun is a waterway on which the boat of the Sun sails at night, he is also a personage who can speak. Similarly, the name of the Ugaritic god Yamm means the sea itself; another of his names evokes the image of a river, but he also appears with the features of a prince or judge who sends ambassadors to the divine assembly. The Greek Pontos is the salty expanse of the sea; he is also a masculine being who couples with Earth and sires offspring. In Egypt, the Nile (and its floodwaters) is

honored as Hapi, an anthropomorphic god. Water is thus the manifestation of a divine power that does not exactly coincide with the tangible appearance of the liquid element. Nevertheless, its immanence within this element is such that water can be perceived as the divinity itself.

In other cases, however, waters simply serve as the abode of spirits or sacred powers. Such spirits may inhabit a lake, a river, or the waves of the sea, or like others may live in a grove, a rock, or a mountain. Several gods that exercise a more extended authority should be mentioned separately. First of all, there are lords of rain, who are in some sense believed to cause it. However, rain also depends on beings whose powers are not restricted to the control of rain. In order to obtain rain, therefore, one must invoke several gods together, or certain ancestors who have become powerful spirits. Rain is sometimes conceived of as a gift from the supreme being, or the god of rain may be made into the supreme being itself.

Several ancient Mediterranean and Near Eastern peoples had a storm god. He rides or gathers the clouds, causes thunder and lightning to strike, and makes the rain fall. This storm god occupies a preeminent position among the gods; he can reign over them, protect the cities or their kings, and extend his power over the entire universe. Less prominent in the Hindu pantheon, the storm god Parjanya is a destroyer of demons; in some texts, he seems to be in command of the whole world.

The power of the gods that reign over the waters in a more general fashion is similarly extensive. The Sumerian god Enki, who comes by sea from a faraway land, established his residence or temple on the underground waters of Apsu, whom he has subdued. Enki is the lord of the waters. After being the major organizer of the world and one of the creators of humanity, he remains the master of fate. Along with An and Enlil, he belongs to the supreme triad. The same can be said of Ea, his Akkadian counterpart. King of the abyss, god of the vast sea, lord of the terrestrial waters, Ea has his place in the celestial world, and his counsel is heeded by the gods. Thus the power of the god of water usually transcends the domain of water.

The inverse phenomenon is also found. The authority of a more universal god is exercised in privileged fashion on the aquatic world. In the Veda, for example, Varuna is a major god who rules over nature, gods, and humans; he is the guardian of *ṛta*, the religious order of things. He is often closely linked to water. With Mitra, he can cause rain; with Indra, he can declare: "It is I who have swelled the rushing waters" (*Rgveda* 4.42). He rests on the waters, and his golden house is built on them. The two oceans are his entrails; he is hidden in each drop of water.

The situation is more highly defined in Greece. Poseidon, the god of the sea, is not essentially an aquatic deity. His name and several myths prove that he has close affinities with the earth. Son of the ancient king Kronos, he was given

sovereignty over the seas when the paternal heritage was divided up; one of his brothers got the netherworld and the other, the heavens. Thus he commands the waters and raises tempests, but he is not immanent in them. Other gods—Pontos, Nereus, and Proteus—are more intimately tied to water. But in the case of Poseidon, sovereignty originates in a region beyond the domain where it is exercised. Whatever their wealth and power, waters are not the source of a political type of power. Political power is closer to the heavens; this is why it cannot be held by a god of the storm.

The qualities and powers of water. In their varied manifestations, the water gods and the waters themselves possess in the present world qualities or traits comparable to those that have been seen in the primordial cosmogonies. The waters that extend beyond the world and delimit it may in some cases be a symbol of the void, as they once were of nothingness; but this is not certain. These faraway waters sometimes feed terrestrial waters: They must have the same density. Water's fluidity and elusiveness are, however, manifested in the faculty of metamorphosis found in certain aquatic spirits or divinities. In a Vietnamese tale, a water spirit takes the shape of a seductive boy. Hindu nymphs turn into birds, and Greek sea gods, Proteus, Nereus, and his daughter Thetis, assume several forms in succession to escape those who attempt to detain them. This ability can be transferred. In Burmese narratives, the water of a certain pond transforms the person or animal who drinks it, the former into an ape, and the latter into a human.

Water is essential for human life; it ensures human nourishment by fertilizing the land. It is more than nourishment, because it is the source of nourishment. It may, therefore, be compared not only to milk, but more particularly to the cow. Because of its utility, it is perceived as a privileged support of vital forces. The Vendas, for instance, equate water with the blood, while the Desána view the rivers as umbilical cords joining people to the amniotic waters underground. In both Hindu and African texts, it is common to speak of the waters giving life and engendering humankind.

This is why water is found associated with sexuality. The Diola sing: "Women's sexual organs are full of water . . . , if Ata Sembe sleeps with a woman, he will always get her pregnant" (Louis Vincent Thomas, *Les religions d'Afrique noire*, Paris, 1969, p. 202). In this respect, waters often assume a feminine character. The Apsarasas of India and the Greek Naiads and Nereids are young women, caught up in erotic adventures. But the waters can also be masculine. "They rest on sperm, as Varuṇa rests on the waters," says the *Bṛhadāraṇyaka Upaniṣad* 3.9.22. To the Greek poets, the heavens send rain, like seed, to the earth, in an amorous outburst. The Egyptian god of the floodwaters of the Nile—Hati, the dispenser of life—is androgynous, and the Nile is imagined as half man and half woman. Its waters are male, and its arable land is female. Together, they are father and mother. In Greece the rivers are strongly masculine, and like the gods of the storm and of rain, have the attributes of a bull.

As vital principle, water allows people to ward off illness and to keep death away. Because water makes the plants of the pharmacopoeia grow, or because of the effects of its intrinsic qualities, the Veda associates it with the origin of medicine. In particular, water is believed to be highly effective against the venom of snakes. In a more positive sense, water is said to give vigor, make old men young, and prolong life.

Water is even capable of conferring immortality. Gilgamesh finds the herb of life, which enables people to escape death, at the bottom of the waters. Several peoples speak of a "water of life" that bestows immortality. Similarly, to give her son Achilles eternal life, Thetis wants to plunge him into the waters of the Styx. The Greeks in general establish a relationship between Okeanos and ambrosia, as the Indians do between water and *soma*.

There is a more enigmatic aspect of water: It possesses wisdom and knowledge. Water seeks the truth, one reads in the Vedas. The Mesopotamian water god Ea, full of wisdom, dispenses counsel to the gods. As a sage, he protects the mythical old wise men who were born in the abyss in the form of fish. The most ancient Greek water gods engender daughters whose names denote qualities of intelligence. Among the Oceanids, these are Metis ("prudence") and Idyia ("the knowing one"); among the Nereids, Panopeia ("the all-seeing one") and Nemertes ("the veracious one"). The latter, says Hesiod, has the same quality of spirit as her father. Nereus is in fact frank, loyal, and gentle, always concerned with justice. He resembles Proteus, who knows the present, the past, and the future.

Where does this wisdom of water come from? A Guaraní narrative establishes a relationship between the freshness of water and the freshness of the soul accompanied by moderation. In a Vedic text the waves, which stave off all evils, also keep away lies. A Greek text associates the extent of knowledge with the immensity of the depths of the sea. But perhaps the wisdom of the water gods is a function of their age. In the Hellenic world, the wisest among them are called "the old men of the sea."

Waters, which at one and the same time are sages and generative forces—to the point of symbolizing at times the creative power itself—are close to the word. To the Dogon, water and the word are joined in the person of the Nommo, whose civilizing activity simultaneously links the arts of civilization with the word and with wetness; one finds similar associations among the Bambara. In *Rgveda* 10.125, the ritual word itself, whose efficacy is cosmic, says of itself: "My origin is in the waters, in the ocean." Water is not always beneficent, however. In the present world, water can be hostile to humans, just as it could be destructive in the remote time of myth. There are catastrophic rains and floods; people drown in rivers and seas. These are not simply accidents but the manifestation of evil powers allied with the liquid element. One example alone illustrates this: Indigenous peoples of the north of Australia have a serpent-shaped spirit that

lives in the clouds during the dry season and in marshes during the rainy season. It is he who drowns humans in floods, he who swallows them up when they venture out into swamps.

The negativity of water can take other forms. For the Desána, water is a symbol of illness. In one Mesopotamian text, bad coughs are caused by Apsu. An account from Gabon goes even further: The water spirit embodies rain, cold, and death. Mesopotamia also has waters of death, just as it has waters of life.

This hostile power is sometimes incarnated in monstrous creatures. The Desána believe that a formidable centipede lives in the sea; they also talk of maleficent serpentine creatures, some of whom eat children. The descendants of Pontos, the Greek god of the sea, include several hybrid beings with destructive powers, such as the Gorgons, who dwell near the waters of Okeanos, and the Hydra, in the marsh of Lerna. One recalls that Tiamat took on the form of a monster. Such monsters survive in the beliefs of ancient Israel; they are the leviathan, Rahab, and the dragon Tannin.

In the Hebrew scriptures, the ocean itself is often represented as an adversary of Yahveh. Of course, in imposing his order on the world, Yahveh conquered the waters and subdued the monsters they harbor; he is henceforth their master. However, their menace continues; the sea monster might reawaken, and if he does, God, who watches him, will kill him.

At times beneficent and at others maleficent, close to the principles of life and to creative power but nonetheless capable of destruction, a relative of gods and monsters, water bears within it all the ambiguities of the sacred. It is an agent of purification not only because it bathes, dissolves, and carries off material filth; its cathartic power is even more mysterious. According to a Babylonian text, water banishes all evils, even those that have not yet had an impact but that have been foretold by bad omens. In a Vedic hymn, water frees humanity from the consequences of false oaths and from all the sins people have committed.

The purity conferred by water is a positive trait. Water conveys to humankind certain of its virtues. It causes vision, according to a Vedic text. In a Greek legend, Pherecydes predicts an earthquake after drinking some water from a well. When Okeanos and Tethys purify Glaucus, they render him capable of undergoing the deification process to which he is subject. Thus, waters are fully purifying to the extent that they are also, to a certain extent, sacralizing.

Several of the qualities of water just discussed are manifest in the world of the dead. For certain Zuni societies, the ancestors inhabit a village at the bottom of a lake. The members of the society believe that when they die they will go to sleep and wake up as young children in this village, at the bottom of the "whispering waters." These waters seem to be the symbol of a blissful condition where ancestral life and childhood commingle. The beliefs of the Desána go even further. A region bathed in water, Axpicon-dia, extends beneath

the earth; from there came the first organizer of the world. It is a uterine domain, the source of all life, to which the people yet to be born are tied by a sort of umbilical cord. The best of the Desána will go there after death. Happy death is thus conceived as a return to the amniotic waters. Among the Polynesians, the dead inhabit a sad region, located beyond the seas; the chiefs, however, go to a different land, where the god Tane gives them a water of life that brings them back to life.

Nun, the primordial water, crosses through the Egyptian land of the dead. At night, the boat of the sun sails over its waves to the east. In some texts, the dead board this boat and make its journey with it. In other texts, they bathe in Nun, into which the sun god also dives. Assimilated to him, they come out again, regenerated. But the infernal waters are not always beneficent and life-giving. They contain reefs that the ferryman's boat must steer clear of; they contain dangers and are disquieting. The Nun was supposed to be the site of mysterious drownings.

Among the Greeks, Hades contains rivers and lakes. The names of two of these rivers reveal their nature: *Pyriphlegethon* (*Puriphlegethōn*) means "burning and flaming like fire"; *Cocytus* (*Kōkutos*) means "groan, lamentation." The rivers terminate in the abyss of Tartaros where, according to Plato, evil souls suffer a temporary punishment. Other souls, however, purify themselves on the banks of the lake Acherousias, where they pass before reincarnation. Proclus states more clearly that the souls purified in Acheron attain a better fate.

One frequently recurring idea is that the dead are thirsty. Drink refreshes them; thanks to it, they regain some form of life, as suggested by Egyptian texts. Not all waters, however, are equally beneficent to the dead. In certain Greek traditions, there are two springs in the netherworld; the initiate knows he must drink from the one that comes from the Lake of Memory. Plato mentions a Plain of Forgetfulness where the Lake of Negligence is found. One of the infernal waters thus suppresses memory while the other maintains and reaffirms it, acting like the water of wisdom and knowledge already discussed. The importance of this opposition is apparent in the privilege granted to Pythagoras and Empedocles, who were said to have been allowed to retain the memories of their previous existences. It would appear from a reading of Empedocles that this privilege belongs to the souls who will shortly escape reincarnation.

CONCLUSION. In conclusion, the wide range of meaning given to the image of water is not without limits, and even opposing meanings given in different myths are not incoherent. These diverse meanings are in large part suggested by the diversity of human experience of water as a natural phenomenon.

Water can be ambiguous. As a fluid, it can symbolize a pure absence or an as yet still amorphous material that will be used by the gods. It may fulfill a positive function. It

bathes, dissolves, and purifies. Essential to human life and necessary for the growth of plants, it symbolizes a generative or life-giving quality, very similar to creative power. It is thus divine and sacralizing. Yet it is also capable of playing a negative role. The gods can utilize the destructive power of its waves. Active in itself, whether divine or monstrous, water erodes everything that takes form and tends to annihilate all distinctions in its own inconsistency. Finally, just as rivers and seas contribute to defining the contours of a country, so the dividing of the waters helps to define cosmic order.

The image of water therefore is not univocal. It can never be interpreted without considering the totality of the myth in which it figures. But it is not indifferent, defined only by the position it holds in the mythic system of a given society. Capable of calling forth the memory of various concrete experiences and numerous emotions, it carries specific meanings within it in a potential state. Each narrative actualizes some of these meanings.

No rule of logic requires that the meaning that water assumes in the evocation of the time of origins must remain unchanged during the course of the cosmogonic process or in the present world. On the other hand, in the small number of mythic systems that this author has studied in some depth, it has been striking that the uses of the image of water, often quite diverse, nevertheless remain coherent, owing to the theological intention that inspires the whole of a given system.

WAWALAG. The most important myth and ritual constellation in Australia's north-central Arnhem Land belongs to the Dua moiety. (Everyone and everything in this entire region belongs through patrilineal descent to one or the other of the two moieties, Dua and Yiridja.) The myth focuses on two sisters in human form who were swallowed by the Great Python, Yulunggul. The sisters are known in north-eastern Arnhem Land as the Wawalag and in north-central Arnhem Land as the Wagilag. The dramatic story line, told in narrative or song form or in a combination of both, is now a popular subject of bark paintings created for sale to non-Aborigines.

SUMMARY OF THE WAWALAG STORY. The two sisters leave their home near the Roper River in Wawalag country for their long journey toward the north coast. In some versions the elder, Waimariwi, is pregnant and in some versions already has a small child (or two). The younger, Boaliri, has just reached puberty. (In one version, she is pregnant.) Along with digging sticks and long food-collecting baskets (signifying a feminine domestic role) and one or two dogs, they bring heavy baskets of stone spear blades (also of the Dua moiety) from the stone-chipping quarries in Ridarngulanguage territory, home of the Yiridja moiety, a source of eligible spouses for Dua moiety Wawalag people. The sisters give names to the places along their way, as well as to all the vegetable foods and small creatures they collect. They are tired when at last, late one afternoon, they come to a quiet water hole shaded by paperbark trees and cabbage palms. They do not know it is the home of the Great Python. They collect stringybark to make a small hut, paperbark for comfortable sleeping mats, and firewood to cook their meal.

At this juncture the emotional tone of the myth changes sharply. Either shortly before the sisters arrive at the complex of named sites centering on the water hole (Mirara-minar,

or Muruwul), or soon after that, the elder sister (or the younger, according to which version is followed) gives birth to a child; in some versions, one of the sisters is menstruating. Now, blood (or the smell of blood) comes close to the water hole or falls into it.

The sisters begin to worry about the possible proximity of a Snake, but since it is too late to move on, they settle down to eat their supper. However, every item of food, as they reach out their hands for it, jumps from the hot coals and makes for the water hole. Dark clouds gather, and rain begins to fall, lightly at first, then heavily, with wind, thunder, and lightning engulfing the hut in a fierce storm sent by the Great Python. During the night the sisters, in turn, dance, sing, and call out ritually in an attempt to calm the storm. In one version the younger sister performs in men's singing style, using two clapping sticks. The elder sister's efforts are more successful. They sing songs with increasingly greater sacred power: songs about the Great Python, about circumcision ritual, about blood, Kunapipi (Gunabibi) songs, secret-sacred songs. Then, thinking all is quiet, they fall asleep while the Great Python, who has emerged from his water hole, sings. Finally, he coils around the hut, puts his head inside, bites their noses, drawing blood, and swallows them—along with the stone spear blades, the baskets, the child(ren), and the dog(s). Later, when an ant bites him, he jumps and vomits them but then he swallows the sisters again.

He raises himself, with his head toward the sky, and talks with other great snakes to the east and southeast about what each of them had been eating. He mentions other food, but finally admits he has eaten the Wawalag and their stone spear blades. Lowering himself to the ground again, he sinks into his water hole with the sisters still inside him. An additional section in versions recorded by William Lloyd Warner (1937, pp. 257–259) tells how the women and children are revived. Then Yulunggul kills them again, swallows them, and takes them back along an underground watercourse to Wawalag country, where he leaves the women, who turn to stone, but keeps the boys inside him because they are of the Yiridja moiety and he is Dua. Then come the linking episodes between the myth as such and its ritual counterparts, including dreams in which the Wawalag sisters teach men the secret-sacred songs and rites that become the responsibility of men of appropriate ritual and territorial status.

COMMENTS AND INTERPRETATIONS. The Wawalag myth is usually long and quite detailed, covering small as well as large events, conversations, songs (referred to by name or included within the text), names of places and foods, brief descriptions of the environmental setting, and symbolic and ritual allusions. This simplified outline constitutes merely a set of clues to the content of the myth. As far as Aboriginal people in north-central and northeastern Arnhem Land are concerned, the range of acceptable versions—and therefore of acknowledged and potential meanings—hinges on factors of sex, age, ritual status, and regional perspectives. This last includes rec-

ognition of priority of rights and priority of ownership of the myth, accorded to a cluster of clans in north-central Arnhem Land.

The most extensive published account of the myth and associated rites derives from Warner's field research in the region, conducted in the late 1920s (Warner, 1937, e.g., pp. 248–259, pp. 376–411). He notes a number of differing versions but adds that "all the fundamental features and most of the secondary ones were always present, no matter how poor the narrator." Ronald M. Berndt (1951) studied the myth from the northeastern Arnhem Land side, with special reference to the Kunapipi complex. In both accounts, the principal meaning to local people lies in the dynamic interrelationship between the myth and three major ritual complexes: the initiatory Djunggawon, the Kunapipi, and the Ngurlmag; Warner adds (p. 249) a fourth, which he calls the Marndiella (Mandiwala). But these ritual meanings themselves include social implications and ramifications that are noted or hinted at in the myth. For example, in some versions the Wawalag sisters would have circumcised their son(s) if the Great Python had not intervened.

In men's versions (Berndt, 1951; Warner, 1937), the sisters commit incest before they begin their journey northward, and it is this "wrongdoing," as well as the "polluting" of the water hole with blood, that is responsible for their being swallowed by the Snake. Women's versions, however (Berndt, 1970), do not mention incest. They imply that, if there had been incest, it would have taken place at the Snake's water hole. Warner actually mentions that "incest" had occurred, in the sense that the women and children swallowed by the Snake are called "sisters" and "sisters' children" by him (pp. 193, 253). In the subsequent conversation between the Snakes (p. 257), when the Wessel Island Snake hears the truth, he is "disgusted. 'You've eaten your own [sisters and sisters' children],' he said. This was a terrible thing." Men's versions do not dwell on this point; instead they blame the women for their earlier "sin."

In regard to the blood in the water hole, the situation is less straightforward than it seems. Men's versions, reported by men, tend to emphasize pollution, uncleanness, or the "profaning" effect of menstrual or afterbirth blood. In many versions, and in associated discussions, the expressions used include "attraction" as well as "anger" and "repulsion," an approach that is certainly compatible with "eating" rather than with more direct killing; moreover, the terms for "eating" in these dialects can apply to sexual intercourse as well as to the ingestion of food. Attitudes toward blood are a central feature in definitions of sacredness in this region. Distinctions between men's blood and women's blood in relation to ritual and natural circumstances of bloodletting or blood emission have been associated with an arbitrary division between sacred and profane that needs much more rigorous scrutiny.

Nancy D. Munn (1969) is concerned with the general issue of the nexus of the Wawalag myth and its ritual inter-

connections; taking “collective symbolic forms as instruments for transforming subjective experience,” says Munn, “the myth conveys body destruction images saturated with negative feeling which the rituals convert into feelings of well-being” (p. 178). She also comments specifically on the importance of blood in the combination of myth and ritual. Basing her analysis on Warner’s material, Munn notes that ritual swallowing by the Snake in contemporary settings is a men-only affair. Women’s biological association with menstruation, for instance, aligns them closely with the Wawalag sisters, so that mythically they have already been swallowed: To be swallowed again in a ritual context would lead to their physical death, as it did for the Wawalag. Men’s ritual blood-letting is symbolically equivalent to the emission of blood by the Wawalag, but in real life the two are incompatible. In terms of seasonal renewal, Munn says, it is men’s blood, drawn and applied in the course of specific rites, that revitalizes the creatures who left the Wawalag sisters’ fire and that “swings the wet season back into the dry, while women’s blood regenerates the cycle of food loss and death and so turns the dry season into the rainy one.” (p. 198). In its non-symbolic state women’s blood is too close to natural physical reality; it must be transformed and brought under men’s control in its ritual equivalent. On the other hand, Munn has already referred to “the significance of blood as a symbolic inheritance binding the two sexes as parties to an exchange: the two women gave men their blood and naming powers (or lost these powers through their death) and men, in return, memorialize the two women” (p. 184).

The theme of blood as an important but contentious issue in myth-based rites and relations between men and women, with special reference to the Wawalag myth, is also treated by Chris Knight, who suggests that “the symbolic potency of the menstrual flow was central to the establishment of culture itself.” He argues (1983, pp. 42, 43) that women, because of their basic natural periodicity, have a life potency that is far stronger than that of men. And he asserts (1984, p. 154) that such myths have to do with women’s ability to synchronize their menstrual cycles in a natural process used by men as a basis on which to construct their own ritual models.

Natural blood from women and ritual blood from men can be powerful in different ways—and mutually dangerous. They represent different kinds of sacredness, a possibility that Émile Durkheim began to explore in his distinction between “positive” and “negative” sacredness but did not carry through to a more comprehensive conceptualization. The Wawalag story has as its central focus a powerful mixture: blood, water, and the Snake. It is this mixture that produces the wet season, crucial for human beings and all other living things in the natural environment. The fertility of the land and all its inhabitants could not be achieved either by the Wawalag alone or by the Snake alone. It came about as a result of the conjunction between them. And it can be ensured, in local belief, only through regular ritual reenactment of the event and its mythic and symbolic interconnections.

- Knight, Chris. “Lévi-Strauss and the Dragon: *Mythologiques* Reconsidered in the Light of an Australian Aboriginal Myth.” *Man* 18 (March 1983): 21–50. An enthusiastic but in parts empirically careless discussion, which includes (p. 41) a parallel between Lévi-Strauss’s contrast between the “raw” and the “cooked” and the creatures who jumped from the Wawalag’s fire; Knight sees this as illustrating the sisters’ ability through “the power of blood to negate or invert the cooking-process, defining meat as sacred/taboo on account of its being raw.”
- Layton, Robert. “Myth as Language in Aboriginal Arnhem Land.” *Man* 5 (1970): 483–497. On the Wawalag, using Warner’s account.
- Layton, Robert, and Chris Knight. “Correspondence.” *Man* 19 (March 1984): 150–157. Layton’s criticism of Knight’s views and Knight’s response. Specifically in regard to the Wawalag, part of the argument hinged on the equivalence of snakes and women in creation myths, rather than rigid contrasts between them; on “underlying logic” as opposed to “superficial separateness”; and on alternating motifs and images in “cyclical alternation,” including “menstrual cyclicity.”
- Lévi-Strauss, Claude. *La pensée sauvage*. Paris, 1962. Translated into English with the unfortunate title *The Savage Mind* (London, 1966). The Wawalag reference is on pages 91–94, and 96. Lévi-Strauss accepts not only Warner’s account of the Wawalag myth but also his interpretation.
- Munn, Nancy D. “The Effectiveness of Symbols in Murngin Rite and Myth.” In *Forms of Symbolic Action*, edited by Robert F. Spencer, pp. 178–207. Seattle and London, 1969. An ingenious interpretation of the Wawalag myth in relation to its sociocultural setting: for example, sorcery narratives, mortuary rites, “symbolic space” as “time,” and male initiation rites as ritual transformation in the context of social hierarchy. Munn uses diagrams to illustrate her main contentions. Her chief source of data is Warner’s volume.
- Warner, William Lloyd. *A Black Civilization: A Study of an Australian Tribe* (1937). New York, 1958. Includes a very detailed

discussion of versions of the Wawalag myth (Wawilak, in his spelling) told to him by men and of the rituals connected with it, as well as men's interpretations of all of these. A remarkably full and sympathetic study, considering Warner's admitted difficulty in coming to terms with the local dialects (for example, he apparently did not hear initial "ng" sounds), but his treatment of the Wawalag constellation exemplifies his negative view of women's religious roles in that region.

CATHERINE H. BERNDT (1987)

WAYANG KULIT SEE DRAMA, *ARTICLE ON*
JAVANESE WAYANG

WEALTH. The relationship between religion and wealth can be analyzed in various ways. Economists of all persuasions have stressed the negative impact of religion on wealth. Adam Smith believed that clergymen, like lawyers and buffoons, are members of an unproductive, frivolous profession. Today, many argue that religion is one of the principal causes of economic underdevelopment. For example, in places like rural Burma, more than 30 percent of the regional income is spent on monks, monasteries, and religious festivals. In India, belief in *karman* (the sum of one's actions in successive states of existence), *dharmā* (duties defined by the religious caste system), and *samsāra* (a cyclical sense of time and rebirth) has been widely criticized as a major cause of poverty. In Muslim countries, some believe that the Islamic law (*shari'ah*), insofar as it sanctifies the religious secular customs of the past, has made modernization difficult and slow.

While the German sociologist Max Weber emphasized the negative role of the religions of the East, he also called attention to the positive impact that religions based on this-worldly asceticism have had on economic development. Weber contended that Calvinism provided the "spirit" necessary for the initial rise of capitalism in the West. His argument, which has been criticized by many as being misinformed and ethnocentric, has nevertheless inspired many attempts to find analogies of the Protestant ethic in successful non-Western countries. Some scholars who have accepted Weber's general thesis have modified its logic. For example, R. H. Tawney, who was reluctant to talk about the causal impact of Calvinism, recognized its importance as a "tonic" in the building of capitalism. Other scholars have found fault with Weber's idea that the rise of capitalism is necessarily accompanied by a decline in religion and magic. While Weber credited sectarianism with a positive role in the rise of capitalism, Liston Pope and others have pointed out the political conservatism and economic passivity of such groups in the southern United States.

If, on the other hand, scholarship on the impact of wealth upon religion is examined, one finds this impact characterized both positively and negatively. Karl Marx and Friedrich Engels believed that Protestantism was the "most fit-

ting form of religion" for the capitalist and that in the religions of the masses one could hear the "sigh of the oppressed creature." Along similar lines, twentieth-century scholars have drawn attention to the influence of economic deprivation on the spread of messianic and millenarian movements. Both Marxists and Weberians believe that an increase in wealth discourages a truly religious spirit. Some scholars, however, argue that a comfortable income seems to encourage piety and have drawn attention to the "de-churching" of the working classes.

Finally, there are scholars who have addressed the differences between religion and economics rather than their interrelationship. Emile Durkheim, for example, contrasted the centrifugal impact of economic life with the centripetal or integrating force of religion. Historians and sociologists of a materialistic bent have tended simply to ignore the problem of religion.

CHARACTERISTIC RELATIONS BETWEEN RELIGION AND WEALTH. There is no simple way to characterize the relationship between religion and wealth in light of the determinate role played by the specific historical and social context. Religion's effect on the wealth or poverty of a country is usually achieved through, or in conjunction with, a complex of other social factors including secular institutions, modal personality systems, and values in general. Among the possible relations between religion and wealth, one that is generally overlooked is the ability, or inability, of religion to step out of the way of economic development. In such a relationship, religion plays the quiescent part of *laissez faire*, *laissez passer* that classical economics assigned to the state. Examples of this kind of passive collaboration with economic development can be seen in civilizations like Europe or Japan in which religious law does not absolutize or sanctify secular conditions of the past, it can also be seen when religious leaders do not interfere in the work of development; when religion abandons traditional, communitarian values; when it ignores the ethical problem of the unequal burdens imposed by development; or when its rituals and taboos passively give way before the requirements of industry. It could be argued against Weber that the most significant contributions made by Protestantism to the development of capitalism were its general indifference to the social problem of poverty, its hostility to the labor movement, and its assumption that individualism is as "natural" in economics as it is in religion.

Since the relation between religion and wealth changes from one type of society to another, one must also attend to the historical stage and specific socioreligious traditions involved. In primitive, archaic, or prehistoric societies, religion tends to be diffuse and undifferentiated from the "material" side of life. Ownership and wealth are woven into a rich tapestry of myth, ritual, and values. Taboos and religious sanctions ensuring the common good and survival of the group put limits on possessions, competition, and market functions. Primitive myths and rituals often express the importance of a proper "ecological" relationship between nature

and possessions. In hunter-gatherer societies, the lord of the animals not only guarantees a good hunting season, but also protects the animals from extinction. As the technological base of society changes—from, for example, hunting to agriculture—new religious symbols begin to appear. While hunters revere the symbols of animals (often their blood and bones), seeds and plants become the foci of the magic and religion of the cultivator. Since religion and wealth were so closely related in prehistoric societies, it has been strongly debated whether the “laws” of modern economics and the alleged natural instincts of “economic man” can be directly applied to people in less developed societies.

With the advent of cities, settled agriculture, writing, and the historic religions (e.g., Hinduism, Buddhism, Confucianism, Christianity, and Islam), the relation between religion and wealth changes. To coordinate societies and economies that were increasingly complex, sacred kings appeared who had in their control not only political power, but also magical power over the well-being of crops, society, and the cosmos itself. Literate priestly classes created sacred texts and laws on the proper use and distribution of wealth. From Africa to the Far East, ancestral spirits were worshiped in order to bring wealth and prosperity to the family. Other deities appeared who had specific functions as gods of wealth and good fortune; by offering tokens of their wealth to these gods (or to priests), people hoped to receive still more wealth and good luck. This ritual exchange is expressed in the sacred Latin formula *do ut des* (“I give to you so that you will give to me”) and in the Sanskrit phrase *dadami se, dehi me*, which has almost the identical meaning. In general, the traditional religions sanctioned the family ownership of wealth, not individually owned private property. In Israel and Greece, religious authority guaranteed the integrity of family property with inviolable sacred landmarks and herms (phallic representations of Hermes). In the ancient Near East, and later in the Far East and Catholic Europe, religious institutions themselves became powerful landlords, controlling trade and the use of large tracts of land.

Reflecting the structure of society, ethical relationships (whether in ancient India, China, or the first-century Roman empire) were both hierarchical and reciprocal. Louis Dumont has called this an ethic of “hierarchical complementarity.” Masters and slaves, husbands and wives, older and younger brothers, teachers and students, rulers and the ruled all had responsibilities for each other. This responsibility included the distribution of scarce resources. In Islam, for example, an alms tax (*zakāt*) was used to support the poor (as well as to spread and defend the faith).

Hinduism. Throughout the ancient world, scattered proverbs and “wisdom literature” served as the only ethical guides to economics. Because traditional society was based on a zero-sum economy, greed was roundly condemned in scripture, myth, and folklore. As time passed, more specific guidance was offered. In India, Kauṭilya’s *Arthaśāstra* (c. 300 BCE to 300 CE) described an economy based on agriculture,

guilds, family ownership, and a bureaucratically centralized state. Most interesting is the way that this text elevates the pursuit of wealth and power (*artha*) above traditional duty (*dharma*). Like the much earlier Code of Hammurabi in the Near East, the *Arthaśāstra* recognizes the taking of interest on loans. In contrast, the *Laws of Manu*, which took final shape during the period from about 200 BCE to 200 CE, reverses the relationship between *artha* and *dharma* and idealizes a more or less static economy based on caste duties (*varṇa dharma*). Generally insensitive to economic opportunity, the *Laws of Manu* limits moneylending to the *vaiśya* caste, allowing brahmins and the *kṣatriya* to lend money only for sacred purposes and then only “to a very sinful man at a small interest.”

Buddhism. While Buddhism has often been regarded as an “otherworldly” religion, it was first propagated by merchants and depended for its existence upon the financial support of lay householders. Sacred texts specified for the laity “right livelihoods,” which excluded the caravan trade, trafficking in slaves, weapons, poisons, or alcohol, and tanning, butchering, and other occupations, and directed how to make, reinvest, and share their wealth with others. Donations to the monastic community (*saṅgha*) became the layperson’s primary way of building up merit. In Mahayana Buddhism, the aspirant to Buddhahood, the *bodhisattva*, was sometimes described as a rich man who provided material and spiritual sustenance for others. As was the case in the Hindu tradition, it was not wealth, but the “attachment” to wealth that was believed to be an impediment to enlightenment.

Confucianism and Daoism. In China, Confucianism and Daoism tended to favor a primitive system of “private” property that has been described as “free enterprise.” This description, however, must be qualified. The Confucians were generally opposed not only to state monopolies but also to competition for profit. The development of a free labor market was delayed by the strength of the family and by the belief that each person should follow the rites, morality, and etiquette (*li*) of his family. As in medieval Catholicism, the merchant was assigned a lowly role. However, Chinese society did have some of the rudiments of a *laissez-faire* system. The Confucian historian Sima Qian (145 BCE to c. 90 BCE) claimed that government intervention in the economy would be unnecessary if farmers, merchants, and other workers fulfilled their duties. The Daoists, emphasizing frugality and voluntary simplicity, were also opposed to the direct intervention by the state. The succinct expression, “the more laws are promulgated, the more thieves and bandits there will be,” is found in the *Dao de jing*.

Judaism and Islam. In Judaism and Islam, wealth was regarded as part of creation and therefore as good. Since God was the “owner” of the world, absolute property rights were impossible. Wealth was a sign of divine approval and poverty was thought to be the result of sin. The identification of wealth and righteousness, sin and poverty was disputed by

only a few religious leaders, such as the prophet Amos, who spoke of the poor as “the righteous.” Because property was deemed inalienable, it could not be taken from a family even by the king. The biblical custom of the Year of Jubilee (*Leviticus* 25) indicates that religious tradition established limitations on the possession of land and slave. In both Judaism and Islam, religious laws concerning usury restricted markets in money.

Christianity. The New Testament radically inverted the traditional attitude toward wealth and power. In the Magnificat (*Luke* 1:52), it is stated that with the coming of the Son of man, God has “put down the mighty from their thrones and exalted those of low degree.” Some pericopes, such as *James* 5:1-4 and *Revelation* 18, express an openly hostile attitude toward the rich. Soon, however, leaders like Clement of Alexandria (c. 150–c. 213) began to soften the hard sayings of Jesus about riches to accommodate well-to-do converts. The problem with wealth now became one of “attitude,” a position that was not unlike the Hindu and Buddhist problem of “attachment.”

Although the early church fathers rarely addressed the issue of economic justice, they shared the antichrematistic outlook of the New Testament and often taught a Stoic indifference (*apatheia*) to the things of this world. Another Stoic idea in their writings would have important consequences for radical sectarians much later on: the notion that the earth is a “common treasury” given by God to all people. Laboring under fervent eschatological expectations, the early Christians were more concerned about the injustice experienced by the oppressed than about the philosophical definition of the justice that was their due. Poverty, as the result of pride and greed, could be alleviated only by the voluntary charity of the church. Soon bishops became administrators of elaborate welfare systems. Only a few Christians, such as Ambrose (339–397), Victricius (c. 400), and Gregory I (c. 540–604) imply that poverty is a matter of justice. When the Parousia failed to occur as expected and as the Roman empire began to collapse, the church was forced to deal more positively with a world that had not come to its expected end. As part of a strategic compromise, the church borrowed deeply from such pagan doctrines as Stoic natural law, which provided a quasi-secular theory of juridical equity. Later, in the scholastic period, the distribution of wealth was treated from a point of view that combined scripture and the writings of the church fathers with the works of Aristotle and Islamic thinkers. One result of the synthesis was a hardening of the church’s position against usury.

While the Protestant reformers were generally stricter in matters of economic morality than the casuists of the late scholastic period, they were followed by others who opened the door of compromise. Usury became legal in Protestant countries, which were fast becoming the most economically advanced in Europe. Protestants repudiated indiscriminate almsgiving and took repressive measures against the indigent. It is debatable whether concern for their own election or sim-

ple indifference to poverty contributed more to the economic success of the Protestant nations. Methodists, Baptists, Pietists, and other sectarians developed an economic rigorism that was similar to the medieval Catholic doctrine of “good works.” Although by the nineteenth century English Methodists and Dissenters had risen to the level of the prosperous middle class, some supported political reforms that would primarily benefit the victims of economic development. Most Dissenters and Nonconformists assumed a conservative, antilabor stand or a position of indifference. This was especially true when they themselves became the majority or the “Establishment,” as in the American South.

CONTEMPORARY RELIGIOUS ATTITUDES TOWARD WEALTH.

In modern times, traditional religious attitudes toward wealth and power have come under heavy criticism. This is largely due to structural changes in society’s industrial base, especially the growth of competition and rapid social mobility, and to the spread of possessive individualism and hedonism in consumer-oriented economies. In communist societies, religious values have been attacked as feudalistic or bourgeois. But in capitalist countries too, modern social roles make the ethics of brotherhood and the spirit of “hierarchical complementarity” seem unrealistic. Traditional charity seems to put the poor at the mercy of the rich. Other traditional attitudes, such as the eschatological indifference of the New Testament and the otherworldly asceticism of the Middle Ages, seem incredible if not irresponsible. Considerations such as these have led to a secularization of economic values in both capitalist and socialist countries. R. H. Tawney claimed that the religious ethic has declined because the church has ceased to think, but it could be asked whether even a “thinking” religion has anything significant to say about contemporary economic problems. The Social Gospel movement of the early twentieth century had some impact on the clergy and on intellectuals but failed to make contact with the working class itself. The “liberation theology” coming out of Latin America and other developing areas has been sympathetically received by only a few in the industrialized West. Many have criticized it as Marxism disguised as Christian social concern. In Asian countries, several forms of “Buddhist socialism” have appeared. Muslims have developed various forms of “Islamic socialism” (which generally recognizes private property rights) and other kinds of “Islamic economics,” often based on the welfare state and religious-nationalistic idealism. Such relatively recent movements in Islam have vehemently rejected Western hedonism and exploitation.

In North America, popular religious groups generally emphasize spiritual inwardness or salvation techniques, ignoring questions about economic and social justice in this world. The secularization of social and economic thought in the academic world is all but absolute. Theories that have the greatest impact in contemporary professional circles usually have the least explicit religious content. This lack of religious influence is especially poignant since religious ethics, both

in the East and in the West, have sometimes been the last repositories of the common good.

BIBLIOGRAPHY

Max Weber sets forth the major issues on wealth in *The Protestant Ethic and the Spirit of Capitalism* (1930; New York, 1958), *Ancient Judaism* (1952; New York, 1967), *The Religion of India* (1958; New York, 1967), and *The Religion of China* (1951; New York, 1968), all originally published in German between 1904 and 1920. Important modifications of Weber's ideas are found in Ernst Troeltsch's *The Social Teachings of the Christian Churches*, 2 vols. (1931; Chicago, 1981) and R. H. Tawney's *Religion and the Rise of Capitalism* (1926; Harmondsworth, 1980). Robert N. Bellah's *Tokugawa Religion* (New York, 1957) is an application of the insights of Max Weber and Talcott Parsons to Japan. *Global Economics and Religion*, edited by James Finn (New Brunswick, N.J., 1983), contains insightful essays on religion and the economies of developing nations. Jacob Viner's *The Role of Providence in the Social Order* (Princeton, 1972) contains important information about Western religious thought on economics, as does his *Religious Thought and Economic Society*, edited by Jacques Melitz and Donald Winch (Durham, N.C., 1978). Joseph J. Spengler's *Origins of Economic Thought and Justice* (Carbondale, Ill., 1980) deals with the ancient economies of Mesopotamia, India, China, and Greece.

WINSTON DAVIS (1987)
Revised Bibliography

WEBER, MAX (1864–1920), German sociologist, was the most influential (and in many respects the most profound) of twentieth-century social scientists. Educated as a legal historian, Max Weber made original contributions to the study of modern social structure, to the analysis of the economy and the law, to the comparative analysis of civiliza-

tions, and to the methodology of the social sciences. Engaged in the politics of his place and time, he brought to his inquiries into authority and power an acute sense of reality. What gave significance and unity to his entire work, however, were his dark reflections on the problem of meaning in human culture. He was acutely aware of the conflict between what he called the metaphysical needs of the human spirit and the constraints of social existence, with the limits of human historical autonomy. It was in this context that his studies of religion acquired a depth and a pathos unmatched to this day.

Weber was the son of a prominent Berlin lawyer typical of the educated bourgeoisie of the German empire under Wilhelm I, immobilized between his abstract attachment to liberal values and his actual predilection for national power. His mother was a devout Lutheran given to charitable works. The view that the dualism that permeated his life and work, between a sublime sensitivity to ethics and a no less pronounced regard for the iron demands of power, came from the conflict of values in his family is no doubt too simple. The dualism, however, was there, and another aspect of it was expressed in his own marriage to the strikingly independent feminist, Marianne Weber. The politicians and scholars of late nineteenth-century Berlin were familiar figures in the household of the Weber's father. Max himself eventually became a leading, if not the leading, figure of the cultural and political elite of early twentieth-century Germany. Ernst Troeltsch was his colleague and friend at Heidelberg, and the great figure of modern German social Protestantism, Friedrich Naumann, was a close associate. The young Georg Lukács, the revolutionary Ernst Toller, and the poet Stefan George frequented his home. Holding chairs successively at Freiburg, Heidelberg, and Munich, Weber quickly rose to fame as both scholar and publicist. He was an editor of the most distinguished social scientific journal of the time, the *Archiv für Sozialwissenschaft und Sozialpolitik*. He did some of his own most important writing for the encyclopedic project that he planned with Joseph Schumpeter, Werner Sombart, and others, the *Grundriss der Sozialökonomik*, 14 vols. (1914–1928). His political activity included work with Naumann's Evangelischer Sozialkongress and with the "Socialists of the Chair" (a group of university professors advocating social reforms, using the Verein für Sozialpolitik as their main instrument of collective research). He frequently contributed articles and editorials to the press. A member of the German delegation to the Versailles peace conference (he abjured the treaty), Weber died before he could participate in the tormented politics of the Weimar republic—or the Third Reich. This bare sketch of his career suggests the complexities with which he struggled: His work is best understood as a desperate effort to effect a precarious synthesis between the contradictory ideas and warring impulses that threaten to sunder modern culture.

Weber's methodological work is often portrayed as an attempt to obtain detachment and distance from the flux and

passions of history. This is perhaps true, but his methodology is inseparable from his metahistorical vision of the world. In opposition to those whom he dismissed as enthusiasts or sectarians, he espoused a politics of realism. For Weber, social science is a disciplined way to know reality, but its scientific status does not entail the promulgation of articulated general laws of the kind developed in physics. Rather, social science for him is concerned with particular historical complexes and sequences. Their unique status does not preclude, and indeed makes more necessary, empirical analysis of their origins and structure. The manifold nature of social phenomena means that the starting point of empirical analysis is a question or a problem generated by the interests and values of the social scientist and his public. Once a particular set of interests and values generates a problem, however, its elements and terms can be stated with relative objectivity. A probable sequence of causation can be reconstructed, often with the aid of an instrumental abstraction that Weber terms an "ideal type." Against this model, the complexity and nuance of reality are illuminated.

Weber, then, insists on the distinctiveness of the human and social sciences but rejects a capitulation to total subjectivism or relativizing historicism. Social science relies on understanding of human motive in social contexts; he conceives of motive as the beliefs or values underlying action rather than a system of biological drives. Weber is therefore an exponent of an empirical and systematic hermeneutics that provides the essential elements for his reconstruction of institutions in their historicity. His methodological strictures, however, cannot be understood apart from his own empirical inquiries.

These inquiries are a singular amalgam of cultural and social analyses. In them the social organization, politics, and culture of the modern Western world are depicted as results of an irreversible process of rationalization. Behavior is controlled by explicit and formal norms, the person is legally separated from the function or office, and the relationship of ends to means is subject to continuous examination and revision. Rationalization makes possible an enormous expansion of market relationships and, therewith, the explosive productivity of the capitalist economy. The separation of market from community, household, and state is the work of modern law and lawyers. Bureaucracy, with its rules, is the opposite of a hindrance to economic development; it is its precondition.

In these arguments Weber is describing, of course, many of the processes others have termed secularization. Indeed, much modern analysis of secularization leads back to his work. His unmatched portrayal of the autonomy of modern social structures and his relentless critique of oversimplified notions of social conflict contributed to that systematic reinterpretation of Marxism that is one of the more enduring achievements of twentieth-century thought. Weber insists on the relatively restricted historical focus of Marxism and argues that the modern bureaucratic state (and ideologies like

nationalism) has attenuated class conflict where it has not subordinated it to other social processes. The struggle of bureaucrats against citizens, he argues, is often as important as class conflict proper. Withal, his notion of the nature of social causation is far from linear. His structural approach to the history of institutions is infused with a large component of Social Darwinism. Society is a system of meanings imparted to routine and of legitimations attached to power. It is also the locus of perpetual conflict in which groups and nations struggle for their very existence.

It was in this intellectual framework that, despite his description of himself as "religiously unmusical," he undertook those studies of religion and society that still read as if they were new. He began with the studies of Protestantism exemplified but hardly terminated in *The Protestant Ethic and the Spirit of Capitalism* (1905). It is not his intention, he writes, to oppose a one-sided idealistic interpretation of the rise of capitalism to an equally one-sided materialistic one. In fact, his work on Protestantism employs many of the sociological concepts later expanded in his studies of ancient Judaism, and of Chinese and Indian religions.

The analysis of the social identity of the bearers of Protestantism, the distinctive tasks imposed by its beliefs, and above all, the practical consequences drawn by Protestants from doctrine for the conduct of their lives, anticipates the recurrent elements of his sociology of religion. The idea of inner, worldly asceticism in *The Protestant Ethic* and of the pursuit of sanctification by ceaseless devotion to the world's work ultimately leads to the exquisitely passionate typology of paths to salvation that crowned his comparative studies.

Weber's early work on Protestantism places much emphasis on the differences between Calvinism and Lutheranism, the archetypical Protestant sects, and has much to say on Roman Catholicism as well. When Troeltsch, in his *The Social Teaching of the Christian Churches* (1912), achieved what was for the time being a definitive sociology of Christianity, Weber sought more distant horizons. He began to study the "universal historical relationship of religion and society." He dealt with prophets and priests in ancient Judaism, with the alternation and fusion of world rejection and world affirmation in Buddhism and Hinduism, with Mandarin rationality and Daoist pantheism in China, and with much else as well. He contrasted the religions of virtuosi with those of popular strata and explored the world religions' very different consequences for communal life, economic system, and political structure. He examined their origins in the psychological response to social conflict, considered their compromises with social constraints, and showed how religions generated entire systems of belief and value, indeed, how they gave institutional structure and cultural content to civilizations.

Weber's studies of the world religions, like his work on Protestantism, reflect his spiritual critique of modern culture. The world religions were theodicies, and in general attempted to answer the implacable questions of human exist-

tence. They sometimes affirmed their worlds, sometimes rejected them, and invariably formed them. Some believers thought of themselves as active instruments of the supernatural and others as passive vessels of divinity. All struggled against accident and appearance and sought the essence of things. Religions invariably conflicted with the concrete structures of existence, with family and the state, with economic forces, and with the immediate demands of sexuality. The “disenchantment of the world” effected by Calvinism also banished from the world the metaphysical pathos of religion. Contemporary bureaucratic and capitalist society is calculable and efficient. It is also without poetry and speaks only banal prose. Religious revivals, because inauthentic, are bound to fail. The substitute religions of aesthetics and sexuality in the modern world cannot perform the moral functions of the historical religions. In any event, they are baubles for the intelligentsia, not doctrines that can move nations. The West’s course of cultural and social development is indeed unique, but it is impossible not to be skeptical about its ultimate value. Contemplation of the world religions can teach one stoicism about his or her own fate and admiration for the deep spirituality of other civilizations. The refusal of artificial spirituality and of nostalgia is the necessary corollary of the political attitude that Weber so favors. His ethic of responsibility is a piece of residual Protestantism, a determination to do the work of the world even when that world is brutal, corrupt, or merely profane.

Weber’s influence on modern thought is ecumenical and large; it is also contradictory. Thinkers as different as Raymond Aron, Georg Lukács, Karl Mannheim, and Carl Schmitt have fashioned or refashioned his ideas to suit their purposes. His comparative and historical work influenced the *Annales* school in France well before World War II. The initial introduction of Weber’s thought into the United States was the work of the reflective political economist G. A. Frank Knight. The European émigrés of the 1930s not only brought Weber with them, but they also brought the world of thought (and politics) that rendered his work significant. Talcott Parson’s reading of Weber was, by contrast, narrow and even tendentious. Among the American social scientists who have both grasped and extended Weber’s legacy are Robert N. Bellah, Reinhard Bendix, Clifford Geertz, Alvin Gouldner, and C. Wright Mills. Not surprisingly, American Protestant theologians such as H. Richard Niebuhr and Reinhold Niebuhr and historians such as Perry Miller have recognized the implications of Weber’s oeuvre for their evaluation of the fate of the churches in the New World. They (with, to be sure, many of their Continental counterparts) have developed Weber’s ideas for purposes true to one of Weber’s main intentions: the self-critique of Protestantism.

BIBLIOGRAPHY

A new edition of Max Weber’s complete works began publication in Tübingen in 1984 under the general title *Gesamtausgabe*. Of the following lists, the first consists of English translations

of those works by Weber most relevant to the study of religion; the second provides an extremely abbreviated selection of secondary works on Weber in English.

Works by Weber

- The Religion of China*. Edited and translated by Hans H. Gerth. Glencoe, Ill., 1951.
- Ancient Judaism*. Edited and translated by Hans H. Gerth and Don Martindale. Glencoe, Ill., 1952.
- The Religion of India*. Edited and translated by Hans H. Gerth and Don Martindale. Glencoe, Ill., 1958.
- The Protestant Ethic and the Spirit of Capitalism*. Translated by Talcott Parsons. New York, 1958.
- The Sociology of Religion*. Translated by Ephraim Fischhoff. Boston, 1963.
- Economy and Society*. Edited by Guenther Roth and Claus Wittich; translated by Ephraim Fischhoff et al. Berkeley, 1978.

Critical Studies

- Antoni, Carlo. *From History to Sociology*. Detroit, 1959.
- Aron, Raymond. *Main Currents in Sociological Thought*, vol. 2. Garden City, N. Y., 1970.
- Baumgarten, Eduard, ed. *Max Weber: Werk und Person*. Tübingen, 1964.
- Bendix, Reinhard. *Max Weber: An Intellectual Portrait*. Garden City, N. Y., 1960.
- Bendix, Reinhard, and Guenther Roth. *Scholarship and Partisanship*. Berkeley, Calif., 1971.
- Fleischmann, Eugène. “De Weber à Nietzsche,” *Archives européennes de sociologie* 5 (1964): 190–238.

NORMAN BIRNBAUM (1987)
Revised Bibliography

WEBS AND NETS. In general symbology, the act of weaving is usually understood to represent processes of creation and growth. Cognate symbols such as net, web, rope, fabric, and the like are frequently employed to suggest the unfolding of individual human lives and of the universe as a whole. These symbols bear also negative connotations as instruments of binding or tools of entrapment. Included in the symbolism of the net, for instance, are those negative forces that interact with positive ones to make of life the ambiguous reality that it is, a condition composed of pleasure and pain, health and disease, life and death, and so on.

In ancient Greece, the net of life and death is said to have been fashioned by the Moirai, personifications of the abstract concept *moira* ("fate, destiny"). These three stern, grim-faced women spin the web of destiny for each person at the time of his or her birth. In Homer, it is the gods who do the spinning (*Iliad* 24.525f.). Sometimes this is done by Zeus (*Odyssey* 4.207f.), but *moira* itself may also be the agent (*Iliad* 24.209f.). Odysseus declares to his blind psychopomp, Tiresias, "My life runs on as the gods have spun it" (*Odyssey* 11.104). In Plato (*Symposium* 196b), the art of weaving as practiced by the goddess Athena is attributed to Eros, the god of love.

Images of the crafts of weaving, plaiting, and interlacing strands to form nets, webs, sieves, and fabrics appear frequently in the literature of ancient Hinduism. In one creation hymn of the *Rgveda*, the cosmogonic agent is described as "stretching the warp and drawing the woof . . . spreading [the fabric of heaven] upon the dome of the sky" (*Rgveda* 10.90.15). Elsewhere in this source (1.164.5), the "concealed footprints of the gods" seem to be thought of as an analogue for the sacrificial laws that are "woven" whenever the gods, in their function as divine priests, perform the sacrifice by the weaving of words.

In the *Mahābhārata*, *kāla* ("time, destiny") is represented as a cosmic weaver who composes the fabric of life for each individual and for the entire universe by intertwining the white threads of light, life, and well-being with the black threads of darkness, death, and sorrow.

Echoing earlier images such as *indrajāla* ("Indra's net") and *brahmājāla* ("Brahmā's net"), Vedānta texts sometimes compare the ultimate basis of the universe to a cosmic spider that in the beginning spins forth the multitudinous lineaments that form the fabric of the world and at the end withdraws those same threads back into its body.

Indian Buddhism makes similar use of these symbols, as an epithet of the *bodhisattva* Mañjuśrī—Māyājāla ("net

of illusion")—and the title of a canonical text, the *Sandhinimocana* (Untying the knots), attest. Echoing the term *bhava-jala* ("net of existence") contained in the *Mañjuśrīnāmasaṃgīti*, Śāntideva, a Mahāyāna poet-philosopher of the seventh century CE, employs the image of a fisher's net to describe the desperate plight of living beings: "chased by fishers, the emotional defilements, into the net of birth . . ." ("klesavagurikaghra-tah pravisto janmavaguram"; *Bodhicaryāvatāra* 7.4).

In defining the essential elements of the process of enlightenment, the *Mahāyānasūtrālaṅkāra* (9.35) likens the realization of voidness (*sūnyatā*) and the cultivation of skillful means (*upāya-kauśalya*) to the warp and woof, respectively, of a fabric: "Just as the particulars of its knotting [*paṃśu*] determine whether a cloth [*vastra*] is colorful or not, so the liberating gnosis is determined as colorful [i. e., endowed with positive qualities] or colorless by the power of motivation."

WEIL, SIMONE (1909–1943), essayist and religious mystic. Born in Paris of secularized Jewish parents, Simone Weil was part of a family whose outstanding trait was intellectual precocity. As a student at France's École Normale, a school noted for its lofty intellectualism and academic rigor, she scored highest on a nationwide entrance examination and in 1931 graduated with the highest rank. The most remarkable quality of this woman, beyond her surpassing intellectual brilliance, was her disposition to extend herself physically in following her sympathies. She also suffered from excruciating headaches, which added to the frailty and exhaustion that came from nervous disability and undernourishment.

From 1931 to 1934, Weil taught school in several French towns and engaged in political activity in behalf of unemployed and striking workers. This political activity, together with her eccentricities of dress and manner, did not make for a successful teaching career. Weil's growing concern with Marxism led her to take a job in a Paris factory, which she stayed with only four months. In 1936 she went to Spain to join Loyalist frontline troops as a battalion cook, but colossal ineptitude for this work, plus a growing conviction that neither side wore the mantle of righteousness, led to her withdrawal from this venture as well.

Beginning in 1937, after several mystical experiences, she became a Christian, relating that in one of these experi-

ences “Christ himself came down and he took me.” After this experience her writing was largely concerned with religion. Weil did not write any books. What we know about her thought comes from her letters, journal, and essays, which may account for the lack of a coherent and developed statement of her religious views. The closest she came to a formal religious affirmation was to the Roman Catholic church but, curiously, she refused its baptism, partly on the grounds that Christianity claimed the Old Testament as the foundation of its truth. She rejected this because she felt that the Old Testament contained too much of war and was too tribal to sustain the Catholic claim to universality.

As a thinker in religion Weil is especially significant for her insights into the effect of mass material culture on the human spirit, especially in terms of the vitiating of freedom and the fragmenting of the idea of community. She died in England during World War II from what is now presumed to have been anorexia nervosa.

BIBLIOGRAPHY

The best statement of sources on Weil is “Simone Weil’s Bibliography: Some Reflections on Publishing and Criticism” by George Abbott White in his *Simone Weil: Interpretations of a Life* (Amherst, Mass., 1981). See also John Hellman’s *Simone Weil* (Atlantic Highlands, N.J., 1982).

WILLIAM D. MILLER (1987)

WELLHAUSEN, JULIUS (1844–1918), was a German Orientalist of signal importance for the study of the history of ancient Israel and early Islam. Wellhausen began his career as professor of Old Testament at the University of Greifswald (1872–1882) and continued as Semitist at the universities of Halle (an der Saale, 1882–1885), Marburg (1885–1892), and Göttingen (1892–1913). He received his early training from Heinrich Ewald (1803–1875) in Göttingen. Wellhausen represents a high point in the literary-critical method in Protestant historical theology: For Wellhausen the critical analysis of literary tradition according to motives and sources, whether in the Old and New Testaments or early Islam, constituted the basis for any historical research. He was critical of the Religionsgeschichtliche Schule (e.g., the work of Hermann Gunkel) that was in the early stages of development at this time.

Wellhausen’s work began with his Old Testament studies. With his works “Die Composition des Hexateuchs” (in *Jahrbücher für deutsche Theologie*, 1876–1877; published as a book in 1885) and *Geschichte Israels* (vol. 1, 1878; 2d ed. published as *Prolegomena zur Geschichte Israels*, 1883), he provided the final breakthrough in the Pentateuch criticism that had been initiated by Edvard Reuss, Karl Heinrich Graf, Abraham Kuenen, and Wilhelm Vatke. With this advance in research Wellhausen also created the basis for a modern view of the history of ancient Israel, which he himself then presented in his work *Israelitische und jüdische Geschichte*

(1894). Wellhausen was the first to make use of the insight that the “law” (*torah*) as it dominates the Pentateuch as it is known, does not represent the earliest constituent of this collection but rather the final (postexilic) stage of its composition. He recognized, too, that the remaining historical sources (Yahvist, Elohist, and Deuteronomistic sources) are older than this, the so-called Priestly source. For Wellhausen, Judaism is a new stage in the history of Israel and is to be distinguished from ancient Israel. For this reason Wellhausen also carried through the notion of historical development to its logical end.

In order to better understand ancient, pre-exilic Israel he applied himself increasingly to the study of Old Arabian and early Islamic history. Employing here a method that was characterized by a critical analysis of the sources, he gave impetus to the study both of pre-Islamic religious history (*Reste arabischen Heidentums*, 1887) and of the life of Muḥammad (*Muhammad in Medina*, 1882; *Medina vor dem Islam*, 1889), and early Islamic history (*Prolegomena zur ältesten Geschichte des Islams*, 1889; *Die religiös-politischen Oppositionsparteien im alten Islam*, 1901). The consequences of these works are still felt today. His most significant achievement, *Das arabische Reich und sein Sturz* (1902), provides the crowning finish to his work.

Following this, Wellhausen devoted himself primarily to study of the New Testament. His explanations and translations of the Gospels and the histories of the apostles brought him less acclaim than his earlier works, but these, too, still belong in the inventory of indispensable historical-critical research. Wellhausen’s works are outstanding not only for their masterful command of the source materials but also for an excellent and impressive style that is particularly conspicuous in his translations.

KURT RUDOLPH (1987)

Translated from German by Matthew J. O'Connell
Revised Bibliography

WENSINCK, A. J. (1882–1939), was a Dutch Semitist, historian of Syriac mystical theology, and Islamicist. Arent Jan Wensinck, born in Aarlanderveen, the Netherlands, began his scholarly career with a year's study of theology in Utrecht. He then changed to Semitic studies, including Arabic, working first in Utrecht under M. T. Houtsma (1850–1943) and then in Leiden under M. J. de Goeje (1835–1909) and Christiaan Snouck Hurgronje (1857–1936). He obtained his doctorate at the University of Leiden in 1908 and subsequently became privatdocent for Syriac and Aramaic at the University of Utrecht. In 1908 he became secretary of *The Encyclopaedia of Islam*. From 1912 until 1927 Wensinck was professor of Hebrew, Aramaic, and Syriac at the University of Leiden, and in 1927 he succeeded Snouck Hurgronje as professor of Arabic and Islam at the same university, at which post he remained until his death.

Wensinck is best known as an Islamicist. He studied Muḥammad's life; he was familiar with the immense *ḥadīth* literature; and he wrote a masterly study on the development of Islamic creeds (*ʿaqīdahs*) and their theological background. Against the same background he described the rise of a distinct Islamic culture during the first centuries of Islam, paying much attention to the development of liturgy and ritual. Wensinck also contributed significantly to the accumulated knowledge of Syrian mystical theology, after this field was opened by the works of Paul Bedjan and others.

Wensinck's major importance, however, seems to lie in his combination of various specializations within the histori-

cal study of religions. He was able not only to establish historical affiliations but also to reveal patterns within the Semitic religious world, patterns common to Israelite, Christian, and Islamic religious data. He explored areas as varied as cosmology, ritual behavior, ethics, mysticism, and folk religion, writing on such varied topics as New Year celebrations, the veneration of martyrs, and the notion of intention in law. Focusing on data relating to devotional and mystical life and thought, Wensinck showed the historical relationship between Muslim and Syriac Christian mysticism: Just as Isaac of Nineveh influenced Muslim mystics, Abū Ḥāmid al-Ghazālī influenced Bar Hebraeus in a later period. Wensinck contributed much to the understanding of al-Ghazālī as a mystic.

At the end of his life Wensinck provided an incentive to study the Aramaic background of the New Testament, which has proved to be a fruitful field of research. Thanks to his sharp, refined mind Wensinck was particularly suited for research in the field of religion, where he let the texts speak for themselves.

BIBLIOGRAPHY

After his dissertation, *Mohammed en de Joden te Medina* (Leiden, 1908), Wensinck published two major studies on Syriac Christian mysticism: *Bar Hebraeus's Book of the Dove* (Leiden, 1919) and *Mystic Treatises by Isaac of Nineveh* (Amsterdam, 1923). There followed three important books in the field of Islamic studies. *A Handbook of Early Muhammadan Tradition, Alphabetically Arranged* (1927; reprint, Leiden, 1971) gives a broad classification in English of Islamic traditions (*ḥadīths*) according to themes. In 1932 he published the excellent study *The Muslim Creed: Its Genesis and Historical Development* (reprint, New York, 1965). His *La pensée de Ghazzali* was published posthumously (Paris, 1940).

Wensinck was an editor of both *The Encyclopaedia of Islam*, 4 vols. with supplement (Leiden, 1913–1934), and the *Handwörterbuch des Islam* (Leiden, 1941); he contributed numerous articles to each. In 1916 Wensinck had initiated another international project, the *Concordance et indices de la tradition musulmane*, 6 vols. (Leiden, 1936–1971), and he remained the supervisor of it until the end of his life. *Semietische studiën uit de nalatenschap van Prof. Dr. A. J. Wensinck, 7 Augustus 1882–19 September 1939* (Leiden, 1941) contains a number of Wensinck's papers in English and French, as well as a bibliography of Wensinck's published work. For a study, in Dutch, of Wensinck's work, see W. C. van Unnik's essay "Professor A. J. Wensinck en de studie van de Oosterse Mystiek," in his *Woorden gaan leven, 1910–1978* (Kampen, 1979), pp. 238–263.

JACQUES WAARDENBURG (1987)

WESLEY BROTHERS. John Wesley, English clergyman (1703–1791), attempted to revive the spiritual life of the Church of England but instead founded Methodism, a worldwide family of independent churches. His father, Samuel (1662–1735), and his mother, Susanna Annesley (1669–

1742), changed their allegiance to the Church of England quite independently of each other before their marriage in 1688. John was probably their fifteenth child, and his brother Charles (1708–1788) the eighteenth. John was educated at the Charterhouse School, London, going on to Christ Church, Oxford; Charles attended Westminster School, and also went on to Christ Church, as had their elder brother Samuel (1691–1739), an ordained clergyman, a schoolmaster at Westminster and Tiverton, and a competent minor poet.

John Wesley's preparations for ordination in 1725 led to a deepened spiritual awareness. He was elected fellow of Lincoln College, Oxford, in 1726, served two years as his father's curate at Epworth and Wroot in Lincolnshire, and returned to Oxford in 1729 to resume his tutorial duties. He also took over the leadership of a religious study group organized by Charles. Similar groups soon arose. They were collectively known as "The Holy Club" and "Methodists," because of the methodical way in which they immersed themselves in the devotional classics and attempted to recreate the life of the apostolic church. In 1735 his sense of a mission to Oxford caused Wesley to refuse nomination at Epworth as his dying father's successor, but later that year he agreed to assume the spiritual leadership of the new colony of Georgia, recruiting as colleagues several Oxford Methodists, including his brother Charles, who was speedily ordained for the task.

John Wesley returned from Georgia after two frustrating years, realizing that his ministry lacked the spark of the personal assurance of salvation which he had witnessed among the Moravians there. Spurred on by another Moravian, Peter Böhler (1712–1775), who was in England on his way to America, he prayed for and received this spiritual certainty on May 24, 1738: "I felt my heart strangely warmed. I felt I did trust in Christ, Christ alone, for salvation; and an assurance was given me that he had taken away *my* sins, even *mine*, and saved *me* from the law of sin and death."

After a three-month pilgrimage to the Moravian headquarters in Germany, Wesley persuaded many of the old religious societies in London to adopt his modification of the Moravian "choirs" to form cells known as "bands" for intensive spiritual sharing among five or six persons of the same sex and marital status. This fostered his own eager attempts to bring others to a personal experience of Christ as Savior and Lord—which offended more formal church people as "enthusiasm." He also formed new societies from those who asked for his spiritual direction. He enriched his followers' faith and worship with song, and with his brother Charles published a new volume of hymns and sacred poems every year from 1737 to 1742.

Pulpits were repeatedly closed to Wesley because he preached on salvation by faith. Encouraged by his former pupil, George Whitefield (1714–1770), on April 2, 1739, in Bristol, he "proclaimed in the highways the glad tidings of salvation . . . to about three thousand people." Nor did he

respect parish boundaries, writing, "I look upon all the world as my parish." His "field-preaching" was supported by a wide-ranging preaching itinerancy, spreading from London to Oxford and Bristol, and thence in 1739 to Wales, in 1742 to Newcastle, in 1743 to Cornwall, in 1747 to Ireland, and in 1751 to Scotland.

To aid him in his task Wesley strove to enlist other clergy in a similar preaching itinerancy, or at least to convince them to maintain deeply spiritual ministries in their own parishes. It soon became clear that his ordained colleagues were too few for the proliferating societies, and Wesley turned to laymen as preaching helpers, thereby scandalizing many otherwise sympathetic clergy. In 1744 he invited the handful of cooperating clergy to meet with him in London to confer about the whole work and its lay helpers, the first of the annual conferences which in 1784 he incorporated as the governing body for Methodism after his death. The early conferences defined Methodist teaching on sin and salvation, teaching which he embodied especially in his *Sermons*. The *Sermons* formed a major part of his huge publishing enterprise, begun at Oxford, which undergirded Methodist private devotions, public worship, evangelistic mission, and the organization of the network of society and preachers.

From the outset Wesley's purpose had been to revive his beloved church from within. However, he was not content to go through normal channels—so frustratingly slow—but maintained an unshaken determination to follow what he believed to be providential guidance in experimentation. Thus he began field-preaching, the employment of lay preachers, the development of his own "connexion" of societies not answerable to church authorities, the building of his own "preaching-houses," the constitution of his own administrative annual assembly, legally incorporated in 1784, the ordination of his own preachers in that same year, as well as his publication of a revised *Book of Common Prayer*. All these things, together with his eventual readiness to open his own buildings during normal times of worship in the established church, proved that although he protested to his dying day that he was a loyal member and minister of the Church of England, his loyalty was certainly not to the church's outward form as it was familiar to him, but to what he considered its essence. Yet there seems little doubt that his remarkable ministry of sixty-five years brought about not only the formation of a new denomination but also the desired reformation of his native church.

SEE ALSO Methodist Churches.

BIBLIOGRAPHY

Works by John Wesley

Under my editorial supervision, a new edition of *The Works of John Wesley* (Oxford, 1975–1983; Nashville, 1984–) is in progress. Thirty-five volumes are projected, of which volumes 1, 2, 7, 11, 25, and 26 have so far appeared. The most useful selection of Wesley's theological writings currently available is to be found in *John Wesley*, edited by Albert C. Outler (New York, 1964).

Works about John Wesley

No one has yet succeeded in presenting a full and fair portrayal of John Wesley in one volume, even a large one, although biographies by both Colwyn E. Vulliamy and Vivian H. H. Green can be recommended. Vulliamy's *John Wesley* (London, 1931) will please the general reader; Green's *John Wesley* (London, 1964), a more penetrating though brief study, will suit the scholar. Both will perhaps benefit from my own book, *John Wesley and the Church of England* (Nashville, 1970), in which I trace Wesley's life against the background of his gradual and largely unacknowledged estrangement from the established church.

FRANK BAKER (1987)

WEST AFRICAN RELIGIONS. West Africa lies between 5° to 23° north latitude, 23° east longitude, and 20° west longitude. It covers about one-fifth of the territory of sub-Saharan Africa and has a population of slightly more than 120 million people, about half of the total intertropical population of Africa. West Africa contains about six hundred ethnic groups, a loose designation with no scientific specificity. Throughout West Africa one finds large cultural variety with various local features.

Traditional religions in West Africa are original systems of relations between human beings and the not ordinarily seen—but not wholly invisible—realm of the divine. There is no concept of original sin for either the individual or the group, but there is a central notion of redemption. The idea of humanity is equated with the lineage, especially with the clan, which is perceived as a social entity bearing the spiritual principle that defines the clan's originality and distinguishes it from other clans. In this context redemption is based in the individual; through the individual as intermediary, redemption extends to the level of the entire family or clan. Individuals can be seen, then, as their own redeemers; eschatology is thus a short-term operation, part secular and part religious. The role of this eschatology is to assure individuals of their reincarnation as ancestors or, still better, of their return to the earth to be among their people at some future time. Because of the diversity of West African peoples and religions, it is impossible to treat them all in a general review such as this one. Hence, in the interest of providing a panoramic view of West African religious experience, it has been necessary to emphasize some traditions and overlook others.

THE CREATOR AND CREATION. Knowledge of the supreme being does not center on a particular set of religious teachings. Rather, one might say, religious adherents achieve their knowledge of God's nature indirectly through iconic images, symbols, metaphors, and metonyms. The principal element of this knowledge is the belief in the distance of God. Compared with a human, earth creature par excellence, the supreme being is so far away in space and in emotional perception that it sometimes cannot even be given a name, much less invoked or honored in worship. The Bwa of Mali, for example, have a name for God, but no cult is directed to

God. The strategy of the African thought process concerning the nature of God is evident. The distance of God generates a religious need in humans; the absence of the divine gives birth to a quest for what is absent, a quest often satisfied through intermediaries more accessible than God.

The supreme being is not uniformly remote throughout West Africa. In a number of traditions, the supreme being is directly involved in everyday life, acting instead of, or in conjunction with, the lesser spirits. In these traditions, people feel a proximity to God that is analogous to the feelings they might have for their kin, and they appeal to and consult God through cults and rituals. Such is the case with Amma, supreme being of the Dogon, whose cults exist throughout all the villages of the Bandiagara cliffs in Mali. Similiar, though less striking, examples are the cult of Rog among the Serer, that of Ata Emit among the Diola, and that of Chukwu among the Igbo. In other traditions, as among the Ashanti, for example, contact with the supreme being is even more intimate: nearly every morning elders pour libations and offer prayers to Nyame (and often Asase Yaa), thanking him for his beneficence and asking for continued prosperity. Supreme beings who are not remote are accorded a variety of characteristics; it is often believed that they control rain and fertility, are a source of appeal in times of affliction, a force for justice in the world, and the guardians of the moral order.

Intermediary spirits are often punctual divinities or gods of specific circumstances, for example, patrons of such important events as war and hunting (Ogun of the Yoruba and Edo; Ta Tao of the Ashanti; Aflim, Dade, Kumi, and Otu of the Fanti; Gua of the Ga, and others). They may also be associated with atmospheric phenomena such as rain and wind, thunder and lightning, and rainbows (So of the Ewe, Xevioso of the Fon, Şango of the Yoruba, and others). Finally, they may be deities of natural phenomena central to human life, such as the earth (Asase Yaa of the Ashanti, Tenga of the Mossi, Oduduwa of the Yoruba, Odua of the Gu, Ayi or Li of the Ewe, and others), the river (Faro of the Bambara, Yemoja and Qya of the Yoruba), the sea (Xu of the Fon), and the sun (Wende of the Mossi, Olorun of the Igbo, and others).

Reference should also be made here to the masters of smallpox, which is a feared and sacralized disease in West Africa. Smallpox is incarnated in the Sakpata divinity of the Fon and Ewe, in Ojuku of the Igbo, and in Şoşona of the Yoruba. The religious importance of this illness lies in its royal character. In the myths of origin of the Kouroumba royalty (Yatenga kingdom in northern Burkina Faso), the first king descended from the sky carrying smallpox and was cured by agriculturalists. Smallpox is believed to be a sickness from the heavens that brings the mark of the starry firmament to the skin. Because its cure was provided by earth dwellers, the divinity who incarnated the disease is both God of the sky and of the earth.

Unlike all the secondary divinities, the supreme being is the creator. The creator alone enjoys this prerogative, al-

though he does not constantly become involved in the details of creation. For example, the creator assigns the task of organizing the creation to a lesser spirit, or monitor, who thus becomes the first means of contact between the supreme being and humans. This occurs among the Bambara (Faro is the monitor for Bemba), the Yoruba (Oduduwa is the monitor for Ọlọrun), the Dogon (the Nommo are the monitors for Amma), and the Bwa (Do is the monitor for Deb-wenu).

Questions about the relations between the supreme being and the lesser spirits have been phrased in a number of ways. Are the lesser spirits extensions of the supreme being, or emissaries? Are they children of the supreme being? Do they have independent wills, and is there antagonism between them and the supreme being? In a sense, there is no one answer; questions such as these cannot be answered according to set theological principles but vary according to the believer's level of knowledge. Noninitiates and those who have little training tend to believe that the lesser spirits are separate from the supreme being (whether they are in a collaborative or conflicting situation with the supreme being) rather than being refractions of his power. Only initiates possessing great knowledge abandon this anthropomorphic view of divine realities. For them, the separation is an artificial concern brought about by the language of theology, invented by people who are unable to speak of God without humanizing God.

Africanists have often tried to establish complete inventories of the divinities encountered in one group or another. Some, for example, have found three hundred divinities among the Ewe, while others have identified from five to six hundred. This passion for inventories and numerical estimation is praiseworthy enough, but it is of no scientific interest. What seems clear in the present state of research is that the different cultures in West Africa all possess the idea of a creator divinity in a more or less developed fashion. This creator is not worshiped with altars, prayers, and sacrifices in all parts of West Africa, which can give the mistaken impression that relations between the human and the divine are not fully articulated.

We must take great caution when we use the word God in speaking of the supreme being of Africans, to whom this word does not have the same meaning as it does, for example, to Christians. Among the two best-studied populations of West Africa, the Bambara and the Dogon, it appears that God is a being who engendered himself; the creation he produced was contained in himself in the form of symbols before it was externalized. Analogous reservations must be made concerning the terms *to create* and *creation*. We often tend to associate these with the verbs to do or to make, but while this association is often accurate in African cosmological myths, it is not always so. Among the Bambara and the Dogon, for example, creation occurs by the thought and the word of God rather than by a manual act.

THE LIVING AND THEIR ANCESTORS. Not all deceased persons are elevated to the rank of ancestor, and death is not always a requirement for becoming an ancestor. In each society it is the living who select members for the rank of ancestor. Thus the notion of ancestralization relates, above all other considerations, to a social and religious model rooted in the idea of exemplarity, that is, in a model to be imitated in order to avoid perdition. Conduct in the human realm determines whether one is ancestralized and reincarnated (a good fate) or exiled into the bush to wander alone, eaten by animals and plagued by mosquitoes (as among the Diola), or condemned to the peppery place of potsherd (as among the Yoruba)—all bad fates. It is significant to note here that a bad fate is never eternal; the concept of eternal damnation is foreign to African religious thought.

To become an ancestor, one must possess certain qualities. The first requirement is longevity; this cannot be achieved through human measures to conserve health but must be bestowed by God. Thus only the elderly can become ancestors. Also important is the individual's physical integrity and morality. Those who die from an ignominious disease (such as leprosy), the insane, those who suffer an accidental death (after a fall or by being struck by lightning), thieves, and those who have committed reprehensible acts cannot become ancestors. Finally, the person's social standing in the community is important. An outsider (a slave, for example), although accepted by, and integrated within, the society, is excluded from the ranks of the ancestors. But above all, the preeminent attribute that allows one to become an ancestor is the self-knowledge that gives a person self-control; this poise is the moral quality *par excellence*. All ancestors were, during their lifetime on earth, models of wisdom, self-control, dignity, and purity.

Since death does not mark the end of human existence but only its changed status, death usually constitutes the necessary condition of being an ancestor. However, this is not true in all West African societies. In a sense, to become an ancestor, an individual must achieve a certain distance from his descendants. This distance is not created solely by death: age itself can provide sufficient reason for becoming an ancestor. Thus, among the Mossi of Burkina Faso a great-great-grandfather can become an ancestor during his lifetime but only in a marginal sense. Such an ancestor can, should the occasion arise, be reborn during his lifetime in one of his descendants. This assertion is based on research among the Mossi, among it research conducted by Doris Bonnet. When an old person returns during his own lifetime in the body of a newborn, the infant is not likely to live long. These beliefs deserve more extensive study, particularly because the Mossi are not the only group in sub-Saharan Africa to hold them. Recent research reveals a similar situation among the Mongo people. The ancestor cannot, however, benefit from the worship of his family group until after his physical death, which is marked by a second funeral or by rituals performed at the burial sites (such as libations and sacrifices, both widely

prevalent in sub-Saharan Africa) and modifications to the burial site itself (for example, construction of altars on top of the ancestor's tomb).

Another important characteristic of the world of the ancestors is its representation as a perfect community. Unlike the society of the living, the community of ancestors is cleansed of antagonism and tension. Ancestors can, of course, become angry or even suffer, but such feelings arise only as the result of neglect or of negative actions on the part of their living descendants.

The universe of the ancestors, sometimes seen as slow moving, is quite active. Although recollection of the ancestors fades because of the weakness of the collective memory of those on earth, the world of the ancestors is constantly renewed and kept vivid in the minds of the living through fresh deaths and reincarnations. Indeed, both worlds are enhanced by this process. For example, each death brings an ancestor into play in the world of the living; by dying or crossing the boundary caused by age, ancestors gain greater access to spiritual power and can thus assist their descendants as intermediaries. But at the same time, by gaining additional ancestors in their ranks, the ancestors acquire new cultural experiences and their world becomes enriched just as the world of the living is enriched by new births. Lastly, ties between the world of the living and that of the ancestors are further reinforced by reincarnation, or the return of the ancestor. Each ancestor can take corporeal form and return to the world when a suitable occasion arises or when he simply longs to return to earth. In a general way each society possesses rules that regulate the ancestor's method of return. These are usually very precise; among the Sara of Chad, for example, a grandfather always inhabits the body of the first grandson born after his death. Among the Yoruba, the process of return involves consultation with the supreme being. Before an ancestor is reborn, the ancestral guardian soul appears before *Ọlọrun* to receive a new body, a new breath, and its destiny for its new life on earth. The guardian soul kneels before the supreme being and asks for whatever destiny it wishes, but *Ọlọrun* will refuse to grant its desires if they are made arrogantly or selfishly. In most cases, the ancestor makes the decision concerning his or her own incarnation, while the living, with the help of various mediums or diviners, attempt to determine the ancestor's will.

The living interact with ancestors by offering them libations and sacrifices. Libations generally precede sacrifices and constitute an overture to dealings with the ancestors. The sacrifice, which is the high point of the ceremony, actively unites the living, in their quest and anticipation, with the dead, in their obligation to respond favorably. Dealings between the ancestors and the living should not be seen as one-sided attempts by weak humans to seek aid from the heavenly powers (as is the case in revelatory religions). These interactions are, in fact, bilateral obligations: humans need the ancestors because of powerlessness and his indigence; ancestors need to be remembered by humans so they can return

to earth by being reborn within the bodies of children within their lineage. The relations between the living and the dead can thus be seen as a kind of individual redemption brought about by humankind's quest for immortality.

Fresh water, millet flour mixed with water, and millet beer or palm wine are usually used in the libations. Fresh water, which usually precedes and sometimes introduces the other two offerings, is an emollient; when poured on the altar it serves as a tender and affectionate gesture to the ancestor. Water and millet flour rise when they are combined, evoking the act of swallowing and its immediate involuntary result, digestion. This offering pushes the ancestor into action. Millet beer and palm wine are stimulants that excite and exalt the ancestors. In a way these drinks make the ancestors lose control and behave as the living wish them to. This last libation represents the final resort to the will of the ancestors before the noblest offering, animal sacrifice, is made.

Animal sacrifice is the most profound means of communicating with the invisible world. The most frequent sacrificial victims are white chickens (male and female) and goats. Sometimes a royal family may sacrifice horses or, as was once the case among the Mossi, human beings. Sometimes cattle are sacrificed, but this occurs only on rare occasions. As sacrificial animals, cattle are reserved for extraordinary events and people (for example, the absolution of an incestuous act, the funeral ceremonies of a chief). The rarity and great significance of these sacrifices can be explained by the fact that West Africa is largely a region of agriculturalists, not pastoralists.

Altars for the ancestors vary but most often consist of one or several stones placed on the ground. They can also be chairs (Ashanti, Ewe, Attie), pottery, clay stools, or doorposts. The officiating priests are either the eldest of the lineage (clan) or a person specifically designated by the group. There are cases, however, as among the Dogon, in which the role is filled in part by a person designated by the ancestor himself.

PLACES OF WORSHIP. Generally West Africans have given more attention to the altar as the locus of the divine than to the sanctuary built to shelter it. There are exceptions: in Nigeria, Benin, Ghana, and Mali, there exist religious buildings in which one part is meant for the public and the rest for protection of cultic materials. (Public here refers to the faithful who have been or will be initiated.) Usually admission to the public parts of the sanctuary is available to the faithful who have been introduced to knowledge of the mystery evoked by the place of worship. The reserved part is only accessible to the high dignitaries of the community of the specific cult. In practice this separation suggests that religion does not merely pose problems of faith and adherence to a system of beliefs; more importantly, it raises questions about knowledge and power. Religion is parceled out in as many sectors, either exclusive of one another or complementary over time, as there are different domains of knowledge.

The linkage between religion and knowledge, particularly prominent in West Africa, is not surprising. Indeed, one can say that it constitutes the characteristic trait of sub-Saharan cultures. The higher one's position becomes in the religious hierarchy, the more knowledge one possesses. The greater one's knowledge, the more likely one will be invested with religious power. All this reveals, on the one hand, the connection between sacred knowledge and power (including political power)—every sage exercises real power over the community he is part of—and, on the other hand, the ways that knowledge is distributed. For example, during initiation rites, knowledge is distributed to the adept drop by drop, as if such instillation were the only possible method of instruction. If any other pedagogic method were used, the adept would reject the knowledge, much like his body would reject the intrusion of a foreign element such as a different blood type. However, there is another reason why knowledge is parceled out bit by bit. The adept is tested at each level to see how he or she reacts to it to ensure that the power that comes with such knowledge is not misused. In many West African societies, for instance, the sacred power to cure affliction through the manipulation of spiritual powers and material substances is not far removed from the practice of sorcery. Both sorcery and the practice of healing often involve the use of similar techniques and medicines; what distinguishes them is the practitioner's intention to do good or evil. Hence, before giving an adept religious knowledge, measures must be taken to ensure that he or she will use this power for the good of the community. An individual with sacred knowledge who is deluded by his or her own power, greed, envy, or malice can have disastrous effects upon the community.

Worship sites are numerous and varied and can be classified according to the four elements: water, earth, air, and fire. Throughout West Africa, water inspires feelings of uncertainty, fear, reassurance, and security; most importantly, it is seen as the source of life. Each body of water has its own spirit. Metonymically speaking, the body of water is both a sort of water god worshiped by riverine peoples and a temple of water in which the faithful, bearing offerings, immerse themselves. For example, the part of the Niger River that crosses Bambara country is said to be the body of Faro, the water spirit, who is responsible for the fecundity, multiplication, and proliferation of all living things. Among the Yoruba of Nigeria it is thought that Yemoja, daughter of Obatala and Oduduwa, gave birth to all the waters of the country and that she is the patroness of the River Ogun, her favorite sanctuary. For the Edo of Nigeria, the waters of the regions belong to Oba. In Ghana and the Ivory Coast, the rivers, streams, and still waters are the property of Tano and Bia. Fresh water, by its very nature favorable to life, is humane. Seawater is inhumane and savage; it needs to be tamed. This negative view of seawater may have been formed during the era of colonization and slavery (both the early Europeans and slave traders arrived by sea); more likely, however, it may simply stem

from the profound attachment to land that is often found throughout Africa.

Sanctuaries related to the land have as much, if not more, variety as those related to water. One must remember that at least 90 percent of the West African population is composed of sedentary agriculturalists and that for them land is the true reservoir of life. Land sanctuaries share one special feature. They are not temples in the true sense of the word because the land has no edifice; the land itself is a religious and sacred monument and thus it would be unseemly to try to limit it, to pretend to enclose it within walls. The sanctuaries of the earth are everywhere that human beings carry out gestures of deference to the nourishing soil. Mountains, grottoes, rocks, and stones that strike the religious imagination, pits and crevasses open to the unknown—all lend themselves admirably to being transformed into places of worship. Cultivated fields are particularly designated for sacralization.

The temples of the air, namely sacred trees and groves, are the most numerous sites of worship and the closest to the religious affections of West Africans. They are considered to have an airy nature because they are in harmony with atmospheric changes and with the seasons. There is not a single human community in West Africa that does not have high regard for this vegetation. The tree stands as an intermediary between the human being and spiritual powers. This mediation is often so central that humans are considered to be an emanation of the vegetation. The Bambara believe in a kind of metempsychosis, or transmigration of souls, in which one guidepost in the journey is a tree. One also encounters this belief among the Fon, for whom certain myths speak of how men and women descended from the branches of a tree in former times. Similarly, West African women desirous of becoming pregnant often implore a tree to give them a child. Trees acquire even more intense religious value when nature integrates them into sacred groves, which are the scenes of religious assemblies and initiation rites.

In West Africa, where there are no volcanoes, temples connected with fire are the most humble, the closest to daily life, and also the most ubiquitous. They are associated with the part of the home in which women prepare food. The fire, which transforms food, brings light and warmth to its users and mediates between the living and the dead. If the faithful lack the resources to provide a sacrificial victim, they can use ashes from the hearth fire as a replacement. The omnipresence of this temple of fire is matched by the reality of the forge in almost all West African groups, even though the profession of blacksmithing is generally considered to be limited to members of a guild. The forge is more than a workshop; it is also a place of worship, a shelter in which human justice gives way to the gentleness of heaven. The most typical characteristic of the forge lies in the fact that it constitutes a place of creation comparable to that held by the creator when the foundations of the world were established. This explains why fire becomes a sanctuary wherein the prayer of an empty

womb beseeching fecundity will, according to the beliefs of the faithful, surely be answered.

Generally speaking, religion in West Africa is men's business. Nevertheless, women, especially after menopause, often become ritual specialists (for example, among the Guere, Ubi, and Wobe of the Ivory Coast; the Dogon of Mali; the Mende of Sierra Leone; and especially, the Yoruba and Igbo of Nigeria). Religious duties, which are numerous and complex, are ordinarily the responsibility of the eldest member of the group. All cultic practices include an oral liturgical element that is of central importance because the word, invested with the characteristics of both water and heat, has fertilizing power.

INITIATION AND SPIRITUAL LIFE. Initiation rites engender an internal disposition that guarantees a way of life different from ordinary existence. This disposition is acquired through the development of spiritual techniques that train the body and promote a sense of the abolition of finitude.

Initiation rites in West Africa fall into two types. In Nigeria, Benin, Togo, and Ghana (that is, among the Yoruba, Hausa, Ewe, Fon, Ashanti, and related groups), initiation is of a type one may term *epispanic*. Here the initiates attract (Gr., *epispaō*) the divinity to themselves, and the impact of the meeting between the human and divine translates into what is commonly called possession or trance. The introduction to and training for the spiritual life are accomplished either by individual training (as, for example, among the Ashanti and the eastern Yoruba) or by collective training in convents, as is the rule among the Ewe, Fon, western Yoruba, and Itsha. This form of initiation is available to both men and women. The physical tests that neophytes undergo during their initiation have a specific goal, even though the initiates may not be aware of it. It involves a spiritualization of the senses, particularly vision, hearing, and taste.

The second type of initiation, termed *allotactic* (Gr., *allos*, other; *taktikē*, from *tassein*, to marshal), is common from Ghana to Guinea. Here the neophytes go to seek God. Clearly the physical tests here are equally rigorous as those in epispanic initiation, but what matters above all in allotactic initiation is the accession of the neophytes to a transforming knowledge that permits them to get closer to particular spiritual beings and even to become a bit like them, in other words, to become immortal, for only through immortality do human beings guarantee their chances for reincarnation. Such transforming knowledge cannot be gained in several months or even in several years. Among the Senufo of Mali and northern Ivory Coast, initiation into the Poro society lasts more than twenty years. For the Bidjogo of Guinea-Bissau initiation takes almost the same time. Men and women are segregated in this form of initiation. Allotactic initiation clearly demonstrates the leitmotiv of African spirituality, the human struggle against total disappearance from the earth.

African spirituality demonstrates that human beings are not born spiritual; rather, they must become spiritual.

Hence, adherents to West African religions find recourse to initiatory techniques that view the body as the starting point of religious and mystical feelings. The body becomes the authentic symbol of the elevation of the human being to the peak of spirituality. Mystical life in African religion does not detach humanity from the earth; instead, it permits human beings to live and relive indefinitely on earth.

WHEATLEY, PAUL (1921–1999) was a professor at the University of Chicago who specialized in comparative urbanism and historical urban geography. If ever there was a contemporary scholar outside the field of religious studies itself who made a persuasive and elegant case for relating the study of religion to comparative worldviews and complex social processes, it was Paul Wheatley. His magisterial book *The Pivot of the Four Quarters: A Preliminary Enquiry into the Origins and Character of the Ancient Chinese City* still stands as a model for comparative studies of the social and religious dimensions of traditional urban settlements. The excellence of this book can be attributed in part to Wheatley's extraordinary linguistic abilities, his insightful handling of primary texts, and his elegant application and testing of his theories on the nature of the city, social stratification, and the religious imagination. Wheatley came to this achievement through his intensive study of historical geography. He was the first British geographer to explore sources in Chinese and Arabic, which he combined with Latin and Greek texts in his early book *The Golden Khersonese: An Historical Geography of the Malay Peninsula Before AD 1500*.

EARLY CAREER. Paul Wheatley was born in 1921 in Gloucestershire, England. He spent part of his youth in the village of Enham (later also named Alamein), a community set aside for families of seriously injured veterans of World War I. During Wheatley's youthful excursions around Coatswell and Salisbury, he developed interests in two landscapes: the geography of that part of England and the celestial landscapes that he observed during nighttime travels. In his early schooling he excelled in Latin and Greek; by 1939 to 1940 he had completed his first college degree in classics (Latin and Greek, philosophy and religion) in a two-year accelerated program offered by Kings College, London. Wheatley also studied two subjects that became foundational for his

later study of urbanism, namely geology and geomorphology (the study of the origin and development of the earth's surface features). In 1940 Wheatley volunteered for service in the Royal Air Force (RAF). He served as a navigator, a parachute instructor in North Africa and Italy, and a trainer for British paratroopers preparing for the invasion of France in June 1944. He saw intense combat as a member of Squadron 150 of the RAF's Bomber Command and Pathfinder Group 205, surviving a crash landing in Iraq as well as forced parachute jumps behind the German lines in Italy and later in Yugoslavia.

POSTWAR WORK. After Wheatley returned from his war service, he met Henry Clifford Darby (1909–1992), a distinguished professor of geography, and became involved in Darby's historical geography project, which made use of the 1068 Domesday Book of William I, King of England from 1066 to 1087. Wheatley's interest in local geography and place names coupled with his knowledge of Latin allowed him to assist in the reading of the medieval manuscripts that Darby was analyzing. Wheatley eventually contributed the Staffordshire chapter and coauthored the Somerset chapter in Darby's book *The Domesday Geography of England*, which was published in 1954. In 1949 Wheatley received the Alexander von Humboldt Prize and was awarded his bachelor's degree with first class honors in geography from the University of Liverpool. He then joined the faculty of University College, London, where Darby had relocated. In 1952 Wheatley left England for the University of Malaya in Singapore (now the National University of Singapore), where he first served as the "neophyte colonial lecturer" and later as lecturer in geography.

During the next seven years Wheatley traveled extensively in the Malay Peninsula, did field archaeology, expanded his linguistic abilities, taught courses at the university, and founded the *Malayan Journal of Tropical Geography*. He also made use of classical Greek, classical Malay, Arabic, and Chinese sources to prepare two works that served both as source books and as innovative interpretations of the historical geography of the region. These were *The Golden Khersonese* and *Impressions of the Malay Peninsula in Ancient Times* (Singapore, 1964). In 1957 Wheatley married Margaret E. Ashworth, a member of the geography faculty at the University of Malaya. They moved to the United States in 1958, where Wheatley served on the faculty of the University of California at Berkeley until 1966. While helping to raise his two sons, Julian and Jonathan, Wheatley became deeply interested in the problem of urban origins. He discovered an intricate set of relationships between the rise of permanent social stratification and the organizing capabilities of religious thought as manifested in monumental ceremonial centers. He began an intensive analysis of the origins of cities as indicated in Chinese sources and expanded his focus to deciphering the process of primary urban generation in Mesoamerica, Mesopotamia, the Indus Valley, Nigeria, Peru, and Egypt.

MATURE WORK. Wheatley's most influential monograph was *The Pivot of the Four Quarters: A Preliminary Enquiry*

into the *Origins and Character of the Ancient Chinese City* (Chicago, 1971). In this study Wheatley sought to understand the complex forces that led to the genesis of the first cities, especially the factors associated with permanent social differentiation. In each instance of urban origins, he found that “the earliest foci of power and authority took the form of ceremonial centers, with religious symbolism imprinted deeply on their physiognomy and their operation in the hands of organized priesthoods.” Priestly elites in all seven areas of primary generation (northern China, Mesopotamia, Egypt, the Indus Valley, southwestern Nigeria, central Mexico, and Peru) had developed “greatly amplified ethical systems” which were part of a “new instrument for the organization of sacred, economic, social and political space” (p. 305). Wheatley stated concisely that these ceremonial centers “functioned as instruments for the dissemination through all levels of society of beliefs which, in turn, enabled the wielders of political power to justify their goals in terms of the basic values of that society, and to present the realization of class-directed aims as the implementation of collectively desirable policies” (p. 305).

Wheatley found the key to the efficacy of these ceremonial centers in a religious mode of thought that he called “cosmo-magical symbolism.” This mode of thought “presupposes an intimate parallelism between the mathematically expressible regimes of the heavens, and the biologically determined rhythms of life on earth (as manifested conjointly in the succession of the seasons and the annual cycles of plant regeneration)” (p. 414). In Wheatley’s understanding, there were at least three patterns of urban order that emerged from cosmo-magical thought: the pattern of building monumental capitals around supremely important ritual structures; the use of cardinal axiality (designing the city with fixed reference lines to the four principal points of the compass) to organize large urban populations, transportation systems and even general systems of market exchange; and the imprinting of episodes from the culture’s mythology in the layout and ornamentation of major buildings. Wheatley illustrated these complex interrelations with the use of maps and narratives, showing the ways in which the morphology of specific ceremonial cities influenced the formation of economic and social order as well as reflecting cosmo-magical thought.

Wheatley’s position was and remains a major challenge to materialist interpretations of the causes and nature of urban organization and authority. While several of his major books resulted from intensive analysis of the geographic and economic, especially exchange patterns of and within urban centers, Wheatley insisted that the evidence showed repeatedly that rulers just as often subordinated their technology and economic practices to religious symbolism as the other way around.

From 1966 to 1971 Wheatley served on the faculty at University College, London, where he produced several definitive essays in urban studies, including “City as Symbol” (1969) and “The Concept of Urbanism” (1972). He also

contributed a prefatory essay to *An Historical Atlas of China* (1966). From 1971 until his retirement in 1991, he served as professor of geography and social thought at the University of Chicago. During Wheatley’s years on the Chicago faculty, he was a member of the Committee on Social Thought and its chairman from 1977 to 1991. The novelist Saul Bellow was one of the distinguished members of this committee and included a flattering literary portrait of Paul Wheatley in his novel *Ravelstein* (2000). Wheatley was remarkably productive during his Chicago years, publishing on various questions of urban origins and history in *From Court to Capital: A Tentative Interpretation of the Origins of the Japanese Urban Tradition* (1978), *Nagara and Commandery: Origins of the Southeast Asian Urban Traditions* (1983), and the monumental two-volume *Melaka: The Transformation of a Malay Capital, c. 1400–1980* (1983), which he edited with Kernal Singh Sandhu. His editorial collaboration with Sandhu continued in *Management of Success: The Moulding of Modern Singapore* (1989). Wheatley’s final book, published posthumously, was *The Places Where Men Pray Together: Cities in Islamic Lands, Seventh to Tenth Centuries* (2001). During these years he also served on numerous external committees, including the Jerusalem Committee, a group that advised Mayor Teddy Kollek (b. 1911) on the future organization of the city; the Ford Foundation, on academic fellowships for Vietnamese refugees; and the regional advisory board of the *Southeast Asian Journal of Ethnicity*. In addition, Wheatley served on the editorial boards of *Urbanism and Social Change*, the *Journal of Urban History*, the *Journal of Oriental Studies*, and other scholarly periodicals.

Wheatley was highly skilled in the use of human language, and wrote elegantly and movingly in his essays and books about the topics that engaged him. After his death in 1999, a eulogy about him stated, “Wheatley was a man of ideas, of exacting standards and often of forceful expression. . . . Only the grand thesis was good enough for him. A belief in the value of a comparative world view and an inter-disciplinary approach inspired his lifelong exploration of urbanism and his conviction that the emergence of the city was a turning point in the history of human society.”

WHEEL SEE CAKRAS; CIRCLE

WHITE, ELLEN GOULD (1826–1915), prophetess and cofounder of the Seventh-day Adventist church. Ellen Gould Harmon was born November 26, 1827, on a farm near Gorham, Maine. As a child she moved with her family to Portland. When she was nine or ten, an angry schoolmate hit her in the face with a rock, knocking her unconscious for several weeks. The accident left her a semi-invalid, unable to continue her schooling (except for a brief period at the Westbrook Seminary and Female College) and unlikely to fulfill her ambition of becoming a scholar.

Raised a Methodist, Ellen in 1840 joined the Millerites, who believed that Christ would return to earth in 1843 or 1844. When he failed to appear on October 22, 1844, the date finally agreed upon, disappointment and confusion swept through the Millerite camp. In December, while praying with friends for guidance, seventeen-year-old Ellen went into a trance, the first of many visions during which she claimed to receive divine illumination. In this state God assured her that the Millerites' only mistake lay in confusing the second coming of Christ with the beginning of the heavenly judgment, which had indeed begun on October 22. In 1846 Ellen was shown the importance of observing the seventh-day sabbath. In both instances her visions supported doctrines that others were already teaching, a pattern that came to characterize her role as a religious leader.

In 1846 Ellen married James White, who became her editor, publisher, and manager. For several years they traveled throughout the Northeast preaching their sabbatarian message. When children began arriving, Ellen reluctantly left them with friends. In 1852 the weary, impoverished couple settled in Rochester, New York, where they collected their children about them and James acquired a printing press. After three discouraging years, the Whites moved to Battle Creek, Michigan, where in the early 1860s they formally created the Seventh-day Adventist church, then numbering about 3,500 members.

Health concerns dominated Ellen White's life during the 1860s. Since her childhood accident she had suffered al-

most constantly from an array of illnesses: heart, lung, and stomach ailments, frequent "fainting fits" (sometimes once or twice a day), paralytic attacks, pressure on the brain, breathing difficulties, and bouts of anxiety and depression. At times she feared that Satan and his evil angels were trying to kill her. In 1863, only months after using water treatments to nurse her children through a diphtheria epidemic, she received a special vision on health. Adventists, she learned, were to give up eating meat and other stimulating foods, shun alcohol and tobacco, and avoid drug-dispensing doctors. When sick, they were to rely solely on nature's remedies: fresh air, sunshine, rest, exercise, proper diet, and, above all, water. A second vision on health led her in 1866 to establish the Western Health Reform Institute in Battle Creek, the first of a worldwide chain of Adventist sanitariums.

During the 1870s the Whites spent considerable time proselytizing on the West Coast. In 1881, James died. Following a yearlong depression, Ellen White resumed her ministry through missions to Europe (1885–1887) and to Australia and New Zealand (1891–1900). Upon returning to the United States in 1900, she purchased a farmhouse near Saint Helena, California, from whence she continued to guide her growing church. Although she never assumed formal leadership of the Adventist organization, White wielded enormous influence, especially late in her career, in matters relating to both doctrine and policy. While in semiretirement, she directed a major campaign to build an Adventist sanitarium "near every large city" and to open a medical school, the College of Medical Evangelists (now Loma Linda University), in southern California. She died on July 16, 1915, at age eighty-seven; over 136,000 Seventh-day Adventists mourned her passing.

Although better at speaking than writing—her modest reputation among non-Adventists derived largely from her lectures on temperance—Ellen White enjoyed her greatest success as an author. Between the late 1840s, when her first broadsides appeared, and 1915, she published over a hundred books and pamphlets and contributed thousands of articles to church periodicals. Since her death the Ellen G. White Estate has brought out dozens of additional books, compiled from her letters, sermons, and articles. Few subjects escaped her attention. Among her most notable works were three sets of books on biblical history and eschatology: *Spiritual Gifts* (1858–1864), *Spirit of Prophecy* (1870–1884), and the "Conflict of the Ages Series" (1888–1917), which included *The Great Controversy between Christ and Satan*, her major eschatological work. Her health writings began with a tract on the perils of masturbation, *An Appeal to Mothers* (1864), and culminated with the widely circulated *Ministry of Healing* (1905). In *Education* (1903), she emphasizes "the harmonious development of the physical, the mental, and the spiritual powers." Between 1855 and 1909 she published thirty-seven volumes of *Testimonies for the Church*, in which she relayed counsel that she had received in visions. The most popular of her books was *Steps to Christ* (1892), a brief devotional work that sold in the millions.

Since early in Ellen White's career critics have alleged that she sometimes contradicted herself, failed to acknowledge—and on occasion denied—her indebtedness to other authors, and allowed her testimonies to be manipulated by interested parties close to her. In response, she insisted on the consistency, originality, and independence of her inspired writings. "I do not write one article in the paper expressing merely my own ideas. They are what God has opened before me in vision—the precious rays of light shining from the throne" (*Testimonies for the Church*, vol. 5, p. 67). In recent years scholars have uncovered evidence that she borrowed extensively from other authors and that her literary assistants provided more than routine editorial and secretarial services.

Although Ellen White preferred to style herself as "the Lord's messenger" rather than as a prophetess, she classed herself with the biblical writers. "In ancient times God spoke to men by the mouth of prophets and apostles," she wrote in 1876. "In these days he speaks to them by the Testimonies of his Spirit" an unambiguous reference to her own work (*Testimonies*, vol. 4, p. 148). Many early Adventists, including her own husband, resisted efforts to equate her writings with the Bible and to make acceptance of her inspiration a "test of fellowship." Nevertheless, by the early twentieth century Adventist churches were "disfellowshipping" members who questioned her gift, and were relying on her views to determine the correct reading of scripture. Among the faithful the very phrase "Spirit of Prophecy" became synonymous with Ellen White and her writings, which they regarded as authoritative not only in theology but in science, medicine, and history as well.

BIBLIOGRAPHY

To date, no full-scale biography of Ellen White has appeared. Of the several autobiographical accounts, the most complete is *Life Sketches of Ellen G. White* (Mountain View, Calif., 1915), the last part of which was compiled by assistants. In 1981 Arthur L. White, a grandson of the prophetess, brought out the first installment (volume 5, covering the years 1900–1905) of a projected six-volume official biography, *Ellen G. White* (Washington, D. C., 1981–), which, though unabashedly apologetic, presents considerable new detail. My own work *Prophetess of Health: A Study of Ellen G. White* (New York, 1976) offers a nonapologetic interpretation of White's health-related activities. For guidance in using White's own writings, there is a splendid three-volume *Comprehensive Index to the Writings of Ellen G. White* (Mountain View, Calif., 1962–1963).

RONALD L. NUMBERS (1987)

WHITE BUFFALO CALF WOMAN is a central figure in Lakota Indian history and contemporary life. Known in the Lakota language as *Pte-san win-yan*, she brought the Sacred Buffalo Calf Pipe and the Seven Sacred

Rites to the Lakota people. The Lakota consider her extremely holy. Some regard her as the reappearance of *Wohpe* (Falling Star or Beautiful Woman) who, like *Pte-san win-yan*, embodies the ideals of Lakota womanhood. White Buffalo Calf Woman is one of many female sacred powers in Native American myth and ritual, including Corn Woman (Cherokee), Changing Woman (Navajo), White Painted Woman (Apache), Our Grandmother (Shawnee), and Thought Woman (Keres).

Some tribal histories indicate that *Pte-san win-yan* arrived among the Lakota in the late 1700s during their difficult transition from the Great Lakes to the Great Plains. Buffalo were integral to Lakota life on the plains, providing everything the people needed for survival. According to written accounts of Lakota oral tradition, White Buffalo Calf Woman appeared to the Lakota long ago when the people were very hungry. Two men who were scouting for food one day noticed a beautiful woman approaching them from a distance. She wore a dress of fine white buckskin and carried a bundle on her back. As she drew closer, one of the hunters felt desire for her, but the other scout cautioned him, recognizing that she was sacred or *wakan*. As the desirous scout reached for her, he and the woman were enveloped in a swirling cloud which lifted to reveal a pile of bones beside the sacred woman. She then directed the remaining scout to return to the camp and instruct the people to prepare a large tipi for her arrival. The sacred woman appeared the following day, singing as she entered the camp and then the tipi:

With visible breath I am walking.
A voice I am sending as I walk.
In a sacred manner I am walking.
With visible tracks I am walking.
In a sacred manner I am walking.

(DeMallie, p. 284)

Sent from the buffalo, she gave the Lakota the White Buffalo Calf Pipe Bundle and taught them how to pray with the Sacred Pipe, *Ptehincala hu kannunpa*. Through the Sacred Pipe, humans became related to and at one with the entire cosmos. She instructed the people on how to live in good relation with one another, and she taught them the Seven Sacred Rites that accompany the Pipe. Finally, she pledged to return to the Lakota in the future. As she left the camp, she stopped, lay down, and rolled over, becoming a black buffalo. Stopping a second time, she changed into a red buffalo. The third time she was transformed into a yellow buckskin buffalo; and finally, the fourth time, before walking out of sight, she became a white buffalo. The Sacred Pipe is now in the possession of Arvol Looking Horse, Nineteenth-Generation Keeper of the White Buffalo Calf Pipe Bundle.

As Lakota mythology suggests, White Buffalo Calf Woman plays an important role in Lakota ritual. The Seven Sacred Rites, which she either brought to the people or modified through the addition of the Sacred Pipe, include ceremonies for purifying the body and spirit (*inika(tm)e*), commonly known as the sweat lodge; dancing looking at the sun,

or the Sun Dance (*wiwanyag wachipi*); crying for a vision, or the vision quest (*hanbleceyapi*); making of relatives (*hunkapi*); throwing of the ball (*tapa wanka yap*); preparing a girl for womanhood (*i(nati awichalowan)*); and keeping of the spirit (*wana(tm)i gluhapi*). The Sacred Pipe is integral to each of these rites and to the annual ceremonial cycle as a whole, which begins in early spring when the sun enters the Lakota constellation that implies the Pipe, thereby igniting the celestial Sacred Pipe and renewing life on earth. White Buffalo Calf Woman is particularly crucial to the Sun Dance and girls' puberty ceremonies, wherein a woman is the embodiment of *Pte-san win-yan*, bringing the Sacred Pipe to the Sun Dance arena in one rite and instructing the girl on Lakota women's codes of conduct in the other.

Many events seemingly threatened the interrelatedness of the Lakota and the buffalo: the outlawing of Lakota ceremonies in the nineteenth century, the imposition of Christianity, the prohibition against traditional buffalo hunting, the decimation of the buffalo herds by non-Indians, and acts of genocide against the Lakota people. However, White Buffalo Calf Woman and the buffalo in general remain the center of Lakota cultural survival. In fact, the birth of several rare white buffalos in the 1990s signaled to some Lakotas the return of *Pte-san win-yan*. Lakotas are working to protect and restore buffalo herds and their natural habitats and to revitalize and strengthen Lakota ceremonies. The White Buffalo Calf Woman Society has been established to support women victimized by domestic violence. In addition, Arvol Looking Horse has emerged as a highly visible religious leader among the Lakota. He and others have led many Big Foot Memorial Rides to help heal the wounds of the 1890 Wounded Knee Massacre and to foster leadership among Lakota youth.

MARY C. CHURCHILL (2005)

WHITEFIELD, GEORGE (1714–1770), English evangelist and itinerant revivalist in America. Born in humble circumstances in Gloucester, England, Whitefield received his bachelor of arts degree from Oxford in 1736, the same year in which Bishop Martin Benson ordained him as deacon in the Church of England. Associated with John and Charles Wesley in an effort to revive a sedate and passionless Anglicanism, Whitefield followed with keen interest the missionary labors of the Wesley brothers in the newly founded colony of Georgia in North America. After nearly three years of preaching in the New World, the Wesleys returned to England discouraged and dismayed by the enormity of the religious challenge abroad. Neither they nor Whitefield's own admirers, however, could discourage the twenty-three-year-old Whitefield from setting out for Georgia on the first of seven voyages to America.

After an absence of less than one year, Whitefield returned to England late in 1738 to receive his ordination as priest, to strengthen his ties with the trustees of the Georgia colony, and to learn that England's hierarchy looked askance at his cavalier attitude toward canon law and the liturgical form of the national church. No less an authority than London's bishop, Edmund Gibson, published in 1739 a pastoral letter condemning "enthusiasm," a dangerous zeal associated with young Methodism in general, and with young Whitefield in particular. For evidence that Whitefield claimed a special and direct guidance from the Holy Spirit, Bishop Gibson turned to the young zealot's first journal, written from December 1737 to May 1738, in which "enthusiasm" seemed so conveniently and convincingly represented. Whitefield responded to this and to many other charges contained in the letter: that he preached extemporaneously in the open fields, that he criticized the national clergy, and that he claimed to "propagate a new Gospel, as unknown to the generality of ministers and people"—all this, said the bishop, in what is surely a Christian country already. Even as Whitefield sought to defend himself against the bishop's attack, he found pulpits in England closed to him and the clergy there growing increasingly wary of him. Overtures from the Georgia trustees enticed him once more, as he was now offered a pastoral charge in Savannah, together with a promise of five hundred acres of land for a proposed orphanage. Two weeks after the Gibson letter was published, Whitefield was on his way back to America.

This second visit, lasting from November 1739 to January 1741, was Whitefield's most successful evangelical tour of the American colonies. Wherever he went up and down the Atlantic coast, his reputation as a dramatic, divine messenger preceded him. Enormous crowds gathered in eager anticipation, in churches or outdoors, in town squares or country meadows. Calvinist in his own theological stance, Whitefield found his greatest reception from similarly oriented denominations: Congregationalists, Presbyterians, Dutch Reformed, and (later) Baptists. While the first Great Awakening could certainly have occurred without him, it is

difficult to imagine that burst of intercolonial and interdenominational pietism arising so swiftly and to such heights apart from the labors of this thundering, persuasive, and tireless traveler.

Even as Bishop Gibson found in Whitefield's own writings his best evidence for the evangelist's excesses, so critics of revivalism in America rifled through his published journals for the ammunition so amply supplied there. Whitefield, for his part, repeatedly and needlessly alienated those who stopped short of uncritical adulation and applause. And although he eventually moderated his censorious tone (and even more important, stopped publishing his journals), damage was done to the evangelical cause on both sides of the Atlantic Ocean. Whitefield also damaged his relationship with the Wesleys by publishing an attack in 1741 upon the Arminianism evident in John Wesley's sermon "Free Grace."

Still, by the thousands the people came to hear and to believe, in Ireland, Scotland, Wales, and England as well as throughout the American colonies. For an entire generation Whitefield not only created an evangelical Atlantic community, he embodied it. Any pious project that required broad support found George Whitefield either assisting or directing the effort. He raised funds for Princeton University, helped Dartmouth emerge as a school open to Native Americans, promoted union in England among Calvinist Methodists, pleaded for more support of the Bethesda (Georgia) orphanage, took up collections for victims of natural disasters in Europe or elsewhere, and sustained the hopes of hundreds of thousands that a great and sweeping revival of piety would enliven and awaken all of Christendom.

In 1770 Whitefield made his seventh and final trip to America. After preaching on Saturday, September 29, to an impromptu crowd gathered in the fields of Exeter, New Hampshire, he urged his horse on to Newburyport, Massachusetts. The next morning at six o'clock, he died. He lies buried beneath the pulpit in the town's Presbyterian church.

BIBLIOGRAPHY

Two recent scholarly biographies elevate Whitefield studies to a higher plateau: Harry S. Stout, *The Divine Dramatist: George Whitefield and the Rise of Modern Evangelicalism* (Grand Rapids, Mich., 1991); and Frank Lambert, *Pedlar in Divinity: George Whitefield and the Transatlantic Revivals, 1737–1770* (Princeton, N. J., 1994).

EDWIN S. GAUSTAD (1987 AND 2005)

WHITEHEAD, ALFRED NORTH (1861–1947), English mathematician and philosopher, much of whose influence has been on theology. Whitehead grew up in a vicarage in the south of England and studied at Trinity College, Cambridge, where he subsequently became a fellow and taught mathematics. In 1890 he married Evelyn Wade. The couple had three children, Eric, North, and Jessie. After 1914 Whitehead taught mathematics at the Imperial College

of Science and Technology in Kensington. In 1924, at the age of sixty-three, Whitehead moved to Harvard University, where he taught philosophy until 1936. The death of his son Eric in World War I is reported to have deepened Whitehead's religious interests.

Whitehead did not make any major contribution to mathematics as such. His early writings were chiefly on the philosophy of mathematics (*Treatise of Universal Algebra*, 1898) and logic (with Bertrand Russell, *Principia Mathematica*, 1910–1913). Later he involved himself increasingly in the rethinking of the natural world required by developments in physics, publishing *An Enquiry Concerning the Principles of Natural Knowledge* (1919), *The Concept of Nature* (1920), and *The Principle of Relativity* (1922). His writings also expressed still broader interests, as, for example, in *The Organization of Thought* (1922), which was largely included with other writings in *The Aims of Education* (1929). After moving to Harvard he developed a full-fledged cosmology in such works as *Science and the Modern World* (1925), *Religion in the Making* (1926), *Symbolism, Its Meaning and Effect* (1927), *The Function of Reason* (1929), *Process and Reality* (1929), *Adventures of Ideas* (1933), and *Modes of Thought* (1938).

Whitehead's cosmology may be understood best by contrasting it with the doctrine of mechanism. The world appears to contain both living, self-activating entities, such as birds and dogs, and inanimate, passive objects, such as stones and drops of water. Mechanism took the latter as fundamental and analyzed everything into inanimate and passive units. In classical atomism the ultimate entities are indestructible bits of matter. Contact imparts motion, but otherwise the atoms do not affect one another. Whitehead described his position as a philosophy of organism, arguing that not only living cells but also molecules and subatomic entities are internally interconnected with their environments.

All philosophies must explain both enduring things and events. Most Western philosophies have taken enduring things as basic and have explained events as the interaction of these. Mechanists see events as changing spatial configurations of unchanging material substances. Whitehead proposed that events are fundamental and that the relatively unchanging entities are "societies" of events exhibiting constancy of pattern.

A particular problem for mechanism is conscious experience. Some mechanists hold that this lacks full-fledged reality. Others accept a dualism of mind and matter. Whitehead rejected both positions, holding that an instance of human experience is an organic event and that it provides the model for discerning the basic structure of all individualized events.

Whitehead believed that cosmology and religion are bound closely together, whether or not the cosmology is theistic. Some who respond religiously to Whitehead's vision of the world want to separate it from talk of God, either because they are offended by such talk or because they are committed

to other doctrines of God. Whitehead, on the other hand, believed that his cosmology was incomplete without God, although the God of organic events is quite different from that of the world machine. Instead of imposing laws of motion, God is the source of novelty, purpose, and freedom. God radically transcends each creature, but it is the divine presence that directs and enables each to reach toward richness in its own immediacy and in those future events to which it contributes. This cosmic urge to life is called by Whitehead the “primordial nature” of God.

Whitehead holds that God is not an exception to the principle of interrelatedness of actual things. Just as God is effective in the world of temporal events, so temporal events in turn enter into the divine life. What perishes in the world is everlasting in God. This aspect of God Whitehead calls God’s “consequent nature.” Apart from the consequent nature of God the utter transitoriness of events would undercut the human sense of meaning and importance.

Whitehead described God as lure for adventure and ideal companion in polemical contrast to a supernatural will untouched by the suffering of creatures. His doctrine also differed systematically from the understanding of God as being itself developed especially by Thomas Aquinas. Since the ideas of sovereign will and being itself have shaped much of Christian theology, some have denied that Whitehead’s doctrine can be accepted by Christians. Others have been attracted to Whitehead’s idea of a conscious, all-loving, all-knowing, everlasting actuality from whom creatures derive all that is good. His image of God as “the fellow sufferer who understands” has gained increasing acceptance.

Whitehead’s thought played an important role in the Divinity School of the University of Chicago from the late 1920s. Charles Hartshorne systematically developed Whitehead’s dipolar theism. Elsewhere, however, Whitehead’s influence was sharply circumscribed by dominant intellectual trends. Analytic philosophy and positivistic science rejected the cosmological enterprise. Neo-Thomist Catholics reemphasized the idea of God as being itself. Neoorthodox Protestants stressed God’s sovereign will. However, beginning in the mid-1960s, analytic philosophy and positivistic science lost their hegemony; Vatican II, the writings of Teilhard de Chardin, and the rise of liberation theology generated a dynamic openness among Roman Catholics; and a somewhat chaotic pluralism replaced the neoorthodox consensus among Protestants. In this new context Whitehead’s influence has grown among philosophers, scientists, and humanists, as well as among theologians. His Christian followers employed his conceptuality in reformulating many Christian doctrines. They led in discussions of problems of religion and science, especially with regard to ecology. They found allies among feminists and points of contact with Teilhardians and liberation theologians. They have helped shape interreligious dialogue.

Although most of Whitehead’s influence has been among North American Protestants, he has a following

among Catholics and Jews as well. There is also increasing interest in Europe, Asia, and Latin America. His influence is institutionalized in the Society for the Study of Process Philosophies, the European Society for Process Thought, the Japan Society for Whiteheadian and Process Thought, the Center for a Post-Modern World in Santa Barbara, and the Center for Process Studies in Claremont, California, and its journal, *Process Studies*.

JOHN B. COBB, JR. (1987)

WICCA. Wicca originated in 1940s England as an attempt to recreate what was believed to be an ancient religious system indigenous to Britain and Europe, characterized by the veneration of nature, polytheism, and the use of magic and ritual. It was heavily influenced by the occult revival of the late nineteenth century, including secret, magical societies such as the Hermetic Order of the Golden Dawn (established in 1888), the notorious magician Aleister Crowley (1875–1947), Freemasonry, and Spiritualism. The rediscovery of classical ideas of nature and deity in Romantic literature and archaeology provided additional sources, as did British folklorist and Egyptologist Margaret Murray’s (1862–1963) “anthropological” study of witchcraft in Europe, *The Witch-Cult in Western Europe* (1921).

These threads were woven into early Wicca by Gerald Brousseau Gardner (1884–1964), a British civil servant who had spent much of his working life in the Far East and had a lifelong passion for folklore and archaeology, visiting many sites of archaeological significance on travels to the Near East. Gardner returned to England when he retired in 1936, living in London and the New Forest before moving to the Isle of Man in 1954. Once back in England, Gardner, already a Freemason, joined the Folklore Society, the Co-Masons, the Druid Order, and the Rosicrucian Fellowship of Crotona. This latter group, he claimed, contained a hidden, inner group of hereditary witches who initiated him in 1939. They also allegedly allowed Gardner to publish their rituals in fictional form in his novel *High Magic’s Aid* (1949), which he wrote under the pseudonym Scire. Gardner was not able to publish more open accounts of witchcraft under his real name until the 1736 Witchcraft Act was repealed in 1951 and replaced with the Fraudulent Mediums Act, which gave freedom for individuals to practice witchcraft as long as no harm was done to person or property. Released from a law that subjected any person alleged to have magical powers to prosecution, Gardner wrote *Witchcraft Today* (1954), which contains an introduction by Margaret Murray, fol-

lowed by *The Meaning of Witchcraft* (1959), taking both himself and witchcraft into the public spotlight.

In *Witchcraft Today* Gardner set out his belief that witchcraft was not only the original indigenous religion of Britain, dating from the Stone Age, but that it had survived the persecutions of the Great Witch Hunt in early modern Europe, continuing in secret but now threatened with extinction. These claims followed closely Murray's thesis that an old religion involving worship of a horned god representing the fertility of nature had survived persecution and existed throughout western Europe. Murray argued that the witch-cult was organized in covens that met according to the phases of the moon and the changing seasons, conducting rituals that involved dancing, feasting, sacrifices, and ritualized sex in honor of the horned god. Later, in *The God of the Witches* (1933), Murray traced the development of this vegetation god and introduced the idea of a fertility goddess into the cult.

Gardner's absolute belief in and perpetuation of Murray's argument led many early Wiccans to believe that they were continuing this ancient tradition of witchcraft, although scholars had refuted the validity of her use of trial records since *The Witch Cult* was first published and dismissed most of her evidence over time. Most, though not all, Wiccans today acknowledge that there is little evidence for a continuous, pre-Christian witchcraft tradition indigenous to western Europe, but Gardner's aim of reviving what he believed to be a dying religion appears to have been fulfilled. His numerous media appearances brought Wicca to public attention throughout the 1950s, during which time he encouraged people to set up covens operating according to the outlines in his books and initiated many people into Wicca. One of these was Doreen Valiente (1922–1999), one of the key figures in modern Wicca. She worked with Gerald Gardner as his high priestess and revised the *Book of Shadows*, a book of rituals, information, and lore for which he claimed ancient provenance, which she felt to be too influenced by the writings of Aleister Crowley. Valiente eventually left his coven in 1957, after falling out with him over ever-increasing publicity seeking, and periodically withdrew from the public face of Wicca throughout her life. She was nevertheless consistent in her support for what she termed the old pagan religions: in 1964 she was president of the Witchcraft Research Association, she was a founding member of the Pagan Front in 1971, and in November 1998 she spoke at the annual Pagan Federation conference in London. Her life within Wicca, witchcraft, and paganism is documented in many of her books, including *The Rebirth of Witchcraft* (1989), *Witchcraft for Tomorrow* (1978), and *Witchcraft: A Tradition Renewed* (1990, with Evan Jones).

Another key figure is Patricia Crowther (b. 1932), who was initiated by Gerald Gardner in 1960 and established covens in Yorkshire and Lancashire. She was an actress and dancer whose husband, Arnold Crowther, was an old friend of Gerald Gardner. Patricia Crowther is the author of a num-

ber of books on witchcraft, including *Lid Off the Cauldron* (1981) and her autobiography, *One Witch's World* (1998), published as *High Priestess: The Life and Times of Patricia Crowther* (2000) in the United States. In the early twenty-first century, she continued to run a coven in Sheffield, and it was an ex-member of her coven, Pat Kopanski, who was instrumental in the initiation into Wicca of Alex Sanders (1926–1988), who developed a second branch of Wicca in the 1960s.

Sanders was a resident of Manchester who claimed a witch ancestress from Snowdonia, in North Wales. His branch of Wicca was based on Gardnerian lines, but Alexandrian Wicca, as it came to be known, was more heavily influenced by ceremonial, ritual magic—Sanders worked for the John Rylands library in Manchester, where he read classical texts on ritual magic, and he had been trained as a medium through visits to a Spiritualist church with his mother during childhood. In 1961 Sanders allegedly wrote to local Wiccans whom he had seen on television, but they took a dislike to him, and it was apparently not until 1963 that he was initiated into Wicca by a priestess in Derbyshire. Sanders went on to act as high priest to a coven in Nottinghamshire, but the group dissolved in 1964, and he then met the seventeen-year-old Arline Maxine Morris (b. 1946). They began running a coven together in 1965, were discovered by a local newspaper, and went on to manipulate the media to such an extent that they became the most famous witches in the world by 1966. Such media attention attracted many people and led to a whole network of covens springing up around them, although longer-established Gardnerian Wiccans denounced Alex as a charlatan. Like Gardner, Sanders sought publicity for Wicca, often of a sensational nature, and by the 1970s he had become known as the King of the Witches.

In 1967 Alex and Maxine Sanders moved to London, and in 1969 Alex Sanders was sensationally publicized in a newspaper article. This article led to many media appearances, a romanticized biography, *King of the Witches*, by June Johns (1969), and a film, *Legend of the Witches* (1969), as a result of which Alexandrian Wicca grew exponentially. In 1973 the relationship between Alex and Maxine broke down, and they divorced in 1982 but remained friends. While Maxine continued to run the coven, Alex retired from the limelight to Sussex, where he continued to teach Wicca until his death from lung cancer on Beltane Eve 1988. He was also a prolific initiator, and many covens in Germany, the Netherlands, and elsewhere in northern Europe sprang from visits to him during this period.

A number of the Sanderses' initiates—particularly Stewart Farrar (1916–2000), Janet Farrar, and Vivianne Crowley—have been responsible for writing extremely influential books on Wicca. Stewart met Alex and Maxine Sanders while working as a journalist in 1969 and was initiated by Maxine in 1970. He and Janet ran their own coven in London, married in 1974, and subsequently moved to Ireland in 1976. Here, they continued to train and initiate people in Wicca

and became prolific Wiccan authors whose many books include *What Witches Do: A Modern Coven Revealed* (1971), *Eight Sabbats for Witches* (1981), *The Witches' Way* (1984), *The Witches' Goddess* (1987), *The Witches' God* (1989), *Spells and How They Work* (1990), and, with Gavin Bone, *The Pagan Path* (1995) and *The Healing Craft* (1999). *The Witches' Way* contains the bulk of the contemporary Gardnerian rituals and was published with the active help of Doreen Valiente, who wrote most of them and had herself made a large amount of material available in her 1978 book, *Witchcraft for Tomorrow*. It thus made the core ritual format and texts of Gardnerian Wicca available to all. After Stewart's death, Janet married Gavin Bone, and they continue to initiate, write, and speak at pagan conferences.

Wiccan priestess, psychologist, and university lecturer Vivianne Crowley was initiated into both Alexandrian and Gardnerian Wicca, and in 1979 she founded a Wiccan coven that combined the two traditions. In 1988 she founded the Wicca Study Group along with her husband, Chris, and it is now Europe's largest Wiccan teaching organization. She is a member of the Pagan Federation council, serving as honorary secretary (1988–1994), prison chaplaincy coordinator (1991–1995), and interfaith coordinator (1994–1996). Crowley has a doctorate in psychology and has trained in transpersonal counseling with the Centre for Transpersonal Psychology in London. Her books include the best-selling *Wicca: the Old Religion in the New Millennium* (1989; 1996), *Phoenix from the Flame: Pagan Spirituality in the Western World* (1994), *Principles of Paganism* (1996), *Principles of Wicca* (1997), and *A Woman's Guide to the Earth Traditions* (2001).

Wicca is not, however, confined to northwestern Europe. It has become a global phenomenon and can be found in most countries populated by people of European descent, including the United States, Canada, Australia, New Zealand, and South Africa. It has spread through such people as Ray Buckland, an initiate of Gerald Gardner, who subsequently emigrated to the United States in 1967, taking Gardnerian Wicca with him. Buckland later became disillusioned with the perceived hierarchy in Gardnerian Wicca and went on to form a more egalitarian tradition of Wicca, which he called Seax, or Saxon Wica [sic]. He is the author of several do-it-yourself guides to Wicca, including *The Tree: Complete Book of Saxon Witchcraft* (1974). The explosion in how-to books on Wicca since the 1980s and, more recently, internet sites has become the main means by which Wicca has spread and grown, evolving and at times mutating quite dramatically.

During the late 1970s and 1980s, for example, a further important development in Wicca took place as the feminist consciousness movement influenced the emergence of feminist Wicca and witchcraft in North America. The Hungarian-born American feminist activist Zsuzsanna Budapest was one of the prime movers behind the development of feminist witchcraft, forming the women-only Susan B. Anthony

Coven, running a shop called The Feminist Wicca in California, and self-publishing *The Feminist Book of Light and Shadows* (1978). The book was a reworking of available Gardnerian Wicca, which excluded all mention of men and male deities and included her own rituals, spells, and lore. It was later expanded and published as *The Holy Book of Women's Mysteries* in 1986.

Starhawk (Miriam Simos) (b. 1951) is one of the most prominent feminist pagan activists in the United States. Her feminist activism in the 1970s led her to the Goddess movement, and she studied feminist witchcraft with Budapest and Faery Witchcraft with Victor Anderson. After practicing as a solitary, Starhawk formed Compost, her first coven, from participants in an evening class on witchcraft and then a second, Honeysuckle, for women only. She was elected president of the Covenant of the Goddess in 1976–1977, published her first book, *The Spiral Dance*, in 1979, and was one of the founders of the Reclaiming Collective in San Francisco in 1980. *The Spiral Dance* has proved to be an ever-popular volume since it was first published in 1979, selling over 100,000 copies in its first ten years of publication. The book is based on Anderson's Faery tradition but incorporates strictly feminist principles into modern witchcraft, principles that are expanded in her later books *Truth or Dare* (1987) and *Dreaming the Dark* (1988). Starhawk combines nature worship, politics, activism, psychology, and goddess worship in an attempt to heal spiritual and political divisions in society and individuals. Such themes come out even more strongly in her two novels, *The Fifth Sacred Thing* (1993) and *Walking to Mercury* (1997). European Wiccan attitudes towards Starhawk's redirection of witchcraft toward political activism tend to be cautious. Recently, Starhawk has actively reclaimed her Jewish roots as well as being a witch, an exploration that has led to her sometimes referring to herself as a "Jewitch."

The religion described by Gardner and developed since the 1950s positions nature as central, through deities representative of nature and rituals associated with seasonal change, and through the growing concern for the environment since the 1970s. Although some versions of feminist Wicca focus exclusively on the divine female, perceptions of deity in Wicca are directly linked to nature and are generally regarded as empowering for both men and women, since they include both goddesses and gods. For example, *The Great Charge*, rewritten by Doreen Valiente from earlier versions, focuses specifically on the goddess as the embodiment of nature, and is one of Wicca's most well-known liturgical texts. It describes the goddess as "the beauty of the green earth, the white moon among the stars, the mystery of the waters" and as "the soul of nature who gives life to the universe." Her counterpart is Lord of the Greenwood, Sun King, Corn King, Leader of the Wild Hunt, and Lord of Death, a god intimately connected with nature represented through the seasonal cycle of festivals.

Each year most Wiccans celebrate eight festivals, known as sabbats; these make up a ritual cycle known as the Wheel

of the Year. Four main rituals are celebrated at the four seasonal festivals described by Murray as the witches' sabbats and based on the agricultural year. These are Candlemas on February 1, May Day on May 1, Lammass on August 1, and Hallowe'en on October 31. During the 1980s these festivals became Celticized as a result of the Farrar's relocation to Ireland and North American interest in Celtic ancestry; they thus tend now to be known as Imbolc, Beltane, Lughnasadh, and Samhain respectively. The four other festivals that make up the Wheel are astronomically fixed: the Winter and Summer Solstices around December 21 and June 21, and the Spring and Autumn Equinoxes around March 21 and September 21. The Winter Solstice is often called Yule and, particularly in North America, the Summer Solstice tends to be called Litha, with the equinoxes known as Ostara (Spring) and Mabon (Autumn).

At each of the festivals, deities are addressed in aspects appropriate to the season. For example, at Hallowe'en or Samhain, gods and goddesses associated with death and the underworld such as Hekate, Hades, Rhiannon, or Anubis might be addressed, as Wiccans celebrate death as part of the cycle of life and seek to prepare themselves for the dark winter months ahead. The Wiccan sabbats are intended to deepen the participants' understanding of the cycle of life, death, and rebirth as revealed in the changes evident in nature, for deities, humans, and the natural world are all seen as interconnected. For this reason many Wiccans living in the Southern Hemisphere have reversed the festivals. For example, Summer Solstice rituals take place on December 21 to celebrate the fullness of life reflected in nature at that time of the year in such countries as in Australia, New Zealand, and South Africa.

Most Wiccans live in urban areas, and rituals that celebrate nature and venerate nature deities help them to feel more in touch with the natural world. This, along with a rise in active concern for the environment since the 1970s, has been a major reason for the growth in popularity of Wicca and Neopaganism in general throughout the latter half of the twentieth century and into the twenty-first. However, Wiccans demonstrate a range of attitudes toward protecting the natural world, from radical environmentalism and direct protest to more abstract views derived from the idealized nature of Romanticism or from Western esotericism. In the latter, nature is a reflection of a greater divine reality, being at once both an intermediary between humanity and divinity and being imbued with divinity itself. Thus, environmental activism does not necessarily follow from a ritual or spiritual engagement with nature, although this is often the case in North American Wicca as practiced and taught by Starhawk, for example. Nature, and Wiccans' understandings of it, are extremely complex; one cannot assume that Wicca and environmentalism go hand in hand.

Such complexity is evident in the diversity of Wiccan traditions that have emerged around the world. Practices borrowed from Native Americans have been adopted and

adapted by Wiccans in North America, for example, while many European Wiccans turn to Saxon, Celtic, or Germanic traditions, seeking inspiration from the supposed indigenous traditions of northern Europe. The classical pagan cultures of Greece, Egypt, and Rome are also mined for inspiration. Feminist witchcraft has had a great impact on Wicca in North America, which has then spread to New Zealand and Australia, but has been less influential in Britain, where the Gardnerian and Alexandrian traditions remain strong. Nevertheless, the multitude of North American Wiccan derivations—including Starhawk's Reclaiming, Faery Wicca, Dianic Wicca, and Seax Wica—have crossed back to Europe, and Starhawk's version in particular has grown in popularity because of its stress on political and environmental action.

Wicca has no centralized, institutional structure, and Wiccans have only a few beliefs to which they all adhere. These include the Wiccan Rede or Law—"Do what thou wilt an it harm none"—and the Law of Threefold Return, which states that whatever a person does, for good or ill, will return to them threefold. The lack of any central organizational structure allows for an enormous level of variety, and Wicca at the beginning of the twenty-first century looks likely to retain its complexity and differentiate further as it continues to spread and grow.

JOANNE E. PEARSON (2005)

WIDENGREN, GEO. One of the most famous historians of religions of the twentieth century, Geo Widengren (1907–1996) was born on April 24, 1907, in Stockholm, Sweden. From his early youth, he devoted his entire life to conducting research and teaching in the universities of Sweden. He studied Iranian and Semitic languages and religions under the supervision of Henrik Samuel Nyberg (1889–1974), the patron of the Uppsala Oriental school for many decades. Immediately after graduating in 1936, Widengren published his Ph.D. thesis under the title *The Accadian and Hebrew Psalms of Lamentation as Religious Documents*. His most important book from his early career, however, is *Hochgottglaube im alten Iran*, one of the most influential monographs of the Swedish school of Iranian studies. Widengren was appointed professor of the history of religions at the University of Uppsala in 1940, a post he held until 1973. During his tenure at the University, Widengren supervised many dissertations, including *Feuerpriester im Kleinasien und Iran* (1943, published 1946), written by his younger colleague, Stig Wikander (1908–1983).

In his early writings, Widengren was influenced not only by the works of scholars such as Nyberg and Tor Andrae, but also by Richard Reitzenstein and Raffaele Pettazzoni. Consequently, his books include themes, motifs, and methodological assumptions that often appear in the influential paradigms of the history of religions in the interwar period. His strongest influence came from Nyberg; like him, his mentor specialized in several philological fields and wrote critical appraisals of textual sources pertaining to both the Semitic and Iranian religions. Widengren’s work, however, was

usually much more accurate, insightful, and innovative than that of most of his predecessors. After publishing his first monographs, Widengren became inspired to synthesize the philological, historical, archaeological, and ethnological studies pertinent to the Near and Middle East using the phenomenological method—involving description, arrangement, interpretation and typology of historical data—that he applied in his imposing treatise *Religionens värld* (World of religion; Swedish edition 1945, German revised translation 1969). If, for instance, the formula *Hochgottglaube* (Faith in a high God) as a recurrent pattern in Near Eastern religions depends at least partially on the impact of the Germanic ethnologic school (as postulated by Wilhelm Schmidt and his followers of the Vienna school), Widengren illustrates the hypothesis by a more comprehensive and insightful usage of the sources.

As Jacques Duchesne-Guillemin wrote in his 1996 obituary, Widengren had a comprehensive knowledge of all the religions and literatures of the ancient Near and Middle East. His academic expertise encompassed the whole territory conquered by Alexander the Great, from Greece on the west to the eastern border of Iran and Central Asia, for over a thousand years. Widengren’s oeuvre must therefore be viewed as sustaining the Swedish school of history of religions, located mainly in Uppsala (see Widengren, 1953; and Carl-Martin Edsman, 2001), although he could sometimes be polemic, as were his fellow renowned representatives of the Uppsala school, Stig Wikander and Carl-Martin Edsman.

Widengren’s series of monographs titled *King and Saviour* (Parts I–V, 1945–55) represents probably the best example of his fine mastery of sources and method. Writing about a major theme in such an extensive cultural geography as that of the “Heavenly Book,” for instance, he reviewed religious concepts and symbols from Accadian, Arabic, Aramaic (Mandaic, Samaritan, Syriac), Armenian, Greek, Hebrew, Iranian, Sumerian, and Ugaritic vocabularies, but never lost sight of the local oral traditions that are so influential to the formation of a religious corpus.

Widengren also wrote extensively on Gnosticism (authoring various books and many inspiring articles despite his avowed distance from the new approaches adopted by scholars after the publication of the Coptic editorial tractates), Manicheism (including a short but valuable encompassing survey), and Mandeism. His main contribution to the latter field, published in 1982, discussed all the favorite motifs of the German and Nordic *Religionsgeschichtliche Schule* related to astronomical symbolism, apocalypticism, the destiny of the soul after death, the influence of Mesopotamian and Iranian motifs in Mediterranean religions of antiquity and Middle Ages, and special topics such as the origin and diffusion of *The Hymn of the Pearl* or the vividly disputed shamanic patterns in Zoroastrianism. Widengren’s long-lasting familiarity with several ancient and early medieval Iranian civilizations allowed him to study the cultural ties between the Islamic and Iranian beliefs as represented in motifs such as the

“tree of life” or the “heavenly ascension” of Muḥammad, (Widengren, 1950 and 1951). For a time, he explored the relevance of Jungian psychology to the study of religions (Widengren, 1967), but he never participated in the Ascona Eranos meetings, nor contributed to the *Eranos Jahrbücher*. Instead of assuming a nonhistorical description of religion after studying ancient documents, Widengren expressed his immense erudition by outlining an evolution of ideas and by linking his conclusions to historical events. His book *Iranisch-semitische Kulturbegegnung in parthischer Zeit* (1960) remains a seminal study, and his many articles on sacral kingship were planned to comprise a great autonomous book, never published.

Religious scholars in the 1960s critiqued these themes, but Widengren continued to defend the importance of Iranian influence throughout his career (see Widengren et al., 1995). In Europe, as in North America, his view supported a pan-Iranist model of historical diffusion. In the twenty-first century, however, religious scholars have largely refuted his vision of ancient Iran as the source of many ancient and modern religious motifs.

Monographs like Widengren’s *Mani and Manicheism* proved his ability to elegantly master in a rather small space the complex problem of the Manichean relationship to Zoroastrianism, Judaism, and Christianity, including developing a political and historical synopsis of Iran under Shapur.

Together with his Italian and Dutch colleagues Raffaele Pettazzoni, Gerardus van der Leeuw, and C. J. Bleeker, Widengren founded the International Association of the History of Religions (IAHR), and he participated in the first IAHR congress, held in 1950 in Amsterdam. He also helped establish the international journal of the IAHR, *Numen*. First published in 1954, the journal quickly developed into one of the major periodicals in the field of religious studies. In this journal, Widengren published a long article (which scholars continue to consult) pertaining to the state and future tasks of Iranian religious history (*Stand und Aufgaben der iranischen Religionsgeschichte*, 1954 and 1955).

Contributing to the initiative of Erik Gren and of other colleagues in close connection with the Nordic School of Oriental and Religious Studies, including Alfred Haldar, Ivan Engnell, Nils Simonsson, and Stig Wikander, Widengren assumed the role of co-editor of *Orientalia Suecana*, which soon became a major scholarly organ and promoter of research. His erudite skills and intellectual stamina were represented in the journal by his rare and illuminating studies such as his micro-monograph on clowns, harlequins and dervishes and their habits in the ancient and medieval near and middle east.

Widengren served as the president of the IAHR from 1960 to 1970. He presided over the Twelfth Congress of the International Association for the History of Religions in Stockholm in August 1970, at which time he resigned his post. Widengren also worked as one of the editors of those

proceedings, thus helping to ensure international recognition of the Swedish school of religious studies.

During the last twenty years of his life, Widengren refined some previously developed themes, including the role of Zoroastrianism under the Sassanids and Syriac religious literature. His successor in the chair of Uppsala, the Egyptologist Jan Bergman, edited a double-volume Festschrift, *Ex Orbi Religionum. Studia Geo Widengen oblata*, and dedicated it to Widengren in 1972 to commemorate his sixty-fifth birthday. Having received worldwide acclaim from his fellow historians, Widengren died on January 28, 1996. Unfortunately, however, no comprehensive record of his publications exists.

EUGEN CIURTIN (2005)

WIKANDER, STIG. Oscar Stig Wikander (1908–1983) was born in Nörrtalje, a small town close to Stockholm, Sweden, on August 27, 1908. He entered the University of Uppsala in 1925, majoring in classical and oriental languages. Wikander's mentor in Asian studies was the great Iranologist and Semitist Henrik Samuel Nyberg, whose principal ideas, expressed in the synthesis *Irans forntida religionen* (1937), exemplify the Uppsalian school's specific contribution to religious studies. In 1931, Wikander became a member of the prestigious Société Asiatique in Paris. He also studied at the University of Copenhagen under the guidance of Arthur Christensen, where he delivered on February 24, 1936, a paper entitled "Karnamak-i-Artaxer och den iranska historietradition" (*Karnamak-i-Artaxer* and the Iranian historical tradition). In 1938 Wikander defended his Ph.D. thesis on the Aryan *Männerbund*, under the supervision of Nyberg, but was awarded only a medium qualification: *med beröm godkänd (cum laudatur approbatur)*.

In Lund in 1943 Wikander submitted another paper, *Feuerpriester in Kleinasien und Iran* (The Fire Priests in Asia Minor and Iran), under the guidance of his colleague, Geo Widengren, which he hoped would establish his academic career. This paper was published with the same title in 1946. While writing *Der arische Männerbund* (The Aryan warrior bands) and before the beginning of World War II, Wikander built strong ties with the German academic community, in particular with Otto Höfler and Walther Wüst from Munich. Wikander's private correspondence as well as his articles published in Swedish journals before the war provide concrete testimony on his ambiguous position on the Nazi political, as well as academic, situation. In February 1944 he left for the Eastern Front (Greece and Turkey), enrolling in the Swedish Red Cross organization. After teaching Iranian languages at the University of Lund from 1941 to 1953, he was appointed professor of Sanskrit and Indo-European languages at the University of Uppsala. Wikander held this position until late 1974. He died on December 20, 1983, in Uppsala, after suffering during the last years of his life from the painful loss of his mental clarity.

During his life Wikander published numerous articles, but only three books: *Der arische Männerbund* (1938); *Vāyu: Texte und Untersuchungen* (1941), and *Feuerpriester in Kleinasien und Iran* (1946). They made him known as an eminent Iranist, although he was a controversial representative of the Uppsalian school. Even though he published no further books after World War II, these three works represent a common methodology: a historical and even social reconstruction on the basis of predominantly philological data. In these works, Wikander embraced Nyberg's distinction between *Mithragemeinde* and *Gathasgemeinde*, the general theory of a pre-Zoroastrian religion, and he used it as a basis for a philological analysis aimed at reconstructing the social institution and religious cults of the pre-Zoroastrian (Indo-Iranian or Aryan) warrior communities, whose principles were very different from the moral Zoroastrian rules. Wikander aimed to prove that such warrior organizations had an important social, political, and religious role within Aryan society. He argued that analysis of these structures should be the main focus of research into Indo-Iranian religions. At the same time Wikander supported Widengren's theory about the high gods of ancient Iran presented in *Hochgottglaube im alten Iran* (1938).

Wikander's 1938 thesis had been preceded by various ethnological and anthropological investigations undertaken during the nineteenth and early twentieth centuries (i.e., the work of such scholars as Leo Bittremieux, Leo Frobenius, Heinrich Schurtz, and Hutton Webster), most of them concerned with African secret societies. Though benefiting from many of these works Wikander was inspired mainly by Otto Höfler's *Kultische Geheimbünde der Germanen* (1934). Both Wikander and Widengren took into consideration the relevance of primitive African materials; while Widengren found identical structures between African and ancient Iranian

ideas concerning the high gods, Wikander considered the political role of Aryan warrior bands to be deeper than that of primitive African secret communities, emphasizing in this way the superiority of Aryan structures.

Apart from his book on Vāyu, whom he treated as a high god of the war, Wikander continued to examine the paradigm of warrior bands and masculine society, but with a different theoretical approach. The conclusion of his controversial "Études sur les mystères de Mithras" (1950), meant to criticize Franz Cumont's theory of the Iranian origin of the Western Mithraic cults, suggests that this Western phenomenon could have had its origin among warrior bands from the Balkans that worshipped the god Sabazios. The existence of an Iranian influence could be certified in the Balkans by the common symbol of the Thracian or Danubian cavalier. Wikander's article on Indo-Iranian twin-gods, published as a tribute to Georges Dumézil, points out how the main attributes of Nakula and Sahadeva received, from *Rgveda* to *Mahābhārata*, new warlike connotations. Finally, at the Congress of Mithraic Studies (Teheran, 1975), Wikander presented the Avestan text *Mibr Yasht* as indicating a purely masculine society, comparable to the Roman society of mysteries and following the general pattern of the archaic *Männerbund*, but from a phenomenological, not historical or sociological, point of view.

Wikander conceived his other two books, *Vāyu* and *Feuerpriester in Kleinasien und Iran*, as complementary and circumscribed to the same purpose: to broaden the reconstruction of the morphology of the socio-religious observances of ancient Indo-Iranians, centered on the cults devoted to the high gods Mithra and Vāyu-Anahita. Though this general theory is considered outdated, Wikander's work on fire-priests can still be used as an introduction to the cults related to Anahita, being valuable for the multiplicity of sources (Greek, Latin, Byzantine, and Arabic) upon which Wikander built his arguments.

Almost all of these theories have been criticized or rejected, including the relevance of the high gods for the ancient Iranian area, the discontinuity between Indo-Iranian preexistent religious forms and Zoroastrian reform, the consistency of a particular cult specific to masculine societies devoted to the Vāyu-Anahita gods, and so on. In addition, Wikander's philological interpretation of key terms, such as the Vedic *maryá*, the Old Iranian *mairya-*, and the Middle Iranian *mērak* (or *mērag*), which he thought proved the existence of warrior bands, seems doubtful. After World War II, Wikander abandoned the philological perspective of socio-religious reconstruction. On this point, he faced the same theoretical difficulties as Dumézil (at least before his *Naissance d'archanges*, 1945) in presuming to be able to reconstruct, on the basis of mere textual evidence, the three functions as social estates, real institutions of the ancient Indo-Europeans—that is, the *sacerdotium*, the caste of warriors, and the caste of growers and breeders (*brāhmaṇa*, *ksatriya*, and *vaiśya*). However, by revising his methodology toward

a more structural approach, Wikander could begin a fruitful dialogue with Dumézil.

In an article first published in the Swedish journal *Religion och Bibel* under the title “Pāṇḍava-sagan och Mahābhāratas mytiska förutsättningar” (“The legend of the Pāṇḍava and the mythical substructure of Mahābhārata,” 1947) and later only partially translated by Dumézil in his *Jupiter, Mars, Quirinus* (1941), Wikander proposed the principle of homogeneity and coherence from old Vedic theology to the epic construction of *Mahābhārata*. By assuming Dumézil’s theory of trifunctional partition, Wikander attempted to demonstrate that the five principal actors in *Mahābhārata* (Pāṇḍavas Yudhiṣṭira, Arjuna and Bhīma, and Nakula and Sahadeva) are the exact epic transposition of the trifunctional Vedic gods, namely Mitra and Varuṇa, Indra, and the twin-gods Nasatyas. A second important article, published in *Nouvelle Cléo*, “Sur le fonds commun indo-iranien des épopées de la Perse et de l’Inde” (1949), shows the extent to which Wikander preserved the relevance of the hypothesis of the common Indo-Iranian mythology, but from a new, Indo-European, comparative perspective. In this field, Wikander made a major contribution with his article “Germanische und indo-iranische Eschatologie” (1960), in which he emphasized the structural, mythological correlation between the Indo-Iranian and German-Scandinavian epic from an eschatological point of view. He expanded this view of Indo-Iranian eschatology in one of his six 1967 Haskell Lectures, “Indo-European Eschatology.”

Few aspects of Wikander’s work were sympathetic to the *Religionsgeschichtliche Schule*, as was certainly the case with his compatriot, Widengren. One could invoke Wikander’s criticism of Cumont’s theory about the Iranian origin of the Western Mithraic cult or his general suspicion of the fervent pan-Iranian theories of Michael Rostovtzeff or Lars-Ivan Ringbom. More eloquent is a short passage from “The Indo-European Eschatology”: “I am not qualified to take up those problems about Iranian influence on the religions of the Bible and the religions of the Greco-Roman syncretism. But, I cannot refrain from regretting that the discussion follows an all too old and antiquated pattern.”

During the last period of his life Wikander turned his attention mainly to the phenomenon of Gnosticism. He published four articles on Gnostic symbols in the work of Erik Johan Stagnelius, the famous Romantic poet of Sweden. Wikander’s “Ingmar Bergman’s Mythic Ironies” on the Gnostic symbolism in some of Bergman’s films, belongs to the same area of interest. It was based on a conference entitled “Bergman, a Gnostic?” held in Chicago in 1967. Wikander was also interested in Mircea Eliade’s scholarly works on religious symbolism (in particular for their examination of the transition from archaic to modern societies). In addition, Wikander worked on projects concerning the epic literature of the Kurds, which he analyzed while traveling in Syria and Lebanon. He transcribed and translated several epic texts in an attempt to reveal the correspondence between the reli-

gious observances of contemporary Kurdish communities and Old Iranian ones. Many of Wikander’s studies on Kurdish folklore remain unpublished.

There are many unpublished manuscripts in Wikander’s archive at Uppsala University Library. The most relevant for the history of religions are the Haskell Lectures (“The Ideology of the National Epic,” “Heroic Age or Mythic Age?” “Problems of Indian Epics,” “Problems of Iranian Epics,” “From Myth to History,” and “The Indo-European Eschatology”), held in Chicago at the invitation of Eliade. These lectures show the influence of Eliade’s work (in particular his *Le mythe de l’éternel retour* [1949] and parts of *Aspects du mythe* [1963]) on Wikander’s thought (especially regarding the relation between myth and history). Another important manuscript entitled “Den ariska romantiken” (The Arian Romanticism) is a sort of history of nineteenth-century European oriental studies, with special attention given to Swedish authors. Wikander mainly analyzed the European adoption of the term *Arian* and the ideological development of its meaning according to English, French, German, and Italian Romantic and post-Romantic writers.

In 1947, Wikander and the Swedish linguist Bertil MalMBERG founded the journal *Studia Linguistica* in Lund. Wikander also planned to publish with Kasten RÖNNOW a series called *Questiones indo-iranicae*, but only one work was eventually published—Wikander’s book on Vāyu. For several years he served on the advisory board for the Uppsalian journal for Asian studies, *Orientalia Suecana*. In 1974 the president of the Society for Mithraic Studies, Harold W. Bailey, invited him to join the advisory board of the *Journal for Mithraic Studies*. He also served with Franz AlTHEIM, Dumézil, and Eliade on the scientific committee of *Mankind Quarterly* during the first years of its publication.

Wikander took part in a number of congresses, including the International Congress for Oriental Studies (Paris, 1948; Munich, 1957), the IAHR congresses (Amsterdam, 1950; Marburg, 1960), the first International Congress for Sanskrit Studies (New Delhi, 1972), and the second International Congress of Mithraic Studies (Teheran, 1975). He also served as visiting professor at Columbia University in New York (1959–1960), at Colegio de México (spring-summer, 1967), and at the University of Chicago (fall-winter 1967).

In conclusion, Wikander’s academic works reveal a surprisingly complex personality, whose place in the framework of the history of religions should be fully reconsidered. Until then, the correspondence between Wikander and Eliade proves it to be extensive.

WILĀYAH SEE WALĀYAH

WILLIAM OF OCKHAM (1280?–1349?), English philosopher and theologian. William of Ockham was born between 1280 and 1285 at Ockham in Surrey, England. He entered the Franciscan order and studied at the Franciscan house in Oxford but without taking his doctorate; hence his title of "Venerable Inceptor," which indicated that he had not received a degree.

Ockham's career is divided into two phases. During the first phase he wrote his major theological, philosophical, and logical works; the most important were his *Commentary on the Sentences* and his *Sum of Logic*. The second phase began when in 1328 he fled from the papal court at Avignon with the general of the Franciscan order, Michael of Cesena, to the German emperor Ludwig of Bavaria, at Munich. Ludwig had become the adversary of John XXII, and Ockham joined the other Franciscan dissidents there who had quarreled with the pope over his denial of the Franciscan claim to be following Christ's life of absolute poverty. Ockham, who had originally been summoned to Avignon to answer accusations of error in some of his theological and philosophical doctrines, spent the remainder of his life polemicizing against papal claims to absolute jurisdiction in temporal and spiritual matters. He died at Munich, probably in 1349.

Ockham was the most influential thinker of the later Middle Ages. Philosophically, he was the first to found his outlook upon the discrepancy between the individual nature of all created being and the universal nature of the concepts and terms constituting our proper knowledge. Since, he said, only individuals were real, all universal and general notions only had real, as opposed to conceptual or grammatical, meaning if they referred to real individual things. In contrast to the overwhelming weight of medieval tradition, Ockham held that there were no such things as universal natures or essences. Instead, therefore, of seeking to explain the individual as the particularization of the universal, as in the statement that the individual man Socrates is the expression of the essence humanity, or that a white object is the manifestation of the quality whiteness, Ockham inverted the order and sought to explain how the mind arrives at the universal concept of humanity or whiteness from exclusive experience of individual men or white objects. He did so psychologically,

logically, and grammatically by seeking to show how the mind forms concepts and what their relation is to the terms and propositions in which knowledge of them is expressed. He thereby gave a new direction to philosophical inquiry, which effectively denied an independent place to metaphysics.

Theologically, the effect was to undermine the bases for a natural theology, since whatever lay outside intuitive experience of individual things lacked evidential status. Not only did that exclude proofs, as opposed to persuasions, for God's existence, but it confined theological discourse to the elucidation of the meaning of the articles of faith rather than providing rational support for their truth. Their truth was a matter of belief. And central to belief was the Christian's recognition of God's omnipotence. By Ockham's time, the affirmation of God's omnipotence had assumed a new importance, partly at least in response to the determinism of Greek and Arabic philosophy. It had come to be expressed in the distinction between God's ordained power (*potentia ordinata*), the power by which he governed the workings of the universe he had created, and his absolute power (*potentia absoluta*), which denoted his omnipotence taken solely in itself without relation to any order, and so is limited by nothing other than logical self-contradiction, which would have impaired it.

It was Ockham who more than anyone gave this distinction the currency which it acquired in the middle of the fourteenth century. He applied it to restate the accepted Christian truth that God could do directly (or indeed differently or not at all) what, ordinarily, by his ordained power, he did by secondary causes. Ockham was thereby reaffirming God's role as the direct ruler as well as creator of the universe. What was novel was the range and frequency of Ockham's application of God's omnipotence to virtually every aspect of creation: nature, knowledge, and matters of belief. Thus God himself could directly cause or conserve an effect that normally had a natural cause: the Eucharist, for example, where the appearance of the elements of the bread and wine could remain after consecration without any longer existing as physical substances. Similarly, absolutely, God could cause direct intuitive knowledge of an object that was not immediately present to the knower. He could do so, not by creating an illusion that what appeared to exist did not really exist, but by himself directly conserving knowledge of an object that was real but not present, such as someone seen in Oxford who was at Rome. Theologically, the implications were perhaps most far-reaching of all—and here Ockham was following Duns Scotus—by substituting God's immediate agency for the agency of the church, above all in directly accepting individuals for eternal life without the requisites of sacramental grace. God was thereby rewarding an individual action or will and not the preceding grace that ordinarily an individual had first to receive as the condition of the reward. Although neither Duns Scotus nor Ockham went beyond stating such a conclusion as the consequence of God's free-

dom from created forms, many of their successors gave the notion much wider application, which virtually denuded sacramental grace of its intrinsic efficacy. The effect was to reinforce the tendency in the religious outlook of the later Middle Ages to make God's will the sole arbiter in individual justification and predestination. It had as its accompaniment a corresponding stress upon individual religious experience based upon faith as the foundation of all theological discourse and alone bringing certainty in a contingent universe.

The extent of Ockham's influence during the fourteenth and fifteenth centuries can be seen in the dominance of the so-called nominalist school that developed first at Paris University and then spread to the new universities founded throughout the German-speaking lands. Its hallmarks were precisely an emphasis upon God's absolute power and therefore on the immediacy of God's will in deciding whom to justify and accept for eternal life. With Ockham's attack upon the concept of the pope's plenitude of power, and his insistence upon the sole authority of faith residing in every believer to decide questions of doctrine, he did perhaps more than any other single thinker to transform the philosophical and theological outlook of the later Middle Ages.

(Notre Dame, Ind., 1987), Léon Baudry's *Guillaume d'Occam* (Paris, 1949), Philotheus Boehner's *Collected Articles on Ockham*, edited by Eligius Buytaert (New York, 1958), Jürgen Miethke's *Ockhams Weg zur Sozialphilosophie* (Berlin, 1969), Paul Vignaux's article "Occam" in *Dictionnaire de théologie catholique* (Paris, 1931), and my own *William of Ockham: The Metamorphosis of Scholastic Discourse* (Manchester, 1975).

GORDON LEFF (1987 AND 2005)

WILLIAMS, ROGER (1603–1683), English and American Puritan minister and prophet of religious liberty, founder of Rhode Island. Born in London, Roger Williams was the son of Alice and James Williams, a merchant tailor. Of his early education little is known, but his ability at shorthand probably attracted the attention of Sir Edward Coke, then lord chief justice, who enabled him to attend Charterhouse School, from whence he won a scholarship to Cambridge (B.A., 1627). After several years' further study in divinity at that Puritan stronghold, Williams became chaplain in the household of Sir William Masham, and he married Mary Barnard, who was to bear him six children. As a convinced Puritan at the time when Bishop William Laud was vigorously opposing the movement, he found it advisable to join the great migration to New England in December 1630.

Called to serve the church at Boston, Williams refused to accept the post because the Massachusetts Bay Puritans

had not fully broken with the Church of England or rejected legal religious establishment, and Williams was by then a thorough Separatist. Instead, he ministered for several years at Plymouth Colony, where the Separatist element was stronger, and undertook missionary work among the Algonquin Indians, learning their language. Williams returned to Massachusetts Bay Colony in 1633, however, accepting a call to the church at Salem. But he angered colonial leaders by insisting that the churches profess separation, by claiming that the royal charter did not provide a valid title to the land, by denying that the unregenerate could take an oath of loyalty (which for him was an act of worship), and by arguing that magistrates could not punish breaches of the first commandments (which deal with religious obligations), but only of those that deal with moral or civil matters. Brought to trial in October 1635, he was banished. Williams fled southward, purchased land from the Indians, and founded Providence, Rhode Island, in 1636. In a departure new in Christian civilization, no church was established in the new colony—religious liberty was for all, even those with whom Williams was in sharp theological disagreement.

Williams earned his living by farming and (until 1651) trading with Indians at a lonely outpost on Narragansett Bay. His knowledge of Indian ways and his friendship with them permitted him to mediate among them, as well as between them and the English, on many occasions. His skill prevented what could have been a powerful Indian alliance against the colonies in 1637. His political abilities were also exercised in helping to keep order among the growing towns of Rhode Island. To secure a charter so that Rhode Island would not be swallowed up by Massachusetts Bay Colony, he journeyed to England in 1643–1644. He became known to the rising Puritan leadership through such writings as *A Key into the Language of America* (1643) and *The Bloody Tenent of Persecution, for Cause of Conscience* (1644), a hastily written but forceful scriptural argument for religious freedom. Successful in obtaining the charter, Williams returned home, but political changes soon jeopardized that achievement. He sold his trading post to finance a return to England (1651–1654), where he associated with such powerful figures as John Milton and Oliver Cromwell. Again he published extensively, notably *The Bloody Tenent Yet More Bloody*, *Experiments of Spiritual Life and Health*, and *The Hireling Ministry None of Christs*, all in 1652. Called home by political turmoil and family need, he left John Clarke of Newport to complete the diplomatic mission; Clarke remained until 1663, finally securing a permanent charter for Rhode Island from the Restoration government. Meanwhile Williams served three years as president of the colony he had founded.

Williams's deepest concern throughout his life was with matters of religion, the central theme of his extensive writings. He remained faithful to common Puritan presuppositions but doggedly pursued their implications to radical conclusions few could accept. A Calvinist in theology, he

emphasized the authority of the Bible as the means by which the spirit of God speaks, interpreting many of its passages in typological and millenarian ways. His greatest divergence with other Puritans was over the doctrine of the church. He sharply differentiated the pure church from the secular world, but he had difficulty identifying it amid the warring sects of his time. Briefly in 1639 he believed that the Baptists came the closest to his ideal of the church. Williams was baptized by affusion (pouring), baptized others, and participated in the founding of the first Baptist church in America at Providence. He soon left the congregation, however, and became known as a "seeker," but was not a member of any Seeker group, although he was acquainted with the Calvinist Seekers in England in the early 1650s.

Williams became convinced that the apostasy of the churches since Constantine had engulfed Christendom and that until God raised up new apostles the true church could not be discerned. Meanwhile, God called "prophets in sackcloth" to preach and witness to the truth, but not to gather churches. As a "prophet in sackcloth" Williams ministered among both English and Indians, but he remained highly critical of Christendom in all its forms, as well as of clergy who earned their livings by ministering. He believed that the truly faithful must be prepared for misunderstanding and persecution, having as their sole defense the sword of the spirit—the word of God. Magistrates have no competence in matters of religion, he insisted, for their rule extends only to civil matters.

Although Williams believed ardently in religious freedom, he was not a tolerant man; he could attack vigorously with tongue and pen (though never by force) those with whom he disagreed in matters of theology and biblical interpretation. He was deeply opposed to George Fox and the Quakers; as a Calvinist he objected to their separation of Word and Spirit, as well as to what was for him their inadequate Christology. He hoped to debate Fox when the latter was in Rhode Island in 1672, but had to settle for sharp exchanges with other Quaker leaders, about which he wrote in his most polemical work, *George Fox Digg'd out of His Burrows* (Boston, 1676).

Williams's role as a pioneer of religious liberty and the separation of church and state has been rightly celebrated as his major contribution; the twentieth-century renaissance in Puritan studies has made clear how deeply his work was rooted in his religious commitments.

BIBLIOGRAPHY

Almost all of Williams's extant writings are in *The Complete Writings of Roger Williams*, 7 vols. (New York, 1963); the first six volumes are reprints of nineteenth-century editions, but the seventh adds tracts not included in previous collections and was edited by Perry Miller with an interpretive introduction. Miller had previously written *Roger Williams: His Contribution to the American Tradition* (1953; reprint, New York, 1966), which includes brief, modernized passages from Williams's major works. A well-delineated interpretation of Wil-

Williams's thought, based on his writings, is Edmund S. Morgan's *Roger Williams: The Church and the State* (New York, 1967). A thoughtful treatment that includes informed attention to the English as well as to the American locales of Williams's life is John Garrett's *Roger Williams: Witness beyond Christendom, 1603–1683* (New York, 1970). A study of his religious and biblical views is W. Clark Gilpin's *The Millenarian Piety of Roger Williams* (Chicago, 1979).

ROBERT T. HANDY (1987)

WILLIBRORD (658–739), pioneer of the English missionaries who crossed the seas to proclaim the gospel to the non-Christian peoples of the continent of Europe. Born in Northumbria, Willibrord as a boy came under the influence of the great Wilfrid, archbishop of York. From 678 to 690 he was in Ireland, and while there he became filled with the desire, which never left him, to preach the gospel to non-Christians.

In 690 Willibrord went to Friesland in the Netherlands, which became his home for forty-nine years. This part of Europe was in a state of great disorder from which it was emerging through the rise of Carolingian power, destined to reach its climax in the empire of Charlemagne. Pepin I gave Willibrord the land near Utrecht on which later Willibrord was to build his cathedral. In 695 he was consecrated archbishop by the pope, who intended to establish Utrecht as a regular province of the church with archbishop and diocesan bishops. This goal was never attained, and after the death of Willibrord, Utrecht gradually lost its importance.

None of the correspondence of Willibrord has survived, and we have hardly anything from his hand. This makes it difficult to get a clear idea of his personality and his work. He seems to have been characterized not so much by brilliance as by steadfast continuance in the work that he had set himself to do. It is clear that his aims were greater than his achievements. He penetrated Denmark and brought back thirty boys who presumably were to be trained as missionaries to their own people, but nothing came of this. It is not clear whether he ever consecrated other bishops. He did, however, in 698 found the Monastery of Echternach in Luxembourg, which later became a great center of missionary work.

Willibrord opened a door to the evangelists of the rising English church, worked out a model of what a missionary should be, and set an example followed by many successors. The churches in the Netherlands are right in regarding him as the apostle of Frisia and the founder of the church in their land.

BIBLIOGRAPHY

The two lives of Willibrord by Alcuin (735–804), *Vita sancti Willibrordi*, "Monumenta Alcuiniana," vol. 6, are hagiographical, full of stories of miracles, and inadequate from the point of view of historical detail and reliability. Of modern works,

William Levison's *England and the Continent in the Eighth Century* (Oxford, 1946), pp. 1–69, is authoritative. Reference may be made also to Alexander J. Grieve's *Willibrord, Missionary in the Netherlands* (Westminster, 1923) and to *The Anglo-Saxon Missionaries in Germany*, edited and translated by Charles H. Talbot (New York, 1954).

STEPHEN C. NEILL (1987)

WINE SEE BEVERAGES; EUCHARIST

WINTER SOLSTICE SONGS. In Europe the celebration of the winter solstice, the longest night of the year, is a heritage that goes back to prehistoric times. The classical Greek and Latin authors, as well as the fathers of the church, attest to the fact that the festivities centered around the winter solstice in antiquity perpetuated traditions still more ancient that were deeply rooted in folk practice. Despite regional differences in the evolution of these feasts and in their cultural significance, they all included elements of sun worship, revels, masquerades, and divination since the winter solstice was considered to be a time of great importance. The fertility of the fields, the reproduction of the cattle, the health of the people, and the conclusion of marriages in the coming year were all deemed to depend on the observance of the solstice rituals.

The celebration of the winter solstice also included the singing of special songs. Unfortunately, very little is known about the songs performed during the cycle of the Roman imperial feasts, the Saturnalia, the Dies Natalis Solis Invicti (the birthday of the Iranian god Mithra), and the Calendae Ianuari, which occasioned the exchange of congratulations and the start of the new administrative year. All that has come down to the present day are the texts of certain congratulatory formulas. From Augustine one learns that in the fifth century CE, on the day of such feasts, songs that from the Christian point of view were "most vain and filthy" were still performed. In comparison with the celebration of the winter solstice in northern Europe, however, the Roman feasts, through their insertion into the official calendar and through their fusion with elements imported from different provinces of the empire, may be considered a relatively late cultural synthesis.

The winter solstice feasts celebrated in northern Europe display different features and have a much more archaic character. Nearly all records of the winter solstice feasts in this area relate only to the Germanic peoples. Nevertheless, this article shall try to demonstrate, most of these customs and beliefs can also be found in the folk traditions of eastern Europe.

According to Latin historians and church chronicles, as well as evidence derived from the laws and capitularies prohibiting pagan practices and early Anglo-Saxon and northern

European literature such as the Icelandic sagas, the Germanic midwinter Yule feast celebrated the reappearance of the sun and had a marked funeral character. It was commonly believed that the spirits of the dead were most haunting during the period of the winter solstice. They would return to their former dwelling places in order to participate in the feasting, and unless they were treated with due honor, they would do harm to the living. On the other hand, the welcoming of the spirits, who were impersonated with masks, was believed to insure peace, health, prosperity, and fertility in the coming year.

Despite the relative richness of data about the mythology and customs of the Germanic peoples, precise information about the specific myths, tales, or songs that were performed during the Yule feast is lacking. Sources that mention the performance of Icelandic sagas on Yuletide are not really an exception. The Icelandic sagas, however, cannot be considered specialized songs of the winter solstice since they were also performed on other occasions, such as weddings and night gatherings. It must also be borne in mind that the Icelandic sagas, although partly based on older oral literature, were composed during the twelfth and thirteenth centuries and thus cannot properly be included among the pagan folk traditions of the winter solstice.

Through missionary propaganda and the skillful strategy of the church, these traditions were partly obliterated and partly assimilated into the patterns of Christian ideology. The winter holy days of the church were originally based on the calendar of the later Roman empire. While ostensibly expelling pagan winter customs, the winter holy days actually adopted some of them under Christian cover, first those of the Mediterranean area, then some of the ancient winter solstice traditions of the Germanic peoples. Thus in the sounds of modern hibernal holy days one can still hear the echoes of the pagan celebrations of the winter solstice.

But the link that still connects the ancient winter solstice celebration to the present day must be sought in the traditions of the peasantry. If in the urban world the church succeeded in gradually assimilating pagan customs, wiping out their memory and finally supplanting them, its success among the peasants came later and was less definitive. Judging by the repeated admonitions that medieval priests addressed to the country folk, it seems clear that the peasants continued to cling to the pagan customs of the winter solstice, especially in northern Europe, where conversion to Christianity came late. Some of these customs still linger in the folk traditions of the Germanic peoples: To this day, the peasants of those countries attribute magical powers to the ashes of the old "Yule log" burned on Christmas and to the bread especially baked for this holy day.

It is not by chance that only in eastern Europe is found a living folk tradition that in part continues the ancient pagan winter solstice traditions. In this outlying region of the continent, at the turn of the twentieth century, and in some areas even until the onset of World War I, the numerically

superior peasant class continued to live in relative isolation, under conditions that were in many ways archaic. Owing partly to this gap in socio-historical evolution, elements of the sun worship referred to among the Germanic peoples in the sixth and seventh centuries can still be found in eastern European folklore. The survival here of winter solstice traditions is also to be explained by the fact that in this area the fight against pagan customs was far less methodical than in the west. Lacking adequate theological training, the village priests of eastern Europe were not intransigent adversaries of paganism; they themselves sometimes contributed unintentionally to the survival of pagan customs or to their symbiosis with Christianity.

The eastern European solstice songs, performed by organized groups of adults during the winter holy days, resemble Christmas carols in the time of their performance and in some minor parallels in subject matter. Unlike Christmas carols, however, which circulated mainly in manuscript and in printed editions, the eastern European songs belonged to oral tradition. At their core, they preserved pagan rituals and myths that are integrated into a rich complex of folk customs of eastern Europe.

Circulating in impoverished form among the Poles, Bylorussians, Moravians, and Serbians, and still in use in certain districts of Greece, the repertoire of winter solstice songs of eastern Europe is rich and well preserved among the Ukrainians, Bulgarians, and especially among the Romanians. The composer and ethnomusicologist Béla Bartók, who collected Romanian folklore from before World War I, noted that "among all the eastern European peoples, the Romanians have preserved best till this day these partly ancient songs of the winter solstice" (Bartók, 1968, p. xxviii).

It can be demonstrated on linguistic grounds that the terms designating the winter repertoire in eastern Europe (i.e., the Ukrainian *koliada* or *koliadka*, the Belorussian *kaliada*, the Bulgarian *koleda*, and the Romanian *colinda* or *corinda*) are all derived from the Latin *calendae*. When one adds to this the fact that early Christian documents, as well as archaeological evidence, prove that the Roman winter feasts enjoyed great popularity in the Eastern Roman Empire, one can conclude that the folk terminology designating the eastern European repertoire of winter solstice songs almost certainly referred originally to the *Calendae Ianuari*. However, whether or not the eastern European songs themselves derived from the Roman winter feasts may be decided only by an analysis of the genre at the level of ritual acts and at the level of verbal expression.

The performance of the eastern European repertoire of solstice songs, which this article shall conventionally call "winter carols," is governed by unwritten regulations and occasionally shows traces of rituals, representations, and beliefs of mythological origin. Because of the present-day decline in the performance of the winter carol, in what follows this article shall take into consideration not only contemporary evidence but also certain data concerning regulations and beliefs

that were obtained from the older generation of carolers or that were recorded in archives.

Owing not only to local circumstances but also to the multiform, diffuse character of the myth itself, the performance of winter carols differs not only from people to people but very frequently from district to district inside the borders of the same country. Thus while this article shall insist on the commonality of the custom among the Ukrainians, Romanians, and Bulgarians, the writer shall also point out certain local peculiarities that eventually could contribute to clarifying the significance of the winter carol.

As mentioned above, the winter carols are performed during the period of the Christian holy days. According to certain witnesses, this period was once dedicated exclusively to winter carols, the performance of other songs being forbidden. In the past, various benefits were attributed to the performance of winter carols during the traditional period: an increase of the wheat and hemp harvest, welfare and health, the fecundity of the cattle. On the other hand, the performance of the carols at other times could harm the harvest and impair the health of children. Such opposing effects—beneficial and harmful—occasioned by the observance or neglect of the time period prescribed by tradition bears witness to the sacred character of the carols.

According to tradition, winter carols are performed by groups of varying composition and organization. Widely distributed and well structured among the Bulgarians, Romanians, and Ukrainians are groups composed of young men, and this may be considered the predominant traditional type. Some of the traditional rules connected with this type of group emphasize the ritual character of the caroling. Thus among the Bulgarians, illegitimate children and those having a physical defect were not permitted to join the group of young men. Archival records and frequent references in the carols to “lads” and “youngsters” show that in the past, at least in certain districts of Romania, caroling was the exclusive prerogative of young unmarried men. In certain districts of Romania, during the winter holy days, the young men of the group were obliged to live together in one dwelling and avoid sexual relations with women. During the same period, young carolers were permitted to behave rather wildly, even to cause minor damage, without being punished.

Today the group of young carolers includes married as well as unmarried men. The organization of such groups starts at the beginning of the Christmas fast (November 15) or at the latest a couple of days before Christmas. On this occasion different duties are assigned to the members of the group. Among the Bulgarians, Romanians, and Ukrainians, it is standard to elect a chief invested with absolute authority over the group and to name a young caroler whose task will be to carry the presents that are given as rewards to the carolers. Among the Ukrainians, the local priest traditionally arbitrated the election of the chief, and the carolers carried the cross with them.

Caroling often entails more than simply singing songs. In certain districts of eastern Europe the caroling is accompanied by the noise of bells, drums, or trumpets, probably aimed at neutralizing the influence of the spirits of the dead, who are widely believed to be especially dangerous during the winter solstice. The Hutzuls, a Ukrainian ethnic group living in the northeastern Carpathian Mountains, associate caroling closely with dance and perform hieratic dances while singing the carols. In certain districts of Romania young carolers would dance with girls after singing the carols in order to bestow upon them joy and good health. In some areas caroling has also been associated with masks. In various districts of Romania, for instance, the dance of the Turka or the Stag (both zoomorphic masks) is performed while, or after, a certain carol is sung.

In Bulgaria, Romania, and the Ukraine, the actual performance of the winter carols takes place on the night of Christmas Eve, on Christmas Day, and sometimes on New Year's Day as well. In certain regions of Romania, groups of carolers sing a special carol at dawn while facing in the direction of the rising sun. The carols may be performed while standing by a window outside a house, in the house itself, or on the road as the carolers go from house to house. By custom the carolers must perform their carols at all the houses of the village, and in turn the people must welcome and reward them. The most common gift is a pastry especially baked for Christmas. It is believed that by eating morsels of this cake or, alternatively, by burying it in the ground or feeding it to cattle, one can ensure the good health of one's children and animals, as well as increase the fertility of the fields. Possibly related to Mediterranean and Near Eastern vegetation rituals is a custom recorded at the beginning of the twentieth century in certain districts of Romania: At the time the young men's group is disbanded, a simulation of the death and resurrection of one of the carolers is enacted. Finally, at the end of the holiday period, the carolers hold a banquet to which they invite the girls of the village.

Winter carols are classified in different ways. Some are named in accordance with the time or place of their performance, for example, “Carol at Night,” “Carol at Dawn,” “Carol at the Window.” Most of the titles refer to the person addressed, such as “Carol for a Girl,” “Carol for a Young Man,” “Carol for a Widow.” Very often the titles refer to the profession of the addressee: “Carol for a Shepherd,” “Carol for a Plowman,” “Carol for a Midwife,” “Carol for a Priest,” and so forth. Here and there, in houses where a member of the family has died, the carolers sing a special piece called “Carol for the Dead.” Such titles, which have become rare in modern times, derive from an earlier period when the carols were connected with funeral rituals. While some of the winter solstice rituals were intended to repel the spirits of the dead, others were aimed at winning their good will by inviting them to join the feasts and honoring them with songs, offerings, and banquets. The belief that during the period between December 24 and January 6 the souls of the dead

come out of their graves and haunt the living is widespread in eastern Europe. In order to appease them, both Slavic peoples and the Romanians used to leave a table laden with food and drink on the night of December 23.

Despite the Latin etymology of the terms designating the eastern European winter carol, the analysis of beliefs and rituals that underlie the performance of the genre does not support the hypothesis of a Roman origin of the custom. It may be assumed that the substratum of the winter carol precedes the romanization of the Thracian populations of eastern Europe. The regulations regarding the organization of young men's groups, as well as other related features, suggest the preservation of vestiges of puberty rituals. Most of the rituals and beliefs associated with the gift of the cake to the carolers, as well as certain remnants of sun worship (e.g., "Carol at Dawn"), seem to belong to a much more archaic stratum than do the Roman winter feasts, and they bear striking resemblances to the northern European celebration of winter solstice. One may deduce that the introduction of Roman winter festivals would not have entailed the abolition of the local festivals. The coincidence of data and certain analogies between the two traditions (revels and masquerades) could not but favor the perpetuation of the local folk tradition under the emblem of the conquerors. The Romans, for their part, were adept at assimilating foreign customs, rituals, and gods through their well-known system of *interpretatio Romana*. It seems very probable that, due to the political and cultural prestige of the imperial winter festivals, local customs relating to the winter solstice, as well as rituals performed at other periods of the year (such as the agrarian rituals performed on the vernal equinox, the old New Year), came to be focused around the new Roman New Year.

The foregoing considerations can be extended through an analysis of the actual repertoire of the winter carols themselves, their fundamental types and motifs. Here one encounters the same problems that are involved in the description of the practice of caroling but now at the linguistic level of the carol itself.

Students of the winter carols generally divide them into two groups: secular and religious. In doing so they mean to distinguish between winter carols that were not influenced by the church and those in which Christian characters or references do appear. A good number of both secular and religious carols contain properly mythological materials, such as the types of carols that present a non-Christian myth of creation in Christian dress. One type of carol, for example, tells how, at the beginning of the world, Judas plunged the universe into darkness by stealing the sun and the moon. Saint John or Saint Elijah then brought the celestial bodies back and thus dispersed the darkness. Another type relates how God created the world by placing the sky on four silver pillars. Despite the references to saints or to God, the versions of creation disclosed by the winter carol have nothing in common with the biblical account in *Genesis* and obviously convey pagan myths about the foundation of the world.

Another category of winter carols, very possibly produced by peasant women, may be connected to feminine rites. In Romania until World War I a female folk society, called Ceata Fetelor, preserved traces of initiation rites for girls, practiced matchmaking charms, and was deeply involved in caroling. Apparently similar societies once existed among other east European peoples as well. Of course, only some of the carols dedicated to unmarried women may be associated with feminine rites. Most of the Romanian, Ukrainian, and Bulgarian carols in this category bear the mark of the traditions and history peculiar to each of these peoples. Common to all three is the well-known allegory of the wedding, which presents the bridegroom in the form of a hunter who pursues a deer.

The Romanian and Bulgarian repertoires contain a large number of carols that deal with hunting. Usually dedicated to young men, these carols were no doubt originally connected with puberty rites. The ritual significance of the hunt as a task preliminary to marriage can still be discerned in the carols that culminate with the killing of the game. As a rule, the victim is an edible wild animal, very often a stag, and the young man plays the part of an accomplished hunter. In a further extension of meaning, the hunter is frequently called the bridegroom, and the hunt is sometimes viewed as a preliminary condition for marriages. Particularly relevant for the relation between the hunt and marriage is the ending of this type of carol: In its death agony, the wounded animal announces the impending marriage of the hunter. It follows that the young man hunts as a candidate for marriage and that the shooting of the game makes him eligible as a bridegroom.

In a distinct group of carols, the hunter-quarry relation is associated with the miracle of metamorphosis. The hunter is confronted by an ambiguous character whose human or social identity is hidden behind the outer form of a wild animal, usually a stag. The creature's ambiguity is manifest from the very beginning: The stag has white or golden horns (colors with a well-known ritual significance); it laughs, sings, and openly defies the hunter. At the revelation of the animal's hidden identity, which entails the recognition of its prestige and authority, the hunter silently gives up the hunt, sometimes breaking his bow into pieces. Here the hunt becomes the scene of a young man's encounter with the sacred. There is undoubtedly a relation between such metamorphoses described in the hunting carols, the dances with zomorphic masks that sometimes accompany caroling, and the confrontations with disguised characters that often take place in puberty rites.

In addition to carols focused on hunters, shepherds have produced a repertoire of carols of their own. Many of these are clearly related to rites intended to encourage the growth of the shepherd's flock. Others have a cryptic character. For instance, in "Mioritza, the Clairvoyant Lamb," a carol known only to the Romanians, a shepherd is ritually condemned to death for reasons that remain obscure.

While the exact ritual significance of some of the carols sung within the restricted circle of the shepherds remains unclear, the significance of caroling within the context of the more ample agrarian rituals is more explicit. This is especially true of the Bulgarian, Romanian, and Ukrainian carols. These carols tell how God, the saints, or the carolers themselves sprinkle the courtyards and fields with water in order to increase the harvest. Quite often, the carol text preserves not only the ritual formula but a descriptive trace of the ritual actions as well:

Water in his mouth he has taken.
The cornfield he has sprinkled.
And thus he spake:
“Wheat, grow you up to my belt
And you, hemp, up to my armpits.”

In the Romanian and Bulgarian repertoires one frequently encounters references to the sun, the sister of the sun, and sometimes to the daughter of the sun. Such personifications are typical of the sun worship that is proper to cultivators and seem to have been connected with the winter solstice celebration. In certain Romanian winter carols, the sun is presented as descending from the sky with a sickle under its arm or as the owner of a ship that harbors the soul of the deceased. Some of the refrains of the Romanian winter carols refer to the sun, its rays, or the dawn, and in certain contexts the sun is referred to as “sacred.” It would be impossible to distinguish a category of carols exclusively on the basis of references to the sun or to agricultural rituals. Rather, one finds such references scattered throughout carols of all sorts—hunting carols as well as those influenced by Christianity. It is clear that the point of view and the mentality of an agrarian society are predominant in the winter carol and that it is still rooted in prehistory. Nevertheless, an analysis of hunting carols reveals that many motifs that were passed down from prehistory were reinterpreted to reflect interests of herdsmen and plowmen.

Even the archaic Romanian carol about the hunters who were turned into stags, a carol that served Béla Bartók in 1930 as the libretto of his *Cantata Profana*, did not escape the influence of herdsmen and plowmen. All the versions tell of an old man who, in teaching his sons to hunt, neglected other professions:

And he taught them not
Any kind of trade:
Neither husbandry
Nor herding of cattle
Only [taught them] hunting.

From the perspective of herdsmen and plowmen, hunting as an exclusive profession becomes a culpable activity.

Another important change can be seen in another set of carols in which the hunter is confronted with strange animals: Not only miraculous stags but also fish that jump out of the sea in order to graze on flowers or pick apples, or (among the Romanians) a lion endowed with horns or equat-

ed with a human being or a dragon. Unlike the animals in the carols that feature the metamorphosis of the hunter's prey, however, these creatures do not pretend to have a hidden identity, and consequently they are neither spared nor feared. They are characterized by the harmful role they play. They are considered malefactors not so much because they steal to eat but because of the damage they do. The fish is blamed less for stealing apples than for spoiling them, and the lion is deemed guilty not only for plundering the vineyard but also of ravaging it.

Although it is possible to draw a parallel between the wild behavior ascribed to these creatures and the disorders permitted to neophytes in a puberty ritual, it is nevertheless evident that the relations between the harmful animals and the hunter described in this category of carols overstep the bounds of the ritual. While the hero continues to play the part of the hunter, he is at the same time represented as the owner of a house or a vineyard or as the protector of an apple tree. Crossing the borderline that separates what is wild from what is cultivated, the harmful animals endanger the interests of the farmers. The ritual matrix of the hunting carol is reduced to an empty shell in order to make way for the message of an agrarian society. The young hero has not dropped the emblem of the hunter; he has nonetheless become a manifest representative of the farmers' interests.

It was not only the agrarian mentality that brought about change in the winter carol but other factors as well; first among these was the influence of Christianity, which took several forms. It is probable that the earliest direct influence of the new faith was the introduction of Christian refrains into the carols. One of the oldest of these is the “hallelujah,” which one finds preserved in a corrupted form. In a more indirect way, Christianity served as a vehicle for conveying legends and beliefs from the Mediterranean and Near East to eastern Europe. For instance, the story found in an apocryphal gospel, which tells of the Mother of God asking a palm tree to lend her its shade, reappears in a winter carol, where the palm tree has become the poplar and fir common to eastern Europe. Such apocryphal legends form the basis of many of the carols.

Only a part of the corpus of religious carols was inspired by Christian apocrypha spread through the Slavonic-Byzantine church. Many others combine Christian themes with the local folk culture of eastern Europe. Here the distinction between religious carols and secular carols breaks down. Symbolic of this lack of a clear boundary is a magnificent robe, described in the carols as adorned with the heavenly bodies, which may be worn in turn by God himself, by Jesus, by a shepherd, or by the boy who, in the carol, is chosen as chief of the army. Similarly, the fusion of Christian motifs with older beliefs could result in surprising, hybrid characters. Judas, for instance, may be equated with a subterranean demon, with a serpent, or with an aquatic monster.

One occasionally encounters carols that betray a degree of tension between Christianity and the folk mythology.

Thus in some of the hunting carols a stag pretends at first to be Saint John, and then denies it and reveals itself to be a sacred beast that measures the earth and the sky. In a large number of the carols, however, there is no such tension. Jesus is depicted dancing with the sister of the sun, Saint Nicholas saves the ships of the sun from sinking, and the birth of Jesus is announced by a fairy. In the mild climate of folk Christianity, which survived until quite late in eastern Europe, the association of the saints with mythological characters was neither resented nor felt to be inappropriate or desecrating.

One of the most straightforward forms of interaction between Christianity and folk motifs was the simple substitution of Christian saints for earlier mythological figures. At a deeper level, however, the Christian ideas of sin and punishment could occasionally give a new meaning to both the motivation and the denouement of the original myth.

Judging by a textual analysis of the carols and related documents, it appears that the process of the christianization of the carols has intensified in the last three or four centuries as a consequence of the increased influence of the church. Yet one can detect in the carol repertoire an old Christian nucleus. The fact that some of the "religious" types conform well to the patterns of the genre and bear folk titles apparently proves their penetration into the winter carol's repertoire at an early date. Among these old Christian carols we may mention the type that represents Jesus surrounded by sheep, a type eventually inspired by the early Christian symbol of the good shepherd, and those that tell of a monastery by the sea or describe the Mother of God with the baby Jesus in her arms.

What one might call the "poetics" of the genre of the winter carol is in fact an ensemble of canons closely connected with the ritual function that the winter carol is intended to serve. Each carol consists of two parts: a first part that is sung, and that includes one or more descriptive or narrative sequences, and a second part that is spoken, and that includes a congratulation formula.

Although relatively concise and placed at the end of the carol, the congratulation formula was of the utmost importance. In a context where ritual formulas were believed to have concrete effects, the wish expressed through the congratulation formula was not intended as the mere expression of a desire but as a means of influencing reality.

The first part of the carol is in a sense the incarnation of the wish expressed in the congratulation formula. Thus, the carol's descriptions and narratives present a series of models, which may be ritual, social, heroic, professional, moral, or physical. Like the fairy tale, the winter carol conveys the singer or listener into a world where dreams come true. But contrary to the fairy tale, which projects the wish into the realm of fiction and places the events in a remote age, the winter carol presents one with a concrete and immediate model of an ideal of life or behavior, an ideal that is supposed to be realized through the compulsory influence attributed to the congratulation formula.

In practice, the carol is always addressed to a specific person, and the name of this person is usually assigned to the hero in the carol. Thus the hero who shoots the stag or captures the lion in the carol is symbolically identified with the person at whose house the carol is performed. A happy ending is dictated by the logic of the ritual: In order to confirm and support the wish expressed in the congratulation formula, the hero, identified with the addressee, must attain victory and receive its rewards. It is to be noted that today this ritual symbolism is perceived as a mere stylistic device, however, or as an homage paid to the host.

There are, of course, exceptions to the aforementioned canons. Some of these are the result of the carols' different ritual functions. As noted, the winter carol can also have a funerary function. In the carols for the dead the rule of the happy ending must naturally be canceled. Other exceptions are to be explained on the basis of the process of a carol's composition. Compiled in stages and from different sources, a carol sometimes includes characters or sequences incongruous with the canons of the genre. The saints, for instance, cannot be identified with the addressee of the carol and consequently cannot take on their names. Various devices are employed to circumvent such difficulties. Thus in various Christian carols, in order to comply with the canons of the genre and at the same time avoid desecrating the sacred character of the saints, a human character is introduced—usually "the Good Man"—who receives the name of the addressee.

The vision presented by the winter carol is one in which harmony and peace reign over the world. The heroes appear in a halo of happiness, beauty, and glory, and conflicts are attenuated or resolved. Even tragic endings are accompanied by serene images: In "Mioritza, the Clairvoyant Lamb" the moon keeps watch over the corpse of the slain shepherd, and according to a winter carol on the theme of the foundation sacrifice, the baby of the immured victim is not abandoned but is nursed by full-uddered deer that descend from the mountains.

The sparkling festive atmosphere peculiar to the winter carol is enhanced by a profusion of gold and white (both originally magical colors) that pour over the most humble objects and turn them into sources of light and wonder. The broom, for instance, is made of gold, as is the spindle and the cradle, while the sea and the heath are all white.

Typical of the winter carol is its refrain. Although part of the refrains that survive are preserved in distorted versions, one occasionally detects certain analogies with the invocations. The refrains, as well as the versification in general, are closely intertwined with the melody, which, by itself, deserves the highest interest of the specialist.

From a stylistic point of view one may distinguish two types of carols: the Ukrainian type, which has a pronounced descriptive character and long final formulas, and the Romanian-Bulgarian type, which includes epic segments and closes with concise formulas. The stylistic and typological analogies

between the Romanian and Bulgarian repertoires suggest that the basic form of the eastern European winter carol was the creation of the Thracians, on either side of the Danube. The fact that a number of mythological carols are common to the Ukrainians, Romanians, and Bulgarians suggests that the Slavs took the custom of the carol from the Thracians at an early date, enriched it with their own traditions, and dispersed it over a wide area. The rich and original character of the Romanian repertoire recommends it as the best source for study of the genre.

This general survey of the complex elements involved in the performance and texts of the eastern European winter carol requires that certain distinctions be made. Thus one may conclude that if the Christian influence is rather insignificant at the level of the customary practices associated with the carol, it cannot be neglected at the level of the text. Without shattering the mythological basis of the genre, the church succeeded in giving a Christian hue to a portion of the winter carol repertoire and, here and there, exerting an even stronger influence. The part played by the congratulation formulas in the structure of the carols may be seen as an echo of the Roman custom of exchanging congratulations on the occasion of the *Calendae Januari*. But in the empire's eastern provinces, the Roman New Year provided only a new label and framework for the well-rooted autochthonous celebration of the winter solstice.

Judging by certain aspects of the custom, and by references within the texts, the eastern European winter songs seem to have served as incantations directed against the evil influences of the dead and to have included elements of sun worship. Viewed from this perspective, the eastern European carol still displays its link with the ancient rituals of the winter solstice, but it has a diffuse ritual character. It incorporated not only the winter solstice rituals but also rituals of puberty, agrarian rituals of the vernal equinox, and the rituals and myths of the New Year.

In the folk traditions of eastern Europe the winter carol represents one of the oldest cultural strata. In it are found the vestiges of prehistoric rituals and cosmogonic myths, and this fact alone makes it important to the history of religions, ethnology, ethnomusicology, and linguistics. But the winter carol is more than a fossilized genre that provides data for the reconstruction of an earlier age. It has conveyed elements of myth and ritual that express fundamental experiences of humankind and thus still appeal to the contemporary reader. Moreover, the eastern European winter carol contains more than ancient myths and rituals; over the centuries, it has integrated a vast range of motifs into a complex synthesis. It may be fairly judged to be one of the purest voices that, emerging from the depths of magical belief, ever reached the heights of poetry. Had it not been embedded in provincial languages, the eastern European winter solstice song would have long ago joined the choir of those perennial songs inspired by faith that delight and strengthen the spirit of humankind.

WINTI SEE AFRO-SURINAMESE RELIGIONS

WISDOM. The term *wisdom* has been used with a great variety of meanings in the course of history. A survey quickly shows that every culture has or has had its ideal of wisdom and recorded it in oral or written sapiential literature. In particular, the relation, both historical and systematic, between wisdom on the one hand and religion and philosophy on the other, varies a great deal. This article can give only a limited selection from the broad range of sapiential traditions and ideas.

GENERAL TERMINOLOGY. As far as we can judge from the terms used and their history, wisdom was originally a practical matter, namely "insight" into certain connections existing in human life and in the world and modes of behavior derived from this insight and put into the service of instruction and education. The Indo-European root of the word *wisdom*, **ueid-*, connotes "perceiving, seeing" (compare Greek *idein*, "idea," and Latin *videre*, "to see"). The German language has preserved the ancient connection between *Weisheit* ("wisdom"), *Wissen* ("knowledge"), and *Wissenschaft* ("science"). A person's wisdom depends on what he or she has seen and thereby come to know. It is therefore a practical knowledge, the primordial shaper of human behavior toward the environing world (to the extent that this knowledge resists the pressures for immediate action). The same practical

element is manifest in other cultures as well. Thus the Hebrew *hokhmah* has to do with “skill, ability” (*hkm*); the Akkadian *némequ* with “dexterity and skill”; Greek *sophia* with “cleverness” or “skill” in any of the arts or professions of life (carpentry, medicine, poetry, music, etc.). The Akkadian word for a teacher of wisdom or learned person, *ummanu*, was borrowed from Sumerian and originally meant “master craftsman.” The cultivation and transmission of cumulative experience in coping intellectually with the world was done mainly in schools that were the seedbeds of literary culture and the forerunners of the later “schools of wisdom” or universities. Oral tradition was likewise controlled by specific groups that were responsible for the maintenance of tradition.

WISDOM, RELIGION, AND PHILOSOPHY. If religion can be broadly conceived as a way of coping, theoretically and practically, with the problems of the world, nature, and society, then wisdom is one part of this effort. In fact, wisdom and the various contents of the religions have historically been closely connected. Wisdom was regarded as an area of religious tradition and derived its authority from its relation to particular gods (especially the sun, as in Mesopotamia and Egypt) or religious principles (e.g., concepts of world order, such as the ancient Egyptian *maat*). In this form, wisdom contributed to the development of theological thought and is part of its history (“priestly wisdom”). Particular divinities were venerated in cult and magic (the two are difficult to distinguish) as protectors or representatives of religious knowledge (Ea and Marduk in Babylonia, Ptah in Egypt). The legitimation of wisdom by more or less religious figures, such as kings, teachers, and priests, belongs in the same context. We know instances of wisdom being personified as a divine hypostasis (e.g., in Buddhism, Judaism, gnosticism, Zoroastrianism). In many religions wisdom is an attribute of the divinities; in monotheistic religions it is an attribute of the supreme God. The wisdom of God transcends that of human beings and makes it pale into insignificance; in Christianity the wisdom of God even turns human wisdom into folly (see below). This Christian revaluation of the value set upon wisdom in antiquity did not, however, lead to an abandonment of wisdom but to its relativization and to a radical transformation of the whole concept.

This more or less positive relation between wisdom and religion is only one side of the coin. Just as often, wisdom went its own way alongside official religion; it was even, as in the ancient Middle East, in tension or conflict with it. To the extent that this was true, it was a profane, secular way of coping with the world that avoided or excluded any appeal to traditional religious entities (gods, cult, priests). It thus paved the way for philosophical and ultimately also for scientific thinking (see the etymological connection mentioned earlier between the German words for wisdom and science). This development is most easily seen among the Greeks, where the concept of philosophy, or “love of wisdom,” took shape. According to tradition (Diogenes Laertius, 1.12; Cicero, *Tusculanae Disputationes* 5.3.8) the term went back to

Pythagoras and was then taken over by Plato and Aristotle, who gave it its normative meaning. It is clear that the projection of the Platonic conception of philosophy and science back onto Pythagoras meant a reinterpretation of the latter’s simple, prescientific notion of wisdom. Pythagoras was undoubtedly a teacher of wisdom, not a scientist or mathematician in the later sense of these words; his explanation of the cosmos had at its center a number symbolism that could not yet be called scientific, since in it number, ritual, and doctrine of the soul still formed a unity (Burkert, 1972). In any case, *philosophy* retained its practical meaning of “way of life” down through the centuries and has not lost it even today. Ancient Greek wisdom, documented in gnomic poetry (Hesiod, Mimnermos, Solon, Phocylides, Theognis), with its simple key idea of “moderation” (*mēden agan*) or “fitness of act to time and situation” (*kairon gnōthi*), found its extreme application in the so-called Sophists, who converted wisdom (*sophia*) into practical rationality and thereby brought its dangers to light for the first time. In contrast to the Sophists, Socrates avoided the concept of wisdom and reserved this quality for God alone (Plato, *Apology* 20–22). For Plato wisdom was the supreme virtue (*Republic* 441c–d). Aristotle distinguished between the practical wisdom of everyday life (*phronēsis*) and speculative wisdom (*sophia*), which concerns itself with “first things” (*Nicomachean Ethics* 4.5.2, 15.1.5). The distinction marked the transition to systematic wisdom, or philosophy. Nonetheless, in the history of philosophy its ancient root—“wisdom for living”—has repeatedly surfaced; in particular it has found ever new expression in ethical systems and endeavors (e.g., those of Spinoza, Kant, Fichte, and Schopenhauer). In his *Wörterbuch der Philosophie* ([1910–1911] 1980, vol. 1, p. 446), Fritz Mauthner formulates the difference between wisdom and practical “prudence,” and between wisdom and philosophy or science with their goal of theoretical knowledge, as follows:

In my opinion, *wisdom* seems to mean not only that those who have this quality, possession, or way of thinking are able on every occasion to act or think with rare prudence in pursuing their theoretical or practical goals; it means that in addition they are able to judge the value of the theoretical and practical goals in question. It also means perhaps that such persons act according to their judgments. Schopenhauer was certainly a philosopher but hardly a wise man. Montaigne was a wise man but not really a philosopher. We think of Socrates as being both wise man and philosopher.

PROBLEMS OF A TYPOLOGY. Since it is not possible at present (or ever, in my opinion) to write a history of the various ideas of wisdom, scholars have quickly settled for providing at least a typology of the concepts of wisdom. Wisdom has taken these broad forms: an anthropological ability to cope with life (the oldest and most widespread form); a rational system (interpretation of the cosmos, philosophy, beginnings of science); and a personification, hypostasis, goddess, or attribute of God.

Any attempt at greater detail becomes mired in the problems of the given historical context. It is possible, for example, with Edward Conze to compare the Buddhist (Mahāyāna) Prajñāpāramitā (“perfect wisdom”) with the figure of Sophia in early Judaism and to find surprising similarities (Conze, 1968, pp. 207–209). There are even chronological correspondences: the hypostatization of both ideas of wisdom began about 200 BCE and yielded similar conceptions. Yet differences of content are unmistakable: Prajñāpāramitā is a personification of Buddhist insight into the “emptiness” of the world and has no connection with an idea of God; the Jewish Sophia became a divine hypostasis that can also be mediator of creation and identifiable with the Law (Torah). The situation is the same with parallels between Egyptian, Mesopotamian, and Iranian ideas of wisdom, each of which retains its own special character and cannot be wholly assimilated to the others and made to coincide with them. By and large, the only common element is the shift in the thematization of wisdom from an anthropological skill to a central religious figure or person who mediates wisdom. In this shift wisdom changes from subject to object; an anthropological capacity for insight becomes a form of revelation about the cosmos or God. The content of wisdom as insight into the coherence of the world and life takes on a religious and, to some extent, esoteric character (as in the *Wisdom of Solomon*, gnosticism, and Mahāyāna Buddhism). This development did not occur wherever ideas of wisdom existed (thus except for Israel and Iran it did not occur in the Near East or in Greece). It looks as if a necessary condition of this development is the existence of a canonical literature that accepts the idea of wisdom. “Revelation” is identified with wisdom inasmuch as wisdom becomes the content of revelation and as a result either heightens the importance of canonicity or permits an extension of canonicity (as, for example, in the Prajñāpāramitā literature or the gnostic writings).

This literary documentation for the idea of wisdom makes possible some typological classifications that should not be overlooked. Thus the “typical” wisdom genre is the *gnōme* (Lat., *sententia*), that is, the tersely formulated “sentence” or maxim, or, more generally, the proverb. The oldest collections of wisdom traditions are collections of proverbs that can be developed into literary works on the theme of wisdom or can at least supply material for such (“teachings,” “disputations,” dialogues). Omens, riddles, fables, parables, and metaphors are also frequently storehouses of wisdom. Wisdom is thus not limited to a particular literary form, although it is closely linked with the proverb and maxim. Its origin in the oral tradition of the preliterate period of history can be demonstrated only through inference from the presence of such traditions among contemporary nonliterate peoples. There is hardly a people that does not possess some stock of wisdom traditions; this stock is the source of wisdom in the original sense of the term. Its beginnings are lost in the darkness of prehistory. The question whether the often asserted “international” character of wisdom literature is to

be explained by evolution (from an original common possession) or by diffusion (through spread and borrowing) cannot be further answered. There are many arguments for the second hypothesis, but the first theory can also be helpful in examining many cultures. In any case, both forms of development can be seen at work in the course of history (the ancient Near East is a classic example of the borrowing of wisdom traditions). The important thing, however, is what particular cultures, literatures, and religions did with the common treasury of wisdom; these results are attractively multifaceted and pluralistic.

THE MANY FORMS OF WISDOM. Space allows only a limited survey of some of the principal forms taken by ideas of wisdom. The emphasis will be on the ancient Near East, which decisively molded the image of wisdom (transmitted through the biblical heritage). Only a brief glance can be taken at India and East Asia, which developed an independent form of wisdom that has influenced the culture and life of these peoples down to our own day.

Mesopotamia (Sumer and Babylonia). The Near East possessed expressions of wisdom at a very early date, although these did not lead later on to a unitary concept of wisdom. The dominant element in this wisdom was skilled proficiency in insightful understanding of the world, human beings, and society. No one doubted the divine origin of wisdom, even if an increasing awareness of the difference between divine and human wisdom manifested itself in later literature and led to a crisis in the wisdom tradition. The basic idea of the wisdom tradition was what scholars have named the “act-consequence connection,” that is, the early insight that specific actions have or can have specific consequences in the lives of human beings. People attempted to find rules of behavior by observing their human environment, but they did not advance as far as systematic reflection or even develop an ethic of behavior (this step was left for the Greeks and the Chinese). Their observations, handed down in the form of aphorisms, provided valuable counsel for kings, officials, and scribes. The storehouse for this wisdom was the school, and its teachers were the scribes, who were therefore regarded as wise beyond others. Wisdom derived its authority from its being traced back to divinities (especially Utu, Shamash, Ninurta, Enki, Inanna) or prehistoric wise men (Shuruppak, Gilgamesh). Because of its origin and approach this wisdom had a eudaimonistic and at times even a mantic character, but in the late period it turned pessimistic and skeptical. The dogma of the act-consequence connection to a great extent prevented the raising of new questions; when these were finally asked they led to a helpless skepticism (the problem of Job, the suffering just man; the problem of a just world order). Modesty, uprightness, consideration for others (love of neighbor), and deliberation were the principal virtues; their cultivation brought life, happiness, children (sons), and God’s providential care.

The decisive force in the development of ancient Mesopotamian wisdom was that of the Sumerians. The Akkadians

for their part mainly translated, transmitted, and interpreted, while adding a few new forms of their own (*Wisdom of Ahikar*, omen literature). The beginnings of wisdom are to be found in the early “lists” or “inventories” in which language was used as a means of “inventorying” the world and thus to some extent ordering or systematizing it. This kind of wisdom has therefore been called “list wisdom” and understood as a first approach to scientific effort (Soden, 1936). More developed approaches led from a simple listing of objects to an appraisal of them; this has come down to us in the form of disputations (literature of disputes over relative values). This kind of wisdom has been described as “value wisdom” (Hans Heinrich Schmid, *Wesen und Geschichte der Weisheit*, Berlin, 1966). The rise of proverbs relating to occurrences in nature and society brought for the first time the formulation of simple factual situations (called therefore the “wisdom of events”). This stage paved the way for wisdom sayings in the narrower sense. The latter emerged from observation of human behavior (initially without thematizing the act-consequence connection), first in proverbs and then clearly in various “counsels,” which unfortunately have come down to us only in fragmentary form (*Counsels of Shuruppak*, *Counsels of Wisdom*). Wisdom gradually made its way into various other genres; meanwhile links were also established between wisdom and ideas of a socio-ethical and legal kind from royal and legal texts (e.g., conceptions of protecting the weak, widows, and orphans; doing good and hating evil; practicing righteousness). Wisdom thus sought to formulate and thereby give insight into the basic rules governing the cosmos. The gods had established a just world order; it was for human beings to learn this order and act accordingly. The challenge to this outlook by, for example, historical events led to a crisis of wisdom, since the act-consequence connection came into question and the theme of the “suffering just man” became topical. This was the subject of the “Job poems,” which followed the “complaint and response paradigm” (*ersha-hunga*). To this genre belong the following: *Sumerian Job*, *the Poem of the Righteous Sufferer* (also called *I Will Praise the Lord of Wisdom [Ludlul bel nemeqi]*, from its opening words), the *Babylonian Theodicy*, and the satirical *Dialogue of a Master and Slave* (or *Dialogue of Pessimism*), which probably does not belong to the wisdom literature but is nonetheless very informative in regard to it. The conclusion reached in these works is that God’s action is inscrutable and his wisdom different from that of human beings. The act-consequence connection is pushed into the background but not abandoned, since insight into the order governing the world is denied to human beings. In all this we can see wisdom in the process of leaving our earth and becoming a supratemporal system and part of the divine world (to which in fact it had always belonged).

Egypt. Unlike Mesopotamia, Egypt did not have a “list wisdom” as a preliminary stage of wisdom; instead the sapiential saying (maxim) served as the starting point of a wisdom literature (the various “counsels”). The sapiential saying either contained a simple statement about the world and so-

cial relationships or it already connected consequences with specific actions that were either recommended or disapproved. Unlike the Mesopotamians, the ancient Egyptians developed the concept of a cosmic order (*maat*) that became basic to the idea of wisdom. The goddess Maat was a daughter of Re, the sun god, and symbolized truth, justice, and order in cosmos and society. The pharaoh was her representative on earth. The wise had to act like Maat; agreement with her bestowed success, disagreement brought punishment (unhappiness). Subordination to Maat was therefore the mark of the wise. Wisdom supplied the needed rules, which were based on tradition and experience (which included successive reinterpretations). Examples of wisdom or, as Egyptologists prefer to say, of “counsels” or “instructions,” go back to about 2800 BCE. Only the names of the earliest have come down to us (*Instructions of Imhotep*, *Instructions of Djedefhor*). The *Instruction of Ptahhotep* is the oldest surviving document of this genre (fifth dynasty). It is filled with optimism about the order (*maat*) that exists and is known and with an unbroken confidence in the act-consequence connection. Modesty, uprightness, self-control, subordination, silence, are virtues of the wise. The idea of the silent sage influenced Egyptian biographical literature. Citations from the wisdom literature can be demonstrated in numerous inscriptions.

Most of the remaining “instructions” are from the Middle Kingdom (c. 2135–1660 BCE) and are “tendentious writings” that discuss problems of wisdom and are therefore also called “disputation literature.” Among them are the *Instruction for Merikare* (tenth dynasty), in which the first mention is made of the judgment of the dead; the *Instruction of King Amenemhet to His Son Sesostris* (twelfth dynasty), which was probably a model for *Proverbs* 22:17–24:22, although the former is more pessimistic and materialistic; and the *Instruction of Cheti, Son of Duauf*, a piece of publicity for the civil service. The threat to the old order shows through in the *Admonitions of an Egyptian Sage* and the *Protest of the Eloquent Peasant*.

To the period of the New Kingdom (c. 1570–1085 BCE) belong the *Instruction of Ani* (eighteenth dynasty), which defends traditional authority against criticism, and the *Instruction of Amenemope* (twenty-second dynasty), which is strongly pietistic and calls for humility toward the hidden rule of the sun god. From the late period (first millennium CE) we have only the very homespun *Instruction of the Papyrus Insinger* and the instruction of a certain Ankhsheshonk. Characteristic of later wisdom (from the eighteenth dynasty on) is the realization, in Egypt no less than in Babylonia, of the limitations of human knowledge and the freedom of the divinity; this meant that the act-consequence connection, though weakened, was not completely abandoned, but was considered to reside in the impenetrable recesses of the godhead. Authority, tradition, humility, circumspection, and silence continued to be themes of wisdom. In fact, in the late period wisdom and piety came to be more closely identified.

Maat yielded to the godhead (Re). Devout individuals had as their partner no longer Maat but God; God became the guarantor of the act-consequence connection, which was hidden from the devout but which they nonetheless humbly accepted as existing. Wisdom now consisted in this knowledge of God and his free will, a knowledge that was familiar to the Bible and probably exerted an influence on it. For that matter, a monotheistic or henotheistic current runs through the entire wisdom literature.

Ancient Israel, Judaism. Israelite wisdom literature (*Proverbs, Job, Ecclesiastes*) underwent developments comparable to those in Babylonia and Egypt. In its earliest, preexilic form, wisdom is here, as in the ancient Near East generally, not specifically religious but focused on the act-consequence connection in the cosmos and in individual lives (see *Prv.* 22:13–23:11). It is not opposed to faith in Yahveh but on the other hand has only peripheral contacts with it (see *Prv.* 16:1–22, 16:28–29). Yahveh, like the ancient Near Eastern and Egyptian sun god, is guarantor of the cosmic order that governs the lives of human beings. Wisdom is primarily concerned with this-worldly questions affecting the order and security of human life; observation and insight into what goes on in the world and society play their part here. From a literary standpoint the proverb or maxim is the basic form of transmission (*Proverbs, Ecclesiastes*; later on, the *Book of Ben Sira* and the *Wisdom of Solomon*). Ascription to Solomon (c. 970 BCE) has a historical basis to the extent that international communication (especially with Egypt) flourished during that period (see the *First Book of Kings* 5:9–14). From that time on in Israel, as elsewhere, the “wise man” (*ish ḥakham*) had his place alongside the priest and the prophet, and the area of tradition with which he dealt soon became one of the most important in Israelite literature (see *Ben Sira* 24:3–7).

In its historical development this literature reflects shifting approaches to wisdom until the latter’s crisis and disintegration (*Job, Ecclesiastes*). To begin with, ancient wisdom is increasingly theologized, that is, connected with the Yahvistic faith, but also systematized or dogmatized and reduced to a series of anthropological contrasts (see *Prv.* 10–15). The wise and the foolish are turned into contrasting types, as are the devout and the ungodly, the sensible and the ignorant, and so on. The act-consequence connection changes (in the post-exilic period) to a connection between behavior and its results (*Prv.* 10:30, 11:3–4). Corresponding dualistic traits make their appearance as human beings are divided into the just and the wicked, and the cosmos into good and evil, just and unjust. Wisdom itself withdraws into heaven and is personified (see below). The ancient program of wisdom, which urged insight into human beings and the world through observation and its application, comes under the control of strict monotheism and the doctrine of creation, both of which leave little room for independent human thought. As a result, the crisis of dogmatized wisdom becomes radical and leads in the *Book of Job* to its rejection. As in the Babylonian

world, an appeal is made at this point to the inscrutability of God (see *Jb.* 40), a solution that is accepted in later Judaism. At the same time, however, a return to the ancient, authentic concept of wisdom is urged (*Jb.* 38–39): understanding of the world consists in the acknowledgement of its given order, even though insight into it is limited. The most radical break with the wisdom tradition comes in the Hellenistic period in the person of Qohelet (the purported author of *Ecclesiastes*), who abandons the act-consequence connection as a means of insight, is skeptical about an order in the world, and demonstrates the meaninglessness of human existence. Wisdom is no longer available in this world (see also *Jb.* 28). Reverence is still shown toward creation and its distant creator, but the “historicality of human existence” and its transitory character are thematized for the first time. Qohelet offers no solution for the crisis; the world and human beings remain unintelligible.

This situation, which we meet only in the Bible, had consequences that probably led to the disintegration of the biblical worldview in gnosticism. But Jewish apocalypticism too had some of its roots in wisdom: the removal of wisdom from the world led to an eschatological hope; the introduction of dualism into the cosmos (see above) led to the apocalyptic doctrine of the two kingdoms; historical events had deprived the scribes, who were the transmitters of wisdom, of their ancient theater of operations, the royal court, and they dreamed of its future restoration. Gnosis and apocalyptic were connected.

Hellenistic influence probably played a part also in the complete transformation of the figure of wisdom (Ḥokhmah). It becomes a suprahuman, otherworldly personage, a divine hypostasis (*Prv.* 8:22–31; *Ben Sira* 4:11–19, 24:3–22; *Wis.* 6–9), a mediator of revelation and creation (*Prv.* 3:19, *Ben Sira* 24:3); it is even identified with the Torah, or Law, as the content of the word of God (*Ben Sira* 24:8, 24:23; *1 Bar.* 3:9–4:4). It takes on the traits of a goddess (perhaps Isis Panthea) and, as Lady Wisdom, becomes the antagonist of Lady Folly, another personification, modeled on Aphrodite or Astarte (*Prv.* 7:9–13, 9:1–18). “Kinship” with her, such as the just or the wise have, bestows immortality (*Wis.* 6:17) and even makes one like God (*Wis.* 6:18). This shift from a horizontal role, as an anthropological skill in understanding of the world, to a vertical role leads in the *Wisdom of Solomon* (first century BCE) and then especially in the work of Philo Judaeus (first century CE) to the idea of wisdom (Gr., *sophia*) as an otherworldly figure accessible only through esoteric “knowledge.” Communication with this distant heavenly wisdom is accomplished in the philosophy of Philo through the Logos (the divine intelligible word), which represents “wisdom close to us.” Sophia is thus accessible only through revelation and knowledge of the Logos. It is no longer available in this world, but has vanished from it (Ethiopic *Apocalypse of Enoch* 42:1–8, 4 *Ezr.* 5:9–10, Syriac *Apocalypse of Baruch* 48:36). At this point the way is already being paved for the gnostic conception of wisdom.

CHRISTIANITY AND GNOSIS. Early Christianity accepted the early Jewish conception of wisdom at various levels. On the one hand, the early Jesus tradition (the purported source of the sayings of Jesus, known as the Q source) took over the ancient Israelite proverbial wisdom (explicit reference is made to Solomon in *Mt.* 12:42, *Lk.* 11:31); on the other hand, Jesus himself is understood as the embodiment of wisdom (*Lk.* 7:35 and parallels; cf. *Mt.* 23:34–36 with *Lk.* 11:49). He is “filled with wisdom” from his childhood (*Lk.* 2:40, 2:52) and surpasses even Solomon in this respect (*Mt.* 12:42, *Lk.* 11:31). His deeds and teachings demonstrate his wisdom (*Mk.* 6:2, *Mt.* 13:54). Scholars therefore speak of a “wisdom-Christology” as one of the earliest forms of christological statement. In the letters of Paul wisdom plays an important role in his dispute with the community in Corinth (*1* and *2 Corinthians*), where a wisdom that was probably already interpreted in a Gnostic manner was being preached and was finding expression in ecstatic utterances (revelations). In response, Paul conceives the momentous idea that Christian wisdom, represented by the Redeemer, is foolishness (*mōria*) to the world, this wisdom being the cross that as sign of the “weakness of God” (*1 Cor.* 1:25) is the very sign of his “strength.” God has destroyed “the wisdom of the wise” and turned it into “foolishness” (*1 Cor.* 1:18–22, 2:6–8). In the presence of the true wisdom of God, which has been revealed in Christ, the traditional wisdom of this world has been reduced to naught, but at the same time it has also been fulfilled. Those who believe in Christ possess “the power of God and the wisdom of God” (*1 Cor.* 1:24, 1:30, 2:10–12, 3:18). Old Testamental and Jewish wisdom literature of two centuries before the common era is here given a completely new interpretation and thereby rescued from the crisis into which it had fallen; on the other hand, limits are also set for any future Christian conception of wisdom. The critical acceptance of ancient wisdom traditions and the ambivalent response of Christian theology to philosophy both have their roots here (see Thomas Aquinas on the one side and Martin Luther on the other). Meanwhile, as the *Letter of James* in particular shows, the principle is still accepted that wisdom shows its truth in ethico-moral practice: Christian life is wisdom made manifest (*Jas.* 3:13–17; cf. *Jas.* 1:5). The ancient idea of wisdom is thus revived here; it becomes a Christian virtue for coping with life.

In my opinion, Gnosticism has its roots in those parts of early Jewish sapiential teaching that, like *Ecclesiastes*, challenged the traditional picture of the world. Independently of this heritage from tradition and the history of ideas, Gnostic literature too continues to present wisdom in the guise of transmitted sayings, for the most part in Christian form (from the Nag Hammadi corpus, the *Gospel of Thomas* and the *Gospel of Philip*; see also *Silvanus* and the *Sentences of Sextus*), but also in new forms of its own (*The Thunder, Perfect Mind*). Most notable, however, is the figure of Sophia, or Pistis Sophia (“faith wisdom”), an ambivalent embodiment of the Gnostic Pleroma, especially in the Barbelo and Valentinian forms of gnosis. According to some heresiological ac-

counts and original (Nag Hammadi) texts, Sophia is a companion of the most high God; more precisely, she is the feminine aspect of his first manifestation or emanation, whose masculine aspect or consort may be identified with the Primal Man, the Son of man, or Christ (Seth). A second, lesser Sophia must also be included in the series of “syzygies” (paired aeons) that derive from the first pair. Other passages—and these are in the majority—describe Sophia variously as one of the final aeons: the one that, as mother of the demiurge (Ialdabaoth), is indirectly involved in the fate of the created world. But she is simultaneously active in the work of redemption, repairing the harm done by the loss of the spark of light, inasmuch as Sophia herself, split into two parts—an upper and a lower, a greater and a lesser, a part of life and a part of death, of truth and of lie, or simply as Sophia and Achamoth (the Aramaic word for “wisdom”)—suffers in an exemplary fashion the fate of the fall and redemption. This version is characteristic of the so-called Barbelo Gnostics and of the Valentinians; it is also attributed to the Cainites and the Ophites, as well as to the Sethians. Several texts from Nag Hammadi also belong here (e.g., *Apocryphon of John, Hypostasis of the Archons, Gospel of the Egyptians, Trimorphic Protennoia*). Gnostic wisdom (*sophia*) serves to express many sides of gnostic thought. It serves as an image of the self-estrangement of God in emanation and reflection; thus it represents the feminine aspect in God, while leaving his perfect unity undiminished. But Wisdom is also (as aeon) the consort of the Savior and is intimately connected with both demiurgic (cosmological) and soteriological processes. This has nothing to do with feminist ideas; behind it, rather, stands the heritage of the Jewish wisdom tradition in its later form.

Iran and Zoroastrianism. It is often forgotten that Iran too has produced an extensive wisdom literature that goes by the Middle Persian name of *bandarz* (early New Persian, *andarz*), meaning “advice, instruction.” This too has been handed down in various forms of *gnomai*. It is preserved only in Middle Persian, but it doubtless had Avestan (Old Iranian) precursors (such as the now lost *Barish nask*). At the center of this literature is “wisdom” (MPers., *khrad*, or *xrat*), whose representatives or transmitters were kings of the prehistoric period (e.g., Jam, Ōshnar) and the Sasanid period (e.g., Chosrau I), viziers (e.g., Wazurgmihir ī Bokhtagān), and priests (e.g., Ādurbad ī Mahraspandān). Here again collection and transmission were the work of priestly schools or the (fire) temples. Since thought, along with speech and action, played a dominant role in Zoroastrianism, great attention was paid to the teaching of religious knowledge. This knowledge was identified with wisdom. But in fact the “knowledge” in question was not only religious, theological, and cultic. Iran had either taken over (via Hellenism) or had itself produced a great deal of secular knowledge.

Nonetheless, the religious framework within which the wisdom tradition was placed played a very important role. According to one of the principal works, *Mēnōg ī Khrad*

(Spirit of Wisdom), all wisdom flows from a single wisdom that goes back to God. Two works in particular are important in this context. One is the sixth book of the encyclopedia *Dēnkard* (Acts of Religion); the other is *Dādistān ī Mēnōg ī Khrad* (Book of Judgments of the Spirit of Wisdom). Both originated in the Sasanid period but preserve older material as well. Book 6 of the *Dēnkard* goes back in part to the Avestan Barish nask; other material comes from oral tradition. Its content is largely religious and has to do with Zoroastrian teaching on cleanliness; it is therefore highly ritualistic in character. In this context wisdom is correct knowledge and correspondingly correct behavior in things religious. “This world was created by Ōhrmazd the Lord [Av., Ahura Mazda] with knowledge (*dānāgih*). He maintains it with sagacity (*frazānagīh*) and manliness (*mardābagīh*); ultimately He will become joyful through it” (Shaked, 1979, sec. 311). This is interpreted as follows by the sages (*dānāgān*): “The thing of Wisdom (*khrad*) is this: sagacity (*frazānagīh*), manliness (*mardābagīh*) and the hope of the Renovation” (ibid., sec. 312). The same passage goes on to say: “The substance of wisdom (*khrad*) is similar to that of fire. For nothing in this world may become so perfect as that which is done by wisdom (*khrad*)” (ibid., sec. 313). In the *Dēnkard*, “character” (*khēm* or *xēm*) is superior even to wisdom, since “wisdom is in character; and religion is in both wisdom and character” (ibid., sec. 6; see also sec. 2). Ōhrmazd creates creatures through “character,” “holds them with wisdom, and takes them back to himself by religion” (ibid., sec. 11).

In other, more secular *handarz* texts wisdom is at the head of the virtues and leads human beings to a knowledge of their duties. Ōhrmazd created the following spiritual realities that help human beings to that goal: “innate wisdom, acquired wisdom, character, hope, contentment, religion [*dēn*], and the consultation of the wise” (*Āyadgar ī Wazurgmibr* 43, cited in Shaked, 1979, p. xxvi). Acquired wisdom is gained through education; innate wisdom preserves human beings from fear and sin. Clearly, in Zoroastrianism wisdom is firmly embedded in a religious context (although secular wisdom is not completely absent). Wisdom is primarily a matter of Zoroastrian knowledge; the latter defines its essence. It is therefore the duty of the faithful to follow the “wise” (teachers, priests) and ask them questions; association with them brings God close to one. Parts of Iranian wisdom literature, however, are also marked by a fatalistic pessimism reminiscent of *Ecclesiastes* (Shaked, 1979, sec. D). “Destiny” (*bakht*, *brēh*, *zamān*) determines human beings; their action is geared to its accomplishment. We see here the influence of Iranian teaching on fate (i. e., Zurvanism), an influence also to be seen in modern Persian literature wherever this is in continuity with ancient Iranian wisdom traditions (proverbial literature, didactic poetry).

Wisdom clearly emerges as a heavenly person or hypostasis, the Spirit of Wisdom (Mēnōg ī Khrad), in the work of the same name. Wisdom is here viewed as one of the “holy immortals” (Amahraspandān; Av., Amesha Spentas); in fact,

the author devotes more prayers to her than to the others (1.53). She is “original wisdom (*āsn khrad*) from the heavens and the worlds”; she dwells with Ōhrmazd and combines all wisdom in herself (57.3–32); she was created by Ōhrmazd (8.3, 8.8), and through her he created the world (1.11, 1.49, 57.5); through her Ōhrmazd keeps the world in existence (1.12). Her most important function is instruction or, as the case may be, revelation. Each of the sixty-two chapters following upon the introduction to the work begins with questions by an (anonymous) “wise man” (*dānāg*), which Wisdom then answers at length. The book is thus a compendium or catechism of Zoroastrianism and derives its authority from the heavenly wisdom of God. The “wise man” who passes its contents on is evidently a representative of the Zoroastrian community or priesthood. He had wandered through the world, from land to land and city to city, looking for wisdom, until he realized that true wisdom was to be found in his religion; then this wisdom appeared to him in bodily form as Ōhrmazd’s Spirit of Wisdom (Mēnōg ī Khrad) and instructed him (1.14–61). The most likely equivalent of this Wisdom in the Avesta is Vohu Manah (Vahuman, Vahman), the Good Mind; “primordial or inherent wisdom” (*āsn khrad*) is found in Yasna 22.25 and 25.18 (*āsnō khratush*) in connection with the Zoroastrian concept of faith (“the innate understanding Mazda-made”).

India. Some of the earliest Indian wisdom literature is found in the collections of proverbial wisdom that were made for rulers or kings, as, for example, the well-known *Pañcatantra* or the *Hitopadeśa* (Instruction in What Is Beneficial). The *Mahābhārata*, the Indian national epic, contains in its didactic sections a good deal of ancient wisdom tradition; this includes the *Bhagavadgītā* in particular. The important part played by knowledge or insight (*jñāna*) in ancient Indian thought (especially in the Upaniṣads) has given wisdom a central position in India. It is difficult to distinguish this wisdom from philosophy, and philosophy in turn from religion; each shares in the character of the others. The *Bhagavadgītā* praises “the way of knowledge or wisdom” in preference to the way of action (*karman*): “A man of faith, intent on wisdom (*jñāna*), his senses (all) restrained, wins wisdom; and, wisdom won, he will come right soon to perfect peace” (4.39; trans. Robert C. Zaehner, *The Bhagavad-Gīta*, London, 1973). Brahmanic philosophy or religion did not, however, reach the point of personifying wisdom or knowledge. This step was taken only in Buddhism, in which the Indian ideal of knowledge, the way to deliverance from the cycle of births (*samsāra*) without reliance on the priestly tradition or extreme asceticism took new forms. But the objectification (hypostatization) of redemptive knowledge or transcendental wisdom (*prajñā*; Pali, *pañña*) came only in Mahāyāna Buddhism, beginning in about 100 BCE in southern or northern India. A whole literature arose (originally in Sanskrit) consecrated to what it termed the “perfection of wisdom” (*prajñāpāramitā*; lit., “the wisdom that has gone beyond”). The earliest *Prajñāpāramitā* works were composed between 100 BCE and 150 CE; from the fourth to the seventh

centuries CE compendia and short versions were redacted under the influence of the Mādhyamika school; from the sixth century on, Tantrism also gained control of these texts and gave them ritualistic interpretations (to the extent even of introducing antinomian practices). As mentioned above, there are a number of parallels between the Buddhist and the early Jewish conceptions of wisdom. The Buddhist “wisdom books” (Conze, 1975) introduce a specifically new type of knowledge about redemption: an insight into the “emptiness” (*śūnyatā*) of existence that promises deliverance. These teachings are presented in the form of dialogues between the Buddha and some of his disciples. The manner of presentation lends authority to the new teaching and gives it canonical status. Here the virtue (*pāramitā*) of “insight” (*prajñā, pañña*), perhaps under the influence of the South Indian mother goddess, is sometimes personified as a goddess of wisdom, Prajñāpāramitā. In this form she is regarded as “mother” of all the Buddhas (*buddhāmāti, jināna mātā*) and *bodhi-sattvas*.

If a mother with many sons had fallen ill, They all, sad in mind, would busy themselves about her: Just so also the Buddhas in the world-systems in the ten directions Bring to mind this *perfection of wisdom* as their mother. The Saviours of the world who were in the past, and also those that are (just now) in the ten directions, Have issued from her, and so will the future ones be. She is the one who shows the world (for what it is), she is the genetrix, the mother of the Jinās, And she reveals the thought and action of other beings. (Conze, 1973, p. 31)

Prajñāpāramitā is depicted iconographically with two, four, six, ten, or twelve arms. Her color is gold or white; her symbols are the lotus and a book (colored blue or red). She often resembles depictions of Mañjuśrī (the male personification of wisdom) or Sarasvatī (the Hindu goddess of learning, eloquence, and intelligence) or Avalokiteśvara, Tārā, and Cunda. To ordinary Buddhists she is a goddess who can be invoked and who bestows merit, well-being, and blessing. Buddhist theologians, however, see in her simply a “spiritual” manifestation of redemptive or enlightening (“*bodhi-giving*”) wisdom, which contains and sustains all things and is called “mother of enlightenment.” Here the very essence of Buddhist doctrine is manifested and personified. The various interpretations of this doctrine in the Mahāyāna schools (Mādhyamika, Yogācāra, Tantra) are also reflected in the figure of Prajñāpāramitā and the literature about her. One of the best-known hymns to her was composed by Rāhulabhadra (c. 150 CE):

Homage to Thee, Perfect Wisdom, Boundless, and transcending thought! All Thy limbs are without blemish, Faultless those who Thee discern. . . . Teachers of the world, the Buddhas, Are Thine own compassionate sons; Then art Thou, O Blessed Lady, Grandam thus of beings all. . . . When as fearful Thou appearest Thou engender'st fear in fools; When benignly Thou appearest Comes assurance to the wise. . . . By all Buddhas, Single Buddhas, By Disciples courted, too,

Thou the one path to salvation, There's no other verily. . . . By my praise of Perfect Wisdom All the merit I may rear, Let that make the world devoted To this wisdom without peer. (Conze, 1959, pp. 168–171)

The Tantric school produced magical incantations or formulas (*mantras*) for Prajñāpāramitā, which were given by the goddess herself. The recitation of these sayings has liberating power; it is also meritorious on behalf of others. In this form of Buddhism the figure of Wisdom unites in itself all aspects of religion, both in theory and in practice. In fact, Prajñāpāramitā is probably its most notable expression.

China. Finally, I shall add a brief word on China, where, in contrast to India, wisdom has minimal connections with religion. In Confucianism it has an unambiguously ethico-moral character. We are reminded of the Greeks when we find wisdom consisting in the avoidance of extremes and the following of the mean. *Chih* (“wisdom”) is one of the five cardinal virtues that characterize the Confucian “wise man” (*chün-tzu*). It includes knowledge of human nature and society, a command of language, and a practical behavior that obeys the Confucian rules (*li*). “The sense of right and wrong is the beginning of wisdom (*chih*)” (Fung Yu-lan, 1952, vol. 1, p. 121). Every human being has the native ability to become wise and needs only instruction and practice, since in the prevailing Chinese view human nature is good (another point reminiscent of Greek thought). Confucianism nonetheless also offers the ideal of the “noble man” or “holy man” (*sheng-jen*) who surpasses even the wise man, since he complies perfectly with all the principles (*li*), lives in harmony with nature and society, and thus is the peerless teacher of an age. The ancient meaning of wisdom as the practical management of life through knowledge of the world and human beings has probably found its most impressive development in China and has for thousands of years profoundly shaped the character of the people. Wisdom is embodied in behavior and can be acquired by practice; it then becomes a habitual attitude.

BIBLIOGRAPHY

There is no monograph that completely covers the concepts of wisdom that are found among various peoples and cultures. Only A. R. Gordon's “Wisdom,” in the *Encyclopaedia of Religion and Ethics*, edited by James Hastings, vol. 12 (Edinburgh, 1921), attempts a survey; the areas most fully studied and described are the ancient Near East (including Israel), Greek thought, and early Christianity. The following bibliography lists other articles and books that I have found helpful and that can serve as an introduction to the subject.

- BIBLICAL BOOKS [FURTHER CONSIDERATIONS]
- THEORETICAL PERSPECTIVES

WISDOM LITERATURE: BIBLICAL BOOKS [FIRST EDITION]

Certain books within the Hebrew scriptures stand out as significantly different from the narrative and legal material comprising the Pentateuch as well as from prophetic and apocalyptic literature. This "alien corpus" is altogether silent with regard to the dominant themes found in the rest of the Bible, for example the promise to the patriarchs, the deliverance from Egypt, the Mosaic covenant, the centrality of Jerusalem and the Davidic dynasty, the prophetic word, and so forth. In the place of such emphases one finds ideas and literary forms that are closer to certain Egyptian and Mesopotamian works. That literary corpus contains a rational principle of the cosmic order that is worthy of study (*hokhmah* in ancient Israel, *maat* in Egypt, *me* in Mesopotamia) and expresses a belief that conduct in accord with this principle brings well-being. Or the literature gives voice to various levels of doubt about the validity of this understanding of reality, a skepticism spawned by life's inequities. Since study of the underlying principle of the universe rather than proclamation of the divine word comes to prominence here, modern scholars designate these texts as wisdom literature.

CHARACTERISTICS OF WISDOM LITERATURE. Decisive differences do exist between Israel's sapiential literature, on the one hand, and certain texts written in Egypt and Mesopotamia on the other. Egyptian wisdom functioned almost exclusively at the royal court. Its aim was to provide proper education for future bureaucrats in the pharaoh's court. Accordingly, this literature largely assumed the form of instruction (e.g., the *Instruction of Ptahhotep*, the *Instruction of King Amenemhet to His Son Sesostris*, and the *Instruction for Merikare*) and its setting was usually the scribal school (praise of which occurs in Papyrus Sallier, Papyrus Anastasi, and the *Instruction of a Man for His Son*.) In Mesopotamia the study of school texts also played an important role, but the fundamental feature of wisdom was cultic, indeed, magical, and the goal of wisdom was to manipulate the paraphernalia of the cult in order to ensure one's existence.

Israelite wisdom finds primary expression in the books of *Proverbs*, *Job*, and *Ecclesiastes* within the Palestinian (Masoretic) canon and in *Ben Sira* (*Ecclesiasticus*) and the *Wisdom of Solomon* in the Alexandrian canon (the Septuagint). Its influence extends beyond these texts to *Psalms* (*Ps.* 1, 19, 33, 39, 49, 127) and various other books. The precise extent of this influence is the subject of considerable discussion; scholars have claimed much of the Hebrew scriptures for the sages (*Genesis* 1–11, the Joseph story, *Deuteronomy*, *Amos*, *Isaiah*, *Micah*, *Jonah*, *Habakkuk*, *Esther*, the succession narrative in *2 Samuel* 9–20, *1 Kings* 1–2, and more). While such claims appear to be exaggerated, they do serve as a reminder that the sages did not dwell in isolation from the prophets, priests, and raconteurs in ancient Israel.

With the exception of *Job*, these Israelite wisdom books are pseudonymous. There is no historical basis for the attribution of the older collections within *Proverbs* to Solomon or for Solomonic authorship of *Ecclesiastes* and *Wisdom of Solomon*; in Egyptian wisdom literature pseudonymity and literary fiction of royal authorship also play a significant role. The unique example of pride of authorship is Yehoshu'a ben Sira, the author of *Ben Sira*, who claims to have run a school about 190 BCE during the high priesthood of Shim'on II. Confirmation of this date comes from information provided by Ben Sira's grandson, who translated the Hebrew text into Greek around 132 BCE, and from the hymn in praise of Shim'on. *Proverbs* contains several different collections from various times, some of which may be preexilic. *Ecclesiastes* probably comes from the end of the third century BCE, while *Wisdom of Solomon* is known to be considerably later, because it was written in Greek and because its thought patterns and rhetoric are thoroughly hellenized. In dating *Ecclesiastes*, grammar and syntax seem conclusive. *Job* is particularly hard to date, but a combination of things, including both language and thought, suggest the sixth century BCE or slightly later.

THEMES, LITERARY TYPE, AND FUNCTION. In general, wisdom literature comprises two quite distinct types: brief observations about the nature of reality and instructions deriving from experience or extensive reflection on the deeper meaning of life. The former are formulated in parallel half lines for the most part; one statement is thus balanced by another, either synonymously or antithetically. Three variants are "Better is this than that" (e.g., *Prv.* 15:16); a graded numerical proverb, such as "Three things . . . yea, four" (e.g., *Prv.* 30:18–19); and "There is . . ." (e.g., *Prv.* 20:15). Most of these brief aphorisms are complete in themselves, although larger paragraphs appear in the latest collection in *Proverbs* 1–9, *Ecclesiastes*, and, especially, *Ben Sira*, constituting paragraphs that resemble brief essays on a specific topic. Speculative wisdom literature (*Job* and *Ecclesiastes*) prefers dialogue and monologue as its peculiar mode of expression.

Another way of categorizing various types of wisdom literature derives from the four uses to which the texts were put: juridical, experiential, theological, and natural. Since the

king was the final court of appeal, and since society relied on royal power to implement justice, the judicial ability to ferret out the truth amid competing claims was greatly prized, as the widely disseminated story about Solomon's royal verdict in the case of two harlots' dispute over a surviving infant suggests (*1 Kgs.* 3:16–28). Experiential wisdom encompasses the overwhelming majority of biblical proverbs. These represent conclusions based on experience, and they endeavor to assist others in the difficult task of coping. Some are content with stating the way things are; others engage the pedagogic enterprise with zeal, offering warnings and motivations for following a particular path of conduct. Theological wisdom is concerned with the first principle of knowledge in religious devotion, the fear of the Lord. It speculates on the presence or absence on earth of the divine rational principle (personified wisdom), and sometimes equates revelation of Torah and human reasoning. Natural wisdom refers to encyclopedic data about heavenly bodies, atmospheric conditions, wild animals, and so forth. Although prominent in Egypt and Mesopotamia, such noun lists (onomastics) did not survive in biblical wisdom, although the divine speeches in the *Book of Job* resemble them in some ways.

The function of Israelite wisdom literature is by no means clear, partly because of the difficulty in tracing the history of this sort of thinking. At least three distinct stages seem likely. Wisdom's earliest phase seems to have coincided with early clan existence, when parents instructed their children in the ways of the world. The vast majority of proverbs attributed to Solomon may well have arisen in this early period because they rarely reflect the situation of the royal court. In the second phase, with Solomon perhaps, and certainly with Hezekiah, wisdom makes itself at home in the court. This phase placed a distinct mark on only a few proverbs, although it did evoke a tradition about "men of Hezekiah" who transmitted the collection in *Proverbs* 25–29. With *Ben Sira* the third phase comes to light, school wisdom. Precisely when this phenomenon first surfaced remains hidden. Certainly, the first epilogue to *Ecclesiastes* (12:9–12) identifies the unknown author of that book as a "wise man" who taught "the people," and the strange pen name *Qohelet* has often been interpreted as one who summoned people to a place of worship and study. (It is more likely that the word alludes to his assembling of proverbs about life's absurdity.)

SCHOOL TEXTS. For various reasons, several scholars have proposed that biblical wisdom literature originated in Israel in monarchic or premonarchic times as texts for study in schools. This theory is based on analogy with schools in the pharaoh's court and in the Mesopotamian temple precincts. Israel's familiarity with international wisdom cannot be denied; witness Solomon's relations with Egypt, the incorporation of a portion of the *Instruction of Amenemope* in *Proverbs* 22:17–23:33, and the *Sayings of Agur and of Lemuel's Mother* in *Proverbs* 30:1–4 and 31:1–9. Corroborative evidence has come from the nature of canonical wisdom—its exceptional literary quality, its conscious rhetoric and pedagogic thrust. To these have recently been added data from Palestinian in-

scriptions (alphabetic series, drawings, inaccurate spellings, transposed letters, large and poorly formed consonants, and so forth). None of this evidence is altogether compelling, although its cumulative force merits consideration. The preservation of wisdom literature implies such a group of individuals, whether they attended a formal institution or not. At least one scholar has simply called this phenomenon “Israel’s intellectual tradition.”

Internal evidence suggests that the *Book of Proverbs* was written for the instruction of young men. That conclusion seems inevitable for at least two reasons: the direct address to “my son” and the extensive warning against the foreign woman, Dame Folly, together with the erotic language about Dame Wisdom, which is appropriate only if the audience is male. This erotic language becomes fully evident in the *Wisdom of Solomon* where readers are invited to strive for marriage with Sophia (“wisdom”), here a divine attribute. Male dominance also explains the misogyny within canonical wisdom, particularly in *Ben Sira* but also in *Ecclesiastes* (although this explanation has been disputed). If the author of the epilogue to *Ecclesiastes* is trustworthy, a democratization may have taken place under this collector of sayings who taught “the people.”

WISDOM AS A WAY OF THINKING. Just what did the teachers wish to communicate to their students? The sages endeavored to discover ways to secure one’s existence and to enrich it, as in *Ecclesiastes*’ question “What is good for humans?” Their ultimate goal was to achieve life’s good things: a good name, longevity, wealth, wise children. Believing that the creator had implanted within the universe the secrets to success, these sages looked for analogies that unlocked the doors to such insight. Observation of nature and human nature, the study of animals and insects—these were the ways in which they obtained information that was then applied to their own concrete situation. They also moved beyond the visible universe to speculate about God’s nature and activity, and even their quest for pleasure was grounded in religious conviction. Since order in society, like cosmic order, is divinely ordained, the wise individual is not disruptive of society. Entirely missing, therefore, is the prophetic sense of social revolution. In its place prudence reigns, and a calculated use of bribes, silence, and the concealment of real thoughts and feelings. Self-control and the right word were their aim. The seekers of wisdom sought to know the appropriate word or proper deed for a given occasion, the one that would confirm their membership in the company of the wise and therefore the righteous.

A CRISIS OF THE INTELLECT. Experience was sometimes ambiguous, forcing the wise to question their own hardened dogmas. That was especially the case with regard to the conviction that virtue flourished and vice resulted in calamity. Belief in reward and retribution evoked powerful protests from the authors of *Job* and *Ecclesiastes*. In Mesopotamia a similar crisis of faith produced such works as the Sumerian *A Man and His God, I Will Praise the Lord of Wisdom*, the

Babylonian *Theodicy*, and the *Dialogue of a Master and Slave*. Furthermore, to the biblical sages life was infinitely more complex than their proverbial formulations might suggest. They therefore ventured to speculate about things that could not be verified in experience. Religion thus emerged into prominence, both as the essential ingredient of all knowledge and as a faith claim. Whereas Yahvism tended to ground its claims in history, the wise took creation as their starting point. They even posited a feminine principle (*hokhmah*) as active in the process of creation (*Prv.* 8:22–31), eventually identifying it with the Torah of Moses (*Sir.* 24:23). In general, creation faith functions to undergird belief in divine justice; only the creator has sufficient power and knowledge to assure justice on earth. As long as sages believed in the power of the human intellect to secure their existence, grace remained in the background. In time, loss of faith in the power of wisdom creates a vacuum into which competing forces come. These opposing responses are pessimism and divine mercy, and their spokesmen are *Ecclesiastes* and *Ben Sira*, respectively.

Skepticism’s roots go back a long way prior to the time of *Ecclesiastes* (e.g., *Jgs.* 6:13, *Prv.* 14:1, 14:13, 16:9, 16:33). Integral to the earliest sapiential expression is the concession that human ingenuity has its definite limits. Those who devise plans for battle must ultimately acquiesce before an incalculable divine will. Life has its mystery, which cannot be penetrated. Even instances of injustice cropped up now and then. In time, those cracks in the fundamental conviction of the sages became more frequent, and the idea of wisdom’s hiddenness suddenly emerged as a viable epistemological option. The poem, probably by another author, that has been inserted into the *Book of Job* (28) marvels at the remarkable achievements humans have to their credit but expresses the opinion that wisdom is accessible to God alone. The author of *Ecclesiastes* admits that wisdom is very deep, so much so that it cannot be fathomed. Ben Sira cannot endorse such skepticism, although he does advise against trying to understand that which is too difficult. In a sense, the nature of human knowledge has been greatly qualified as a consequence of man’s limited powers.

Sometimes an inability to comprehend life’s mysteries ends in awe rather than skepticism. That is the insight put forth with poetic brilliance in the *Book of Job*. The decisive issue here is whether faith can transcend self-interest. To be sure, the book offers counsel on how to respond when trouble strikes innocent victims, but even more central is the issue of whether anyone will serve God for nothing. Job’s final submission before a self-manifesting deity points to a wholly different response from that of skepticism or banality: a bowed knee and silenced protest, a seeing with the eye of faith. A similar response occurs in Psalm 73, which is often included in discussions of wisdom literature, where the believer comes close to abandoning the faith because of the prosperity of the wicked but in the end recognizes God’s presence as the highest good.

WISDOM AS A TRADITION. Such shifts in perspective indicate that the wise were very much aware of history even if they did not ground their teachings in it. Indeed, a decisive transition takes place in the early second century with Ben Sira. In part a result of the Hellenistic environment within which he wrote, this borrowing of various features from Yahvism, for example, references to the primeval history, patriarchs, and prophets, was Ben Sira's way of salvaging the ancient teaching in a changing society. By means of mythological speculation he was able to identify earlier revelation with divine wisdom (*Sir.* 24:23) and locate its residence in Jerusalem (*Sir.* 24:1–12). Again and again Ben Sira alludes to biblical stories, until finally he compiles a hymn in praise of ancient heroes of the faith (*Sir.* 44:50).

The unknown author of *Wisdom of Solomon* continued Ben Sira's reliance on canonical tradition as a framework, particularly the account of Egyptian bondage and divine deliverance. This Exodus material generated unusual interest for the Jews who resided in Alexandria a millennium later. In this instance the author reflects on the events of the Exodus in Midrashic style; the running comments on scripture are designed to evoke psychological factors such as dread even though the central focus is a frontal attack on idolatry. Nevertheless, the Hebraic tradition shares equal billing with the Hellenic, and this is entirely new for the wisdom literature. The Greek influence is considerable: the style is replete with Greek rhetoric, and the content is equally Greek in origin, including the four cardinal virtues, the notion of immortality, the twenty-two attributes of deity, the description of the curriculum in a local school, the rhetorical device called *sorites*, and much more.

PERSONIFIED WISDOM. The change within wisdom thinking from the sixth to the first century BCE is nowhere clearer than in the notion of personified wisdom. In the latest collection of *Proverbs* (1–9) Wisdom appears in the guise of a teacher; here she invites and threatens young men, seeking to deliver them from Dame Folly. In *Proverbs* 8 Dame Wisdom is a celestial figure who assists God in creation; she is the manifestation of divine thought, depicted in veiled erotic language. Interpreters have often compared this theologoumenon to the Isis myth and to the teachings about the Egyptian goddess Maat. Elsewhere in *Proverbs* (3:16), Wisdom holds life in her right hand, riches and honor in her left hand, just as Maat is depicted as holding in each hand emblems that symbolize these qualities. In the *Book of Job* there is mention of an impenetrable wisdom who is known to the underworld by rumor but to whom only God has direct access (*Jb.* 28:20–28).

In contrast, Ben Sira writes that wisdom existed in heaven but searched the whole earth for a place of residence and finally chose Jerusalem as a permanent abode. This celestial figure then loses her enigmatic character, however, and becomes identical with the Mosaic law. Divine wisdom is thereby domesticated on earth, and Greek philosophy and the Hebraic tradition become equal in this aspect. In *Wisdom*

of *Solomon* this heavenly figure is a divine attribute that guides the chosen people to their destiny. Those who desire to succeed in life must win her favor, and she is therefore to be courted like a bride.

To sum up, poetic imagery in *Proverbs* has by the time of *Wisdom of Solomon* become an actual figure who functions to bring well-being to God's people. By way of *Ben Sira* this imagery was particularized to refer to an actual body of literature, the Mosaic law. From first to last, however, wisdom's role in the initial act of creation was an active one. The intention was to give a name to the order that governs reality itself and thus to suggest a universe in which right thinking and acting would prosper. The author of *Ecclesiastes*, who did not endorse such faith, maintained silence with regard to personified wisdom. Instead, he echoes one feature of the poem in *Job* 28: the profundity of wisdom and, therefore, its hiddenness (*Ecl.* 7:23–29).

A CORPUS OF LITERATURE. The thesis of a shift in wisdom thinking that took place with *Ben Sira* and *Wisdom of Solomon* does not imply monolithic thought prior to the second century, but it does assume that certain essentials held the literature together despite individual characteristics. A closer look at the actual contents of this literature may illustrate this point.

Proverbs. The *Book of Proverbs* comprises at least nine separate collections, four major ones—(I) 1–9, (II) 10:1–22:16, (III) 22:17–24:22, (IV) 25–29—and five minor ones—(V) 24:23–34, (VI) 30:1–9, (VII) 30:10–33, (VIII) 31:1–9, (IX) 31:10–31. Two (VI and VIII) are attributed to foreign authors (Agur and King Lemuel's mother, respectively), and another (III) makes extensive use of an Egyptian source (Amenemope). Three (I, II, and IV) are credited to King Solomon, and one (V; cf. III) is simply called "More Sayings of the Wise." Only two brief collections (VII and IX) have no superscriptions. The probable order of dating is IV, II, III, and V, from oldest to most recent; the relative ordering of the others is uncertain. The initial collection is probably the latest one, with the possible exception of IX. Affinities with Canaanite literature suggest an early date for VI and VIII, but their religious content renders the issue unclear. In any event, much of the material probably arose in preexilic times.

In the older collections the dominant form is a single verse parallel with another. The parallel verse may be synonymous, antithetical, or ascending (climactic). Each brief aphorism registers an observation that compels assent; therefore, the sentence argues from what is presumed to be a general consensus. The other major proverb type is the instruction, which urges a particular course of action and reinforces it with threats of punishment or promises of reward. Instruction pervades the latest collection, but the decision about the date of composition is not based on form. In Egypt "instructions" (a form that has its own genre identification, and covers a wide spectrum of texts) date from very early times, while the late *Teaching of Onksheshongy* resembles the brief apho-

risms in the earliest collections of *Proverbs*. Thus we see that dating from form is tricky. In the later biblical material single proverbs give way to brief essays, some of which make their point by citing a proverb and developing it. *Ben Sira* develops this trend so that paragraph units result. In *Proverbs* one finds extended treatments of such themes as the relative value of various professions (38:24–39:11), the place of physicians in society since God punishes the wicked by sending illness (38:1–15), duty to parents, drunkenness (19:1–3), headstrong daughters (42:9–11), dreams, discipline (30:7–13), passions (40:1–11), and shame (41:16–42:8). The different form in *Proverbs* 1–9 is accompanied by a more self-conscious theology. Whereas wisdom literature throughout the ancient Near East prefers the general name for God, these chapters use the name *Yahveh* quite freely. Furthermore, they insist that the fear of the Lord is the *sine qua non* of true intelligence. It is possible that one passage (6:20–35) draws on language from *Deuteronomy* in juxtaposing the fire of lust and the lamp of parental instruction. In these chapters, too, personified wisdom functions to mediate divine presence. Accordingly, she addresses the people in the manner of a prophet or a prophetic depiction of God, and she offers life itself.

There are some brief sayings elsewhere in the *Book of Proverbs* that are wholly secular in tone. That does not necessarily indicate an early date. It is more likely that religious and secular proverbs existed simultaneously but that they served different constituencies. Some of these secular sayings call attention to social inequities without any indication that such situations should be rectified. Other proverbs identify areas in which humans confront their limits. Those who wage war can make careful plans, but the battle's outcome rests in divine hands. This awareness of finitude crops up in Egyptian wisdom as well, where royal wisdom abounds. The attribution of wisdom to Solomon is therefore an interesting parallel, although it cannot be known whether this tradition of Solomonic authorship has any basis in history. One thing appears certain: the supposed Solomonic enlightenment never existed, and the type of wisdom credited to that king in *1 Kings* 4:29–34 (English version) does not correspond with sayings in the collections bearing his name. Nevertheless, Solomon may have sponsored a group of sages in his court, as Hezekiah did in the late eighth century. These sages may have shown their appreciation by attaching the king's name to their compositions. Unfortunately, these collections do not require an assumption of courtly provenance, although they do contain an occasional reference to royalty. The same is true of *Proverbs* 25:2, which states that God's glory consists in concealing things, whereas a king's glory lies in searching them out.

In general, the thrust of the sayings in the *Book of Proverbs* has a universal quality. Similar aphorisms exist in Egyptian wisdom and, to a lesser extent, in Mesopotamian. The biblical proverbs contrast the wise and the foolish (called the silent and the heated in Egyptian wisdom literature), offer

advice on table manners, warn against laziness and sexual debauchery, endorse eloquence, observe human foibles for what they are, talk about responsibilities in given vocations, compare human conduct to that of animals or insects, encourage strict discipline of children, inculcate respect for parents and persons in authority, and treat social relations in all their complexity. Extended treatises occur outside the initial collection on significant issues, for instance, the dangers of strong drink and the virtues of a good wife.

The Book of Job. The fundamental presupposition underlying virtually all these proverbs is a belief in reward and retribution. The universal creator oversees the governance of the universe and makes certain that those who merit life's good things receive them. The author of the *Book of Job* questions this principle, although at first the argument set forth by his hero rests on the very premise it refuses to acknowledge. Were it not for this principle, Job would have no basis on which to complain, since there would be no anticipated correlation between conduct and life situation. The author of *Ecclesiastes* is much more thorough in rejecting this dogma, for in his view time and chance strike everyone without respect to behavior. In both cases, later tampering with the author's final product has radically altered its meaning.

The *Book of Job* resembles disputes in Mesopotamian wisdom (such as *I Will Praise the Lord of Wisdom*), but it also has elements of a lament (one critic has called the book a paradigm of an answered lament). An old folk tale in epic prose sets the stage for the poetic dispute: a patient Job loses everything and praises God nonetheless until God rewards him by doubling his original possessions. Apart from this narrative framework, *Job* consists of a dispute between Job and his three friends and a second dispute between God and Job. Speeches by the youthful Elihu interrupt these two disputes; like the poem in *Job* 28, these speeches (*Jb.* 32–37) are probably secondary. The hero of the poetic speeches is far from patient. Instead, he complains bitterly because God has become a stranger to him for no discernible reason. Although his three friends encourage him to pray for forgiveness, Job insists that he has done nothing to deserve such harsh treatment. His bitterness arises from a sense of an oppressive divine presence and an awareness that the deity he once knew can no longer be found. Now and again Job entertains the notion that a vindicator will set things right and establish his innocence. At last, despairing of assistance from his friends, Job utters an oath of innocence highly reminiscent of Egyptian cultic practice and challenges God to slay him or confirm his oath of purity (*Jb.* 31). God responds to the challenge but hardly in the way Job expected (*Jb.* 38–41). In a style similar to school questions in Egyptian texts, the deity addresses Job with a host of questions that force him to look beyond his own situation and survey the vast scope of creation. The shift in focus corrects Job's anthropocentricity while acknowledging divine solicitude for wild creatures beyond the parameters of human habitation. The divine speeches evoke a feeling of unworthiness in Job, who confess-

es that this new insight about God overshadows his former knowledge as immediate information does secondhand information. The resolution comes through repentance, if that is the true meaning of Job's final response to God. The Mesopotamian parallels to *Job* find their answer in the cultic realm, and proper ritual plays a significant role.

Ecclesiastes. Israel's contribution to skeptical literature, the *Book of Ecclesiastes*, presents reflections on life's vanity and concludes that everything is empty, like breath itself. Purporting to be written by the wisest and wealthiest king in Israel, it claims that all pursuits achieve no lasting results. For this book's author, wisdom no longer possesses the power to guarantee success; all human endeavors amount to a senseless "chasing after wind." He feels that even though some sages claim to know the truth about reality, they do not really penetrate to the heart of things (8:17). The great shadow hanging over life is death, which makes no distinctions between good and bad people or between animals and humans. The universe is out of kilter, and God is indifferent to what takes place on earth (9:11–12). As a consequence humans are advised to follow a path of moderation, to be neither overly righteous (like Job) nor excessively wicked (7:15–18). Such dark thoughts eventuate in hatred for life (2:17), and stillborns are considered more fortunate than the living (6:1–6). To be sure, wisdom does bestow a relative advantage over folly, as light is usually superior to darkness. But oppression runs rampant, and there is no comforter. The positive advice given is to enjoy life during one's youth, before death yields its awesome power. The book closes with a poem about old age and death (comparable texts have been found in ancient Sumer and Egypt). Unhappy with the negative note on which the book ends, someone added an epilogue that characterizes the teacher and his work (12:9–12), to which yet another epilogue has been attached (12:13–14). This final word neutralizes the entire book by summing up its contents as fearing God (piety) and keeping the commandments (praxis).

Ben Sira. The author of *Ben Sira* strives mightily to combine traditional religious belief and the wisdom tradition. Although capable of soaring to lofty heights in poetic verse, his heart is especially stirred when priestly interests and prerogatives come to mind. This fact has led some critics to the view that religion (the "fear of the Lord"), not wisdom, was central to Ben Sira. The same emphasis occurs in the long poem celebrating heroes of the past, a poem that concludes with a lavish description of the high priest in attendance at the altar (44–50). Competing traditions are held in check in *Ben Sira*. This accounts for the acceptance of old belief in the functioning of reward and retribution, along with special attention to divine mercy.

In some respects *Ben Sira* resembles *Proverbs*, even with regard to the subject matter. Nevertheless, whereas *Proverbs* for the most part couches its teaching in succinct observations, *Ben Sira* systematically elaborates upon one topic after another. In so doing *Ben Sira* occasions a decisive stylistic

change: refrains occur with regularity. The same phenomenon is typical of Egyptian instructions; in fact, Egyptian influence in *Ben Sira* is likely (cf. *The Satire on the Trades* and Papyrus Insinger).

One important concern in *Ben Sira* is theodicy, the defense of divine justice. *Ben Sira* employs an ancient form of debate to achieve the defense and adds two distinct answers, one metaphysical and the other psychological, to the problem of theodicy: that the universe itself fights on the side of virtue and punishes wickedness, and that reward or punishment may be inner states of tranquillity or anxiety. Furthermore, God will set things right in a moment, so that one cannot be adjudged righteous or sinful until death; a similar expectation of future divine action furnishes comfort to the author of Psalm 73. Such faith finds appropriate expression in prayer and in hymnic praise; both modes of worship characterize Ben Sira the teacher. Wisdom has now become an integral facet of Yahvistic faith.

Wisdom of Solomon. The combination of piety and practical ethics continues in *Wisdom of Solomon*, which presents Hebraic ideas in Hellenistic dress. In this Hellenistic setting religious syncretism poses a problem of grave proportions; to combat the attractiveness of idols as an expression of devotion to the gods, the author ridicules this type of worship mercilessly. A similar attitude pervades the author's references to Egyptian rulers; like the earlier sages, this unknown author deals with only two categories of people, wise and foolish, who are, respectively, good and evil. The new element is an identification of good and evil along ethnic lines, a precedent for which occurs in *Ben Sira*. The earlier universalism that was an identifying mark of wisdom has faded under the mighty impact of national religious tradition.

Perhaps the single most radical departure from older sapiential teachings is the elevation of the erotic dimension as the dominant metaphor for the educational enterprise. Knowledge is a highly desirable bride of the one who is favored by the deity. The paradigm that functions effectively in this respect is grounded in the legend about King Solomon, wisest of men. But such intellectual superiority came as a divine gift in response to humble prayer. The power of wisdom transcends the personal inasmuch as it governs the affairs of a nation. In fact, wisdom functions in the same way that the holy spirit is described as functioning in the rest of the Hebrew Bible: as a personification guiding the prophets and leaders of Israel. Once again, an earlier characteristic of wisdom literature, its individualism, gives way to the nation of Israel.

With increased stress on divine activity come two further transformations of ancient wisdom: humanism bows before revelation, and eudaemonism bows before duty. Belief in immortality relieves the human finitude of its tragedy, because pleasures may be delayed until the next life.

LATER DEVELOPMENTS. The Jewish Alexandrian philosopher Philo Judaeus, who was born about 20 BCE, avails him-

self of Logos speculation from Greek and Jewish thinkers to present wisdom as the ordering principle of the universe and an expression of the divine will. Comparison with the Stoic Logos principle was almost inevitable, because this similarity in the two intellectual systems served as a bridge to bring them closer together. Like the author of *Wisdom of Solomon*, Philo was steeped in Hellenistic thought and expression. Nevertheless, the content of his thought is often thoroughly Judaic. Scholars cannot decide whether the language of mystery religions belongs to the heart of his message or is mere window dressing.

Philo does not borrow exclusively from Israelite wisdom literature but makes free use of the patriarchal stories. His elaborate allegorical exegesis of biblical texts is largely Greek, although certain writings from Qumran also employ a complex kind of hermeneutics (cf. the *Habakkuk Commentary*). This ancient sect in the region of the Dead Sea largely ignored the wisdom literature, with one possible exception—the erotic dimension of knowledge.

Late Jewish narratives—*Tobit*, for example—make occasional use of motifs and data from canonical and noncanonical wisdom. Certain affinities between older wisdom and *Pirqei avot* (Sayings of the Fathers) have often been cited, but these seldom extend beyond surface resemblances. Within the Apocrypha, *2 Esdras* (*4 Ezra*) wrestles with the difficult problem of theodicy, and the pseudepigraphic *Testaments of the Twelve Patriarchs* contains ethical teachings that resemble wisdom texts.

The New Testament. The wisdom tradition seems to have influenced the unknown author of the earliest source for the Gospels, known as Q. Jesus is credited with a number of gnomic sayings, most of which function to orient by disorientation: they challenge listeners by forcing them to rethink their own presuppositions about a given situation. One noteworthy feature of these sayings attributed to Jesus is their unusual attitude toward women. Whereas aphorisms concerning women in the first-century Greco-Roman world and in Jewish literature contain a strong misogynistic element, the brief sayings placed in Jesus' mouth are remarkably free of this sentiment.

The prologue to the *Gospel of John* utilizes Logos speculation to express the belief that Jesus was an earthly incarnation of the deity, and the *Gospel of Matthew* dares to identify Jesus with divine wisdom, the embodiment of Torah (*Mt.* 11:25–30). Outside the Gospels, Paul's letters rely on Judaic speculation about wisdom to express Jesus' role in creation itself. Furthermore, just as the sages had developed a theory in opposition to theodicy as an extreme response to evil (that is, the very wish to defend God's honor is blasphemous, since the deity is by definition just), Paul ridicules human wisdom and proclaims that God's love and power are demonstrated by Jesus' death on the cross. It is conceivable that Paul's opponents were witnessing the birth of Christian Gnosticism, perhaps even performing midwife service. One other New Testament text is strongly influenced by Hebrew wisdom,

the short *Letter of James*, which draws freely upon brief aphorisms to inculcate certain teachings in the minds of listeners.

Gnosticism. The influence of the wisdom tradition in Gnosticism is somewhat anomalous. In Jewish tradition wisdom played a vital role during the creation of the world. For the Gnostics the present material universe is the product of demiurges, inferior divine beings. Nevertheless, wisdom speculation was too appealing for Gnostics to ignore, although they soon found ways to overlook wisdom's role in creating the universe. Three documents deserve consideration here: the *Gospel of Thomas*, the *Sentences of Sextus*, and a nongnostic text from Nag Hammadi, the *Teachings of Silvanus*. The influence of the wisdom tradition on Thomas may explain why instead of a passion story one finds a collection of sayings. The *Sentences of Sextus* (second century) contains over four hundred maxims of non-Jewish origin whose purpose is to describe the ideal Christian. The *Teachings of Silvanus* is a text that manifests typical Jewish stylistic forms: the address to "my son," which is reminiscent of the *Book of Proverbs*; poetic parallelism; and certain subjects and expressions that correspond to canonical ones. All this indicates that early Christians may have been drawn to some features of Hebrew wisdom and that they agree with their predecessors who believed that the intellect was a sufficient means of coping with reality and achieving the good life.

BIBLIOGRAPHY

The most comprehensive discussions are James L. Crenshaw's *Old Testament Wisdom* (Atlanta, 1981) and Gerhard von Rad's *Wisdom in Israel*, translated by James D. Martin (Nashville, 1972). Three older treatments contain much valuable material: Johannes Fichtner's *Die altorientalische Weisheit in ihrer israelitisch-jüdischen Ausprägung*, "Beihefte zur Zeitschrift für die Alttestamentliche Wissenschaft" (BZAW), vol. 62 (Gießen, 1933); Oliver S. Rankin's *Israel's Wisdom Literature* (Edinburgh, 1936); and Hilaire Duesberg and Irénée Franzen's *Les scribes inspirés*, 2d ed. (Maredsous, Belgium, 1966). Three colloquiums have illuminated many disputed points; these are *Les sages du Proche Orient ancien*, edited by François Wendel (Paris, 1963); *La sagesse de l'Ancien Testament*, edited by Maurice Gilbert (Gembloux, 1979); and *Sagesse et religion*, edited by Edmond Jacob (Paris, 1979). Three additional collected works are highly informative: *Studies in Ancient Israelite Wisdom*, edited by James L. Crenshaw (New York, 1976); *Israelite Wisdom: Theological and Literary Essays in Honor of Samuel Terrien*, edited by John G. Gammie et al. (Missoula, Mont., 1978); and *Aspects of Wisdom in Judaism and Early Christianity*, edited by Robert L. Wilkin (Notre Dame, Ind., 1975).

The finest survey of current research on Egyptian wisdom is R. J. Williams's "The Sages of Ancient Egypt in the Light of Recent Scholarship," *Journal of the American Oriental Society* 101 (1981): 1–19, while Glendon E. Bryce's *A Legacy of Wisdom* (Lewisberg, Pa., 1979) is an update of Paul Humbert's pioneer study of Egyptian influence on Israelite wisdom, *Recherches sur les sources égyptiennes de la littérature sapientiale*

d'Israël, "Mémoires de l'Université de Neuchâtel," vol. 7 (Neuchâtel, 1929). For Mesopotamian wisdom three references are noteworthy: W. G. Lambert's *Babylonian Wisdom Literature* (Oxford, 1960); Giorgio Buccellati's "Wisdom and Not: The Case of Mesopotamia," *Journal of the American Oriental Society* 101 (1981): 35–47; and Bendt Alster's *Studies in Sumerian Proverbs*, "Mesopotamia," vol. 3 (Copenhagen, 1975). Leo G. Perdue's *Wisdom and Cult* (Missoula, Mont., 1977) remains the fullest discussion of that issue, and the related matter of royal wisdom has been studied by Leonidas Kalugila in *The Wise King*, "Co-niectanea Biblica, Old Testament Series," vol. 15 (Lund, 1980).

Several examinations of school wisdom have appeared; Roger N. Whybray's *The Intellectual Tradition in the Old Testament*, BZAW, vol. 135 (New York, 1974), opposes such a view, while Hans-Jürgen Hermisson's *Studien zur israelitischen Spruchweisheit*, "Wissenschaftliche Monographien zum Alten und Neuen Testament," vol. 28 (Neukirchen-Vluyn, 1968), Bernhard Lang's *Frau Weisheit* (Düsseldorf, 1975), and André Lemaire's *Les écoles et la formation de la Bible dans l'ancien Israël*, "Orbis Biblicus et Orientalis," vol. 39 (Göttingen, 1981), defend the existence of a school in Israel.

Heinrich Schmid's *Wesen und Geschichte der Weisheit*, BZAW, vol. 101 (Berlin, 1966), has documented the crisis throughout the ancient Near East that resulted from a collapse in the dogma of reward and punishment. The pervasive presence of sapiential themes and theology has been examined in Donn F. Morgan's *Wisdom in the Old Testament Traditions* (Atlanta, 1981); Gerald T. Sheppard's *Wisdom as a Hermeneutical Construct: A Study in the Sapientializing of the Old Testament*, BZAW, vol. 151 (New York, 1980); and Max Küchler's *Frühjüdische Weisheitstraditionen*, "Orbis Biblicus et Orientalis," vol. 26 (Göttingen, 1979). The problem of theodicy is discussed in an anthology edited by James L. Crenshaw, *Theodicy in the Old Testament* (Philadelphia, 1983). Burton L. Mack's *Wisdom and the Hebrew Epic* (Chicago, 1985) discusses Ben Sira's hymn in praise of the fathers.

JAMES L. CRENSHAW (1987)

WISDOM LITERATURE: BIBLICAL BOOKS [FURTHER CONSIDERATIONS]

The subject of wisdom literature in the Bible has flourished in the last decades of the twentieth century and the beginning of the twenty-first century. New material and approaches have helped bring some aspects into clearer focus, while others remain just as obscure as ever.

It was previously thought that the authors of the Dead Sea Scrolls were uninterested in wisdom; with the fuller publication of more Qumran texts, however, they discovered that the opposite was true. In addition to copies of the biblical wisdom books and some Targums (Aramaic translations) of *Job*, wisdom texts from the Qumran Dead Sea scrolls also include: some sapiential psalms from Cave 11 (11Q5); parts of six copies of a large instruction known as "Sapiential Work A" (1Q26, 4Q415–418, 423); descriptions of a wicked woman the wise are to avoid and a woman the wise are to follow (4Q184 and 4Q185), perhaps to be identified with

the Dame Folly and Dame Wisdom of *Proverbs*; a series of beatitudes (4Q525); other collections of maxims or instructions (4Q424 and 4Q420–421); a hymn about acquiring knowledge (4Q413); and several others. Many of these works were probably not composed by the Qumran community; rather, they likely existed beforehand and were merely copied by them. Unique among Jewish instructions, a fragment of Sapiential Work A (4Q415 2 ii 1–9) seems to be directly addressed to a woman; a wife is given conventional advice: to cling to her husband, to honor her father-in-law, and so on.

Scholars continue to investigate biblical wisdom's relation to the wisdom traditions in the neighboring Near Eastern literatures, as well as its place in world religions. In the case of Ancient Egypt, further explorations of the subgenre of instructions have yielded more specific similarities in language and form with those in the Bible. Moreover, the tale of Aḥiqar,

the earliest text of which is written in Aramaic and dates to the fifth century BCE in Egypt, but which was subsequently transmitted in over a dozen languages, contains a series of proverbs that demonstrate the popularity and continuity of the proverb tradition in the Near East across the centuries. With regard to Mesopotamia, the Sumerian "proverb" or "rhetoric collections" have been more fully published and studied, and other wisdom pieces have been considered in connection with the Bible. For instance, the so-called Sumerian poem about early rulers, preserved in three Old Babylonian copies and in seven Sumerian-Akkadian bilingual fragments from thirteenth-century Syria, constitutes a particularly interesting case. In this composition, the universal literary motif of the fleeting nature of glory and fame, epitomized by the medieval theme *ubi sunt qui ante nos fuerunt?* (where are they who were before us?), seems to lead to a more optimistic corollary, the *carpe diem* (seize the day) theme, which can be compared to several passages in *Ecclesiastes*. Outside the ancient world, scholars have found many parallels to the biblical *Proverbs* in Arabic and African sapiential traditions, and they have shown that proverbial sayings and their many settings are cross-culturally quite similar, as are the multiple settings from which they arise. These correspondences do not necessarily imply genetic or historical relationships between the traditions; instead, they may actually indicate cross-cultural commonplaces.

New approaches to the Bible's wisdom tradition also include feminist interpretations, among other. For example, the existence of female sages has been explored, as has women's verbal use of proverbs. While some scholars have looked to ancient Near Eastern goddesses as precursors of Dame Wisdom and Dame Folly (the Egyptian Isis, the Canaanite Astarte, and the Mesopotamian Inanna, among others), others have suggested that Dame Wisdom is a hypostasis of Yahweh or a literary device, or a "literary compensation for the eradication of the worship of these goddesses" (Hadley in Day et al., *Wisdom in Ancient Israel*, p. 236).

Still, despite numerous recent monographs and articles on biblical wisdom literature, little consensus has been reached on some of the important issues; namely, the setting of wisdom in ancient Israel, the existence of a school or court tradition as in Mesopotamia or Egypt, the existence of sages as a professional class, the precise definition of “wisdom literature” (including its specific rhetoric, vocabulary, and themes), and the appropriateness of the generic label “wisdom” or the unity of all ancient Near Eastern texts deemed such, and so forth. One of the most basic questions yet to be answered definitively is whether there were schools in ancient Israel. The best supporting epigraphic evidence may perhaps be found in several inscriptions with sequences of numbers and measurements especially from the regions of Kadesh Barnea and Kuntillet ‘Ajrud, as well as abecedaries (rudimentary alphabets) from various locations. These scarce indications, however, cannot compare to the abundance of evidence that exists for the scribal traditions in ancient Egypt and Mesopotamia.

Concerning vital questions about the nature of biblical wisdom literature, therefore, one can anticipate continued lively debate among scholars, and hopefully subsequent advancement of our understanding.

BIBLIOGRAPHY

Some of the most important recent discussions on wisdom or the sage in the Bible are: J.G. Gammie and L.G. Perdue, editors of eds. *The Sage in Israel and the Ancient Near East* (Winona Lake, 1990); Stuart Weeks, *Early Israelite Wisdom* (Oxford, 1994); Roland E. Murphy, *The Tree of Life: An Exploration of Biblical Wisdom Literature*, 2d ed. (Grand Rapids, 1996); Leo G. Perdue, *Wisdom and Creation: The Theology of Wisdom Literature* (Nashville, 1994); John Day, Robert P. Gordon and H.G.M. Williamson, editors of *Wisdom in Ancient Israel: Essays in Honour of J. A. Emerton* (Cambridge, U.K., 1995); Joseph Blenkinsopp, *Wisdom and Law in the Old Testament: The Ordering of Life in Israel and Early Judaism* (Oxford, 1995); John J. Collins, *Jewish Wisdom in the Hellenistic Age* (Louisville, Ky., 1997); James L. Crenshaw, *Education in Ancient Israel: Across the Deadening Silence* (New York, 1998); Carol Fontaine, *Traditional Sayings in the Old Testament* (Sheffield, U.K., 1982).

For wisdom at Qumran see: Charlotte Hempel, Armin Lange, and Hermann Lichtenberger, editors of *The Wisdom Texts from Qumran and the Development of Sapiential Thought* (Louvain, 2002); and Daniel J. Harrington, *Wisdom Texts from Qumran* (London, 1996).

As for the ancient Near Eastern parallels, see: Riad Aziz Kassis, *The Book of Proverbs and Arabic Proverbial Works* (Leiden, 1999); Nili Shupak, *Where Can Wisdom Be Found? The Sage's Language in the Bible and in Ancient Egyptian Literature* (Fribourg/Göttingen, Germany, 1993); Hellmut Brunner, *Die Weisheitsbücher der Ägypter: Lehren für das Leben*, 2d ed. (Zürich, 1991); and Miriam Lichtheim, *Late Egyptian Wisdom Literature in the International Context: A Study of Demotic Instructions* (Freiburg/Göttingen, Germany, 1983). For the Sumerian proverbs, see Bendt Alster, *Proverbs of Ancient Sumer*, 2 vols. (Bethesda, Md., 1997).

TAWNY L. HOLM (2005)

WISDOM LITERATURE: THEORETICAL PERSPECTIVES

There is great ambiguity in defining wisdom literature within Jewish and Christian studies. This literary corpus has been defined alternately as (1) a precise canonical division of biblical books attributed to Solomon (traditional view); (2) the literary product of a particular social class (i.e., the sages of Israel); (3) an empirical literature developed to address the problems of government and administration; (4) an instructional literature developed to teach social conduct in the family unit; (5) a literary observation on creation in reaction to the failure of prophecy; (6) an international literature often characterized as universal, eudaemonistic (i.e., happiness as life's goal), secular, or humanistic; (7) a literature whose goal is to facilitate the reading and interpretation of sacred tradition and scripture itself; (8) a literature expressive of an intellectual tradition distinguishable from other types of thought in Hebrew culture; and, (9) most broadly, any literature that expresses a particular view toward reality (especially in clan, court, or scribal settings) in answer to the question “What is good for men and women?”

This representative—but by no means exhaustive—list of definitions reflects the lack of consensus about what wisdom is and how the wisdom tradition can be said to have shaped a literary genre called wisdom literature. The problem of definition may be elucidated by examining the relevant wisdom terms and patterns of usage in canonical deuterocanonical and extra-canonical texts through the Second Temple period (536 BCE–70 CE).

PROFESSIONAL CLASS OR CANONICAL DIVISION? Despite the pervasive use of the words *hokhmah* (wisdom) and *hakham* (wise) and the Greek equivalents *sophia* (wisdom) and *sophos* (wise) in the Bible and Septuagint (third-century BCE Greek translation of the Hebrew scriptures), they do not technically describe either a professional class or a canonical division of scripture. Although the word *hak-ham* appears in *Jeremiah* 18:18 in a context that to some scholars suggests three professional classes (priests, prophets, and sages), such a reading is by no means conclusive and has been forcefully challenged by Roger Whybray (1968), among others. Other texts suggestive of a professional class of *ha-khamim* (sages) are similarly inconclusive (see *Is.* 5:21, 29:14, 31:2; *Jer.* 8:8, 9:22). Aside from these biblical references, certain external evidence of international school and scribal structures has been used to posit similar biblical institutions. However, lack of direct biblical evidence makes these theories somewhat speculative.

Whether wisdom constitutes an intra-canonical category is likewise debatable. Not until the apocryphal *Book of Ben Sira* (second century BCE) is there even an allusion to the tripartite canonical division: law, wisdom, and prophets (expressed in this unusual order at 39:1)

WISDOM-TORAH IDENTIFICATION. A related and more sharply defined issue in *Ben Sira* is the clear and striking identification of Torah and wisdom in chapter 24. Here

Wisdom, personified as a preexistent entity with God at creation, is said to have found a resting place in Israel (*Book of Ben Sira* 24:9). Furthermore, wisdom is peculiarly merged with Torah so that there is no Torah study without the study of wisdom. Beyond the early association of wisdom and Torah in *Deuteronomy* 4:6, the logic of this identification may be sought in the second-century BCE encounter between Judaism and Hellenism, whose rich philosophical traditions challenged Israel to provide a philosophical foundation for its own sacred history. In such a setting wisdom takes on a decidedly apologetic task. For the author of *Ben Sira*, Torah is mediated or interpreted by wisdom—the same wisdom perhaps that provides the international standard for the conduct of human affairs. The concerns of *Ben Sira* are echoed in *Baruch* (*Bar.* 3:9–4:4) and perhaps even in the final stages of earlier biblical books in which wisdom interprets sacred tradition.

This wisdom-Torah association persists in the later rabbinic literature. More typical of rabbinic interpretation, the Mishnah tractate *Avot* entertains the same wisdom-Torah juxtaposition but comes to the opposite conclusion: Rather than wisdom leading inevitably to Torah, knowledge of Torah now must precede and temper wisdom. In the words of the rabbinic sage Simon the Just:

He whose wisdom takes precedence over his fear of sin, his wisdom will not endure. . . . That is why a person should first . . . carry out the commandments, even if he does not understand the reasons why. . . . He whose wisdom exceeds his works is one who does not carry out what he learns; therefore his knowledge of the Torah will not keep. (*Avot* 3.12)

In the Dead Sea Scrolls at Qumran, in which the wisdom tradition is variously supplemented or even supplanted by apocalypticism, there is surprisingly little *hokhmah/bakham* vocabulary. Nevertheless, selected scrolls (1 QS, 1 QH, 1 QM) are strongly reminiscent of the late wisdom writings (e.g., *Book of Ben Sira*, *Baruch*, *Wisdom of Solomon*). Here an esoteric wisdom aids in the interpretation of Torah; what can be known about the origin and end of the world is not clearly discernible either in creation itself or in Torah plainly interpreted. Torah mysteries are revealed to the sectaries who become by membership in the community initiates into divine mysteries (1 QS 9:17–18; 1 QH 1:21). And yet, this esoteric wisdom is still linked to ethics and piety as in the older wisdom-Torah dialectic. The created order is still cause for praise despite its secrets (1 QH 1:11–12), and the secrets will finally be revealed to the remnant of those who obey to the commandments:

But with the remnant of those who held fast to the commandments of God He made his Covenant with Israel forever, Revealing to them the hidden things in which all Israel had gone astray. (1 CD 3:13–14; as cited in Vermes, 1962, p. 85)

A similar wisdom-Torah dialectic, now with different aims, may be at work in the New Testament *Gospel of Matthew* in

which Jesus is depicted as both a new Moses (e.g., *Mt.* 5:17–20; 23:34–40) and as Wisdom's representative (*Mt.* 11:19, 25–30; 23; cf. *Book of Ben Sira* 51) and in the *Letter of James* in which the “wisdom from above” (*Mt.* 3:17) seems to replace explicit Torah language.

The coexistence of such varied perspectives on the role of wisdom testifies to the highly pluralistic milieu of Hellenistic Judaism. Ultimately, for Judaism, Torah remained the standard by which all other scripture was to be interpreted, for despite the eventual recognition of the prophets and the writings as canonical divisions, at no time were these placed on equal footing with Torah. To the contrary, the challenge at Yavneh in the first century to the canonicity of *Song of Songs* and *Ecclesiastes* testifies to their tentative status, although the view that these books “defile the hands” (i.e., are to be revered as sacred writings) prevailed.

WISDOM ATTRIBUTED TO SOLOMON. The ascription of three books to the hand of Solomon, Judaism's preeminent wise man (*1 Kgs.* 3–5), is evidence of another link between wisdom and sacred history. *Proverbs*, *Song of Songs*, and (obliquely) *Ecclesiastes* all claim or allude to Solomonic authorship. The curious circumstance that *Ecclesiastes* is ascribed not to Solomon but to Qohelet, who is nevertheless described in language appropriate only to Solomon (“Son of David, king in Jerusalem”), is regarded by Brevard S. Childs (1979) as evidence of canonical shaping. By means of this device, the reader who knows the tradition of wisdom surrounding Solomon is instructed to read *Ecclesiastes* as an authoritative part of that tradition. If this assessment is correct, the assignment of texts to Solomon provides the earliest glimpse of a biblical category functioning as (what is now referred to as) wisdom literature.

Although modern scholars such as Whybray, Gerhard von Rad, Walter Bruggemann, and Joseph Blenkinsopp have tended to attribute a secular humanistic orientation to the literature of the Solomonic enlightenment, Jewish historian Josephus Flavius (37/38–c. 101), the rabbi, and the early church fathers offer evidence for the inadequacy of this assessment. Both Flavius and Origen (c. 185–c. 254) refer to the Solomonic works as theologically didactic, that is, teaching divine wisdom. In his famous discussion of the twenty-two books of scripture “justly accredited” and “containing the record of all time,” Josephus observes that “four contain hymns to God and precepts for the conduct of human life [*hypothekas*]” (*Against Apion* 1.39). These four are thought to be *Psalms*, *Proverbs*, *Ecclesiastes*, and *Song of Songs*.

In the prologue to his *Commentary on Song of Songs*, Origen places “three books written by Solomon's pen [in] didactic order” from *Proverbs* to *Ecclesiastes* to *Song of Songs*. In this order, he writes, the books present three general disciplines by which one attains knowledge of the universe. The Greeks call them ethics, physics, and enoptics (Origen, *Commentary on Song of Songs*).

Origen's thought was further systematized in the fourth century by Gregory of Nyssa (c. 335–c. 395), who writes that

God used Solomon as an instrument to show “in systematic and orderly fashion, the way which leads upward to perfection.” These three books, analogous to stages of growth in the physical body, reveal a particular order of development that brings human beings to virtuous life. From *Proverbs*’s neophyte wisdom, suitable for the child, to *Ecclesiastes*’s teaching that “beauty is that beyond anything grasped by the senses,” to *Song of Songs*’s “initiation of the mind into the innermost divine sanctuary,” the human soul is directed gradually toward its final “mingling with the divine” (Gregory of Nyssa, *Homily on the Song of Songs*).

WISDOM SINCE THE ENLIGHTENMENT. With the Enlightenment and the rise of modern biblical scholarship came a departure from the traditional definition of wisdom literature as material attributed to Solomon. Attention turned now to the issues of form and redaction criticism and particularly to newly discovered ancient Near Eastern wisdom parallels (especially Egyptian texts). In this period the term *wisdom literature* came to be a standard designation for a vaguely defined type of Old Testament literature.

Interest in the implications of scientific findings for the standing of wisdom in biblical theology also arose in the modern period, doubtless in reaction to the Enlightenment preoccupation with historical critical method. Von Rad’s (1972) three-part chronological division of Old Testament wisdom history into old (secular) wisdom, theological wisdom, and apocalyptic wisdom is perhaps the most comprehensive result of such study, although it has received sharp criticism by such scholars as James Crenshaw and Gerald Sheppard.

In the 1950s a new and extensive exploration of wisdom influence on biblical texts generally not defined as wisdom literature was initiated by von Rad’s (1966) study of the Joseph narrative in *Genesis*. Von Rad’s claim that the *Genesis* narrative, through its use of wisdom themes and vocabulary, presents Joseph as one trained in the wisdom of the Egyptian court drew much criticism but also gave rise to a generation of similar studies. Studies of other narrative texts, like Whybray’s (1968) *Succession Narrative* and Talmon’s (1963) study of the *Book of Esther*, followed von Rad’s lead. Legal and prophetic texts were similarly explored by Moshe Weinfeld, Joseph Jensen, William Whedbee, and others.

CROSS-CULTURAL STUDIES OF WISDOM IN THE ANCIENT NEAR EAST. The international context of biblical wisdom is already suggested by the claim in *1 Kings* 4:30 that Solomon’s wisdom surpassed that of all the peoples of the East and Egypt. The comparison of Egyptian instructional literature to *Proverbs* by Adolf Erman (1924) and Paul Humbert (1929) opened a new phase of inquiry into wisdom literature as a genre. From the Egyptian *sebayit* (teaching) with its central idea of *maat* (the divine order of truth established by God) to the Sumerian and Assyro-Babylonian instructional texts of Mesopotamia, parallels to nearly every presumed wisdom category in the Hebrew scriptures have been found. Egyptian texts relating advice to the student were found to

bear strong resemblance to the biblical *Proverbs*, whereas texts listing the works of nature, such as the *Onomasticon of Amenemope*, were compared to texts such as *Job* 38–39. Likewise, the biblical theme of the suffering of the righteous and the skeptical tradition of Qohelet found rough parallels in certain Egyptian texts (such as the papyrus *Dispute over Suicide*) and even stronger resonance in Mesopotamian texts like the poem *Ludlul bel nemeqi* (the Babylonian Job), the *Dialogue of Human Misery*, and the *Dialogue of Pessimism*.

Despite these strong family resemblances, however, many scholars have objected that ancient Near Eastern parallels have been exaggerated in the secondary literature. W. G. Lambert’s (1960) pivotal study of Babylonian literature stresses the inapplicability of biblical definitions of wisdom to the Akkadian word *nemequ*, usually translated “wisdom.” Unlike biblical wisdom, *nemequ* most often refers to skill in cult and magic lore in which the wise man is the initiate. Although Babylonian literature exhibits thought patterns similar to those often characterized as biblical wisdom (e.g., proverbs, advice on living), “there is no precise canon by which to recognize them” as wisdom texts (Lambert, 1960). In any case Lambert cautions that the term *nemequ* does not adequately define these writings.

Equally problematic is the attempt to equate proverbial or folk sayings with wisdom. Once again the cross-cultural resemblance is undeniable and yet one cannot limit wisdom to proverbs without depriving the term *wisdom* of its rich nuance. Proverbs, after all, occur in the widest variety of cultures, often without any religious content or implication. The discovery of Egyptian parallels to biblical proverbs is far from establishing an international standard for wisdom.

WISDOM AS A CATEGORY IN THE HISTORY OF RELIGIONS. If it is somewhat problematic to speak of a cross-cultural wisdom literature in the ancient Near Eastern context, it is even more difficult to do so in the context of contemporary comparative religions. It would be tempting, for example, to draw a correspondence between Buddhism’s *prajñā*, sometimes personified as a goddess who brings enlightenment to all buddhas, and the personified Wisdom of *Proverbs* 8. Both figures are praised in hymns that endow them with feminine traits, and yet the practices directed toward achieving the two states—*prajñā* and biblical wisdom—are near opposites. Buddhism, particularly Mahāyāna Buddhism, undertakes to awaken *prajñā* “found slumbering under ignorance and karma which come from our unconditioned surrender to the intellect” (Suzuki, 1958 p. 5), whereas biblical wisdom is often characterized as an intellectual tradition. In other words, wisdom in the biblical tradition is often associated with knowledge, and *prajñā*—more like antknowledge—is characterized by detachment from the intellect and the cultivation of a transcendental insight into things “just as they are” (*yatha bhutam*), without conceptual distortion.

Closer to what scholars associate with biblical wisdom is the wisdom of Zoroastrianism, which is manifest in perfect control over the will, shown in “good deeds, righteousness

and good repute," according to *Denkard*, a ninth-century encyclopedia of Zoroastrianism. The source of this wisdom is the Creator "who is essential wisdom"; the created "receive it through their own faculties" (*Denkard* 380.19–382.3). As in much of the Bible, wisdom and righteousness go hand in hand.

Islamic mysticism offers another example of wisdom as anti-intellectualism. For the Šūfīs, all wisdom (*aqul*; universal reason) is included in the letter *alif*, the first letter of the Arabic alphabet and symbol for God. It requires no study of books or philosophical quest because knowledge is immediately derived from God. Furthermore, it is typical of Persian mystical literature to elevate love over intellect or to substitute "rapture for reasoning" (Schimmel, 1975, p. 431).

Each of these traditions undoubtedly exhibits internal diversity and nuance in its definition of wisdom equal to or exceeding the variations in biblical and other ancient Near Eastern texts. The problems encountered in the comparison of the latter, texts from similar temporal and geographical settings, are only exacerbated in the broader cultural context of contemporary history of religions. If there is no consistent use of the term in the ancient Near East, there is far less consistency of definition about a wisdom genre outside of that milieu. The question remains, then, whether wisdom can be spoken about as a category of literature either within the Bible or in the broader and more problematic cross-cultural context of world religions.

ALEXANDRA R. BROWN (1987 AND 2005)

WISE, ISAAC M. (1819–1900), pioneer and leading organizer of American Reform Judaism. Born near Eger, Bohemia (now Cheb, Czech Republic), Isaac Mayer Wise led an impoverished childhood. He received a traditional Talmudic education, which, though irregular, gave him an extensive acquaintance with rabbinic literature and an appetite for wider knowledge. In 1846, after holding a minor rabbinical position in Radnitz, he left for America.

Essentially Wise was an autodidact. He appears to have imbibed Mendelssohnian ideas in Europe, but on his arrival in New York there was nothing to distinguish him from conventional Orthodoxy. The mainspring of his Reform inclinations, which surfaced in America, appears to have been a sense of the needs of Judaism in the New World. He became the rabbi at a synagogue in Albany, New York, and not only instituted reforms there but began to write and lead efforts designed to bring direction to the scattered elements of American Jewry—to formulate a particularly American Judaism. A quarrel within his synagogue over certain of these reforms led to his being forcibly ejected from his position in 1850; he thereupon started his own congregation. In 1854 he moved to Cincinnati, where he remained until his death. During the course of his lifetime Wise was twice married; he had ten children with his first wife and four with his second.

In Cincinnati, Wise started a weekly, *The Israelite* (later renamed *The American Israelite*), which was quickly followed by a German periodical for Jewish women, *Die Deborah*. He wrote voluminously: history, theology, poetry, catechisms, and liturgical writings issued from his pen. Wise's overriding concerns were to provide the American Jewish community with a synod that would set qualifications for American rabbis and to establish a college that would train them and legitimize changes in ritual. This program incurred the suspicion not only of Orthodox Jews but also of the more doctrinaire Reform Jews, and it led to violent polemics with his colleagues.

Nevertheless, as a result of Wise's propaganda the Union of American Hebrew Congregations was established in 1873 in Cincinnati, and in 1875 the union opened Hebrew Union College, with Wise as its president. His energy, resilience, and single-minded devotion to his tasks nursed the college through a difficult beginning, and when in 1889 the Central Conference of American Rabbis was established Wise became its president. His place in the history of American Judaism rests on his intuition of the needs of an as yet inchoate community and his persistence in bringing his ideas to fulfillment.

S. D. TEMKIN (1987)
Revised Bibliography

WISE, JOHN (1652–1725), Congregational clergyman and proponent of ecclesiastical liberty in the Massachusetts Bay Colony. A graduate of Harvard College in 1673, Wise by the end of the 1670s had settled in the town of Ipswich as its parish minister, remaining in that capacity and locale until his death. Wise is remembered chiefly for his defense of a pure "congregational" polity, each local church being left free to conduct its own affairs without hindrance or help from "higher" or more numerous clerical authorities. In *The Churches Quarrel Espoused* (1710) and again in *A Vindication of the Government of New-England Churches* (1717), Wise ridiculed the notion that pastors were unable to lead their own flocks, perform their proper duties, or steadily "steer in all weather that Blows." It was quite unnecessary, he argued, and indeed potentially dangerous, to resort to councils or synods—to consociations or committees—to "advise" or "assist" the independent congregation. If people cannot direct their own worship, he continued, perhaps they are incapable even of choosing their own spouses. Some may even think that a committee is needed to "direct all Wooers in their Choice for the Marriage Bed; for that there is many a fond Lover who has betrayed the glory of Wedlock by making an unwise and unfortunate Choice; and why not particular Beds be overruled, as well as particular Churches?"

With such wit joined with even more convincing arguments from antiquity, from nature, and from Christian scripture, Wise argued narrowly for the congregational way, but he also argued broadly for local rule and individual liberty. That Wise's plea for ecclesiastical liberty had inescapable implications for civil liberty found explicit recognition in the republication in 1772 of both works noted above. After the Sugar Act (1764), the Stamp Act (1765), the Townshend acts (1767), and the Boston Massacre (1770), New Englanders welcomed the assurance that a natural person is "a Free-Born Subject under the Crown of Heaven, and owing Homage to none but God Himself."

The only modern biography of John Wise is George A. Cook's *John Wise: Early American Democrat* (New York, 1952, 1966). For a fuller assessment of Wise's significance, see Perry Miller's *The New England Mind: From Colony to Province* (Cambridge, Mass., 1953).

EDWIN S. GAUSTAD (1987 AND 2005)

WISE, STEPHEN S. (1874–1949), American rabbi, Zionist leader, and social activist. Scion of a family of European rabbis, Stephen Samuel Wise was brought to America as an infant from Budapest to join his father, Aaron Wise. Educated at Columbia University, he received private rabbinic training and was ordained by Adolf Jellinek of Vienna. From service as assistant rabbi at the Conservative synagogue B'nai Jeshurun in New York, he moved to the pulpit of Reform Temple Beth Israel in Portland, Oregon, and returned to New York in 1907 to found and head the Free Synagogue. Its pulpit would be free, said Wise; its pews would welcome all; its purpose would be to make its congregants more "vitaly, intensely, unequivocally Jewish."

A religious liberal and social activist, Wise used the pulpit and lecture platform to promote both liberalism and social justice. As an American clergyman he involved himself in civic affairs and social and economic issues, helping to found both the National Association for the Advancement of Colored People (1909) and the American Civil Liberties Union (1920); as a rabbi he made the plight of brethren abroad, Jewish rights at home, and the democratization of Jewish communal life his central concerns. Above all was his lifelong devotion to the cause of Zionism. He was a founder of the Federation of American Zionists in 1898, and he twice served as president of the Zionist Organization of America (1913–1920; 1936–1938).

To help democratize the structure of the American Jewish community, Wise took leadership in the organization of the American Jewish Congress. He was its president from 1921 to 1925 and honorary president until his death. In the wake of the rise of Nazism, he organized the World Jewish Congress in 1936 and served as its president. To bring greater unity to American Jewry, he founded a nondenominational rabbinical seminary, the Jewish Institute of Religion, in 1922. Wise was acclaimed as one of the most stirring of pulpit orators and platform lecturers of his generation.

ABRAHAM J. KARP (1987)
Revised Bibliography

WISSOWA, GEORG (1859–1931), was a German philologist and historian of Roman religion. Georg Otto August Wissowa was born near Breslau, the son of a civil servant. His grandfather was a noted Tacitus scholar and the director of Breslau's Catholic Gymnasium, where Wissowa himself was educated, graduating with superior marks in 1876. That same year he entered the University of Breslau, where he studied under the classical philologist August Reifferscheid, who introduced him to the study of Roman religion. In 1880 Wissowa successfully defended his doctoral dissertation, "De Macrobiani Saturnalium fontibus." He subsequently continued his studies in Munich under Heinrich von Brunn, then one of Germany's foremost students of Roman antiquities. From Brunn he gained an appreciation of the importance of art and monuments for the understanding of Roman religious life, and in 1882 he produced a habilitation thesis on the images of Venus in Roman art ("De Veneris simulacris romanis"). Through Brunn, Wissowa also met that towering genius of Roman historical studies, Theodor Mommsen, whose methods he later applied to the study of Roman religion.

Upon the acceptance of his thesis, Wissowa joined the faculty at Breslau as a privatdocent, but he spent his first year in that position doing research in Italy (his only trip to the homeland of Roman civilization). In 1886 he accepted a post as associate professor at Marburg, where he was promoted to professor ordinarius in 1890. In 1895 he left Marburg for the University of Halle (Saale), where he spent the remainder of his career.

During the early part of his career Wissowa wrote nearly a dozen articles dealing with Roman religious antiquities. There were, in fact, preliminary studies for what was to be his chief contribution to the science of religion, *Religion und Kultus der Römer* (1902; 2d ed., 1912). In this work he traced the development of Rome's religion and described in detail its gods and practices. The book's importance lies in Wissowa's successful identification of the several strata of Roman religion, his clarity and precision in delineating the nature of its various facets, and his masterful treatment of its evolution by adoption of foreign forms. He demonstrated once and for all the essential dissimilarity of Greek and Roman religion, emphasizing that the latter was highly legalistic and almost totally lacking in mythology. In an era dominated by the comparative approach to religion popularized by James G. Frazer's *The Golden Bough*, Wissowa anticipated more recent anthropology by insisting on the need to understand Roman religion on its own terms and as an organic unit (cf. his remarks on Frazer in *Religion und Kultus*, 2d ed., p. 248,

n. 3). *Religion und Kultus der Römer* soon became the foundation for all subsequent work in its field. Though other general treatments of the subject have appeared since its publication, it remains a standard and indispensable authority.

Hardly less important for the study of religion was Wissowa's decision to take on the task of reediting August Pauly's *Realencyclopädie der klassischen Altertums-wissenschaft*. The resulting compendium, not completed until 1972, became a standard reference for all students of the ancient world. It naturally included numerous articles on ancient gods and cults, many of them written by Wissowa himself. He was, in addition, a contributor to W. H. Roscher's *Ausführliches Lexikon der griechischen und römischen Mythologie* and to James Hastings's *Encyclopaedia of Religion and Ethics*.

Wissowa continued to be an active author and teacher until 1923, when his health failed. He spent the last eight years of his life as an invalid. It is to be regretted that his physical condition prevented him from participating in the discussion of new archaeological evidence unearthed during the 1920s that was to prove of major significance for the history of Roman religion.

BIBLIOGRAPHY

In addition to the works cited above, Wissowa wrote a collection of articles, *Gesammelte Abhandlungen zur römischen Religions- und Stadtgeschichte* (1904; reprint, New York, 1975), which supplement *Religion und Kultus*. Of his many other valuable articles, I would single out as particularly interesting "Zum Ritual der Arvalbrüder," *Hermes* 52 (1917): 321–347.

A bibliography of Wissowa's works (nearly complete, but add the articles listed in the index to the *Encyclopaedia of Religion and Ethics*, edited by James Hastings, Edinburgh, 1908–1927) may be found at the end of Otto Kern's obituary for Wissowa in the *Biographisches Jahrbuch für Altertumskunde* 60 (1934): 120–145. This article and Kern's *Georg Wissowa: Gedächtnisrede* (Halle, 1931) are the fullest treatments of Wissowa's life.

WITCHCRAFT

This entry consists of the following articles:

CONCEPTS OF WITCHCRAFT
AFRICAN WITCHCRAFT

WITCHCRAFT: CONCEPTS OF WITCHCRAFT

The term *witchcraft* embraces a wide variety of phenomena. Its meaning varies according to historical and cultural con-

text. The word *witch* derives from the Old English noun *wicca* (sorcerer) and the verb *wiccian* (to cast a spell). The original concept of witchcraft corresponds to what anthropologists call *sorcery*: the attempt to influence the course of events by ritual means. Sorcery is widespread and found in almost every culture and historical period. Two other, quite different, phenomena have also been called *witchcraft*. The first is the alleged diabolical witchcraft of early modern Europe and its colonies; the second is Neopagan witchcraft, a twentieth-century revival. This article will distinguish sharply among these three phenomena, because the connections between them are few and tenuous.

ANTHROPOLOGICAL CONCEPTS OF SORCERY AND WITCHCRAFT. Anthropologists distinguish between sorcery and witchcraft. Sorcery is a system of beliefs and practices whose goal is to manipulate nature in order to bring about specific changes that benefit the sorcerer or her or his clients. Witchcraft is the belief that certain members of society are inherently able to harm others. Sorcery involves a set of skills that can be learned; witchcraft is usually thought to be inborn and inherited. In practice, however, sorcery and witchcraft beliefs often exist side by side, and it is sometimes difficult to separate the two.

The simplest forms of sorcery involve the performance of one action in order to bring about another, such as performing sexual intercourse in a sown field to assure a good harvest, or putting pins in an image to cause injury. However, sorcery often goes beyond the performance of magical acts and invokes the help of spirits. In order to cure illness, a Guatemalan sorcerer may perform rituals invoking the aid of San Simon, a Catholic saint who has absorbed the characteristics of an indigenous Mayan deity. If a member of the Lugbara tribe of Zaire and Uganda were injured, he might appeal to the shrines of his dead ancestors for help. This type of magic has much in common with prayer: both magic and prayer attempt to assure a spirit's assistance. However, while prayer usually implores a deity's cooperation, magic sometimes attempts to compel the gods to collaborate.

Sorcery implies an underlying belief system in a coherent universe in which all parts are interrelated, and influencing one part can affect another. In such a universe, relationships exist linking human beings with stars, plants, minerals, animals, and other natural phenomena, as well as supernaturals, such as gods, nature spirits, and angels. This belief system is known as the "magical worldview." Its thought processes are intuitive rather than analytical, but they have their own internal logic, and are thus not inherently irrational. They can arise out of an emotionally charged experience: for example, if in a rage you curse someone who has offended you, and shortly afterwards this person dies, you may feel both guilty and powerful, and henceforth assume that certain powers are available to you. Empirical science ignores such events because they cannot be verified through experimentation, but societies whose worldviews are not exclusively empirical regard them as direct and convincing evidence of a coherent, magical universe.

Almost all societies have some form of sorcery; in many, it plays an important function. In cultures without access to medical technology, sorcerers may function as healers. Even when medical cures are available, people may still resort to sorcerers to heal certain kinds of illnesses that do not respond readily to pharmaceuticals or surgery. Healers, medicine men, and so-called witch doctors are sorcerers who by definition have a positive function in society, for their work is to cure victims of the effects of witchcraft or malevolent magic. Individuals may consult healers to obtain relief from disease or other misfortunes attributed to witchcraft or sorcery; tribal and village authorities may summon them to combat drought or other public calamities. Dances and other rituals serve to detect and repel witches and evil spirits. Such protective sorcery assumes special social importance in times of famine, war, or severe stress in the community.

In some cultures, sorcery and religion come together: a priest or priestess may perform ritual acts to make rain, ripen the crops, procure peace, or ensure victory in war. When such acts are performed publicly, for the public good, they are generally viewed as benevolent and have a positive social function. But when they are performed privately and for the benefit of a few individuals, they are often regarded with suspicion. The distinction between public and private magic often becomes the distinction between “good” and “bad” magic. Both Vodou and Santeria, Afro-Caribbean religions in which elements of magic exist within a religious framework, make formal distinctions between public religious ceremony and private sorcery done against certain individuals; the latter is condemned. Private sorcery provides the poor, the weak, and the powerless with a tool of resistance and revenge. During periods of great social tension, such as plague or warfare, recourse to sorcery tends to increase and intensify, as more individuals feel powerless at the mercy of larger forces.

Periods of social strain are also characterized by a rise in witchcraft accusations. Unlike sorcerers, witches do not actually have to perform any actions to harm their victims. The Azande of southern Sudan believed that witchcraft was a psychic act; it required no magic spells or actions, and could even be done involuntarily. Witchcraft was inherited from the parent of the same sex. Witches were believed to possess *mangu*, a substance thought to be lodged in the intestines and to confer the spiritual power to harm. Witches were also believed to be able to send their spirits out at night to eat the souls of their victims, causing them to sicken and die. The Azande often blamed any kind of misfortune, from cracked pots to serious illness and death, on witchcraft. Their suspicions fell first upon neighbors with whom they had a disagreement. In order to identify whether witchcraft was responsible for their problems, they would consult oracles. If the oracle’s response indicated that witchcraft was to blame, the Azande would confront the alleged witch and ask him to blow water over an offering in order to “cool” his emotions towards the victim. This act alone was usually enough

to undo the witchcraft and mend social relations. Only in severe cases would disagreements result in the trial and execution of the witch.

The Navajo Indians of the American Southwest believed in witches called *skinwalkers* who would transform into wolves or coyotes at night in order to stalk their victims. Skinwalkers were said to assemble secretly in order to concoct a poison made from corpses that they used to kill their enemies. They were thought to fly through the air at night to blow the corpse poison into the smoke holes of their victims’ hogans (a hogan is a Navajo dwelling). Both the Azande and the Navajo had healers who specialized in curing cases of witchcraft; however, among the Navajo, these specialized healers sometimes became suspected of witchcraft themselves. This occurs in many societies where sorcerers are enlisted to undo witchcraft, because it is assumed that those who have the power to heal can also use that power to harm.

Cultures with a belief in witchcraft often imagine witches as the very opposite of everything considered right in society. A witch is someone who disregards social rules, flouting even the most basic rules regarded as standards of decency in a particular society. Witches are often said to commit murder and incest, to engage in cannibalism and indiscriminate orgies, to have the ability to transform into animals, and to eat or otherwise abuse corpses. In other words, witches are people who violate the most basic rules in human society. Because the basic rules that maintain social order are similar cross-culturally, witches tend to be imagined in similar ways. It follows that individuals who flout other kinds of social rules, or who appear anomalous in other ways, stand a chance of being accused of witchcraft. For example, among the Azande, those who did not behave as good neighbors, who had many quarrels within the village, or who had a history of violent behavior were more frequently accused of witchcraft. Among the Navajo, those who appeared greedy, selfish and refused to share with their families, or who were marginal to the community and lived in peripheral areas were vulnerable to witchcraft accusations. Belief in witchcraft thus serves as a form of social control, reinforcing sanctioned behaviors and creating a threat against those who violate social norms.

Witchcraft beliefs also function as an attempt to explain the reasons behind otherwise unexplained negative events: illness, calamities, natural disasters, and death. Some anthropologists have argued that witch beliefs disappear once more scientific explanations for illness and natural phenomena are available. But even when humans understand the physical causes of a misfortune, the question remains: why does it strike some people, but not others? When a granary collapsed, killing a man inside it, the Azande were perfectly capable of understanding that it had given way because it was in a state of disrepair and weakened by termites. Still, the question for them remained: why had it collapsed at that very moment, and why when that particular man was inside? It is this question, the question why things happen as they do, that witchcraft beliefs attempt to tease out.

Witchcraft beliefs may also serve to explain the unexplainable. In all human cultures there are some experiences that are difficult to explain. These include experiences as diverse as sleep paralysis, near-death experiences, and dissociative states that produce very strong physical sensations that can lead believers to interpret them as signs of a spiritual reality that is contiguous to our material reality. Such experiences figure prominently in folklore about witches and witchcraft. In Newfoundland, for example, people often attribute the experience of sleep paralysis to being “hagged” or “hag ridden,” believing that a malevolent witch sends her spirit out at night to torment them in their sleep. Because sleep paralysis often produces a physical sensation of a weight on the chest or a presence pressing down on the sleeper, the belief that witches cause this phenomenon may have arisen as an attempt to explain it.

Unlike sorcery, witchcraft beliefs are not true universals; that is, they do not occur in all cultures. They are most often found in small-scale agricultural societies with a stable settlement pattern, where neighbors have intimate knowledge of one another and social relationships are intense and multilayered. They also tend to be more frequent in cultures with little access to Western scientific knowledge and technology. Witchcraft beliefs are rare in large-scale societies with a great deal of social mobility. But similar phenomena, or so-called witch-hunts, do occur in developed societies with excellent access to information and scientific knowledge, for some of the same reasons they occur in small-scale societies: the desire to effect social control and to blame others for factors causing social tensions.

WITCHCRAFT AS A HISTORICAL PHENOMENON. Patterns of sorcery have existed in virtually all societies in the past, including Western society. The classical Greco-Roman and Hebrew societies from which Western civilization sprang entertained a great variety of beliefs and practices about sorcery, from public rituals that melded with religion to legends about hideous *striae* and *lamiae* reported by the poet Horace. He portrayed these witches as clothed in rotting shrouds, with disheveled hair, clawing the soil with taloned fingers as they invoked the gods of the underworld. The Greeks distinguished between three varieties of magic. The highest was *theourgia*, a kind of public liturgy “working things pertaining to the gods” (*theoi*), in which magic and religion blended. *Mageia* was the next variety; its practitioners worked technical magic privately to help themselves or their clients. *Goeteia* was the lowest form; “howlers” of incantations and mixers of potions, its practitioners were widely feared.

The sorcery of most cultures involved incantations supposed to summon spirits to aid the sorcerer. In many societies the connection between sorcery and the spirits was not explicitly formulated. But in both Greco-Roman and Hebrew thought the connection was defined or elaborated. The Greeks believed that all sorcerers drew upon the aid of spirits called *daimones* or *daimonia*. A Greek *daimon* could be either malevolent or benevolent. It could be almost a god (*theos*),

or it could be a petty spirit. In the thought of Plotinus (205–270 CE) and other Neoplatonists, the demons occupied an ontological rank between the gods and humanity. The Hebrews gradually developed the idea of the *mal'akh*, originally a manifestation of God's power, later an independent spirit sent down as a messenger by God. In Greek translations of Hebrew, *mal'akh* became *angelos*, “messenger.” Christians eventually identified “angels” with the Greek *daimones* and defined them as beings ontologically between God and humanity.

But a different element gained influence through the apocalyptic writings of the Hellenistic period (200 BCE–150 CE): the belief in evil spirits led by Satan, lord of all evil. The idea had limited precedents in earlier Jewish thought but gained prominence in the Hellenistic period under the influence of Iranian Mazdaism, or Zoroastrianism. Under such influence, the Christians came to divide the Greek *daimones* into two groups, the good angels and the evil demons. The demons were supposed to be angels who, under Satan's leadership, had turned against God and thereby become evil spirits. Sorcerers sought to compel spirits to carry out their will, but angels under God's command could not be compelled; thus it was supposed that sorcerers might well be drawing upon the aid of evil demons. This was the central idea of the second main variety of witchcraft, the alleged diabolism of the late medieval and Renaissance periods in Europe.

EUROPEAN WITCHCRAFT. Although simple sorcery had always existed, a new concept of witchcraft evolved in medieval and early modern Europe. The Christian concept of the devil transformed the idea of the sorcerer into that of the witch, consorter with demons and subject of Satan. Since 1880 this kind of diabolical witchcraft has been subject to four major schools of interpretation. The first, rooted in classical nineteenth-century liberalism, perceived witchcraft as an invention of superstitious and greedy ecclesiastics eager to prosecute witches in order to augment their own power and wealth. The second school, that of Margaret Murray, argued that witchcraft represented the survival of the old pagan religion of pre-Christian Europe. This religion (which never existed in the coherent form she believed) she supposed to be the religion of the majority of the people down into the seventeenth century, although subject to constant persecution by the Christian authorities. Murray's theory had great influence from the 1920s through the 1950s; unsupported by any credible evidence, it is now rejected by scholars. The third school emphasizes the social history of witchcraft, seeking to analyze the patterns of witch accusations in Europe much as anthropologists have done for other societies. The fourth school emphasizes the evolution of the idea of witchcraft from elements gradually assembled over the centuries. Most scholars currently belong to one or the other of the last two schools.

Historical development. The first element in diabolical witchcraft was sorcery, which existed in Europe as it did elsewhere. It persisted through the period of the witch craze

and indeed has persisted to the present. Without this fundamental element, belief in diabolical witchcraft could not have existed. The second, related aspect was the survival of elements from pagan religions in the folklore of Christian Europe. In some parts of Europe, women believed that they participated in nighttime spiritual journeys led by the goddess Diana or by other supernatural female figures. These nighttime spiritual assemblies would dance, feast, and occasionally enter the homes of neighbors, rewarding the hospitable and punishing the slovenly. The wild ride with Diana was a form of folk belief in the “wild hunt,” a troop of spirits led by a female or male deity that rode out at night, striking terror in those who encountered it.

During the Middle Ages, the Christian view of these beliefs changed. Early in the period they were seen as merely superstitious and mistaken, but towards the tenth and eleventh centuries they began to be considered heretical. The *Canon Episcopali*, a legal document of the Frankish kingdom issued about 900 CE, condemns “wicked women. . . who believe that they ride out at night on beasts with Diana, the pagan goddess. . . . Such fantasies are thrust into the minds of faithless people not by God but by the Devil.” Gradually, the folk concept of the wild hunt, with its feasting, music, and dancing, was transformed into the diabolical sabbat, a nocturnal assembly of witches under the direction of the devil where horrible acts took place.

Another element in the development of diabolical witchcraft in Europe was Christian heresy. The classical formulation of diabolical witchcraft had been established by the fifteenth century. Its chief elements were: (1) a pact with the devil; (2) formal repudiation of Christ; (3) the secret nocturnal meeting; (4) the ride by night; (5) the desecration of the Eucharist and the crucifix; (6) orgy; (7) sacrificial infanticide; and (8) cannibalism. Each of these elements derived from one or another charge made against medieval heretics. Heresy became the medium through which sorcery was linked with the devil.

At the first formal trial of heretics in the Middle Ages, at Orléans in 1022, the accused were said to hold orgies underground at night, to call up evil spirits, to kill and cremate children conceived at previous orgies and use their ashes in blasphemous parody of the Eucharist, to renounce Christ and desecrate the crucifix, and to pay homage to the devil. The history of such charges goes at least as far back as the court of Antiochus IV Epiphanes of Syria (176–165 BCE), who made similar accusations against the Jews; the pagan Romans used them against the Christians, and the early Christians used them against the Gnostics. An early eleventh-century pedant must have resurrected the charges from patristic accounts of Gnostic heresy and applied them to the Orléans group, applying the archetypal thinking common in the Middle Ages: a heretic is a heretic, and whatever one heretic does another must also do. Thus the *idea* of heresy, more than any actual heresy itself, became the basis for the connection of heresy with witchcraft. Some later heretical groups,

such as the sect of the Free Spirit, also were accused of similar diabolical crimes. Not all heretics were so charged, however. On the whole, the accusations were limited to those who had some connection with dualism, the doctrine that not one but two eternal principles existed. The two principles, one evil and one good, struggled for control of the cosmos. Dualist influence on most medieval heresies was indirect, but upon Catharism it was both direct and pronounced.

Catharism was a dualist heresy imported into western Europe from the Balkans in the 1140s. Strong in southern France and northern Italy for well over a century, it dominated the culture of Languedoc and the Midi in the years around 1200; it was suppressed by the Albigensian Crusade and eradicated by the Inquisition. The Cathari believed that matter, and the human body in particular, were creations of the evil god, whose intent was to hold the spirit imprisoned in the “filthy tomb of the flesh.” The evil god is Satan, lord of this world, ruler of all material things and manipulator of human desires for them. Money, sex, and worldly success were the domain of the devil. These doctrines brought the devil closer to the center of attention than he had been since the time of the “Desert Fathers” a thousand years earlier. If only to refute Catharist theories, Scholastic theologians had to give the devil his due. The Catharist designation of Satan as the lord of the things of this world may also have led some who desired those things in the direction of Satan worship.

Scholastic theology was the next major element in the formation of the witch concept. Tradition going back to the early church fathers had suggested that the Christian community, which formed the mystical body of Christ, was opposed by an opposite group forming the mystical body of Satan and consisting of pagans, heretics, Jews, and other unbelievers. It was not only the right but the duty of the Christian to struggle against this evil host. Saints’ lives and legends of the intense struggles of the Desert Fathers against demonic forces kept this tradition alive, and it was reinforced by Catharist dualism. In the twelfth through fourteenth centuries the Scholastics developed the tradition of the body of Satan, refined its details, and supplied it with a rational substructure. They extended the devil’s kingdom explicitly to include sorcerers, whom they considered a variety of heretic. Simple sorcerers became, in the dominant Scholastic thought of the later Middle Ages, servants of Satan.

The link between sorcerers, heretics, and Satan was the idea of pact. The notion of pact had been popularized in the eighth century by translations of the sixth-century legend of Theophilus. In this story, Theophilus was a clergyman who sold his soul to the devil in exchange for ecclesiastical preferment. He met the devil through a Jewish magician and signed a formal pact with “the evil one” in order to fulfill his desires. The Scholastics derived a number of sinister ideas from the legend of Theophilus. Their theory transformed the person making the pact from a relatively equal contracting party to an abject slave of Satan who abjured Christ, did feudal homage to “the dark lord,” and kissed his master’s geni-

tals or backside in token of his submission. The Scholastics also broadened the idea of pact to include implicit as well as explicit consent. One did not actually have to sign a contract to be a member of Satan's army; anyone—heretic, sorcerer, Jew, Muslim—who knowingly opposed the Christian community—that is, the body of Christ—was deemed to have made an implicit pact with the devil and to number among his servants.

The shift from Platonic to Aristotelian philosophy in the thirteenth and fourteenth centuries encouraged the process of demonizing witches. Platonic thought allowed for the existence of a natural, morally neutral magic between divine miracle and demonic delusion; but Aristotelianism dismissed natural magic and denied the existence of occult natural forces. If no natural magic existed, it followed that wonders were worked either through divine miracle or demonic imposture. Magicians compel or exploit supernatural powers, and since God and the angels cannot be compelled or exploited, the powers with which sorcerers deal must be demonic, whether they know this explicitly or not. Thus, Scholastic logic dismissed simple sorcery as demonic witchcraft.

Theology, then, made a logical connection between witchcraft and heresy. Heresy is any persistently held belief counter to orthodox doctrine. One who used demons serves the devil rather than God, and if one serves the devil, one acknowledges that correct theology involves serving the devil rather than God: this was the worst imaginable heresy.

The final element in the transformation of sorcery into diabolical witchcraft was the Inquisition. The connection of sorcery with heresy meant that sorcery could be prosecuted with much greater severity than before. Late Roman laws against sorcery were extremely severe, but during the early Middle Ages simple sorcery, or natural magic, was treated with relative leniency. Often it was ignored; when detected, it might bring no more than a fairly stiff penance. Elements of simple sorcery were incorporated into Christian practice, as seen in the combination of Christian prayer and pagan spells commonly said by parish priests in England during the tenth and eleventh centuries. Penalties for heresy, on the other hand, were severe. Suppression of heresy in the earlier Middle Ages was inconsistent, but in 1198 Innocent III ordered the execution of those who persisted in heresy after having been convicted and excommunicated. Between 1227 and 1235 a series of decrees established the papal Inquisition. In 1233 Gregory IX accused the Waldensian heretics, who were in fact evangelical moralists, of Satan worship. In 1252 Innocent IV authorized the use of torture by the Inquisition, and Alexander IV (1254–1261) gave it jurisdiction over all cases of sorcery involving heresy. Gradually almost all sorcery came to be included under the rubric of heresy.

The Inquisition was never well organized or particularly effective; in fact, most cases of witchcraft were tried before the secular courts. Nonetheless, the Inquisition provided one essential ingredient of the witch craze: the inquisitors' manuals. These manuals told inquisitors what signs of Satanism

to look for, what questions to ask, and what answers to expect. Having obtained the answers they expected by using torture or the threat of torture, the inquisitors duly entered the answers in formal reports, which then added to the body of "evidence" that witches flew through the air, worshiped the devil, or sacrificed babies. It is unlikely that no one in the period ever practiced Satanism, but it is even more unlikely that any widespread Satanism existed. The great majority of the accused were innocent, at least of diabolism.

The witch craze. The number of executions for witchcraft was measured in the hundreds until the end of the mid-fifteenth century, but from 1450 to 1700—the period of the Renaissance and the origins of modern science—as many as a hundred thousand may have perished in what has been called the great witch craze. The witch craze can be explained by the dissemination, during a period of intense social unrest, of the intellectual elements summarized above by the Inquisition, the secular courts, and above all the medium of the sermon. The popularity of the sermon during the later Middle Ages and the Reformation explains how beliefs about witches spread in a period when the leading intellectual movements, such as nominalism and humanism, downplayed or even ignored witchcraft. The invention of the printing press also did its part in spreading the evil. In 1484 Pope Innocent VIII issued a bull confirming papal support for inquisitorial proceedings against witches, and this bull was included as a preface to the *Malleus maleficarum* (The Hammer of Witches), a book by two Dominican inquisitors. Published in 1486, the *Malleus* went into many editions in many languages, selling more copies in Protestant and Catholic regions combined than any other book except the Bible. The *Malleus* colorfully detailed the diabolical, orgiastic activities of witches and helped persuade public opinion that a cosmic plot directed by Satan threatened all Christian society.

Fears of cosmic plots increase in periods of high social tension. The fifteenth and sixteenth centuries witnessed a growth of existential anxiety, a widespread belief that the antichrist, the return of the savior, and the transformation of the world were at hand. As the religious split between Catholicism and Protestantism widened during the sixteenth century and flared up into religious warfare, eschatological fears deepened. Catholics saw the Protestants as soldiers of Satan sent to destroy the Christian community; Protestants viewed the pope as the antichrist. Terror of witchcraft and prosecution of witches grew in both Catholic and Protestant regions, reaching heights between 1560 and 1660, when religious wars were at their worst. No significant differences distinguished Catholic from Protestant views of witchcraft. The Protestants, who rejected so many of the accretions of doctrine in the Middle Ages, accepted beliefs about witches almost without modification. Martin Luther (1483–1546) declared that all witches should be burned as heretics in league with Satan; persecutions in the regions ruled by the Calvinists were comparable to those in Catholic and Lutheran areas.

Tens of thousands were persecuted and hundreds of thousands terrified and intimidated during one of the longest and strangest delusions in history.

The discourse of diabolical witchcraft was often invoked by ordinary people to prosecute neighbors for petty jealousies and resentments characteristic of small-scale societies. The craze was restricted almost exclusively to western Europe and its colonies. Since diabolism is virtually meaningless outside a Christian conceptual framework, it could not spread to non-Christian areas. Although the Eastern Christian church shared the same beliefs in the powers of Satan as the Western church, it experienced no witch craze. The absence of the witch craze in the Eastern church illustrates the hypothesis that for a craze to break out, three elements are required: (1) the appropriate intellectual structure; (2) the mediation of that structure from the elite to the people at large; and (3) marked social tension and fear.

Skeptics such as Johann Weyer (fl. 1563) and Reginald Scot (fl. 1584), who wrote against belief in witchcraft, were rare and were often rewarded for their efforts by persecution; Weyer, for example, was accused of witchcraft himself. More typical of the period were the works of the learned King James I of England and VI of Scotland (d. 1625). Personally terrified of witches, James encouraged their prosecution, wrote a book against them, encouraged the statute of 1604 against pact and devil worship, and commissioned a translation of scripture (the Authorized Version or King James Bible) that deliberately rendered certain Hebrew words (such as *kashshaf*) as “witch” in order to produce texts such as “Thou shalt not suffer a witch to live” (*Ex. 22:18*), which supported the king’s design of suppressing witchcraft legally. In 1681 Joseph Glanvill was still able to publish a popular second edition of a work supporting belief in diabolical witchcraft. But by that time the craze was beginning to fade. Cartesian and scientific thought had no room for witchcraft; ecclesiastical and civil authorities agreed that witch prosecutions had got out of hand; and European society was settling down to two centuries (1700–1900) of relative peace and prosperity. The greatest outburst in those centuries was the French Revolution; it occurred in an intellectual context (the Enlightenment) in which revival of witch beliefs was impossible. European society found other rationales by which to demonize aristocrats, Jews, communists, capitalists, imperialists, or whomever was selected as an object of hatred. The date of the last execution for witchcraft in England was 1684, in America 1692, in Scotland 1727, in France 1745, and in Germany 1775.

WITCHCRAFT AND SOCIETY. The most important social function of the belief in diabolical witchcraft was scapegoating. Sometimes this process was conscious and cynical, as when Henry VIII added witchcraft to the list of charges trumped up against Anne Boleyn. Much more often it was unconscious. If one is impotent, or one’s crops fail, or one becomes ill, it helps to blame a witch, not only because it relieves one of guilt but also because the belief that a witch has

caused one’s problems gives one the illusion of being able to solve them. If God or fate has caused your illness, you may have no remedy; if a witch caused it, then you may recover once the witch has been found and punished. Some scholars have hypothesized that witchcraft accusations function as a form of psychological projection: according to this unconscious mechanism, reviled characteristics are projected onto another individual or social group. “I hate you” becomes “You hate me,” leading to suspicions and accusations of witchcraft against the target. During the period of the witch craze, projection had the important function of promoting the cohesion of Christian communities by the postulation of a powerful external foe. Witches thus served a purpose similar to that of external enemies in modern warfare, for they united the people against a common threat.

Historians have noted correlations between witch accusations and social position. Persons between the ages of forty and sixty were most commonly accused; the accused had fewer children than normal; children were seldom accused of witchcraft but were often believed to be its victims; people accused of witchcraft had been previously accused of other crimes more frequently than normal, especially offensive language, lying, theft, and sex offenses. Chronic grumbling, abrasive personality, quarreling, and cursing also increased one’s chances of being accused. The social status of accused witches was usually low or lower middle, though sometimes magistrates, merchants, and other wealthy persons were involved. Anyone connected with medicine, especially midwives, was prone to suspicion, because illness and death could so easily be blamed upon witchcraft.

The most striking social correlation is between witchcraft and women. Although in certain areas and for brief periods of time more men were accused than women, over the entire history of the witch craze 75 percent of the accused were women. In the sixteenth century many more women were living alone than men. Given the patriarchal structure of European society at the time, a woman living alone without the support of father or husband had little influence and little legal or social redress for wrongs. Such women were often reduced to begging and depending on the charity of their neighbors. They also naturally tended to grumble or curse more than persons having effective influence in society. A physically weak, socially isolated, financially destitute, and legally powerless old woman who provoked resentment in her neighbors became an easy target for projection.

But the explanation lies only partly in specific social conditions. The misogyny underlying the association of women with witchcraft sprang from deep and ancient psychological roots. C. G. Jung, Mircea Eliade, Wolfgang Lederer, and others have commented on the powerful ambivalence of the feminine in religions, mythologies, and literatures dominated by males. The male view of the archetypal feminine is tripartite: she is the sweet, pure virgin; she is the kindly mother; she is the vicious, carnal hag. From the twelfth century, Christian society developed a compelling

symbol incarnating the first two types in the Blessed Virgin Mother of God. As the power of the symbol of the Virgin Mother grew, the shadow side, the hag symbol, had to find outlet for its corresponding power. In ancient polytheistic religions the dark side of the female archetype had been integrated with the light side in the images of morally ambivalent goddesses such as Artemis. Split off from the positive side of the archetype, the Christian image of the hag became totally evil. In the period of the witch craze, this one-sided image was projected upon human beings, and the witch, no longer simply a sorceress, became the incarnation of the hag. Other androcentric assumptions in male-dominated religions encouraged the connection. The biblical narrative of creation blamed Eve for having succumbed to the temptation of the serpent, resulting in the expulsion of humans from the Garden of Eden. God, the chief power of good, was imagined in masculine terms, and so the devil, the chief power of evil, was supposed to be masculine also. Since it was believed that the devil's followers submitted to him sexually, it was naturally supposed that they should be women, some of whom described their intercourse with the devil in lurid detail.

The outbreak of witch trials in Salem, Massachusetts, during 1692 has been the subject of careful social analysis. Although the first hanging of a witch in New England occurred in 1647, it was at Salem in 1692, when the craze was already fading in Europe, that the colonies produced their most spectacular series of witch trials, in which nineteen persons were executed. After a group of young girls suffered an unusual combination of symptoms and visions, their elders suggested that they might be the victims of witchcraft, and the witch-hunt began. At the time, Salem village was in the throes of a long dispute concerning the church. An unpopular minister, John Burroughs, was succeeded by a controversial one, Samuel Parris, in 1689, just at the time when England was undergoing a revolution and the lines of authority were blurred. The villagers split into factions supporting and opposing Parris, and, since no structured means of expressing dissent existed, its release took the form of vituperation and slander. Continuing incursions of hostile Indians further exacerbated the situation, leading some settlers to conclude that a diabolical conspiracy was to blame.

The outbreak was the violent expression of deeply felt moral divisions; the moral divisions were generated by the quarrel over the governance of the church, and the quarrel over governance was exacerbated by the Indian wars and deep-seated conflicts between prominent families. Salem was a small, premodern village in which everyone knew everyone else, a situation that encouraged people to correlate unfortunate events with unpopular individuals and to blame them for their misfortunes. Intensely religious to a degree seldom paralleled in Europe at the time, the New England Puritans could not view the strife in their village in purely personal or political terms. They interpreted it in religious terms, as a manifestation of the cosmic struggle between Christ and Satan, good and evil. The tradition of belief in the existence

of witchcraft was a vehicle perfectly adapted to the expression of such assumptions. Many towns and villages had political controversies without becoming centers of the witch craze; clearly such controversies do not automatically produce witch accusations and cannot be considered their cause. Most sophisticated scholars give full weight to the history of religious concepts and avoid simplistic correlations between external phenomena and witch beliefs. Disasters and controversies can produce witch accusations only in the presence of certain value systems. But such social tensions, once those value systems are there, can provoke the outbreak of a witch persecution.

MODERN WITCHCRAFT. The eighteenth and nineteenth centuries in Europe, with their secularism, scientism, and progressivism, were not conducive to witch beliefs of any kind. Yet Romanticism, an intellectual movement that arose in Europe at the end of the eighteenth and the beginning of the nineteenth century, laid the groundwork for a new permutation, which became the third main variety of witchcraft: Neopaganism.

Romanticism located authenticity in the folklore of European peasants, which was presumed to contain elements of ancient pagan religions. This led to a renewed interest in both folklore and paganism, reflected in the art and literature of the time, and to a revisionist interpretation of the witch. Franz-Josef Mone, Jules Michelet, and other writers of the mid-nineteenth century suggested that European witchcraft was really a widespread fertility cult surviving from pre-Christian paganism. Such arguments influenced anthropologists and folklorists at the turn of the century, such as James Frazer, Jessie Weston, and Margaret Murray. In 1899, amateur folklorist Charles Leland published *Aradia: The Gospel of the Witches*, a text claiming to present evidence that witchcraft was the survival of a pagan cult of Diana. *Aradia* influenced Murray and other twentieth-century anthropologists. Meanwhile, interest in the occult gained fashion among intellectuals and poets such as Algernon Blackwood and Charles Baudelaire. By the early part of the twentieth century, occultism enjoyed a certain popularity, especially among bohemians; magicians such as Aleister Crowley, who styled himself "the Great Beast," attracted a following. Their doctrines were a mixture of ritual magic, sorcery, dubious historical and philosophical arguments, and a longing for enchantment in an increasingly mechanized world.

Out of the crucible of early twentieth-century British occultism emerged modern Neopagan revival Witchcraft, or Wicca. Around the time that the poet Robert Graves was writing his imaginative *White Goddess* (1948) about an alleged worldwide cult of the moon goddess, the Englishman Gerald Gardner was recording the first documents that led to the formation of this new religious movement. According to his followers, Gardner, who was born in 1884, was initiated into the ancient religion in 1939 by a witch of the New Forest named Dorothy Clutterbuck. In fact, Gardner probably cobbled together elements of revival Witchcraft from his

experiences with various occult and theatrical groups, including the Co-Masons, the Rosicrucian Theatre, and the Crotona Fellowship. Gardner's claim to be the mediator of an ancient religion was spurious, but he launched a growing religious movement that has gained many adherents throughout the world. Whatever its origins, it has become a legitimate religious movement in its own right.

The overall world numbers of revival Witches are difficult to calculate, but scholars estimate that in North America alone there are about 500,000. There are numerous denominations of Neopagan Witchcraft, including Gardnerian Craft, which traces its lineage to Gardner's 1950s coven; Reclaiming Witchcraft, an American variant with an eco-feminist perspective; and Dianic Witchcraft, an all-female tradition. The tenets of Witchcraft as it has evolved include a reverence for nature expressed in the worship of a goddess and (sometimes) a god; the practice of group magic aimed at healing or other positive ends; colorful rituals whose goal is to produce ecstatic experience; and an acceptance of the sensual, bodily aspects of human existence. It rejects diabolism and even belief in the devil on the grounds that the existence of the devil is a Christian, not a pagan, doctrine. It offers a sense of the feminine principle in the divine, a principle almost entirely forgotten in the masculine symbolism of the great monotheistic religions. And its eclectic paganism promotes a sense of the variety and diversity of the sacred.

Modern Neopaganism has no connections with diabolism. Diabolism, in fact, has almost ceased to exist in the late twentieth century. Though a few groups claiming to practice Satanism, such as the American Church of Satan and the Temple of Set, do exist, their practices are more like ironic rejection of bourgeois conventions than true devil worship. Sorcery, on the other hand, continues to flourish worldwide. *Curanderos* in Mexico and the American Southwest still practice healing with herbs and charms. Fear of sorcerers persists as widely as sorcery itself. In many parts of Africa, sorcery and counter-sorcery continue to be a part of everyday life, especially away from urban centers.

During the 1980s and 1990s, fears of Satanic activities briefly reemerged in North America. In these so-called Satanic panics, rumors spread about far-reaching diabolical conspiracies whose activities allegedly included the sexual abuse and murder of children, the practice of cannibalism, and the induction of new victims into the cult through role-playing games and rock music. The panics were most intense in small towns whose industrial base had been eroded by economic transformation, resulting in financial collapse. They were exacerbated by social changes, such as the rising divorce rate, the increasing number of women in the work force and of children in day care, and new definitions of gender roles, which led to social tensions. Some fundamentalist Protestant ministers fomented the panics by acting as conduits for the rumors. The panics culminated in a series of lengthy trials against the operators of several preschools and day-care centers, who were charged with sexually abusing children in the

context of Satanic rituals. Though the charges were later proved to be completely false, a number of people were sentenced to prison. As in most cases of witchcraft accusations, Satanic panics projected fears and anxieties that arose out of social transformation onto completely innocent people. No evidence of diabolical conspiracies or Satanic ritual abuse rings has ever been found.

CONCLUSIONS. One of the most surprising aspects of the study of witchcraft is that African, Asian, European, and Native American cultures all postulate similar behaviors on the part of witches. Witches are often elderly and socially isolated; they meet at night in small groups to plot evil deeds; they are able to leave their bodies or change their shapes; they can suck the blood, drain the energy, or devour the internal organs of their victims; and they murder family members, commit cannibalism, fly through the air, hold indiscriminate orgies, and seduce sleeping people. These similarities go beyond the possibility of coincidence. While some anthropologists believe they are the result of diffusion from a single early Paleolithic human culture, others argue that they are the product of projection, a psychological defense mechanism that helps human beings maintain an image of themselves as good by projecting negative, undesirable impulses away from the self and onto another. All societies designate certain behavior as bad, undesirable, or negative; however, the impulses behind the behavior are part of human nature, and cannot be completely banished from human consciousness. In projection, the forbidden thoughts or impulses are attributed to an "other," whether a group or an individual. Projection may work on both an individual level and a societal one. For example, a person may have long-standing disagreements with a neighbor. One day, the neighbor curses at some chickens that have wandered into the yard; the next day, some of the chickens sicken and die. The individual may assume the neighbor caused the loss. On a societal level, a village may blame a bad harvest or a plague on the presence of witches in the community. In both cases, the witch is imagined as an antisocial force embodying the essence of evil. When the witch is construed as the opposite of right society, projection is at work.

All cultures grapple with the problem of evil. We observe people performing monstrous acts of destruction and cruelty against their own self-interest as well as that of the community. We watch illness and natural disaster strike randomly without any sense of justice or fairness; around us, good people suffer and die while the wicked prosper. Many feel that evil exists in the world to a degree far beyond what one might expect in nature. This pervasive power, whose purpose seems to be to corrupt and destroy the cosmos, can be perceived as coming from an external being. The witch as an embodiment of this evil is a powerful metaphor whose power may be diminished from time to time, but is unlikely to disappear.

WITCHCRAFT: AFRICAN WITCHCRAFT

As a set of beliefs that varies region by region and has a good many consequences in everyday life, African witchcraft is in many respects similar to corresponding sets of beliefs found among peoples of other continents. African systems, however, are of great interest because they have some unique features and because they have provided material for the formulation of definitions and the development of theories of worldwide application.

GENERAL CHARACTERISTICS. Most African societies—though not all—hold the cardinal belief that certain members of the community are in the habit of using supernatural means for illicitly destroying the interests, or even the lives, of their fellows. This basic tenet has led Africans to attribute to persons designated by terms we might translate as “witches” or “sorcerers” characteristics that resemble those of their counterparts elsewhere. Beliefs about witches are, of course, not directly observable, but they may have overt consequences in everyday life.

Subjective aspects. Thus African witches (in the generic sense, including sorcerers) are believed to harm others either because they possess powers (of which they may not be aware and which their fellows find incomprehensible) that emanate from their aberrant personalities or because they perform antisocial magic, technically referred to as “sorcery” (see below). Furthermore, they resemble witches in other continents in that they are believed to employ certain species of animals and, in some instances, spirits or humanoid creatures as their servants, messengers, or familiars. Familiars are sometimes reputed to drive their owners to their evil practices.

Like their counterparts elsewhere, African witches are believed to belong to associations that meet periodically (usually around a fire) to discuss the promotion of their interests, the regulation of relations among them, and to celebrate recent antisocial accomplishments by, for example, having a ghoulish feast of the revived body of someone they have killed supernaturally. These associations form distorted reflections of the societies in which they are believed to exist. On the one hand, they may mirror the authority structure

of the polity of which they are a part, as when, among the Chewa, their meetings are presided over by a village headman who is himself a witch. On the other hand, among some peoples the organization of witch societies may contrast with that of everyday society; among relatively egalitarian peoples witch societies are more hierarchical and vice versa. In any case, witch societies invariably invert normal ethical standards by delighting in the practice of promiscuous sexual activity (including incest), by going naked, by frequenting forbidden places such as graveyards, and by murdering and eating their fellow human beings, often their close relatives (African witches are believed to attack their neighbors and kinsmen rather than distant and unrelated persons).

As in other parts of the world, African witches are often reported to be preponderantly women (although there are notable exceptions, such as among the Azande, Bemba, and Tonga). However, it is important to note that the actual summation of cited cases of witchcraft may yield a gender ratio that is at variance with the traditional one expressed in general statements made by informants. Thus, although Chewa tradition holds that most witches are women, it is men, the more socially and politically active sex, who form a clear majority of those cited in instances of witchcraft.

Finally, in Africa as elsewhere, the belief in witchcraft—together with other components of the religious system—provides an explanatory framework, a means by which the misfortunes that befall people may be understood and, in terms of their beliefs, avoided in the future. African societies vary in the degree that witchcraft (as opposed to the other elements of religious belief) plays in the explanation of everyday events and, more importantly, crises. Thus, among the Lugbara, misfortunes appear to be attributed more often to the intervention of ghosts rather than witches, whereas among the Chewa the reverse is true. But in all societies where witchcraft is a component of the belief system—and this applies to the majority of African societies—witchcraft beliefs are of paramount importance insofar as they explain the persistence of evil and the inability of humans to eradicate it. As J. D. Krige (1947) puts it:

Witches and sorcerers are considered [by the Lovedu] to be the embodiment of malignant forces ever on the alert to enter into unholy matrimony with the criminal impulses of the human heart. Witchcraft particularly [as opposed to sorcery—see below] is the essence of evil, vicious and inscrutable, that whirls through the universe and seeks asylum in sinful souls in which the germs of wickedness lie ready to be quickened into life.

Overt consequences of belief. Some of the consequences of witch belief are visible to the ethnographer. This is because, given that people believe in and are concerned about witches, they take steps to protect themselves from them and (as individuals or assisted by professionals such as diviners, or perhaps backed by the political authorities) to detect, prosecute, and sometimes destroy by vengeance-magic those they assume to be bringing them harm. Many

of the processes involved in self-protection, divination, and revenge are spiritual, usually involving magical substances (often translated as “medicines”) of botanical origin, though activated by ingredients of animal or human origin which are of symbolic significance, such as a piece of human caul (protective in function) added to the powdered root of a particular species of tree to make a protective amulet.

Protective steps include not only wearing amulets but also taking “medicines” orally, washing the body in infusions of them, or rubbing them into incisions made in the skin. Huts and field crops can also be treated to make them invisible to, or impenetrable by, witches. Divination includes the use of oracles such as those of the Azande of the southern Sudan (adjective and singular noun, Zande), the best known of which consists of feeding benge, a poisonous substance, to chickens, mentioning the name of a suspect each time, and determining the guilt of a particular suspect by noting whether the chicken poisoned in accompaniment to his name dies.

Elsewhere in central Africa an ordeal is held in which a poison (*mwafi*, *mwabvi*, etc.) is administered to the human suspects themselves (and sometimes to the accuser as well to check that he is acting in good faith), and a person is deemed guilty if he retains the poison (an action that will cause him eventually to purge, faint, or actually die) and innocent if he vomits it. In southern Africa witches may be “smelled out” in a public ceremony by a diviner, who is guided by his audience’s verbal responses to his tentative naming of the suspects. All over Africa diviners use a variety of techniques—dreaming, manipulating various kinds of apparatus, throwing dice (“bones”), opening the Bible or the Qur’an at random—to help clients identify their attackers.

From several parts of Africa it has been reported that persons found to be guilty of witchcraft were traditionally burned. This penalty is also suffered by convicted witches in some other parts of the world.

DISTINCTIVE FEATURES. A comparison by E. E. Evans-Pritchard (1929) of Zande and Trobriand magic (and thus of the variant of witchcraft sometimes separately designated as sorcery—destructive magic illegitimately applied) suggests that whereas Melanesians regard the verbal element, or spell, in an act of magic (in general and sorcery in particular) as all-important and insist on its being word perfect, Africans place greater emphasis on the material element, or “medicines.” Hence in Africa the verbal element is less important, more properly being regarded as a relatively informal address made to the “medicines” to activate them and make them attack the proper victim.

Another feature setting off African witch beliefs from those found elsewhere is the range of animal species that witches are assumed to use as familiars. Whereas in Europe, cats, dogs, and weasels are commonly believed to be witches’ familiars (dogs and foxes in Japan), in Africa hyenas, owls, and baboons are commonly listed. While not unparalleled

elsewhere, witches in some African societies are believed to be served by familiars of human origin or appearance, such as a “zombie” (*khidudwane*) among the Lovedu of the northern Transvaal or a “hairy dwarf” (*tokoloshe, tikeloshe*) among the Zulu and Xhosa-speaking peoples of Natal and the eastern Cape Province of South Africa. Within Africa, regional variations apply to the main list of familiars, with hyenas cited more often in central Africa and baboons in southern Africa.

There are similar regional differences in other aspects of witch beliefs and their everyday concomitants. For instance, while in most parts of the continent people accused of witchcraft are likely to refute the accusation and with it the long list of crimes (e.g., murder, incest, necrophagy) that it implies, there is a tendency, reported mainly from West Africa, for people to confess their witchcraft, sometimes voluntarily.

DEBATE OVER A BASIC DISTINCTION. An outstanding instance of how African ethnography has stimulated worldwide debates over terminology is provided by Evans-Pritchard’s seminal book on the Azande (1937). In witchcraft theory, the Azande make a distinction between two entities, *mangu* and *ngwa*. *Mangu*, a hereditary substance which can be discovered by autopsy in the stomach of a witch, exerts a baleful mystical influence over the lives of others in the community when it is activated by hatred. On the other hand, *ngwa* (“magic”) is not identified with a particular substance; less of an object, it is subdivided into “good” magic (*wene ngwa*) and “bad” or “criminal” magic (*gbighita ngwa*). Evans-Pritchard translates *mangu* as “witchcraft” and *gbighita ngwa* as “sorcery.” He sums up:

To Azande themselves the difference between a sorcerer and a witch is that the former uses the techniques of magic and derives his power from medicines, while the latter acts without rites and spells and uses hereditary psycho-physical powers to attain his ends. Both alike are enemies of men, and Azande class them together. (Evans-Pritchard, 1937, p. 387)

Although Evans-Pritchard emphasized that he expressed no opinion on the applicability of this distinction to peoples other than the Azande, several anthropologists working in Africa have found parallels to it, and this would, at first sight, justify its more general use. Thus the distinction between “night witch” and “day witch” made by the Sotho-speaking peoples of the plateau of South Africa, as well as the Lovedu, parallels that made by the Azande between witch and sorcerer. Similarly, among the Chewa of east-central Africa the distinction between *nfiti yeniyeni* (“real witch”) and *mphelanjilu* (“killer for malice”) is similar, though not as clear since both are commonly referred to as *nfiti*. However, among the Nguni-speaking peoples of South Africa (including the Zulu, Pondo, Bhaca, Xhosa, etc.) the distinction is tenuous, applying simply to the mode of attack, that is, “with animals (familiars)” or “with medicines.”

Some anthropologists question the value of employing the witch-sorcerer distinction more widely than in the con-

text to which Evans-Pritchard limited it. This position is taken by both Victor Turner (1964) and Mary Douglas (1967) in their respective review articles on the books by John Middleton and E. H. Winter (1963) and Maxwell Gay Marwick (1965). Turner’s conclusion is that “almost every society recognizes such a wide variety of mystically harmful techniques that it may be positively misleading to impose upon them a dichotomous classification” (Turner, 1964, p. 323); Douglas suggests that it would be better to use traditional English terms freely and to classify beliefs according to whatever criterion is significant (Douglas, 1967, p. 73).

A related debate has stemmed from the reports by Godfrey Wilson (1936) and Monica Wilson (1951a, 1951b) that the Nyakyusa of southern Tanzania believe that “the defenders” of the village, by exercising a supernatural power known as “the breath of men,” protect their fellows and punish those who transgress; it is claimed that this power “comes from the same source as the power of the witches” (Wilson, 1951a, p. 97). In its antisocial form, that is, if it is illicitly used (and victim-transgressors are often likely to assert this), this power is indistinguishable from the witchcraft of other societies. Thus the Nyakyusa, who like peoples all over the world divide magic into good and bad forms, also dichotomize mystical influence in the same way, with “the breath of men” as its approved form and witchcraft as its disapproved form. Wilson reminds us that Henri A. Junod, in his classic study of the Tsonga of southeast Africa, first published in 1912–1913, came to the tentative conclusion that these people believe that the power of the magician, who protects the interests of society, and that of the witch, who destroys them, is derived from the same source (Junod, 1927, pp. 504–505, 516).

Alan Harwood (1970) has found a belief parallel to that of the Nyakyusa among the neighboring Safwa. Like the Azande, the Safwa distinguish between the power derived from medicine (*onzizi*) and a power that they refer to as *itonga* and that they believe to be inherited and hidden in its operation. But unlike the Azande (according to Evans-Pritchard’s account) and like the Nyakyusa, the Safwa subdivide not only medicine but also “hidden power” into approved and disapproved forms. As to hidden power, “good *itonga*,” according to Harwood, is believed to be used in divination to protect members of the community from external attack and to punish some of them for uncooperative behavior; “bad *itonga*” is used to introduce foreign substances into another person’s body or into his gardens to diminish their effectiveness and is said to enable its possessors to “consume” members of their own lineage (Harwood, 1970, pp. 59–60). *Itonga* is thus conceived of as a neutral spiritual power and, since it is innate and can harm people, its bad (antisocial) form can reasonably be equated with the witchcraft of other societies. Harwood believes that, “appearances to the contrary, the Safwa are not alone with their neighbours the Nyakyusa in believing that the mystical power of ‘witches’ is morally neutral, and that perhaps the ethnocentric precon-

ceptions of ethnographers are responsible for the dim light in which African 'witches' have traditionally been painted" (Harwood, 1970, p. 69). In particular, after carefully reexamining Evans-Pritchard's account of Zande witchcraft, Harwood concludes that Evans-Pritchard's finding that the Zande word *mangu* denotes an exclusively antisocial power—and should therefore be translated as "witchcraft"—is mistaken and comes from his having taken the perspective of the witch doctor (diviner) rather than that of the ordinary villager.

THEORETICAL APPROACHES TO AFRICAN WITCHCRAFT.

With its rich variety of social structures and belief systems, Africa has provided useful material for the development of theories that account for the continued existence of witch beliefs and contribute to our understanding of the dynamics of society in general.

Evans-Pritchard's approach (1937) explains Zande witch beliefs mainly by showing their concordance with the basic assumptions and modes of reasoning, or philosophy of life, prevailing in the society and, somewhat incidentally, by relating them to social conditions, including stratification. The theoretical approaches to witchcraft taken by J. D. Krigé (1947) in reference to the Lovedu, Monica Wilson (1951) in her comparison of the Mpondo of South Africa with the Nyakyusa, and Siegfried Frederick Nadel (1952) in his comparison of four West African peoples are of a more psychological orientation, showing varying degrees of similarity to Clyde Kluckhohn's analysis of Navajo witchcraft (1944). These writers explain witch beliefs as giving expression to the stresses, strains, and predilections that arise in the particular circumstances of the society concerned. The basic defect in these psychological approaches is that, based as they are on speculative propositions, for example, those of depth psychology, they do not generate hypotheses that are testable. More recently this approach has developed into, or been displaced by, a Lévi-Straussian structuralist model in which a society's cognitive system is taken to be a logical system in its own right rather than just a secondary reflection of social relations. This approach is found in Edwin Ardener's analysis of the witch beliefs of the Bakweri of west Cameroon (1970) and in subsequent studies by W. David Hammond-Tooke on the Cape Nguni of South Africa (1974) and by Michael D. Jackson on the Kuranko of northeast Sierra Leone (1975).

A more sociological orientation is found in the approaches of James Clyde Mitchell (1956), Middleton (1960), and Marwick (1952, 1965). By comparing the incidence of accusations and believed attacks of witchcraft in different categories of relationship, these writers relate witch beliefs to periodic social processes, such as the division of lineages into segments as their size increases in successive generations. Associated with this approach is a reemphasis of the principle, implicit in the writings of most students of witchcraft, that a society's conception of the characteristics of the witch reinforces its norms by providing a negative example.

All three types of approach try to make sense of what in modern society are regarded as bizarre and fallacious beliefs, and because they provide functionalist justifications of the continuance of witch beliefs, they have been criticized. For instance, James R. Crawford (1967) has argued that placing too much emphasis on the idea that an allegation of witchcraft is merely a symptom of social malaise leads to a failure to recognize that the allegation usually embitters social relations and increases social tension by adding a new dynamic dimension to them, for example, making a previously private quarrel public. Similarly Douglas (1963) has pointed out that, though an accusation of witchcraft may facilitate developmental processes, such as lineage segmentation, "it is also an aggravator of all hostilities and fears, an obstacle to peaceful co-operation . . ." and "orderly social relations."

Turner warns against the use of any single explanation of the complex circumstances leading to an accusation of witchcraft, arguing that "each instance or set of accusations has to be examined within a total context of social action, which includes the operation of biotic, ecological, and intergroup processes, as well as intra-group developments" (Turner, 1964, pp. 315–316).

In the light of the criticisms that have been made of prevailing theories, we would do well to adopt a more comprehensive model for the analysis of African witchcraft. Ecological circumstances, including the prevalence of disease vectors and the level of medical understanding and associated hygiene, contribute to morbidity and mortality rates and thus provide the raw material of misfortunes requiring explanation; social structure and associated tradition lay down the general direction that the explanations (including accusations of witchcraft) will take. But far from resolving the tensions that cause them, accusations may often exacerbate them.

WITCHCRAFT UNDER MODERN CONDITIONS. The colonial authorities in Africa banned many divinatory practices such as the poison ordeal and smelling-out ceremonies, and they usually declared the imputation of witchcraft legally punishable. This led Africans to adopt alternative, and usually secret, ways of identifying those whom they believed to be witches. Antiwitchcraft cults developed and often recurred in many African societies, and some writers attribute their rise to the suppression of the traditional means of detection. Some of the African churches independent of the missions include witch finding among their activities.

The impression of most ethnographers has been that Africans' preoccupation with witch beliefs has increased in modern times and that this is to be explained by the conflict between the values of the economically egalitarian indigenous societies and the more individualistic ones of the intruders. Certainly people who have advanced educationally and financially are often concerned about protecting themselves from the witchcraft of those retaining a more traditional way of life.

This majority view was contested by Godfrey and Monica Wilson (1945, p. 120), who believed that the relative importance of witchcraft was declining and that of science increasing. Some statistical evidence has come forward recently (Mitchell and Mitchell, 1980; Hammond-Tooke, 1970), and this supports the Wilsons' view in that it demonstrates that modern social changes tend to be accompanied by a progressive, if slow, secularization of the beliefs that traditionally explained misfortunes.

MAXWELL GAY MARWICK (1987)
Revised Bibliography

WITTGENSTEIN, LUDWIG (1889–1951), one of the most influential philosophers of the twentieth century. Born of a wealthy family in Vienna, Wittgenstein did most of his philosophical work at Cambridge, England. He became a British subject in 1938 and succeeded G. E. Moore as professor of philosophy at Cambridge in 1939. His two principal works were largely responsible for the "linguistic revolutions" in twentieth-century Anglo-American philosophy. The *Tractatus Logico-Philosophicus* (German edition 1921, English translation 1922, second English translation 1961), completed in the Austrian army during World War I, was the only one of Wittgenstein's books published during

his lifetime. It inaugurated a logical-structuralist approach to philosophical analysis. The *Philosophical Investigations* (Oxford, 1953) initiated what came to be called ordinary language philosophy. Some dozen other books of lectures, notes, letters, and various manuscripts and manuscript fragments have been published posthumously; the most important is probably *On Certainty* (Oxford, 1969). This material, on which Wittgenstein was working at the time of his death, seems to point the way toward still a third period of his philosophy.

Wittgenstein concerned himself primarily with the nature of language, a concern that for him entailed the understanding and clarification of meaning. Thus he believed language to be the proper subject of philosophy, for it is according to the terms of language that the world and human life become comprehensible. The function of philosophy is to see language clearly and thereby dissolve (particularly at certain critical nodes) metaphysical problems and anxieties created by deep misunderstandings about the grammatical possibilities of language. Wittgenstein excelled in the subtle examination of how ordinary words with ordinary uses come to seem fraught with metaphysical complexities.

The spirit in which these profound philosophical (and not merely linguistic) studies were carried out was the very reverse of a positivistic or scientific one, though some of Wittgenstein's early interpreters, such as Bertrand Russell, misunderstood him on this point. In his notebooks, excerpts from which have been published under the title *Culture and Value* (1977; Eng. ed., 1980), he declared himself out of sympathy with the scientific and progressivistic spirit of the age. Even in his early letters to Paul Engelmann and Ludwig Flicker, he made it clear that the purpose of the *Tractatus* was an ethical and not a scientific or positivistic one.

Wittgenstein once told a friend that he could not help seeing everything from a religious point of view. He belonged to no religious group or institution, though his mother was Catholic and he had been baptized a Catholic. (Three of his grandparents are said to have been of Jewish extraction.) During World War I he came under the influence of Tolstoy's writings on the Gospels and adopted a Tolstoyan mode of life, giving away his considerable inheritance and living ascetically as a village schoolteacher in southern Austria. To his friends he expressed admiration for Kierkegaard and Augustine and for some of the writings of George Fox and the prayers of Samuel Johnson. Engelmann reported that Wittgenstein believed in the Last Judgment but could make little out of the biblical doctrine of creation.

Wittgenstein wrote very little specifically on religion; the most important documents in this regard are *Lectures on Religious Belief* (Oxford, 1966) and *Remarks on Frazer's "Golden Bough"* (London, 1979). Yet his philosophy is permeated with a religious spirit. It was one of his strongest convictions that religion should be shown and demonstrated in everything rather than talked about as a separate matter. He advised his students that philosophical problems must arise out

of a genuine need rather than as an expression of wit and cleverness. The important question about a philosopher, he said, is how much his ideas cost him. Wittgenstein believed that a philosophy is no better than the life out of which it arises and that in order to see things clearly it is necessary, above all, to destroy vanity. Unexamined biases and commitments are a mortgage against clarity.

Wittgenstein's reserve on the subject of religion arose not only from his feeling that it is more important to talk to God than to talk about God, but also from his awareness that in the present age religious expressions are almost certain to be misunderstood. Thus he considered dedicating one of his books, later published after his death as *Philosophical Remarks*, "To the glory of God," but decided against it.

What is evident from the study of Wittgenstein's life and work is that he was a clear-cut "supernaturalist," in the sense that he sharply separated God from the world. He told a student, Friedrich Waismann, that it is more profound to believe that something is good because God commands it than to believe that God commands it because it is good.

Religion for Wittgenstein was a matter of belief, and such beliefs outranked any explanations, reasons, or logic. Wittgenstein had no patience with either sociological or psychological "explanations" of religion, and even less with scientific attempts to bolster religion or to create religious emotions as responses to scientific wonders. Religion had to do with a different and more important dimension than that of fact: the dimension of how we are to live.

His most important contribution to the philosophy of religion was in his analysis of belief in *Lectures on Religious Belief*, included in *Lectures and Conversations*, compiled by Yorick Smythies, Rush Rhees, and James Taylor (Oxford, 1966). Here Wittgenstein examines the role played by religious beliefs in the guidance of life and attempts to disentangle them from all factual matters, including claims about existence. He makes the important point that denying a religious belief or disagreeing with it is not contradicting anything, since the essence of religious belief has nothing to do with whether something is or is not the case, or was or will be the case. Rather, it has to do with how we live and die. When people are willing to suffer and die for their religious beliefs, it is not for some factual proposition that they are willing to suffer and die, though it may appear so. Thus a belief in the Last Judgment should not be taken as an assertion that a certain event is or is not going to take place, but as something like an icon guiding our thoughts and actions, particularly in times of crisis. The attempt to make religious beliefs appear reasonable Wittgenstein regarded as often "ludicrous."

HENRY LE ROY FINCH (1987)

WOLFF, CHRISTIAN (1679–1754), rationalist philosopher of the German Enlightenment. Born in Breslau, Wolff was educated there and at the University of Jena. Though he had studied theology and philosophy, Wolff's main interest while at the university was in mathematics. Wolff earned his master's degree from the University of Leipzig in 1703; in 1707, with the help of a recommendation from Gottfried Wilhelm Leibniz, he was appointed professor of mathematics and natural sciences at the relatively new University of Halle, where he taught until 1723. In that year he moved to the University of Marburg, subsequently returning in 1740 to Halle, where he remained until his death.

Wolff's education familiarized him with Lutheran, Calvinist, and Roman Catholic viewpoints in theology, with Aristotelian and Cartesian school traditions in philosophy, and with emerging empirical methods in Newtonian science. The most important single influence on Wolff's thought was Leibniz, but it is too simple to say that Wolff merely systematized the views of his great predecessor.

Wolff began lecturing on philosophy in 1709. In 1713 he published his first major work in the field, a German logic. Later German works dealt with metaphysics (1720), ethics (1720), politics (1721), physics (1723), teleology (1724), and physiology (1725).

In 1728 Wolff turned his attention beyond the borders of Germany to the larger intellectual world. This new international audience was addressed in Latin in a series of works that are larger, more extensive in scope, and some would say more "objective" or "scholastic" in character than their German predecessors. They include treatises on logic (1728), ontology (1729), cosmology (1731), empirical and rational psychology (1732 and 1734), natural theology (2 vols., 1736–1737), universal practical philosophy (2 vols., 1738–1739), natural law (8 vols., 1740–1748), *jus gentium* (1749), and ethics (5 vols., 1750–1753).

Two aspects of Wolff's life and thought are perhaps most significant for the history and development of religious thought. The first of these is his clash with Pietist theologians at Halle. Wolff's commitment to rational method, the content of his metaphysics, his success with students, and an abrasive personal style soon generated criticism. Among the issues at stake were Wolff's acceptance of the Leibnizian doctrine of preestablished harmony and his emphasis on God's intellect as the controlling framework for divine freedom and power. Wolff was accused of idealism, fatalism, determinism, Spinozism, and atheism—all fairly standard charges at the time, though in this case not without some basis in fact. When their efforts to alter his views or to limit his influence within the academic world did not succeed, some of Wolff's

opponents made an external appeal to political authority. The result, in 1723, was an order from King Frederick William I—issued without a hearing—that removed Wolff from his professorship and banned him from Prussia within forty-eight hours on pain of death. This was perhaps a more serious escalation than even Wolff's enemies might have desired, with ominous implications for academic freedom. In fact, another post was immediately available at Marburg in Hesse-Cassel, and exile only heightened Wolff's popularity. Moreover, upon the accession of Frederick the Great to the Prussian throne in 1740, Wolff was recalled in triumph to Halle. In the meantime, he had switched from German to Latin in his writing and had published an eloquent essay on the freedom to philosophize in his "Preliminary Discourse on Philosophy in General" (1728).

The second issue worth noting is Wolff's commitment to natural theology. Wolff saw his philosophy as a support rather than a hindrance to religion. His account of God's existence and attributes was meant to lay the basis for a secure theology and ethics. This is in keeping with his goal to achieve through philosophy both a science and a wisdom. In retrospect, what Wolff has given posterity is the epitome of a rationalist tradition in philosophical theology. His demonstrations of the existence of God, for example, include both *a priori* and *a posteriori* proofs, forms of the ontological, cosmological, and teleological arguments. Their exposition presented Kant with a ready-made target for his well-known critique.

In both his teaching and early writings, Wolff made a major contribution toward establishing the German language as an accepted instrument for scientific work. The common opening phrase in the titles of his central German works ("Rational thoughts on . . .") and the equally common subtitle of his Latin volumes ("Treated according to the scientific method") mark Wolff's abiding concerns for method, order, and system. Wolff divided human knowledge into three parts: history (knowledge of the fact), philosophy (knowledge of the reason for the fact), and mathematics (knowledge of the quantity of things). He subdivided philosophy into metaphysics, physics, and practical philosophy; further divided metaphysics into ontology, cosmology, psychology, and natural theology; and popularized the distinction between empirical and rational modes of knowing. These divisions are implemented in both his German and Latin writings, which themselves enjoyed a huge success, often appearing in multiple editions right up to the time of his death. Wolff's views soon dominated the academic scene in Germany; his students filled key posts in institutions of higher education, and his prestige was immense. Kant called Wolff "the greatest of all the dogmatic philosophers." Despite contemporary adversities and relative obscurity today, Wolff was undoubtedly the most influential philosopher in Germany between the death of Leibniz in 1716 and the publication of Kant's *Critique of Pure Reason* in 1781.

BIBLIOGRAPHY

A new edition of Wolff's *Gesammelte Werke* is well under way (Hildesheim, 1962–) in three series: (1) German works, (2) Latin works, and (3) related materials and documents. The *Preliminary Discourse on Philosophy in General* is available in an English translation by Richard A. Blackwell (Indianapolis, 1963). The only comprehensive study of Wolff's thought is Mariano Campo's *Cristiano Wolff e il razionalismo precritico*, 2 vols. (Milan, 1939); reprinted in *Gesammelte Werke*, series 3, vol. 9. For historical context, see Lewis White Beck's *Early German Philosophy: Kant and His Predecessors* (Cambridge, Mass., 1969) and my article "Christian Wolff and Leibniz," *Journal of the History of Ideas* 36 (1975): 241–262. For his metaphysics, see *Le métaphysique de Christian Wolff* (1990); *Gesammelte Werke*, series 3, vol. 12.1 & 12.2) by Jean École, the editor of Wolff's Latin metaphysics volumes. École has also edited a collection of essays by experts on Wolff's philosophy, *Christian Wolff: Autour de la philosophie Wolffienne* (2001; *Gesammelte Werke*, series 3, vol. 65). For Wolff's philosophical theology, see James D. Collins's *God in Modern Philosophy* (1959; reprint, Westport, Conn., 1978), pp. 133–143; Anton Bissinger's *Die Struktur der Gotteserkenntnis: Studien zur Philosophie Christian Wolffs* (Bonn, 1970); my article "The Existence of God, Natural Theology, and Christian Wolff," *International Journal for Philosophy of Religion* 4 (1973): 105–118; and two articles by Jean École, "De la démonstration *a posteriori* de l'existence et des attributs de Dieu, ou la *Theologia naturalis, Pars I* de Christian Wolff," *Giornale di metafisica* 28 (1973): 363–388, 537–560, and "De la démonstration *a priori* de l'existence et des attributs de Dieu, et des erreurs sur Dieu, ou la *Theologia naturalis, Pars II* de Christian Wolff," *Giornale di metafisica* 32 (1977): 85–109, 237–272.

CHARLES A. CORR (1987 AND 2005)

WOLVES. Wolf symbolism embraces the dual aspects of good and evil human nature. Although the dark, menacing image of the fearless predator and ravaging killer preponderates, wolves also personify a protective spirit and the nurturing mother. In classical times the wolf, perceived in both aspects, symbolized transition. The "hour of the wolf," for example, is the time of emergence from darkness into light or, contrarily, of reversion to the world of darkness and ignorance. The biblical verse "The wolf also shall dwell with the lamb" (*Is.* 11:16) is a metaphor for the assimilation of the lower to the higher and participates in the symbolism of the center. The Roman *signa* represents the wolf mounted on a cube (earth) and on a sphere (heaven). As an alchemical symbol, the wolf, together with the dog, stands for the dyadic nature of Mercurius, the philosophical mercury, the *nous* ("intelligence").

Many of the ancient war gods bore the name Wolf. Apollo, more widely known as a sun god, was associated with the wolf, and the epithets "wolf-born" and "wolfish Apollo" occur in Greek and Roman literature. In the *Aeneid*, the god assumed the form of a wolf in order to destroy the sorcerers of Rhodes, and a bronze statue of a wolf still stands at his

shrine at Delphi. The Romans associated the wolf with the god Mars, and their legions marched into battle under the protection of the sacred wolf displayed on their banners. The Lupercalia, a festival of ancient Rome, has been interpreted as a wolf festival with wolf priests. Wolf deities were worshiped in Iran and Scythia, and in Japan the wolf was long regarded as a great god. The Teutonic war god *Woðan* (whose name derives from *wut*, “fury”) and his Scandinavian counterpart, *Óðinn* (Odin), were accompanied by wolves when waging war. The Finns called wolves “dogs of the death spirit.” American Indian tribes whose gods bore wolf names preceded their war sorties with wolf dances to ensure victory.

The most sinister wolf image is that of Fenrir, or Fenrisúlfr (Fenriswolf), in Norse mythology. The son of the trickster Loki, this monster embodied the destructive potential of chaos in the universe. Immured by the gods in the bowels of the earth, he broke out of his prison and devoured the sun and so brought about the twilight of the gods. In the thirteenth-century Icelandic Eddas, the cyclic cosmic battle between the gods and antigods is called “the war with the wolf.”

Exaltation of wolves rather than fear of them prevailed in archaic times, for, as hunters, humans identified themselves with the wolf, the exemplary predator. Animals were considered divine in those early societies and were the nucleus around which religious belief crystallized. The discovery of Neolithic figurines of men wearing wolf masks and wolf skins suggests ceremonies of a religious and initiatory character. When wolf totems were created and the name of the animal taken by the tribe, it was often in the belief that the tribe was descended from a wolf ancestor, an idea that reflects a religious concept of great antiquity. The Chinggisids attributed their origin to a wolf who had come down from heaven to mate with a doe. Analogous myths existed among various tribal peoples of Inner Asia. The wolf also figured in the mythology of the American Indian hunting societies, such as the Cheyenne, and for some tribes of the Plains and the Eastern Woodlands, it was a clan or gens animal. Awed by the skill of the wolf as predator, these tribes incorporated its image into their rituals and ceremonial dances with the aim of acquiring the animal’s stamina and courage. Conversely, the wolf was anathema for agricultural societies, although, according to Herodotus, the priests of Ceres had wolf guides.

In ancient Egypt, Greece, and Rome, the wolf, symbolizing the warrior-hero, was a guardian figure on monuments. An emblem of valor, it was a dominant image in the *Volsungasaga* and in the Teutonic military societies, the Berserkers and Männerbünde. Fostering the cult of the fanatical warrior, these martial brotherhoods held initiation ceremonies for the purpose of transforming the neophyte into a wolf. By donning the skin of the invulnerable animal, the initiate was thought to acquire its ferocity and power. Such traditions of initiatory transformation are documented in cultures as remote as those of Iceland and Africa.

The widespread and enduring association of wolves with ferocity and greed, darkness and death, prevailed among the

Hindus and Celts. For the Chinese, the animal signified avarice and voracity, for the Zoroastrians and Armenians, evil more malign than that of the serpent charms used to destroy it. The Abyssinians regarded wolves as demons in animal form. In Judaism, wolves connoted bloodthirstiness and the spirit of persecution, and the biblical epithet “stiff-necked” derived from the belief that the animal was unable to turn its head. In both testaments of the Bible, wolves are characterized as “ravening.” The image of the wolf as Satan or his henchman, a devourer of human souls, pervaded Christianity. The wolf represented the heretic, despoiler of the sheepfold of the faithful, of which Christ was the shepherd-protector. In “The Parson’s Tale” Chaucer speaks of “the devil’s wolves that strangle the sheep of Jesus Christ.” Dante, in the first canto of his *Inferno*, names the she-wolf “laden with all craving” as one of the three dangerous beasts in the dark wood of fear; and in the eighth circle of Hell, thieves, liars, and hypocrites are condemned for “the sins of the wolf.”

In many societies, the wolf was the symbol of outlaws, fugitives, and exiles, all of whom were believed to be under the protection of wolf gods. In the laws of the Hittites as well as those of Edward the Confessor, such men were required to wear a wolf-headed mask. Around 350 CE, the first bishop of the Goths applied the term *wolf* to any man who had committed a capital crime.

Early associated with sorcery and superstition, wolves were said to be the mounts of warlocks and witches. In Norse mythology, they consorted with the Norns, and Circe’s palace was surrounded by tame wolves that she had subdued by enchantment. “Tooth of wolf” is an ingredient of the witches’ brew in Shakespeare’s *Macbeth*, and various parts of the animal’s body were included in the armaments of magic of American Indian medicine men.

Perhaps the most colorful of the beliefs relating to wolves is that of lycanthropy, the ancient belief in the transformation of human into werewolf. This fearsome, night-roaming beast, avid for human blood, has been an almost universal specter. Legends of werewolves are known in almost every part of the world, and where no wolves have existed, the belief in were-animals has been associated with the fiercest native animal: the tiger in India, the jaguar in South America, the hyena in Africa, and the fox in Japan and China, where stories of the werefox have been preserved in the lore of popular Taoism. Werewolves played a role in the shamanism of Asia, and Inuit (Eskimo) and Chukchi shamans transformed themselves into wolves when in trance. Herodotus wrote of the Neuri turning into wolves annually, which suggests periodic religious ceremonies in which wolf masks and wolf skins were worn. Socrates refers to werewolves in Plato’s *Republic*; Pliny gives an account of werewolfry in his *Natural History*; and Vergil wrote that the creatures were produced by means of magic herbs. Such beliefs may have had their origin in the mythico-religious complex of wolf gods or in rituals of the return of the dead. But it

was in medieval Christian Europe that the werewolf most obsessed the human mind, and the Catholic Inquisition exploited the panic it aroused to further the suppression of heresy.

Wolves have been represented in Christian art as susceptible to spiritual persuasion and reform. The wolf of Gubbio, which had terrorized that Italian village, was converted by Francis of Assisi and is often depicted as his companion. Odo of Cluny, the tenth-century French saint, is said to have been rescued by a wolf when assailed by foxes, and the manuscript of the life of Edmund the Martyr (ninth century) contains an illustration of a wolf guarding the saint's severed head.

Wolves as nurturing figures occur in myth and legend, often mothering human infants who become founders of dynasties or nations. The best known of these, the Capitoline wolf that nursed Romulus and Remus, the legendary founders of Rome, is by no means the only surviving monument to this widespread legend. Coins antedating the founding of Rome bear the images of wolves with twin children. Apollo's children by human mothers were also said to have been suckled by wolves.

Siberian and American Indian shamans regarded wolves as guardians or helpful spirits and a source of great power. The doctoring societies of the Quileute and Makah Indians of the Northwest Coast performed wolf dances to heal the sick, and the image of a wolf head was believed to be a safeguard against evil. For many Indian tribes the wolf represented the corn god. The Keresan Pueblo tribe of the Southwest ordered the world according to the four cardinal points plus the zenith and nadir, and each of the six points was said to be dominated by a god, with the wolf in the west.

Wolves are often represented in fairy tales and fables as helpful animals; they manifest a sagacity and acumen superior to human knowledge.

ANN DUNNIGAN (1987)
Revised Bibliography

WOMAN SEE FEMININE SACRALITY

WOMEN'S STUDIES IN RELIGION. Women's studies in religion comprise the many and varied scholarly approaches to the study of religion that arise from commitment to the equal dignity of the sexes, that employ the category of gender as a necessary and key variable in the inquiry, and that focus explicitly on the dynamic and reciprocal interplay between religion and women's lives. Taken together these diverse approaches constitute a major body of research that has irreversibly altered the landscape of religious studies.

Women's studies emerged as a new field of inquiry across a number of academic disciplines in the late 1960s and early 1970s, when the entry of greater numbers of women into higher education coincided with the second wave of feminism. The largely Western phenomenon of the women's liberation movement politicized women (and men) as they became aware of the historical legacy and cultural pervasiveness of sex discrimination and gender stereotyping. Recognizing these damaging features within their own disciplines, female students and teachers began to explore these and the many other ways that gender matters shape their subjects and the manner in which they are taught and on this basis to develop critiques of and alternative approaches to the subject matter and the methods of its study. As a result women are the focus of study as never before, and in most fields of academic research gender is considered an indispensable analytical category.

The initial impetus for women's studies in religion was (and to some extent remains) the need to counter what Rosemary Radford Ruether described as "the buried continent of unconscious androcentrism" that has shaped religion and its study (Ruether, 1985, p. 706). Feminist conscientization rendered this latent male bias visible, and women's scholarship began to expose its full extent. It became clear, for example, that there was a dearth of research into women's religious experience and participation, leading to gaps in knowledge and understanding. In part this was due to the paucity of

available source material relating to women's religious lives, but it was also the result of scholarly neglect. Where such material had been the subject of scholarly attention, there was a tendency to impose false assumptions about innate sex differences and gender roles onto the interpretation of data, based on Western constructions of femininity and masculinity.

A disproportionate amount of research was devoted to men's religion and to the elite males who had shaped religions. Those aspects of religion that were singled out as characteristic, significant, and worthy of study were often male-dominated, with females less prominent and portrayed as occupying inferior or supporting roles. As Rita Gross, one of the founders of the field of women's studies in religion and a graduate student of Mircea Eliade during the late 1960s, stated, "One did not receive a coherent, connected account of women's religious lives and activities, but only glimpses, as they entered or left the stage of men's lives" (Gross, 2002a, p. 45). This (often inadvertent) male focus created a skewed picture of the religions of the world. Human religiosity was described (unwittingly) in terms of male religious experience. For instance, the state of knowledge about religious initiation was based largely on research into male initiation. To a significant degree, it was the religious experience of males and not humankind that was being recorded for posterity, thereby distorting the historical record. Furthermore religious texts and traditions, themselves largely the products of male authorship and systematization, are often framed in predominantly androcentric terms and are often carriers of patriarchal, sexist, and even misogynistic material. Women scholars of religion were faced with the dual problem that androcentrism was a feature of both the shapers of religion and the shapers of its study. One of the continuing tasks therefore of women's studies in religion is to seek out and correct androcentric bias in primary and scholarly sources.

The academic community of scholars of religion was made aware of its own partiality and blindness to gender injustice thanks to the pioneering research of scholars such as Carol P. Christ, Rita Gross, Judith Plaskow, Rosemary Radford Ruether, and Valerie Saiving, who pointed to the suspect nature of previous generalizations, theories, and models that were based on incomplete or erroneous pictures of religion. In light of this critique, women's studies began to reconfigure approaches to studying religion by introducing new data, methodologies, and alternative organizing principles to those that had traditionally constituted the theoretical framework of religious studies.

In 1972 the first Working Group on Women and Religion was held at the Annual Meeting of the American Academy of Religion (AAR)—the largest professional body for scholars of religion; the first signs of the anticipated integration of women's studies into the mainstream of the discipline. A year later, in 1973, the Women's Studies in Religion Program was founded at Harvard Divinity School, the foremost research center for the study of gender and religion in the early twenty-first century.

THE CONTEMPORARY PURVIEW OF WOMEN'S STUDIES IN RELIGION. From these beginnings, women's studies in religion have proliferated and diversified. The heterogeneity of the field extends far beyond the differences that exist as a result of religious diversity. Neither can women's studies scholars be characterized as a homogeneous group. While the majority of scholars in the field are women, there are growing numbers of men whose research concentrates on the study of women's religion, such as David Kinsley and Arvind Sharma. As with all subject disciplines, there are ideological divisions that give rise to internal debate and disagreement on theoretical, methodological, and programmatic issues. In order to discuss the contemporary diversified nature of women's studies in religion and examine the questions that enliven scholarly debate, it will be necessary to classify the field into four chief areas of study, though it is well to note that many women's studies scholars are engaged in research that spans these categories.

Recording and analyzing the diversity of women's religious lives. First and foremost, what unites all scholarly approaches to women's studies in religion is that such studies seek to contribute to human knowledge and understanding of the rich global diversity and complexity of women's religious lives cross-culturally and historically and, where necessary, to correct any absence from or distortion in the historical record. The extraordinary diversity of women's religious lives, in the present and in the past, is one of the chief findings of women's studies in religion (see Durre Ahmed, 2002; King, 1987; Plaskow and Christ, 1989). There is burgeoning scholarship on contemporary women's participation in the religions of the world (e.g., Holm, 1994; Sharma, 1987, 1994a, 1994b), in women's involvement in new religious movements (e.g., Palmer, 1994; Puttick, 1997), and in the recovery of women's religious history from all periods—including prehistory (e.g., Bynum, 1992; Kraemer, 1992; Newman, 1995). After centuries of neglect, women's religious lives—be they those of extraordinary mold breakers or those of the conventional majority—are being indelibly written into human history, allowing for the first time comparative study of materials and practices that have yielded, across cultures and historical periods, patterns of commonality in female religious experience and expression (e.g., Falk and Gross, 2001). Prompted by the feminist critique of androcentrism in religion, much of the initial focus in women's studies was on the negative influence of religion on women's lives. Subsequent primary research has disclosed more fully the positive motivations for women belonging to religions, including the role played by religions in conferring value to women's lives, in legitimating everyday female activities, in nurturing identity, in providing sanctuary from life's frustrations, and in empowering resistance to oppression in all its forms.

Although most religions are male-dominated in terms of power structures, female adherents are the majority participants in many religions, and a small number of religious

movements and sects—such as Afro-Brazilian healing cults, Japanese *Ryūkyū* religion, Christian Science, and Black Carib religion—can be described as women's religions to the extent that the leaders and most of the adherents are female (see Sered, 1994). Women's sacral power is honored cross-culturally through specialist roles as ascetics, diviners, healers, mystics, prophets, shamans, and witches. Frequently women are leading organizers and participants in purification, fertility, birth, and funerary rites and carry the burden of preserving oral traditions. Within many religions women prepare ritual food and observe low-profile and often private rites within the household (e.g., praying, fasting, chanting) as a means of protecting their families and their livelihoods from harm.

Although leadership positions are more associated with male religious roles, women share with men authority and leadership positions in many religions, whether as bishops, priests, and preachers in certain Christian denominations, as priestesses in traditional African religion and Haitian vodou, as Conservative, Reform, and Reconstructionist Jewish rabbis, as Buddhist teachers, and in the rare but not unheard of cases of Hindu gurūs and Daoist priests. Some religions offer females certain roles and communities that allow them to be independent from the conventional domestic arrangements of marriage and childbearing, as in women's religious orders in Buddhism and Christianity. Stories of powerful female heroes, teachers, and saints are preserved in many traditions. Women have been active as founders of new religious movements, including Mother Ann Lee, the eighteenth-century founder of the Shakers in North America, and Nakayama Miki, the nineteenth-century founder of Japanese Tenrikyō. In the late twentieth century women-dominated goddess-based feminist spiritualities became popular. Amid this colorful diversity it is clear that the reasons women become involved with and remain in religions are many and complex and are subject to the influence of various social, political, and economic factors that inform women's needs and desires (see Woodhead, 2001, 2002).

If women's studies, particularly ethnographic and sociological research, have uncovered the diverse nature of women's participation in religion, they have also demonstrated the shadow side of the role that gender ideology plays in patterning and stratifying religious participation. Religions can be sites of discrimination against women, who frequently find themselves subject to male domination, excluded from certain (prestigious) roles and sacred spaces, and recipients of fewer legal privileges and their putative nature, bodies, and sexuality devalued and subject to ritual proscriptions. Even in religions such as Bahā'ī, Islam, Jainism, Sikhism, and Zoroastrianism that introduced improvements in women's rights over the prevailing culture, male dominance persists. As a result women may be positioned in ambiguous and complicated relationships with their religions that require them to adopt creative strategies in negotiating fitting places for themselves within their traditions.

The application of gender analysis to religious traditions. A second major strand of women's studies in religion is the application of gender analysis to religious traditions. This entails analysis of the ways in which religions in the past and in the present have developed and deployed gendered systems of thought, symbolism, and religious practices and how these (and other forces) have shaped women's religious lives for good or ill. This in turn leads to evaluation of humanity's pluriform religious heritage and the envisaging of its future forms in light of this gender-based inquiry.

Much (though not all) of this analysis arises from women's dissatisfaction with the gendered organization of their religions and initially was carried out predominantly by feminist scholars in North America and Europe examining the negative impact of religion on women's lives. Faced with the realization that androcentric and patriarchal values were as deeply embedded within religions as within the rest of human culture, these feminists sought to delineate and critique their malign omnipresence in religious scriptures, texts, teachings, rituals, forms of worship, institutional hierarchies, the construction of religious language and symbolism, and so on. An influential early feminist critique of religion was Mary Daly's *The Church and the Second Sex* (1968), which built on Simone de Beauvoir's *The Second Sex* (1949) to argue for an end to what Daly described as "Catholic antifeminism." Five years later Daly's position was firmly post-Christian. Her landmark *Beyond God the Father* (1973) advocated a radical feminist spirituality disconnected from patriarchal religion. Daly's contribution catalyzed feminist reactions to religion; numerous scholars set to work unpicking the fabric of religions and pointing to their distorted patterns of thought. No historical religion has since escaped feminist scrutiny.

Alongside the feminist critique and deconstruction of religious traditions, men and women sensitive to questions of gender (not all of whom identify as feminist) are engaged in the study of the positive elements in their tradition that offer resources for a renewed, nonoppressive contemporary religious expression. For example, there is considerable interest in the study of divine females such as Buddhist bodhisattvas, Hindu goddesses, and Daoist celestials. Mostly this research involves the recovery and restoration of previously overlooked or neglected elements of religion and includes, for instance, the retrieval of women's histories (including the documentary recording of the legacy of the women's movement itself), the rehabilitation of suppressed or marginal female characters (e.g., mythical female figures such as Lilith), the reappropriation and, where necessary, reinterpretation of scriptures and teachings, and the preservation of endangered but valuable religious traditions and practices that are meaningful for and often performed by women but threatened by forces such as urbanization and industrialization.

As a result of this work of critique and recovery, women are actively engaged in reconstructing and transforming religions so that they are in line with gender justice and better

nurture female identities. This is occurring in an enormous variety of ways: through the rethinking and reformulation of the philosophical and theological aspects of religion—increasingly achieved by bringing other academic disciplines into creative conversation with the theoretical elements of religion (e.g., reinterpreting the meaning of and employing new images for the divine); through the creation of new religious practices (e.g., the use of new forms of prayer, ritual, and worship); and through the establishment of new social organizations (e.g., women's support, networking, and campaign groups). Correspondingly the aim is to replace all institutional practices and thought patterns that deny or undermine women's full participation and flourishing. As such this constructive and corrective task is praxis-based and politico-ethical in character, involving advocacy for women's rights (e.g., campaigning for the greater presence of females in leadership positions) as women worldwide seek to make their religions more conducive to women's authentic agency and development.

This threefold project of critique, recovery, and reconstruction has been carried out most extensively within Christianity and Judaism, where it has often (though not unproblematically) gone by the name of feminist theology. However, the same process is occurring to some degree in all religions and constitutes the greater bulk of writing in women's studies in religion (e.g., Gross, 1993; Mernissi, 1991; Plaskow, 1991; Robinson, 1999; Ruether, 1983; el Sa'dāwī, 1980).

Some women, like Daly, have found the feminist critique of religion to be decisive. They argue that the historical religions cannot be reformed in line with gender justice and identify as postreligious and secular (e.g., Taslima Nasrin) or prefer to express their religious experience and spirituality through means other than traditional religion (e.g., Carol P. Christ; Daphne Hampson).

The development and study of new religious movements that express women's spiritualities. This brings us to a third area of activity in women's studies in religion: the development and study of new religious movements that draw on the articulation of women's spiritualities. Within the Western world, the demise of organized religion has been accompanied by a growth in unofficial spiritualities, many of which largely attract female adherents. For example, one of the fastest growing is the mind-body-spirit movement that offers holistic means to self-improve one's bodily and spiritual well-being using techniques such as yoga, meditation, Tai Chi, and reflexology.

The most studied strand of new women's spiritualities is often termed *feminist spirituality*. Feminist spirituality, while of importance in its own right as a religious phenomenon, offers women's studies an important example of a form of religious expression that has been created explicitly by (mainly Western) women for women who have chosen to jettison the negative patriarchal inheritance of historical religions and create anew an inclusive worshipping community

based on feminist principles. Some of the chief exponents of spiritual feminism are Zsuzsanna Budapest, Carol P. Christ, Naomi Goldenberg, Asphodel Long, Melissa Raphael, and Starhawk. The way spiritual feminists choose to express their religious sense varies. Thus while the label spiritual feminism unites adherents under a common identity, it is more accurate to speak of feminist spirituality movements in the plural since there are differences in approach and focus. Feminist spirituality movements reject institutional structures, organizational hierarchies, creeds, and fixed forms of worship. The form of spirituality these movements espouse is gynocentric and ecological. The focus is on the celebration of female sacred power, which is accompanied by a positive evaluation of the female body, sexuality (including the erotic), and fecundity. Nature is revered for its powers of birth and regeneration, and humanity is understood to be intimately connected to and responsible for the natural world.

As a response to and reaction against patriarchal religion and, more specifically, as a result of the rejection of the use of male imagery and language for the divine, spiritual feminists often draw instead on the symbolic power of the Goddess. For instance, female gods such as Ishtar, Diana, or the Great Mother may be invoked in feminist rituals, and appeal may be made to various ancient Goddess traditions (e.g., Gimbutas, 1974; Spretnak, 1981). The way the Goddess is conceptualized in these movements varies. She may be worshipped as supreme being, personification of the earth, or alternatively, function as a nonrealist symbol of female perfection. In any case the Goddess is visualized through immanent or other means than traditional, transcendent categories. The term *thealogy* (in contradistinction to theology), coined by Naomi Goldenberg (1979, p. 96), is now widely employed to signal the importance of Goddess worship and symbolism to the movements and to refer to the growing body of literature that offers scholarly reflection on spiritual feminism (e.g., Christ 1979, 1997; Eller, 1993; Goldenberg, 1979; Long, 1994; Raphael, 1999). However, some spiritual feminists prefer not to be defined in relation to the enterprise of theology to the degree that it is viewed as an inherently patriarchal discipline that entails a retreat from praxis into systematic theorizing about doctrine. Other elements that have proved attractive to spiritual feminists include pagan and Wiccan traditions. Participatory rituals, occasionally with magical overtones, are often held to coincide with pagan feasts such as the spring equinox and summer solstice. Some of the key figures in feminist spirituality identify as witches (e.g., Zsuzsanna Budapest; Starhawk). This both reclaims the witch as a positive female role and at the same time honors those women who were historically persecuted for witchcraft because of their refusal to succumb to (often religious) authority.

Feminist spirituality movements are deliberately eclectic and syncretistic, and this, combined with the rejection of institutional organization, accounts for their variety. To a certain extent these feminist strategies of connection and appo-

priation are similar to those employed by women who seek to rebuild the traditional religions. Both entail the recovery of suppressed or forgotten symbolism and traditions and the construction of new religious expressions on this basis. However, the borrowing of religious symbols—such as the incorporation of goddess traditions into feminist spirituality—risks offending those from the indigenous cultures of Africa, America, Australia, China, and India whose symbols have been reappropriated for use by Western women if it is done without due sensitivity to their proper context. There is also debate about whether spiritual feminists are engaged in the recovery or imaginative re-creation of religious history. Controversially the archaeologist Marija Gimbutas postulated the existence of peaceful goddess-worshipping matrifocal cultures in Neolithic Europe that were superseded by warfaring patriarchal tribes that worshipped male gods. That a pre-patriarchal golden age of female-affirming religious culture ever existed has been disputed—even by feminists sympathetic to Goddess spirituality (e.g., Eller, 2000; Hewitt, 1993). Irrespective of whether conjecture plays a part in such hypotheses, innovation in ritual celebration is of more importance to feminist spirituality movements than appeal to historically verifiable traditions.

The critique and transformation of the academic study of religion. A fundamental task of women's studies scholarship has been to interrogate and overhaul the presuppositions, explanations, key principles, and accepted canons and methods that shape the academic study of religion. As has been indicated, women's studies in religion arose from the realization that the academic study of religion was an androcentric enterprise. A central goal of women's studies has therefore been to dismantle the epistemological and methodological architecture of the discipline constructed from within the parameters of androcentrism and to rebuild religious studies so as to incorporate into its framework critical awareness of the role gender plays both in shaping religion and in shaping its study in order to offer a fuller and truer account of the religious experiences of humankind.

As women's studies entered the scholarly arena, the academic study of religion was dominated by the *Religionswissenschaft* school, led by scholars such as Mircea Eliade, Joseph Kitagawa, and Charles Long. The laudable ambition of this influential movement was to study any and all human religious phenomena dispassionately, impartially, and non-judgmentally, free from religious and all other bias that might interfere with the goal of the objective and scientific study of religion. Religion was understood to be a universal human phenomenon that, despite its cross-cultural and historical variety, has distinctive transcultural features in common (such as initiation rites) that are shared by the timeless, supposedly genderless, and otherwise decontextualized *homo religiosus*, "religious man." This ahistorical, undifferentiated generic subject was soon subjected to critical scrutiny by women's studies scholars and *homo religiosus* exposed as the false universal it was.

The androcentrism of the *Religionswissenschaft* school was diagnosed by Gross: "*Homo religiosus* as constructed by the history of religions does not include women as religious subjects, as constructors of religious symbol systems and as participants in a religious universe of discourse" (Gross, 1977, p. 10). While it was claimed that women were included under the generic *man*, examination of scholarship by historians of religion demonstrated that this was not the case. For instance, Saiving found that Eliade's *Rites and Symbols of Initiation* (1958) devotes just 9 of its 175 pages to female initiations (Saiving, 1976, p. 184). While this is attributable to the lack of reliable ethnographic data on women's rites, Saiving takes issue with Eliade's extrapolation from the more extensive data on male initiation rites to his conclusions about initiation as a human phenomenon: "What he says about the *human* meaning of initiation corresponds almost exactly to what he says about *male* initiation" (Saiving, 1976, p. 189). Similarly, though Eliade's magisterial three-volume work *A History of Religious Ideas* (1978–1985) seeks to relate "the spiritual history of humanity" (Eliade, 1978, p. xvi), Christ finds: "The history of religion which Eliade tells is distorted by dualism, Idealism, and false universalization of male experience" (Christ, 1991, p. 94). If women's religious data is omitted from the construction of models and theories about religion, it comes as no surprise when women are treated as curious exceptions to the (male) norm. Thus Gross notes: "Most of the time, Eliade writes about women as symbols to *homo religiosus*, rather than as real people. When he does, infrequently, write about women as real people, it is because their behavior represents a special case that does not fit his general descriptions or theories" (Gross, 2002a, p. 46).

While the *Religionswissenschaft* school had been sensitive to the dangers of allowing Christian models of religion to function as a key to the interpretation of other religious traditions, the movement had been blind to the way gender affects scholarship. The quest for a universal account of religion as such was conducted using inadequate data, erroneous inferences and dubious hypotheses. Women's studies scholarship demolished the assertion that the discipline of religious studies was scientific and impartial and demonstrated the illusory nature of the claim to objectivity. As Kinsley indicates: "The effect [of women's studies] has been to show, often in shocking and dramatic ways, the extent to which history of religions has not been true to its own mandate. It has been neither all-inclusive nor objective in its study of human religiousness" (Kinsley, 2002, p. 2).

This powerful feminist critique of the scientific study of religion crystallized a thoroughgoing reconceptualization of the subject, initiating a change in the discipline that has been characterized by several scholars as no less than a conceptual paradigm shift (see Christ, 1987, 1991; Gross, 1983; King, 1995; Warne, 1989). Within religious studies as a whole there is an increased sensitivity to the influence of gender in shaping religious and research perspectives and greater

caution in the formulation of generalizations about religious beliefs, symbolism, and practices. The methods of studying religion have been expanded as women's studies scholarship has penetrated the specialist academic disciplines in the study of religion. While the study of religious texts remains an important element in religious studies, it has been recognized that, to the extent that it exists, sacred literature is of limited use for ascertaining the reality of ordinary women's (and men's) religious lives on the ground. Women are often absent from holy writings, and when women are mentioned in texts and teachings, there is the danger of distorted or idealized portrayals of their lives.

Women's studies have helped to dislodge the discipline's overemphasis on and priority given to text-based research by shifting the focus to other sources and methods of obtaining information about women and their religions. Within the specialisms of anthropology and sociology of religion, more extensive use of fieldwork has improved data gathering through the increased use of interview techniques and the collection of oral testimonies. With greater numbers of female researchers engaged in fieldwork, there is wider access to women's spaces, allowing more detailed study of female-dominated religious subcultures. Scholarly interest in popular and folk religion, where women are often more prominent, has also aided the documentation of women's religious participation.

One important methodological question that arises with respect to the conduct of fieldwork concerns the relationship between the researcher and the subject of research—the observer and the observed. Women's studies scholarship exposed the false claims to objectivity made by scholars within the so-called scientific study of religion, and this has given rise to a wider hermeneutical suspicion of the ethos of objectivity, including a questioning of whether the methodological values of impassive detachment and scholarly neutrality are genuinely attainable (and desirable) in the field and whether fieldwork observations can supply an accurate account of religion uninfluenced by the observer's presuppositions, values, and evaluative and interpretive faculties (see Franzmann, 2000; Knott, 1995). The issues at stake can be ethically perplexing, involving, for example, matters of whether fieldwork necessarily objectifies women who are studied; whether the establishment of trust and friendship have a place in ethnographic research; whether scholarly noninvolvement implies tacit approval of unjust power relations between those who are studied; and how far a researcher should stand back from cultural practices that she or he judges to be harmful, degrading, or otherwise questionable (see Jacobs, 1991).

Feminist and other researchers committed to social justice for women may find the research values of noninterference and neutrality conflict with a perceived duty to engage in the consciousness-raising of research subjects and to speak out against the discrimination and oppression of women. Some female scholars suggest the values of engagement and

empathy—as important feminist commitments—should replace the ethos of objectivity as the appropriate feminist and morally responsible means of conducting research in religion (e.g., Christ, 1987, 1997). In order to take proper cognizance of the inherent presence of scholarly subjectivity and the perspectival nature of human knowing, it has become common for women's studies scholars (and other scholars of religion) as creators of knowledge, in an act of self-reflexivity, to disclose to their readership as prolegomenon to their research, their authorial standpoint, social position, interests, background, and any other relevant features in order to make explicit those factors that may shape and color the research questions, objectives, methods of study, and conclusions. The theoretical aspects of feminist epistemology and standpoint theory find an important place in feminist philosophy of religion (see Anderson, 1998; Jantzen, 1998).

EXPERIENCE, IDENTITY, AND DIFFERENCE. The process of articulating one's standpoint as a situated subject has become a critically important exercise in women's studies, not least as a means of shedding light on three dominant but problematic analytical themes: experience, identity, and difference. To be a person in the world necessarily entails location in a particular place and time, and humans are further shaped (though not determined) by social identities and roles that contribute to self-understanding and form identities, that make one subject to different life experiences, that give one particular outlooks or perspectives on the world, and that enable differences to be discerned between oneself and other differently situated subjects. A greater appreciation of the role of social location in creating and shaping human diversity has allowed women's studies in religion to offer more sophisticated analyses of the factors that affect women's religious lives and to dispel some of the generalizations about "women's experience" that characterized certain less-critical early feminist critiques of religion (see Davaney, 1987). If previously more sweeping assertions were made about women's lives on the basis of a monolithic understanding of womanhood, there is now recognition of the analytical inadequacy of "woman" as a unified category. Women have diverse needs, desires, ideals, and so on and are embodied subject to differentials such as sexuality, religion, nationality, ethnicity, "race," class, caste, and age. As such women's religious lives are shaped by a complex interaction of forces, and they cannot be understood adequately using the category of gender alone. For example, the plight of *dalit* women in India is as much concerned with issues of economics and caste as it is with gender (see Jogdand, 1995).

It is clear that women who belong to religions in the advanced industrialized countries of the Northern Hemisphere are affected differently by political, economic, and environmental forces than those within the more rural economies of eastern Europe and the Southern Hemisphere. Traditional forms of religion and ritual practices and the family units that preserved them are subject to transformation through the impetus for economic development and the demise of rural communities. While many women are affected by these

changes transculturally, the effects are often most acute in developing countries since it is women in traditional societies who tend to safeguard and preserve religious customs and values from the modernizing and Westernizing tendencies that globalization brings. In this context, in countries such as India and Pakistan, women have found themselves peddled by religious nationalisms eager to promote them as antiseccular symbols of national pride, identity, and purity. When it comes to ecological activism, religious women have campaigned more vigorously for sustainable development and global resource management in countries that are directly affected by the destruction of habitat through deforestation, the industrial pollution of rivers, and the stripping of natural resources compared to those in more affluent nations, where a sense of connection to and responsibility for the environment has to a large extent been compromised by mass consumption and consumerism (see Ruether, 1996).

Crucially the way geopolitical economic forces affect contemporary religions cannot be understood without recognition of the influence of the shameful history of Western imperialism, colonial expansion and exploitation, racism, slavery, and the imposition of Christianity onto indigenous peoples. These wrongdoings were perpetrated under the guise of promoting civilization and religious salvation, and their enduring legacy has been Third World debt, apartheid, racial discrimination, religious unrest, the emergence of fundamentalisms, tribal warfare, genocide, displaced peoples, and an obscene discrepancy between the economies of the rich North and poor South. The historical legacy of Western imperialism and its contemporary afterlives cast a long shadow over international relations and religious identities.

This historical background has had a profound influence on women's studies and continues to act as an obstacle to the global solidarity of women. While women are united in fighting sexism, they are divided by injustice with regard to "race," religion, class, nationality, economics, sexual orientation, and so on. In these respects women can be the perpetrators as well as the victims of discrimination and injustice—as were white Western women during the colonial era. For those women still experiencing the aftermath of colonial empire building, the Western message of women's liberation is an ambivalent one. Feminism is a suspect category for a significant number of nonwhite and non-Western women who associate the term with the bourgeois liberal individualistic claims of white, educationally privileged, and economically elite middle-class women whose gender analyses do nothing to address the racism, classism, and economic injustice suffered by most of the world's women. For some, feminism also stands for sexual licence and family breakdown. For these reasons, many nonwhite and non-Western women—including some who campaign for women's liberation—eschew the feminist label (see Isasi-Díaz, 1993, p. 4).

In the early days of the women's movement many Western women were unaware of these sensitivities. Western feminists would often write as though gender were the only lens

through which women's lives could be understood, whereas for some women the discriminating factors were as much associated with economic injustice, racial prejudice, and imperialistic domination. The idealism of the women's movement tended to neglect these conflictual elements, and those involved in women's studies failed to see the monopoly of power that Western women possessed as shapers of the new discourse (see Williams, 1985). Feminist theory, it was thought, included all women and could address their universal concerns.

In the same way that the *Religionswissenschaft* school had initiated a flawed attempt to distill the essential nature of pure religion, uncontaminated by social, political, or any other context that gives religion its variety and complexity, so too Western feminists constructed anemic accounts of women's nature and experience that had the blood of real lives drained out of them. Women's studies scholars were falling into the same homogenizing traps and reproducing the same errors as their male predecessors. The social, political, and other contextual elements that form women's lives and create distinct identities were submerged under the rhetoric of a nebulous undifferentiated "women's experience." In a repeat performance of the mistakes of androcentric scholarship, the formulations of feminism that were articulated represented the interests and perspectives of the white Western women who had created them, and the dominant feminist critiques of religion were based on the predominant religion of the West, Christianity. These analyses lacked the standpoints of other women from different contexts whose life experiences could provide additional perspectives that previously had been omitted.

CONTEXTUALITY AS A CHARACTERISTIC OF WOMEN'S STUDIES IN RELIGION. The scope of women's studies broadened as new writings emerged from women keen to assert their distinct identities and name their particular experiences (see Kwok, 2002). These built on the feminist critique of religion but also reacted against it. For example, African American women (avoiding feminist nomenclature) adopted Alice Walker's term *womanist* to describe their theological and ethical projects, located in the experiences of not only sexism by males but also racial and economic oppression by the white majority in the United States (e.g., Cannon, 1988; Grant, 1989; Williams, 1993). Initially united by their Christian heritage, womanists have since shed their exclusively Christian focus. Similarly Ada María Isasi-Díaz and colleagues coined the term *mujerista* theology to express the religious reflection and liberative praxis that arises from the ethnically diverse Latina women living in the United States who are united by their common experience of sexism, poverty, and racism (Isasi-Díaz et al., 1992). Numerous other local and contextualized women's theologies also emerged differentiated on geographical, ethnic, and other grounds that reflect the pluralism of Christianity (humanity's most populous and geographically dispersed religion) and that express the shared perspectives of women united by marginalization, communal struggle, and religious empowerment

(e.g., Brock et al., 1987; Katoppo, 1979; King, 1994; Oduyoye, 2001; Kwok, 2000).

As a result of this proliferation of contextualized approaches, women's studies in religion are more diverse, complex, and internally divided but also more inclusive as the many social allegiances and religious loyalties of women are given expression. Further diversification seems inevitable as increasing numbers of women from traditions other than Christianity organize themselves into distinct local constituencies.

The ideological diversity that exists leads to dissonant responses to religious issues that concern women. For example, there is no consensus on the use of the *hijāb* (veil) in Islam, which has become a particularly contested and polysemic religious symbol. The requirement that Islamic women dress modestly in public is interpreted differently in different social and historical locations. The practice of veiling is frequently characterized by non-Muslims as nothing other than an illustration of the religion's oppression of women. While some Muslim feminists may agree with this assessment and applaud the influential action of Egyptian feminists who first cast off the veil in the 1920s, other Muslim women, where veiling is not compulsory, have reclaimed the practice both as a symbolic act asserting Islamic identity over against Western liberalism and in order to enter public life free of the male gaze (see Leila Ahmed, 1992; Hoodfar, 2001).

The veiling issue illustrates the complexity and multiple layers of meaning that religious symbols can have for women and also demonstrates the need for women's studies scholars to actively foster intercultural and interreligious sensitivity and dialogue as a means of overcoming prejudicial intolerance and supremacist tendencies and of learning from encounters with those who are other. This has been theorized by writers such as Rita Gross, Ursula King, and Maura O'Neill and put into practice by initiatives such as the Asian Women's Consultations on Interfaith Dialogue (AWRC) (AWRC, 1990, 1995; Gross, 2002b; King, 1999; O'Neill, 1990). Nevertheless further critical reflection and practical measures by women are required in this area—especially given the continuing augmentation and exploitation of religious suspicions and hostilities for political, terror, and militaristic purposes.

To the extent that religions have sought to control and circumscribe female sexuality, women who have chosen to live outside the framework of heterosexuality and straight conventions have found themselves doubly oppressed by religious teachings, ideals, and practices that concern sex and gender. Yet lesbians and other queer women have found homes in religions and have drawn on their marginal experience to theorize about religion and sexuality and to campaign for societal acceptance and civil rights. Women who have identified as lesbians, such as Rebecca Alpert, Mary Daly, Beverley Harrison, Carter Heyward, Mary Hunt, Audre Lorde, and Elizabeth Stuart, have made important contribu-

tions to what has become a subject discipline in its own right: in 1986 the American Academy of Religion Lesbian-Feminist Issues and Religion Group was established (see Alpert, 1997; Daly, 1978; Harrison, 1985; Heyward, 1984; Hunt, 1983; Lorde, 1984; Stuart, 2003). In addition to exploring the intersection of religious and sexual identity, these writers have expanded the understanding of terms such as *eros*, *embodiment*, *desire*, and *friendship*.

INTERDISCIPLINARITY AS A CHARACTERISTIC OF WOMEN'S STUDIES IN RELIGION. As women's studies in religion have embraced these new identities and contingencies, the purview of the field has grown and diversified by the welcome introduction of new intellectual resources and interdisciplinary approaches that have preserved women's studies from becoming stagnant and irrelevant. For example, the insights of postcolonial theory are commonly employed by female scholars from non-Western contexts (e.g., Donaldson and Kwok, 2002). The Argentinean liberation theologian Marcela Althaus-Reid has combined the class analysis of liberation theology with feminism, postcolonial theory, and queer theory to offer new insights into the oppression of the economically and sexually disenfranchised (Althaus-Reid, 2000, 2004). Sharon Welch and Mary McClintock Fulkerson have both incorporated poststructuralist theory into their influential feminist liberation theologies, and Fulkerson has also drawn on the empirical social sciences (Fulkerson, 1994; Welch, 1985). Terms such as *woman*, *experience*, *identity*, *subjectivity*, and *difference* are critically examined using the tools of postmodern feminist theory (see Chopp and Davaney, 1997). Religious feminists are examining issues of sexual difference, the symbolic order, and the divine through the psychoanalysis and philosophy of French feminists such as Luce Irigaray and Julia Kristeva (e.g., Joy et al., 2002, 2003; Kim, et al., 1993). Perhaps most significantly for women's studies, the intellectual vibrancy of gender studies—which continues to anchor theoretical work in women's studies—is leading to increased interdisciplinary collaboration between male and female scholars of religion (e.g., Peskowitz and Levitt, 1997).

FROM WOMEN'S STUDIES TO GENDER STUDIES IN RELIGION. The evolution of gender studies as an academic discipline in its own right has had a considerable impact on women's studies in religion. If women's studies scholars have learned that factors other than gender must also be taken into account when seeking to understand women's religious lives, gender studies have shown that gender itself is not a straightforward category: sexed identities are more diverse, fluid, and performative attributes than previous scholarship and religious or cultural prescriptions had appreciated (e.g., Butler, 1990). These insights, which gave birth to queer theory, have resourced lesbians and other women who point to the inadequacies of religious attitudes to sexual orientation. Feminist theory has benefited from the more nuanced accounts of gender that now exist, which have challenged the feminist fundamentalisms that stress either secure and normative sex differences or that appeal to aspirations of androgynous

sameness. The advent of gender studies has also created a much-needed intellectual space for men's studies in religion to flourish (e.g., Boyd et al., 1996). This, along with the synergistic collaboration of male and female scholars of religion who employ gender theory in their work, has raised important foundational questions about the future of women's studies in religion.

One question involves whether gender theory as a discourse might subsume feminist theory and how such a scenario would affect women's studies. It has already been noted that some female scholars of religion do not identify themselves or their work as feminist. It is for this reason that the phrase *feminist studies in religion* was considered an inadequate title for this encyclopedia entry. The question of appropriate nomenclature for the discipline is more than an exercise in terminology. The term *gender studies in religion* better reflects the fact that both females and males are affected (albeit diversely) by the many ways gender matters shape religions. It also addresses the concerns of the significant numbers of female and male students who (rightly or wrongly) find feminism threatening and women's studies courses exclusionary. Increasingly academic work in women's studies is based in gender studies departments. In these respects gender studies in religion is a more inclusive subject discipline and offers a more adequate terminological label than either feminist or women's studies in religion. However, while the trend toward gender studies may attract more students into the field, it may also call into question the continued need for separate women's studies courses on educational curricula, leading to closures or mergers of academic programs. The danger is that absorption into gender studies may further dilute the status and visibility of scholarship that concentrates on women's religion or lead to a loss of provision altogether.

THE ACADEMY AND WOMEN'S STUDIES IN RELIGION. As a cross-disciplinary subject, work in women's studies in religion is often carried out as a subsidiary aspect of established cognate disciplines within religious studies, theology, or (less frequently) women's and gender studies departments. As a result the subject has struggled for acceptance in the academy, and it remains marginalized and underfunded. Nevertheless women's scholarship is supported and shared through numerous international and faith-based organizations, networks, and conferences. The World Wide Web has proved particularly effective in making widely available religious and other online resources to large numbers of interested women inside and outside of academia.

Of the enormous body of literature devoted to women and religion, Serinity Young's *Encyclopedia of Women and World Religion* (1999) deserves mention as the first comprehensive reference work in the subject. And if women's studies in religion have often been forgotten within the wider women's studies discourse, this oversight has been corrected in the *Routledge International Encyclopedia of Women*, in which "Religion and Spirituality" comprises one of its thirteen major sections (Kramarae and Spender, 2000). Estab-

lished periodicals that publish on women and religion include Arvind Sharma and Katherine Young's *Annual Review of Women in World Religions*, the *American Journal of Feminist Studies in Religion*, and in the British Isles *Feminist Theology*, which has a broader compass than its name suggests. From Australia come the biannual *Women-Church: An Australian Journal of Feminist Studies in Religion* and the annual online journal *Seachanges: The Journal of Women Scholars of Religion and Theology*. Christian journals include the *Yearbook of the European Society of Women in Theological Research*; *In God's Image*, the Asian women's theological journal; *Revista Con-spirando: Latin American Review of Ecofeminism, Spirituality, and Theology*. *Hawwa: Journal of Women of the Middle East and the Islamic World* and *Al-Raida*, published by the Institute for Women's Studies in the Arab World, are English-language journals. Within Judaism there exists *Bridges: A Journal for Jewish Feminists and Our Friends*; *Nashim: A Journal of Jewish Women's Studies and Gender Issues*; and *Women in Judaism*, a multidisciplinary electronic journal. While such journals facilitate scholarly exchange, it is still mainly Western women who have access to these and other resources.

While few doubt that the entry of women's studies in religion into the academic arena constituted a major event in the history of the study of religion, the extent to which women's studies have transformed the discipline of religious studies is a moot point (see Plaskow, 1999; Warne, 1998). The pattern across specialisms is uneven. Whereas anthropological, psychological, and historical studies of religion have integrated feminist insights into mainstream scholarship, feminist writings remain on the fringes of sociology and philosophy of religion (see Sharma, 2002). There is more work to be done before the marginalization of women's scholarship finally comes to an end. However, much has been achieved. One need only compare the revised edition of this encyclopedia with its first edition (1987) to see the abundant growth and reconceptualization of the subject on the grounds of gender. Ursula King's trenchant criticisms of the neglect of women's scholarship in the first edition did not go unheeded (King, 1990). This second edition of *The Encyclopedia of Religion* gives eloquent testimony to the manifest influence of women's scholarship in engendering religious studies.

BIBLIOGRAPHY

The literature on women's studies in religion is vast and varied. The most comprehensive treatment of the subject is in the

- Encyclopedia of Women and World Religion*. For an indication of how the field has changed since its inception, compare this entry with its forerunner "Women's Studies" by Constance H. Buchanan in the first edition of the *Encyclopedia of Religion*. Gross's *Feminism and Religion* offers a detailed overview of the impact women's (and especially feminist) studies have had on religion; and their direct influence on the subject specialisms and methods of religious studies are discussed by Sharma (2002). The edited collections listed here typically offer a combination of essays on theoretical questions in gender and religion and on the contemporary and historical impact of religions on women's lives. JULIE CLAGUE (2005)

WŎNHYO (617–686), Buddhist philosopher and putative founder of the Pöpsöng (Dharma-Nature, also called Haedong) school of Korean Buddhist thought. Wŏnhyo is indisputably the greatest Buddhist exegete produced by the Silla kingdom's Buddhist tradition, if not Korea's premier philosopher of all time.

Wŏnhyo was born into the Söl clan, a tribal league of the Chinhae region of the southern Korean peninsula, which had been assimilated into the Silla aristocratic system (*yuktu p'um*) in the early years of the common era. After his ordination into the Buddhist order, Wŏnhyo and his close friend, Ŭisang (625–702), founder of the Korean Hwaöm (Chin., Huayan) school, twice decided, we are told, to undertake a pilgrimage to China in order to study with the renowned Chinese translator Xuanzang (d. 664). On their first trip in 650 the two Silla pilgrims were arrested as spies by Koguryŏ border guards and spent several weeks in prison before being repatriated. During their second attempt in 661 it is said that the friends traveled to a port in the Paekche region, where they hoped to board a ship bound for the mainland. Forced by a heavy downpour to spend the night in what they thought was an earthen sanctuary, they learned the next morning that it was actually an ancient tomb littered with human skulls. Marveling at his mind's ability to transform a thoroughly gruesome site into a comfortable haven, Wŏnhyo realized his world was created by the mind alone. His enlightenment rendered his planned pilgrimage to China unnecessary, and he returned to his home country to undertake a life of writing, preaching, and proselytizing. Sometime during his career, a liaison with a widowed princess led to the birth of a son, Söl Ch'ong (c. late sixth to early seventh century), who developed the Idu system of transcribing Korean, the first indigenous writing system used on the peninsula. Along with lecturing on Buddhism to the Silla aristocracy, which had only recently (and grudgingly) converted to the religion, Wŏnhyo also traveled among the peasant populace, instructing them with popular songs and verses. Hence, Wŏnhyo's prodigious efforts at proselytism helped to cement Buddhism's place as the national religion of Korea during the early years of the Unified Silla period (668–935).

Wŏnhyo was a prolific writer and commentator, authoring some one hundred works, of which over twenty are still extant. His interests ran the gamut of Buddhist materials then available in East Asia, from Mādhyamika, to Yogācāra, to Pure Land. Wŏnhyo played a major role in introducing to the Korean intelligentsia to Buddhist scriptures and com-

mentaries, which, prior to his time had been virtually nonexistent in Silla. Wŏnhyo was the first Korean Buddhist to attempt to reconcile the disparate teachings of Chinese and Indian Buddhist philosophy, in particular the Mādhyamika and Yogācāra traditions. In his commentaries he eschewed the explication of scriptures according to the hermeneutics of any particular school; rather, he attempted to reveal the unifying principle, the “one mind,” that vivified each of those texts. In one of his principal works devoted to his synthetic philosophy, *Simmun hwajaengnon* (Ten approaches to the reconciliation of doctrinal controversy), Wŏnhyo states that his fundamental intent is to harmonize the differences that characterize the various schools of Buddhist philosophy and merge their views into two all-inclusive perspectives. These were, first, the dependent origination approach (*saengi-mun*), in which the myriads of qualities were shown to be the products of a perdurable causal process, and, second, the return to the source approach (*kwiwŏn-mun*), in which all such phenomenal characteristics were abandoned so that one could return to their ultimate source, the one mind. This dichotomy is seen, with slight variations, in many of Wŏnhyo’s writings.

Perhaps Wŏnhyo’s most influential works were his commentaries to the *Tasheng qixin lun* (Awakening of faith in Mahāyāna) and the *Huayan jing* (Skt., *Avatamsaka Sūtra*, *Flower Garland Sūtra*). In the former commentary, Wŏnhyo outlines a four-stage soteriology—from nonenlightenment, to apparent enlightenment, advanced enlightenment, and finally ultimate enlightenment—that demonstrates how ordinary persons can hope to achieve spiritual liberation. Both of these texts had such a profound effect on the philosophical development of Fazang (643–712), the systematizer of the Chinese Huayan school of Buddhist thought, that Wŏnhyo is now considered to be an important vaunt-courier of that school. Wŏnhyo’s many outlines (*chongyo*) to Buddhist sūtras also sought to treat those texts in terms that would result in fraternal harmony rather than sectarian controversy. The synthetic tendencies in Wŏnhyo’s thought were to inspire all future Korean Buddhist writers and establish doctrinal synthesis as the hallmark of the Korean Buddhist tradition. It is for this reason that Wŏnhyo is traditionally regarded as the founder of the synthetic Pŏpsŏng school, one of the five Buddhist scholastic schools of the mature Silla tradition.

ROBERT EVANS BUSWELL, JR. (1987 AND 2005)

WORD SEE LANGUAGE; LOGOS

WORK. Once, at the dawn of creation, in the Golden Age, when earth and sky were conjoined (or when there was only sky), when only children, or the first human pair, inhabited the world, there was no “work.” Only God, or the gods, worked their divine eternal play, the uncompelled sport of inexhaustible creativity. Only the primordial smith, the primal maker, seeded or molded the earth as archetypal sower or first craftsman. The fruits of the earth were available to all.

The world range of the myth indicates the universality of the theme. In ancient narratives from the Vedic, Greek, and Judeo-Christian traditions, from Africa, from North and South America, the subsequent fall from this paradisiacal state is widely associated on the one hand with some false move or a human choice based on some petty, selfish desire and on the other with the plunge into the *condition humaine*—nakedness, the loss of immortality, the withdrawal of the sky, the opening of Pandora’s box of woes, the cycle of birth and death, and the sentence to hard labor for life.

The tale is compelling on several counts. Most people experience lack of ease in their endeavors—as Marsilio Ficino notes in a letter on the work of the mind (*Epistolae* 2.1), they seem to be rolling the stone of Sisyphus up the steep slopes of the mountain—and wish to find rest. Equally it can be argued that on some level everyone, even the unemployed, the idle rich, and the thief, is working at something and longs to find fulfillment in that work. Indeed, the history of labor, from Adam and Eve to the arts (or, by extension, to the most advanced technology), is literally the history of humankind.

At the same time, myth provides the notion of a deeper level of universality: The sentence to work symbolizes humanity’s physicality in the world in the sense its separation from the divine, the cosmic, the natural. From this breach follows all suffering and toil. Significantly, in some versions of the story the point is made that in fact some form of work was originally designated for human beings. The *Book of Genesis*, for instance, indicates that Adam was first placed in the garden to work (or till) and keep it (2:15; cf. 2:5); only after the Fall is there talk of toil or suffering (*’itsstavon*) and

the sweat of the brow. Similarly, according to a common African theme God originally meant the world to be a tilled garden, with no bloodshed, work, or sorrow. Depicting a reversed sequence of the human encounter with toil and ease, ancient Chinese myth relates that the primal figure Gun labored in vain to tame the great flood; only his son Yu, by going with the flow of things, was able to complete the task and make the earth suitable for cultivation. A distinct line is drawn between the first human participation in divine work—the easy yoke of conformance to the cosmic order—and the labor under which humans burden. In the words of the Hebrew scriptures, this is the heathen world of the “work of men’s hands” (*Dt.* 4:28, *2 Kgs.* 19:18, *Is.* 2:8), the cosmos bereft of hierophany. It is a treadmill on which humans are bound to do it all themselves, including the manufacture of their own clay gods.

PHYSICAL WORK. Removed from sacred context, human activity is in itself simply neutral bodily movement. Whether the task is stopping the pigs or pushing papers around in a corporate office, work may be experienced as exhausting or, if the natural and efficient operation of the body is discovered, it may be felt as easy, enjoyable, even rewarding, at least up to the point when muscle fatigue or mental torpor takes over. But work unrelated to any higher meaning threatens to inspire the “work ethic” that so fascinated Max Weber: Labor itself becomes the end of life, at best valorized as the worship of accomplishment, success, or physical prowess, at worst crystallized into a nightmare of the most menial physical chores, undertaken in a tortured attempt to keep one’s own body (and perhaps the body of one’s immediate family) alive “between a sterile earth and an uncontrollable sky” (Agee, 1960, p. 325).

By contrast, esoteric traditions in both primal myth and organized mystical discipline assign human activity to a hierarchy of levels among which physical human bodies constitute only the most readily discernible plane. Transcending that plane is the world of the mind, which has its own work and rest; beyond that, the realm of the inner self, or spiritual being. Within this context, religious work is the actualization of principle through action, to be realized on all three levels.

Physical work may be taken as a starting point of experience, since one has to begin where one is: in the physical world. But bodily work serves as a metaphor for work on some other level, as in the New Testament parables about laborers, or in this passage by the Palestinian tanna Ṭarfon: “The day is short, and the work is great, and the laborers are sluggish, and the reward is much, and the Master is urgent” (*Avot* 2.20, cited in *Sayings of the Fathers*, New York, 1945, p. 43). The performance of physical work may even be experienced as metaphor, as when sweeping the floor is taken as a spiritual task and becomes a means of revelation (cleansing myself, or the face of God).

Religiously viewed, physical work serves outwardly to maintain the world, in the sense of renewing its structure (maintaining the order of the cosmos) or in the simple sense

of paying creation back for the life than one has received as a gift. Both work itself, as a reflection of the primal structuring of the world, and the cycles of rest that punctuate it are ways of acknowledging the creative source as supreme. The injunction to serve the earth directly, to earn one’s daily bread literally, is an expression of this inexorable law of just returns. It is honored by the apostle Paul (“If any would not work, neither should he eat”; *2 Thes.* 3:10), the Chan master Hyakujo (“No work, no food”; in Paul Reps, *Zen Flesh, Zen Bones*, New York, 1957, p. 70), and Gandhi in his invocation of the *Bhagavadgītā* 3.12 (“He who eats without offering the sacrifice eats stolen food”). Since the world itself is based on sacrifice (the supreme deity’s creation of everything from nothing, or from his own substance), “this body, therefore, has been given us, only in order that we may serve all Creation with it” (Gandhi, 1960, p. 12). This fullhearted acceptance of the human condition as a call to labor in the sweat of one’s face may be the supreme act of obeisance (the Ṣūfi servant of God prostrate in the dust of the desert), or it may be an act of total obedience in penance for the original sin of disobedience, as Simone Weil proposed (Weil, 1952).

In another view, physical work expresses the primary function of the human being among all creatures: Humans are enjoined to subdue the earth and thus to reassert the hierarchical order of creation. At the same time, work subdues the earth of the human body, as anyone who has engaged in extended physical exertion will testify. Not only Western monastics but the Eastern Fathers as well called for severe labor (along with weeping) as ascetic practice. The early Shakers (for whom the terms *work* and *worship* were as synonymous as they were for the Benedictines) called their frenzied exercises *laboring* and communally shook off their physicality to the tune of such songs as *The Zealous Laborer* (“Oh, how I long to be released / from every feeling of the beast”). Yet consciously applied physical work is more than simple mortification of the flesh. It can be a strengthening, cleansing, a temporary bypass of the usual, interfering complex of mental associations, comparable to any other form of meditation.

MENTAL WORK. In an essay that serves to define work at the mental level, Simone Weil reflected that the purpose of academic study is ultimately to “help form . . . the habit of that attention which is the substance of prayer” (Weil, 1973, p. 108). From the view of esoteric tradition, the function of mental work is to direct activity to the level of spirit (or the harmonious universe, or the gods). This is accomplished, first, by practicing a condition of attention at rest in which physical or intellectual activity can proceed naturally, and second, by deliberately dedicating the activity to the sacred realm. The outward work may be offered for the welfare of all (the bodhisattva’s vow) or to the god or goddess in charge of the specific field of endeavor; or its fruits may be sacrificed to the supreme self. By this direction of attention or intention, outward work of whatever kind is acknowledged to be sacred or construed as living prayer in the sense of the Christian monastics’ *laborare est orare* or what the Tibetan monk

Chögyam Trungpa has called “meditation in action.” Such mental work serves the heart of orthodox spiritual praxis, which decrees all activity to be valorized at every moment by dint of its relationship to the divine and all work to have for its goal the realization of one’s natural being. This is the alchemical *opus* of transformation to a higher state.

SPIRITUAL WORK. Preparation for the spiritual event of self-realization is traditionally the only real work there is. It demands the most stringent of efforts, calling as it does for the elimination of such obstacles as egocentrism and attachment to results and the abandonment of compulsive human activity (the attempt to make things go as one would like them to). In the Sūfī classic *Mantiq al-tayr* (The conference of the birds) Farīd al-Dīn ‘Aṭṭār warns that on the path to God “a hundred difficulties will assail you. . . . You will have to make great efforts. . . . The Spiritual Way reveals itself only in the degree to which the traveller has overcome his faults and weaknesses, his sleep and his inertia, and each will approach nearer to his aim according to his effort” (trans. Nott, New York, 1954, pp. 98, 107).

Yet it is in keeping with the mystical paradox that whenever this spiritual effort is encountered consciously, the outward effort is negated. When the simple working of the laws of nature are perceived through attention, experienced as my own nature, and allowed to act unimpeded by personal interference, work on any level becomes “not doing,” “nonaction,” “inaction.” In the words of Zhuangzu, “The mind of a perfect man is like a mirror. It grasps nothing. It expects nothing. It reflects but does not hold. Therefore, the perfect man can act without effort” (trans. Watson). Similarly, the *Dao de jing* refers repeatedly to the sage who works without doing; the *Bhagavadgita* states that “the knower of truth, seated in the Self, thinks ‘I do nothing at all, though seeing, hearing, touching, smelling, eating, going, sleeping, breathing, speaking, letting go, grasping, opening and closing the eyes’ ”(5.8f).

Nondoing is an entirely pragmatic matter, as witnessed even by the dry psychological records of Mihaly Csikszentmihalyi’s “flow experience” reports, descriptions of moments in which subjects engaged fullheartedly in activity have experienced a release from habitual limitations and the work is seen to “flow by itself.” “The secret of power,” wrote Emerson, “is delight in one’s work. . . . Place yourself in the stream of power and wisdom which animates all whom it floats, and you are without effort compelled to truth, to right and a perfect contentment.” The arts have been classically sacralized in this sense, of course. The spirit of the Shaker craftsmen no less than that of medieval scribes fostered an atmosphere of meditative stillness in which the direction of the work would present itself effortlessly in the moment of the creative act. Similarly, Simone Weil’s statement that “attention consists of suspending our thought, leaving it detached, empty, and ready to be penetrated by the object” has the ring of an instruction in Zen art. In a frequently translated passage from Zhuangzu, Prince Wenhui learns the art of

life from his cook, who explains his observation of the Dao in carving up an ox: There are natural spaces through which the blade simply passes, and the carcass falls apart of itself.

Surely this is the message of Jesus’ invitation “Come unto me, ye that labor and are heavy laden, and I will give you rest” (*Mt.* 11:28). If the Dao can arise in the interstices between a cleaver blade and the joint of the bullock, why not in the space between an iron and a shirtsleeve, or between an editor’s blue pencil and the manuscript page? In that space, work itself literally constitutes rest, earth and sky are conjoined, and the sentence of human work resolves back into its source, becomes what it has always been in reality: God’s work, the play of his creation.

BIBLIOGRAPHY

The richness of the subject is hardly matched by the number of works that directly address it at any length. Dennis Clark’s *Work and the Human Spirit* (New York, 1967) offers a very general sociocultural discussion from the Christian view. Etymological considerations are well served by Klaus R. Grinda’s study *Arbeit und Mühe: Untersuchungen zur Bedeutungsgeschichte altenglischer Wörter* (Munich, 1975), which demonstrates that words in English meaning “work” and those meaning “effort, labor, suffering” stem from entirely separate semantic fields. Readers who wish to address the theme of sacred and profane meanings of work may be moved by James Agee’s intense, poetic vision of physical toil at a level utterly bereft of sacrality; see the section “Work” in Agee and Walker Evans’s *Let Us Now Praise Famous Men* (1941; Boston, 1960), pp. 319–325.

Max Weber’s *The Protestant Ethic and the Spirit of Capitalism* (1958; New York, 1976) presents his classic interpretation of the development of the “work ethic” of modern capitalism through the influence of ascetic Protestant doctrine. Gandhi’s plea for widespread commitment to “bread labor” as a service to creation is offered in a small collection of his published statements and newspaper essays, *Bread Labour: The Gospel of Work* (Ahmedabad, 1960). For a document of the Catholic view of work, see the encyclical *Laborem exercens* from the pen of John Paul II, published as *On Human Work* (Washington, D.C., 1981). Much of the discussion is devoted to social-humane issues, but see pages 9–15 and the section “Elements for a Spirituality of Work” on pages 53–60.

Simone Weil’s *The Need for Roots* (1952; New York, 1971) presents her vision of physical labor as simultaneously the most torturous “subjection to matter” and the most transcendent human activity. Her wonderful essay “Reflections on the Right Use of School Studies with a View to the Love of God,” in *Waiting for God* (1951; New York, 1973), pp. 105–116, offers profound insights regarding attention in work at any level. The same volume includes a brief discussion of physical work on page 170.

Finally, two books explore in depth the theme of craft as a way of self-knowledge: Carla Needleman’s *The Work of Craft* (New York, 1979) and D. M. Dooling’s *A Way of Working: The Spiritual Dimension of Craft* (New York, 1979), a collection of essays by various hands.

Revised Bibliography

WORLD RELIGIONS. There are three overlapping yet divergent senses in which the term *world religions* is commonly used today. In its broadest sense, it is shorthand for the “religions of the world,” that is, any religion that currently exists or formerly existed somewhere in the world. The emphasis, however, tends to be on extant religions rather than those that flourished in the past, and in this connotation another often favored synonym is “living religions” or “living faiths.” In the second, somewhat more restrictive and evaluative sense, only a certain number of religions is meant: usually, “the major religions of the world,” meaning the type of religions that can claim to have played a distinct and significant role in the historical process of a nation or a region, or the type of religions that purportedly have had universal aspirations and an appeal that transcends the limits of a particular locality or ethnic group. Thirdly, especially when the term appears in the context of an academic curriculum, course title, book title, and so on, *world religions* is often adopted expressly to signal that the subject matter covered therein is not limited to Christianity, the Biblical tradition, or the so-called Judeo-Christian perspective, but is inclusive of all or many other religions. Whichever sense of the term is meant, it is far more frequently used in the plural form than in the singular. In fact, the cardinal presupposition underlying the concept of world religions is the multiplicity of religion; it is predicated on the idea that *religion* is a genus comprising many species, and that Christianity, for example, is but one of them. This idea, though a truism nowadays, is distinctly modern, if not to say altogether unprecedented in the history of the West.

Although regularly mentioned in scholarly tracts as well as in nonscholarly media, *world religions* is not a technical term. There has been little critical discussion of the concept or its history; nor is there an established definition agreed upon by religion specialists. The term itself originated in certain academic contexts of the nineteenth century, and it was indeed a matter of considerable scholarly debate among European scientists and theologians then, but those arguments are now largely forgotten and further obscured by contemporary usage, which appears to take little account of past concerns. It is therefore best to understand that the meaning of this term at present is largely determined by conventional

practice rather than by any scholarly consensus or rigorous analytic considerations. At the same time, the notion of world religions can be shown to have a complex historical relation to some earlier conceptual schemes for delineating the variety of religious traditions, schemes that it presumably has replaced.

Until the early decades of the nineteenth century, a well-established convention going back to the Middle Ages had been to divide the world population into four groups: Christians, Jews, Muḥammadans (as Muslims were commonly called then), and, finally, those others who were attached to countless varieties of idolatry (also called pagans, heathens, or polytheists). This four-part classification implied, however, not a recognition of four distinct religions as we think of them now, but a division of the world’s nations into, first, the correctly faithful believers in the true and only God (i.e., Christians of various sorts), then two major groups with errant or heretical opinions and attitudes toward God (Jews and Muḥammadans), and then the rest, who were altogether ignorant of God and therefore paid inappropriate reverence to various substitute objects, or idols. In effect, in this frame of mind, there was only one religion—the true one—and others were various ways of straying from it. The plurality of religions presupposed by the concept of world religions, therefore, came as a sea change in the way in which Europeans thought about themselves—understood first and foremost as Christendom—and about their relation to the rest of the world.

ORIGIN AND EARLY USES OF THE TERM. The coinage of the term *world religion*—in German, *Weltreligion*—was probably not unrelated to the advent of similar terms, such as *world history* (*Weltgeschichte*, a concept especially associated with G. W. F. Hegel) and *world literature* (*Weltliteratur*, associated with Goethe), which began to circulate in the early nineteenth century. Whatever this relation may have been, there is little doubt that the term originated in German. In summarizing the nineteenth-century controversy over the notion of world religions, the Dutch historian of religion P. D. Chantepie de la Saussaye, in his *Manual of the Science of Religion* (1891, p. 54), credibly notes that the word was first introduced by Johann Sebastian von Drey in 1827. A prominent German Catholic theologian and cofounding editor of the *Tübingen Theological Quarterly*, Drey in that year published in this journal a two-part article entitled “Von der Landesreligion und der Weltreligion” (loosely translated, “on the religion of a country and the religion of the world”), wherein he argued that the Christian Church, in its true catholicity, was an institution pertaining to what was universally human, and as such it differed fundamentally from the cult of any particular nation. In effect, *world religion* was the term he applied uniquely and exclusively to Christianity (*Christentum*), in contradistinction from all the indigenous religions of Europe and elsewhere, roundly called paganism or heathenism (*Heidentum*). What is significant here, therefore, is not only the appearance of the term—albeit in the singular—but also the pairing of *world religion* with its pre-

sumed other, *Landesreligion*, or, literally, “religion of the land,” meaning “religion of a country,” or more commonly, “national religion.”

Half a century later, this pairing of terms was to acquire further significance in the context of a debate among certain Dutch and German scholars. The debate had to do with the distinction between two supposedly different *types* of religion: purportedly “universalistic” religions on the one hand and religions that were said to be ethnically, nationally, or racially particular on the other. Meanwhile, the most pertinent development in the intervening decades was the European “discovery” of Buddhism. As Philip Almond has shown in *The British Discovery of Buddhism* (1988), it was only in the course of the nineteenth century that Europeans came to believe that: (1) that certain traditions of ritual practice and cultic observance, philosophic systems, legends, and clerical institutions found in various parts of Asia actually constituted a single religion; (2) the essential identity of these greatly divergent and diffuse phenomena could be traced back to a particular historical moment and location in northern India, indeed, to a specific historical personage who lived several centuries before Jesus of Nazareth; and (3) the successful dissemination of this religion in Asia was such that it either rivaled or possibly surpassed Christianity in the size of its adherents. Among the ramifications of this understanding of Buddhism as a distinct religion was a sudden awareness that there was another religion in some way comparable to Christianity. Like Christianity, which grew out of an older religion unique to the ancient Israelites, it was thought that Buddhism grew out of Hinduism (more commonly called Brahmanism then), the quintessential religion of India. Buddhism, too, supposedly began as a reform movement initiated by an extraordinary but historical figure, Gautama, bearing a moral message and spiritual appeal to all humanity. Like Christianity, it was also observed, Buddhism disappeared eventually from the land of its origin but spread swiftly beyond national, ethnic, and regional boundaries, not to mention among people of different social strata. In effect, European scholars came to recognize in Buddhism a second world religion, though this did not necessarily lead them to relinquish the claim for the unique and absolute superiority of Christianity.

The discovery of Buddhism was among the most important achievements of the European scholarship on India, which had gained momentum since Sir William Jones’s celebrated pronouncements in 1786 suggesting the affinity—and hence the likely commonality of origin—between the classical languages of India and of Europe. This was to be the basis of the idea of the Indo-European (or Aryan) language family, a group of related languages purportedly characterized and distinguished from other groups by the purity of their grammatical form (i.e., inflection). This idea helped redefine Europeanness, aligning Europe with ancient India and Persia, while separating it from the Semitic (those who spoke languages allegedly marred by “imperfect inflection,”

exemplified by Arabic and Hebrew), as well as from all the rest—that is, the speakers of the noninflectional (or agglutinative) languages of Asia and Africa. In the course of the nineteenth century these groupings of languages became increasingly understood not only in the linguistic sense, but also in an ethnic and, finally, a racial sense. In view of the newly emergent idea of Aryan Europe and, concomitantly, the possible ancestral relation to the “noble race” (“Arya”) of ancient India, the recognition of Buddhism as a world religion had implications far beyond the technical question of how to classify religions of the world.

The question of religious versus racial identity was brought into even sharper focus by a related notion—also based on the new understanding of language groups—that Christianity, insofar as it began as one of the numerous Jewish sects, is Semitic in its historical origin, no less so than Islam and Judaism. This notion was at once intriguing and disturbing to many nineteenth-century Europeans who considered themselves Aryan yet claimed Christianity as their own, so much so that various theories were advanced implying that Christianity was only incidentally and tangentially related to the religion of the ancient Israelites. Some argued that Christianity grew not so much out of ancient Judaism as out of Panhellenism—that is, the widespread Greek culture of the Mediterranean world in late antiquity (for example, Emile Burnouf, *La Science des religions: Sa méthode et ses limites*, 2nd edition, 1872). Others propounded a theory of the Indian origin of Christianity (Louis Jacolliot, *La Bible dans l’Inde: Vie de Iezeus Christna*, 1869) or even went so far as to suggest that Christianity began in a community of Buddhist missionaries residing in Egypt (Arthur Lillie, *Buddhism in Christendom, or, Jesus, the Essene*, 1887).

Although these enormously popular nineteenth-century speculations have been largely discredited by mainstream scholarship, it is important to remember that such efforts to Hellenize and Aryanize Christianity and to separate it from its presumed Semitic parentage was not unrelated to the new recognition of Buddhism as a world religion, and, moreover, to the understanding that Buddhism was an Aryan religion in its essential beginning, though now extant only among the non-Aryan nations of eastern Asia in its various corrupted forms. At the same time, Islam—the powerful domain of an alien religion well known to European Christians for centuries—came to be increasingly represented as the religion of the Arabs, therefore, as a quintessentially Semitic religion. This opinion—which formed the basis of the argument that it was not a world religion—was held by some prominent scholars, despite the widely acknowledged fact that the great majority of Muslims, then as now, were not Arabs.

These newly emergent trends of thought were largely implicit, and yet essential to the scholarly debate about world religions that took place in the 1870s and 1880s. The scholars who engaged in this debate appear to have been uniformly of the opinion that Buddhism, in addition to Christianity, was a world religion, thus differing in their conception of the

term from that of Drey half a century earlier. The controversy was above all over the status of Islam. Some scholars counted, as a matter of course, Christianity, Buddhism, and Islam as world religions (presumably on the grounds that all three were major religions, each with a transnational spread, thus de facto demonstrating their “universalistic” aspirations and capabilities); other scholars, however, strenuously maintained that Islam was not a world religion but instead quintessentially a national religion specific to the Arabs, that it was adopted by non-Arabs only for extraneous political reasons or because it was imposed upon them by force (see Kuenen, 1882; Pfeleiderer, 1907). These contentious arguments led some others to question the cogency of distinguishing world religions from national religions in the first place, and to mitigate the earlier claims for the scientific usefulness of these categories (see Rauwenhoff, 1885; Tiele, 1885; Jastrow, 1901).

There was no clear resolution to the debate in the end; rather, it appears that the matter was decided by default. For, by the early decades of the twentieth century, when the use of the term *world religions* in the plural became well established, it was simply taken for granted that Christianity, Buddhism, and Islam were world religions. Ernst Troeltsch, for example, in his essay entitled “The Place of Christianity among the World Religions” (1923), named all three as world religions without any explanation. More fundamentally, the demarcation between *world religions* and *national religions* was effectively undermined, as the latter category dropped out of use entirely.

Perhaps no one was more instrumental in making this turn definitive and authoritative than Max Weber. In the last decade of his life, he undertook an ambitious multivolume project under the general title *The Economic Ethic of the World Religions* (*Wirtschaftsethik der Weltreligionen*), which remained unfinished at the time of his death in 1920. As can be discerned from his introductory essay of the same name, originally published independently in 1915, he treated *world religions* strictly as a conventional nomenclature referring to the major religions of the world, and he included Hinduism and Confucianism in the list; in addition, he found it necessary to consider in the same context “Ancient Judaism,” though he stopped short of naming it a bona fide world religion. Weber was of the opinion that any numerically substantial or otherwise significant religion was of interest precisely because of its uniquely characteristic ethos, each specific to the history and culture of a particular people. Put differently, all of those Weber called “world religions” were, in his view, what nineteenth-century scholars called “national religions.”

ADAPTATION OF THE TERM IN ENGLISH. The use of the term *world religions* in English most probably began with its appearance in C. P. Tiele’s article “Religions,” published in the ninth edition of the *Encyclopaedia Britannica* (1885). This was a rather literal translation of the term *wereldgodsdiensten* from his native Dutch; for, until then and sometime thereafter,

the usual translation of *wereldgodsdiensten* and *Weltreligionen* was either “universal religions” or, as Tiele himself sometimes preferred, “universalistic religions.” Although the nineteenth-century Dutch and German scholarly debate over the notion of world religions did not extend to the English-speaking world, it was known among the scholars (Jastrow, 1901, pp. 122–123), and perhaps more importantly, a parallel distinction between what continental European scholars called “national religions” and “world religions” had been drawn under different names. To cite two of the most prominent examples, the renowned Christian socialist and progressive Anglican Frederick Denison Maurice published his Boyle Lectures under the title *The Religions of the World and Their Relations to Christianity* (1847). He argued that, although all religions purported to unite and encompass all humankind in their aspiration to rise above the merely human, only Christianity actually achieved this goal, and that all other “religions of the world” were but melancholy testimonies to the impossibility of fulfilling their ideals on their own terms. In short, in his view, Christianity alone accounted for the whole, and was therefore universal, while all other religions were limited and particularistic. A second example is from across the Atlantic: the distinguished Unitarian minister James Freeman Clarke of Boston published a series of articles in 1868—issued in 1871 in a single volume as *Ten Great Religions: An Essay in Comparative Theology* and reprinted many times—where he drew the same distinction between the truly universal religion, which he termed “catholic religion,” namely Christianity, and all the rest, which he called “ethnic religions.”

It was in this sense of “universal religion” that the term *world religion*, in the singular, first came to be used by certain Anglophone theologians toward the end of the nineteenth century. John Henry Barrows—an American Presbyterian minister who served as the president of the World Parliament of Religions in 1893—lectured in India under the title “Christianity, the World-Religion” (1897), signaling his conviction that Christianity alone was the truly universal religion. Similarly, William Fairfield Warren—the occupant of arguably the first chair of comparative religion at an American university and later president of Boston University—gave the same appellation to Christianity when he wrote *The Religions of the World and the World-Religion* (1892). Far from being a synonym for “religions of the world,” then, for these authors, *world-religion* (in both cases hyphenated) signified one unique religion, their own, which, in their opinion, happened to be universally viable. In effect, they viewed the contrast between Christianity and all other religions as Maurice and Clarke had, and at the same time, their usage of the term *world-religion* was consistent with Drey’s original sense of *Weltreligion*.

It is difficult to determine with certainty how this exclusivist or Christian supremacist connotation of *world-religion* came to be displaced or overridden by the other pluralistic use of the term assumed by Tiele and others, or, for

that matter, how the novel theory originating in the scientific discourse of continental Europe—suggesting, specifically, that Buddhism at least should be regarded as a world religion in addition to Christianity—was first received in the English-speaking world generally. As it happened in the German-speaking world, the claim for the “uniquely universal” status of Christianity eventually became less pronounced in the notion of world religion(s), while the other, seemingly indifferent sense of the term, comprising any numerically significant religions, eventually prevailed.

It was during the decades between the two world wars that the use of the term *world religions*, as well as the standard list of about a dozen religions so designated, became conventional. What is remarkable about this turn of events is, first, the relatively precipitous establishment of the convention, and secondly, its unchallenged stability to this day. It is also striking that the rhetorical emphasis shifted, suddenly turning to what was regarded as current, alive, and immediately present, whereas during the nineteenth century all of the non-Christian religions—with the conspicuous and ever troublesome exception of Islam—were represented as bygone religions, as fossil-like remnants of “ancient,” “archaic,” “defunct,” or “past” religions that had been superceded by the coming of Christ.

Since the beginning of the early twentieth century, then, there has been a list of world religions that could be called standard or customary, albeit with some individual variations—some addition, subtraction, further division, or merging. The typical list almost invariably includes Christianity, Buddhism, Islam, Hinduism, and Judaism; it also frequently identifies Confucianism, Daoism, and Shintō (at times grouped together as “Chinese and Japanese religions” or “East Asian religions”), as well as Parsiism (or Zoroastrianism), Jainism, and Sikhism.

In addition to these purportedly major religions, a typical world religions textbook or curriculum often includes discussion of traditions that are supposedly minor in scale, numbers, or world-historical significance. In earlier times, these minor traditions were often referred to as “savage” or “primitive” religions, though nowadays these appellations are generally avoided and variously replaced by “primal,” “preliterate,” “tribal,” or even “basic” religions. The content of the category, under whatever name, has remained more or less constant; it refers to those cultic practices, mythic lore, and cosmologies that fall outside of the above-named major religions. Such small-scale religions are recognized generically as a type, and examples of this type are said to be found in profusion, particularly in Africa, the Americas, the Pacific islands, Oceania, Central and Southeast Asia, and other pockets of indigenous tribal life. Within this group, individual cases and examples are specified by their geographical location or by certain subcategories coined by European scholars in the eighteenth and nineteenth century, such as shamanism and animism. Whether these minor traditions en masse are treated as part of world religions or as constituting

a category in addition to world religions depends on whether a given author defines the term *world religions* as “all religions of the world” or as “major religions.” In any case, the supplementary status of “the rest” seems inevitably to have remained anomalous and problematic, thereby threatening the symmetry and stability of each classification system, whether it be the fourth category (idolaters) in the traditional system, that of national religions in the nineteenth-century scientific system, or the generic category of tribal religions among world religions in the system in use at the beginning of the twenty-first century.

BIBLIOGRAPHY

There has been little scholarly discussion or critical examination of the idea of *world religions*. Regarding the ideological implications of applying this concept to a specific geographical location, Timothy Fitzgerald considers the case of India in “Hinduism and the World Religion Fallacy,” *Religion* 20 (1990): 101–118. Russell T. McCutcheon critiques an aspect of the current pedagogic practice of religious studies, as predicated on the notion of world religions, in *Manufacturing Religion: The Discourse on Sui Generis Religion and the Politics of Nostalgia* (New York, 1997). For an overall history of the idea of world religions, see Tomoko Masuzawa, *The Invention of World Religions* (Chicago, 2005).

It is important to consider this history in relation to the formation of the concept of religion(s) more generally, and for this purpose particularly informative are two articles by Jonathan Z. Smith, “Religion, Religions, Religious,” in *Critical Terms for Religious Studies*, edited by Mark C. Taylor, pp. 269–284 (Chicago, 1998), and “Classification,” in *Guide to the Study of Religion*, edited by Willi Braun and Russell T. McCutcheon, pp. 35–44 (London, 2000).

Historically, F. Max Müller has been regarded by many scholars as the progenitor of the science of religion and of the modern scholarly classification of religions, as delineated in his *Introduction to the Science of Religion* (London, 1873); it is all the more notable, then, that Müller expressly avoided engaging in the debate concerning the notion of world religions and that he never made use of the term. For critical discussions by his contemporaries of the category of world religions and systems of classification, the following texts may be consulted: C. P. Tiele, *Geschiedenis van den Godsdienst tot aan de heerschappij der Wereldgodsdiensten* (Leiden, 1876), translated by J. Estlin Carpenter as *Outlines of the History of Religion to the Spread of the Universal Religions* (London, 1877), as well as Tiele’s entry, “Religions,” in the ninth edition of the *Encyclopaedia Britannica* (Edinburgh, 1885); Abraham Kuenen, *Volksgodsdienst en Wereldgodsdienst* (1882), translated by P. H. Wicksteed as *National Religions and Universal Religions* (London, 1882); L. W. E. Rauwenhoff, “Wereldgodsdiensten” (in Dutch), *Theologisch Tijdschrift* 19 (1885): 1–33; P. D. Chantepie de la Saussaye, *Lehrbuch der Religionsgeschichte*, vol. 1 (Freiburg, Germany, 1887), translated by Beatrice S. Colyer-Furgusson as *Manual of the Science of Religion* (London, 1891); Maurice Vernes, *L’Histoire des religions; son esprit, sa méthode, et ses divisions, son enseignement en France et à l’étranger* (Paris, 1887); Morris Jastrow

Jr., *The Study of Religion* (New York, 1901); and Otto Pfleiderer, *Religion und Religionen* (Munich, 1906), translated by Daniel A. Huesch as *Religion and Historic Faiths* (New York, 1907).

Regarding the earliest examples of texts employing the modern notion of world religions (though not necessarily adopting the term) and exhibiting more or less the same list of religions as is encountered today, the following were among the most renowned and authoritative: George Foot Moore, *History of Religions*, 2 vols. (New York, 1913–1919); Robert Ernest Hume, *The World's Living Religions: An Historical Sketch* (New York, 1924); and John Clark Archer, *Faiths Men Live By* (New York, 1934). Whereas nineteenth-century books, pamphlets, and lectures on the subject of world religions were often intended for future Christian missionaries and for others likewise seeking a confirmation of Christian superiority in comparison to other religions, the texts just mentioned are meant expressly for liberal arts college students and for the general public. In this connection, also noteworthy is what appears to be the first correspondence course in world religions and an early instance of a university extension enterprise based in Chicago. The textbook for the course—twelve monthly issues containing essays by prominent scholars, including Müller (Oxford), Jastrow (Pennsylvania), and Chantepie de la Saussaye (Amsterdam), among others, and edited by Edmund Buckley—is entitled *Universal Religion: A Course of Lessons, Historical and Scientific, on the Various Faiths of the World* (Chicago, 1897).

The earliest books that mention *world religions* in the title—in English and in the contemporary sense of the term—are Charles Samuel Braden's *Modern Tendencies in World Religions* (New York, 1933) and *Modern Trends in World-Religions*, edited by A. Eustace Haydon (Chicago, 1934).

Meanwhile, the extant portion of Max Weber's unfinished project, *Die Wirtschaftsethik der Weltreligionen* (literally, *The Economic Ethic of the World Religions*), was published posthumously as *Gesammelte Aufsätze zur Religionssoziologie*, 3 vols. (Tübingen, Germany, 1921). The introductory essay by the same name as the overall project had been previously published independently in *Archiv für Sozialwissenschaft und Sozialpolitik* (1915); it has been translated as "The Social Psychology of the World Religions" and included in *From Max Weber: Essays in Sociology*, edited and translated by H. H. Gerth and C. Wright Mills (New York, 1946), pp. 267–301. Weber's most famous work, *The Protestant Ethic and the Spirit of Capitalism*, translated by Talcott Parsons (New York, 1930), constitutes but a segment of this massive project, as do three other monograph-length works by him that were separately published in English: *The Religion of China*, translated by Hans H. Gerth (New York, 1951); *Ancient Judaism*, translated by Hans H. Gerth and Don Martindale (New York, 1952); and *The Religion of India*, translated by Hans H. Gerth and Don Martindale (New York, 1958).

The subject of world religions in general gained much popularity in the English-speaking world in the second half of the twentieth century. In the decades following World War II, curricula for the secular study of religions proliferated, particularly in American colleges and universities. Concurrently, there appeared a number of texts that came to have enduring influ-

ence and that have undergone many reprints and revised editions. Those include *The Religions of Man* by Huston Smith (1st ed., New York, 1958); *The Concise Encyclopedia of Living Faiths*, edited by R. C. Zaehner (New York, 1959); *The Religious Experience of Mankind* by Ninian Smart (1st ed., New York, 1969); and *Religions of the World* by E. Geoffrey Parrinder (New York, 1971).

TOMOKO MASUZAWA (2005)

WORLD'S PARLIAMENT OF RELIGIONS.

Held in Chicago from September 11 to 18, 1893, in conjunction with the Columbian Exposition, the World's Parliament of Religions was a milestone in the history of interreligious dialogue, the study of world religions, and the impact of Eastern religious traditions on American culture. The parliament's several delegates from Asia were among the first authoritative representatives of their traditions to travel to the West. The earliest Vedāntist and Buddhist organizations in the United States to cater primarily to Westerners can be traced directly or indirectly to the conference and its delegates.

Though awakened by the "Yankee Hindoo" motif of New England transcendentalism during the early part of the nineteenth century and furthered by the educational efforts of the Theosophical Society (founded in New York in 1875), American interest in Eastern spirituality was enhanced by the publicity created by the conference. The number of courses in "comparative religion" at American colleges rose appreciably as a result of the event. At the same time the parliament provided an occasion for dialogue, enabling Christian apologists to present forceful counterarguments to those of their Eastern colleagues, linking faith in Christ with "progress" and moral superiority and justifying missionary endeavor. Indeed, while the parliament was undeniably liberal Protestant in tone, it was also a pioneering ecumenical event, international in scope. Roman Catholic and Jewish spokespeople took their places alongside representatives of those "mainstream" Protestant denominations that were, at that time, usually perceived as the dominant form of American religious life.

The idea of sponsoring a parliament of religions was proposed to the Columbian Exposition by Charles C. Bonney (1831–1903), a civic leader and devout layman of the Swedenborgian Church; his role could be said to epitomize the rising influence of the laity in American religion at the time. Paul Carus (1852–1919), the Open Court Press editor and publisher, influential through his early introduction of Eastern classics to Western readers, was also an active promoter of the event. The leadership of the parliament itself, however, was clerical—preeminently in the person of John Henry Barrows (1847–1902), a prominent Chicago Presbyterian minister.

Nonetheless, the most lasting impression at the conference was made by three colorful, articulate representatives of

Hinduism and Buddhism: Swami Vivekananda (1863–1902), Anagārika Dharmapāla (1864–1933), and Shaku Sōen (1859–1919). Vivekananda, a disciple of the saintly Ramakrishna Paramahansa (1836–1886), was the founder of the Ramakrishna Mission, which has planted outposts of intellectual Hinduism (frequently known as Vedanta Societies) throughout the West. Dharmapāla, a Singhalese reformer, was the founder of the Maha Bodhi Society, which aimed at revitalizing and promoting Buddhism in dialogue with modern thought; the society came to have a great deal of interaction with Western Buddhists. Shaku, a Japanese Zen priest, was particularly influential through his students, who included the first Zen monks to settle in America (a decade or so later) and the layman D. T. Suzuki (1870–1966), whose books have done much to introduce Zen to the West.

The parliament was not without difficulty or dissent. Islam was inadequately represented; the participation of Roman Catholics sparked much controversy within their church; and many conservative Protestants were horrified by the entire project. The gathering's coincidental connection with the American "triumphalism" of the Columbian Exposition, in the heyday of Western expansion, sent a strangely ambiguous message. But the parliament's American fruits, in the form of both increased academic study of world religion and non-Western religious presences in America, foreshadowed the religious pluralism of the twentieth century and remain visible in the twenty-first.

At the same time, non-Western delegates like Vivekananda (though often seen by conservative coreligionists as too prone to universalism and modernism) became key promoters of reform within their own faiths. Moreover, the parliament was viewed by nationalists as legitimating their homeland's spiritual culture against colonialism, and so played a role in the cultural and, ultimately, political renaissance of nations like India and Sri Lanka.

In 1993, on the centenary of the first parliament, a second Parliament of the World's Religions (apart from one or two smaller interreligious events called congresses or parliaments) brought some six thousand attendees to Chicago. The effects of a hundred years were evident. Among the most conspicuous delegates were Tibetan Buddhists, Western Neopagans, and Native Americans, all unrepresented in 1893. The distinguished student of American religious pluralism Diana Eck noted in a major address that when Swami Vivekananda came to Chicago there were no known Hindus in that city, while in 1993 some twenty Hindu temples served the Chicago area. The same was true also with Buddhism, Islam, and other religions once mysterious to most Americans.

The twentieth-century event was far more participatory than the earlier one, despite the dramatic opening procession in 1893. The halls of the hotel in which the 1993 event was held echoed with the sounds of chants, gongs, drums, and prayers as well as speeches. This parliament focused not only on getting acquainted but also on the application of the

world's religious energies to the world's problems. A parliamentary document, "Toward a Global Ethic," called on the planet's spiritual leaders to work assiduously toward universal justice, peace, nonviolence, and ecological awareness. The major address at the closing ceremony was given by the Dalai Lama, who urged the implementation of these values.

For all that, it cannot be said that the 1993 parliament had the impact of the first. It was but one voice and one interreligious experience among many in the late-twentieth-century world, whereas the first parliament in a real sense created, or epitomized, a new era in world spiritual interaction.

A third Parliament of the World's Religions, inspired by the second, was held in Cape Town, South Africa, in December 1999. While inspiring for the some six thousand attendees, it too was of less historical significance than the first.

WORSHIP AND DEVOTIONAL LIFE: JEWISH WORSHIP

Although never discouraging private, incidental prayer, Judaism gives absolute priority to the formal worship of the community. Jewish law (*halakha*) establishes that even individuals praying privately must first recite the fixed texts,

meeting their own needs through added intentionality (*kavanah*) before adding freely composed prayers only in restricted locations. This worship functions as a constant reminder to Jews of their existential situation: they are members of the people Israel, living a life enabled by God in a divinely created and maintained world, corporately heirs to the irrevocable covenants between God and Israel. The formal prayers grow from this relationship, expressing praise, petition, and thanksgiving to God, as well as reminding Jews of the expectations it places on them for a life lived constantly in the divine presence. In reciting these prayers, Jews locate themselves within a sacred history that extends from creation, through the exodus and Sinai revelation, to the future messianic fulfillment of God's promises.

Jewish worship includes prayers by which to respond to the inherent holiness found in every moment of life, from the seemingly mundane (like the proper functioning of bodily orifices), to the seemingly miraculous (like seeing rainbows and flowering trees). It touches on every moment of normal waking life, from rising, dressing, eating, and studying to interpersonal relations. The Babylonian Talmud (Menaḥot 43b) cites the second-century CE Rabbi Meir that everyone must recite one hundred blessings daily. By this practice, one acknowledges the sanctity of all these moments, praising God as sovereign of the universe for all aspects of the divine relationship with creation.

The first preserved Jewish prayer books, from the ninth century CE, begin as lists of these hundred blessings. Jewish worship calls for the regular recitation of many of these blessings during statutory formal worship of God, thrice daily with additional services on holidays. Concatenations of blessings structure the central statutory prayers. These prayers ideally are recited with a *minyan*, a quorum of ten worshippers, usually but not necessarily in a synagogue, in the presence of a Torah scroll. Individuals, however, may recite most of these prayers for themselves. Any member of the *minyan* (adult Jews, traditionally only men) may lead public prayers, taking on the role of the *sheliaḥ tsibbur*, the emissary of the congregation. No clergy are necessary, although a congregation may appoint a *hazzan*, or cantor, as a professional *sheliaḥ tsibbur*, and in modern liberal contexts rabbis often lead services.

ORIGINS. This system of worship apparently developed in response to the destruction of the Jerusalem Temple by the Romans in 70 CE. While the Temple functioned, Jewish corporate worship of God was sacrificial, consisting of daily and festival sacrifices offered by the priestly families on behalf of the nation and in response to God's biblical covenantal commands. These sacrifices, like those of the Jews' neighbors, required scrupulous attention to detail, both in the choice of unblemished sacrificial victims and in the performance of the cultic acts. Priests offered lambs morning and afternoon, as well as incense and grain offerings and additional sacrifices to mark Sabbaths and holidays. Individual Jews who could attend brought various other offerings, either from personal

obligation or in celebration. Many holy days called for special Temple rituals: the sacrifice of paschal lambs at Passover, the complex expiatory offerings of the high priest on Yom Kippur, the blowing of the *shofar* (ram's horn) on Ro'sh ha-Shanah, circumambulation with *lulav* (palm branches) at Sukkot, or the singing of *hallel* (*Psalms* 113 to 118) on most festivals.

We know of few settings where Jews gathered for worship outside of the Temple while it functioned. Synagogues existed in Israel and in the Diaspora, but probably as places for reading and studying scripture or for meetings, not for regular communal prayer. Communities whose local priests were serving in Jerusalem (the *ma'amad*) apparently gathered for a scripture-centered worship during those weeks. At least one dissident group, objecting to the administration of the Temple, retreated to the Dead Sea and conducted regular, nonsacrificial worship. Textual evidence from the Dead Sea Scrolls, as well as from liturgical passages in contemporary Jewish literature, suggests that a recognized register of prayer language was emerging, in Hebrew and in continuity with biblical prayer texts. Jewish prayer in Greek likely also existed in some circles, but evidence is sparse.

RABBINIC PRAYER. With the destruction of the Temple, the covenantal, biblically-mandated worship of God ceased, creating a spiritual crisis. Many competing substitute methods of worship were likely proposed, most of which failed to gain authority. Some Jews may also have chosen simply to wait for a restoration of the cult, as had happened after the destruction of the Solomonic Temple by the Babylonians. The worship system that became universal Jewish prayer seems to have begun as a substitution for sacrifices among the rabbinic class under the leadership of Rabban Gamli 'el at Yavneh in the last decades of the first century CE. In a revolutionary move, Rabban Gamli 'el decreed that instead of priestly, sacrificial worship in Jerusalem, now every Jew everywhere was responsible for daily verbal prayer (Mishnah *Berakhot* 4:3). Sages of his academy organized a prayer of eighteen blessings, known then as "the prayer" (*ha-t'fillah*) to be recited at every weekday service, with shorter versions for holy days. Later Jewish communities call this prayer the *'amidah*, for the standing posture in which it is recited, or *sh'moneh 'esreh*, the eighteen. The recitations of this prayer assumed the names of the daily sacrifices and were recited at corresponding hours while facing Jerusalem's Temple Mount. The content of this prayer is complex, but its focal point on weekdays is a petition for messianic redemption, including the rebuilding of the Temple. On Sabbaths and holidays, a single blessing reflecting on the holiness of the day replaces its thirteen petitionary blessings.

Scholars today debate whether Rabban Gamli 'el's court decreed simply the thematic structure of this prayer, enabling individuals to develop their own precise language, or whether they promulgated a verbatim tightly composed set of prayers. Classical rabbinic texts preserve only snippets of these prayers. The sheer variety of language that developed in sub-

sequent centuries around the common Yavnean structure suggests some freedom. In either case, we know little about how quickly Jews throughout Israel, let alone throughout the Diaspora, responded to this revolutionary decree. Materials embedded in the late-fourth-century Christian Apostolic Constitutions (VII:33–38) suggest that Greek versions were also extant.

It is possible that rabbinic prayers became Jewish prayers more broadly and became the worship of the preexistent synagogue only as rabbinic influence grew in the third and fourth centuries. Archaeological evidence points to a flowering of synagogue construction in Byzantine Palestine, and these synagogues show some evidence of rabbinic presence. Rabbinic tradition records that only in the third century did rabbis rule that only blessings formulated as “Blessed are You, Lord our God, King of the universe” were appropriate (Babylonian Talmud *Berakhot* 40b). This is also the period where rabbis finalized the protocols for joining the *ṭ’fillah* with the recitation of *sh’mā’*.

The *sh’mā’*, the recitation of *Deuteronomy* 6:4–9, 11:13–31, and *Numbers* 15:37–41, forms the second major component of rabbinic prayer. Its origin is obscure, but its recitation morning and night as a liturgical unit surrounded by blessings is presumed in the earliest rabbinic texts. In reciting these biblical passages, one declares loyalty to God and God’s commandments. The passages command Jews to surround themselves physically with reminders, placing the text on the entrances to their house (*mezuzah*), wearing it on their forehead and arm (*ṭ’fillin*), and knotting fringes on the corners of their clothes (*tsitsit*). The complex blessings surrounding the biblical passages focus on Judaism’s central theological tenets: God is creator, the revealer of Torah, and the one who saves.

Whether or not all synagogue communities conducted rabbinic prayer, the rabbis presumed early that their worship would take place in the presence of the Torah scroll and that the *sheliakh tsibbur* for the *ṭ’fillah* would stand before the ark housing it—presumably located in the communal synagogue. The third major component of rabbinic prayer is native to the synagogue: the public reading and exposition of scripture. This apparently had its roots in the Second Temple period. The rabbis maintained the pattern of reading Torah on the Sabbath and the Monday and Thursday market days. Cyclical reading of the entire Torah apparently developed gradually during the rabbinic period, with two cycles emerging: an annual cycle with the entire Pentateuch being read in one year, and a so-called triennial cycle with the entire text being read twice in seven years. Originally, each community followed its own cycle. By the Geonic period (late sixth to eleventh centuries), the Babylonian annual cycle gradually displaced all alternatives. Since then, on Simḥat Torah (Rejoicing of the Torah) at the conclusion of the fall festivals, Jews complete *Deuteronomy* and immediately begin *Genesis*. Evidence for ritual reading from the Prophets (*haftarah*) appears first in *Luke* 4:17. These readings, only per-

formed on Sabbaths and festivals, are not cyclical. They correspond either to the content of the Torah reading or to the day and are not uniform universally. They include only a small fraction of the prophetic corpus.

A specified number of congregants participates in the lection each time, either by personally reading a section of the text or, more frequently, by reciting blessings over the text read by a designated reader. The pentateuchal text must be chanted from a properly prepared parchment scroll that contains a perfect copy of the entire Torah; the scroll itself, like ancient Hebrew texts, contains neither vowels nor musical notation. In this way, the reading ritually recapitulates the revelation of Torah at Mount Sinai. Today, the rest of the congregation follows in printed Bibles that often include vernacular translation or commentaries. Until medieval Jews adopted other vernaculars, Aramaic translation (*targum*) accompanied all readings of scripture. The scrolls of *Song of Songs*, *Ruth*, *Lamentations*, *Ecclesiastes*, and *Esther* are read on Passover, Shavu’ot, the Ninth of Av, Sukkot, and Purim, respectively.

Psalms also play an important role in Jewish worship, but not in a lectionary context. The synagogue perpetuates the Temple’s festival recitation of *hallel* (*Psalms* 113 to 118), as well as the daily psalms originally recited by the Levites there (*Psalms* 24, 48, 82, 94–95:3, 81, 93, 92). Other psalms eventually became standard as introductory morning prayers (*p’suqei d’zimra*, verses of song). Although the full list varies from rite to rite and is expanded on Sabbaths, all today include daily the core of *Psalms* 145 to 150 as well as *Exodus* 15.

Other nonsacrificial Temple rituals specific to various holidays were also integrated into the synagogue service, often in the additional service (*musaf*). The Ro’sh ha-Shanah *musaf* includes an elaborate ritual for the blowing of the *shofar*; the Yom Kippur *musaf* includes an extended recollection of the high priest’s rituals in the Temple; Sukkot rituals include waving the four species (*lulav*) during *hallel* and parading with them with special songs before or after *musaf*. Jews of priestly descent also pronounce the priestly benediction (*Nm.* 6:24–26) over the assembled congregation. Outside of Israel this occurs only during the *musaf* of festivals; in Israel, Sabbaths are added. In Jerusalem, in proximity to the location of the Temple, priests pronounce it daily.

The Hebrew of the core prayers described above also alludes deeply to biblical language but rarely cites verses verbatim. Probably in the mid-first millennium it became common to construct new prayers as florilegia of biblical verses. Prayers of this style appear around the earlier core, both in the introductory psalms and in the supplicatory prayers (*tahanun*) that came to follow the *amidah*. However, allusions to the Bible and to midrashic comment on it continued to inform the rich body of liturgical poetry (*piyyut*) that embellished the core prayers on Sabbaths and holidays in that period and later. Prayers constructed of verses characterize the liturgy of Karaite Jews, a group rejecting rabbinic teach-

ings that emerged in the closing centuries of the first millennium.

MEDIEVAL ADDITIONS. Various elements of private liturgy also became part of public prayer in the medieval period, out of concern for their popular neglect. These include the series of blessings intended to accompany one's actions while rising in the morning (*birkhot hashahar*) and a symbolic study of both written and oral Torah. This Torah study provides another opportunity to recall and vicariously participate in the Temple sacrifices by reciting the biblical and rabbinic texts describing them.

This complex of prayers constituted public worship for all Jews until modernity. All the regional rites preserved this basic structure, differing only in specific wording and, especially, in their poetic additions. Medieval Jews increasingly considered their received rites to be authoritative and unalterable, appropriately meeting God's desire for worship. Medieval and early modern Jews adapted their fixed prayers to new situations through interpretative strategies, investing their received prayers with new, frequently mystical, meanings. These meanings could find expression through meditations on the fixed texts or through additions in the interstices of the prayer book of *qavvanot*, texts expressing the mystical intentions of the prayers. Frequently, one generation's innovative response became the fixed liturgy of their descendants. Most widely accepted were memorial prayers added in the wake of the Crusades and liturgies influenced by the customs of sixteenth-century Lurianic Qabalah, like the *Psalms* and songs welcoming the Sabbath (*qabbalat shabbat*).

Especially with the expulsion of Jews from Spain in 1492, the regional nature of the rites changed. Rather than adapting to the rites of their new homes, the refugees who were dispersed throughout the Mediterranean and Europe preserved their Sephardi (Iberian) rites. This led to the demise of almost all Mediterranean and Eastern rites and meant that communities now sometimes supported multiple synagogues with different customs. Heredity more than location determined liturgical details. Influenced by Lurianic mysticism, Hasidism, beginning in the eighteenth century, deliberately adopted elements of Sephardi-rite liturgy into their eastern European Ashkenazi context.

Little is known about women's participation in this system. Women seem to have attended services more in late antiquity and in Christendom than under Islam. From the twelfth century, there is evidence in the Rhineland both for women's sections of synagogues and for women who led other women in prayer there. In some places women prayed the statutory prayers but in their vernacular; others learned Hebrew; others were probably regularly "prayerful" but did not know the official prayers. Prayer books produced for women presume their participation in the normative liturgy, but such early modern Yiddish prayers (*tehines*) often parallel rather than participate in the "men's" liturgy.

MODERNITY. With Napoleon (1769–1821), western European Jews became citizens and sought to become full mem-

bers of greater society. This meant, for some, transforming Jewish worship into something less strange in Christian eyes. Elements of this transformation included increased decorum, more formal music, more preaching, and shortened prayers (by removing much *piyyut* and mystical accretions). Reform Judaism adopted vernacular prayer and theologically driven changes to its contents. This allowed for radical abbreviation of the traditional liturgy, but the structure described above usually remained discernable. Rabbis and cantors were increasingly liturgical experts performing for a largely passive audience. After 1948, the presence of the State of Israel encouraged a cultural expression of Judaism, generating a return to Hebrew prayer and concepts of Jewish peoplehood. In this period, women too became full participants in the non-Orthodox synagogue, counting for the *minyan* and serving as its professionals. Feminism has generated another set of changes to prayer language with demands for egalitarian language. While Orthodox Judaism (as it became known in this period) can allow only aesthetic changes to the worship service, a full spectrum now exists between it and the most radical Reform settings, where immediate response to cultural change is normative.

BIBLIOGRAPHY

Since the publication of a series of Hebrew articles by Ezra Fleischer beginning in 1990, there has been significant scholarly disagreement over the origins of rabbinic liturgy. For a review of these articles, see Ruth Langer, "Revisiting Early Rabbinic Liturgy: The Recent Contributions of Ezra Fleischer," *Prooftexts* 19, no. 2 (1999): 179–194; and Ezra Fleischer and Ruth Langer, "Controversy," *Prooftexts* 20, no. 3 (2000): 380–387. Among those disagreeing with Fleischer are Stefan C. Reif, *Judaism and Hebrew Prayer: New Perspectives on Jewish Liturgical History* (Cambridge, U.K., 1993), which provides the most comprehensive recent scholarly survey of Jewish prayer, including important discussions of medieval and early modern dynamics. See also Reuven Kimelman, "The Literary Structure of the Amidah and the Rhetoric of Redemption," in *The Echoes of Many Texts: Reflection on Jewish and Christian Traditions, Essays in Honor of Lou H. Silberman*, edited by William G. Dever and J. Edward Wright (Atlanta, 1997), pp. 171–218. Also of importance are Kimelman's "The *Shema* Liturgy: From Covenant Ceremony to Coronation," *Kenishta: Studies of the Synagogue World* 1 (2001): 9–105. Fleischer challenges the still influential theory, informed by form-critical methods, of Joseph Heinemann, *Prayer in the Talmud*, translated by Richard S. Sarason (Berlin, 1977). Earlier methods are generally no longer accepted. However, Raymond Scheindlin's translation of Ismar Elbogen, *Jewish Liturgy: A Comprehensive History* (Philadelphia, Jerusalem, and New York, 1993; German ed., 1913), incorporates the editorial updates of the 1972 Hebrew edition. Even though Elbogen's historical reconstructions are now deemed unreliable, his descriptions of the litur-

gy remain valid. Important discussions also appear in Lee I. Levine, *The Ancient Synagogue: The First Thousand Years* (New Haven and London, 2000). Another dimension of attention to the nonverbal dynamics of early liturgy appears in Uri Ehrlich, *The Non-Verbal Language of Jewish Prayer* (in Hebrew; Jerusalem, 1999).

The subsequent history of Jewish prayer is less well studied. Reif's *Judaism and Hebrew Prayer* provides the only comprehensive overview. Hebrew liturgical poetry is the focus of many recent important publications in Hebrew. On the dynamics of this genre, see Joseph Yahalom, *Poetry and Society in Jewish Galilee of Late Antiquity* (in Hebrew; Tel Aviv, 1999). On early medieval liturgy, see Lawrence A. Hoffman, *The Canonization of the Synagogue Service* (Notre Dame, Ind., and London, 1979); Naphtali Wieder's collected articles, *The Formation of Jewish Liturgy in the East and the West* (in Hebrew; Jerusalem, 1998); and Ezra Fleischer's *Eretz-Israel Prayer and Prayer Rituals as Portrayed in the Geniza Documents* (in Hebrew; Jerusalem, 1988). On dynamics of liturgical development see Ruth Langer, *To Worship God Properly: Tensions between Liturgical Custom and Halakhah in Judaism* (Cincinnati, 1998). Collections of important studies include E. D. Goldschmidt, *On Jewish Liturgy: Essays on Prayer and Religious Poetry* (in Hebrew; Jerusalem, 1980) and Israel Ta-Shma's *The Early Ashkenazic Prayer: Literary and Historical Aspects* (in Hebrew; Jerusalem, 2003). On the impact of mysticism on the liturgy, see especially Meir Bar-Ilan, *The Mysteries of Jewish Prayer and Hekhalot* (in Hebrew; Ramat Gan, Israel 1987); Moshe Hallamish, *Kabbalah: In Liturgy, Halakhah, and Customs* (in Hebrew; Ramat Gan, Israel, 2000); and Louis Jacobs, *Hasidic Prayer* (London and Washington, 1972; reprint, 1993). On women and prayer, see *Daughters of the King: Women and the Synagogue*, edited by Susan Grossman and Rivka Haut (Philadelphia, New York, and Jerusalem, 1992); and Chava Weissler, *Voices of the Matriarchs: Listening to the Prayers of Early Modern Jewish Women* (Boston, 1998).

WORSHIP AND DEVOTIONAL LIFE: CHRISTIAN WORSHIP

The death of Jesus of Nazareth by crucifixion and his resurrection on the first day of the week constitute the root paradigm of Christianity and, as such, are central to Christian worship in all its dimensions. Because that death and resurrection occurred at Jerusalem at the time of the Jewish Passover (Heb., Pesah; *pascha* in the Greek transliteration of the Aramaic), this paradigm is frequently referred to as "the paschal mystery." Paul's *First Letter to the Corinthians* (5:7) identifies the death of Jesus with the sacrifice of the Passover lambs, and that same identification is made in the *Gospel of*

John (19:32–36 refers to the prohibition against cracking the bones of the lamb eaten at Passover). References in early Christian literature to the Cross or to the death of Jesus should most frequently be understood as including Jesus' resurrection and glorification, the total paschal mystery as that paradigm of salvation in which the Christian participates.

CHRISTIAN INITIATION. The public ministry of Jesus began with his baptism by John in the river Jordan. The accounts of that baptism report that when Jesus came up from the water the Holy Spirit descended upon him and the voice of God proclaimed him to be the Son of God. This outpouring of the Holy Spirit is referred to (*Acts* 10:38) as an anointing by virtue of which Jesus is the expected "anointed one" (the Messiah, or Christ). Such ritual washings as the baptism of John were common in Judaism in the first century of the common era, and many scholars suppose that the early Christian baptismal rituals were influenced by the initiatory ritual employed for converts from paganism to Judaism, where circumcision was followed by a ritual washing.

Early Christian baptism. The earliest accounts of Christian baptism focus on the confession of Jesus as Lord, usually in response to preaching, and on the ritual washing. The earliest church order, *Didache* (before CE 100), describes that washing, following extended catechesis, as preferably accomplished by immersion in running water, but it allows for water to be poured over the initiate three times. In either case, the baptism is to be performed "in the name of the Father, and of the Son, and of the Holy Spirit." It is uncertain whether such references to the anointing and sealing of Christians as that in *2 Corinthians* 1:21 refer to an actual anointing with oil in first-century initiatory ritual, but such anointings do appear in the course of the second century. In Syria an anointing prior to the water bath was called *rushma* ("mark") and has been interpreted as a Christian surrogate for the circumcision that preceded the water bath in Jewish proselyte baptism. Elsewhere such baptismal anointing was associated with the outpouring of the Holy Spirit upon Jesus and so was performed after the water bath. Such postbaptismal anointing (referred to as the "seal") was frequently accompanied by imposition of the baptizer's hands upon the initiate. Such is the pattern reported for North Africa by Tertullian (*On Baptism* 7–8).

The most extensive of the early church orders, the *Apostolic Tradition* (third century), usually assigned to Hippolytus at Rome, reveals a more extensive initiatory process. After three years as catechumens (learners), candidates for baptism are selected after careful scrutiny and enter a final period of intensive preparation under direct supervision of the bishop. At the end of that period, concluded with a two-day fast, the initiates keep vigil through the night from Saturday to Sunday until cockcrow. Then, stripped of their clothing and having renounced Satan and his service, they are anointed with an exorcised oil. Next, entering the water, they profess belief in each of the persons of the Trinity in response to a three-fold creedal examination and are immersed after each profes-

sion. Coming up from the water, they are anointed with another oil, the “oil of thanksgiving” (later known as *chrisma* or *muron*), and reassume their clothing. They are then led to the bishop before the gathered congregation and anointed again by him with the imposition of his hands upon their heads. The bishop then kisses each initiate, and they take their places in the congregation to participate in the prayer of the community and in the eucharistic meal for the first time. This complex initiatory ritual set the pattern discernible, with significant variations, in later centuries. The Eastern churches maintain only one postbaptismal anointing, while the anointing by the bishop was eventually separated from baptism in the Western church, coming to be known as “confirmation.”

It is widely supposed that the initiation described in the *Apostolic Tradition* took place on Easter at the conclusion of the paschal vigil. In the course of the third century such paschal baptism became the norm in most churches, and many scholars have suggested that the custom was much more ancient. Such a time for baptism is rendered particularly appropriate by the baptismal theology of Paul (*Rom.* 6), which associated baptism with participation in Christ’s burial and resurrection, and by Jesus’ references to his coming passion and death as his “baptism” (*Lk.* 12:50).

Normalization of infant baptism. While primitive baptismal practice with its extensive catechesis took adult baptism to be normative, in the third century the baptism of young children, although opposed by some, was practiced frequently. By the fifth century it was perhaps more common than the baptism of adults, and by the sixth century the catechumenate was reduced to a formality. Vestiges of that formative process perdured, nonetheless, and were still evident in the rites used by Western Christians at the time of the Reformation. The reforms of the sixteenth century removed from the baptismal rite many of the ceremonies that had belonged formerly to the catechumenate, and the postbaptismal anointings were also dropped from Protestant baptismal practice. Infant baptism continued to be the norm, however, and increasingly a postbaptismal formative process of instruction and discipline led to a rite of confirmation after age seven for both Catholics and Protestants, although for Catholics that rite usually followed well after admission to the Eucharist.

Opposition to the baptism of those too young to make a personal profession of faith occurred from time to time in the Middle Ages and became a significant wing of the Reformation with the Anabaptists. Since the seventeenth century, such refusal to practice pedobaptism and the insistence on believers’ baptism has been characteristic of several Protestant churches, the Baptists being the most numerous. While Roman Catholics, Anglicans, and churches of the Evangelical and Reformed traditions continue to baptize infants, as do the Eastern churches, liturgical studies in the twentieth century have focused attention on the rich initiatory rituals of the patristic age, and restoration of that classic passage

through catechesis to baptism, anointing, and eucharist has held an important place in the agenda of recent liturgical reform, the Rite of Christian Initiation of Adults in the Roman Catholic church being a significant instance.

THE HOLY EUCHARIST. As early as the *Didache*, participation in the communion meal, or Eucharist, was limited to the baptized, and such participation in the Eucharist is regularly found as the conclusion of the initiatory process. The Eucharist is, indeed, the locus of that *koinōnia*, or communion, which is the mode of the Christian’s unity with other Christians in the unity of the church, and of the church’s unity with Christ: a unity expressed and realized in the believer’s feeding on Christ’s body and blood through the eucharistic signs of bread and wine. The *Didache* speaks of the Eucharist as a sacrifice, and this may reflect a sense of continuity with the *zevah todah*, the “thank offering” of the Second Temple period in which those who offered a sacrifice consumed part of it, thus keeping communion with God, to whom the victim was offered.

In later centuries both this offering of the eucharistic gifts of bread and wine to God as a memorial of and thanksgiving for Christ’s death and resurrection, and the consecration of these gifts to identify them with Christ’s body and blood, would achieve explicit expression in the eucharistic prayer, the central prayer of the Eucharistic liturgy. The *Apostolic Tradition* presents the text of a eucharistic prayer that opens with a dialogue between the officiating celebrant and the congregation which has remained virtually unchanged in the West, and proceeds to a thanksgiving for the redemptive work of Christ, which comes to its climax in a recitation of the charter narrative describing the institution of the Eucharist by Jesus on the night before his crucifixion. The earliest such institution narrative is that in Paul’s *First Letter to the Corinthians* (chap. 11), written around 55 CE, which many exegetes consider to have been a text transmitted through liturgical tradition.

In the *Apostolic Tradition* that narrative’s concluding command, “When you do this, make my memorial,” is followed at once by the clause that accompanies the narrative in virtually all early liturgies, although the wording varies considerably. Such a clause, known technically as *anamnēsis* (“memorial”), is generally believed to have been attached to the institution narrative from the first inclusion of that narrative within the body of the eucharistic prayer. In the prayer of the *Apostolic Tradition* the *anamnēsis* reads, “Remembering therefore his death and resurrection, we offer to thee this bread and cup, giving thanks to thee that thou hast made us worthy to stand before thee and to minister to thee.” This is the earliest extant example of such an inclusion of the narrative and the *anamnēsis* in the body of the eucharistic prayer, but it is typical of the prayers of the fourth century and later. In the *Apostolic Tradition* the *anamnēsis* is followed by an invocation of the Holy Spirit upon the oblation of the church, praying that all who receive the holy gifts, being united, may be filled with the Holy Spirit for the strengthening of faith.

Such an invocation of the Holy Spirit is referred to as an *epiklēsis*.

That pattern for the eucharistic prayer was expanded in most of the Eastern empire in the fourth century. In the first place, after the opening dialogue, a praise of God as creator, hymned by the heavenly hosts, was added before the christological thanksgiving. Such an opening praise of the creator, ending in the singing of the Sanctus (a liturgical hymn already in the Temple liturgy reflected in *Isaiah* 6:3 and continued in the synagogue liturgy after the destruction of the Temple), is characteristic of eucharistic prayers of Cappadocia, Syria, Palestine, and eventually Alexandria. A second development in these fourth-century prayers is the focusing of the *epiklēsis* on the oblations of bread and wine, invoking the Holy Spirit for their consecration as the body and blood of Christ. Also, the older content of that supplication, the gathering of the church into union with God, was expanded into a series of intercessions.

Influenced perhaps by a transitional phase in liturgical evolution at Alexandria, a different pattern for the eucharistic prayer emerged in the West. First visible in northern Italy in the late fourth century (in *De sacramentis*, a series of post-baptismal instructions commonly ascribed to Ambrose of Milan), this Western eucharistic prayer appears in virtually its final form in the *Gelasian Sacramentary*, an eighth-century document reflecting usages of sixth-century Rome. In this Western pattern the opening dialogue leads into a variable prayer of praise and thanksgiving, sometimes general in its content but more frequently phrased to reflect the varying emphases of particular feasts or seasons of the liturgical year. This variable praise leads into the Sanctus, and thereafter the prayer is relatively invariable and comes to be known as the Canon Actionis or Canon Missae, titles that reflect its regularity. This canon is supplicatory throughout, with intercessions and commendations of the eucharistic gifts preceding and following a prayer for their consecration, the institution narrative, and *anamnēsis*.

This Canon Missae became the standard eucharistic prayer for all the Western church from the ninth century. Unlike the Eastern prayers discussed above, this Western prayer contained no explicit invocation (*epiklēsis*) of the Holy Spirit for the consecration of the eucharistic gifts as Christ's body and blood. Theological reflection associated that conversion of bread and wine increasingly with the words of Jesus in the narrative of the institution: "This is my body" and "This is the chalice of my blood of the new and eternal covenant." While occasional theologians expressed the view that such identification of the gifts with the body and blood of Christ was to be understood symbolically or typologically, a more realistic interpretation prevailed, especially from the eleventh century, and this encouraged a perception of the Eucharist as a sacramental representation of Christ's redemptive sacrifice, complete and efficacious even if none but the celebrating priest received Communion. That the people were disinclined to frequent Communion is indicated by the

requirement of the Fourth Lateran Council (1215) that all must communicate at least once annually.

In spite of the moderating expressions of sensitive theologians, such emphasis on the sacrificial character of the Mass (as the Eucharist was known in the West) and diminution of its character as communion meal grew stronger in the later medieval period and established the eucharistic agenda of the Reformation. While the reformers' understandings of Christ's presence in the Eucharist varied widely, there was broad agreement on two matters: the suppression of all reference to the Eucharist itself as a sacrifice and insistence on general reception of Holy Communion as constituting the divinely instituted memorial of Christ's death on Calvary, itself the sole and sufficient sacrifice for the sins of the world. For the reformed liturgies the narrative of the institution of the Eucharist, already central in medieval tradition as the formula of consecration, achieved even greater prominence, its scriptural origin exempting it from the general reaction against liturgical elements that could be ascribed to human composition.

Protestant eucharistic liturgies in general sought to give expression to the cardinal principle that it is only faith in the sufficiency of Christ's redeeming work which justifies sinners. Protestants opposed all liturgical practice that could be interpreted as a human "good work." Even so, such major reformers as Martin Luther and John Calvin assumed that the Eucharist would continue to form the core of the Christian observance of Sunday as it had from the first century, but the popular disinclination to frequent Communion proved too strong in the end, and in Protestant worship the Eucharist became an occasional observance, being celebrated only monthly or even less frequently. This brought the reading and preaching of the word of God much more strongly to the fore and established the contrast between Roman Catholic and Protestant forms of worship still visible today, although the extent of that contrast has been reduced vastly in the twentieth century, especially as a result of the Second Vatican Council (1962–1965).

THE LITURGY OF THE WORD. As early as the second century the eucharistic meal was preceded by readings from the scriptures, preaching, and extended prayers of intercession. Justin Martyr, in chapter 67 of his first *Apology*, addressed to the emperor Antoninus Pius around 155 CE, describes the assembly of Christian worshipers on Sunday and tells us that on such occasions there were readings from the "memoirs of the apostles" or the prophets for as long as time permitted. Then the "president of the brethren" preached about what had been read, exhorting the congregation to perform good deeds. After that, the congregation prayed in common for themselves and for all the church. At that point, the gifts of bread and wine for the Eucharist were placed on the table, and the eucharistic prayer was begun.

The basic outline of the Liturgy of the Word has remained largely the same to the present, although introductory entrance rites (chants and prayers) appropriate to rich new

architectural settings of the liturgy were added from the fifth century on. By that time, too, other musical elements, such as the singing of psalms or verses with “Alleluia” between scripture readings, as well as within the Eucharist proper, had begun to appear in many areas. In spite of these enrichments and eventual variation in the number of scripture readings, the basic picture given by Justin is still clearly discernible.

PREACHING. While in most traditions today the sermon retains the place it had in the second century, at the conclusion of the scripture readings, preaching has never been limited to that liturgical context. Throughout Christian history the gift of prophetic proclamation has been exercised within, parallel to, and apart from the regular ritual patterns of Christian worship. While preaching has regularly been considered a responsibility of officiating clergy, it has not been limited to them. At times, patterns in the official cultus have come to leave little place for preaching, and in such circumstances preaching has flourished alongside that cultus and on occasion as a vehicle of opposition to it. Even where preaching continued within the traditional Latin liturgy in the later Middle Ages, it frequently formed the centerpiece of a larger bloc of catechetical and devotional material in the vernacular, known by the collective term *prone*. Its variable content established by the preacher, a *prone* might include such didactic materials as the Ten Commandments or the Apostles’ Creed, practical pastoral elements such as the announcement of proximate fasts or festivals or the publication of the banns of marriage, and devotional elements such as intercessions (replacing the Latin prayers of the faithful, which had fallen into desuetude in the early medieval period). Such a *prone*, including the sermon, might be found before the eucharistic liturgy, at its midpoint following the scripture readings, or apart from the liturgy. This provided the format for the Preaching Service, which achieved great popularity in some quarters of the Protestant Reformation where proclamation of the word of God in preaching took on the character of an alternative to the liturgical tradition. Such a preaching tradition continues to form the mainstream of much Protestant worship today, set in a context of instructional and devotional elements of the free composition that characterized the medieval *prone*. Other strongly homiletical traditions have set the sermon in the context of the Liturgy of the Word, even when no eucharist followed, or in the context of the traditional Liturgy of the Hours.

LITURGY OF THE HOURS. Scholars disagree in their reconstructions of the regimen of daily prayer among Christians of the first two centuries, but there is broad agreement that this regimen, however described, grew out of the Christian continuation of patterns of daily prayer in first-century Judaism and the daily service of the synagogue, which furnished the public framework of that prayer.

The *Didache* (chap. 8) orders the Lord’s Prayer three times a day, but it is not clear what hours are intended. The third-century *Apostolic Tradition* speaks of seven times for prayer during the day, the frequently mentioned third, sixth,

and ninth hours, plus evening, midnight, cockcrow, and morning. These hours, interpreted as commemorative of moments in Christ’s passion or focused on expectation of his triumphant return, are set forth as occasions for private prayer, although it seems that the morning hour (and occasionally the evening) were also times of public assembly. In the fourth and following centuries, public offices of prayer in the morning and evening form the daily pattern of the church’s liturgical prayer, although monastic influence led to a much more complex regimen. The fully developed monastic liturgy consisted of a major vigil at cockcrow, and other assemblies for prayer at around 6:00 AM and at every third hour thereafter until the hour of retiring. The establishment of urban monasteries in connection with major basilicas brought a conflation of this monastic regimen with the simpler cathedral hours of prayer, and in the medieval period all clergy were obligated to recite a liturgy of the hours deeply shaped by the presuppositions of the monastic tradition.

Sixteenth-century reforms of the hours of prayer, such as that by Thomas Cranmer in the English *Book of Common Prayer*, returned to the simpler regimen of two hours in the day, morning and evening, but Cranmer’s work still betrayed such monastic characteristics as the systematic reading in course of all the psalms (albeit within the space of a month, rather than a week as had been the custom). Twentieth-century reform of the Liturgy of the Hours in the Western churches has continued this emphasis on the morning and evening offices as times of public liturgical prayer, while providing for certain of the intervening hours for private use.

LITURGICAL ARTICULATION OF TIME. The Liturgy of the Hours reveals the Christian perception of times as themselves symbolic of the paschal mystery and as the framework within which the church watches for the coming of Christ. However, derived as this daily regimen was from the traditions of Judaism, the hours of the day were not the only time cycle to receive Christian expression. This was equally true of two other important cycles in the Old Testament, the week and the year.

Liturgical week. None of the numerous scholarly efforts to get behind the Jewish seven-day week and to discover its origin apart from the history of Israel has achieved definitive success. That seven-day cycle seems to have been present with the earliest settlement of Israel in Canaan, and the question of the ultimate origin of the week must remain unsettled. What can be said more surely is that the cycle was defined by the treatment of every seventh day as a day of rest for servants and draft animals and, by extension, for the whole people. This Sabbath (meaning “to stop” or “that which stops”) recurs every seventh day without regard to other time cycles, such as the month or the year, making the week an independent cycle. Not originally a day distinguished by obligations of worship, the Sabbath came to afford peculiar opportunity for public worship because of the rest from ordinary employment which it demanded.

While early Christians participated in the worship of the synagogue as opportunity afforded, it is likely that the Sabbath, with its extended synagogue liturgy, was an especially important occasion for Christian witness. Some have suggested that the Christian observance of the first day of the week, Sunday, found its beginnings in the gatherings of Christians for their characteristic table fellowship following the conclusion of the liturgy at the closing of the Sabbath at sundown. Others have insisted that it was in the evening from the first day to the second (Sunday to Monday) that Christians began to assemble, on the model of the appearances of the risen Christ reported in *John* 20. What seems sure in either case is that the first Christians continued to observe the week as defined by the Sabbath and that, once growth of the movement required gatherings at a longer interval than daily, assemblies of a specifically Christian character were on the first day of the week, the day of Christ's resurrection.

Several writers have suggested that, because that weekly assembly was the time of the Eucharist, the Lord's Supper (*kuriakon deipnon*; *1 Cor.* 11:20), the first day of the week came to be known as "the Lord's Day" (*kuriakē hēmera*). Whether that is the reference of that phrase in *Revelation* 1:10 or not, it is clear that the term was used for the first day of the week as early as the *Didache* (chap. 14). Sources from the second century speak of that first day of the week, the first day of creation, as the Eighth Day, the day beyond the creation itself and the day of the new creation accomplished by Christ's paschal sacrifice (*1 Cor.* 5:7). Such thought reflects the strong sense of Christ's spiritual presence in the community constituted by the outpouring of the Holy Spirit (*Acts* 2), a "realized eschatology" that throughout Christian history expresses the sense of the presence in worship of both Christ's redeeming action in the past and a prolepsis of his future appearing in judgment at the end of history. The meeting of that memory of the past and that hope for the future in the Eucharist on each Lord's Day has been a constant dimension of classical Christian liturgical experience.

Beyond that festal Sunday, the weekly celebration of the paschal mystery, Christians very early began to observe every Wednesday and Friday as fast days (*Didache* 8). Friday was the day of Jesus' crucifixion, and most early interpreters of this custom treat Wednesday as the day of his betrayal by Judas Iscariot. However, one third-century source, *Didascalica apostolorum*, places Jesus' arrest in the early hours of Wednesday, a chronology that would put his last supper with his disciples on Tuesday night rather than on Thursday, as is the more common tradition. This alternative chronology, Annie Jaubert has suggested, may reflect the impact on early Christianity of the Essene community at Qumran. The unique calendar of that group always situated the Passover in the night from Tuesday to Wednesday and was so arranged that all important liturgical days occurring on fixed dates of the month would fall on Wednesday, Friday, or Sunday. (It remains unclear how such a calendar of exactly 52

weeks, only 364 days, would adjust for its significant error.) Tertullian speaks of these Wednesday and Friday fasts as "stations," a term encountered earlier in the *Shepherd of Hermas*, and it is clear that in the third century they were days of liturgical assembly, even for the Eucharist, in addition to the assembly on Sunday. While always secondary to Sunday, the primitive prominence of Wednesday and Friday continued in the later history of the Christian week and is still manifest in various ways in the several traditions.

According to Tertullian (*On Fasting* 14.3) it appears that some Western Christians (probably Romans) were deviating from the common practice of the church by ordering certain Sabbaths (i.e., Saturdays) in the year to be observed with fasting, a custom that Innocent I (*Epistle* 25, CE 416) reports for every week at Rome. Tertullian had complained that fasting on the Sabbath was forbidden except for the Sabbath before Easter. In this he seems to reflect correctly a tradition still followed in all the Eastern church, a tradition probably rooted in the Jewish prohibition against fasting on the Sabbath. This suggests a much stronger continuation of Sabbath observance among Christians than some writers (e.g., Willy Rordorf) have supposed. Such continuation of observance, if there was any, would concern the Sabbath rest rather than a day for liturgical worship. The association of rest from secular employment with Sunday rather than the Sabbath stems from the time of Constantine, but the direct identification of Sunday as the Christian Sabbath and its rigorous observance according to Old Testament norms appears first in English and Scottish Protestantism, especially in the seventeenth century. Apart from that, the term *Sabbath* has continued to be understood to refer to the seventh day of the week and was employed to designate that day in all medieval liturgical books.

Liturgical year. While it seems likely from such texts as *Acts* 20:7 that the beginnings, at least, of the Christian week go back to the apostolic period, other passages such as *Colossians* 2:16 suggest that liturgical time patterns of Judaism were considered, at least in the gentile mission, to be matters of little importance, given the expectation of the proximate Parousia. Still other texts, however, make it clear that even Paul, the apostle to the gentiles, was far from insensitive to the festivals of Israel and did not hesitate to relate them to the paschal mystery.

The Christian Pascha. Many scholars have, with modifications, held to the notion that the celebration of the annual paschal festival of Easter was established on the Sunday after Passover at Rome in the apostolic period. This assertion can be documented only from the fifth century, and many other scholars consider it to be contravened by documents of the second century that seem to assert that there was no annual observance of Pascha (Easter) at Rome prior to Soter, bishop there from 165. According to Karl Holl, the Passover, continued by Christians at Jerusalem in the night from 14 to 15 Nisan, was accommodated to the structure of the week, by moving the feast to Sunday, only after the establishment

of a gentile hierarchy in Jerusalem following the Bar Kokhba Revolt (c. 132–135). Prior to that, the Christian Pascha would have been observed annually on the same date as the Jewish Passover, being in fact a continuation of the Jewish festival, reinterpreted in light of the tradition that identifies the crucifixion of Jesus as coinciding with the slaughter of the lambs for the festival of Passover at the Temple. By the time of such an adjustment of the Christian Pascha to the structure of the week, Christians of Jewish background had been driven out of Aelia Capitolina, the new Roman city built on the ruins of Jerusalem, to settle elsewhere, some in Mesopotamia, others in Asia Minor. It is in that latter area, especially, that we discover our earliest documents of a Christian celebration of Pascha, kept on the Jewish date in the night following 14 Nisan, the anniversary of the Crucifixion. Late in the second century, controversy developed over whether the Christian Pascha should be observed on that date or whether its preliminary fast should be terminated only on Sunday, the weekday of the Resurrection. This controversy was finally concluded by a decision in favor of a Sunday Pascha by the first ecumenical council at Nicaea in 325. By that time, however, the Pascha was almost universally observed on Sunday, and the original one day of fasting (now the Sabbath) had been extended to six days, the Holy Week that is still the most solemn time of the year for Christians.

Even when transferred to Sunday, the paschal solemnity continued to be spoken of as a memorial of the passion of Jesus. Much more than that was included in the content of the festival, however, and it can best be described as a total festival of Christ celebrating the incarnation, passion, death, resurrection, and glorification of the Savior. That unitive content was refracted, especially during the fourth century, and distinct events came to be associated with particular days: the death of Jesus with Friday of Holy Week, his resurrection with Easter Sunday, his ascension into heaven with the fortieth day after Easter, and the outpouring of the Holy Spirit upon the church with the fiftieth day, corresponding to the Jewish Feast of Weeks (Shavu'ot), or Pentecost. From the end of the second century, at least, that entire fifty-day period from Pascha to Pentecost had been kept as the extended paschal rejoicing, and recent reforms of the liturgical year have sought to restore the integrity of that festal period.

Christmas and Epiphany. Since the eighteenth century it has been commonly observed that the celebration of the nativity of Christ on December 25, first discernible at Rome around 336, represents a Christian adaptation of the winter solstice festival established by the emperor Aurelian in 274 CE. Some more recent studies have revived interest in the hypothesis of Louis Duchesne, who suggested that the date was arrived at by counting forward nine months from March 25, a date taken in the West in the third century to be that of Jesus' death. Duchesne held that the impatience of symbolic number systems for fractions made this to be as well the date of Christ's conception. However arrived at, that date would have coincided with the solar festival at Rome, and later data

make it clear that the themes of the two festivals merged in the celebration of Christmas.

Coincidence with pagan festivals has also been argued for the early Eastern date for the nativity of Jesus, January 6, the Epiphany (Gk., *epiphaneia*, "manifestation"), although the argument is much less firm in this case. Here again, Duchesne's computation from a fixed date for Christ's death (April 6 in Asia Minor, according to the fifth-century church historian Sozomen), taken to be as well the date of the Incarnation, would yield the nativity nine months later, on January 6. That date seems to have been treated as the beginning of the year and, with that, the beginning of the reading of the gospel. Preference for a particular gospel in a particular church would lead to the association of different themes with the festival of Epiphany: at Jerusalem the reading of *Matthew* led to an emphasis on the nativity; at Alexandria a preference for *Mark* emphasized the baptism of Jesus; at Ephesus the predominance of *John* stressed the Cana wedding feast. While such an explanation is only hypothetical, those three themes are associated with Epiphany in the later fourth century. By that time the December 25 festival of the nativity had been accepted in the East (with the exception of Jerusalem and Armenia), and the January 6 festival of Epiphany had been adopted in the West. At Milan, Epiphany celebrated the baptism of Jesus, but at Rome it formed a duplication of the nativity observance, limited to the commemoration of the visit of the Magi. That visit of the Magi, the baptism of Jesus, and the miracle at Cana formed the *tria miracula* that were celebrated at Epiphany in Gaul. There a preparatory period, eventually six weeks, preceded the nativity festival, and this was adopted in the seventh century at Rome, though shortened first to five weeks and later to the present four. As Epiphany and Christmas had been considered the beginning of the liturgical year, so this season of preparation came to be considered the beginning of the year, and it is with the first Sunday of Advent that Western liturgical books begin.

Lent. The emergence of Pascha as the preferred time for the rites of initiation, in accordance with the death/resurrection theology of baptism taught by Paul, led to the development of a period for final catechesis and ascetical formation prior to paschal baptisms. While such a period is indicated as early as the third-century *Apostolic Tradition*, its length is indefinite prior to Nicaea. Thereafter it is spoken of as the fast of forty days and spans a period of six weeks either prior to Easter (as in Rome and fourth-century Alexandria) or prior to Holy Week (as in Syria, Constantinople, and eventually all the Eastern churches). The forty-day duration of the fast has traditionally been associated with Jesus' fast immediately following his baptism by John, and recent studies have supported Coptic sources that place the original fast of forty days immediately following Epiphany (celebrating Jesus' baptism) at Alexandria. After Nicaea the prepaschal situation of the fast is universal, although its separation from the six-day paschal fast in the Eastern rites may still re-

flect the wider separation of them in early Alexandria. There, Coptic tradition maintains, the fast of forty days concluded with the administration of baptism in the sixth week and the Feast of Palms on the following Sunday, an arrangement similar to the later Byzantine conferral of baptism on the Saturday of Lazarus, the day before Palm Sunday. After Nicaea that Palm Sunday is the day before the paschal fast and, in the late fourth century, is considered to be the first day of Holy Week at Jerusalem.

Although preparation for baptism constituted the original agenda of the Lenten period, by the end of the fourth century in the West it was also a period for the ritual humiliation of penitents, those who for grave sin had been severed from the communion of the church. Such penitents were publicly reconciled in Holy Week so as to be able to celebrate Easter as restored Christians, and their penitential exercises during Lent gave that color to Lenten piety. In Byzantine tradition, which has known no such formal reconciliation of penitents in Holy Week, the Western penitential concern was long absent from Lent, although similar penitential piety did enter that tradition through monasticism from the eighth century on.

Christian liturgical traditions that observe the Lenten fast experience Lent as a time of ascetical development, of "dying to self," so as to participate fully in the renewal of life in the celebration of Christ's resurrection. This participation in Christ's dying and rising, focused in the annual observance of Lent, Holy Week, and the fifty days of Easter rejoicing, is that same paschal mystery experienced by each Christian in baptism, in every celebration of the Eucharist, and indeed in every dimension of the complex of worship and sacramental life for which the paschal mystery of Christ's redemptive death and resurrection is the root paradigm.

BIBLIOGRAPHY

The principal liturgical texts relevant to Christian initiation are presented in English in Edward C. Whitaker's *Documents of the Baptismal Liturgy*, 2d ed. (London, 1960), and John D. C. Fisher's *Christian Initiation: The Reformation Period* (London, 1970). Texts relevant to the Eucharist can be read in English in *Prayers of the Eucharist, Early and Reformed*, 2d ed., edited by Ronald C. D. Jasper and Geoffrey J. Cuming (New York, 1980), and *Liturgies of the Western Church*, edited by Bard Thompson (New York, 1961). The best survey of the whole range of the history of Christian worship is *The Study of Liturgy*, edited by Cheslyn Jones, Geoffrey Wainwright, and Edward Yarnold (London, 1978). The limitations of the magnificent overview by Gregory Dix, *The Shape*

of the Liturgy (Glasgow, 1945), have been addressed in a new edition (New York, 1982) with appended notes by Paul Marshall taking account of some more recent developments. Josef A. Jungmann's *The Early Liturgy: To the Time of Gregory the Great* (1959; reprint, London, 1966) is an excellent survey, less detailed than his magisterial two-volume *Missarum Sollemnia: Eine genetische Erklärung der römischen Messe*, rev. ed. (1949; reprint, Freiburg, 1958), translated as *The Mass of the Roman Rite*, 2 vols., rev. ed. (New York, 1959).

For more particular studies of rites of initiation, G. R. Beasley-Murray's *Baptism in the New Testament* (New York, 1962) is the standard treatment of that period. For the patristic period, see Hugh M. Riley's *Christian Initiation* (Washington, D.C., 1974), and for the medieval, John D. C. Fisher's *Christian Initiation: Baptism in the Medieval West* (London, 1965). Aidan Kavanagh's *The Shape of Baptism: The Rite of Christian Initiation* (New York, 1978) examines reforms since the Second Vatican Council against the background of the earlier tradition. Much recent concern with the Eucharist has focused on the eucharistic prayer, and several contributions to this discussion, which have appeared in the liturgical journal *Worship*, have been collected in *Living Bread, Saving Cup: Readings on the Eucharist*, edited by R. Kevin Seasoltz (Collegeville, Minn., 1982). For a systematic treatment of the evolution of that central prayer of the Eucharist, see Allan Bouley's *From Freedom to Formula* (Washington, D.C., 1981).

WORSHIP AND DEVOTIONAL LIFE: MUSLIM WORSHIP

The nature of Muslim devotional life in Islam is rooted in its basic theological presuppositions. The three primary fun-

damentals of religion (*uṣūl al-dīn*) are *tawḥīd* (belief in the unity of God), *nubūwah* (belief in prophets), and *qiyāmah* (belief in the Day of Judgment). The acceptance of these three beliefs is required of all Muslims. Collectively, they constitute the essence of the Islamic worldview.

Tawḥīd is the core concept of Islam. The sovereignty of a monotheistic God, who is omnipotent, omniscient, and simultaneously transcendent and immanent, is Islam's definitive tenet. For Muslims there is one and only one true God, who is identical with the God of Abraham, Moses, and Jesus. The necessity of obedience to God's will is thus the foundation for all devotion in Islam. Every human being should aspire to live as a servant (*'abd*) of God. For this reason, the required ritual acts of worship are referred to collectively as *'ibādah*, which can be translated as either "worship" or "service." According to the concept of *nubūwah*, God communicates through prophets (*nabīs*) and messengers (*rasūls*). Thus, human agency is essential to the process of revelation. The centrality of this concept can be seen in the fact that the first human being, Adam, is also the first prophet, as humanity should never be without divine guidance. It is through the prophets in their roles as messengers and models of behavior, especially the final prophet, Muḥammad, that humanity learns how to live in obedience to God's will. Devotional life in Islam rests simultaneously upon the worship of and obedience to God, and allegiance to and veneration of the Prophet Muḥammad, who serves both as a teacher and an exemplar.

The doctrine of *qiyāmah* asserts that there will come a time when all human beings will be judged according to their beliefs and actions. Thus, whether interpreted literally or figuratively, *qiyāmah* asserts that human beings are fully responsible before God for their actions. Despite the apparent logical contradiction between an omniscient and omnipotent God and human free will, Islam clearly asserts that, however this contradiction is resolved, individuals must act as if they had free will and fulfill their ritual and ethical obligations with clear intention.

Within this theological context, acts of devotion and worship serve two interrelated purposes. The first is as the fulfillment of God's commandments. As such, they are evidence of obedience to God in preparation for the Day of Judgment. But devotional actions also serve to transform the worshipper, bringing him or her into greater conformity with the divine will. Devotion in Islam is not simply an end in itself; it is also a means for facilitating proper ethical behavior. God calls on humanity not only to follow commands related to the proper performance of ritual, but also to live lives devoted to justice (*'adl*) and ethical behavior (*akhlāq*). One who lives his life in the constant remembrance of God will develop the virtue of *ihsān* (beneficence) and become a more perfect human being. Devotional actions within Islam are thus simultaneously evidence of obedience to God and mechanisms for the spiritual education of believers.

'IBĀDAH. The most obvious form of worship and devotion within Islam are those actions commonly referred to as "the Five Pillars of Islam." These are: the confession of faith (*shahādah*), ritual prayer (*ṣalāt*, or *namāz*), the fast (*ṣawm*) during the month of Ramaḍān, the *ḥajj*, or pilgrimage to Mecca, and the paying of alms to the needy (*zakāt*). These are the minimal required devotional practices of exoteric Islam. Collectively, they are referred to as *'ibādah* because they indicate and affirm the worshipper's status as a servant (*'abd*) before God. All of these actions require the worshipper to first make an intention to perform them (*nīyah*), thus affirming the doctrine of human responsibility inherent in the doctrine of *qiyāmah*. All of the actions of the *'ibādah* result in *thawāb*, or spiritual benefit, for the worshipper.

It is through the recitation of the Shahādah—also called the *kalimah*, or word of belief—that one becomes a Muslim. The Shahādah contains two declarations, which must be recited publicly in Arabic. The first, "*ashhadu an lā ilāha illā Allāh*" (I bear witness that there is no god but God), is an affirmation of *tawḥīd*. The second, "*ashhadu an Muḥammadan rasūl Allāh*" (I bear witness that Muḥammad is the Messenger of God), is an affirmation of *nubūwah*. This public recognition of the unity of God and the spiritual authority of Muḥammad, made with proper intention, is sufficient to make one a member of the Muslim community.

ṢALĀT is the daily ritual prayer. Many Muslims consider prayer to be the most important of all Islamic devotional actions. Each prayer consists of a sequence of prescribed actions coupled with the recitation of devotional phrases in Arabic and short *sūrah*s from the Qur'ān. Each of these sequences is referred to as a *rak'ah*. Sunnī Muslims are required to pray five times a day—after dawn, at noon, in the afternoon, at sunset, and in the evening. Each of these prayers consists of between two and four *rak'ah*s. Twelver Shī'ī Muslims pray the same number of *rak'ah*s each day but combine their prayers into three sessions. The fact that prayer punctuates the day at regular intervals affirms the importance of the Qur'anic concept of *dhikr*, or the remembrance of God. Generally, within Islam the root of human disobedience and sin is seen as forgetfulness. Prayer at regular intervals encourages Muslims constantly to remember the presence of God.

The time of each prayer is announced by the *adhān* or "call to prayer." Each *adhān* is recited in Arabic and includes declaration of the Shahādah and the *takbīr*—the affirmation that "God is Greater" (*Allāhu akbar*). Recited by the *mu'adhdhin* publicly from a minaret, the sound of the *adhān* has become one of the defining characteristics of living in a Muslim environment.

As with all acts of *'ibādah*, the act of prayer begins with the making of proper intention or *nīyah*. This is followed by *wuḍū'*, or ablutions, as one must approach God in a state of physical purity. One prays facing in the direction of the Ka'bah in the holy city of Mecca. This directional focus is called the *qiblah*. Within a mosque, the *qiblah* is marked by a niche called the *mihṛāb*. Thus, Muslims in communal

prayer throughout the world stand in straight lines, except in the sacred precinct surrounding the Ka'bah itself, where it becomes apparent that Muslims in prayer are actually arranged in concentric circles facing the Ka'bah and each other.

The act of *ṣalāt* in Islam is a physical performance. Worshippers use their bodies and their voices to physically express obedience to God. The performance of prayer calls for the worshipper to engage in a series of postures culminating in complete prostration as physical evidence of submission and obedience to God. The language used in *ṣalāt* is not the vernacular of the individual worshipper but rather the Qur'anic Arabic of the time of the Prophet. In performing *ṣalāt* individual believers repeat actions initially performed by the Prophet Muḥammad. Whenever Muslims engage in prayer they form a chain of piety back to the very origins of Islam and affirm a single ritual community with all other Muslims both spatially and temporally. It is an affirmation of *tawḥīd* and *nubūwah*, which links together all Muslims into a common devotional community.

Prayer can be either individual or communal. On Fridays the congregational prayer may take place in a special building called a *masjid*, literally a "place of prostration." Prayers are said behind an *īmām khaṭīb*, who stands at the *mihṛāb* and leads the community through the actions of the *ṣalāt*. At these Friday prayers the *īmām khaṭīb* delivers a sermon called a *khuṭbah*, which generally takes the form of a commentary on a Qur'ān verse, exhorting believers to lead more devout and ethical lives. It should be noted that the *khuṭbah* can also be used for political purposes. For this reason, Muslim rulers have generally attempted to maintain a degree of control over the content of the *khuṭbah*.

Along with the five daily prayers and the Friday congregational prayer, there are special prayers associated with religious holidays and funerals. There are also prescribed supererogatory prayers, which, while not required, are recommended and can be performed at other times of the day. Finally it should be noted that *ṣalāt*, the ritual prayer in Arabic, is not the only form of prayer in Islam. While the term *du'āhamza* has a variety of meanings, it most commonly refers to personal prayer recited in one's own language. The saying of *du'āhamza* is an essential aspect of piety of Islam, which affirms the personal relationship of individual believers with God.

While literalist traditions within Islam have seen the act of *ṣalāt* as the simple fulfillment of a divine command, Muslim mystics and esoteric interpreters have noted that there are both exoteric (*zāhirī*) and an esoteric (*bāṭinī*) dimensions to *ṣalāt*. For them, prayer is a mystery that imprints upon the bodies and the souls of worshippers and assists in their spiritual transformation.

RAMAḌĀN AND ZAKĀT. Muslims fast during the lunar month of Ramaḍān, abstaining from food, drink, and sexual intimacy from sunrise until sunset. They should also attempt to

avoid negative and hostile emotions. The fast is incumbent upon all adult Muslims, although the sick, the aged, pregnant and nursing women, and travelers are exempt from its demands. The Ramaḍān fast acts to remind believers of their dependence upon God and affirms their servitude before the divine will. According to some Muslim commentators, it also helps to build an attitude of self-discipline and patience (*ṣabr*) and nurtures a sense of empathy and compassion for the sufferings of the poor.

The fast has both individual and social dimensions, as individual believers experience the fast in the context of community. Families tend to wake collectively to prepare breakfast before sunrise. The breaking of the fast at sunset, called *ifṭār*, is the occasion for shared meals with family and friends. It is not unusual for people to gather in the evening to listen to recitations of the Qur'ān. The Qur'ān is, in fact, traditionally divided into thirty equal portions, each called a *juz'*, so that the entire text may be recited over the month-long period of the fast. The end of the Ramaḍān fast is marked by the festival of 'Īd al-Fiṭr. This is a day for giving charity, exchanging gifts and cards, and visiting one's friends and relatives. The sense of a shared ritual duty helps to create the sense of a single community bound by common practice and belief.

Zakāt refers to the payment of a percentage of one's wealth as alms to the poor. The giving of *zakāt* may appear to be an ethical rather than a devotional act. It is, however, almost always mentioned in the Qur'ān in tandem with *ṣalāt*. The giving of *zakāt* cleanses one's wealth and renders it legitimate. The giving of *zakāt*, like *ṣalāt* and *ṣawm*, affirms the notion that humans are not autonomous beings but rather servants of God. One's wealth is in fact only an *amānat* (trust) from God, who is the real owner. Therefore, while almsgiving is an ethical action designed to support the community, it is also an affirmation of *tawḥīd*.

THE ḤAJJ. At least once in a lifetime Muslims should, if possible, make the pilgrimage to Mecca during the month of Dhū al Ḥijjah to perform the rites of the *ḥajj*. There is a lesser pilgrimage called the *umrah*, which can take place any time, from which a believer also gains *thawāb*; but it is the collective and communal action of the *ḥajj* that is required (*wājib*) by Islamic law.

In no other ritual context are the doctrines of *tawḥīd*, *nubūwah*, and *qiyāmah* so clearly apparent. The *ḥajj* takes place in the city of Mecca and its environs, where the religion of Islam was born. Having faced all of their lives in the direction of the Ka'bah for prayer, worshippers now travel to the site of the *qiblah*. Here they encounter the structure containing the room that once housed the polytheistic deities of the Arabs, until cleansed of them by the Prophet Muḥammad and left empty to symbolize the unity of God—the essential symbol of *tawḥīd*. The most common image associated with the *ḥajj* is the circumambulation of the Ka'bah, called the *ṭawāf*. As they circle the Ka'bah seven times, each pilgrim re-

cites the *talbiyah*, proclaiming in Arabic, “Here I am. O my Lord, Here I am.”

However, the central act of the *hajj* takes place on the ninth day of Dhū al-Hijjah at the Mount of Mercy, on the plain of ‘Arafāt, where the Prophet delivered his farewell sermon. This event is called the *wuqūf* (standing). Having previously entered into a state of ritual sanctity known as *iḥrām*, the pilgrims stand draped only in two seamless pieces of white cloth. Dressed identically, all traces of worldly hierarchy are eradicated and each stands equally before God, awaiting divine mercy. This action is not only an affirmation of *tawhīd*; it is also an evocation of the *qiyāmah*, when all believers will stand at their graves dressed in their funeral shrouds to await the judgment of God.

The events of the *hajj* are also evocative of *nubūwah*. Because Mecca is the birthplace of Muḥammad, wherever one looks one is confronted with the remembrance of the Prophet. Although it is not technically part of the *hajj*, most pilgrims travel to the city of Medina to visit his tomb. Elements of the *hajj* also evoke the memory of other prophets as well, especially Ibrāhīm. Near to the Ka‘bah is the *maqām* of Ibrāhīm, where he stood to lay its cornerstone. The well of Zamzam marks the place where Hagar and Ismā‘īl were rescued from thirst by the angel Jibrīl, who struck the earth with his wing to bring forth water.

On the tenth day of Dhū al-Hijjah, pilgrims sacrifice an animal in memory of Ibrāhīm’s sacrifice. This is the feast of ‘Īd al-Aḍḥā, the second major festival in Islam after ‘Īd al-Fiṭr. On this day Muslims throughout the world make their own sacrifices, sharing the meat with their own families and giving a portion to the poor.

THE QUR’ĀN AS AN OBJECT OF DEVOTION WITHIN ISLAM. Devotional piety within Islam is not restricted to the *‘ibādah*. For example, the veneration of the Qur’ān is a ubiquitous form of piety. As the concrete presence of the word of God the Qur’ān is not only a source of knowledge, it is also a focus of devotion and veneration. As God’s word it must be treated with respect. One should not handle it while in a state of ritual impurity. It is a violation of religious etiquette to place anything else, even another book, upon the Qur’ān. Devout Muslims wrap the Qur’ān in silk and store it as the highest object in the room. The recitation of the Qur’ān is an act of piety; professional reciters of the Qur’ān are considered great artists, whose recordings are popular throughout the Muslim world.

Phrases from the Qur’ān are used in numerous formulaic ways throughout the day. For example, the opening *sūrah*, *al-Fātiḥah*, is recited on numerous occasions, such as when visiting the tombs of Ṣūfī saints. Pious Muslims will often evoke the phrase *bismillāh* (in the name of God) before initiating any activity—especially at the beginning of a journey. One should not speak of future actions without saying *inshā‘allāh* (God willing), affirming thereby that only God is the true author and knower of future events. The evocation

of God’s word is, in a very real sense, the evocation of God, and as such it facilitates *dhikr*. Such actions are thus invocations of *tawhīd*.

VERNACULAR TRADITIONS WITHIN ISLAM. Because Arabic is the language of the Qur’ān, and because *ṣalāt* is performed in Arabic, Islam’s rich vernacular devotional traditions are often overlooked. In the South Asian musical tradition of *qawwālī*, the Prophet Muḥammad and Ṣūfī saints are praised in Urdu and Panjabi. The Shī‘ī tradition has produced moving poetry of mourning for Imām Ḥusayn in Urdu and Persian called *marsiyyeh*. The Ismā‘īlī tradition includes the recitation of devotional poetry called *gināns*. There is a rich tradition of devotional poetry in Swahili connected with the birthday of the Prophet. Among the Alevīs of Anatolia there is a profound musical tradition called *nefes* in which songs about the Twelve Imāms and the great *pir* Hacı Bektash Veli are sung in Turkish to the accompaniment of the *saz*. While *‘ibādah* provides evidence of the unity underlying the world of Islam, these vernacular practices are examples of its rich diversity. Much of this vernacular literature is connected with that aspect of Islamic piety that involves devotional allegiance to persons.

The piety of devotional allegiance. Many of the most popular forms of Muslim devotion are those associated with devotional allegiance to holy persons, especially the Prophet Muḥammad. The person of the Prophet is as important as the Qur’ān in Islamic piety. As one Shī‘ī scholar has pointed out, when the earliest Muslims accepted Islam there were only a few verses of the Qur’ān. At that time the fundamental action of accepting Islam was to give allegiance to the Prophet. This is the root of the piety of devotional allegiance.

Certain radical reform movements within Islam, most notably Wahabism, have been critical of devotion to the Prophet, seeing it as a form of *shirk* (associating partners with God). But for most Muslims, devotion to Muḥammad follows instinctively from their love for God. If all Muslims should love God, what better expression of that love can there be than to love the one whom God loves best? And that person is Muḥammad, who bears the title *Ḥabībullah*, the beloved of God.

There are a variety of expressions of devotion to Muḥammad. In many places the birthday of the Prophet is celebrated as a holiday (‘Īd Milād al-Nabī), with special vernacular poetry recited for the occasion. *Na‘ī*, the a cappella recitation of devotional verse about the Prophet Muḥammad in Arabic and vernacular languages, is especially popular in South Asia. Another important form of devotion to the Prophet is the recitation of *durūd*, the formulaic blessing of the Prophet recited in Arabic. Muslims often recite *durūd* in conjunction with pilgrimage (*ziyārah*) to the tomb of the Prophet or Ṣūfī saints. It is commonly believed that if one recites *durūd* at the tomb of the Prophet in Mecca he will actually hear it. The recitation of *durūd* is also thought to produce spiritual effects, such as the appearance of the Prophet to the devotee in a dream.

One of the central beliefs associated with this concept of devotional allegiance is the belief in the continuing spiritual existence of the Prophet Muḥammad. Although the Prophet died a physical death like any other human being, most Muslims believe that he is still available to his devotees as a spiritual presence. He is said to be “present and watching” (*ḥāḍir-o nāẓir*). Despite the fact that radical groups like the Wahabis firmly reject this notion, its supporters point to *ḥadīths* that state that the Prophet is a manifestation of a preexistent light—the prophetic *nūr*. Thus the Prophet is not merely a model of behavior, he is also an object of veneration.

Devotional allegiance in Shī‘ī Islam. For many Muslims the piety of devotional allegiance extends beyond the person of the Prophet Muḥammad to include those who are identified as his legitimate representatives and successors. Once again, if one is to love the Prophet, should one not express that love by loving those whom he loved? Within Shī‘ism this love focuses on the *abl al-bayt* (the family of the Prophet; literally, “the people of the house”) especially the Shī‘ī *imāms*. The first *imām*, ‘Alī ibn Abī Ṭālib, Muḥammad’s cousin and son-in-law, is especially venerated. He is identified as *Mushkil Kusha*, the remover of obstacles. It is not uncommon in Asia for Muslims—Sunnīs as well as Shī‘ah—to say “*Ya ‘Alī Madad*” (“Oh ‘Alī, help me”) when attempting a difficult task. Not only is the tomb of ‘Alī in Najaf in Iraq a center of pilgrimage, but his purported tomb in Mazār-I Sharif in southern Afghanistan is also a major pilgrimage site for Muslims.

The Prophet’s grandson, Imām Ḥusayn, also has a major role in Shī‘ī devotional life. As the martyr of Karbalā’, killed by the Caliph Yazīd on the tenth of the lunar month of Muḥarram, he has a special place in the hearts of Shī‘ī Muslims. While the Shī‘ah believe that all the *imāms* share in the same spiritual light, Imām Ḥusayn was the last of the immediate *abl al-bayt* who lived with the Prophet in Medina. This immediate family—consisting of Muḥammad, his daughter Fāṭimah, her husband ‘Alī, and their two children, Ḥasan and Ḥusayn—are often represented iconographically by the image of a five-fingered hand. In South Asia these five persons are venerated as “the five pure ones” (*pañjatan pāk*). As the final surviving grandson of the Prophet, Ḥusayn’s murder is an axial event and has deep spiritual significance.

During the first ten days of Muḥarram, Shī‘ī Muslims enter into a state of ritual mourning. People dress in black and recite mournful poetry. They also gather in mourning assemblies to hear the retelling of the story of Karbalā’. It is commonly believed that Fāṭimah attends these assemblies and gathers the tears of the mourners to present them before God on the Day of Judgment. The day of ‘Āshūrā’ on the tenth of Muḥarram is a particularly fervent day of devotional activity, when the community gathers to mourn and share food.

The precise nature of mourning for Imām Ḥusayn varies from region to region. In Iran there are stylized *ta‘ziyah*

plays, which depict the events of Karbalā’. In South Asia there are processions culminating in ritual funerals for the *imām*. But for Shī‘ī Muslims everywhere, participation in these events is a crucial marker of religious identity. There is a famous aphorism: “Every day is ‘Āshūrā’, every place is Karbalā’.” The events of Karbalā’ are not seen as mere historical events. Beneath the appearances of ordinary reality the eternal struggle between “Good and Evil” that took place paradigmatically at Karbalā’ is always reoccurring. Humanity is always being asked to choose between the path of Imām Ḥusayn and the path of Yazīd, the path of light and the path of darkness. The ritual recreation of the events of Karbalā’ during the month of Muḥarram is a way of preparing for participation in the eternal spiritual struggle between “Good and Evil.”

It should be noted that devotion to ‘Alī and his descendants extends into the Sunnī community as well. For example, the day of ‘Āshūrā’ is commemorated by many Sunnīs. More importantly, the great majority of Sunnīs who accept the validity of the Ṣūfī tradition accept ‘Alī as the master of the esoteric sciences. He is venerated as *Shāh-i Awliyā’* (King of the Saints). Within the Ṣūfī traditions, devotional allegiance extends to include the various *awliyā’* (sing. *walī*; saints) of the Islamic mystical traditions. Like the Prophet, they are simultaneously models of behavior and objects of devotion; and, as with the Prophet, people seek their intercession. Within the worldview of Sufism it is believed that the *awliyā’*, who trace their spiritual lineage back to the Prophet through a chain of spiritual transmission, have achieved a state of annihilation in God. For those who practice it, devotion to the *awliyā’* is intimately connected to notions of *tawḥīd* and *nubūwah*.

Devotion to Ṣūfī saints takes a variety of forms. Some people visit living saints to formally become their disciples (*murīds*) on the Ṣūfī path (*ṭarīqah*). Those on this path practice specific devotional exercises. Chief among these is *dhikr*, which involves the individual or collective repetition of the names of God in order to produce an altered state of consciousness called *ḥāl* or *wajd*. But many people visit the *awliyā’* simply to seek their blessing or to request some material benefit, such as the birth of sons, better jobs, or successful marriages.

More common than visitation to living spiritual masters is pilgrimage (*ziyārat*) to the tombs of deceased *awliyā’*. The gravesites of important Ṣūfīs have, over time, become the locations of major tomb complexes. Such *ziyārats* are found in nearly every corner of the Islamic world. The tombs of such major figures as Aḥmad Yasavī in Central Asia, Aḥmad al-Badawī in North Africa, Mu‘īn al-Dīn Chishtī in India, and Jalāl al-Dīn Rūmī in Anatolia are not only local but regional and even international centers of pilgrimage. It is commonly believed that, like the Prophet, the *awliyā’* continue to exist as spiritual presences at their tombs. As with visits to living *awliyā’*, pilgrims come to seek both spiritual and material blessings. Pilgrims may make vows in connec-

tion with their requests, which they later fulfill by performing pious action. Šūfī shrines have thus become centers for the feeding of the poor, as pilgrims often fulfill their vows by feeding the less fortunate.

There is a general air of piety and devotion within the precincts of a Šūfī tomb. The *awliyā'* are the true rulers of this world, and one approaches them as one does a monarch, with humility and respect. There is thus a proper etiquette (*adab*) for interacting with the *awliyā'*, whether as living masters or at their tombs.

In many parts of the world the death or birth anniversary of the *awliyā'* is celebrated with religious festivals that at first glance may seem to conflict with the piety inherent in *ziyārat*. In South Asia, for example, these celebrations, called *'urs*, include fairs (*melas*) and carnival attractions, as well as pious devotions. Not surprisingly, aspects of these manifestations of the piety of devotional allegiance are frequently attacked by Muslim reformers, who see in them, at the very least, a form of popular innovation, and at the worst a kind of *shirk* that violates *tauhīd*. Defenders of these traditions, however, have argued that those who take part in these popular expressions of piety are ultimately expressing their devotion to God and his Prophet. As such, their actions are within the proper purview of Islamic piety.

WORSHIP AND DEVOTIONAL LIFE: HINDU DEVOTIONAL LIFE

Although there is great variety in the forms of devotional life in Hinduism, some common themes may be identified that characterize the general religious impulse behind their variety. One important theme is that of ritual enhancement: Devotional practice aims at sustaining or improving the circumstances of the worshiper. These aims may be immediate and practical, such as the healing of disease, avoidance of the destructive influences of malevolent forces, fertility of crops, animals, and persons, and maintenance of family solidarity; or they may be more soteriological in character, such as the pursuit of liberation (*mokṣa*) from the bondage of rebirth. In this way, devotional life may be seen as a series of elaborate strategies for the enhancement of an individual's or group's situation as defined in terms of both worldly and transcendent goals.

A second theme centers on the ordering function of devotional life. Ceremonies frequently require the creation and/or maintenance of conditions of ritual purity. This purity may be temporary, brought about through bathing, cleaning, and providing substances deemed pure and religiously efficacious for the various rites, or it may be of a more permanent sort, such as the employment of members of castes, especially in their roles as priests, who are deemed sufficiently pure within the caste hierarchy to make their participation in devotional performances ritually effective.

A third theme is that of negotiation or exchange, in which devotional performances become occasions for giving human resources of food, gifts, and devotion to supernatural entities and powers in exchange for human well-being, which is understood to flow from those persons and powers as a consequence of the rite. While this negotiation process may have as its goal the pursuit of order and the existential enhancement of the worshiper, it may also involve episodes that are chaotic and/or playful.

The major forms of devotional practice in the Hindu tradition include sacrifice (*yajñā*); ceremonies for the ancestors (*śrāddha*); life cycle rituals (*saṃskāra*); meditational or ascetic practices (*tapas*); worship of deities (*pūjā*); pilgrimage

(*yātra*); personal vows (*vrata*); festivals and fairs (*utsava, melā*); sacred calendars (*pañcāṅga*); and religious healing or exorcism (*cikitsā*). Some of these devotional practices have ancient textual warrants for their authority that date back to the period of the Vedas and that are perpetuated by members of the traditional priestly castes, especially brahmins. Others are preserved in oral tradition among castes and communities further removed from the ritual texts and practices of the traditional religious elite groups. In both cases, these devotional traditions rest on the assumptions of their participants that they possess long-standing authority and efficacy.

SACRIFICE. As both the Vedas and the Brahmanas, books of ritual instruction and commentary, attest, sacrifice (*yajña*) is among the earliest forms of devotional life. The sacrifices are distinguished in the later literature between those performed in temporarily constructed enclosures or in the open air for larger communities (the *śrauta*, lit. “solemn,” rites) and those that are restricted to individual households and are performed indoors. At the center of Vedic sacrifice is the use of fire and the ritual transformation of the patron or sacrificer (*yajamāna*), who is given rebirth through the sacrifice into the world of the gods. Fire is personified as the god Agni, who mediates between the worlds of gods and humans and who is associated with the warmth of the world and its creatures. Priests who maintain sufficient purity act on behalf of the patron who sponsors the sacrifice and for whom the benefits of the rite accrue. The Vedic *śrauta* sacrifices frequently employed sixteen or seventeen brahmins in various specialized roles. The priests offered oblations of milk, butter, honey, grains, fruits, animals, water, and soma, the elixir of immortality (*amṛta*), along with recitations of mantras. The *śrauta* sacrifices included the Agnihotra, a relatively simple morning and evening series of offerings; the Aśvamedha, in which a horse roamed for a year to measure the boundaries of the kingdom and then was captured and sacrificed to the gods for the protection and well-being of the kingdom; the Rājasūya, which consecrated the king by putting him through a ritual rebirth that included the rebirth of the cosmos; and the Agnicayana, which reinvigorated the cosmos by constructing an altar of fire, feeding the gods offerings of divine drink, and providing a voice for divine speech through the sustained recitation of sacred formulas.

Usually a king or tribal leader served as the sponsor of such sacrifices on behalf of his clan and the world as a whole. In this way, the sacrifice had as a specific goal the enhancement of a particular individual and as a general goal, universal enhancement. The fire served as the symbol connecting personal, political, cosmological, and metaphysical understandings of the world through its capacity to serve as element, deity, animating power in all beings, and receptacle of offerings. These offerings usually involved the blood sacrifice of animals and the brewing of soma, a beverage having hallucinogenic properties and believed to contain immortalizing power much desired by the gods. The aim of the *śrauta* rites was to reestablish or maintain the welfare of the universe. They provided food, long life, sons, cattle, and power;

they did not seek to confer release from the world (*mokṣa*) but to sustain it in its optimal form. The sacrifice, with its fire at the center, served as the axis around which the cosmos, containing all that moves and does not move, journeyed through time and space. Since the Vedic period these rites have undergone gradual eclipse, and in the present day they are performed only occasionally by groups of brahmins who raise the funds for their performance through contributions.

Following similar patterns resting on the same religious beliefs and assumptions, the domestic (*grhya*) rituals articulated the religious concerns of people rooted in the world of family and kingdom. The head of the household served as the patron or sacrificer before the household fire by offering butter and grain cakes variously directed at the gods, ancestors, all beings, sages, and humans, all of whom often appear in the guise of guests and beggars. These rites, along with the life-cycle rituals (*samskāras*), continue to be performed by traditionalist brahmins. In addition, the Vedic tradition of sacrifice has had a profound influence over other forms of devotional life beyond the boundaries of Brahmanical practice, from temple worship to popular fairs and festivals.

ANCESTOR RITUALS. The Śrāddha rites, or ceremonies performed for the dead, begin at the conclusion of the corpse’s cremation. According to the textual traditions of the Gṛhyasūtras, which were contemporary with the Brahmanas, the rites should last for a year, although twelve days as a symbolic year is the more common pattern. These Śrāddha rites continue to be performed among brahmins and other castes traditionally understood to be “twice-born” and therefore eligible for the benefits of Vedic rites and knowledge. After the eldest son, serving as the sacrificer, has ignited the cremation fire and the body is consumed, a temporary ritual body (*pinḍa*) fashioned from cooked rice is assembled over a period of ten days. This body contains the ghost (*preta*) and serves as a receptacle for subsequent offerings, thus enabling the deceased to be nourished on the long journey to join the ancestors in the divine world. On the final day the assembled body is cut into three pieces and merged with *pinḍas* representing the deceased’s father, grandfather, and great-grandfather dwelling in the earth, atmosphere, and heavens, respectively. These rites establish the deceased harmoniously within their appropriate worlds and prevent them from becoming hungry and haunting their living descendants. In this way the ceremony honors and serves the needs of the ancestors, seeks their influence within the world of the dead for the benefit of the living, and protects the living community from potential peril wrought by ancestors insufficiently sustained in their respective worlds.

Other ceremonies, performed on the new-moon day of each month, provide ritual veneration of the ancestors as part of the regular rhythms of the religious calendar. In these rites a brahman—and in some parts of India, a crow—represents the ancestor and receives offerings of *pinḍas*, water, and sesame seeds from his descendants. Annually the descendants journey to sacred sites and rivers to have *pinḍa* ceremonies performed.

LIFE-CYCLE RITES. The literal meaning of *saṃskāra* is “refined” or “well-accomplished,” and thus the *saṃskāras*, or life-cycle rites, are directed at the ritual perfection or consecration of an individual at various moments in life. The traditional number of these rites varies with different texts and performance traditions, most of them having from twelve to sixteen rituals that might be performed throughout a person’s life. These include rites for auspicious conception, the birth of a son, safe delivery, birth (Jātakarman), naming the child, first solid food, first haircut, initiation into learning the Vedas (Upanayana), and first hearing of the sacred Gayatrī mantra—thus marking the transition into the first of the four life stages (*asrāmas*), namely, studentship (*brahmacarya*). The marriage rite (Vivāha) marks the onset of the second stage, that of the householder (*gṛhastha*). *Saṃskāra* performance calls for fire, offerings, and brahmins to receive the offerings that remain after the gods and ancestors have been honored.

Although today only a relatively few groups of brahmins maintain the *yajña* traditions, the larger patterns of Vedic sacrifice have continued to shape later devotional life. The sacrifice’s concern for achieving ultimate conceptual order and performative effectiveness found new voice in the speculative and ascetic traditions making use of a number of meditative techniques, the best-known of which is yoga. The concern for the constituency of the ancestors continued to be articulated in the Śrāddha rites, in which descendants construct new and purified bodies for the dead. The worship of the gods, which is not emphasized in yoga and Śrāddha practices, becomes highly developed in the tradition of *pūjā*, which makes use of permanent or disposable images of gods and goddesses.

ASCETIC AND MEDITATIONAL PRACTICES. The practice of sacrifice in ancient India yielded a tradition of speculation on the sources and meanings of the sacrifice itself. The ritual commentaries (Brāhmaṇas) invited meditations on the homologies between elements of the sacrifice and those of the cosmos and the individual in order to identify that which lay at the source of all reality. Knowledge paralleled ritual exactitude as a source of power to participate in and even transcend profane time and space. The practice of asceticism (*tapas*) provided the moral, physical, psychological, and intellectual environment in which the one who knows the inner meanings of the sacrifice might achieve proximate or ultimate religious transformation.

Ascetic and meditational practice is probably the most ancient Hindu religious practice. Evidence from images and cylinder seals from the Indus Valley of the third millennium BCE suggests that ascetic practices were part of this pre-Vedic culture. As speculation about the homologies between the sacrifice and the *yajamāna* (patron or sacrificer) grew during the late Vedic and Brahmanic periods, the fire of the sacrifice became identified with the bodily warmth produced during prolonged periods of meditation. As an acquired skill resulting from intense practice, *tapas* was principally a technique

for achieving power and therefore had no inherently moral quality; it became a means by which one might appropriate the creative heat that animates the Vedic fire and thereby direct its power toward one’s own ends. In the epic and Puranic traditions, gods and demons alike make use of ascetic practice in order to overpower or resist their opponents. As the internalization of the creative heat of the cosmos, *tapas* came to be recognized by virtually every religious and philosophical tradition in South Asia as a valuable or necessary component in the pursuit of both proximate and ultimate religious goals. The *Bhagavadgītā* classifies *tapas* according to its uses or goals; it recognizes the purpose of release from rebirth, which it considers to be a “pure” goal; the purpose of obtaining supernatural powers; and the purpose of increasing one’s enjoyment of worldly pleasures. These three goals are classified as *sattva* (“luminosity”), *rajas* (“energy”), and *tamas* (“inertia”), respectively.

The traditions of *tapas* that have been most systematically formulated are those of *rajāyoga*, that is, the classical system of Yoga as taught by Patañjali; the controlling of bodily and mental states, or *haṭhayoga*; and the use of complex visual and aural symbolization drawing upon sexual and ritual imagery in order to achieve powerful and highly desirable religious experiences, or Tantra. As a form of *tapas*, Yoga draws upon ancient traditions of South and Central Asian shamanism in which trances were induced through strict regulation of diet, breathing, bodily movement, and autosuggestion in order to ascend into ecstatic states. During the Upaniṣadic period (c. 800 BCE–200 CE) there emerged further systematic formulations that classified bodily and mental states in a finely distinguished hierarchy leading to *mokṣa* (release from rebirth) as its ultimate goal. One of the most important of these various meditational traditions found precise articulation by Patañjali in his *Yoga Sūtra*, written probably during the Gupta period (320–540 CE), with important later commentaries such as the sixteenth-century *Yogavārttika* of *Vijñānabhikṣu*. The social contexts of yogic devotional practice were small communities of ascetics assembled around a *guru* (“teacher”) who was highly regarded for his skills in the practice and for personal religious charisma. This classical formulation of Yoga remained largely compatible with Brahmanical orthodoxy and orthopraxis.

The practice of asceticism found particular favor among sectarian devotees of Śiva, the mythological embodiment of ascetic power. This tradition combined the classical with the more esoteric and eroticized practices and postures of the non-Vedic traditions of Tantra.

Unlike the ascetic traditions of Brahmanic culture, which held sensory experience suspect and emphasized celibacy and the restraint of erotic impulses, Tantric practice pursued the senses by integrating erotic desire into ascetic transcendence. Building on the techniques of *haṭhayoga*, the *vāmamarga*, or “left-path”—indicating deviation from the “right-path,” or Brahmanic orthopraxis—provides for practitioners to become initiated into “circles” (*cakras*) in which

males identify with Śiva and females with Śakti, his consort. While Vedic and Tantric mantras are chanted the adept heightens his or her sense experience by consuming *Cannabis sativa* followed by fish, meat, aphrodisiacs, and liquor, and by engaging in sexual union with the consort. The female practitioners, called *śaktis*, imitate the active role of the Goddess in the cosmos by initiating sexual union with the males who take the role of Śiva. By a highly stylized process the male adept simultaneously retracts his mind, his breath, and the flow of his semen. The intensity of these forms of control is understood to pull up the animating power of the universe (*kuṇḍalinī*) through the physical body into the subtle body and finally to merge with the Śiva-Śakti principles at the center of the cosmos. This experience is believed to result in a quick, though potentially quite dangerous, path to *mokṣa*.

Tantric practice and imagery inspired much of India's erotic art, much of which is founded on the iconography of Śiva's ithyphallic emblem (*liṅga*) located in the center of Śakti's "seat" or "vulva" (*pīṭhā*). By reversing the logic of orthodox asceticism, which stressed renunciation of sensuality as the means of overcoming attachment to the world and its consequences for *karman* and suffering, Tantra exploited sensual experience and placed the practitioner in the midst of heightened sensuality, using its power for mystical ends. This radical reinterpretation of the traditions of *tapas* never won favor in the Brahmanical tradition, but remained a marginal movement. It did, however, influence temple devotional life, especially in South India.

WORSHIP OF DEITIES. Derived from the Sanskrit root meaning "honor" or "worship," *pūjā* involves the ritual offerings of foods, service, and gestures of respect usually bestowed upon deities in their iconic forms. As a devotional tradition, *pūjā* appears to have emerged during the late Brahmanic period from the practice of honoring brahmins during their visits to the home. The practice then became amalgamated into later *bhakti*, or devotional Hinduism, through its classical textual formulation from the sixth century onward in ritual sections of the Puranas. Today, *pūjā* is one of the most pervasive forms of Hindu worship, and is observed with varying degrees of complexity by most Hindus. The enduring popularity of *pūjā* as a devotional undertaking may be in part its ability to combine elements of Vedic practice with popular religious sentiment.

Pūjās vary widely in ritual complexity, from simple offerings of sips of water, flowers, food, the recitation of mantras, the singing of devotional songs (*āratīs*, *kīrtanas*), and the waving of lighted camphor before the image, to extended ritual episodes that draw on Vedic texts involving offering hospitality, invocations, bathing and dressing the image, and offering many kinds of foods, flowers, and leaves. The image of the deity is frequently made of perishable materials such as clay or wood, and may be brought ceremoniously into the home. It is placed in a part of the household set aside for the deity's residence and then ritually enlivened by establishing in it vital breath (*prāṇapratiṣṭhā*). There it dwells as a living

member of the household for a period of time and is then taken to a nearby river, temple tank, or ocean to be immersed, thereby dissolving back into its primal elements.

Similar patterns of hospitality and praise may be seen in *pūjās* performed in temples. The temple traditions rely heavily on the images and mythologies of divine kingship: The deity is the king or queen of the universe and the shrine is his or her palace. The temple images are periodically enthroned and taken in procession around the ritual boundaries of the kingdom, where they are seen and adored by multitudes of worshipers. The priests perform the duties associated with *pūjā* in both large public settings and small private ones for client worshipers.

Central to the religious appeal of *pūjā* for many Hindus is the experience of *darśana* ("auspicious seeing"). When an image of a deity is prepared and placed on view in the home or temple, appropriately honored and attired in festive costume, the deity makes himself or herself available to be seen by worshipers. The deity "sees" them and extends his or her grace to them, tangibly in the form of *prasāda*, the sacred food that, having been offered to the god or goddess and thus become sanctified by its proximity to the deity, is now returned to the worshiper. At the same time, the deity is "seen" by the worshiper, thereby establishing a visual and personal moment of mutual religious contact.

PILGRIMAGE. As with many other religious traditions, Hinduism has long valued visits to sacred places. These places are frequently associated with geographical features such as rivers (Gangotri, Allahabad, Banaras), places marking land's end (Kanya Kumārī, Rameśvaram, Dvarkā), and mountains (Bādrināth). Other shrines derive their sanctity from the deities who reside there, for example, Viṣṇu at Puri and Tirupati, Kṛṣṇa at Vrndāvana, Śiva at Ujjain and Nāsik, the Goddess at Kāmakhya, Madurai, and Kālighaṭ. Some pilgrimage centers have appeal throughout the subcontinent, drawing pilgrims from upper classes and providing religious merit for those who journey the distance to receive the *darśana* of the deity enshrined there. Other centers are more regional, or local; they serve pilgrims from the more immediate areas and may have large constituencies from particular castes and groups of castes. The pan-Indian shrines are generally the centers for the "high gods and goddesses" of the Hindu pantheon who are celebrated in the Sanskrit lore of the epics and Purāṇas, whereas the regional and local shrines house deities whose lore is carried more commonly through oral and non-Sanskritic literary sources; these regional deities are, however, frequently associated with one of the "high gods." Pilgrimages (*yātrā*) may be made at any time, but those undertaken in conjunction with sacred times in the religious year are understood to be particularly efficacious.

Pilgrims make the often arduous journey to shrines for many reasons: in order to honor the deity who lives there, to bring offerings, to celebrate the magnificent and heroic deeds performed there as told in the sacred lore of the shrine, to receive the deity's grace through the experience of *darśana*,

or “beholding,” to gain personal religious merit, to derive specific benefits such as healing or the expiation of past misdeeds, or to enhance their personal status in their home communities when they return. Pilgrims often visit shrines as part of the performance of a vow (*vrata*) in which the pilgrimage becomes a gesture of gratitude given in exchange for benefits bestowed by the deity. Pilgrimages also serve as occasions in which Hindus temporarily move out of the hierarchical structures of home and village and enter into a more amorphous realm in which the pilgrims encounter one another as parts of a single generic religious community with the shrine as its symbolic center. Finally, pilgrimages to shrines serve as occasions for religious educations and microcosms of the religious life; they are journeys, at once personal and collective, through auspicious temporal and spatial contexts that enhance the devotees’ religious appropriation of their lives.

VOWS. A *vrata*, or vow, is a ritual practice undertaken for a specific length of time in order to achieve a particular goal. It is usually undertaken by an individual and may include various forms of renunciation, such as fasting, celibacy, and an increased intensity of religious awareness that usually takes the form of reciting stories (*kathā*). A *vrata kathā* (“vow story”) can be either ancient or contemporary, and its purpose is to disclose the origin of the vow and its efficacy. As a form of devotional practice, *vrata* is more commonly observed by women, and is often directed toward goddesses. The aims to be achieved through their observance of *vratas* are often quite immediate and pragmatic: the birth of children, particularly sons; success in business and on examinations; abundant harvests; healing of illness; return of an errant spouse; and so forth. The *vrata* involves a basic exchange in which the devotee demonstrates her (or his) heightened religious devotion and faith which the deity receives as a gift and in which she or he delights. In return, if the deity is satisfied that the vow was pure in its intent and execution, she or he rewards the devotee according to the request made in the vow. In this way the tradition of *vrata* makes use of the Hindu renunciatory impulse in order to contribute to the maintenance and enhancement of the everyday world.

FAIRS AND FESTIVALS. Just as nature passes through seasons of cold weather, heat, and the rains, Hindu religious life passes through seasons marked by various collective religious observances. Each deity has his or her own month or season. Which festivals are observed is shaped in some measure by caste and sectarian affiliation. In North India, for example, the religious year begins in the month of Caitra (March–April), with the first festival being Navarātri, or “Nine Nights,” in honor of the Goddess. As the hot season approaches the festival life takes on a more austere and ascetic character. It is the season for honoring the goddess Śītālā, the bringer of fever diseases. Her images are cooled with water in an effort to prevent her (and the cosmos she embodies) from becoming overheated and thus conveying fever to worshippers. The monsoon, occurring during the months of Āśādhā (June–July) and Śrāvaṇa (July–August), disrupts

travel from place to place. It is the time when the various mendicants cease their pilgrimages and settle in shrines and hermitages for the rainy season to observe Cāturmāsya, or the “four-month” retreat. This period has its mythical parallel in Viṣṇu’s cosmic sleep. The full-moon night of the month of Āśādhā (June–July) is called Guru Pūrṇimā and is the time when Hindus pay homage to their religious teachers.

With the conclusion of the rainy season, festival life increases in intensity through the relatively cool and dry months that follow. The months of Śrāvaṇa (July–August) and Bhādrapada (August–September) are filled with religious fairs (*melās*) held at shrines and temples, where the images of the deities are displayed for worshipers to receive their *darśana* (auspicious viewing). *Melās* are also recreational and commercial occasions for merchants and traders to set up temporary booths and sell their wares. An important festival during the waxing fortnight of the month of Śrāvaṇa is Nāga Pañcamī (“serpent’s fifth”), because it falls on the fifth night of the fortnight. Snakes are particularly dangerous during the rainy season because the flooding forces them out of the subterranean holes in which they had taken refuge during the preceding hot, dry months. Although especially associated with Śiva, the veneration and propitiation of the serpent is acknowledged by Hindus from many different ranks. The full moon of the month of Śrāvaṇa is the occasion for the honoring of brothers and sisters in the celebration of Rakṣā Bandhana (“tying the amulet”), in which sisters tie elaborately decorated wrist-ornaments on their brothers.

The goddess Gaurī and the gods Gaṇeśa and Kṛṣṇa are celebrated during the month of Bhādrapada (August–September), followed in the fall season by the month of Āśvina (September–October) with the rituals of remembrance of the ancestors (Pitṛ Pakṣa) in which the annual Vedic *śrāddha* ceremonies are performed. This is followed by the second Navarātri, or nine-night worship of the Goddess, called Durgā Pūjā. Rāma is worshiped with sacred dramas and processions celebrating his victory over the demon Rāvaṇa. During the following month of Kārtika (October–November), the popular festival of Dīvalī, a Vaiṣṇava celebration particularly popular among merchant castes, marks another year’s return of Lakṣmī, the goddess of wealth and good fortune. It is a time of housecleaning and refurbishing, the purchase of new clothing and cooking pots, and general renewal of life. It is a highly auspicious time in the Hindu year, and Hindus, especially in the north, celebrate it with great enthusiasm.

The cold season lasts through the months of Mārgaśīrṣa, Pauśa, and Māgha, and brings about a decrease in the rhythm of fair and festival activity. The sun is worshiped especially during this season, and it is a good time for Hindus to undertake pilgrimages to near or distant shrines. As the weather begins to warm again during the months of Phālguna (February–March) and Caitra (March–April) the major celebration is Māhaśivarātri (“great night of Śiva”), the principal festival in honor of the god Śiva. Kṛṣṇa, the

erotic cowherd, is celebrated with the dionysian festival of Holī in which devotees dance, play pranks, and douse one another with colored water. Although the new year does not actually begin for another fortnight, Holī serves as the event of chaotic renewal that marks the end of the old year and begins the new year with appropriate exuberance.

As classified and prescribed by the sacred calendar, the Hindu year provides a temporal structure for an array of religious moods and activities to take place. As one moves through the days and weeks of the year, various occasions—both solemn and raucous—affirm the many gods, goddesses, ancestors, and auspicious as well as inauspicious powers. As a totality of time, the religious calendar provides an eternal architecture through which time as the experience of irreversible duration may pass. Every year is new and different from the last, yet through the observances of sacred festivals and fairs each year is a repetition of the enduring and paradigmatic forms of religious experience and community life.

SACRED CALENDARS. The Hindu sacred calendar is called the Pañcāṅga (“five limbs”). It contains the temporal structure of opportunities for religious enhancement by identifying those segments of time that are appropriate for various undertakings, whether they be moments of auspicious power or moments of danger. The Hindu year is based on the twelve lunar months, which are slightly shorter than the solar months of the Western calendar. Each month is made up of two fifteen-day fortnights (*pakṣas*, “wings”). The first is the waning or dark (*kr̥ṣṇā*) fortnight moving toward the new moon night (*amāvāsyā*); the second is the waxing or bright (*śuklā*) fortnight, which culminates in the full moon night (*pūrṇimā*). Each day of the month is thus described by its place in fortnight (e.g., “the fourth day in the bright fortnight”). Days occurring during the bright half of the month are generally regarded as inherently auspicious, because time, like the moon, is moving toward fulfillment; days occurring during the dark or waning half of the month tend to be associated with danger and inauspiciousness and often call for more cautious behavior and an increase in asceticism. Because the lunar months are shorter than the solar, the calendar adds an extra month every two to three years to make it coincide with the solar calendar.

The lunar days and weeks move through cycles overseen by deities. For example, Sunday is ruled by the Sun (Ravi) and is therefore called Ravivāra; Monday is governed by the Moon (Soma) and is called Somavāra; Tuesday is overseen by Mars (Maṅgala) and is known as Mangalavāra; Wednesday, ruled by Mercury (Budha), is called Budhavāra; Thursday, ruled by Jupiter (Bṛhaspati), is called Bṛhaspativāra; Friday, ruled by Venus (Śukra), is called Śukravāra; and Saturday, ruled by Saturn (Śani), is called Śanivāra. The Pañcāṅga details the auspicious and inauspicious powers inherent in each lunar day (*tithi*). This information is useful to Hindus in planning new undertakings such as setting out on journeys, opening businesses, and, especially, performing weddings. Because time is not merely neutral duration but

already carries with it certain identifiable—and to some extent predictable—powers, the moment of one’s birth serves to define or characterize one’s character and destiny. Astrological information regarding the precise time of one’s birth carries considerable weight in arranging marriages, and it is commonplace for the horoscopes of prospective brides and grooms to be scrutinized to determine if the potential marriage carries sufficient auspicious powers to ensure its success and its capacity to enhance the lives of others in the extended family. In cases where the astrological signs may be inauspicious, avoidance or compensatory ritual undertakings may be recommended by astrological specialists.

RELIGIOUS HEALING AND EXORCISM. The Hindu cosmos is a complex structure of interacting, and at times competing, powers with which (or whom) Hindus must align themselves to their maximum advantage through devotional actions that generate personal and collective enhancement. This enhancement is frequently represented through imagery and ritual strategies having to do with purity, renunciation, and prostration. The pursuit of these forms of enhancement shape particular ritual actions, diets, and social associations. Nevertheless, even when these efforts are undertaken, but especially if they are neglected or held in contempt, individuals can fall prey to malevolent forces. These malevolent forces take the forms of “hungry ghosts”—those spirits who are trapped in the interstitial realm between the living and the dead—witches, demons, and sometimes deities (such as Śītala, the goddess of smallpox) who themselves have been victims of misfortune. They tend to inhabit territories of maximal pollution such as graveyards and cremation grounds, places where violent and untimely deaths have taken place, or in marginal areas, such as forests, at the edge of the inhabited worlds. They appear under cover of darkness, frequently attacking their victims in dreams. Diseases, particularly diseases of a psychosomatic or psychological character for which precise empirical diagnosis is lacking, are often understood to be the result of the malevolent intervention of one of these spirits, either out of the spirit’s own bad temper or as the consequence of a curse of a worldly opponent.

Individuals are diagnosed as possessed by malevolent entities if, in addition to physical symptoms such as fever, they exhibit erratic behavior such as falling into trance and verbally abusing members of their family. Certain exorcist-healers are called upon to induce the evil spirit to come out. These healers, frequently from low-caste or tribal communities, are recruited on the basis of their personal charisma and their knowledge of and fearlessness within the territory of the demonic. They bring a specialized knowledge of mantras and medicines to the treatment of their clients or patients. Often the exorcist goes into shamanic trance and takes onto himself the voice and persona of the demon or argues with it in a way suggestive both of juridical proceedings and drama. The patient is frequently accompanied by members of his or her family, so that the diagnosis and treatment of the illness serve to integrate into rather than isolate the patient from his or

her family. In some cases, shamanic healers maintain regular practices in or around religious shrines and pilgrimage centers and serve clientele who come to the shrine for general religious merit and treatment for specific disorders.

CONCLUSION. While each of these general types of devotional practice has nearly infinite variations in textual tradition and local custom, they all serve as structures for symbols, actions, and understanding that help to locate Hindus in complex and at times conflicting worlds of meaning. The devotional practices of Hinduism hold in common the goal of moving individuals, groups, and the whole cosmos toward conditions of greater well-being. This movement is always undertaken in the face of counter movements, symbolized by particular forces such as demons or the more abstract formulations of cosmological entropy expressed in theories of the yugas or in the belief in the deterioration of wisdom, virtue, and well-being through the mere passing of time. Devotional practices give Hindus something to do in the face of the desire for enhancement and the anxiety over its erosion or nonattainment, something to do that brings them together as siblings, families, castes, communities, and as the whole culture itself.

BIBLIOGRAPHY

Descriptions of Hindu devotional practices are scattered throughout the literature on Hinduism, but some sources distinguish themselves as places to begin in pursuit of further study. On Vedic sacrifice (*yajña*), see P. V. Kane's *History of Dharmasastra*, vol. 2 (Poona, 1941), pt. 1, chaps. 17–18, and pt. 2, chaps. 19–35, which provides detailed discussions of ritual procedures, although it may appeal less to nonspecialist readers. *Agni: The Vedic Ritual of the Fire Altar*, 2 vols., edited by Fritz Staal (Berkeley, Calif., 1983), provides the fullest textual and ethnographic documentation on traditions of Vedic ceremonialism in India today. On ancestor worship, see David M. Knipe's "Śapīṇḍīkarana: The Hindu Rite of Entry into Heaven," in *Religious Encounters with Death*, edited by Frank E. Reynolds and Earl H. Waugh (University Park, Pa., 1977). A good treatment of Hindu life-cycle rites can be found in Raj Bali Pandey's *Hindu Saṃskāras*, 2d rev. ed. (Delhi, 1969). For a discussion of asceticism in its orthoprax and Tantric forms, see Mircea Eliade's *Yoga: Immortality and Freedom*, 2d ed. (Princeton, N. J., 1969); Agehananda Bharati's *The Tantric Tradition* (London, 1965); and Philip Rawson's *The Art of Tantra* (London, 1973). For a discussion of *pūjā*, see P. V. Kane's *History of Dharmasastra*, vol. 2

(Poona, 1941), and Jan Gonda's *Viṣṇuism and Śivaism* (London, 1970). Little systematic research has been done on *vrata*, but a useful introduction may be found in Diana L. Eck's *Banaras: City of Light* (New York, 1982).

Discussions on Hindu pilgrimage may be found in Agehananda Bharati's "Pilgrimage in the Indian Tradition," *History of Religions* 3 (Summer 1963): 135–167, and Surinder M. Bhardwaj's *Hindu Places of Pilgrimage in India* (Berkeley, Calif., 1973). Festivals and fairs are best discussed in sources with specific ethnographic focus. Two good books are Lawrence A. Babb's *The Divine Hierarchy: Popular Hinduism in Central India* (New York, 1975) and Ákos Östör's *The Play of the Gods* (Chicago, 1980). Sacred calendars are discussed by both Eck and Babb, in works cited above, and in Muriel Marion Underhill's *The Hindu Religious Year* (Calcutta, 1921). Discussions of healing and exorcism may be found in Sudhir Kakar's *Shamans, Mystics, and Doctors: A Psychological Inquiry into India and Its Healing Traditions* (Boston, 1982).

WORSHIP AND DEVOTIONAL LIFE: BUDDHIST DEVOTIONAL LIFE IN SOUTHEAST ASIA

Mainland Southeast Asia comprises the modern countries of Thailand, Laos, Cambodia, Burma (Myanmar), and Vietnam, as well as parts of Malaysia and Yunnan province in China. However, it is more useful to examine the Buddhism of the region in terms of language group or culture than of these relatively recent nation-states. This Buddhism is in no sense monolithic, and one may reasonably speak of "Buddhisms" of the Thai, Lanna Thai, Shan, Lao, Khmer, Mon, Arakanese, and Burmese. These Buddhisms are "Theravādin" in the sense that they are transmitted by monastic orders that descend from Sri Lankan ordination lineages, and in the sense that these orders are custodians of a foundational literature, the Pali canon. The use of Pali, the classical Indic language of Theravāda Buddhism, links the Buddhisms of the region and gives them common access to the rich narrative and philosophical heritage of Sinhalese Buddhism, to which they ultimately refer. But each Buddhism also has its own Pali and vernacular compositions, preserved in manuscript, inscription, and recitation, and in its own practices and rites.

Until the late colonial period, "Theravāda" was not the marker of identity for either members of the order or lay fol-

lowers. For them what we call *Buddhism* was the *sāsana*, the teaching of the Buddha, and the system of ethics and mental culture that he instituted. Even the monastic ordination lineages did not describe themselves as Theravādin; instead they identified themselves with ethnic or geographic terms, such as “Sinhala monks,” “Mon lineage,” or “Lanka lineage.” By the late nineteenth century, Theravāda developed as a self-conscious religion in the European sense of the term, and the term is now a potent marker of identity in South and Southeast Asia and, increasingly, the West.

Devotion is essential to the Buddhisms of Southeast Asia (as it is to all Buddhisms). In a certain sense the whole edifice of Buddhism rests upon devotion, insofar as devotion is one of the primary driving forces of the ideology of merit, which has produced much of the region’s material and spiritual culture. As part of a complex of beliefs and practices, however, it resists reification and isolation, and must be viewed in its ritual and social contexts.

ACTS OF DEVOTION. Devotion may be public or private. Public devotion is a social act that announces an individual’s active participation in a Buddhist community. Private devotion confirms and strengthens an individual’s consciousness as a Buddhist. In both cases it is ritualized and formulaic, but at the same time it is flexible and renewable.

Devotion is expressed through rituals that engage the “three doors” of body, speech, and mind. It is enacted physically through prostration, raising the hands with palms pressed together, and sitting with legs tucked behind. With speech one murmurs or recites formulas. The mental workings of devotion—the worshipper’s wishes and aspirations—are ultimately private, but, as seen below, they have often been recorded in inscriptions.

The simplest act of devotion is homage in front of an image, usually of the Buddha, accompanied by offerings of flowers, incense, and candles. Its focus is the “three jewels”: the Buddha, the *dhamma*, and the *saṃgha* (always in the same order), and for that reason three incense sticks are usually offered. Reflections on the virtues of these three are the “three recollections” that structure daily chanting programs. First, praises will be offered to the Buddha, and his blessing and protection will be invoked; the same will then be done for the *dhamma* and the *saṃgha*.

The Buddha is seen as the acme of wisdom, power, and compassion. His many names express his many virtues: the Awakened One, the Blessed One, the Teacher, the Protector, the Omniscient One, the Ten-Powered One, and so on. His power comes from his practice of the perfections (*parami*) during countless previous births. This aspect of the Buddha is seen in the *Mhākāruniko Nātho* (Stanzas on the greatly compassionate protector):

For the welfare, benefit, and happiness
Of all breathing things
The Greatly Compassionate Protector
Fulfilled all of the perfections

And realized ultimate awakening:
By virtue of these words of truth
May all afflictions never be.

The Buddha’s virtues are so many that he is ultimately beyond praise. This idea is expressed in a Pali stanza included in old Thai liturgical manuscripts (Skilling, 1998):

If a person had a thousand heads—
Each head with a hundred mouths,
Each mouth with a hundred tongues— If he could live
as long as an aeon
And possessed great supernormal power:
He would still be unable to enumerate The virtues of
the
Teacher in full.

DEVOTION AND LITURGY. Devotion has produced a vast liturgical corpus in Pali and in vernaculars. The shared use of Pali does not mean that the regional Buddhisms chose the same texts for recitation or gave the Pali the same pronunciation and cadence. Texts and recitation styles differ widely in the Mon, Khmer, Burmese, Thai, and Lao traditions. Even within a single tradition they vary according to ordination lineage and individual temple custom.

Liturgy lies at the heart of Buddhist practice. An integral part of living Buddhism, it is a teaching vehicle for both monastics and lay followers. In public rituals there is often a leader—a layperson, nun, or monk—who recites the formulas through a microphone, to be followed by the assembly. The recitation of formulas is a powerful vehicle of inspiration. Choral chanting by well-trained monks or nuns has a musical aesthetic that, combined with the fragrance of incense, the serenity of images, and the rich tapestry of mural paintings, is one of Buddhism’s most sensuous expressions.

Throughout the region liturgy opens with a simple statement of reverence towards the Buddha, repeated three times: *Namo tassa bhagavato arahato sammā-sambuddhassa* (Homage to the Blessed One, the Worthy One, the Truly and Fully Awakened One). In public rituals this is followed by the taking of the five, eight, or ten precepts. After this a specific ritual will take place: offering food, offering robes, recitation of texts appropriate to the occasion, and so on, enacted with appropriate formulas. Some rituals end with the spreading of loving kindness towards all beings, or a brief session of silent meditation. At the end of an offering ceremony the monks chant verses that rejoice in the merit performed (*anumodanā*). The liturgy closes with invocations of blessing through the power of the three jewels:

May all blessings come to be, may all deities protect:
By the power of all buddhas (*dhammas*, and *saṃghas*)
May you always be well.

The generic name for apotropaic texts is *paritta* (protection). The core texts of the *paritta* come from the *tipiṭaka*, and have been used in all traditions of the region for centuries. These are supplemented by noncanonical protections, among which the *Jinapañjara*, *Sambuddhe*, and *Bāhum* are three of the most popular. The *Jinapañjara* (Cage of the conquerors)

stations buddhas, arhats, and the *parittas* themselves around the body at specific points, thereby making a protective cage. The *Sambuddhe* stanzas (Skilling, 1996) invoke the power of multitudes of buddhas, and the *Bābum* invokes the eight victories of the Buddha, such as his defeat of Māra or his taming of the maddened elephant Nālagiri. The interdependence of liturgy and art is seen in the fact that the eight victories are depicted in temple murals in Cambodia and Thailand.

The formula requesting the chanting of *paritta*, recited by lay followers to the monks three times at the beginning of the ceremony, succinctly expresses the function of *paritta*:

To ward off disaster, to accomplish all blessings,
To eradicate all suffering, fear, and illness:
Please recite the auspicious *paritta*.

A bewildering variety of chanting books, in all shapes and sizes, is readily available in the region's bookstalls. In Thailand the sixteenth printing of the *Royal Chanting Book* (ten thousand copies) is 427 pages long; first published in 1880, it is available in Pali only and in Pali with Thai translation. Other popular sellers are the *Seven* or the *Twelve Protections* and the *Manual for Laymen and Laywomen*. Cambodian *paritta* collections include the *Anthology of Pali Paritta* and *Pali Recitations*; for laypeople there is the *Householders' Practice*. A comprehensive collection used in Burma is the *Great Paritta*. Popular throughout the region are books devoted to magic diagrams, talismans, and spells.

Many of these collections are bilingual. Translations may follow the Pali, or face it on the opposite page. In one translation style the Pali is embedded in the translation: Pali and vernacular follow each other phrase by phrase. An early Thai collection in this style, the *Translated Chants*, dates to the beginning of the nineteenth century. Other devotional poems or chants are composed directly in the vernacular. There is, however, no body of devotional literature, either authored or anonymous, comparable to the vernacular Indian *bhakti* literature.

Books serve as aids to memory. Monastery regulations and ritual needs require monks and novices to commit liturgical repertoires to memory. Long-term monks memorize the *pātimokkha*, the monk's code, which takes up to an hour to recite. Nuns are adept at chanting, and in Thailand today it is primarily nuns who preserve the vernacular *Phra Malay* recitation, often chanted at funerals. The presence of nuns at ceremonies was noted by early Western travelers to Siam, such as Jeremias van Vliet, an agent for the Dutch East India Company at Ayutthaya from 1629 to 1634:

Besides these male priests, there are connected with the principal temples many old women, who also have to shave their heads. They are dressed in white linen, and they are present at all sermons, songs, ceremonies and other occasions connected with the religion. They are not, however, subject to any extraordinary rules, and they do everything out of religious fervour and free will. Also they have to live on the alms which they receive

from the people. There are no young maidens or pregnant women among them. (van Vliet, 1910, p. 77)

Lay knowledge of chanting varies. Most people are familiar with the basic chants—the three refuges, the precepts, and the formulas of offering—and can at least repeat them after a leader. Many memorize short texts like the *Jinapañjara*, *Sambuddhe*, or *Bābum* stanzas, and recite them in their private devotions. The same text can be recited more than once. In Thailand the number of repetitions may be determined by one's day of birth; for example, a person born on a Monday should recite the Pali stanzas beginning “*yaṃ dunimittam*” (“Whatever ill omens. . .”) fifteen times daily. Some learn to recite chants backwards, in the belief that this increases the efficacy of the syllables.

Demonstration of devotion is not limited to temple ritual. Verses of homage to the three jewels open classical and popular texts. The *Cintāmaṇi*, a manual of Thai language and prosody dating to seventeenth-century Ayutthaya, contains many examples of homage to the Buddha, some quite elaborate, in a range of meters. Thai religion has always been inclusive and eclectic, and homage does not neglect the classical deities of India or local spirits of all stripes. Reverence is also due to teachers and parents, and when they are invoked five joss-sticks or five candles may be offered.

The opening of *Samutthakhot Kham Chan*, a metrical adaptation of the nonclassical *Samuddaghosa Jātaka*, offers extravagant praise to the Buddha followed by homage to Brahmā, Śiva, and Viṣṇu. A Southern Thai verse version of a well-known *jātaka*, “The Story of the Six-Tusked Elephant King” (*Phraya Chaddanta*), invokes the protection of a catalogue of deities:

I pay homage to my teachers
Who have trained and instructed me
That I might compose this tale.
I pay homage to the Buddha,
To the *dhamma*, and the *saṃgha*,
To my Mother who protected me—
May I be free from danger.
I pay homage to my Father
Who cared for me until I grew up. I pay homage to
Goddess of Grain
Who guards us all and always.
I pay homage to all spirits
Who dwell on earth up to the sky:
To Vessuvanna, to Thousand Eyes,
To Indra and Brahmā who always
Protect against danger, obstacles,
Disaster, and misfortune. May that called danger
Never approach or trouble me!

Modern studies tend to compartmentalize divinities, goddesses, and spirits as “Hindu,” “non-Buddhist,” or “animistic,” assigning them static textbook identities that miss the point. In the tolerant pluralism of Southeast Asian culture they are part of a seamless hierarchy of power and merit, with the Buddha, at least ideally, at the top.

THE CULT OF IMAGES. The production and worship of images of the Buddha has fired the religious imagination to the

point that images are everywhere—not only in temples, but in the open air, homes, and schoolyards. Altars bear not just one image, but dozens. In Thailand nearly every roadside shop boasts a shelf lined with deities, raised up on a wall facing the entrance. Many of these shrines are extraordinarily eclectic, with a profusion of figures from the revered King Rāma V (r. 1868–1910) to bearded Chinese deities. A seventeenth-century Persian visitor to Ayutthaya observed that:

The Siamese persevere in worshipping idols. . . They are not even like the other idolaters who worship one special idol which has a determined shape and form. In Siam anyone who pleases makes an image out of plaster, wood, or mud, sets it up in a particular spot and worships it. . . The scholars of Siam exclaim, “Since we cannot experience direct contact with God in all His glory and perfection, we are obliged to seek him through substitutes, which we can behold with our own eyes. Therefore we make the idols our masters and gods.” (Ibn Muhammad Ibrahim 1972, p. 114)

Although Ibn Muhammad Ibrahim’s understanding of the Buddha as “God” may not be strictly accurate, he does grasp one important point: images can be made by anyone. The production of images is deemed a source of great merit; according to a uniquely Theravādin belief, it helps to preserve the *sāsana* for its allotted five-thousand-year life span. The result of this potent authorization is that those who are able to do so sponsor images, often as a family or group project. In most cases an altar is not the product of a conscious and finite iconographic program. Living altars continue to grow, to accumulate new images in accordance with the imperatives of merit. Since to restore an image is also a source of merit, the images themselves undergo periodic repair and are never finished. This is also true of temple buildings, mural paintings, and manuscripts: they must constantly be renovated, restored, and rewritten, in the insatiable quest for merit and perfection.

In the middle of the twentieth century a Thai scholar remarked that:

Perhaps more than any other country in the world, Thailand is the land of Buddha images. They range in size from tiny miniatures to huge giants. They are made of many different kinds of materials—stone, plaster or terracotta, wood, crystal or jade, silver, or gold. . . For more than 1300 years the artists of our country have concentrated on making Buddha images, to such an extent that at the present time the images far outnumber the human population. (Luang Boribhal Buribhand, 1956, p. 3)

If one counts the small amulets highly prized by the Thai, the statement may well be true. But the other cultures of the region share the same ideology of merit, and also produce images in large numbers. A popular custom was to turn spacious limestone caves into cathedrals filled with images, such as the Pak U grottoes on the Mekong River near Luang Prabang in Laos, or, in Burma, the Pindiya Caves in the Shan States and the Kaw-gun caves on the Salween River near

Moulmein. The latter was eloquently described by a “bygone traveler”:

Everywhere, on the floor, overhead, on the jutting points, and on the stalactite festoons of the roof, are crowded together images of Gautama—the offerings of successive ages. Some are perfectly gilded; others encrusted with calcareous matter; some fallen, yet sound; others mouldered; others just erected. Some are of stupendous size; some not larger than one’s finger; and some of all the intermediate sizes—marble, stone, wood, brick, and clay. Here and there are models of temples, some not larger than half a bushel, and some ten or fifteen feet square, absolutely filled with small idols, heaped promiscuously one on the other. A ship of five hundred tons could not carry away the half of them. (O’Conner 1904 [1993], p. 289, condensed)

When an image is installed there is an inauguration ceremony and a celebration, which may last a week or more. At certain times of the year, often the solar New Year, images may be carried in procession on land or water with grand festivity and merrymaking. Such a procession was witnessed by Ibn Muhammad Ibrahim:

There are also special occasions when the idols are mounted on traveling palanquins and brought in from the outlying temples to the city temples where the king and monks worship. In such a case the Siamese say that one idol has come to visit another. . . . Then the city population gathers together and they play drums and flutes. The devout bring flowers and leaves from the trees and fasten them on the temple walls to make festoons. They also fashion artificial flowers from paper. (Ibn Muhammad Ibrahim, 1972, pp. 118–119)

Other foci of devotion are *cetiyas*, bodhi trees, and replicas of the Buddha’s feet or footprints. In Southeast Asia *cetiya* and *stupa* are generally synonymous, and refer to solid free-standing structures built to house relics. *Cetiyas* come in all shapes and sizes; as reliquaries they are often called *Phra That* (from Pali and Sanskrit *dhātu*, “relic”) or *Phra Mahathat* (from *mahādhātu*, “great relic”) in Thai, Lao, and Lanna Thai. *Cetiyas* can enshrine images, scriptures, and other objects of reverence, as well as rich offerings of gold, gems, and pearls. Relics are frequently installed in Buddha images, sometimes (if the chronicles are to be believed) miraculously. A well-known verse venerates most of the sacred objects together: “I pay homage to all *cetiyas*, all and always, wherever they are established— / Physical relics, Great Awakening Trees, and images of the Buddha.”

Relics and images are installed with pomp and celebration. In 1718 in the central Thai principality of Chainat, for example, high-ranking monks were invited from the capital (at that time Ayutthaya) to lead the festivities for the Great Relic. These included one day each of recitation of the “(Summarized Account of) the Buddhist Councils” (*Saṅgāyanā*), of the *tipiṭaka*, and of the “Great Birth” or *Vesantara Jātaka*. The site was decorated with offerings, parasols, banners, flowers, torches, and candles, and there were

performances of masked dance, shadow-puppet plays, and drama. The event was carefully recorded in a large stone inscription that stands at the temple today (*Prachum Silacharuk* 4, no. 97, 1970, pp. 73–74).

*Cetiya*s fill temple compounds and dot the countryside of the region. Bodhi trees are planted in temple precincts. A liturgical genre, both Pali and vernacular, offers homage to the trees of past and future buddhas. Theravādin tradition lists ten future buddhas, starting with Metteyya (this does not mean that there are no others—there are, but they are not named). A class of texts known as *Anāgatavamsa* (Chronicle of the future) is devoted to them. A Thai-language version of one such text explains at the end that, “Any human beings, female or male, who offer homage and bow in respect to the ten Lord Buddhas along with the ten Glorious Great Awakening Trees . . . will gain fruit and benefit. They will not be born in hell for as long a period as one hundred thousand aeons. This is a result of the wholesome intentions of the person who recollects the ten Lord Buddhas.”

Shrines housing replicas of the soles of a Buddha’s feet (positive models) or of his footprints (negative impressions) as the primary icon are common. The replicas are made on stone slabs, wooden panels, or cloth painting. In addition to replicas, there are also “natural” footprints, believed to have been left by a buddha—not only Śākyamuni, but also his three predecessors in this “Auspicious Aeon.” According to old traditions, Śākyamuni left the impression of his foot or feet at five sites in India and Sri Lanka. These are listed in chants that venerate the five prints “from afar”: that is, it is possible to render homage and request protection without going on pilgrimage, although several of the sites have been localized in Burma and Thailand and are relatively accessible.

Other verse compositions, in Pali, Khmer, Burmese, and Thai, list the one hundred and eight auspicious signs that adorn the soles of the Ten-Powered One’s feet and invoke their protection. A Southern Thai text on the signs opens as follows:

May I offer obeisance to the supreme feet of the Buddha,
The glorious and resplendent pair.
My ten fingers raised in a row are bright like golden candles;
My two eyes are alight like a pair of lamps: these I offer.
My hair-knot is like a flower-garland, like beautiful golden nenuphars.
My melodious voice is like an offering of incense and candles.
My heart I dedicate like fragrant scents.

The text ends with the promise that whoever recites the names of the signs will gain vast merit and meet the future Buddha Metteyya. Such texts can be recited at home, or in the presence of one of the replicas of the Buddha’s footprints enshrined in temples and pavilions throughout the region.

DEVOTION AND CUSTOM. Devotion has its own protocols—it invests parts of the body, direction, and space with its own

values. Shoes must be removed before entering a temple or shrine, or—mainly in Burma—at the very first gate, before entering the precincts of monasteries and pagodas. Feet should not be pointed at images or objects of respect, which should be placed higher than the worshipper. One should keep to the right of revered objects, and use the right hand when making offerings. Damaged or discarded objects of reverence are not thrown away or sold: they are left in temples or at the foot of bodhi trees. To steal or damage an image of the Buddha, a bodhi tree, a *cetiya*, or a religious text is a heinous crime that will send the culprit straight to hells of unremitting torment. Such values were incorporated into legal codes, for example the *Three Seals Code* of medieval Siam, which stipulated severe if not gruesome punishments for those guilty of such crimes.

In some cultures access to sanctuaries is determined by gender. In Burma, only males are allowed onto the upper platforms of pagodas—for example, at the Shwedagon Pagoda in Rangoon, where they can sit in meditation or apply gold leaf directly to the revered shrine. In Northern Thailand, women are barred from the raised platform upon which the images are installed; in Northeastern Thailand, females cannot enter the ordination hall; and in Central Thailand they cannot sit on the raised platform within the ordination hall.

Devotion has its own vocabulary. Special terms, often derived from Sanskrit, are used to describe images: one does not buy an image, one *rents* or *reverses* it. One does not take it home: one *invites* it into one’s house. The features of the image are spoken of in a special language used also for members of the royal family. Venerated images are addressed directly, in the second person, with kinship terms identical to those used for revered monks, such as “Great Father.”

DEVOTION AND MATERIAL CULTURE. Worship has had an immense impact on material culture and technology, and thereby on the economy. Special utensils, crafted from bronze, silver, or gold, fulfill ritual functions. Offerings to monks or idols require fine trays and bowls made from lacquer or metal. At the end of a merit-making ceremony, water is poured from a bronze vessel into a small bowl, both purpose-made. In Thailand the monks hold ornate fans in front of themselves when performing certain ceremonies; the fans are a unique art form.

Skilled bronze casters, stonecutters, and woodcarvers produce images in a range of styles, sizes, and materials. Gold beaters produce delicate squares of gold leaf to apply to images. Garland makers station themselves at pagoda gates, threading fragrant flowers such as jasmine and roses into beautiful shapes. Annual rituals have led to the development of unique products, such as the giant candles offered to monasteries at the beginning of the three-month rains-retreat, or the fine threaded sweets prepared at Nakhon Si Thammarat in Southern Thailand to offer to *pretas* (so-called hungry ghosts, tormented by hunger because their mouths are the size of needles).

The premodern landscape was transfigured by devotion. Land, groves, fields, and villages were offered to temples and exempted from taxation. The architecture of the region is in part a response to the needs of devotion. Monastic complexes include buildings for public worship, from simple open-sided pavilions to grand and ornately decorated halls. Large stupas have broad circumambulatories. In Thailand, distinctive shrines—often miniature versions of grander structures—stand raised on pillars in gardens: these are the spirit houses, which accommodate the spirit of the land. Opulent shrines to Brahmā, Indra, or other deities stand in front of banks and office buildings.

Special shops cater to the needs of the faithful, offering a wide range of paraphernalia, including incense, candles, images, monastic requisites, and shrine tables. Crafts and trades were integrated into city plans: the gold beaters' quarters in Mandalay and Bangkok, the religious supplies stores in central Bangkok, and the image makers district in Thonburi, across the river from Bangkok. The economy of worship played a role in the exploitation of natural products and translocal trade. Lime, laterite, and stone were quarried for use as construction materials (lime for the manufacture of stucco to decorate religious structures). Gold, bronze, and tin were mined, exported, or imported, and from antiquity the tropical forests of Southeast Asia supplied the international market with aromatics and exotic timber.

DAILY ROUTINES AND RITUAL CALENDARS. The daily monastic routine includes morning and evening chanting structured around homage to the three jewels. The time of the chanting (from four in the morning on) and the selection of texts vary from temple to temple. Lay people may start their day with chanting and meditation before a private altar. In Thailand the day ends with an act of homage, as recommended by the nineteenth-century poet Sunthorn Phu in his *Svasti Raksa*, a book of stanzas on etiquette for the maintenance of one's well-being:

When you go to bed,
Don't forget to salute the pillow,
While saying your praise and gratitude
To your parents and your teachers. (Umavijani, 1990,
p. 86)

The lunar calendar is used for religious purposes. Special offerings are made on the "holy days" of the four quarters of the moon, especially the lunar fortnight, when the monks recite the *pāṭimokkha*. The Thai cycle of court festivals is described in several late-nineteenth-century texts, including an elegant verse composition by Prince Maha Mala and two detailed historical studies by King Chulalongkorn (Rāma V). In Thailand today the highlights of the year are the great full-moon celebrations or *pūjā* of the months of Māgha, Visākha, and Āsāḷha. On these nights, lay people throng to circumambulate *uposatha* halls and *cetiya*s, carrying candles, incense, and flowers. The monks recite Pali texts and give sermons explaining the significance of the ceremonies, which mark events in the life of the Blessed One. Visākhā Pūjā, which

usually falls in April, commemorates the birth, awakening, and passing away of the Master, while Āsāḷha Pūjā marks his first sermon in the Deer Park at Sārnāth near Vārāṇasī—the "Turning of the Wheel of the *Dharma*." The rich ritual calendar includes the day-long "Sermon on the Great Birth"—the *Vessantara Jātaka*—formerly one of the greatest entertainments of the year, and in the countryside still indispensable as a rainmaking festival. At the New Year people fashion *cetiya*s from sand, and decorate them with papers parasols, flags, and banners.

For the monks the most important event is the three-month Vassa, or "rains-retreat," during which they remain in their home-temple and do not travel. In Thailand males often ordain as monks especially for this three-month period in order to deepen their understanding of the Awakened One's teaching. Male government officials may obtain fully paid leave for this purpose. Although the Vassa is originally and primarily a monastic retreat, during this period devout lay followers may stay overnight in the temple each lunar quarter to chant and meditate. A few take extra vows of abstinence or devote themselves to meditation throughout the three-month period. In Northern Thailand, collections of texts to be chanted during this period are called *Nangsu non wat* (Books for staying overnight in the temple), and special quarters are erected for females within the temple precincts. Other monastic rites that take place after the rains are Pavāraṇā, when monastics invite their fellows to point out any wrongs they may have committed during the rains-retreat, and Parivāsa, penitence for having concealed breaches of certain monastic rules. In Thailand and Cambodia the latter has become ritualized; large numbers of monks from many temples gather at a designated site for the period. Another important festival is the offering of Kaṭhina robes to the monks.

People make special offerings on their birthdays, or in memory of their parents or loved and respected ones on the anniversary of their deaths. They may offer food to the monks on the early morning alms-round, or to the *saṅgha* in general at a temple. Monks are invited to bless newlyweds at wedding ceremonies. At funerals the monks recite texts for the benefit of the deceased. In Thailand they recite extracts from the *abhidhamma*, often every night for forty-nine days in front of the coffin in special funerary pavilions in the temple precincts. For the final passage, the cremation, monks recite a simple stanza on impermanence. On this occasion sons may "ordain in front of the fire," that is, become a monk for a few hours or a few days in order to offer the merit to a deceased parent.

In Thailand a major source of temple income is the annual festival (*ngan wat*), a full-fledged fair with Ferris wheels, rock music concerts, and entertainments of every description. For several days the temple becomes a noisy hive of activity. Another grand affair is the consecration of the monastic boundary, or *sima*. In Central Thailand this has become a weeklong fund-raising event usually held to coincide with

the Chinese New Year in order to attract the wealth of the powerful business and merchant communities of Chinese origin. Less frequent are image-consecrations, for which revered monks are invited to chant special Pali stanzas.

PILGRIMAGE. From chronicles and inscriptions we know that pilgrims from Southeast Asia regularly visited the holy sites of India and Sri Lanka. Royal missions were sent to repair the temple at Bodh Gayā, the “Diamond Seat” where Śākyamuni achieved awakening. In the Pala and Sena periods, Southeast Asian monks traveled to study at the famed universities of Northern India and the monasteries of Sri Lanka, carrying images, scriptures, practices, and ideas back and forth. Pilgrims and monks also traveled throughout Southeast Asia, which had its own study centers and pilgrimage sites.

The most important pilgrimage sites are reliquary shrines (*cetiya*, stupa) and footprints of the Buddha. *Cetiyas* housing hair and bone relics of Śākyamuni are found throughout the region; many boast a chronicle that validates their claims to the pilgrims’ devotions and offerings. In lower Burma two of the greatest attractions are the old Mon stupa of Shwedagon, which enshrines the relics of four buddhas, and the extraordinary pagoda of Kyaiktiyo, which perches precariously on a massive boulder at the top of a hill. In upper Burma pilgrims are drawn to the Mahamuni image in Mandalay and to Mandalay hill. But there are many others: “Most of the commanding heights in Burma have long since been crowned with pagodas, and a visit to any of these gratifies the innate piety and gaiety of the people” (O’Connor, 1904, p. 347).

For the Lao, one of the holiest stupas is Phra That Phanom on the western bank of the Mekong River. Northern Thailand has a tradition of pilgrimage to twelve sites determined by one’s year of birth according to the twelve-year cycle. These include the Shwedagon Pagoda in Burma, the old Mon stupa at Hariphunchai in northern Thailand, and the stupa at Wat Suthep overlooking the Chiang Mai Valley. In Southern Thailand the tall, tapering reliquary at Nakhon Si Thammarat draws busloads of pilgrims from the Thai and Chinese Buddhist communities in Malaysia and Singapore. On the way they stop at other sites, such as Wat Pa Kho in the narrow Sathing Phra peninsula, where a footprint was left on top of a hill by a revered seventeenth-century monk named Luang Pu Thuat. To attract wealthy Chinese pilgrims, temples along the route have built statues of Kuan-yin, the “Goddess of Mercy,” some of them immense.

Pilgrimage centers in central Thailand include Thung Yang in Uttaradit province, where there is a large stone slab where the four buddhas have sat, and the fifth, Metteyya, will sit. Thung Yang was formerly the goal of royal pilgrimage (e.g., during the reign of King Borommakot of Ayutthaya, who restored the complex of sites). Its foundational legend is narrated in both Pali and Thai texts. To the west of the old capital of Ayutthaya and the present capital of Bangkok is Phra Taen Dong Rang, a localized site of the Buddha’s

passing away, which was visited in 1836 by the poet Nai Mi, who wrote:

We brought incense, candles, and choice flowers
And gathered to pay homage to the stone couch
Between a pair of Rang trees.
Their branches, twigs, and sprouts bowed low in hom-
age.
Oh, the Rang trees still adore the Teacher—
How sad that we were born too late to meet him!
All we can see is the stone couch,
Our minds overwhelmed with sorrow and dismay.
Tears stream down as we call to mind
The Holy Omniscient One.

Rang tree is the Thai name for the Indian sala tree. At the same site the poet saw a stone held to be the blood that the Buddha vomited during his final illness, and the site of his cremation on a nearby hill.

From the seventeenth century on, the leading Thai pilgrimage site has been Phra Phutthabat, in Saraburi province to the east of Ayutthaya, identified with one of the five places where the Omniscient One left his print. The annual pilgrimage was a grand affair. Commoners streamed in by boat, horse, and oxcart, and on foot. Stalls were set up at the approach to the shrine, and for a week there were festivities of all kinds—acrobatics, shadow and puppet theatre, dance-drama, and fireworks. King and court made the pilgrimage regularly, first by boat and then by elephant with opulent pageantry. The king would make grand offerings, and perform a unique sword-dance on elephant-back in homage to the footprint. Surviving records—poems, official documents, and a seventeenth-century Dutch account—leave no doubt about the significance of the pilgrimage.

IDEOLOGIES OF BENEFIT AND EXCHANGE. The human predicament is a life of insecurity, suffering, and impermanence, inevitably ending in death. The Buddha taught people to recognize the predicament, identify its roots, and then to practice in order to free themselves from it. Therefore it is said that the Buddha arose in the world “for the benefit of the many, for the happiness of the many, from compassion for the world, for the welfare, benefit, and happiness of gods and humans.” Buddhism is a quest for security and benefit, and it is the Buddha who explains the “ultimate blessings” (*maṅgala*).

Tradition lists “three bases for the performance of merit” (*puñṇakiriyavatthu*): giving or charity, precepts or ethical conduct, and mental culture or meditation. The performance of these leads to three types of felicity (*sampatti*): felicity as a human, felicity in heaven, and the felicity of *nirvāṇa*. Worship and devotional life are directed towards these three goals, which are often referred to in sermons and narrative literature. They are inspired and guided by the ideology of benefit or advantage. The Pali term for this is *ānisamsa* (Skt., *ānuśamsa*, Tib., *phan yon*). It is a key concept not only in Theravāda Buddhism but in all Buddhisms; it is prominent in the earliest texts—the sūtras of the Pali

Nikāyas and Sanskrit Āgamas—for example in the *Metta-ānisaṃsa-sutta* of the former, which promises eleven benefits for those who practice loving kindness: they will sleep well, they will wake happily, they will not have bad dreams, and so on. Thai Buddhists developed a genre of sermon, both in Pali and in Thai, that lauds the specific benefits of specific meritorious acts, such as producing an image of the Buddha, offering candles at the beginning of the rains-retreat, or erecting sand *cetiya*s. *Anisaṃsa* texts are known in other traditions, such as the Sanskrit *Triratnabhājana-ānuṣaṃsa* (Advantages of revering the three gems) from Nepal, or the *Advantages of the Diamond Sūtra* from Tibet.

Another key term in the pragmatics of offering is *paṇidhāna* (Skt., *praṇidhāna*): wish, aspiration, or prayer. When making offerings, one makes a silent wish for specific benefits. This is the private and personal aspect of devotion mentioned above. There are also generalized and public aspirations, such as prayers for the health and welfare of teachers, preceptors, parents, rulers, and all sentient beings. Many of the earliest Buddhist inscriptions (starting from the second century BCE) in India record aspirations. The practice was followed in Southeast Asia; some of the Thai and Cambodian aspirations recorded on stone are long and elaborate verse compositions.

The ideology of *ānisaṃsa* and *paṇidhāna* is one of exchange. One takes refuge in the three jewels, and in return they grant protection or fulfill wishes. When supplicants pray before an image they promise something in return—special food, servants, or entertainment, for example—if their wish is fulfilled. In earlier periods servitors, livestock, groves, fields, and land were granted to images. Such grants were recorded in inscriptions and legal documents, which today are primary sources for the study of economic history. Today live music and dance are offered in some temples; in others one sees small model dancers.

Together, the complex of worship—the chants of refuge and homage, the prayers and aspirations—invokes and constructs an intricate universe of relations and obligations. Offerings are made to the Buddha, and merits are shared with relatives, deities, and spirits, who in turn are asked to offer protection or grant wishes. Offerings to the monks transmit merit to deceased relatives; Buddha images convey benefits. The question of whether it is the image or the Buddha that is addressed and responds can never be resolved, since in the imagination they are both the same and different.

MODERNITY AND BEYOND. *Modernity* and its cognates are troubled and troublesome terms. In this entry they are used as unavoidable conventions for a modernity that begins in the early nineteenth century and continues through the twentieth century to the present. In the last half of the twentieth century the impact of new ideologies and technologies effected enormous change throughout the region.

The Western calendar and the “working week” have broken the rhythm of the lunar calendar, especially in the cit-

ies, where urban life has its own priorities. Urban migration has disrupted the agricultural calendar and the transmission of knowledge within village communities, as has compulsory secular education. This—along with the rapid spread of modern communications, culminating in the internet—has contributed to the erosion of community memories. People have less time for festivals and religious practice; ceremonies and chants have been simplified and abridged, and also standardized as a result of centralized monastic education and print technology. This has led to an impoverishment of liturgical and ritual repertoires, since many of the older chants and rites have fallen into disuse. Old temple districts and craft quarters have been savaged by ruthless construction of roads and commercial buildings, and temple precincts have become parking lots. Festivals are packaged for tourist consumption.

The commercialization of worship in the cash economy has led to questions about the nature of devotion. Is Buddhism being packaged and sold like any other product? Have devotees turned into consumers? Have values gone awry? Do people equate the degree of merit with the financial value of their offering? Some temples, such as Wat Chonlaphrathan in Nonthaburi, Thailand, explicitly discourage lay followers from offering commercialized products. The temple donates excess offerings to orphanages, prisons, or victims of natural disasters; on festival days this amounts to several truckloads.

But the human predicament remains. Buddhist teachings address human needs, and they have always shown resilience and adaptation. The vitality of Buddhist worship and practice is undaunted by modernity. On offering-days devotees bring traffic jams into temple compounds. Radio, television, and the internet are used to propagate Buddhist values. New generations explore the relationship between the teachings of Buddhism and contemporary understandings of society and the universe, proposing compatibilities with science, ecology, feminism, and human rights. Throughout Thailand there has been a rapid development of the cult of Kuan-yin, whose image graces separate shrines or altars beside the presiding Buddha. Migration has led to the construction of Khmer, Lao, Burmese, and Thai temples abroad, especially in the United States, where new forms of worship are developing.

BIBLIOGRAPHY

The primary sources for the study of devotional life in Southeast Asia are inscriptions, chronicles, royal orders, poetry, and the accounts of foreign travelers. Very little research on the subject has been published. The best comprehensive English-language source remains a work first published in 1939: Kenneth Wells, *Thai Buddhism: Its Rites and Ceremonies* (Bangkok, 1975). Wells describes the main ceremonies and translates many formulas and chants. One of the few works dealing with *anisaṃsa*—specifically that connected with

erecting sand *cetiya*s—is Louis Gabaude, *Les cetiya de sable au Laos et en Thaïlande: Les textes* (Paris, 1979). The present entry is based on Pali and Thai sources and field observations. Translations are the author's unless otherwise noted; in some cases the translations are condensed.

The chanting books mentioned in the essay are as follows:

Bhanavara Pali (Pali recitations)

Chet tamnan, Sattaparitta, Cularajaparitta (Seven protections)

Ghipatipatti (Householders' practice)

Khu mu ubasok ubasika (Manual for laymen and laywomen)

Mahaparitta (Great *paritta*)

Parittasamodhana Pali (Anthology of Pali *paritta*)

Sipsong Tamnan, Dvadasaparitta, Maharajaparitta (Twelve protections)

Suat mon chabap luang (Royal chanting book)

Suat mon plae (Translated chants)

WORSHIP AND DEVOTIONAL LIFE: BUDDHIST DEVOTIONAL LIFE IN EAST ASIA

Buddhist practice in East Asia extends across almost two millennia and several different religious cultures and languages. This means that there is a rich and complex set of practices to consider—far too many to attempt a comprehensive presentation within the scope of this article. The character of East Asian Buddhist practice differs both from that of the Western traditions, which have informed the way in which ritual and practice are understood in religious studies, and from many of the popular representations of Buddhism. These differences constitute a series of theoretical issues, which include the relation between the categories of ritual

and meditation, the relation between local and translocal traditions of practice, the complex relation between practice and ideology, the social dimensions of East Asian Buddhist practice, the multivalence of practices, and the emic categories for types and structures of ritual practice. The following will discuss specific instances of East Asian Buddhist practice in relation to these issues.

RITUAL AND MEDITATION. Contemporary Western religious discourse frequently differentiates between ritual and meditation as mutually exclusive categories, often implicitly valuing meditation and dismissing ritual. However, the cultic practices of East Asian Buddhism cannot be so clearly distinguished, as they have both ritual and meditative aspects. For example, the most familiar Buddhist practice is doubtless sitting meditation as found in the Zen (Chin., Chan; Kor., Sōn) tradition. Often considered the epitome of meditation, upon examination one finds such meditation to be a highly ritualized practice. All aspects of behavior during Zen meditation are prescribed, from bodily posture while sitting to the manner of walking while circumambulating the temple between sitting sessions and the manner in which one enters the meditation hall and takes one's seat. Even outside of the meditation period, the manner of one's behavior in all activities—particularly during meals, and excepting only break periods—is carefully prescribed.

Conversely, the rituals of the Japanese Tantric tradition of Shingon are filled with meditative elements. For example, the Full Moon Visualization practice (Jpn., *gachirin kan*), which is one of the introductory practices in the training of a Shingon priest (Skt., *ācārya*; Jpn., *ajari*), includes gazing at a white circle until one is able to see the image mentally, without the support of the visual object. One then imagines this white circle expanding to fill the entirety of the universe and shrinking to a tiny spot at the very center of one's visual field. The Full Moon Visualization practice also exemplifies the continuity between Indian and East Asian Buddhist practices. The practice matches the *kaṣiṇa* practice recorded for example in Buddhaghosa's *Path of Purification* (Pali, *Viśudhimagga*). The *kaṣiṇas* are a set of ten visualizations of a circular device made of a variety of substances and colors (Skt., *rūpa*), one of which is a white circle. Thus, it forms part of a tradition of practice that, while originating in a specific historical and cultural location, was relocated across China to Japan, becoming thereby translocal.

LOCAL AND TRANSLOCAL. All religion is local. Some practices, however, are portable, and being carried across linguistic and cultural boundaries become translocal. Frequently, this process of movement between religious cultures leads to confrontation, interaction, and appropriation of practices, symbols, and ideas. In East Asia many practices are shared by Buddhist, Daoist, neo-Confucian, Shintō, and Shugendō traditions. Despite this long history of religious interaction, Buddhist practices do demonstrate a high level of continuity between their Indian origins and their East Asian instantiations. This continuity, however, should neither be interpreted

ed as providing a basis for claims of authority or authenticity, nor taken as grounds for claims that some practices are pure while others are syncretic. It is simply the case that Buddhist practitioners both maintained practices originating in India and integrated East Asian religious elements into Buddhism.

One example of the interaction between local and translocal traditions of practice is the Ghost Festival (Skt., Avalambana or Ullambana; Chin., Yu lan pen; Jpn., Urabon or Obon). While drawing on Indian antecedents, the Ghost Festival originated in medieval China and continues in present-day Japan and in Japanese Buddhist temples in the United States. The founding story for the Ghost Festival is that of the monk Maudgalyāyana (Chin., Mulien), who saves his mother from her current birth as a hungry ghost (Skt., *preta*; Jpn., *gaki*) by making offerings to monks coming out of their summer retreat (Skt., *varṣā*; Chin., *anju*)—a three month period of reclusion and intensified practice. The rainy-season retreat dates from the time of the historical Buddha, Śākyamuni, and was in fact common to other groups of wandering ascetics in fourth century BCE India.

While based on Indian monastic antecedents, the Ghost Festival complex was adapted to local values and local practices. Developed in response to the Chinese emphasis on filial devotion (*xiao*), the Ghost Festival was promoted to high levels of popularity. Additionally, the involvement of laity and the emphasis on the agricultural cycle with its symbolism of renewal are aspects of the Chinese Ghost Festival that distinguish it from the Indian precedents. In China the schedule of the Ghost Festival correlates strongly with the agricultural cycle. There, the monastic summer retreat began in the middle of the fourth lunar month and ended in the middle of the seventh lunar month, while in India and Central Asia there was much more variation in the monastic schedule.

One of the specific rites that frequently forms part of the Ghost Festival in some contemporary Japanese Buddhist traditions is the feeding of the hungry ghosts. The dead are conceived under two categories: those who have a relation with a living family and those who do not (Jpn., *muenbotoke*). The former can proceed through a cycle of rituals over a period of thirty-three years and become a member of the anonymous collectivity of the ancestors. In the contemporary Japanese Shingon tradition of Tantric Buddhism, these memorial rites proceed through an increasingly extended cycle and are associated with a group known as the Thirteen Buddhas (though technically not all are buddhas): first seventh day, Acala (Fudō); second seventh day, Śākyamuni (Shaka); third seventh day, Mañjuśrī (Monju); fourth seventh day, Samantabhadra (Fugen); fifth seventh day, Kṣitigarbha (Jizō); sixth seventh day, Maitreya (Miroku); seventh seventh day, Bhaiṣajyaguru (Yakushi); hundredth day, Avalokiteśvara (Kannon); first anniversary, Mahāsthāmaprāpta (Seishi); third anniversary, Amitābha (Amida); seventh anniversary, Akṣobhya (Ashuku); thirteenth anniversary, Mahāvairocana (Dainichi); and thirty-third anniversary, Ākāśagarbha (Kokūzō).

However, those who do not have family relations who can insure that this process is completed are in danger of becoming hungry ghosts—dangerous and dissatisfied—wandering the human realm at the time of the Ghost Festival. During the Ghost Festival in contemporary Japan one can see offerings to hungry ghosts placed outside the homes of those who also have offerings to their own ancestors on their family altar.

Hungry ghosts are described as having huge bellies, indicative of their hunger, at the same time they have exceedingly slender necks, blocking them from taking in as much as their hunger drives them to desire. In another description, whenever they do take food their mouths burst into flames, giving them their alternate name of “flaming mouths.” By the power of the ritual, the throats of the hungry ghosts are opened and they are able to consume the offerings made to them. Indeed, after consuming the offerings, their evil *karma* is extinguished and they are reborn in a Pure Land.

Another practice that combines local and translocal religious forms, and also continues into the present, is pilgrimage. Classic Chinese pilgrimage sites for Buddhists were Mount Tiantai and Mount Wutai. The former was important as the location in which Zhiyi (538–597) established the Tiantai tradition (Jpn., Tendai). Consequently, monastic pilgrims, even from Japan, were drawn to Mount Tiantai. For example, Ennin (794–864) of the Japanese Tendai tradition centered on Mount Hiei outside Kyoto spent nine years in China and recorded his travels in a historically important journal. Of more popular appeal was Mount Wutai, widely considered to be the residence of Mañjuśrī, the *bodhisattva* of wisdom. So popular was Mount Wutai that it drew pilgrims not only from within China itself, but also from Mongolia, Inner Asia, and Tibet.

In Japan, Mount Kōya is an important pilgrimage site, particularly the tomb of Kūkai (774–835; posthumous title, Kōbō Daishi, founder of the Japanese Tantric Shingon tradition), where he is said to remain in perpetual meditation. Although the most important center of Shingon Buddhism, because of Kūkai’s wide appeal, Mount Kōya serves as a pan-Buddhist pilgrimage site. Also associated with Kūkai is the pilgrimage route encircling the island of Shikoku. Beginning and ending on Mount Kōya, the route comprises eighty-eight temples. Despite the association with Shingon, specific temples along the route are affiliated with a variety of Japanese Buddhist sects, and have an equally wide variety of chief deities (Jpn., *honzon*). Specific sites along the route mark events in Kūkai’s life, and thus the entire route is often asserted to have been established by him. However, the route only became a pilgrimage circuit much later, becoming most popular in the first half of the nineteenth century. The circuit character of the Shikoku pilgrimage is shared with many South and East Asian pilgrimages, and distinguish these from Western pilgrimages, which tend to be linear.

Throughout its history in East Asia, Buddhist practice interacted with other religious traditions, with borrowing

being done in both directions. In Japan the rise of distinct, self-identified Shintō traditions in the fifteenth century saw the adaptation of Buddhist practices into Shintō forms. For example, Yūitsu and other Shintō lineages developed their own rituals of fire offerings (Skt., *homa*; Jpn., *goma*), clearly modeled on Tantric Buddhist practices. Practice of the *homa* seems to have been entirely exterminated from the Shintō tradition by the suppression of Buddhism (Jpn., *shinbutsu bunri*) in the second half of the nineteenth century, which involved the enforced “purification” of Shintō. Shugendō, the way of mountain ascetics, also developed a *homa*, this one being performed out of doors (Jpn., *saitō goma*). Shugendō *saitō gomas* continue to be performed in contemporary Japan, sometimes on the grounds of Buddhist temples or Shintō shrines, and they have also become part of the Japanese new religions (Jpn., *shin shūkyō*). Conversely, in interaction with Chinese religious culture, within which the Northern (Big) Dipper was a key element—Buddhist practitioners created a *homa* with that constellation as the chief deity.

Understanding the relation between local and translocal practices requires an examination not only of the textual record but also of the artistic record. While sometimes appearing to be normative, textual sources may in fact only represent one local version of a practice. Like other visualization practices, visualization of the Land of Bliss (Skt., *Sukhāvātī*; Jpn., *Gokuraku*) originated in India, was practiced in Central Asia, and was subsequently transmitted to East Asia. The artistic record found in Central Asian cave temples at Turfan show great variety in the visualization sequence and in the elements to be visualized. As Pure Land visualization was transmitted further east—to Dunhuang, China, and Japan—the practice became much more standardized, closely matching the version found in the *Contemplation Sūtra* (Skt., *Amitāyur dhyāna sūtra*; Chin., *Kuan wu liang shou ching*; Jpn., *Kammuryōju kyō*).

PRACTICE AND IDEOLOGY. The relation between practice and ideology, or doctrine, is complex. Both practice and ideology influence one another. For example, practices are molded by conceptions of the path to awakening, while cosmological conceptions reflect states of mind created through meditative practice. Likewise, practices appropriated from another religious tradition or relocated into a new religious milieu may be reinterpreted in order to fit into their new setting. An emphasis on the integrity of practice and ideology is found within Buddhist conceptions of the path to awakening. One of the traditional Buddhist ways of talking about the path is to organize it under the three categories of precepts, meditation, and wisdom (Skt., *śīla, samādhi, and prajñā*). These are known as the three learnings (Skt., *trīṇīśikṣāḥ*; Jpn., *sangaku*). Contrary to the idea propagated by some that meditation alone is adequate, the three learnings are understood to form an integrated whole and to all be equally necessary.

The *Contemplation Sūtra* provides a doctrinal justification for both recitation of the name of Buddha Amitāyus

(Amitābha) and visualization of his image. Both kinds of practices are forms of “keeping the Buddha in mind” (Skt., *buddhānusmṛti*; Chin., *nianfo*; Jpn., *nembutsu*), and as such are considered to imbue the practitioner’s mind with the qualities of the Buddha. This is very similar to the idea of “becoming a buddha in this body” (Jpn., *soku shin jo butsu*), which informs Tantric Buddhist practice in East Asia. This idea is reflected in the identification of the practitioner’s body, speech, and mind with the body, speech, and mind of the Buddha, which is key to many East Asian Tantric Buddhist rituals.

SOCIAL DIMENSIONS. An additional consideration is the common conception of Buddhist practice as primarily being a matter of a solitary practitioner seeking awakening. The vast majority of Buddhist practices in East Asia are social activities, either involving the monastic community or the larger community. Even the practice of seated meditation as found in the Zen lineages, often considered paradigmatic of Buddhist practice, is rarely performed as an individual practice in East Asia the way it is in the contemporary West. Rather, it is performed as part of a larger, monastic context, meaning that it is performed both communally and as part of a larger set of monastic practices. What has formed the popular image of the solitary practitioner is the noteworthy exception that becomes legendary for that very reason.

Buddhist practitioners and institutions have also long been deeply involved with the state, being institutionally dependent on the court for approval of monks and for economic support. As a consequence, there are many rituals directed toward the protection of the state, from the alleviation of droughts to protecting the state from invaders. Sometimes called “national protection” (Chin., *hu guo*) Buddhism, this meant providing ritual services for the benefit of the court. Perhaps the most important ritual for national protection is the Humane Kings ritual, such as that created by Amoghavajra (Chin., *Bukong*) when he reworked the *Scripture for Humane Kings* in eighth-century China. The scripture is classed as one of the perfection of wisdom (Skt., *prajñāpāramitā*) sūtras, though it is apparently unique in promoting not wisdom (Skt., *prajñā*) as key to movement along the path to awakening, but rather forbearance (Skt., *kṣānti*; Chin., *ren*) as most important. This plays on the homophone with the Confucian virtue of humaneness (also *ren*). The equation of these two virtues allowed for the promotion of Buddhism in fifth-century China, when the first version of the *Scripture for Humane Kings* (traditionally considered a translation by Kumārajīva) appeared—a time when Buddhism was struggling for legitimacy in a Confucian world.

For most of East Asian Buddhism, the Pure Land practice of reciting the name of the Buddha Amitābha serves to advance the search for rebirth in the Land of Bliss. Both in China and Japan, mixed groups of monastic and lay adherents were formed to support their members in this practice, in some instances meeting monthly for extended periods of recitation. Some groups combined lectures on the *Lotus*

Sūtra with recitation practice. Of particular importance was supporting dying members so they could pass away either reciting the name Amitābha or at least hearing the name recited. The earliest of these groups is thought to have been established in 402 CE by the monk Huiyuan on Mount Lu. Comprising 123 adherents, both lay and monastic, it is known by its later appellation, White Lotus Society. Half a millennium later in Japan a similar group was formed on Mount Hiei. Known as the Samādhi Society of Twenty-Five (Jpn., Nijūgozanmai-e), this group was founded in 986 and reorganized in 988 by the monk Genshin.

MULTIVALENCE OF PRACTICES. Some of the most common categories for the discussion of religious practices are based on distinctions between elite and popular (social status) or between monastic and lay (institutional affiliation) forms of practice. These categories, however, are often misleading in the case of East Asian Buddhism, where—as we have seen with the Pure Land recitation societies described above—the same practices were commonly engaged in by both monks and laity. Geoffrey Samuel has proposed a more nuanced three-part division based on goal or motivation. Of course, all category systems are provisional. The limiting factor in this case is that motivations may differ between different people, and the same practice may be engaged in with different goals in mind. Thus, rather than utilizing Samuel's three-fold division as a means of categorizing ritual practices per se, it provides us with a means of acknowledging the multivalence of ritual practices. The strength of this categorization is that it is based on Buddhist categories themselves, rather than being imposed from outside.

Samuel's three categories are: pragmatic, *karma*-oriented, and *bodhi*-oriented. Pragmatic practices are directed toward providing immediate benefits in this life. *Karma*-oriented practices deal with the issues of death and rebirth, such as past and future lives. *Bodhi*-oriented practices are those in which the goal is awakening. Understanding East Asian Buddhist practices as having these three dimensions is important because it demonstrates the breadth of religious practices and concerns in Buddhism, a breadth often obscured by the typical representation of Buddhism in contemporary Western religious culture, which focuses solely on an individualized quest for awakening. Some of the practical concerns include healing, exorcism of demonic possessions, and apotropaic protection from demonic attack and possession.

Healing has been a primary human concern in Buddhism, as in other religious traditions. In medieval Chinese Buddhism, for example, there are many stories of recitation of *mantras* and *sūtras* healing the practitioner, either lay or monastic, from illness or demonic possession. Common among these recitative practices are recitation of the name of the Buddha Amitābha (Chin., Amitou; Jpn., Amida) and the *Diamond Sūtra* (*Prajñāpāramitā hṛdaya sūtra*). Like constructing roads and bridges, and providing economic support for monks and monasteries, such recitative practices were un-

derstood to generate merit that could benefit the practitioner either in this life or the next.

Recitative practices also served karmic functions, and their efficacy was not considered to be limited to Buddhist settings, but rather extended across the Chinese cosmology. An anecdote tells of a man of good standing who, upon entering a Daoist temple while drunk, playfully pulled the writing brush from the hand of the statue of the judge of evil. Later he is met by a messenger who has been ordered by the judge to bring him before the otherworldly court. Reciting the *Diamond Sūtra* in secret, he is reprimanded severely by the judge of evil, but eventually forgiven when he promises to recite the *Diamond Sūtra* seven times a day for the rest of his life. Many other texts, including the *Lotus Sūtra* and its "Guanshiyin" chapter, which itself circulated as an independent text, were the object of recitation practice.

This recitation of *sūtras* is one part of what has been called the "cult of the book," in which texts were given religious significance in ways other than being read for their didactic content. Both hagiographic collections, such as the *Lives of Eminent Monks* (*Gaoseng zhuan*) by Huijiao (496–554), and miracle tales written by laypersons record a variety of devotional practices directed toward *sūtra* texts. *Sūtra* texts were collected, preserved, and displayed, which seems to continue the equation made between the Buddha and his teachings—*sūtra* texts themselves were treated as comparable to relics; that is, as vehicles for the presence of buddhas and *bodhisattvas*. The physical presence of a *sūtra* text also provided protection when worn on the body like an amulet, and miraculous punishments were said to follow on acts of desecration against *sūtra* texts.

Similar to healing, exorcistic, and apotropaic rites are practices related to personal hygiene, which are found throughout East Asian monastic Buddhism. One particular set of these practices is focused on avoiding the polluting and demonic forces of the toilet. A sixteenth-century Korean *Sōn* manual reflects beliefs and practices inherited from China, which are still found in some Japanese temples as well. Before entering the latrine, a monk is to snap his fingers three times to warn the demons dwelling there. This is followed by a series of five *mantras*—for entering the latrine, for purification, for cleansing the hand, for getting rid of filth, and for a pure body.

Illness and demonic possession do not seem to have been clearly distinguished, as illness was often understood as a sign of demonic possession—seen, for example, in the Japanese *Tale of Genji* (*Genji monogatari*), written by Murasaki Shikibu at the very beginning of the eleventh century. Exorcistic rituals date back much further in China, however. Compiled in the middle of the fifth century CE, the Buddhist *Book of Consecration* employs a practice of impressing a seal empowered with the names of powerful spirits. Despite the text's use of the Sanskrit term *mudrā*, which literally means "seal," the Buddhist form of this ritual draws on earlier Chinese practices. Seals were used as the symbol of authority and

power, and by carving seals with the names of powerful spiritual entities, such as the Yellow God, Monarch of Heaven, and impressing these either directly on buildings or on pieces of paper hung on a house, one could be protected from demonic forces. Such apotropaic uses clearly match exorcistic uses in which the seal is applied to the body of the afflicted person.

TYPES AND STRUCTURES. Buddhist practitioners have categorized ritual practices according to their purposes. These native taxonomies demonstrate the continuity of Buddhist thought, which originated in Indian Buddhism and is found in Tibet as well as East Asia. These categories are applied, for example, to the *homa*, which has its origins in pre-Buddhist Vedic votive rituals employing fire as a means by which the offering is transferred from the officiant to the deities evoked. In the esoteric Buddhist traditions, there are five purposes for which the *homa* may be performed: for pacification (Skt., *śāntika*; Jpn., *soku sai*); for increase (Skt., *pauṣṭika*; Jpn., *zō yaku*); for subjugation (Skt., *ābhicāruka*; Jpn., *gō buku* or *jō buku*); for subordination (Skt., *vaśikaraṇa*; Jpn., *kei ai*); and for acquisition (Skt., *aṅkuśa*; Jpn., *kō shō*). The use of the same ritual for differing purposes is evidenced by this practice. Each of these five kinds of *homa* are interpreted as having both a practical purpose and as conducive to awakening. For example, the *homa* of pacification functions practically to protect the practitioner—or the ritual sponsor—from accidents, disasters, and misfortunes. The esoteric interpretation is that the ritual extinguishes obscurations (Skt., *kleśa*; Jpn., *bonnō*). Indeed, the ideology of esoteric Buddhism presents a view in which there is no real difference between these two effects, based on the equation of *samsāra* and *nirvāṇa* found in the Madhyamaka tradition. An instance of the practical application of the *homa* of pacification is found at the Shin Daibutsu temple in Mie prefecture, where the ritual is performed for the protection of truck drivers who work in the logging industry.

The contents and organization of many of the rituals of East Asian Buddhism were based on a common set of elements and structures. In China, one of the most widely practiced monastic rites was repentance. Repentance rituals were built up out of a set of common elements. The earliest set of these elements appears in the *triskandha* ritual found in the *Ugra-paripṛcchā Sūtra*, translated into Chinese in the last decades of the second century CE. Typically, the *triskandha* is a three-part ritual involving repentance, rejoicing in the merits of others, and requesting the buddhas to teach. This was not a fixed form, however. In some versions, rejoicing in the merits of others is replaced with committing oneself to changing one's future behavior. Requesting the buddhas to have pity on the practitioner replaces requesting the buddhas to teach. The formulaic character of repentance rites indicates that these are not confessions of particular sins that one has committed, but rather a ritualized repenting of all of the karmic offenses that one may have performed—not only in this lifetime, but indeed in all previous lifetimes throughout beginningless time.

The ritual format of repentance rites expanded over time, coming to include from four to eleven ritual actions, known as “limbs.” While there are eleven elements in both the Indian and Chinese forms, differences between the two traditions lead to a total of fourteen. These are making offerings (Skt., *pūja*, *pūjanā*; Chin., *gongyang*), going for refuge (Skt., *śāraṇa-gamana*; Chin., *sangui*), receiving the five precepts (Chin. only, *shou wujie*), relying on the Buddha's path (Skt. only, *mārgāśrayaṇa*), offering praise (Skt., *vandanā*; Chin., *zan fō*), performing veneration through prostrations (considered part of the offerings in Sanskrit; distinguished in Chinese, *li fō*), confessing or repenting (Skt., *pāpa-deśanā*; Chin., *chanhui*), rejoicing in the merits of others (Skt., *punyaṇumodanā*; Chin., *suixi*), requesting the buddhas to teach (Skt., *adhyeśanā*; Chin., *quanzhu*, *qing*), requesting the buddhas to remain in the world (Skt., *yācanā*, not distinguished from requesting the buddhas to teach in Chinese), sacrificing the self (Skt., *atmatyāga*, *ātmabhāvananiryātana*; Chin., *sheshen*), giving rise to the thought of awakening (Skt., *bodhicittotpāda*; Chin., *fa putixin*), transferring merit (Skt., *pariṇāmanā*; Chin., *huixiang*), and making vows (Skt., *prañidhāna*; Chin., *fayuan*).

The structure of the *homa* ritual demonstrates another organizing structure. The fundamental ritual metaphor is that of feasting an honored guest, which originates in Vedic ritualism and was adopted into all Tantric traditions. The ritual proceeds through a regular sequence beginning with preparing the site and offerings, inviting the deities into the ritual space, making offerings and ritually identifying with the chief deity, separating from the chief deity and returning the deities to their place in the *maṇḍala*, and finally ending the ritual and opening the ritual space.

CONCLUSION. The range and variety of East Asian Buddhist practice can be exemplified by examination of a specific cult, such as that of Kṣitigarbha, the Earth Treasury *Bodhisattva*. There are three primary axes of this cult: devotional practices, repentance rituals, and funerary rituals. The devotional practices include recitation of the name of the *bodhisattva*, creation of different kinds of representations of the *bodhisattva* and their veneration, and recitation and copying of the *Sūtra of the Bodhisattva Kṣitigarbha*. Recitation of the name and veneration of the image of Kṣitigarbha seem to have been influenced by the Pure Land tradition's practices. The link between Pure Land and the cult of Kṣitigarbha is indicated by the changes to the standard Amitābha triad of Amitābha Buddha and his two attendant *bodhisattvas*, Avalokiteśvara and Mahāsthāmaprāpta. In some cases Mahāsthāmaprāpta is replaced by Kṣitigarbha. A variety of repentance rituals focusing on Kṣitigarbha were also written.

The diversity of East Asian Buddhist practices constitute a rich field of study, especially given the difference between these practices and both the intellectual heritage of Western religious studies and the popular representation of Buddhism in the West. The issues raised by the study of East Asian Buddhist practice include the integrity of ritual and medita-

tion, the dynamics of local and translocal practices, the complex relation between practice and ideology, the social dimensions of practice, the multivalence of practice, and the emic categories for types and structures of practice.

RICHARD K. PAYNE (2005)

WORSHIP AND DEVOTIONAL LIFE: BUDDHIST DEVOTIONAL LIFE IN TIBET

Tibetan Buddhism is a continuation of the form of Buddhism that gradually developed over fifteen hundred years in India. The Indian masters who came to Tibet as missionaries encountered folk traditions and beliefs and either suppressed them or incorporated them, in modified form, into the Buddhist universe. Tibetan Buddhism is therefore a complex and layered set of philosophical concepts, rituals, and local beliefs symbolically represented by a pantheon of deities who are either considered Buddhist or have been integrated into Buddhism. The faith of the people is rooted in the historical presence of the Buddha Śākyamuni, his teachings, and the monastic community (i.e., "the three refuges"). Their faith focuses on the celestial Tantric emanations of Śākyamuni, especially on the "wrathful tutelary deities" and the *bodhisattvas*, in particular Avalokiteśvara, Mañjuśrī, Vajrapāṇi, and Tārā in all her forms; these *bodhisattvas* symbolize compassion, knowledge, and power to overcome obstacles. Tibetans also believe in numerous spirits of the land, sky, and underworld. While they consider these spirits to be inferior to the elevated Buddhist pantheon, Tibetans believe that they can have more immediate influence on their daily mundane life than the *bodhisattvas*, and therefore they worship them.

There is a complementarity between the monastics who live in communities and the lay people. According to the Tibetan Buddhist idea of spiritual evolution, merit and wisdom must be gathered for a person to advance towards better rebirths and eventual buddhahood. A lay person mainly concentrates on merit, while also gathering wisdom by supporting the members of the monastic community, who pursue study, reflection, and contemplation in order to gain wisdom. The duty of monastics is to attend to the spiritual aspect of humankind, while lay people provide material support to the religious communities.

Karma, the consequence of the actions of past lives, along with the consequences of this life's actions in a subsequent life, form the theological basis of the people's beliefs. The maintenance of the right attitude and the right mind so as to accumulate merit is the key to a better future life; few people hope to reach the enlightened state, by which they will escape the wheel of reincarnation. Each being has to practice religion in the best way possible at the level reached in this present life. The worship and devotional life of Tibetans reflect these specificities of Tibetan Buddhism.

For most people, including monastics, worship as an individual or a community revolves around thanksgiving and pleasing the deities in order to be safeguarded; worship also involves beliefs concerning protection against evil influences, which can take the form of spirits, and the accumulation of meritorious actions. Most of the devotional life of Tibetans is made up of rituals or actions directed toward these aims.

In monastic communities, besides individual practices, worship takes the form of common daily rituals to the Buddha, *bodhisattvas*, and deities who are specific to each religious tradition within Tibetan Buddhism. The recitation and chanting of prayers accompanied by music is one of the best-known features of Tibetan Buddhism. Certain sequences of prayers and gestures form a liturgy, also called ritual, which can be performed for different purposes and be more or less elaborated. Sacrificial cakes (*gtor ma*) made of cereals and butter are erected and offered to deities by the monastics. Each deity has a specific sacrificial cake. Sand *maṇḍalas*, which take days to make according to a prescribed text, are sometimes offered and then destroyed at the end of the ritual, demonstrating the impermanence of all things. Monastics have other important ceremonies as well: rituals of ordination (for novices and fully ordained monks), monthly rituals of purification, summertime rituals of retreat, and rituals of accession to higher ranks and offices within the monastic hierarchy.

Lay people visit temples on auspicious days to offer butter lamps and incense sticks, and to prostrate in front of the deities, asking for their blessings. They can also offer tea or make any other kind of offering to the whole monastic community, actions that will bring them merit. Out of devotion, lay people often use all their extra earnings to make religious contributions towards new statues or paintings in a temple, or toward building a Buddhist memorial *mchod rten* (chorten, in Sanskrit, stupa), or to go on pilgrimage. These actions are believed to not only add merit to a person's *karma*, but also to increase positive influences for the whole community and beyond to all sentient beings. Collective or individual practices are based on the same belief. Devotional actions are not only meant for oneself but for humankind, and they take different forms.

Nyung gnas (*nyungne*, prayer and fasting), which can last for several days, is practiced mainly by groups of village women and nuns for the benefit of all. *Dbyar gnas* (*yarne*) is the summer retreat made by monastic communities after

the model of Buddha's life. The *Phyag 'bum* (*cha bum*, 100,000 prostrations) are also performed by individuals as a spiritual and devotional exercise that should be done once in a lifetime; it is very strenuous and usually takes three months to complete. A person performing a large number of prostrations can wear a leather apron and gloves, especially during pilgrimages.

Recitation of formulas called *mantras*, which are dedicated to a single deity, is performed with a 108-bead rosary or a prayer wheel and is the most common and ubiquitous form of worship. The two main formulas are *oṃ maṇi padme hūṃ*, the six-syllable *mantra* of Avalokiteśvara, the *bodhisattva* of compassion, who can release sentient beings from the six realms of rebirth, and *oṃ vajra gurū siddhi hūṃ*, the *mantra* of Padmasambhava, whom Tibetans call Gurū Rinpoche. Women have a special devotion for Tārā, the savior and female aspect of Avalokiteśvara, and they recite her *mantra* as protection. These *mantras* can be recited whenever people have free time and while traveling. Elderly people devote most of their time to recitations for their own accumulation of merit, as well as for the merit of all sentient beings. Collective 100,000 recitations are also organized by monastic communities.

Circumambulations around holy places are the third most popular form of devotion, following prostration and recitation; all three are often combined. The holy place could be a monastery, a temple, a *mchod rten* (Buddhist memorial), even a whole city like Lhasa or a mountain like Kailash in Western Tibet. Buddhists perform their circumambulation with the holy place on the right-hand side (Bonpos keep it on the left-hand side). The manner of performing circumambulation is left to each person's initiative; the practice may be performed daily or on auspicious days, and may include fast walking and half or complete prostrations individually or in a group.

The cult of relics is another manifestation of worship in Tibetan Buddhism. Miraculous imprints of parts of the body of a saint are found in rocks, and people touch them with their forehead in order to attain blessings. Bones found after the cremation of high lamas and even mummies are enshrined in *mchod rten* and are objects of great veneration and a source of blessings. One impressive example is the temple containing the reliquary *mchod rten* of the Dalai Lamas in the Potala in Lhasa. Tibetans, in an uninterrupted flow, pass in front of them, touch them with their forehead, burn incense sticks, and pour butter and oil into the butter lamps. This manifestation of faith is all the more poignant now that the Potala is officially a museum and people have to move very quickly through the temple. In addition, designated holes and passages in rocks at "power places" are associated with a means to purify oneself from sins. They are matrices symbolizing rebirth to a new life.

All these devotional manifestations find their apex in pilgrimages. During pilgrimages, monastics and lay people alike combine all of them. This is probably one reason why

pilgrimages are so highly regarded in Tibetan Buddhism. They often represent a lifelong dream, the realization of which demands financial investment and hardship for most people. But these material conditions make the pilgrimage even more meritorious, and the devotion shown by pilgrims amply demonstrates the total spiritual fulfillment of this act.

Holy cities like Lhasa, monasteries like Bsam yas (Samye), and sacred mountains like Gang Tise (Kailash), A myes ma chen (Amnye Machen) in northeastern Tibet, and Tsa ri (Tsari) in southeastern Tibet are the most rewarding in terms of blessings and merit. But people also make pilgrimages to sites that are not far from their region, and some pilgrimage destinations are purely local. Travel to a distant pilgrimage site, which can take weeks to reach, is usually organized by a group of villagers headed by a monk. With the assistance of a religious guidebook, the monk points out the important places en route and explains their symbolic meaning. The skor ra (kora), or circumambulation of a mountain (mountains are considered the abode of a manifestation of the Buddha), can take several days.

Only the most determined do the full prostration all the way; helped by a friend, they may live off alms on a physically exhausting but spiritually fulfilling journey. Today in Lhasa one can still meet such leather-clad pilgrims who have prostrated all the way from their home regions to the holy city, continuing their devotion through the fumes and the noise of the traffic. The pilgrim is oblivious to the ugly aspects of the modern city and sees only the holy places. India and its historical Buddhist sites, such as Bodh Gayā, are the ultimate pilgrimage destinations for Tibetan Buddhists.

One of the strongest aspects of Tibetan devotional life is the veneration in which high incarnate lamas (addressed as *rinpoche*, “precious jewel”) are held. Such a lama is a *sprul sku* (*tulku*), which, in Tibetan, means a body of incarnation, implying that he is a human embodiment, a quintessential representative, of the Buddha or a *bodhisattva*, or the present form of a saint. The Dalai Lama is the best known of such high lamas: he is the incarnation of the *bodhisattva* Avalokiteśvara, the all compassionate, and the Buddhist protector of Tibet. However, there are hundreds of incarnate lamas. Some are the embodiment of a long lineage of past lamas, some are more reputed for their spiritual achievement and teachings than others, but all command a veneration that is difficult to describe in rational terms. Being in their presence, listening to their teaching, and getting blessed by them are among the greatest benedictions a devotee can hope for. This explains the gathering of thousands of people who come from all over the world when one of these high incarnates gives a public initiation. It also explains the blessing on the head given by the touch of a lama’s photograph.

According to Tibetan Buddhism, rites fall into four main categories: (1) pacification rites (to pacify, bless, and heal); (2) augmentative rites (to increase lifespan and good luck, and to generate bounty and wealth); (3) empowering rites (to enhance control of divine and human individual and

social forces, and to tame and discipline); and (4) wrathful rites (to protect against evil and remove obstacles; exceptionally, these rites may involve the taking of sentient life). This four-fold philosophical categorization of rites is understood by most educated monks, but common people often do not perceive the rites in this way. They see rites as a means to remedy a particular situation.

An important aspect of devotional life is made up of rituals performed at home. Each house has an altar room or, in the case of very poor people, a corner devoted to religious activities. Monastics, or simply religious practitioners in some areas, are called into a family’s house and stay there for one or several days, depending on the length of the ritual they have been asked to perform. The reading of a specific text, often a version of the *Prajñāpāramitā* in 100,000 verses (*’bum*) or 8,000 verses (*brgyad stong pa*) is done, if possible, once a year in each household to insure blessings to the family. On a grander scale, a noble family can ask for the reading of the 120 volumes of the Bka’ g’gyur (*Kanjur*), considered to be in the Tibetan Buddhist canon the words of the Buddha. There are religious communities that specialize in reading the scriptures.

Other rituals have different purposes, and they usually involve lengthy preparations in the making of sacrificial cakes, effigies, or thread crosses, and the gathering of special ingredients and vessels. A ritual has more value if it is presided over by a reincarnate lama. The purpose of these rituals is to cleanse the house after a birth or a death; to ensure the prosperity of the family, the harvest, and the cattle; to ward off evil spirits who have caused sickness or misfortune; to call back prosperity and fortune or *g-yang* (*yang*); to protect members of the family while they travel; or to redeem sins. It may be in the rituals that the assimilation of pre-Buddhist or non-Buddhist beliefs into Buddhism is most obvious. The best example might be the state oracle ceremony, still performed today. During every New Year festival, the oracle monk of Gnas chung (Nechung) monastery, next to ’Bras spung (Drepung) near Lhasa and now rebuilt at Dharamsala in India, dressed in ceremonial garments and crowned by heavy headgear, is brought before the Dalai Lama in public. While in a trance, possessed by the deity Rdo rje drag ldan (Dorje Dragden), he blesses the state and the people and shoots a symbolic arrow at the heart of the scapegoat effigy in which all the evil of the previous year is magically entrapped. The effigy is then burned in a bonfire. In coded language, the oracle monk provides information to the state, responds to questions, and gives warnings of impending dangers.

Many rituals that Tibetans perform as part of their devotional life find their origins in the pre-Buddhist religion, commonly called Bon. Once a year, community rituals dedicated to the local guardian deity of the territory are performed; these involve the burning of incense and juniper, as well as the erecting of prayer flags near the abode of the deity, usually on a mountain. The burning of juniper, called *bsangs*

(*sang*), is also done daily by each family in order to please the local deity. This does not prevent Buddhist prayers being said every morning in the family altar room, where butter lamps and water bowls are placed as offerings to the Buddha and *bodhisattvas*.

The great capacity of Tibetans to assimilate or maintain, side by side, different beliefs in a religion called Tibetan Buddhism has led to a rich devotional life that is supported by an unwavering faith in meritorious acts and compassionate beings.

WORSHIP AND DEVOTIONAL LIFE: DAOIST DEVOTIONAL LIFE

The Chinese have traditionally rendered a cult to a vast array of spiritual beings that includes, in addition to their own ancestors, great heroes of the past, spirits of place, and the souls of the unfortunate dead. Every geographical unit had its own god of the soil; every social grouping has its patron deity and temple. There were gods who judged the souls of the dead and gods who kept watch on the conduct of the living; there were gods of healing and gods who spread epidemics. Even the latrine, as a distinct place, had its guardian spirit.

Chinese popular religion is essentially concerned with the cultivation of the good graces of these spirits, most of whom are at once potentially harmful and potentially beneficial. Their cults represent alliances or covenants between the worshipers and the worshiped: in exchange for the protection and assistance of the spiritual potentate, the faithful render it a cult. It is a reciprocal relationship, with obligations on both sides. These features of the religion of the people also characterize state-sponsored religion from very early times, as may be seen in the third-century BCE descriptions of the gods of the realms' mountains and rivers in the *Shanhai jing* (Classic of mountains and seas): sovereignty over a given territory required knowing the nature of the local gods and making the prescribed sacrifices to them.

Daoism, by contrast, is the cult of the Dao ("way"); it denies neither the existence of the gods nor the legitimacy of the cults rendered them. It simply accords them an insignificant place in the world of the Dao. "In a world governed according to the Way," says Laozi (fourth century BCE), "spirits are impotent, or rather, it is not that they are impotent, but that they have no power to harm people."

Unlike the gods of the popular pantheon, the Dao "gives life yet lays no claim, is generous but exacts no gratitude" (*Laozi* 2); it "clothes and feeds the myriad creatures but does not lord it over them" (*Laozi* 34). The natural model for this "highest good" is water. "Because water excels in ben-

efiting the myriad creatures without contending with them and collects in a place ordinary people despise, it comes close to the Way" (*Laozi* 8). "Greatly virtuous behavior," therefore, "consists in following the Way" (*Laozi* 21), and the Daoist is simply one who, because he "acts in accord with the Dao, is like the Dao" (*Laozi* 23).

A book of philosophical maxims, the *Laozi* says nothing of the practices that most probably lie behind Laozi's principles. Recent studies of hitherto neglected texts, such as the *Neiye* ("inward training"), said to date to about the same time as the *Laozi*, have helped to fill this gap by showing that meditation practices were already highly developed at that time. The discovery in tombs dating to the early imperial period (early second century BCE) of medical texts and texts of macrobiotic hygiene has also opened up new perspectives on what some now call "proto-Daoism." These new sources show that the human body was already then understood as a kind of microcosm, subject to the same rules of order and disorder as the macrocosm. In both worlds, the normal circulation of *qi* (breath, vapor, energy) was seen as essential to health, and techniques were therefore proposed for ensuring and improving this circulation. Prominent among these techniques were breath and sexual cultivation.

The *Liexian zhuan* (Biographies of the immortals), a second-century collection of seventy hagiographic sketches, gives a good idea both of the range of these practices and of their social function. All the practices focus on the human body, which is conceived of as a kind of "energy bank" whose original capital can either be spent—the result is death—or "nourished" and so augmented until one obtains immortality. Adepts "nourished their energy" (*yang qi*) with a great variety of natural products thought to be particularly potent. The most remarkable of these products is without doubt the "essence of the mysterious female," obtained by means of the "arts of the bedroom." But most of the products were of either a plant or mineral variety: roots, thistles, chrysanthemums, pine seeds, mica, and cinnabar are among those mentioned. Inasmuch as most of these products could be found only by patient searching in uninhabited regions, the future immortals (*xian*) appear as solitary individuals who, having learned the techniques of searching and use from a master, disappear into the mountainous wilds or the "Far West" and are never seen again. But some return on occasion to cure people or save them from a natural disaster.

One Cui Wen Zi, for example, after having lived for a long time in obscurity at the foot of Mount Tai—also called the Eastern Peak and considered to be the dwelling place of the souls of the dead—returns one day to human society to sell his "yellow potions and red pills." When later a great epidemic breaks out and the deaths number in the tens of thousands, the civil authorities come to Cui begging him to save the people. Carrying a red banner in one hand and his yellow potion in the other, Cui goes from house to house, and all who drink his potion are saved.

Cui later goes off to Sichuan in western China to sell his pills. Although no cult is established in his honor, many of the immortals do become cult objects. Huang Yuanqui, a Daoist (*daoshi*) who descends occasionally from his mountain to sell drugs, comes to be worshiped because he saves the local people from an earthquake by giving them advance warning of its imminence. A female Daoist (*daoren*) by the name of Changrong likewise becomes the object of a cult when, over a period of two hundred years, she wins fame by giving away to widows and orphans all the money she makes selling a special plant from her mountain as a dye. Another mountain-dwelling Daoist first appears to give one Shantu a recipe or an herbal drug that not only heals his wounds but also completely satisfies his hunger. When Shantu returns to become his disciple, the Daoist reveals himself to be an "angel of the Five Peaks," that is, one of the divine messengers of the five sacred mountains of China.

HEAVENLY MASTER DAOISM. If most of the immortals of the *Biographies* were hermits of the distant past, the second century CE also witnessed the appearance of the first mass movements in Daoism. The most important proved to be that of the Way of the Heavenly Masters (*Tianshi dao*), which has survived to the present. Sometime in the middle of the second century—the traditional date is 142 CE—Zhang Daoling, on the basis of a revelation received from the Most High Lord Lao (the religious title of the philosopher Laozi), founded a "church" composed of twenty-four "governances" (*zhi*). The twenty-four governances on earth corresponded to twenty-four energies in heaven, and the term therefore implied that the world of the Heavenly Masters was "governed" according to the same principles as heaven.

Behind this program for an orderly world lay a detailed cosmology. The Dao was conceived of as a giant body containing three pure energies in a chaotic state. Over time, these energies separated out to form a three-layered universe composed of the heavens above, the earth beneath, and the waters under the earth. Each of these three layers spread out to the "eight confines," that is, the four directions plus the four corners. The twenty-four governances are the replica of these twenty-four regions of the universe; both are expressions of the twenty-four celestial energies, each of which is dominant in turn for fifteen days each year: $24 \times 15 = 360$.

The new religion was called the *zhengyi mengwei dao* ("way of the alliance of the orthodox one with the gods"). The Orthodox One was the "unique energy" of Lord Lao—his revelation—communicated to Zhang Daoling. The gods were taken over from the popular pantheon, but they included only the gods who assisted in governing the universe, that is, the gods of the hearth and of the soil, who reported at regular intervals to heaven on the conduct of the family or the community of which they had charge. In addition, there were the Four Generals, who "hold the year-star in place," that is, regulate time, and the Three Officers, who control the Three Realms of heaven, earth, and the waters. Explicitly excluded from this pantheon were the souls of the dead,

which played so large a part in popular religion. They were considered “stale energies” that needed to be recycled, and whose worship, as it retarded their recycling and so contravened the natural order, could only cause harm to the living.

The Three Officers were particularly important because they were cosmic inspector gods. It was to them that ill adepts had therefore to address documents of confession, for all illness was considered to be the result of sin. Each of the Three Officers governed a portion of time, as well as a portion of space. Every year, at the beginning of their respective reigns, assemblies of the gods were held to bring the registers of merit and demerit of all beings up to date. On those days, called the days of the Three Assemblies, the Daoist faithful gathered for communal rituals and meals called *zhai* or *chu*. The word *chu* means “kitchen” and therefore refers primarily to the communal meal. The word *zhai* came to mean “vegetarian meal,” in part because Daoist meals did not involve animal sacrifices like the meals associated with popular cults; however, its basic meaning is “to equalize,” in the sense of “to compose oneself” in preparation for an important encounter, especially with the gods. The term “merit meals” was also used because, as with the meals in the popular cults, the food eaten was first offered to the gods. It was thus consecrated food that brought merit and blessing to its partaker.

The days of the Three Assemblies were also the occasions for bringing the registers of the faithful up to date. This was the job of the *jijiu* (libationers), as the heads, male or female, of the twenty-four governances were called. Everyone in his or her governance, layperson or priest, had a register that corresponded to his or her level of initiation. The texts concerning these registers are unfortunately late (sixth to eighth century) and contradictory, but we can deduce from them that the faithful were organized in a military hierarchy, conceived, no doubt, on the model of the heavenly host that was holding its assembly at the same time.

According to some texts, the body of the Dao—the universe—contains a grand total of 36,000 energies. The bodies of earth dwellers, however, contain only half that number, and adepts must, therefore, learn how to recognize the energies within their bodies so as to “hold them in place” and attract their 18,000 celestial counterparts to come and “attach themselves” to them. This latter term indicates how Daoism borrowed the practices of popular cults and rationalized them by making them controlled techniques in the context of a complete cosmological system, because it is the same term used to describe the phenomenon of possession—the god “attaches himself” to the medium—on which many popular cults are based.

The expedition of petitions was also a characteristic feature of Heavenly Master Daoism. One surviving collection lists the names of some three hundred such texts, together with the offerings that were to accompany them. The petitions are confessions of sin, statements of merit obtained by the performance of a given ritual, and prayers for children, for long life, and for deliverance from every imaginable kind

of difficulty (drought, locusts, rats, tigers, sorcery, epidemics, etc.). The offerings invariably include rice, silk, money, incense, oil, and the paper, brushes, and ink needed to write the petition. The generic term for such offerings came to be *jiao*, a word that originally referred to the ceremonial offerings made in connection with a marriage or with male puberty rites. What distinguished such an offering from other offerings was that it was not performed “in response” to someone or “in exchange” for something. It was, in that sense, a gratuitous act, as opposed to an act of gratitude.

Jiao offerings of this kind remain to the present day the one truly distinguishing feature of Daoism in general. Nowadays, in addition to rice, they include tea, fruits, wine, precious objects, candles, even the texts used during the rituals. They are called “pure offerings” in order to distinguish them from the offerings of popular religion, which still include meat, either cooked or raw. These two different types of offering show better than anything else the real differences between the alliances of ordinary people with their gods and the Alliance of the Orthodox One with the Powers: ordinary alliances are “deals” between nonequals, and the offerings are often described quite frankly as “payoffs,” such as one would make to a local hoodlum or mandarin. At the same time, such an alliance has nothing permanent about it: it can be broken by either of the contracting parties for “breach of contract.”

The Alliance of the Orthodox One with the Powers, being based on the structure of the universe itself, cannot be broken; it can only be recognized. Ritual action that is in accord with this structure automatically brings a response of “merit,” for like is attracted to like. Adherents of the Alliance, therefore, must transcend the expectations of reciprocity and mutual obligation that normally determine social and spiritual relations and take responsibility for their own destiny. They must learn to become, like a king, “solitary, single” (*Laozi* 42). All of this is expressed in the “pure offering,” an offering that is pure because it includes no blood sacrifices, but also because it expresses the pure intentions of the participants in the offering. It is these pure intentions that will ineluctably attract to the participants the pure energies that bring fortune, health, and salvation. The *jiao* offering continues to celebrate, thus, both a marriage and a coming of age.

In addition to the vast range of rituals performed, either on the occasion of set feast days or at moments of crisis, Heavenly Master Daoism involved private practices. Recitation of sacred texts (of the *Laozi* in the first place, but also of rhymed verses describing the spirits inside the body) was one of them. By recitation, the adept assimilated the text and thereby gained mastery over the spirits described in it. Cycles of recitation imitated the gestational cycles in the body of the Dao, and mastery over the energies within attracted their counterparts without.

Great emphasis was also placed on moral behavior, and each step up in the hierarchy of registers brought with it an increase in the number of commandments to be observed

(180 for libationers). The basic idea of these many commandments was to preserve and nourish the pure energies within rather than squandering them on the outside in the pursuit of pleasure. Because infractions of the commandments were thought to lead to illness, rituals of confession were from the very beginning a central part of the movement. In the “vegetarian vigils” (*zhai*) that became characteristic of Daoism from the mid-fifth century on, partly under Buddhist influence, litanies of confession came to play a major role in all Daoist liturgies.

INDIVIDUAL PRACTICES. The rise of communal Daoism did not put an end to the kinds of individual practice alluded to in the *Biographies of the Immortals*. Beginning in the fifth century, individual eremitism gradually gave way to monastic communities called *guan*. The word means “to observe” or “to visualize”; it refers especially to the “inner vision.” Such inner vision being the fruit of individual practice, the constitution of “hermitages” clearly did not put an end to the individual practice of the arts of immortality. These arts included techniques of visualization, breath control and circulation, gymnastics, special diets, intercourse, and alchemy. Early forms of external alchemy involved a fairly broad range of minerals and metals, with cinnabar and lead being central to the process. Later forms used lead and mercury. Internal alchemical methods ranged from the relatively empirical, scarcely distinguishable from the more ordinary techniques of breath circulation, to the extremely abstract and symbolic, virtually indistinguishable from traditional cosmological speculation. What these various techniques and recipes shared was a common symbolic and cosmological framework and the fact that they were transmitted from master to disciple in separate lineages.

Breathing techniques included purely internal methods such as embryonic breathing and circulating the energy while ceasing to breathe. Other methods involved the absorption of outside energies followed by the wedding of these energies to their internal counterparts. Such techniques were usually practiced at times determined by the system of symbolic correspondences. Absorption of the energies of the five directions, for example, was linked to the cycle of the sun, whereas that of the energies of the sun and the moon was linked to the phases of the moon. The adept was to inhale the energies of the four directions on the first and central days of the corresponding season (the “eight segmental days” [*ba jie ri*] because they divided the year into eight equal segments) and those of the center on a day in the sixth month when the central element, earth, was dominant.

The adept who practiced the “method [*dao*] of the absorption of the essences of the sun and the moon” did so on set days on each month: on days 1, 3, 5, 7, 9, and 15. At daybreak, according to the fourth-century *Tai-shang lingbao wufu xu* (Preface to the five symbols, potent treasure of the most high), the adept would face the sun, close his eyes, and visualize a small boy, dressed in red, inside his heart. He would massage himself with both hands from his face to his chest twelve times; then,

the yellow energies of the true red of the solar essence come before his eyes. They enter his mouth, and he swallows them eighteen times, sending them downward with a massaging movement. He prays, “Original Yang of the Solar Lord, join your power to mine so that together we may nourish the young boy in my Scarlet Palace.” After a moment, he visualizes [the energies] going down to the crucible [*dan tian*, in the depths of the belly], where they stop. This leads to eternal life. (*Tai-shang lingbao wufu xu* 1.19a)

From very early times, imaginative visualization played a central role in the Daoist’s search for transcendence. In the *Laozi zhongjing* (second century CE), for example, the adept learns to visualize a whole series of gods, from the Supreme Great One above his head to the spirit of his feet. Inside his body, at each of several levels and with constantly shifting names, he visualizes a kind of holy family composed of a Mother of the Dao and Father of the Dao, together with their infant Real Person. The resultant familiarity with the divine forces of his body becomes vital to survival during a three-day retreat at the time of the autumn equinox, when celestial gods come to inspect the human world: by “holding these forces in his mind’s eye” (*cun*), he prevents them from leaving his body. Having thus preserved all his own energies, the adept ultimately succeeds in attracting their celestial counterparts and thereby achieves immortality.

The visualizations in the eleventh-century *Lingbao bifa* are very different, focused not on individual gods but on metaphorical representations of the energies of the viscera that combine in an extraordinary variety of ways. After a first cycle of visualizations concentrated within the trunk of the body, a second cycle expands to include the head. In the third and final cycle the adept achieves complete unity of concentration and energy. This enables him to make, cautiously at first, journeys of the mind outside the body and, finally, complete liberation.

A similar process of interiorization occurs in the rituals of communal Daoism, partly as a result of Tantric influence. The esoteric aspects of rituals for presenting memorials, for example—the hand gestures, the dance steps, the visualizations—become ever more important and complex. In extreme cases the external, written memorial disappears altogether. Perhaps most remarkable of all is the appearance, in the thirteenth and fourteenth centuries, of rituals of “universal salvation” (*pudu*) performed by individual laypeople in the quiet of their own meditation rooms. Down to the present day the ritual of universal salvation is normally the most public, not to say noisy, of all rituals.

It is probably also during the Song dynasty that communal Daoism of the kind described above died out. (It seems to have survived only among the Yao tribes of southern China, Thailand, and Laos into the twentieth century.) Lay initiation disappeared, and the priest became a ritual specialist serving a community that had by and large ceased to understand the nature of the rituals for which it still felt a need. The result was not only an increase of ritual secrecy and es-

oterism, but also a proliferation of rituals. (Urbanization and mercantilization of the economy were also factors in this.) One of the most interesting cases of a new ritual is that of the posthumous ordination of laymen. People became thereby in the next life what they had ceased to be in this life, members of a Daoist community. The religious affiliation of common people in this life tended now only to be with the temples and gods of the very popular religion Daoism had originally set out to combat and replace. Daoism was on its way to becoming what it is in modern times, the servant of the religion of the people, called on primarily to perform offerings that legitimize the gods of the people by showing them how the order of the Dao works, and integrating them thereby into that order.

BIBLIOGRAPHY

The best general introduction to religious—especially Heavenly Master—Daoism is Kristofer Schipper's *Le corps taoïste* (Paris, 1982), translated as *The Taoist Body* by Karen Duval (Berkeley, 1993). On pre-imperial meditation techniques, see Harold D. Roth, *Original Tao: Inward Training (Nei-yeh) and the Foundations of Taoist Mysticism* (New York, 1999). On early macrobiotic techniques of longevity, see Donald Harper, *Early Chinese Medical Literature: The Ma-wangdui Medical Manuscripts* (London and New York, 1998). On Daoist practice in the formative Six Dynasties period, see Stephen R. Bokenkamp with Peter Nickerson, *Early Daoist Scriptures* (Berkeley, 1997). On Daoist alchemy, see Joseph Needham's *Science and Civilisation in China*, vol. 5, pts. 3 and 4: *Alchemy and Chemistry* (Cambridge, U.K., 1976–1980), and Fabrizio Pregadio, "Elixirs and Alchemy," in Livia Kohn, ed., *Daoism Handbook* (Leiden, 2000), chap. 7, pp. 165–195. On Maoshan practice, see Isabelle Robinet's *Méditation taoïste* (Paris, 1979), translated by Julian F. Pas and Norman J. Girardot as *Taoist Meditation: The Mao-shan Tradition of Great Purity* (Albany, N.Y., 1993). On symbolic alchemy, see Farzeen Baldrian Hussein, trans., *Procédés secrets du joyau magique: Traité d'alchimie taoïste du XIe siècle* (Paris, 1984). On the *Laozi zhongjing*, see John Lagerwey's "Deux écrits taoïstes anciens," in *Cahiers d'Extrême-Asie* 14 (2003).

JOHN LAGERWEY (1987 AND 2005)

WOVOKA (c. 1856/8–1932), Paiute religious prophet and messiah of the Ghost Dance of 1890; also called Jack Wilson by white settlers. Although he often referred to himself as Kwohitsauq ("big rumbling belly"), after his paternal grandfather, he was given the name Wovoka (or Wuvoka, "cutter") by his father, Tävibo ("white man"), who was reported to have trained his son in Paiute shamanistic practices. Tävibo had been an active participant in the 1870 Ghost Dance led by the Paiute shaman-prophet Wodziwob. Central tenets of this earlier Ghost Dance were related to the later teachings of Wovoka, which in turn led to the Ghost

Dance movement of 1890. Among these earlier revelations was the prediction of the return of the ancestral dead. This imminent return was to be assisted through the practice of a round dance, which would also effect an earthly cataclysm and so result in the removal of white men.

In addition to Paiute shamanic practices and the Ghost Dance of 1870, Wovoka was influenced by his contact with Skokomish Shakers, Mormons, and other Christians. The Puget Sound Shaker religion of the Skokomish leader Squsacht-un (called John Slocum by whites) was primarily concerned with healing. It combined native shamanistic and Christian religious practices. These Shakers produced twitching-ecstasies and trances that sometimes lasted for days. Wovoka's later teachings were also similar to Mormon doctrines regarding the rejuvenation of the American Indians, the radical transformations in the earth's terrain, and the return of the Messiah. Moreover, Paul Bailey indicates in his biography of Wovoka (1957) that the famous Plains Ghost Dance shirt bears a resemblance to Mormon holy garments. Finally, after his father died, Wovoka was hired by a white family named Wilson. This position brought him into close contact with Presbyterian Christianity, which involved Bible reading, moral exhortations, and pietistic stories about Jesus.

Around 1888 Wovoka is reported to have undergone his first deathlike trance-journey to heaven. From this point his teachings were derived from conversations with the ghosts of the dead. Wovoka's oral revelations were associated with the ritual performance of the round dance, which promoted moral and spiritual renewal. His teachings were transmitted by means of a syncretic mythology and dramatized through the skillful use of his personal power symbols.

Wovoka's foremost revelations came in a deathlike coma experienced while he was suffering from scarlet fever during the solar eclipse of 1889. During this trance-coma Wovoka related that he saw God on a transformed earth where Indians and game animals abounded. Wovoka's messages increasingly focused on the presence of the Messiah, a role he himself gradually assumed. His mythology centered on the imminent revival of deceased Indians, who would be reunited with their living kin in an earthly paradise. His description of the fate of whites varied. He predicted that they would be either swept away by the cataclysm or amalgamated into the restored humanity. Many of these doctrines, such as the transformed earth, were more fully explicated by Wovoka's disciples, who disseminated the Ghost Dance in the years following 1889.

The later Ghost Dance, similar to that of the Ghost Dance of 1870, was a kind of round dance that lasted for five nights. Men and women, their fingers intertwined, shuffled sideways around a fire, dancing to the songs that Wovoka received from the dead. While the Paiute participants themselves did not go into a trance, Wovoka did occasionally journey in a trance state to the ghosts, who assured him that Jesus was already on the earth with the dead, moving about as in a cloud. Moreover, along with their remon-

strations against lying, drinking, and fighting, the dead said that Indians should work for the whites and have no more trouble with them.

Wovoka's personal power-symbols were typical of native shamanic practices. Along with his sombrero he used eagle, magpie, and crow feathers and red ochre paint from the traditional Paiute holy mountain (now called Mount Grant). As with so many visionary symbol systems, their meaning is not fully known, but Wovoka often incorporated these symbols into his teaching so as to foster belief in his messianic role among his followers.

Wovoka went somewhat into hiding when news of the Wounded Knee massacre of 1890 reached him. He vigorously condemned the misunderstanding of his teachings, especially as reflected in the Lakota armed resistance. He also denied any influence in the development of the Ghost Dance shirts. He later reemerged as the continuing leader of the much diminished Ghost Dance. He readjusted his predictions of imminent earthly transformation, explaining that Indian ritual and ethical behavior had not conformed properly to his visions. Wovoka died on September 20, 1932, in Schurz, Nevada; his death was preceded a month earlier by that of his wife, Mary, his companion for over fifty years.

More is known of Wovoka than of other similar religious figures, but he can be seen as part of a larger revivalistic movement of the period. Various tribal groups, caught in the death throes of their traditional cultures and the inescapable morass of governmental reservation policy, responded to Wovoka's revelations from a variety of motivations that mediated between their present distress and their future hopes. Wovoka's injunctions against warfare, immoral behavior, and some traditional medicine practices enabled many who participated in the Ghost Dance to begin the psychic transitions needed to respond to the changing circumstances of life. Most important in this connection was Wovoka's orientation away from exclusive tribal recognition toward a pan-Indian identity.

BIBLIOGRAPHY

The most authoritative treatment of Wovoka is still James Mooney's *The Ghost Dance Religion and the Sioux Outbreak of 1890* (1896; reprint, Chicago, 1965). A biography of limited value because of its popularizing tone is Paul Bailey's *Wovoka: The Indian Messiah* (Los Angeles, 1957). A good overview of Wovoka can be found in Bryan R. Wilson's *Magic and the Millennium* (New York, 1973). For an informative account of Wovoka's continuing involvement, by mail, in Ghost Dance activities after 1890, see Grace M. Danberg's edition of *Letters to Jack Wilson, the Paiute Prophet, Written between 1908–1911* (Washington, D.C., 1957).

JOHN A. GRIM (1987)

WRITING, SACRED SEE CALLIGRAPHY; SCRIPTURE

WUNDT, WILHELM (1832–1920), German physiologist, philosopher, and psychologist, was best known as the founder of experimental psychology. Born the son of a Lutheran pastor, near Mannheim, Wundt studied at Tübingen, Heidelberg, and Berlin, took his Ph.D. and M.D. degrees at Heidelberg, and taught at the universities of Heidelberg, Zurich, and Leipzig. Early in his teaching career at Heidelberg he wrote *Beiträge zur Theorie der Sinneswahrnehmung* (1858–1862), considered to be the first treatment of psychology as an experimental science, and *Vorlesungen über die Menschen- und Tierseele* (1863). Perhaps his most important work for psychology was *Grundzüge der physiologischen Psychologie* (1874), in which he advocated investigating the immediate experiences of consciousness using a method of introspection. In 1874 he was made professor of inductive philosophy at Zurich. In the following year, he accepted a professorship at Leipzig, where in 1879 he founded what is generally regarded as the world's first psychological laboratory. In 1881 he founded a journal of psychology, *Philosophische Studien*, which primarily published the results of research conducted at his Leipzig institute and which helped to establish experimental psychology as a separate discipline.

During his long career at Leipzig, Wundt's most important works were *Grundriss der Psychologie* (1896) and his *Völkerpsychologie* (10 vols., 1900–1920). These two works represent diverse streams that Wundt held together: his interest in physiological psychology and his more philosophical approach to the analysis of ethnic groups. For him, they were not so disparate; he considered psychology the science that could study the phenomena of human consciousness in both its individual and its group manifestations. In his *Völkerpsychologie* Wundt considered an immense amount of anthropological data. He viewed religion, myth, morality, art, and language as phenomena of long duration and therefore as constituting a psychic reality distinct from individual consciousness. Wundt discerned a "folk soul," which for him was not a substance but rather a psychic actuality that could be studied. The idea of a collective unconscious was quite foreign to Wundt, who rejected any idea of the unconscious, advising his students that its study by psychology was a mistake. Wundt focused instead on the objective forms of language, morality, and religion. Nevertheless, his earlier association studies anticipated and inspired the work of his student, Emil Kraepelin, in psychopathology, and stimulated the development of the association test used by C. G. Jung and his associates in Zurich.

Although social psychologists (except possibly for those in Germany during the Nazi period) have rejected any notion of a folk soul and have operated from premises different from those established by Wundt, social psychology has continued the study of the objective forms of religion in society.

Wundt's interests in the universality of mythological motifs and the nature of the language of religion have been taken up by students in the fields of history of religions (although the evolutionary approach implicit in Wundt's more philosophical works has been rejected) and psychology of religion, especially from Freudian and Jungian perspectives.

BIBLIOGRAPHY

The best recent studies of Wundt's work are two publications stemming from the celebration of the founding of his psychological laboratory in 1879: *Wundt Studies: A Centennial Collection*, edited by Wolfgang G. Bringmann and Ryan D. Tweney, with a foreword by Ernest R. Hilgard (Toronto, 1980), and *Wilhelm Wundt and the Making of a Scientific Psychology*, edited by R. W. Rieber in collaboration with Arthur L. Blumenthal, Kurt Danziger, and Solomon Diamond (New York, 1980). Both are critical of Edwin G. Boring's evaluation of Wundt in *A History of Experimental Psychology*, 2d ed. (New York, 1950), which, however, provides considerable biographical data. A good summary of Wundt's legacy is found in Daniel N. Robinson's *Toward a Science of Human Nature: Essays on the Psychologies of Mill, Hegel, Wundt, and James* (New York, 1982).

WALLACE B. CLIFT (1987)
Revised Bibliography

WYCLIF, JOHN (1330?–1384), English scholastic theologian, trenchant critic of abuses in the church, and promoter of a vernacular translation of the Bible. Wyclif was the most learned man of his generation in England. The rigor of his scholastic logic and, in his last years, his appeal to scripture as the sole authority for the church's life, led him into heresies. During his time and to this day, he has had both sympathetic admirers and caustic critics. Nonetheless, the real, human Wyclif remains an enigma. We know little about him except that he led an austere life marked by tireless study, lecturing, and writing.

Nothing certain is known about Wyclif's family or its resources. John Wyclif (or Wycliffe) was born near Richmond in North Riding, Yorkshire. At an early age he entered Balliol College, Oxford, and then served as its regent master from 1360 to 1361. The date of his ordination is unrecorded. Later he resided at Queen's College, where he studied for and received his bachelor of divinity degree (1369) and his doctor of divinity degree (1372). Early connections with Merton College and Canterbury Hall are disputed.

University scholars without means of their own were dependent upon "provisions to livings" of parishes or prebends

and canonries in collegiate churches or cathedrals. From this income they were expected to pay vicars for service during their absence. Wyclif was no exception. In 1361 Balliol gave him its choicest living at Fillingham, Lincolnshire. The following year he received from Pope Urban V a prebend at Aust in the collegiate church of Westbury-on-Trym near Bristol, but he neither resided there nor ever provided a vicar. In 1368 Wyclif exchanged Fillingham for Ludgershall, a less lucrative living in Buckinghamshire, because it was nearer to Oxford. He left this in 1374 for a royal provision at Lutterworth, Leicestershire. There he spent the last three years of his life. He died on December 31, 1384, after a massive paralytic stroke.

In philosophy Wyclif was a realist and in theology an advocate of Augustine's doctrines of predestination and grace. Only in the mid-1370s did he come into prominence outside Oxford for his views on *dominium* (lordship and ownership). Between 1376 and 1379 he published successively *On Divine Lordship*, *On Civil Lordship*, *On the Duty of the King*, and *On the Church*. In these treatises Wyclif argues that only God is the true Lord and owner of his whole creation. Whatever authority and property human beings possess they have from God, to whom they owe faithful service. Only the predestined have any right to them, but, like Augustine, Wyclif believed that no one could know who was and who was not among the elect. Hence one should suffer patiently under unjust and greedy masters until they repent or are removed and dispossessed.

Both estates of the realm, civil and ecclesiastical, should be under the authority of the king in all temporal matters. The ecclesiastical estate (including theologians) is of greater dignity because it is called to serve in spiritual teaching and guidance. It should be stripped of all temporal possessions, except what was necessary for food, clothing, and lodging, and no clergy should hold any civil office. The king should remove all unworthy clergy. All ecclesiastics, from the pope on down, should live in poverty as Peter and the other apostles did.

Although Wyclif's views were largely theoretical and not altogether unprecedented, they were noticed by Edward, Prince of Wales (the "Black Prince," 1330–1376), and his younger brother John of Gaunt (1340–1399), who became duke of Lancaster in 1362. The two virtually ruled England during the declining years of Edward III (1312–1377) and probably saw in Wyclif a front for their aim to plunder the church's wealth. In February 1377, Wyclif was summoned before the bishops at Saint Paul's, London, to answer for his views. He arrived accompanied by four friar doctors of theology and by John of Gaunt with some of his supporters. At once a bitter altercation broke out between Gaunt and Bishop William Courtenay of London, and the duke's party with Wyclif left before Wyclif could be heard or condemned.

In May, Gregory XI sent bulls to England denouncing nineteen propositions from Wyclif's writings and asking for a thorough investigation and Wyclif's arrest. Before the bulls

arrived, however, ten-year-old Richard II had become king, and nothing became of the pope's directives. The archbishop of Canterbury, Simon of Sudbury, asked the faculty at Oxford to give an opinion on the propositions. They were unanimous in stating that some of them "sounded ill" but that they "were all the same true." In March, Wyclif appeared before Sudbury and Courtenay at Lambeth, just as a message arrived from the king's mother forbidding them to pass judgment on Wyclif. A mob broke into the meeting, and the bishops concluded the meeting by merely enjoining Wyclif from publicly disputing and preaching about his controverted views.

If Wyclif's mouth was shut for a time, his pen was not stilled. In 1378 he wrote *On the Truth of Holy Scripture*, in which he affirms that the Bible taken literally is the sole law of the church and that a translation without interpretation is needed so that the humblest person can learn from it. The treatise *On the Eucharist* (1379) cost him much support. In it he denies the dogma of transubstantiation: it is unscriptural, unknown in the church before the twelfth century, idolatrous, and contrary to his realist position that no substance can be changed into another substance. Yet he affirms the real presence of Christ's body and blood sacramentally in bread and wine. His last major work, the *Trialogus* (1382), gives a summary of his views.

Wyclif's enemies blamed him for the Peasants' Revolt in 1381, but there is no evidence to support the connection. After Archbishop Sudbury's murder during the rebellion, Courtenay succeeded to the primacy (1382–1396), determined to root out Wyclif's teachings at Oxford. In May 1382 he presented twenty-four propositions from Wyclif's writings to a council of bishops and theologians in London. Ten were voted heretical, the others erroneous. Leading Oxford supporters of Wyclif were summoned to appear and persuaded to recant. In November, Courtenay held the Convocation of Canterbury at Oxford, where all doctors, masters, and bachelors made their submission.

Yet Courtenay never moved against Wyclif personally. Wyclif had retired to Lutterworth in 1381 and suffered his first stroke in 1382. In his last years Wyclif may have supervised the translation of the Latin Vulgate Bible and the training of "poor preachers," cleric and lay (the Lollards), to spread the gospel, but his personal involvement has been disputed. The translation has come down in two principal versions, a literal version and a later, more idiomatic English version.

The marriage of Richard II to Anne of Bohemia (1382) brought several leaders of the Czech reform movement to England who took many of Wyclif's writings back home. Jan Hus, the principal champion of that movement, admired Wyclif and quoted extensively from his writings, but he used them with care, especially those on the Eucharist. The Council of Constance in 1415 burned Hus as a "Wycliffite" heretic and ordered that Wyclif's remains be exhumed and

burned. Bishop Richard Fleming of Lincoln did this in 1428 and cast the ashes into the Swift River.

The extent of Wyclif's influence on the sixteenth-century Reformation is open to debate. Luther knew of him through Hus's writings. In England, Thomas Cranmer, archbishop of Canterbury (1533–1556), owned a copy of the *Trialogus* printed at Basel in 1525. Yet references to Wyclif, always with approval, are scanty in his writings. Cranmer's views on the Eucharist were similar to Wyclif's, and he too worked for an English translation of the Bible. He would have supported the reform of the church by the king, but not its disendowment and reduction to apostolic poverty.

After Elizabeth I's settlement of the church in 1559, Wyclif became a hero and a martyr to those who dissented from it. Yet even they, contrary to Wyclif, would have had the church the dominant power in the kingdom. Wyclif's importance lies partly in his influence on Jan Hus, but even more in his propagation of reformed principles.

SEE ALSO Cranmer, Thomas; Hus, Jan.

BIBLIOGRAPHY

The numerous Latin writings of Wyclif have not been completely edited in modern editions. Most of them have been published by the Wyclif Society of London since 1884. A complete listing of Wyclif's Latin works, based on notes of S. Harrison Thomson, has been completed by his son, Williell R. Thomson, in *The Latin Writings of John Wyclif: An Annotated Catalog* (Toronto, 1983). It notes all manuscripts and editions, with commentary on them. The authenticity of many, if not all, of Wyclif's English works is disputed. The best selection is Herbert E. Winn's *Wyclif: Select English Writings* (Oxford, 1929). A comprehensive bibliography is that of C. C. Scott in *Cambridge Medieval History*, vol. 7 (Cambridge and New York, 1932), which goes with Bernard L. Manning's chapter "Wyclif" in the same volume, pp. 486–507. Translations of Wyclif's Latin writings are few, but see the excerpts from *On the Pastoral Office* and *On the Eucharist* in *Advocates of Reform from Wyclif to Erasmus*, edited by Matthew Spinka, "The Library of Christian Classics," vol. 14 (Philadelphia, 1953), pp. 32–88.

The standard biography is Herbert B. Workman's *John Wyclif: A Study of the English Medieval Church*, 2 vols. (Oxford, 1926). Less sympathetic to Wyclif is K. B. McFarlane's *John Wycliffe and the Beginnings of English Nonconformity* (London, 1952), reprinted under the title *The Origins of Religious Dissent in England* (New York, 1966). McFarlane gives good background material about Oxford and church-state relations in Wyclif's time and, based on original research, carries the story through the Lollard movement until 1417, when it is driven underground. John Stacey's *John Wyclif and Reform* (Philadelphia, 1964) is informative and well balanced.

The influence of Wyclif on the Bohemian reformers is carefully researched by Matthew Spinka in *John Hus and the Czech Reform* (1941; Hamden, Conn., 1966). On the English version of the Bible associated with Wyclif, see Henry Hargreaves's "The Wycliffite Versions," in *The Cambridge History of the Bible*, vol. 2, *The West from the Fathers to the Reformation*

pp. 387–415, with bibliography, pp. 527–528.

MASSEY H. SHEPHERD, JR. (1987)

X–Y

XAVIER, FRANCIS (1506–1552), cofounder of the Roman Catholic Society of Jesus (the Jesuits), missionary, and saint. Francisco de Jassu y Xavier was born in the family castle in the kingdom of Navarre (now northern Spain), the fifth and youngest child of noble, wealthy, and pious Catholic parents. His early education took place at home and under the tutelage of local priests. In 1525 the keen, ambitious student left home permanently, bound for Paris. A handsome, slender, athletic youth, about five feet four inches tall, he was noted then, as throughout his life, for his cheerful and vivacious personality. At the University of Paris, Xavier gained a master of arts degree in philosophy in 1530, taught this subject for several years (1530–1534), and then studied theology until 1536.

During his years at the university, Ignatius Loyola, a fellow student since 1528, became an increasingly important influence on Xavier, and by 1533 Xavier had become one of his disciples. In 1534 Xavier made the Spiritual Exercises under the direction of Ignatius and on August 15 he joined Ignatius and five other students in a chapel in Montmartre, a district of Paris, where all of them vowed to lead lives of apostolic poverty, to labor for the salvation of their neighbors, to make a pilgrimage to Jerusalem, and to place their services at the disposition of the pope. Together with three other students who joined the group when it renewed its vows a year later, these men were the ten founders of the Society of Jesus.

Beginning the pilgrimage to Jerusalem, Xavier left Paris in November 1536 with eight of his companions and, traveling by foot, reached Venice nearly two months later. Ignatius met them there. In Venice, Xavier, along with Ignatius and four other companions, was ordained a priest in June 1537. War with the Turks ruled out a voyage across the Mediterranean to Palestine, so in 1538 Xavier went to Rome and there shared in the discussions that led to the founding of the Society of Jesus. Until his departure from Rome in 1540, he served as secretary of the new religious order.

When the pious King John III of Portugal put out a call for missionaries, especially for the care of recently converted Paravas (Bhavatas) in southern India, Xavier left Rome

CLOCKWISE FROM TOP LEFT CORNER. Sculpture of a *yakṣa* at the Great Stupa at Sāñcī, India. for Portugal, traveling overland to Lisbon in the entourage of the Portuguese ambassador. While awaiting the annual departure of the India fleet, Xavier performed various priestly tasks in the city and at the royal court. His ship set sail in April 1541, rounded the Cape of Good Hope, and wintered in Mozambique, where Xavier's two Jesuit colleagues remained. After further stops at Melinde (Malindi, in modern-day Kenya) and the island of Socotra (off the coast of modern-day Somalia, where Xavier had to be dissuaded from remaining), the voyage ended in May 1542 in Goa, a district on the west coast of India and the main Portuguese center in that country.

Until the end of the rainy season in September, Xavier ministered to the Portuguese and native Christians in Goa. Accompanied by three native helpers, he then sailed to the southern tip of the continent. For the next three years his apostolate was centered in Malabar and Travancore, the coastal regions northwest of Cape Comorin; in the regions northeast of the cape as far as São Thomé (modern-day Madras); and on the neighboring island of Ceylon. Much of his ministry consisted of instructing the thousands of Parava pearl divers and fishermen who had been converted to Roman Catholicism around 1535 but whose religious knowledge remained minimal. Spectacular numbers of conversions were made: Xavier reported baptizing over ten thousand villagers in Travancore in one month.

In September 1545 Xavier sailed from São Thomé to Malacca, a Portuguese settlement on the Malay Peninsula; then to the Moluccas, or Spice Islands, in the East Indies, where his main concern was the native Christians, left without clergy in the Portuguese centers of Amboina and Ternate; and then as far north as the Moro Islands. He returned to Malacca in June 1547 and to Goa in March 1548. After further work along the Fishery Coast he returned to Goa once again. In April 1549 he set sail with three Japanese converts and two fellow Jesuits to inaugurate the Christian mission in Japan. When he departed from Japan for Goa twenty-seven months later, he left behind some two thousand converts. Hoping to initiate a Christian mission to China, he took ship from Goa in April 1552, but he was not allowed to disembark on the Chinese mainland. After three months of fruitless waiting on the desolate island of Sancian (near Canton), he died on December 3 following a brief illness. His incorrupt body was taken in 1554 to Goa, where it is still enshrined and greatly venerated.

Xavier is ranked among the greatest missionaries in Christian history. His numerous far-ranging journeys were not those of a spiritual adventurer, restlessly seeking new fields to conquer. He served not only as missionary but also as apostolic nuncio and Jesuit superior, with the duty of investigating mission possibilities in areas then little known to Europeans. He was both a pioneer and organizer of the Jesuit missions in the Far East, intent on obtaining suitably trained European co-workers. He was eager to supply mission stations with churches, schools, and personnel and to be kept

informed about them. Both his actions and his writings show practicality, prudence, and sound spirituality. His success was promoted also by his exemplary apostolic zeal, his personal holiness, and his ability to mix easily with persons of all classes, races, and beliefs. In addition, he was a man much devoted to prayer, a mystic. Unlimited confidence in God, his most basic spiritual trait, freed him from discouragement in the face of obstacles and reverses. These characteristics, together with his reputation as a wonder-worker, led Christians, Muslims, and pagans alike to refer to him as "the holy father," and "the great father." Since his death, he has been venerated as the ideal missionary and, as such, has inspired thousands to devote their lives to spreading the gospel far afield. In 1622 he was canonized, and in 1927 he was designated by Pius XI as patron of all missions. His annual liturgical feast is celebrated on December 3.

SEE ALSO Jesuits.

BIBLIOGRAPHY

The critical edition of the letters and other writings of Xavier that supplants earlier, defective editions is *Epistolae S. Francisci Xaverii aliaque eius scripta*, 2 vols., edited by Georg Schurhammer and Joseph Wicki (Rome, 1944–1945), published as volumes 67 and 68 of *Monumenta historica Societatis Iesu*. Applicable bibliographies include *Archivum historicum Societatis Iesu* (Rome, 1932–) and *Bibliographie sur l'histoire de la Compagnie de Jésus, 1901–1980*, 7 vols., by László Polgár (Rome, 1982–). A readable, brilliantly written biography, the one most widely read in English, which has also been translated into several languages, is James Brodrick's *Saint Francis Xavier, 1506–1552* (New York, 1952); it should be studied with some caution, however, because of questionable accuracy in its characterizations of Xavier. *The Life and Letters of Saint Francis Xavier*, 2d ed., 2 vols. (1881; reprint, London, 1927), by Henry J. Coleridge is useful still because of its translation into English of all the letters of Xavier, although the collections of letters used by Coleridge have now been superseded by that edited by Schurhammer and Wicki. *Francis Xavier: His Life, His Times*, 4 vols., by Georg Schurhammer (Rome, 1973–1982) is the definitive biography by the leading authority on Xavier, the result of decades of study. Schurhammer's *Saint Francis Xavier: The Apostle of India and Japan* (Saint Louis, Mo., 1928) and Margaret Yeo's *Saint Francis Xavier: Apostle of the East* (New York, 1932) are both good, popular biographies.

JOHN F. BRODERICK (1987)

XENOPHANES (c. 580–470 BCE), Ionian poet, satirist, philosopher, and theologian, was born in Colophon, a wealthy city of Ionia under the influence of the Lydian kingdom. Because of Persians' invasion of the city, he had to flee to South Italy. He spent much of his life wandering through Sicily and Greece until he joined a Phokaian colony sent to Elea in Lucania, and he taught there, founding the Eleatic school. His pupil Parmenides was the founder of Western metaphysics. A friend of Empedocles, Xenophanes attacked

Pythagoras and was attacked by Heraclitus. He has been considered both an amateur thinker and “a paradigm of the [pre-Socratic] genius” (Barnes, 1982, p. 82). In fact, he was a significant thinker and an innovator in many fields of research, such as natural sciences, morality, and gnosiology. His approach to the problems of human knowledge is so particular (and somewhat contradictory) that he can be defined as a sceptic, an empiricist, a rationalist, a fallibilist, a critical philosopher—or, more accurately, a natural epistemologist. A precise definition of his epistemological attitude clearly influences any evaluation of his theology (see fragment 34: “No man has seen, or ever will see, the exact truth about the gods”).

As a religious thinker, Xenophanes has been identified as the founder of the Greek enlightenment, prior to Heraclitus and Hecataeus. From the complex of his polymath oeuvre (of which only 43 fragments and 52 controversial *testimonia* have been preserved) he emerges as a critical thinker, sceptical about any claims to knowledge in religious matters. As a consequence of the elusiveness and versatility of his thought in these matters, an ample variety of opinions has risen about his religious positions. If one emphasizes single facets of his teaching, it is possible to consider him a traditional polytheist, a revolutionary monotheist, a pantheist, or even an atheist or precursor of negative theology. What is clear is that with him there emerged in Greece the first form of scientific inquiry into indigenous and alien religious realities.

Xenophanes’ first concern was God and the divine. He wrote: “One god is greatest among gods and men” (fragment 23). This does not mean that he was a monotheist. The fragments warrant attributing to Xenophanes the novel idea of a single god of unusual power (*henotheism*), but not the stronger view that beyond this one god there could be nothing else worthy of the name. God is a body (testimonium 28), spherical in form, being alike and perceptive in all his parts (testimonia 1, 28, 33, and 34) and in a way coextensive with the whole universe (testimonium 31), and identical with the One (testimonia 30, 34 and 35). God is ungenerated and eternal (testimonia 28 and 31), motionless (fragment 26), and at the same time “shaking all things by the thought of his mind” (fragment 25). Apparently, this view anticipates Anaxagoras’s *Nous* (intellect, mind—the intellectual principle that is separate from the mass that it governs), which is the ultimate source of movement, and the Aristotelian doctrine of the prime unmoved mover. Xenophanes was the first to regard the soul (*psuchē*) as “breath” (*pneuma*), that is, moving air, full of vital energy (testimonium 1). His concept of time is cyclic: there is an unlimited number of worlds existing successively without overlapping one another, and a new generation begins again after each cosmic catastrophe (testimonia 1, 33, and 37)—the first manifestation of the doctrine of the Eternal Recurrence, later adopted by the Pythagoreans, the Stoics, and Friedrich Nietzsche (1844–1900). Earth (*Gaia*) is the root and the ultimate destination of all things

(fragments 27, 28, 29, 33)—perhaps a survival of ancient pre-Olympian religiosity.

From the theological reflection combined with the scientific speculation, Xenophanes moved to scathing criticisms of the most objectionable aspects of Greek religion. He attacked poets (including Homer and Hesiod) for saying false and immoral things about the gods in their tales of divine warfare with Titans, giants, and centaurs (fragment 1); as well as in their attributions to the gods of things that are matters of reproach even among men—thrift, adultery, and mutual deceit (fragments 11 and 12). Further, he repudiated the whole enterprise of divination through natural signs (testimonium 52) and the connected popular belief in the godship of celestial bodies (fragment 32 and testimonia 32 and 38–46). Subjects of stern rebuke are also the contemporary outbreaks of ecstatic religion such as the naturalism of the Bacchic cult (fragment 17) and the Pythagorean belief in the reincarnation of the human soul in any animal form (fragment 7). Had Xenophanes limited himself to these assertions, he would have emerged only as an innovative theologian, albeit one less insightful and less audacious than his near contemporary and fellow Ionian, Heraclitus of Ephesus. Nor would he have found a place among the pioneers of the comparative study of religion. As can be inferred from Aristotle’s and Plutarch’s testimonies (testimonium 13), the Ionian thinker perceived a marked affinity between the cult of the Greek *Leucothea*, worshipped with funeral dirges (*threnoi*) although considered a deity (ergo, immortal for the Greeks), and the cult of the Egyptian Osiris, who was ritually mourned by his worshippers (as befitted a dead god) but was at the same time honored as a very high-ranking god. Thus, Xenophanes seems to have virtually highlighted—two and a half millennia before James Frazer (1854–1941)—the typological category of the dying/rising gods present on both sides of the Mediterranean. This ability for critical perception, which earned Xenophanes the mantle of “precursor of comparative ethnology” (Pettazzoni, 1954, p. 134), is certainly connected with his experience as an Ionian citizen who since birth had been familiar with the beliefs and customs of the other peoples of Anatolia: the Lydians, the Carians, and the Median-Persian invaders. Xenophanes could autoptically realize that the routes through which humans (and, by paradoxical analogy, the other animals) reach the representation of the divine are numberless. Starting with his criticism of the anthropomorphism typical of the Greek conception of divinity (fragment 14), Xenophanes came to make two famous assessments: “The Ethiopians say that their gods are snub-nosed and black, the Thracians that theirs are blue-eyed and red-haired” (fragment 16); and “But if horses or oxen or lions had hands or could draw with their hands and do the works that men can do, horses would draw the forms of the gods like horses, and oxen like oxen, and they would make their bodies such as they each had themselves” (fragment 15). This can be viewed as the first application of a comparative perspective to the study of religion.

BIBLIOGRAPHY

All the fragments (21 B: 1–45) and the *testimonia* on Xenophanes' life and teaching (21 A: 1–52) are collected in *Die Fragmente der Vorsokratiker*, vol. 1, edited by Hermann Diels and Walther Kranz (6th ed., Berlin, 1951), which has an indispensable critical apparatus and German translation of the text. Diels's and Kranz's numeration is still the standard system of reference. A personal selection, in English translation and with substantial interpretation, is provided by Geoffrey S. Kirk in *The Presocratic Philosophers: A Critical History with a Selection of Texts*, 2d edition, edited by Geoffrey S. Kirk, John E. Raven, and M. Schofield (Cambridge, U.K., 1983), pp. 163–181. A complete edition with Greek text and Italian translation is given by Mario Untersteiner, *Senofane's Testimonianze e frammenti* (Firenze, Italy, 1956). The commentary and the introduction (especially "Senofane di fronte alla religiosità preellenica. Il politeismo" and "Il dio di Senofane," pp. 134–212) are important from the religiohistorical point of view. James H. Lesher, in *Xenophanes of Colophon: Fragments: A Text and Translation* (Toronto, 1992), provides a very informative and perceptive commentary on most of the fragments (Greek text of all the fragments, with critical annotations) and the *testimonia* (English translation only). The interest of this work is philosophical but the main theological questions are examined with subtlety. Extensive bibliographies are provided by Untersteiner and Lesher.

Among the numerous general interpretations, Hermann Fränkel, *Early Greek Poetry and Philosophy* (Oxford, 1975), pp. 325–337, and Jonathan Barnes, *The Presocratic Philosophers* (London, 1982), pp. 82–99, are representative of two divergent approaches: for the German scholar, even as a theologian, Xenophanes was "a staunch empiricist"; for the British philosopher, he was "the initiator of natural theology." Relevant themes of Xenophanes' religious thought are examined in various recent contributions. Michael Eisenstadt, in "Xenophanes' Proposed Reform of Greek Religion," *Hermes* 102 (1974): 142–150, argues for Xenophanes' approval of the worship of the Olympian gods in spite of the philosophical inadequacy of traditional religion. In "The Xenophanean Religious Thought: A Field of Various Interpretations," *Kernos* 2 (1989): 89–96, Aikaterini Lefka outlines the main approaches to the philosopher's teaching about god. Mark J. Edwards, in "Xenophanes' Christianus?," *Greek, Roman, and Byzantine Studies* 32 (1991): 219–228, seeks to demonstrate (somewhat unconvincingly) that the three crucial fragments cited by of Alexandria in the *Stromateis* (fragments 14, 15, 23) are attributable to a Christian or Jewish forger. Massimo Di Marco, in *Sapienza italiana. Studi su Senofane, Empedocle, Ippone* (Rome, 1998), pp. 9–31, contributes a useful discussion on the controversial issue of Xenophanes' relationship with the Eleatic school. In a series of insightful articles—"Elea, Senofane e Leucothea," *Annali Istituto Universitario Orientale Napoli* 16 (1994): 137–155; "Senofane ed Elea," *Quaderni urbinati di cultura classica* 95 (2000): 31–49; and "Il frammento Lebedev di Senofane," *Quaderni urbinati di cultura classica* 98 (2001): 25–34—Giovanni Cerri reconstructs the polytheistic back-

ground (Leucothea, Persefone) against which Xenophanes built his characteristic theology.

Xenophanes is acknowledged as the founder of religious criticism by Raffaele Pettazzoni, in *La religione nella Grecia antica fino ad Alessandro*, Bologna, 1922, 2d ed. Turin, 1954, pp. 133–134, and in two standard histories of the comparative study of religion: Jan de Vries, *Perspectives in the History of Religions* (New York, 1967; 2d ed., Berkeley, Calif., 1977), pp. 3–5; and Eric J. Sharpe, *Comparative Religion. A History* (London, 1975; 2d ed., 1986), pp. 3–4.

GIOVANNI CASADIO (2005)

XIAN. Usually written using the characters for "man" and for "mountain," the character for *xian* is said originally to have been composed of those for "man" and for "ascend." An early dictionary explains that it refers to those who, "when they grow old, do not die." *Xian* means "to move into the mountains"; that is why it is written with the character for "man" next to that for "mountain." Together, these etymologies circumscribe a field of meaning that links the search for survival beyond death to mountains and to the heavens—a range that quite accurately reflects both the practice and the status of *xian* throughout Chinese history. It also explains why the term is translated in English either as "immortal" or "transcendent."

The *xian* is in the first place a human being. But unlike ordinary human beings who die and become ancestors (or roving ghosts), the *xian* survives beyond death and becomes, as a result, the focus of tales and even of worship. The earliest images of these extraordinary beings date to the Han dynasty (206 BCE–220 CE) and sometimes portray them with wings, a feature expressed in later texts that refer to them as *yuren*, or "feathered humans" (this term is also a synonym for Daoists). One of the earliest tales describes them as living on distant, perhaps imaginary isles in the sea off the eastern coast of China. The First Emperor (r. 221–206 BCE), having heard of them and being desirous of surviving beyond death like them, dispatched three thousand lads and lasses to find them, but the ships never returned, and rumor had it, in later times, that they had found and populated what is now known as Japan.

Other early tales recount the earthly lives of future *xian*. Not surprisingly, many of them were indeed mountain-dwellers: people who had left their homes and families to become hermits and devote themselves to the search for survival. They went to the mountains not only to find the necessary solitude, but also because they could find there the herbs and minerals they needed to secure, at the very least, longevity. *Xian* who had lived several centuries became a standard trope in hagiographies, as were the capacity to foresee the future, ubiquity, and "ascension to the heavens in broad daylight."

Of the seventy immortals whose legends are recounted in the earliest collection, the *Liexian zhuan* (Biographies of

the immortals; second century CE), over twenty may be classified as gods. Some, such as Chisongzi (Red Pine), the Master of Rain, are known to have been the focus of official worship, but most are worshiped as local saints. A woman by the name of Changrong, for example, is said to have been a “person of the Dao” living on Mount Chang. For over two hundred years she was seen coming and going, “and her complexion was that of a twenty-year-old.” For generations, she sold plants used for dyeing and gave the money thus earned to widows and orphans. “Thousands worshiped her.” Hanzi, a lover of dogs, was led by one into a cave where he discovered a magic world of palaces, forests, and immortals guarding the gates. He also encountered his dead wife, who urged him to join her. A year later he did so, and from then on only left the mountain on occasion “to succor his lineage. The people of Shu built a temple for him at the mouth of the cave. Over several thousand *li* in the southwest, people worship him.”

The immortals of the *Liexian zhuan* are prescient, and this enables them to save local populations from floods by giving advance warning. Others provide drugs that save people from epidemics. Of some it is said simply that they disappear without a trace, of others that their corpse disappears and only a sacred writ or some clothing are found in the grave, of still others that people catch a glimpse of them now and again over decades or centuries.

Immortals are usually thought of as a quintessentially Daoist category, a classification that is probably legitimate in modern times, when the Eight Immortals with their drunken whimsicality and endearingly unorthodox behavior come to be almost synonymous with Daoism, at least in the popular mind. A Daoist work of the Yuan, the *Lishi zhenxian tidao tongjian* (Comprehensive mirror of the real persons and immortals who have embodied the Dao through the ages) by Zhou Daoyi (fl. 1294–1307), would seem to confirm this Daoist identity by linking *xian* and *zhen*, immortals and real persons, to the idea of “embodying the Dao.” In fact, the term *zhen* has an even longer pre-Daoist history than *xian*. At the time of the compilation of the *Liexian zhuan*, Daoism did not yet exist as a self-conscious religious movement or institution, and only two or three of its *xian* were explicitly said to have been “people of the Dao” while alive. A good number of the immortals in the *Liexian zhuan* turn up again in two works of the fourth century: the *Sou Shen Ji* (In search of the gods) of Gan Bao (b. 280) and the *Shenxian zhuan* (Biographies of the gods and immortals) of Ge Hong (283–343). While Ge Hong’s work is generally classified as Daoist, that of Gan Bao is not: it is said to belong to the category *mirabilia*. Classifications aside, what the titles of their texts confirm is that *xian* and *zhen*, immortals and gods, were not hermetically sealed categories. *Xian*, insofar as they do constitute a distinct type of divine entity, should probably be distinguished from *zuxian*, or ancestors: both once lived on earth, and both continue to interact with humans after their death (both are also referred to as *shen*, “gods”). But in the

case of ancestors, this interaction occurs primarily, though not exclusively, within the lineage, while in the case of immortals, virtually all links with lineage are severed: they belong to and embody the Dao; that is, they “live as long as Heaven and Earth.”

JOHN LAGERWEY (2005)

XIAO. For the three thousand years of China’s recorded history, *xiao* (filial piety) has been the cornerstone of Chinese religious, social, and ethical life. According to China’s oldest dictionary, *xiao* simply means “to serve one’s parents well.” This concept’s unchanging spirit has been that one surrenders pleasures and even necessities to ensure the happiness of one’s parents. Within the family, this moral value has subordinated the young to the old and the individual to the collective. Since Confucianism maintained that the ruler-subject relationship was merely an extension of that between parent and child, within the larger community, *xiao* has produced loyal and obedient citizens. Due to its overwhelming importance, each of China’s great religious traditions—Buddhism, Confucianism, and Daoism—appropriated and popularized its understanding of it. Moreover, *xiao*’s appeal extended well beyond China to all of East Asia.

Although long a salient feature of Chinese society, *xiao*’s meanings and requirements have undergone much change. Around the year 1000 BCE, *xiao* probably originated as a form of sacrifice given to the powerful dead, which included one’s ancestors, in-laws, and allies. Soon its focus narrowed to service to one’s senior patrilineal kin, both living and dead. By the fifth century BCE, Confucians began to remold filial practices into specific ceremonial forms, which their ritual codes spelled out in great detail. Through daily morning and evening audiences, sons and daughters (in-law) were supposed to nourish their parents, obey their instructions, anticipate their wishes, and ensure their comfort. This service did not end with death; rather, it intensified. For three years, a son or daughter was supposed to serve the parents’ spirits through ascetic mourning rituals: he or she should dress in rough hemp clothes, live in a hut near the parent’s tomb, and forego meat, alcohol, music, and sex. After the conclusion

of these rites, he or she continued to serve the dead by preserving the patrimony and producing heirs—acts that ensured that the ancestral sacrifices would be ceaseless. During the third century BCE, most notably in the *Xiao jing* (Classic of filial piety), a short work that almost every imperial dynasty promoted, Confucians assimilated *xiao* to the lord-retainer tie. They argued that, since in a larger sense a ruler parents his people through the care he lavishes on them, a retainer should serve his ruler as he would his father. Hence, by definition, a filial child should also be a loyal subject.

After China's unification in 221 BCE, imperial governments found *xiao*'s hierarchy-affirming message to be irresistible; consequently, dynasty after dynasty lavished awards on outstanding filial children. The Han dynasty (206 BCE–220 CE) even selected its officials on the basis of their reputation for filiality. By the fourth century, each officially sanctioned dynastic history devoted a chapter to the previous era's filial paragons. By the Tang (618–907), unfilial behavior, such as failing to sufficiently nourish one's parents or marrying while mourning them, became punishable by law. Buddhists, too, discovered that to appeal to Chinese sensibilities they had to emphasize filial piety; thus, they stressed that their religion best served one's parents because it saved them from the torments of purgatory and delivered them to Buddhist heavens. Daoists likewise insisted that mastery of the immortality arts would not only secure salvation for oneself, but also for seven generations of one's ancestors.

By the late imperial period (960–1911), the overwhelming emphasis placed on filial piety led to increasingly extreme manifestations of it. Inspired by Buddhist tales of self-sacrifice, filial children would slice off part of their flesh and feed it to their parents to cure them of incurable diseases. Moreover, although classical texts stressed the need for filial children to remonstrate with their errant parents, late imperial filial piety emphasized the inviolable obedience owed to parents and discounted the possibility that they could ever be wrong. At the same time, filial directives increasingly fell upon women in their role as daughter-in-law. Hence, women were credited with increasingly extreme and self-destructive forms of filiality. In the twentieth century it is precisely this fanaticism that led intellectuals such as Lu Xun (1881–1936) to condemn filial piety (and Confucianism, which it exemplified) as an impediment to modernization and westernization.

tity: A Comparative Study of Chinese Ethical Values in Ming-Ch'ing Times (Leiden, 1988) looks specifically at the extremism that was associated with late imperial expressions of filiality. Norman Kutcher's *Mourning in Late Imperial China: Filial Piety and the State* (Cambridge, U.K., 1999) examines how governments tried to regulate *xiao*'s demands.

KEITH N. KNAPP (2005)

XIAO BAOZHEN (d. 1166 CE), Daoist master of the Jin period and founder of the Taiyi sect of Daoism. A native of Ji prefecture (present-day Henan province), he was also called Yuan Sheng. Neither his occupation before becoming a Daoist master nor the training he undertook to that end is known. During the Tianjuan period (1138–1140) of Emperor Xizong's reign, Xiao established the Taiyi sect in Ji prefecture. Of the three new Daoist sects established in the northern reaches of the Jin kingdom (Quanzhen, Zhenda, and Taiyi), Taiyi was the most similar in character to existing Daoist teachings. Its practices centered on the talisman called Taiyi Sanyuan that had allegedly been transmitted to Xiao from an immortal. Although the contents of the talisman are not known, it is clear that the sect placed great importance on talismans and incantations. Because of Xiao's ability to relieve people's suffering, disperse evil spirits, and cure illnesses, he gradually attracted many disciples and succeeded in establishing the Taiyi sect. As Xiao's teachings became a source of salvation for people wracked by the social unrest of the time, his sect's power grew apace. Hearing of his growing reputation, Emperor Xizong invited him to the court during the eighth year of his reign (1148). While at court, Xiao demonstrated his spiritual prowess by curing a sick person. Deeply impressed, the emperor presented Xiao with a name plaque inscribed "Taiyi wanshou gong," the name he bestowed on Xiao's Daoist temple in Ji prefecture, thereby indicating official recognition and patronage of Xiao's sect. Xizong is also said to have been converted to Taiyi Daoism by Xiao.

Although part of Xiao's teachings centered on the use of talismans, he did not adopt elixirs of immortality or other elements of the immortality cult. Instead, he upheld the "middle way," forbidding the drinking of intoxicants and the consumption of the five pungent substances. He also forbade priests to marry. It is clear that the rules of conduct that he taught were strict and aimed at transforming Daoist speculative theories into a disciplined monastic practice. He also required that successive head priests of his school take his own name. Unfortunately, many elements of his life remain unclear.

KUBO NORITADA (1987)

*Translated from Japanese by James C. Dobbins
Revised Bibliography*

XINXING (540–594), Chinese Buddhist monk and founder of the Sanjie Jiao, or Three Stages sect. A native of Henan Province, Xinxing entered the religious life at an early age and eventually took full monastic orders (*upasampadā*) at the Fazang Si near the city of Ye, the capital of the Northern Qi dynasty and a thriving center of Buddhist learning. With the eclipse of the Northern Qi by the Northern Zhou dynasty and the initiation, in the year 574, of a vigorous proscription of Buddhism by the new government, Xinxing renounced his vows and lived as a common laborer. It was during this period that he formulated the religious doctrines that would form the basis for the Sanjie Jiao.

The foundation of Xinxing's thought was the conviction, common to many segments of the Buddhist community during the latter half of the sixth century, that the Buddha's teachings had recently entered a period of degeneration and decline foretold in several Buddhist scriptures. This period, known as *mofa*, or the Latter Days of the Law, was believed to be one in which the spiritual capacities of sentient beings would be so far diminished as to render them incapable of observing the Vinaya or of distinguishing good from evil and truth from falsehood. Because it was an age far removed from that of Śākyamuni (fifteen hundred years from the date of his *parinirvāṇa* by the reckoning of many of Xinxing's contemporaries), sentient beings were deemed no longer subject to his guidance and unable even to practice Buddhism as it had traditionally been taught, let alone to attain enlightenment. Adherents of this doctrine believed that *mofa* would last for ten thousand years, at the end of which time the teachings of Śākyamuni would disappear from this world.

Against this starkly eschatological background, Xinxing argued for a reappraisal of contemporary Buddhist practice, one that would bring it into conformity with the greatly altered historical conditions prevailing during the *mofa*. He believed that it was only when religious practices matched the capacities of sentient beings and the historical conditions under which they lived that genuine enlightenment was possible. Unlike thinkers of the Pure Land tradition, who saw in the onset of *mofa* the need to replace the traditional range of Buddhist practices with a single, "easy," discipline, the worship of the Buddha Amitābha, Xinxing claimed that the practice most appropriate to the *mofa* age was a radical recognition of the Buddhahood inherent in *all* sentient beings. Calling his teaching that of the Universal Dharma (*pufā*), Xinxing advocated rigorous moral training to combat the degeneracy of the age and a catholic embracement of "all Bud-

dhas and all *dharmas*," predicated upon the underlying Buddha nature in all things. Members of his school were thus conspicuous for the public obeisance they made to others as a recognition of their potential Buddhahood, and for their strong emphasis on charitable activities. The sect came to receive lavish donations and eventually instituted *wujin zangyuan* ("inexhaustible treasuries") as a means of dispensing its charities to the needy and to the *samgha*.

With the reunification of the empire under the Sui (589), Xinxing was summoned to Chang'an by the emperor Wen (581–604). At the suggestion of one of his ministers, five temples were built in the capital for followers of the sect, thus providing an institutional base around which the sect flourished for the next decade. During this brief period of official favor and patronage Xinxing produced many of his most important works, including the *Sanjie fofa* and the *Duigen qixin fa*. In all, his works are believed to comprise at least forty fascicles, some of which were only recovered in this century among the documents unearthed at Dunhuang.

In the year 600, the Three Stages sect suffered the first in a series of proscriptions. The enormous wealth of the sect, its essentially negative assessment of the moral condition of society, and its contention that human institutions, particularly governments, were incapable of conferring any lasting spiritual benefits, made it a conspicuous target for the civil authorities. Throughout the Tang dynasty the sect suffered numerous attempts to seize its wealth and outlaw its writings, until it finally succumbed under the general suppression of Buddhism in the year 845.

MIYAKAWA HISAYUKI (1987)
Revised Bibliography

XI WANG MU, whose name is usually rendered as "queen mother of the west," appeared in the earliest stages of Chinese mythology and was a focus of intense religious devotion during the first few centuries of the present era. It is possible that she is mentioned in the oracle bone inscriptions of about 1500 BCE, but she appears with more certainty in the *Zhuangzi* (fourth century BCE) and later writings. Xi Wang Mu is described as one who had "attained the Dao,"

but nothing is known of her beginning or her end; she was said to dwell in the never-never land of the far west. In some sources she is described as a being of hybrid form. Usually her realm is pictured at the summit of a mountain called Kunlun, but there are also references to a cave residence. She is said to possess certain magical powers and to live in material splendor, surrounded by rare jewels. She may be accompanied by spirits, also of hybrid form, and Kunlun is sometimes described as a being protected by encircling waters, or as beyond human reach.

The queen was also credited with various cosmic powers. She may have controlled certain constellations, and she may have been able to maintain or to disrupt the rhythms that kept the universe in operation. She is also believed to have held the secret of the elixir of immortality, which she made available to suppliants in the form of a potion.

These characteristics feature in several versions of a Chinese myth relating a meeting between partners. According to one version, in order to keep the cosmic rhythms in motion it was necessary for two stars (who were otherwise separated by the Milky Way) to meet annually at a crucial point during the summer. The same theme is seen in accounts of meetings held during the summer between the Queen Mother of the West and various earthly monarchs. Sometimes the queen is described as receiving a king in her own abode; sometimes she travels to earth in all her glory to meet a king or emperor in his realm. The purpose of these ceremonial meetings was to enable the human partner to obtain the drug of immortality. In another version the queen is partnered by a mythical consort known as the King Father of the East.

According to several accounts, a soteriological movement that centered on the invocation of the queen swept through wide areas of northern China in 3 BCE. Descriptions of this movement refer to such practices as the exchange of tokens or talismans, the performance of religious services, and singing or dancing, as well as a certain amount of permissive or unrestrained behavior. The purpose of these gatherings was to prepare for the arrival of the queen and to convey or to acquire the promise of deathlessness. But it was not until the middle of the first century CE that the queen began increasingly to be associated with immortality.

Early Chinese notions of an afterlife had envisaged a "paradise of the east" situated in islands such as Penglai. In addition to the attempts made by talismanic means to guide the souls of the deceased to paradise by way of those islands, considerable effort was stimulated by a completely different notion, one that sprang from intellectual rather than religious motives. It was hoped that the provision of symbolic objects of a different sort, notably a particular type of bronze mirror, would set a deceased person within the most favorable cosmic circumstances. By this means a correspondence would be forged between the individual's personal circumstances of life and death and the eternal cyclical movements of heaven and earth. But from perhaps the middle of the second century BCE emphasis was being directed to the acquisi-

tion of immortality through the agency of the Queen Mother of the West, in one of two ways. Either she might be induced to provide the elixir that would ensure continuity of life on earth, or the soul might journey to the land where the queen presided, a realm populated by mythical beings who took part in a superhuman existence.

The custom of burying talismans to ensure the happiness of the deceased was established in China long before the first century CE, but from this time on the Queen Mother of the West appears repeatedly in funerary iconography. Her attributes, as shown on stone reliefs, frescoes (rarely), and bronze mirrors, include a characteristic headdress or crown and sometimes a throne, composed of part dragon and part tiger, on which she is seated in majesty. She is accompanied by one or more hares who are engaged in compounding the elixir, a three-legged bird (sometimes three separate birds), and a nine-tailed fox, all of whom have special duties and properties. She may be attended by an armed guardian. Sometimes suppliants are shown beside the queen, praying for the drug or drinking a dose in a cup. In a few instances she is portrayed at the top of a pillar that is virtually inaccessible to man; rarely, her partner is shown beside her, similarly enthroned.

In time the symbolic power of this type of iconography weakened, so that the details that originally possessed talismanic significance were reduced to decorative motifs and reproduced inaccurately. At the same time it is likely that the queen's religious significance and her popularity began to decline as Buddhist influence began to grow in China, beginning perhaps in the third century CE. Traces of Buddhist characteristics can be seen in versions of the myth of the queen that appeared from the third century CE. This shift in emphasis culminates in the well-known account of a banquet given by the queen during which Monkey steals the peaches of immortality from her table. Monkey's subsequent punishment and adventures are all placed within a Buddhist context.

MICHAEL LOEWE (1987)

XUANZANG (596?–664), religious name of the Chinese pilgrim-monk who became a leading cleric of the early Tang dynasty after returning from an eighteen-year journey to the homeland of Buddhism in India. Famous in his own day as a Buddhist scholar and adviser to the emperor, Xuanzang eventually came to be best known as the historical prototype for the legendary Tripitaka, Master of the Three Collections

of the Buddhist Dharma, whose mythical adventures with his companion, the supernatural monkey king Sun Wukong, are elaborated in the great sixteenth-century Chinese folk epic, the *Xiyou ji* (Journey to the West).

Born into a family of relatively important government officials and court scholars under the Sui dynasty (581–618), Xuanzang grew up during a period of great turmoil and transition, a time that saw the reunification of the Chinese empire after almost three centuries of division. With the encouragement perhaps of his father, he decided early to follow the example of an elder brother in pursuing a monastic career. The young monk is depicted as a precocious, even impetuous student, one who diligently sought out the best scholars of the realm, only to decide while still in his twenties that he had already exhausted the resources available to him in China. To truly master the Buddhist teaching, he felt, he would have to travel to the source of the tradition, to the Ganges River valley, thousands of miles away across some of the most inhospitable terrain in Asia.

In 627 Xuanzang set out on his pilgrimage, surreptitiously crossing the western frontier of China after failing to secure the official bureaucratic approval he had sought. After an arduous journey across mountain and desert with several long sojourns at the oases of Central Asia, he finally reached India two years later, there slowly to make his way to the various sites associated with the career of the Buddha and also to spend a number of years studying with Buddhist teachers, including the aged Yogācāra master Śīlabhadra at the great university-monastery of Nālandā. We are told that the gifted Chinese monk mastered the intricacies of Buddhist philosophy, both Hīnayāna and Mahāyāna, while also pursuing studies in the standard curriculum of the day: Vedic literature, logic, grammar, medicine, and mathematics. Excelling at philosophical debate, an important spectator sport in the prosperous urban centers, Xuanzang's fame increased steadily. He was chosen to represent Nālandā in important contests, and in 642, fourteen years after leaving China, he was summoned to the court of King Harṣa, a patron of the arts and ruler of most of northern India. With the generous patronage of Harṣa, which ensured his victory at a royal debate held in Kanauj later that year, Xuanzang reached the apogee of his career in India and began to make plans for a return to China.

After traveling for more than a year, Xuanzang arrived back in China in 645 bringing an extensive collection of Buddhist texts and artifacts. The new Tang dynasty was a powerful and recently consolidated regime ready to initiate an expansionist policy in the west, a campaign that would eventually extend China's frontier across much of the very terrain that Xuanzang had come to know so well. The emperor Taizong was quick to recognize the strategic military value of his extensive knowledge of the geography, customs, and politics of the many kingdoms to the west, but Xuanzang politely declined to return to lay life in order to serve as a court official. The monk did agree, however, to record

his knowledge in a long and detailed travelogue, the *Da Tang xiyu ji* (Record of western realms), a document that remains one of the best historical sources for Central and South Asia during this period. In recognition of his unique knowledge, Xuanzang was received as a national hero and eventually installed as the director of a lavishly funded translation project that greatly expanded the Chinese Buddhist canon.

Taizong's imperial patronage gave Xuanzang a position of great prestige and power within the Chinese Buddhist establishment of Chang'an. As a Buddhist philosopher and scholar, he is probably best characterized as a radical conservative. The radical aspect of his character was evident already in the restlessness of his youth, in the dissatisfaction with the state of Chinese Buddhism that inspired his long pilgrimage to India. His primary concern was to preserve faithfully the roots of the tradition, and he had little interest in the new, more indigenous Chinese Buddhist thought that was being formulated in the late sixth century. It was surely no accident that once in India he allied himself with the most conservative faction of Mahāyāna thought then current, the scholastic Yogācāra doctrine represented by Śīlabhadra, a school that was vigorously resisting the innovations of *tathāgata-garbha* thought and Tantric practice. The Yogācāra thought he followed sought to revitalize the old Abhidharma program of systematic soteriology, undertaken anew in light of the Mahayana concept of emptiness (*śūnyatā*). His respect for older Buddhist traditions is demonstrated further by his devotion to the Maitreya cult and by the conspicuous absence of any reference to the increasingly popular Amitābha cult in his travelogue and his biographies.

In spite of his prestige, Xuanzang's best efforts to restore a more Indian style of scholastic Buddhism in China were swept away by the new schools of Chinese Buddhism, schools that better addressed the Chinese philosophical problematic. Court patronage proved fickle, the influence of his disciples waned quickly, and in the end his teaching survived as a distinct lineage only in Japan, where it was known as the Hossō school. Modern scholars have gained an invaluable picture of early India through Xuanzang's prodigious efforts. Yet it is not as scholar or philosopher that he is most venerated within the tradition. For East Asian Buddhists, Xuanzang came to epitomize the sincerely devout and pious pilgrim, the itinerant seeker ever in arduous pursuit of ultimate enlightenment.

BIBLIOGRAPHY

The grandeur of the Tang dynasty and the drama of Xuanzang's journey are well captured by René Grousset in his popular history, *Sur les traces du Bouddha* (1929; reprint, Paris, 1977), translated by Mariette Leon as *In the Footsteps of the Buddha* (London, 1932) and translated again under the same title by J. A. Underwood (New York, 1971). The best scholarly survey currently available is *Genjō* by Kuwayama Shōshin and Hakamaya Noriaki (Tokyo, 1981). On Xuan-

zang's relationship to the Tang court, see Stanley Weinstein's *Buddhism under the Tang* (Cambridge, U.K., 1987).

In addition to his many translations, Xuanzang wrote a record of his journey and several philosophical treatises, including most notably an essay reconciling Mādhyamika and Yogācāra. Only the travelogue has survived, however, and of it there are several translations, all now rather dated and in need of revision. The best is Samuel Beal's *Si-yu-ki: Buddhist Records of the Western World*, 2 vols. (1884; reprint, Oxford, 1906). There is no complete translation of the main biographical document, that written by Xuanzang's contemporaries Huili and Yanzong. Beal published a partial translation of this work also, *The Life of Hiuen-Tsiang* (London, 1911). Preferable, though difficult to obtain, is the more complete and more accurate version published by the Chinese Buddhist Association of the People's Republic of China in commemoration of Xuanzang's anniversary: *The Life of Hsüan-tsang*, translated by Li Yung-hsi (Beijing, 1959).

Xuanzang's understanding of the Vijñaptimātratā school of Yogācāra thought is best seen in the *Cheng weishi lun*, a synoptic edition of ten Indian commentaries on the *Thirty Verses* of Vasubandhu prepared by Xuanzang and his main disciple, Kuiji. This work was translated by Louis de La Vallée-Poussin as *Vijñaptimātratāsiddhi: La Siddhi de Hiuan-tsang*, 2 vols. with separate index (Paris, 1928–1929), and less adequately by Wei Tat as *Ch'eng Wei-shih Lun: The Doctrine of Mere Consciousness* (Hong Kong, 1973).

On the complex problems with Xuanzang's chronology, see especially Luo Xianglin's "Xuanzang Fashi niandai kao," published with an English summary in the *Journal of Oriental Studies* 3 (1956): 34–47. For further research on the geographical and historical data in Xuanzang's travelogue, see Thomas Watter's monograph *On Yuan Chwang's Travels in India* (London, 1904) along with the extensive review by Paul Pelliot in *Bulletin de l'École Française d'Extrême-Orient* 5 (1905): 423–457. On Xuanzang's rather tenuous relation to the mythical Tripiṭaka in the folk epic *Xiyou ji*, see the introduction to Anthony C. Yu's four-volume translation, *The Journey to the West* (Chicago, 1977–1983).

ALAN SPONBERG (1987)
Revised Bibliography

XUNZI ("Master Xun") was, after Confucius and Mencius (Mengzi), the third great Ru or "Confucian" of the classical

period of Chinese thought. Despite conflicting and fragmentary evidence regarding his exact dates, Xunzi appears to have lived from approximately 310 to 220 BCE, through the climax of the Warring States period of Chinese history. This was a time of social turmoil and terrible interstate warfare, culminating in 221 BCE with the annexation of all the original "central states" of China by the western state of Qin. Xunzi rose to a position of intellectual and cultural eminence during his own lifetime, three times serving as head librarian among the assembled scholars in the state of Qi, traveling widely to different states, and even briefly holding a significant administrative post in the state of Chu.

Xunzi saw himself as defending the true Confucian heritage from threats both internal and external to the tradition. He appears familiar with all the known currents of thought of the period, and often aggressively attacks some central point of a previous thinker while quietly borrowing other elements of their thought that seem valuable to him when properly assimilated into his Confucianism. He wrote focused, well-constructed essays in a pugnacious and frequently colorful style, which taken as a group present a remarkably coherent and powerful religious philosophy. His intellectual goal was to rearticulate Confucianism on a more sophisticated and realistic anthropological, political, and cosmological basis, while preserving the hopeful humaneness of the Confucian Way.

In contrast to Mencius, who retains the Zhou dynasty idea of a purposive *tian* or "Heaven" that lifts up worthy leaders at regular intervals to put the Confucian Way into practice, Xunzi argues that Heaven is not humanlike and is unconcerned with human affairs. It follows its own path, does not reward goodness or punish evil, and does not send meaningful omens or respond favorably to appropriate sacrifices. To view the arts of sacrifice and divination as techniques to manipulate spiritual or material realities, Xunzi thinks, is a profound error; such ceremonies, as well as other rituals, are done to bring order to human life and thereby give it beauty and proper form. For Xunzi, Heaven does occupy the supreme position in the cosmos, and along with Earth deserves ritualized respect as one of the "three roots" of human existence; this is so because Heaven and Earth through their interactions mysteriously generate all life, including human life. But humans have a crucial role to play, governing themselves and indeed ordering the whole world, on the basis of steady cycles of change within the cosmos. Heaven, like a ruler, occupies the central position of the cosmos; but human beings, like ministers of state, actively order the natural and social worlds according to the Way. This Confucian Way is for Xunzi the human Way, in explicit contrast with the Heavenly Way, and it is crucial for us "not to compete with Heaven over responsibilities."

For Xunzi the Way is the ultimate human tradition, created over time by the ancient sages in response to human nature and the environment, and yet still universally binding on all human beings. This Way is both necessary and suitable

for us, Xunzi argues (notoriously in the view of later Chinese commentators), because humanity's innate impulses are *z*, "bad," in the sense of "ugly" or "foul." This is a direct attack on Mencius, who taught that people all possess four "sprouts" or "beginnings" of virtue within their hearts, which we must attend to and follow if we are to become good (in Mencian terms, we will "cultivate" our "sprouts" until they are fully grown). Xunzi adamantly rejects these agricultural metaphors for self-cultivation, and the whole anthropological edifice they are meant to symbolize. Following our uncultivated intuitions and impulses will lead only to strife, Xunzi thinks, as people struggle with each other for social dominance and limited material resources. We have no reliable in-born moral intuitions; we must learn the Way from others, and only over time will its fittingness and power become apparent to us.

Xunzi speaks of the formation of virtuous people as a long, initially difficult and unpleasant process akin to crafting beautiful and useful implements out of less than ideal raw materials. Mere indoctrination or coercion will be insufficient, however; people must be exposed to the gracious humaneness of the Confucian Way, and judge for themselves that it is more desirable than their current anxious, dangerous, and painful lives, even from an ignorant starting point.

A beginning Confucian student needs above all to find and follow a wise teacher, and congregate with fellow students of the Way. Xunzi describes in some detail the practices of self-cultivation he recommends, the most prominent of which are textual study of the Confucian classics, the practice of ritual, and musical performance and appreciation.

Xunzi's treatment of ritual is particularly noteworthy. His use of the term is very broad, encompassing not only sacrifices and discrete ceremonies, but also deportment, etiquette, speech, and even dress; such matters of interpersonal "style" are crucial elements of Xunzian ethics. According to Xunzi, ritual works at personal, social, and even cosmic levels, properly ordering all things into harmonious wholes. Over time, by means of diligent ritual practice, the Xunzian student will "cut and stretch" his dispositions to feel, judge, and act so that they come to perfectly accord with the rites; by doing this he will come to follow and "enact" the Way. For Xunzi, Confucian learning is a sham unless it is grounded in a bodily appropriation of the Way, so that a person's every movement and word is appropriate; this sort of self-mastery can only be attained by practicing ritual and music. Fully cultivated leaders will both exemplify and implement the Way in society at large, ushering in a humane society where the poor, weak, and infirm never lack for basic necessities, the strong are restrained from predation and redirected to more public service, and the surplus bounty of a harmonious state will be used to elevate and enrich the lives of all, according to their virtue and social standing (which ought, in a Xunzian world, to coincide). Even the natural world will share in greater fecundity and order when brought under Confucian stewardship, as people's needs are met in harmo-

ny with natural processes. This ideal state of affairs, which Xunzi calls "forming a triad with Heaven and Earth," is the fullest flowering of the human Way.

Xunzi's ideas had a significant impact on the formation of later Confucian imperial bureaucracy and methods of education. Moreover, his students preserved texts (such as the *Odes*) that proved indispensable to later Chinese tradition. Nevertheless, his two most famous students were viewed by later Confucians as apostates from the Way who brought disgrace upon their teacher by aiding Qin's ruthless drive to unify China. And later, during the Confucian revival of the Song dynasty (960–1279 CE), Mencius's views on human nature became canonical, with Xunzi's thereafter considered heterodox. He was thus occasionally disparaged but largely ignored until modern times. He is the subject of considerable current scholarly interest in the West because of his philosophically complex and sophisticated version of Confucianism.

BIBLIOGRAPHY

John Knoblock's three-volume *Xunzi: A Translation and Study of the Complete Works* (Stanford, Calif., 1988–1994) is invaluable, particularly in its voluminous notes to the commentarial tradition, even if particular translations are sometimes debatable or excessive; Knoblock includes ample introductory material on Xunzi's context, and the fullest collected bibliography of Xunzi studies available. Burton Watson's partial translation is also very good (*Hsün-Tzu: Basic Writings*, New York, 1963), as are the precisely rendered but brief selections translated by Eric Hutton in *Readings in Classical Chinese Philosophy*, edited by Philip J. Ivanhoe and Bryan W. Van Norden (New York, 2001). The best collections of secondary works are *Virtue, Nature, and Moral Agency in the Xunzi*, edited by T. C. Kline III and Philip J. Ivanhoe (Indianapolis, Ind., 2000), and *Ritual and Religion in the Xunzi*, edited by T. C. Kline III (New York, 2004). Other helpful works concerning Xunzi's understanding of ritual include A. R. Radcliffe-Brown's classic and insightful "Religion and Society," in Radcliffe-Brown, *Structure and Function in Primitive Society: Essays and Addresses* (1952), pp. 153–177 (New York, 1968), and Robert F. Campany, "Xunzi and Durkheim as Theorists of Ritual Practice," in *Discourse and Practice*, edited by Frank Reynolds and David Tracy, pp. 197–231 (Albany, N.Y., 1992). Edward Machle's *Nature and Heaven in the Xunzi: A Study of the Tian Lun* (Albany, N.Y., 1993) is a searching treatment of Xunzi's views of *tian* or "Heaven" that argues Xunzi should be seen as a religious thinker, and that his *tian* is better understood as a Chinese sort of high god than as an amoral, law-governed "Nature."

AARON STALNAKER (2005)

YA'AQOV BEN ASHER (c. 1270–1343), Hispano-Jewish codifier. Ya'aqov was a son of the great German halakhist Asher ben Yehi'el, who settled with his family in Toledo in 1303. Ya'aqov ben Asher never accepted rabbinical office and at times suffered economic adversity, but he

continued his father's lifework—the revival of Talmudic studies in Castile and the fusion of Franco-German and Spanish *halakhab*.

Ya'aqov's *magnum opus* was his code, the *Arba' ah turim* (lit., "four rows"; see *Ex.* 28:17). It consists of four books: *Orah hayyim*, on liturgy and holidays; *Yoreh de' ah*, on "the prohibited and permitted" and other topics, including mourning, charity, education, and filial piety; *Even ha-' ezer*, on family law; and *Hoshen mishpat*, on civil law. Ya'aqov sought to attain coherence and order in Jewish law, but in a manner less radically reductive and homogenizing than that of Maimonides in his *Mishneh Torah* a century and a half earlier. Instead of excising all disagreement and discussion, as Maimonides had done, Ya'aqov skillfully integrated into his code brief discussions of legal cruxes and of the divergent views of major authorities who represented different schools, generally concluding with his father's view.

The language of the *Turim* is clear and simple. Unlike *Mishneh Torah*, its arrangement aims at functionality rather than conceptual categorization. This practical orientation is evident also in its omission of all laws not applicable since the destruction of the Temple. Nor does the *Turim* attempt the grand synthesis of law and theology to which *Mishneh Torah* aspires. It does, however, contain many homiletical and hortatory passages (especially in the section prologues) based on classical *aggadah* and the author's own pure and simple piety. Only rarely are there reflections of the Ashkenazic Hasidism of Ya'aqov's German forebears and of his opposition to philosophical rationalism. The spirituality underlying Ya'aqov's piety occasionally breaks through the surface, as in his recommendation, inserted matter-of-factly in "the laws of prayer," that one emulate the "men of piety and good deeds [who] would so meditate and concentrate in prayer, that they achieved a stripping away of corporeality and an intensification of the rational soul, which brought them close to the level of prophecy."

The *Turim* became an immensely popular work among both Sephardic and Ashkenazic Jews and occasioned many commentaries. It was the second Hebrew book published (Piove di Sacco, 1475) and in the sixteenth century served as the basis for Yosef Karo's classic code, the *Shulhan' arukh*.

Ya'aqov also composed a commentary on the Torah (1806) that clearly summarizes the brilliant but difficult thirteenth-century Pentateuch commentary of Moses Nahmanides, without the latter's qabbalistic exegesis. To each section, Ya'aqov prefaced homiletical interpretations based on the numerical value of letters (*gematriyyah*) and the orthographic peculiarities of the Masoretic text. Ironically, these interpretations, mentioned as a relatively inconsequential afterthought in Ya'aqov's introduction, became extremely popular, eclipsing the main body of the commentary.

BERNARD SEPTIMUS (1987)
Revised Bibliography

YAKŞAS SEE NĀGAS AND YAKŞAS

YAKUT RELIGION. The Yakuts, who numbered 328,000 during the 1979 census, are the northernmost of Turkic peoples. Beginning in the twelfth and thirteenth centuries, under pressure caused by Buriat encroachment, they gradually emigrated northward from the Lake Baikal region of southern Siberia. They moved upstream along the course of the Lena River and finally settled in northeastern Siberia, the coldest region in the world. The horses and cattle bred by these semisedentary people have successfully adapted to the rigorous climate; however, hunting and fishing provide the Yakuts with a significant additional source of income. The Yakuts are organized in patrilineal and exogamic clans regrouped into tribes.

Under pressure from the Russians, who subjugated them during the first half of the seventeenth century, the majority of Yakuts were baptized by the end of the eighteenth century. They adopted Christianity primarily for material reasons (e.g., gifts of crosses, shirts, and various privileges). At the same time, they secretly preserved their own religious

system, shamanism, which was modified superficially as the result of contact with Russian Orthodoxy. The practitioners of shamanism accepted the new idea of a reward after death and attributed the traits of God, the Virgin Mary, and the guardian angels to some of their spirits.

COSMOLOGY. The Yakut universe is composed of three superimposed worlds. The “upper world” comprises nine skies of different colors. Spirits reside in each sky: In the east are the *aīyys*, bright, creative spirits, and in the west are the *abaasys*, dark, harmful spirits. (The Yakuts are situated in the east.)

The “middle world,” flat and octagonal, is populated by humans and by a host of spirits. The forest of this world is a formidable territory because the greatest number of spirits are found there: Although they grant game, they also capture the souls of hunters who have pleased them.

The “lower world” is a crepuscular region solely inhabited by the harmful spirits who roam among a metallic, iron vegetation. Here, the “sea of death,” composed of children’s cadavers, churns its waves. The term employed for “lower world,” *allaraa*, signifies “below, downstream, in the north.” (The rivers of Siberia flow northward, hence the use of the same term for both “downstream” and “north.”) It is possible that the lower world is not conceived of as a sinister and subterranean replica of the middle world but rather as a watery abyss in the northern regions. In any case, the contrasts of above and below and of upper and lower do not figure predominately in the Yakut religion. More important is the division of the sky into east (good) and west (evil): This division allows for the classification of the spirits.

THE PANTHEON. The bright, creative spirits, *aīyys* (from the Turkic root “ai,” “to create”), assure the Yakuts their survival by granting them the souls of children and also of horses, cattle, and dogs, the Yakuts’ only domesticated animals. However, the Yakuts must pay homage to the *aīyys* with milk offerings and prayers and must consecrate animals to them from their herd. The consecrated animal (*zykh*) is not slain; it is sent back to the herd and is treated with respect, for it no longer belongs to humans but to the spirit to which it was consecrated. This spirit will reward the people for their care by granting fertility to the herd. The *aīyy* cult, called “white shamanism,” disappeared in the eighteenth century and never was studied properly.

The White Lord Creator, Iurung Aīyy Toion, is the master of all the *aīyys* who are imagined to be like rich Yakuts and are organized in clans, as are the Yakuts themselves. Associated with the sun and the heat of summer, the White Lord Creator resides in the ninth sky, where “the grass is as white as the wing of a white swan.” He rules the world, sends the soul (*kut*) to children, and assures fertility in cattle and the growth of plants, but he does not interfere in human affairs on his own initiative. During the great spring feasts called “libations” (*ysyakh*), he is first offered libations of fermented mare’s milk; later, horses are consecrated to him. Occasionally a goddess, the wife of this god, is mentioned; she

would become an avatar of the goddess of the earth. Such an identification of the goddess may be a vague indication of a marriage between the sky and the earth.

The *aīyysyts*, a group of spirits, female for the most part, attend to human reproduction and the reproduction of certain species of animals (especially the domestic species). The *aīyysyt* who attends to human reproduction brings the soul of the child created by Aīyy Toion. She also comes to help women during childbirth. She is often associated with Iëiëkhsit, and is occasionally confused with her. When they are associated, Aīyysyt is the one who grants the soul and Iëiëkhsit is the one who delivers it. (The latter has been likened to a guardian angel.) Aīyysyt and Iëiëkhsit are both proper nouns and epithets that can be applied even to male personages: When one is begging for offspring one uses the epithet Aīyysyt, and when one desires an intermediary the epithet Iëiëkhsit is used. The three *aīyysyts* of man, of horned livestock, and of dogs are all feminine spirits, but the spirit that grants horses, “the formidable Dzhësëgëi,” is masculine. When mares and cows reproduce, and each time a child is born, relatives and cousins come together to offer a ritual of renewal to the spirit that granted the soul. However, the ritual for the spirit-master of horses is conducted by the (male) ruler of the house, while the other two rituals are celebrated by the women.

The goddess of the earth, who lives among beautiful white birches far from the evil spirits, takes care of the traveler, blesses the harvests, and occasionally decides the fate of the newborn. The spirit-master of the domestic fire assures the survival of the household: In his embers tremble the souls of children and calves yet to be born. He removes harmful spirits and purifies the accessories of the hunt that are soiled by the presence of a menstruating woman. This spirit-master also serves as an intermediary for other spirits by delivering offerings to them that are thrown into his flames in their honor. In exchange, one must not forget to feed him by throwing him a mouthful of food before each meal; otherwise, he may take revenge by, for example, burning down the house.

On the opposite side, in the western sky, loom the black spirits, *abaasys* (the Turkic root is probably *ap*, “enchantment”), “gigantic as the shadows of larches under the full moon.” In fact, they appear to be more terrible than they really are, because once they have sent diseases (most often, various types of insanity), they will take them away if the shaman sacrifices horses with suitable coats. The supreme ruler of the nine clans of *abaasy* is Ulu Toion (“powerful lord”), who gave the Yakuts fire and perhaps one of the three souls that the Yakuts believe each person possesses (according to some, the soul he gave was the *siur*, vital energy). He is the protector of the black shamans, *abaasy oīun* (lit., “shamans in contact with the *abaasys*”).

Other harmful *abaasys* populate the earth and the lower world. The two most celebrated are the ruler of the lower world, Arsan Duolan (a pale replica of Ulu Toion), who

sends infant mortality and obstinacy, and Kudai Bagsi, the ruler of the smiths, who cures the apprentice smith of his initiation illness if the shaman offers him a black bull.

Among the harmful spirits are the unsatisfied deceased (*iuërs*) those who died without completing a full life cycle, such as young girls who died without having been married. The souls of suicides and of shamans become the most formidable *iuërs*.

In the domestic environment and in natural phenomena that directly influence humanity's well-being, there exists a supernatural force that the Yakuts call *ichchi* ("master, possessor"). This force is personified in the spirit-masters who reside in the object, house, or territory they possess. To ensure that a tool be effective or that a house not collapse, to avoid being crushed by a tree or hurled into the waters when crossing the forest or the river, one must make an offering to one's spirit-master.

Since the Yakuts believed the spirits were organized in clans as they themselves were, they recognized their right to have tribal property. This property was the game and fish existing in the territory of these spirits. They accorded part of this to humans in exchange for food (milk products, alcohol, flesh of domestic animals) in an alliance that is similar to that formed between bartering human tribes. However, the spirits never give enough souls of game, cattle, and children. This is where the shaman intervenes.

THE SHAMAN. To obtain the souls of wild game, the shaman provides the master of the particular kind of animal in question with food in return: He smears the blood of a sacrificed animal on a wooden statuette where he has caused the spirit-master of the forest, the rich Baianaï or Baryllakh, to descend. He then gives a symbol of these souls (e.g., feathers, etc.) to the members of the clan. To obtain the souls of children and additional cattle, the shaman himself goes to the beyond to confront the *aïyysys*. At first the spirits refuse, remembering the wrongs that humans have committed. Then, after considering the supplications of the shaman, they give him the souls. The position of the shaman has changed: He no longer barter, he implores, because the *aïyy* spirits, dispensers of cattle and human offspring, are venerated, unlike the spirits of the hunt or of illnesses, whom the shaman treats as equals.

To cure illness, which the Yakuts conceive as the installation of an evil spirit in the body of the ailing person and also as the theft of the soul by a spirit "soul-eater," the shaman trades the soul of the sick person for that of a sacrificed animal, which he sends into the otherworld. These negotiations with the spirits take place during the shamanic séance, which is generally held nocturnally at the afflicted person's home, with relatives and neighbors in attendance. The séance includes a purification ceremony; a convocation of the spirits through the shaman's chanting, accompanied on the tambourine; a voyage of the shaman himself into the otherworlds to find the spirits (a voyage mimicked by the shaman's dance); and an act of divination.

The shaman is aided by his principal spirit (*ämägät*), generally the shaman's ancestor, who chose the shaman from among his descendants in order to pass on the shamanic gift, a gift that always remains in the same family. Women also can become shamans (*udaghans*), but female shamans are less numerous because the clans are patrilineal. Once chosen by the ancestor, the soul of the future shaman takes on the form of a young bird and is educated atop either the mythic larch of the upper world or the pine tree of the lower world. It is during his initiation that the shaman seals his alliance with the spirits. In the course of his sleep, his body is cut up in the lower world and consumed like a sacrificial animal by several spirits. The spirits then reconstitute his body. Recreated in this manner, the shaman acquires rights over the spirits who have consumed his flesh and who will subsequently help him remove illnesses.

The shaman is also aided by zoomorphic spirits who transport him in the air or under the ground and who fight at his side. Moreover, the shaman possesses an animal double (usually a male moose or bull); it is in this form that he fights against shamans of enemy clans. If the shaman's animal double has been killed, he himself dies. The shaman also fights against the souls of dead avengers, the spirits of illnesses and epidemics. He also assures the survival of his clan by divination—predicting the future, the areas where game will be most plentiful, and so forth. In this dark universe, where mad spirits who populate three-fourths of the sky in the west predominate, where the bright spirits (*aïyys*) often refuse to grant offspring and prosperity, and where "soul-eating" spirits lurk about the earth and in the lower world, the shaman is the Yakuts' only support.

LAURENCE DELABY (1987)

Translated from French by Sherri L. Granka

YAMA. In the earliest R̥gvedic hymns, Yama is a benign god who looks after the well-being of the dead, whom he entertains with food and shelter. His abode and its environment are pleasant and comfortable; survivors supplicate him for the care of their departed relatives.

Yama is the son of Vivasvat and Saranyū; he has a twin sister, Yamī. In the *R̥gveda*, Amṛta (“ambrosia”) is Yama’s son, but in the *Atharvaveda*, Yama has a son, Duḥsvapna (“bad dream”), by Varuṇānī. In the epic-Puranic literature, the Aśvins are his brothers, and Śani and Manu are his half brothers. The Aṅgirasas are his associates.

The name *Yama* is derived from a stem meaning “twins”; Latin *gemini* and the Avestan names *Yima* and *Yimeh* are cognates. In a R̥gvedic hymn, Yamī implores Yama to unite with her, but he rejects her advances. The hymn has an abrupt, inconclusive end. In Buddhist literature, Yama is identified with Kāma (“desire”) and Māra (“death”). In the Vedic literature, Yama has close relations with Rudra, Soma, Agni, Kāla, and Nirṛti. Yama also bears a remote relationship to Varuṇa.

Yama in the Vedas was the first mortal to die. He then went to heaven, where he ruled over the dead. But toward the close of the Vedic period sinister traits began to appear in him, and they grew stronger with time. Yama then became the god of death and the lord of Hell. In the *Kaṭha Upaniṣad*, as death personified, he holds a long discourse with the boy Naciketas, whom he initiates into the mysteries of life, death, and immortality. Prayers are offered to Yama for longevity and deliverance from recurring deaths. Yama also grants release from *aśanāyā* (hunger). In many rituals of ancestor worship, oblations are offered to Yama with prayers for averting recurring deaths. In the Gṛhyasūtras, oblations are offered to Yama’s men, presumably his associates, in the realm of the dead.

Of the two paths in later Vedic eschatology, Devayāna and Pitṛyāna, the latter is that of the fathers and of spirits doomed to rebirth. These spirits proceed through Soma, the moon, and are judged by Yama. In the epics and Purāṇas, Yama has a palace, Śubhāvātī, in the netherworld. Yama’s realm begins, in Buddhist literature, to shift from the heaven of the gods until, in the Hindu epics and Purāṇas, it assumes distinctly sinister characteristics. As god of death and lord of Hell, Yama is dark and malevolent, yet still a giver of boons.

The south is the region of Yama (as it is that of the Avestan Yima) and the region of death. Yama has two dogs, Śyāma and Śabala, who are associated with the final judgment of souls, as are Hades’ dog, Kerberos, the Egyptian Anubis, and Yima’s four dogs. Yama is also associated with oil and with the dove, eagle, and raven (all of which are endowed with sinister traits). The epic and Puranic Yama has a buffalo for a mount. Dread monsters (*rākṣasas*), semidivine *yakṣas*, demons, cruel messengers, the Aṅgirasas, and the souls of the departed throng his realm. His ritual oblations in ancestor worship are gruesome and evil. The symbols asso-

ciated with his various aspects as Kāla, Mṛtyu, and Antaka are images of repulsiveness, cruelty, and deformity. In descriptions of Yama red and black colors predominate.

In the final stage of his evolution, Yama shares two significant characteristics with Śiva: He is Kāla (“time”) and Dharmarāja (“lord of righteousness”). As Kāla, he is also Antaka, the “ender” (i. e., Death). As Dharmarāja, he takes over Varuṇa’s role as the moral judge and punisher whose assistants torture the wicked in hell. At this stage his name is clearly derived differently, from the root *yam* (“to control”), from which are derived *yantraṇa* (“constriction”) and *yantraṇā* (“torture”). As Dharmarāja, Yama can also be lenient to supplicants and revoke his own order (as he did for Sāvitrī) or modify it (as he did for Pramadvārā in the *Mahābhārata*).

Numerous episodes in the epics and Purāṇas contribute to Yama’s almighty and sinister image. This image contrasts with his early Vedic appearance as a minor god who is simply a “gatherer of men.” A cluster of hymns in the tenth and last book of the *R̥gveda* presents him as a benign god like any other in the pantheon. But from the *Yajurveda* (especially in the Puruṣamedha sacrifice), where different oblations are prescribed for each of the various aspects of Yama, his personality undergoes a radical change: From the benevolent god of the dead he becomes the dread god of death. The theophany of Yama as Kāla, Antaka, and Dharmarāja brings him closer to Śiva.

SUKUMARI BHATTACHARJI (1987)
Revised Bibliography

YAMAGA SOKŌ (1622–1685), Japanese Confucian of the school of Ancient Learning (Kogaku). Sokō was born in Aizu, the son of a masterless warrior named Yamaga Sadamochi (1585–1664) and Sadamochi's mistress, Myōchi (d. 1677). He began studying the Confucian classics at the age of five or six, and at eight he was enrolled at the Hayashi school in Edo (present-day Tokyo). As a youth, he also studied Japanese literature, Shintō, and military science—the latter with Obata Kagenori (1572–1663) and Hōjō Ujinaga (1609–1670).

Sokō first achieved fame in 1642 when he published *Heibō yūbishū* (Collected Writings on Military Methods and Preparedness), a fifty-volume work on military science that treated a whole range of subjects from castle defense to warrior organization. Over the next two decades his lectures on military affairs and the Chinese classics attracted growing numbers of local warriors and lords. In 1652 Sokō entered the service of Asano Naganao (1610–1672), lord of the Akō domain, and served him until 1660, when he resigned to devote himself to teaching. Despite his service in the Asano house and his success as a teacher, Sokō longed to become a direct retainer of the shogun. Although he nearly realized this ambition on several occasions, his hopes were dashed in 1666 when the senior councillor Hoshina Masayuki (1611–1672) had him exiled to the Akō domain. The ostensible reason for this was the publication of *Seikyō yōroku* (Essentials of the Sages' Teachings), in which Sokō criticized the officially sanctioned Neo-Confucianism. During his exile Sokō was well cared for by the Asano family, had an endless stream of visitors from Edo, and wrote more than seventeen books, the most important of which were *Takkyō dōmon* (A Child's Queries During Exile), *Chūchō jijitsu* (The Truth about Japan), and *Haishō zanpitsu* (Last Testament in Exile). When he was pardoned in 1675 he returned to Edo, where he resumed his teaching career, once again lecturing on military science and Confucianism. He died of jaundice in 1685.

Sokō is best known as a military thinker, Confucian scholar, and nationalist. Early in his life he concentrated on formalizing and systematizing the essentially medieval mores, customs, and institutions of the warrior class. In the early 1650s, he developed the notion of what he called *bushidō* ("way of the warrior"), which, borrowing heavily from Neo-Confucianism, provided a philosophical basis for military science and described the ideal behavior of a class whose chief function was no longer to fight but to govern.

Sokō is also known as an advocate of Ancient Learning. While he had once subscribed to Neo-Confucianism, he came to oppose it, calling for a return to the teachings of the ancient Chinese sages and Confucius. In *Seikyō yōroku*, he attacked Neo-Confucianism's introspective concerns and in their stead, advanced a new utilitarianism, stressed the importance of social relationships, and recommended the revival of ancient Chinese regulations and rituals. Sokō began the work that Itō Jinsai (1627–1705) and Ogyū Sorai (1666–1728), his successors in the school of Ancient Learning, would complete. While in exile, Sokō became an ardent nationalist. In *Chūchō jijitsu* and *Takkyō dōmon* he argued that Japan's indigenous religion, Shintō ("way of the gods"), was superior to Confucianism and that Japan itself was superior to China and all other countries in the world.

Sokō's writings reveal, first, an impressive eclecticism that reflects his having studied, at different times, Neo-Confucianism, Shintō, military science, Buddhism, and even Taoism. They also reflect his concern, associated with his utilitarianism, with the actual affairs of daily life and the larger problem of how best to govern the country. Finally, Sokō's writings give evidence of his fierce loyalty to the shogun and the government he headed. Although Sokō never became a direct retainer of the shogun, he taught hundreds, perhaps thousands, of Tokugawa retainers and formulated political principles aimed at strengthening shogunal rule.

SAMUEL HIDEO YAMASHITA (1987)

YAMATO TAKERU. Yamato Takeru, whose name means "brave man from the Yamato region," is a legendary character described in the records of the Yamato kingship, including the *Nihonshoki* (720 CE) and *Kojiki* (712 CE). According to the *Nihonshoki* and *Kojiki*, Yamato Takeru was the son of Keiko Tenno, the twelfth emperor. He laid the foundations for the Yamato kingship to rule almost all of the Japanese islands by conquering previously unsubjected peo-

ples, such as the Kumaso in the southwest and the Emishi in the northeast. Yamato Takeru's conquests finally ended when he died after his defeat by a mountain god just before returning to the Yamato region. Today, Yamato Takeru is not considered to have been an actual living person, but his character may reflect memories of Yuryaku Tenno, who lived during the fifth century.

The descriptions of Yamato Takeru's character are similar in the *Kojiki* and *Nihonshoki*, but his relationship with his father, Keiko Tenno, is described very differently in the two books. In the *Nihonshoki*, Yamato Takeru is the one and only crown prince who is relied on by his father as a man of perfected character in terms of the ideal Chinese Confucian. But in the *Kojiki*, Yamato Takeru is just one of many princes, and he is hated by his father because of his extraordinary powers as a trickster-like character. Yamato Takeru's expedition is also described differently in the two books. In the *Nihonshoki*, he leads his father's army, whereas in the *Kojiki* he is forced to enter enemy territory almost alone, as if he had been expelled from the Yamato region, even though he had shown obedience to his father. The relationship described in the *Kojiki* could be thought of as an Oedipus complex in reverse, with the father showing hatred for the son regardless of the son's affection towards him.

Legends of Yamato Takeru are also found in the *Fudoki*, a compilation from the early eighth century CE explaining the origins of the names of places across the Japanese islands. There are some suggestions in the *Fudoki* that Yamato Takeru was classified as an emperor. From the evidence of the *Nihonshoki*, *Kojiki*, and *Fudoki*, there are at least three different types of legends concerning Yamato Takeru. Although they are not unified, all of these books concern the Yamato kingship.

In the medieval era, there were repeated attempts to unify the numerous records of Yamato Takeru. Most of the stories of the period, in the *Heike monogatari* and other works, were based on the *Nihonshoki* account. They emphasize the Yamato Takeru legend as a story about the miraculous powers of the Kusanagi sword, one of three items making up Japan's imperial regalia. This emphasis reflected the fact that at this point in history the warrior class controlled the political power of Japan, and the imperial family feared losing cultural power as well. Thus, the imperial family and their supporters sought to exemplify the family's strength and lineage through their possession of the legendary sword.

Beginning in the middle of the early modern period, Yamato Takeru came to be characterized as a figure with rich human emotions, especially the feeling of sorrow. Scholars of Japanese classical studies, such as Motoori Norinaga, drew more upon the *Kojiki* account. In the modern era and moving into World War II, the Japanese government used the figure of Yamato Takeru to represent and glorify the loyal subject, implying that it was honorable to die in war for the country and the emperor. After Japan's defeat, Marxists historians, such as Ishimoda Shō, re-presented the story of Ya-

mato Takeru as crystallizing memories of pre-imperial Japan. Ishimoda believed that the national epics of Japan were equal to the Greek and Roman mythologies. They could be traced back to the stage before the construction of an artificial national identity through the *Kojiki* and *Nihonshoki*, when there was, according to Ishimoda, a pure national sensibility. The image of Yamato Takeru has been transformed through interpretive acts in every period of Japanese history and used to legitimate the standpoint of each interpreter. For many, the legend of Yamato Takeru was thought to preserve historical traces of national memories of how ancient Japanese society was established. The image of Yamato Takeru will no doubt continue to change over time in order to meet new needs.

ISOMAE JUN'ICHI (2005)

YAMAZAKI ANSAI (1618–1682), Japanese Confucian and Shintō scholar of the early Tokugawa period. The son of a samurai who lost his position in the turbulence of the early Tokugawa period, Ansaï was set at a young age on a career as a Zen priest. However, in his twenties he became acquainted with the anti-Buddhist writings of the Song Chinese Neo-Confucian scholar Zhu Xi. Inspired by them, he rejected Buddhism in favor of Confucianism, left the monastery, and devoted himself to the study and explication of the ideas of Zhu Xi. He attracted many disciples, drawn primarily from the samurai class, and developed close relations with a number of important political figures. He thus played a significant part in the spread of Confucian learning among the Tokugawa samurai class. Ansaï was also deeply interested in the fusion of Confucianism and Shintō that had been developed by contemporary Shintō scholars such as Yoshikawa Koretaru. From Yoshikawa, Ansaï received the Shintō religious name of Suika Reisha, and Ansaï's own version of Confucian-flavored Shintō is known as Suika Shintō.

Insisting that, like Confucius, he sought only to transmit, not to create, Ansai wrote little of a systematic, interpretive nature. His preferred method was to compile selections of excerpts from the writings of Zhu Xi and to express his own views on Zhu Xi's teachings through lectures on these excerpts and a few chosen texts. Ansai's ideas were thus conveyed primarily in the form of lecture notes taken down by his disciples. As reflected in these notes, Ansai's lectures, delivered in a forceful, colloquial style, sought both to come to terms with the complexities of Zhu Xi's metaphysics and to deliver them to a relatively uneducated audience in a simple, direct fashion. This approach was undoubtedly an important factor behind the popularity and influence of his school.

Similarly, Ansai stressed mastery of a few basic texts rather than wide reading. Whereas other Tokugawa Confucian scholars, such as Hayashi Razan, emphasized the importance of erudition and thereby presented Confucian learning as the special province of the professional scholar, Ansai decried the pursuit of erudition as encouraging dilettantism and as counterproductive to the development of a firm sense of moral priorities. Confucian scholars of other schools criticized his position as narrow and rigid, but it did serve to offer a large audience entry into the forbidding body of Chinese Confucian literature.

Ansai insisted that his selection of the core teachings of Zhu Xi constituted the orthodox tradition. In fact, however, he modified Zhu Xi's ideas in several important ways. For instance, he gave added emphasis to the moral importance of the relation between lord and vassal, depicting the obligation of the vassal to the lord in absolute terms comparable to that between parent and child. The Ansai school position on this subject contributed to the growth of the idea, found widely in the late Tokugawa period, of the absolute, eternal nature of the obligation of loyalty to the imperial line.

Another area in which Ansai deviated significantly from Zhu Xi was in emphasizing the importance of "reverence" over "investigation of the principle of things" in the process of the individual's cultivation of his innate moral nature. The resulting stress on cleaving to the norms of Confucianism and on rigorous introspection to ensure that one's behavior conformed to those norms contributed to the characteristically stern and dogmatic tone of the Ansai school.

Ansai's linking of Confucianism and Shintō was another distinctive feature of his teachings. Unlike other Confucian scholars such as Hayashi Razan, who sought to equate Shintō and the Confucian way, Ansai presented them as two distinct manifestations of a universal truth, each particular to the country in which it originated. Ansai's joining of Shintō and Confucianism added a note of mystery and religious authority to Confucianism that furthered its acceptance in Tokugawa society, while his insistence on the particularly "Japanese" character of Shintō endowed his school with a nationalistic flavor that tended to increase with the passage of time. However, many of the connections Ansai

made between Shintō and Confucianism were forced and far-fetched, and his leading disciples, although declaring themselves faithful to the essence of Ansai's teachings, broke with him over the question of the relationship between Confucianism and Shintō. This break led in later years to the division of the Ansai school into two major branches, one Confucian and one Shintō.

BIBLIOGRAPHY

An introduction in English to Yamazaki Ansai's major ideas can be found in Okada Takehiko's "Yamazaki Ansai," in *Principle and Practicality: Essays in Neo-Confucianism and Practical Learning*, edited by Wm. Theodore de Bary and Irene Bloom (New York, 1979). For an account of the ideological orientation of his school, see Herman Ooms, *Tokugawa Ideology: Early Constructions, 1570–1680* (Princeton, N. J., 1985). Bitō Masahide's *Nihon hōken shisōshi kenkyū* (Tokyo, 1961) presents an incisive treatment of Ansai's place in the development of Tokugawa thought and of the points where Ansai diverges from Zhu Xi.

KATE WILDMAN NAKAI (1987 AND 2005)

YĀMUNA (fl. c. 1022–1038), known in Tamil as Ālavandār; Hindu philosopher, theologian, and devotional poet. Yāmuna lived in the Tamil-speaking area of South India and represented a learned family of brahmins who played a leading role in the formulation of the Śrī Vaiṣṇava tradition and of the Viśiṣṭādvaita school of Vedānta, which is most widely associated with the name of Rāmānuja. The Śrī Vaiṣṇavas made a major contribution to the development of Hindu religion by being the first Brahmanic movement to integrate fully into the classical Vedic tradition a popular, predominantly non-Brahmanic religious movement, the ecstatic devotion (*bhakti*) of the Tamil hymnists called the Ālvārs. This synthesis of popular or vernacular elements with Vedic or Sanskritic ones provided a highly influential model for a number of later Hindu theistic sectarian movements.

Yāmuna is recognized as the fourth in the preceptorial line of *ācāryas*, or teachers, who provided the intellectual leadership of the Śrī Vaiṣṇava sect, and is the first for whom there are extant works. His incompletely preserved literary corpus thus provides the major beginning point for a study of the formulation of this important movement and its school of philosophical theology, Viśiṣṭādvaita Vedānta. Yāmuna's name is closely linked with that of his grandfather, Nāthamuni (c. tenth century), who is acknowledged as the first teacher in the Śrī Vaiṣṇava line. Nāthamuni, in addition to propounding a system of logic and epistemology (*nyāya*), was the head of a family of prestigious Bhāgavata brahmins devoted to Hare Krishna and is the one to whom tradition ascribes the canonization of the Tamil hymns of the Ālvārs in the collection entitled the *Divyaprabandha*. While the evidence for this traditional ascription is inconclusive, Yāmuna's two devotional hymns to Visnu and Śrī, the *Stotraratna* and the *Catuśślokī*, reflect the influence of the Ālvārs' ecstatic devotional style.

According to the tradition, Yāmuna's greatest contribution lay in attracting to the Śrī Vaiṣṇava sect Rāmānuja (eleventh to twelfth centuries), their sixth teacher and the classical exponent of Viśiṣṭadvāita. Although the two never met, it is clear from the literary evidence that Yāmuna was the seminal thinker who provided the primary inspiration for Rāmānuja's major Vedantic writings. The basic structure for Rāmānuja's commentary on the *Bhagavadgīta* was provided by Yāmuna's versified summary, the *Gītarthasamgrahā*; and in his other works Rāmānuja regularly refers to and quotes from Yāmuna's major Vedantic philosophical writings, the *Siddhitrāya*, a triad of critical works (*Ātmasiddhi*, *Samvitsiddhi*, and *Īśvarasiddhi*) that are now only fragmentarily preserved, having been eclipsed by Rāmānuja's own definitive works.

Another of Yāmuna's major contributions as represented by his largest completely preserved work, the *Āgamaprāmānya*, was his defense of the Pañcarātra revelation or scriptures (Āgamas) as being equal to the Vedas in authority. These Pañcarātra Āgamas, also called Tantras or Saṃhitās, provide the scriptural basis for the earliest post-Vedic, Tantric tradition to arise during the first millennium CE. Yāmuna's defense of these temple-oriented ritual texts as compatible with the Vedas and Vedānta facilitated a radical enlargement and enrichment of the Hindu scriptural base, as did the incorporation of the Tamil hymns of the Āḷvārs.

Works by Yāmuna

Gītarthasamgraha. Edited with an English translation by J. A. B. van Buitenen in his *Ramanuja on the Bhagavadgīta*, pp. 177–182. Delhi, 1968.

Siddhitrāya. Edited, translated, and annotated by R. Ramanujachari and K. Srinivasacharya. Annamalainagar, 1943. Reissued with a new introduction by Ramanujachari as *Sri Yamunacharya's Siddhi Traya* (Madras, 1972). Contains Yāmuna's three major but fragmentarily preserved Vedantic works: *Ātmasiddhi* (pp. 1–151), *Īśvarasiddhi* (pp. 153–174), and *Samvitsiddhi* (pp. 175–213), "The Definitive Determinations of the Self, of the Lord, and of Consciousness." *Yāmuna's Āgama Pramānyam, or, Treatise on the Validity of Pañcarātra*. Sanskrit text with English translation by J. A. B. van Buitenen. Madras, 1971.

Works about Yāmuna

The most complete survey of Yāmuna's extant literary corpus, written from a traditional perspective, is M. Narasimhachary's *Contribution of Yamuna to Visistadvaita* (1971; 2d ed., Hyderabad, 1998). The most comprehensive critical work is Walter G. Neevel, Jr.'s *Yāmuna's Vedānta and Pañcarātra: Integrating the Classical and the Popular* (Missoula, Mont., 1977). A critical study of Yāmuna's theory of consciousness is Roque Mesquita's *Yāmuna's Philosophy of Consciousness: eine Studie zu seiner Samvitsiddhi* (Vienna, 1990).

WALTER G. NEEVEL, JR. (1987 AND 2005)

YANTRA. Geometrical diagrams known as *yantras* form a very special class of religious symbols in Hinduism. Their forms and functions within the tradition vary according to their uses. The most important ones are those that serve as supports for daily ritual worship and as meditational aids to stimulate inner visualizations; others are employed in astrology and temple rites; some are meant for proficiency in occult arts, and many of these are used as talismans.

Meditational *yantras* are an indispensable constituent of Tantric worship and are a substitute for the deity's iconographic image. Basically, a *yantra* used in this context is an abstract icon of some personification or aspect of the deity. Most Indian divinities have been assigned aniconic symbols in their specific *yantras*. Whereas an anthropomorphic image is a static presentation, the *yantra* is a dynamic symbol of the totality of the cosmos. Hence it is represented as an expanding form emanating from the central nucleus, a dimensionless point, the *bindu*. A linear configuration, the *yantra* usually has around its center several concentric primal shapes, such as triangles, hexagons, circles, octagons, and rings of lotus petals. The figure's periphery is a square enclosure with four sacred doors opening toward the four cardinal directions. The centrifugal *yantras* are conceived of as a sacred dwelling in which the presiding deity and its retinue take up residence. The seat of the principal deity is in the center, while those of its emanations, or *parivāra devatās*, are arranged concentrically in successive circuits known as *āvaraṇas* ("veils"), so called because they conceal the luminous splendor of the deity in the center.

At the subtlest level, *yantras* translate into visual terms the theory of cosmogenesis. They are to be read as dynamic graphs of the creative process of cosmic evolution and involution that takes place from the center and moves outward. The creative process is represented by the unity of the male and female principles, which, descending into the world of multiplicity, are symbolized by the concentric geometric circuits. The best example of this type of *yantra* is the Śrīcakra of the cult of the goddess Tripurasundarī. It is composed by the interlacing of two sets of triangles: Four apexes point upward, representing Śiva, the male principle, and five apexes point downward, representing sakti, the female principle. The Śrīcakra is devised to give a vision of the totality of existence, so that the adept may internalize its symbols for the ultimate awareness of his own unity with the cosmos. Every meditational *yantra* is in essence a psychic improvisation in which the closed concentric circuits of various geometric shapes, from the periphery to the center, correspond to the planes of the adept's consciousness.

Architectural *yantras* contribute substantially to the conceptual basis of the Hindu temple. An early example is the Vāstupurusa Maṇḍala, of which Hindu manuals of architecture provide thirty-two variations. The *maṇḍala* represents the diagram of the ordered cosmos. In Tantric temple rites, *yantras* were laid into the foundation of the womb chamber and were also embedded in cult figures installed in

the shrine. *Yantras* were also used as compositional diagrams in the execution of sculptural images adorning the walls of the temple. The architectural *yantra* functions as an ideogram, while the temple is a materialization of the concepts it embodies.

Occult *yantras* are distinguished from all other *yantras* by their practical applications. They serve as powerful diagrams of magical potency, used mainly in preventive medicine, as good luck charms, for exorcism, to ward off calamities, and so forth. The occult figures are not stereotyped; their designs vary according to the object of worship. One of the most popular is the Dhāraṇa Yantra; worn as an amulet for protection, this *yantra* is given to a person after the priest has consecrated it in a life-giving ceremony. Another kind that serves the same purpose is the magical square. The proven efficacy of such *yantras* is explained in psychological terms. To the individual who wears a *yantra* as a talisman or an amulet, the diagram manifests itself as a repository of power through which the presence of the divinity can be invoked at will. Ultimately, the efficacy of the *yantra* is brought about by the adept's own willpower, working through faith.

Yantras are most commonly drawn on paper or engraved on metals or rock crystals, although any flat surface, such as a floor or wall, can be used. The *yantras* are always used in conjunction with mantras, or mystical sound-units, that correspond to the deity's subtle form. Mantras are employed to energize the latent force inherent in the deity's *yantra*. Indeed, it is said that a *yantra* without its seed mantra is as lifeless as a corpse.

MADHU KHANNA (1987)
Revised Bibliography

YAO AND SHUN were legendary sage-rulers of antiquity in China. According to traditional Chinese historiography, Tang Yao (Yao of the Tang clan or state; personal name, Fang Xun) or Tang Dao ruled from 2356 to 2256 BCE. A ruler of great virtue, he considered his son Dan Zhu (or, in some versions, his ten sons) unworthy to rule the empire, and thus selected Shun to be his successor, having first given to him his two daughters in marriage. Yu Shun (personal name, Zhong Hua) served Yao first as a minister, then in Yao's old age as regent, finally succeeding him and ruling for fifty years. Shun in turn considered his son Shang Xun (or, in some versions, his nine sons) unworthy to rule and so he selected Yu as his successor. Yu became the founder of the Xia, traditionally considered to be the first hereditary dynasty in China.

In Zhou dynasty (eleventh to third century BCE) texts, history conventionally begins with the time of Yao. All the great cosmological events took place during his rule. The ten suns appeared, nine of which were shot down by the archer Yi; Buzhou Mountain, the pillar of the northwest, was brought down by Gonggong; and the great flood occurred, which was eventually controlled by Yu. During the Warring States period (403–221 BCE), however, other rulers, some of whom were originally the mythical ancestors of other houses, began to be placed before Yao, and in the *Shi ji*, the universal history compiled by Sima Qian during the second century BCE, Yao and Shun are but the most recent of five emperors.

Yao abdicated to Shun because of Shun's virtue. An exemplar of filial piety since the Zhou period, Shun often appears on temple frescoes, usually following a plow drawn by an elephant. His filial piety is exemplary because his wicked father, Gu Sou ("blind man"), and his younger brother Xiang ("elephant") both tried to murder him. They first tried to kill him by removing the ladder and setting fire to a granary while he was repairing its roof; then they filled in a well that he had been sent to dredge. The earliest version of this story is in the *Mengzi*. In the more elaborate Han dynasty version found in *Lienu zhuan* (Biographies of exemplary women), Yao's daughters advised Shun how to escape his father's evil schemes. Shun continued to serve his father as a son should and without resentment; according to the *Mengzi*, his father was in the end pleased.

Although Shun is a symbol of filial piety, in accepting the succession to Yao and in marrying Yao's two daughters, he both went against his father's will and displaced Yao's son

from the succession. His role therefore is paradoxical, and his story exemplifies the conflict between the principles of rule by virtue and rule by hereditary right that is a common theme in the succession legends recorded in Zhou dynasty texts. Motifs in the story of Shun's succession, such as the ruler's perception of his successor's virtue in spite of his lowly position and his willingness to rely on a man of low birth, also occur in the legends that surround the foundation of the hereditary dynasties.

Elements in the stories of Yao and Shun in early texts suggest still earlier legends concerning clan origins. The earliest record of the story of Yao and Shun is found in the "Yao dian" chapter of the *Shang shu*, a Zhou dynasty text. In this text, Yao is called *di* (lord), a title that suggests Shangdi, the high lord of the Shang dynasty (c. sixteenth to eleventh century BCE) who is later equated with Tian (Heaven). The succession story of Yao to Shun may contain the remnants of an earlier cosmogonic myth in which the Lord on High first gave the rule to Shun, the progenitor of the Shang people. Shun has been identified with Di ku (who gave birth to the first Shang ancestor, Xie, by means of the egg of a black bird) and with Zhun, the husband of Xihe (who gave birth to the ten suns) and possibly the highest ancestor claimed by the Shang kings in their oracle-bone inscriptions. Shun is also closely associated with the Eastern Yi tribe. His two wives are sometimes identified with the goddesses of the Xiang River in the "Nine Songs" of the *Zhuzi*.

The philosophers of the Warring States period recounted the story of Shun's succession to Yao with differing emphasis and attitudes concerning the role of the sage and the right to hereditary succession. Recently discovered philosophical texts written on bamboo slips and buried in tombs around the end of the fourth century BCE include several accounts of Shun's accession to Yao with many details not found in the traditional texts. These suggest that the idea that a virtuous ruler should appoint a sage rather than an heir as his successor was an important philosophical position in this period.

SARAH ALLAN (1987 AND 2005)

YATES, FRANCES AMELIA was born on November 29, 1899, in Southsea, Hampshire, and died in Surbiton,

Surrey, on September 29, 1981. By the time a brief illness ended a long life of intense and single-minded scholarly endeavor, her reputation had reached almost cult status.

Yates was the fourth and youngest child of James Alfred Yates and Hannah Eliza Malpas. Her father, having entered Portsmouth Naval Dockyard as an apprentice, had risen to chief constructor of the British navy. One of her elder sisters was a schoolteacher and novelist, the other an art-student-turned-missionary. On the death in action of her only brother in 1915, the ambitions of a close-knit family came to center on her. Hopes of following her brother to Oxford having been disappointed, partly because of interruptions to early formal schooling, she took a London first-class degree in French by correspondence, following it with a graduate thesis on French religious drama of the sixteenth century. She never married.

Yates would often later pay tribute to the material and intellectual support of her family and its tradition of what she called "effort." Observantly Anglican, liberal in their opinions, interested in ideas, devoted to Shakespeare, and sympathetic to matters French, they left their mark on her strongly individual mind and personality. They enabled her to begin the life of a modestly circumstanced private scholar; from a newly purchased family house in Claygate, in the countryside outside London, where she lived uninterruptedly from 1925 until almost the day of her death, she would go to read in the British Museum Library and the Public Record Office. The hallmark of her work was always firsthand acquaintance with her sources.

On those sources was based her first book: the prize-winning and still standard *John Florio: The Life of an Italian in Shakespeare's England* (1934). Here, as throughout her work, the religious dimension—the Florios were Protestant refugees—is a major concern. *A Study of Love's Labour's Lost* (1936), her second book, explored Shakespeare's ideas about language. Less successful, it led her in 1937 to the Warburg Institute, then newly escaped to England from Nazi Germany, which became her intellectual second home. She began to use its excellent library and to learn from Fritz Saxl, Gertrud Bing, Edgar Wind, and Rudolf Wittkower how to apply an encyclopedic historical approach to the study of Giordano Bruno, which had led her there in the first place. When, in 1941, she was given a part-time place on the staff, it was virtually her first paid employment; she remained part of the institute until she died, bequeathing to it her residual estate to found research fellowships.

The new approach she learned there, combined with her innate intellectual courage, is already clear in her independent line on Giordano Bruno's religious and philosophical position in essays she wrote in 1937–38; it was consolidated in "Queen Elizabeth as Astraea" (1945), a ground-breaking inquiry into the messianic ideas behind the cult of the English ruler. The French Academies of the Sixteenth Century, which followed in 1947, was a remarkable, original, and wide-ranging investigation of how academic study had once

been directed at promoting religious and civil harmony; it was also a demonstration of the historical significance of ideas and ideals judged worthless and ineffectual by progressivist opinion. The power of heterodox thought, already a theme in her early work on Bruno, is again apparent in her pioneering essays of 1954 and 1959, for which she learned Catalan, on the universalist mystic Ramon Lull, whom she judged important for later philosophers, especially Bruno. *Giordano Bruno and the Hermetic Tradition*, published in 1964 when she was in her mid-sixties, is—along with *The Art of Memory* of 1966—the book for which she is best known. In each she argued at length for the importance of Hermeticism as the secret heart of Renaissance Neoplatonism, especially invoking Giulio Camillo Delminio in relation to the Renaissance transformation of artificial memory systems. Her opening for Anglophone scholars of Renaissance occult belief, studied historically and not from the believer's point of view, as a legitimate subject for investigators of Renaissance thought in general has had a profound effect, not least in arousing the opposition of historians of science.

In the background of everything that Frances Yates wrote was a vision: peace and harmony denied by faction and fanaticism. *The Valois Tapestries* (1959) was a study of the politico-religious context and purpose of these great works of art; she republished it in 1975, at the same time as a collection of related essays, *Astraea: The Imperial Theme in the Sixteenth Century*. *Shakespeare's Last Plays: A New Approach* of the same year was the closest she came to the definitive work on the mind of Shakespeare she had always hoped to write. In her *Theatre of the World* (1969), the grand theme is hardly apparent; this book was rather aimed at showing influence from the Vitruvian tradition on the structure of Elizabethan public theaters. The magus figure of John Dee is, however, seen as important for the transmission of these ideas. In the politico-religious context of the age of James I and the Winter Queen of Bohemia, which is the subject of *The Rosicrucian Enlightenment* (1972), Dee plays an expanded role, which is further enlarged in Yates's final book, *The Occult Philosophy in the Elizabethan Age* (1979).

Frances Yates, it has been said, created her own discipline. She was widely honored for it by invitations, honorary degrees, and international prizes from universities, academies, and other bodies in Britain, Europe, and the United States, and by her appointments as OBE (Officer of the Order of the British Empire) in 1972 and DBE (Dame Commander of the Order of the British Empire) in 1977; her writings have been translated into many languages. Despite a certain personal diffidence, she was undeterred by opposition, retaining a conviction that her approach was both right and fruitful.

BIBLIOGRAPHY

Frances Yates's writings are listed in her posthumously published *Ideas and Ideals in the North European Renaissance*, volume 3 of her *Collected Essays* (London, 1984, pp. 325–336); her books and articles have been many times reprinted in English and in translation. The most important are:

John Florio: The Life of an Italian in Shakespeare's England. Cambridge, England, 1934.

"Queen Elizabeth as Astraea." *Journal of the Warburg & Courtauld Institutes* 10 (1947): 27–82; reprinted with other essays in *Astraea: The Imperial Theme in the Sixteenth Century*. London, 1975.

J. B. TRAPP (2005)

YAZATAS. The term *yazata* occurs in the Avesta, the collection of sacred books of Zoroastrianism, as an attribute or designation of divine beings. From this term is derived the Middle Persian *yazd* ("god"; pl., *yazdān*). The word appears frequently in the Avesta, although not in the five *Gāthās* ("songs") attributed to Zarathushtra (Zoroaster); in Gathic it appears only in the *Yasna Haptanhāiti* (*Yasna* of the Seven Chapters), ascribed to Ahura Mazda. Its meaning in this text is "worthy of worship, worthy of sacrifice" (from the verb *yaz*, "to venerate, sacrifice"), identical to that of its Vedic counterpart, *yajata*. This is the general meaning of the term, which is used to refer to divine beings, usually secondary

gods, personifications, or cult gods of the pre-Zoroastrian Indo-European pantheon that had been absorbed into the religion. Thus, as Zoroastrianism reached a compromise with ancient polytheism, *yazata* came to designate a deity who was readmitted to the cult. At the beginning of the hymn dedicated to Vayu (*Yashts* 15), for example, the god is called *yazata* in a sentence that is evidently meant to justify the integration of the hymn within the canonical list of the *Yashts*, a section of the Avesta.

In the Zoroastrianism that evolved following the prophet's reforms, some of the ancient *daivas*—the word is used here in its most general and archaic sense, to mean “gods”—became or were reinstated as *yazatas*. That is, they were transformed from beings whose worship was forbidden (*daivas* in the later sense of “demons”) back into beings whose worship was permitted or even recommended. The *Yashts* is very instructive in this regard: many passages in various hymns provide justification for the readmission to the cult of one or another *daiva*, and often it is Ahura Mazda himself who is said to approve such a reintegration.

The meaning of *yazdān* in Pahlavi texts (from the ninth and tenth centuries CE) is derived from this general meaning of *yazata*. It is used for various categories of divine beings: for the gods in general, for the ancient *yazatas* in particular, and for the Amesha Spentas (MPers., Amahraspandan). The *yazdāns* rule over the months, the days, and five liturgical periods of the day.

But in the Avesta *yazata* has a precise meaning: any entity to whom a hymn is dedicated. Besides Ahura Mazda and Vayu, *yazata* refers, as has been noted (Kellens, 1976), to the following beings: Mithra, Sraosha (“discipline”), Arštāt (“justice”), Nairyōsanha (“of manly utterance”), Verethraghna (“victory”), Ātar (“fire”), Apām Napāt (“son of the waters”), Zam (“earth”), and Gairi Ushidarena (“mountain dawn-abode”). But in the so-called Younger Avesta it is, above all, the deities who form the escort of Mithra who are defined as *yazatas*. From this it follows that not all the beings to whom a hymn in the Avesta is dedicated are in a strict sense *yazatas* and that *yazata* is not the Avestan equivalent of the Old Persian *bagā*; the latter has no specific meaning but only carries the general sense of “god,” as does the parallel Avestan *bagha*.

GHERARDO GNOLI (1987)

Translated from Italian by Roger DeGaris

YEHOSHU'A BEN ḤANANYAH (first and second centuries CE), Palestinian tanna who taught in Jerusalem and later at Yavneh and Peqī'in. Legend has it that when he was a child his mother carried him to the study hall so that he would become accustomed to hearing words of the Torah (J.T., *Yev.* 3a). Because he was a Levite, it is assumed that he sang in the Temple before it was destroyed. He is said to have made his living as a needlemaker or blacksmith.

Yehoshu'a achieved prominence as a leading rabbinic authority of his day. He was one of the five prominent disciples of Yoḥanan ben Zakk'ai (*Avot* 2.8). With Eli'ezer ben Hyrcanus, Yehoshu'a is alleged to have carried Yoḥanan ben Zakk'ai out of Jerusalem in a coffin in 68 CE during the siege of the city by the Romans (B.T., *Git.* 56a). During Yehoshu'a's later career he was the center of contention within rabbinical circles. Several sources recount how he was humiliated by the *nasi* Gamli'el (B.T., *R. ha-Sh.* 25a). Yehoshu'a's dispute with Gamli'el over whether the evening prayer was compulsory or voluntary brought about the events that led to the deposition of Gamli'el and the ascension of El'azar ben 'Azaryah to the office of *nasi* (B.T., *Ber.* 28a).

Yehoshu'a was involved in many legal disputes with Eli'ezer ben Hyrcanus; one celebrated argument concerned the ritual cleanness of the ovens of 'Akhn'ai (a kind of tiled oven). Yehoshu'a ruled that the ovens were ritually unclean; Eli'ezer said that the ovens could not become ritually unclean (B.T., *B.M.* 59a–b). Eli'ezer announced that a heavenly voice had declared his own position correct. Yehoshu'a responded with the famous declaration: “It [the Torah] is not in heaven” (a quotation from *Di.* 30:12)—that is, the rabbis alone have the authority to decide matters of law, not a supernatural voice or even a direct revelation.

An important teaching attributed to Yehoshu'a shows a positive attitude toward outsiders: He declared that pious Gentiles will be able to enter heaven (Tosefta, *San.* 13.2). According to tradition, he engaged in many discourses with political figures and various groups, including the Roman emperor Hadrian, the elders of Athens, and the Jews of Alexandria.

Recent scholarship has questioned the legitimacy of attempts at reconstructing the lives of Yehoshu'a and his fellow rabbis from the scattered traditions in rabbinic literature. No systematic analysis has been made of Yehoshu'a's philosophical or religious beliefs.

TZVEE ZAHAVY (1987)
Revised Bibliography

YEHOSHU'A BEN LEVI, Palestinian amora of the early third century. A native of Lydda (modern-day Lod), Yehoshu'a reflects the interests and traditions of Judaea at a time when rabbinic activity was becoming increasingly concentrated farther north in Galilee.

Yehoshu'a's son married into the patriarchal house (B.T., *Qid.* 33b), a fact that may explain the notorious incident in which Yehoshu'a arranged for a wanted Jewish nationalist to be handed over to the Romans (J.T., *Ter.* 8.10, 46b). In general, he was an active representative of Jewish interests before the Roman authorities, both in the regional capital at Caesarea (J.T., *Ber.* 5.1, 9a) and, apparently, even in Rome (*Gn. Rab.* 33.1, 78.5). On the other hand, by ordaining his own disciples (J.T., *Ned.* 10.8, 42b), Yehoshu'a contributed to one of the important developments in Palestine in the third and fourth centuries—the weakened prestige of the patriarchate among the rabbis of the Land of Israel.

Yehoshu'a's main distinction was as a master of *aggadah* (nonlegal rabbinic thought), a rubric of learning that he associated with the "honor" promised in *Proverbs* 21:21 (B.T., *B.B.* 9b). He was a fervent advocate of Torah study (B.T., *Mak.* 10a, *Meg.* 27a, *Eruv.* 54a). His descriptions of the fates of the righteous and the wicked after death (B.T., *Eruv.* 19a) and his reported conversations with the Angel of Death and with the prophet Elijah (B.T., *Ber.* 51a, *Ket.* 77b; J.T., *Ter.* 8.10, 46b) made him a favorite subject of later legend. It was to him that Elijah allegedly made his famous remark that the Messiah might come any day—any day, that is, that Israel was ready to listen to God's commands (B.T., *San.* 98a).

Although Yehoshu'a was technically not a tanna, he lived close enough to the tannaitic period, and his teachings were honored enough, that one of his sayings was added to the closing paragraph of the Mishnah (*Uqs.* 3.12) and another was included in the supplementary chapter added to the Mishnaic tractate *Avot* (known as *Ethics of the Fathers*, 6.2).

ROBERT GOLDENBERG (1987)
Revised Bibliography

YEHUDAH BAR IL'AI (second century CE), Palestinian tanna. Born in Usha, in the lower Galilee, he was a student of 'Aqiva' and Tarfon and was ordained as rabbi by Yehudah ben Bava' during the Hadrianic persecutions in the aftermath of the Bar Kokhba Revolt.

Numerous traditions attributed to Yehudah are preserved in rabbinic literature where he is usually referred to without patronymic. Along with Me'ir, Shim'on, and Yose, he is one of the most frequently quoted authorities of his generation. His importance is reflected in the tradition that tells us that his contemporaries were called "members of Yehudah bar Il'ai's generation" (B.T., *San.* 20a). Yehudah is also one of the most important transmitters of rabbinic teachings from the Sanhedrin at Yavneh before the Bar Kokhba Revolt to the Sanhedrin at Usha afterward. He cites numerous legal rulings in the names of 'Aqiva', Tarfon, and other masters of the period of rabbinic activity at Yavneh.

To date, no systematic analysis has been made of Yehudah's traditions, probably because of the sheer size of the corpus of sayings attributed to him. There are, for example, some 180 disputes recorded between Yehudah and Neḥemyah, yet these represent only a fraction of the entire collection ascribed to Yehudah. Jacob Epstein (1957) believes that the corpus of his traditions was one of the primary documents used in the redaction of the Mishnah by his student Yehuda ha-Nasi'. Several of his rulings deal with the standardization of rabbinic liturgy (*Ber.* 4.1), the regulation of prayer (*Ber.* 4.7; *Tosefta, Ber.* 1.9; *Tosefta, Ber.* 3.5), and the regulation of daily liturgical blessings (*Tosefta, Ber.* 6.18). Other rules ascribed to Yehudah emphasize the importance of concentration and intention during the performance of rituals (*Tosefta, Ber.* 2.2) and the importance of maintaining the proper frame of mind during recitation of prayers (*Ber.* 2.2). Yehudah is also associated with legislation concerning the recitation of blessings over foods (*Ber.* 6.4; *Tosefta, Ber.* 4.4–5) and with blessings over natural wonders, both those for which one is permitted to recite blessings (*Ber.* 9.2) and those for which one is forbidden to recite blessings because it would appear to be a form of idolatry (*Tosefta,*

Ber. 6.6). Yehudah's legal, exegetical, and theological sayings range across the whole spectrum of rabbinic thought and life.

TZVEE ZAHAVY (1987)
Revised Bibliography

YEHUDAH BAR YEHEZQE'L (c. 220–c. 299), a leading second-generation Babylonian amora, based in Pumbedita. He studied chiefly with Rav and then Shemu'el. Although remaining subservient to the exilarch (B.T., *Qid.* 70a–70b), the leader of the Jewish community appointed by the Persian authorities, Yehudah was empowered by him to apply rabbinic law in the marketplace and in civil and other matters that fell under his jurisdiction, especially through the enforcement of documents (B.T., *Mo'ed Q.* 4b, *Yev.* 39b).

As a teacher of rabbinic tradition, Yehudah cited the Mishnah to draw out its subtle legal points and to emend or explain it to make it fit the physical and social conditions of Babylonian Jewry or extra-Mishnaic tannaitic traditions (Epstein, 1964). In interpreting and rewording the comments of Rav and Shemu'el, Yehudah played a crucial role in preserving and employing their teachings (Bokser, 1980, esp. pp. 399–406, 414–415).

Yehudah was accorded high status due to his communal role, expertise in tracing people's genealogy, and devotion to Torah study (see, e.g., B.T., *Mo'ed Q.* 16b–17a, *Hag.* 15b). People believed that he was able to communicate with the dead, intercede for rain, and give insightful advice on health and other practical matters (B.T., *Ber.* 20a and parallels, *A. Z.* 28b–29a). He lectured in the *pirqa'*, a popular instructional gathering for both aggadic and halakhic subjects aimed at the general public but to which disciples were also expected to attend (B.T., *Shab.* 148a).

Notably, Yehudah speculated on the creation (B.T., *Shab.* 77b), handed down teachings on sacred objects such as the *mezuzah* and fringes (*tsitsit*) (B.T. *Men.* 35b, 39b, 41a), and proposed additional blessing formulas for the wedding ceremony (B.T., *Ket.* 7b–8a) and other situations. He reportedly concentrated on *neziqin* (Torts)—the area in which he had received actual authority from the exilarch.

Stating that the laws of *neziqin* had to be carried out to obtain saintliness (B.T., *B. Q.* 30a), Yehudah asserted that equity in one's daily life was a criterion of one's faith. This rootedness in the practical realm and concern that people relate to the society in which they live may be further reflected in his teachings that discouraged his disciples from emigrating from Babylonia to Palestine (B.T., *Ber.* 24b; B.T., *Ket.* 110b–111a); he believed they should not hold their personal religious goals over the needs of the community in the here and now, in the Diaspora.

BARUCH M. BOKSER (1987)
Revised Bibliography

YEHUDAH HA-LEVI (c. 1075–1141), Jewish poet, theologian, and physician. Born in either Tudela or Toledo, Spain, to a wealthy and cultured family, Yehudah ben Shemu'el ha-Levi was well educated. He studied the Bible, rabbinic literature, Arabic poetry, philosophy, and medicine. During his early travels in southern Spain he won acclaim for his poetic talent and was warmly received by many prominent Jewish families. However, in the wake of the Almoravid invasions of the area to halt the Christian *reconquista*, his enjoyment of courtly life was cut short. Eventually he settled in Christian-held Toledo, supporting himself as a physician and continuing to write. But he viewed with growing alarm the disruption of Jewish life throughout Andalusia. Sometime after 1125, in response to the queries of a Karaite thinker, ha-Levi began to draft a defense of Judaism, which developed into his most famous work, the *Kuzari*. In the summer of 1140, various personal, political, and religious considerations prompted him to depart for Palestine. Legend claims that he was killed within sight of Jerusalem, although recent studies suggest that he died *en route*, in Egypt.

Ha-Levi's poetry is generally regarded as the finest Hebrew verse written in the Middle Ages. Besides addressing all the traditional secular and religious themes of his day, he also developed, in his poems of Zion, an entirely new genre expressing both his own and his people's longing for renewal in their ancestral home. This longing was intensified by the

upheavals and persecution suffered by Jews on both sides of the Mediterranean following the Almoravid invasion of Andalusia and the First Crusade. As ha-Levi observes,

Between the hosts of Se'ir [Christians] and Qedar [Muslims], My host is utterly lost. . . . When they wage their wars, we fall with their fall.

Dismayed by the upheavals within Spanish Jewish life and sensing its eventual dissolution, ha-Levi began to question the value of some of its main cultural pursuits, especially philosophic speculation about religion:

Let not the wisdom of the Greeks beguile you Which has no fruit, but only flowers. . . . Why should I seek out crooked ways And forsake the mother of paths?

While philosophy could produce a tantalizing array of opinions, it could not satisfy the spiritual hunger of men seeking concrete guidance for their actions. This required a return to the wellsprings of traditional Jewish piety, since one could approach God only by following “the mother of paths,” the Torah.

I have sought Your nearness. With all my heart have I called You; And going out to meet You I found You coming toward me.

Still, for ha-Levi, the path of return and religious renewal inevitably led to the Land of Israel as the chief site of past revelations and as the focus of God’s promised redemption:

Have we either in the East or the West A place of hope wherein we may trust, Except the land that is full of gates Toward which the gates of Heaven are open?

Ha-Levi’s only theological work, the *Kuzari* (Book of the Khazars, or Book of refutation and in defense of the despised faith), develops these and other themes in a five-part dialogue, mainly between a pagan Khazar king who is converted to Judaism and the Jewish sage who instructs him. The king’s conversion was factual, but ha-Levi created this dialogue with him to answer contemporary criticism of Judaism by representatives of philosophy, Christianity, Islam, and Karaism. The philosopher is clearly the most formidable spokesman of those who leave it to human reason to determine how best to serve God. The fact that a pagan king must evaluate their competing claims aids ha-Levi in giving all the participants, and notably Judaism, a fair hearing. It also underscores, inasmuch as a king is preeminently a man of action, the importance of practice over theory.

The story opens as the king repeatedly dreams that an angel is telling him that his intention is pleasing to God but his mode of worship is not. Convinced that this vision is genuine, he invites first an Aristotelian philosopher and then scholars of Christianity and Islam to instruct him.

The philosopher, expressing views reflecting the influence of Ibn Sīnā and Ibn Bājjah, denies the presuppositions of the king’s dream. God as a perfect and changeless First Cause has neither likes nor dislikes, he says, or even knowledge of the king’s mutable behavior, for all these would

imply deficiency and imperfection in God. Still, a human may perfect him or herself and even achieve prophecy by studying the eternal system of necessary causes that emanate from God, thus attaining union with the Active Intellect, the source of all human knowledge. Since the principal requirement for achieving that union is the purification of one’s soul, it does not matter from a purely rational standpoint which religious regimen one follows.

The king finds the philosopher’s argument plausible, but says it does not provide what he seeks. Nor does he find that philosophers are able to prophesy. Consequently, he turns to the Christian and Muslim scholars. Their expositions directly address his concern, but they do not provide adequate evidence for their respective claims. Still, because both scholars agree that their beliefs are based on God’s well-attested revelation to Israel, the king finally consults a Jewish scholar.

The rabbi declares his faith in the God of Abraham, Isaac, and Jacob, who led the Israelites out of Egypt, miraculously sustained them, and gave them his law in the Torah of Moses. Subsequent discussion of these claims eventually convinces the king of their truth because they are supported by what he regards as compelling grounds: public, empirical, direct, and miraculous evidence. Over 600,000 initially skeptical Israelites saw and heard God personally reveal his commandments at Mount Sinai and transmitted a unanimous, reliable report of that occasion to subsequent generations.

The king regards the rabbi’s account as superior not only to that of the other scholars but also to that of the philosopher. The philosopher infers the existence and nature of God from some aspect of the world’s order, but such speculation is tenuous and uncertain, and it evokes no reverence for its object. By contrast, there is nothing tenuous or uncertain about the veracity of a collective experience of God, transmitted by a reliable, uninterrupted tradition.

The rabbi goes on to depict those few who are able to prophesy as quite literally belonging to the divine realm. Relying heavily on conceptions current in Shiism, he argues that in relation to the traditional hierarchy of inorganic matter, plants, animals, and human beings, this elect group (*ṣafwah*) constitutes an essentially separate order, manifesting extraordinary faculties and behavior. Because they are by nature conjoined with “the divine thing” (*al-amr al-ilāhī*)—ha-Levi’s multivalent term for diverse aspects of divine immanence—they alone can communicate God’s will to ordinary persons, whereas human speculation and cosmic powers, like the Active Intellect, cannot. Tradition identifies Adam as the first to possess this prophetic faculty or inner eye. From him it passed to the biblical heroes until it reached the children of Israel. Prophecy flourished among them because, like choice fruit, it was cultivated in the ideal climate of the Land of Israel, through use of the Hebrew language and adherence to the regimen of God’s own laws. With exile

and the neglect of many commandments, prophecy ceased, yet it will reappear once the original conditions are restored.

After converting, the king learns more about these matters and also that Israel remains a living focus of divine providence in the world, despite its exile and degradation. While other nations and religions imitate its religious institutions, they are “dead” by comparison; they rise and fall according to chance and natural causes, being subject neither to miraculous deliverances nor to catastrophic defeats. Israel, however, like a seed cast upon the ground, is governed by a secret, providential wisdom, whereby it transforms its surroundings and will eventually produce a unified humanity obedient to God’s will.

The pious human personifies this obedience with a faith that is natural and wholehearted, neither the product of speculation nor vulnerable to it. Ruling one’s self and one’s inclinations, the individual is uniquely suited to rule the city, for like Plato’s philosopher-king he or she gives everything its due by exercising rational choice. The behavior of the pious human thus conforms to the rational, political laws (such as decrees of justice) that are preambles to the divine traditional laws (such as ritual rules), preceding them in nature and in time. The former constitute the indispensable prerequisite for the existence of any group, even a den of robbers. But the divine laws are more important than the rational laws, because they specify the application of the latter and also bring people to communion with God and to happiness in ways that reason cannot explain.

In their knowledge of God, both the pious and the prophets apprehend all that the philosophers do and more. They, too, recognize God generically as Elohim, the governing cause of the universe from whom the natural forms of all things emanate in regular ways, indifferent to the needs and merits of human beings. But they also experience God individually as YHVH (Adonai), who reveals himself to those suitably prepared and who overrides natural causes on their behalf at predetermined times. Only as YHVH does God evoke love and service, for in communion with him humans find their greatest happiness, and in separation from him, their greatest misery.

The rabbi’s final exposition and critique of philosophy attempts to show the king that he need not be persuaded by many of its key claims, since they are untenable. Earlier he had suggested that the philosopher seeks wisdom only because he lacks a reliable tradition embracing wisdom, while Israel has received divine wisdom in a Torah that contradicts nothing truly demonstrated by philosophy. Apparently influenced by al-Ghazālī’s *Incoherence of the Philosophers*, he now suggests that what has been so demonstrated is confined largely to mathematics and logic. In physics, he argues, the philosophers’ account of the four elements is empirically unsubstantiated. In psychology, their theory of the Active Intellect entails numerous absurdities, and in metaphysics, their views on divine causation are riddled with inconsistency. The most we can know regarding metaphysics is that only

God governs material things by determining their natural forms. Since philosophy offers little wisdom about matters of such importance, a turn toward the divine wisdom embodied in Israel’s ancestral tradition is called for. But, as the rabbi recognizes, a wholehearted turn toward the ancestral tradition can be completed only by a return to the ancestral land. Accordingly, as the dialogue closes, he follows the logic of his position and departs for the Holy Land.

Ha-Levi was the first medieval Jewish thinker to appreciate fully the challenge posed to Judaism by Aristotelian rationalism and to address it in a philosophically literate way. Speaking as a religious empiricist and working from the sources of Judaism, he produced what has become a classic theological defense of Judaism as a suprarational religion of revealed practice.

BIBLIOGRAPHY

The definitive edition of the original Judeo-Arabic text of ha-Levi’s *Kuzari* is the *Kitāb al-radd wa-al-dalīl fī al-dīn al-dhalīl*, edited by David H. Baneth and prepared for publication by Haggai Ben-Shammai (Jerusalem, 1977). Hartwig Hirschfeld’s *The Kuzari (Khitab al-Khazari): An Argument for the Faith of Israel* (1905; reprint, New York, 1964) is a complete but largely outdated English translation of his own earlier edition of this work. An abridged but far more adequate translation of Hirschfeld’s edition, accompanied by a brief but useful commentary, has been provided by Isaak Heinemann in *Three Jewish Philosophers*, edited by Hans Lewy et al. (New York, 1960). Heinemann’s translations of ha-Levi’s poetry have served as the basis for some of the translations offered by me in this article.

The groundbreaking studies of ha-Levi’s religious philosophy by Harry A. Wolfson, collected in volume 2 of *Studies in the History of Philosophy and Religion*, edited by Isadore Twersky and George H. Williams (Cambridge, Mass., 1977), remain valuable, as does Leo Strauss’s classic analysis of ha-Levi as an esoteric writer in “The Law of Reason in the *Kuzari*,” in Strauss’s *Persecution and the Art of Writing* (1952; reprint, Westport, Conn., 1973), pp. 95–141. The best recent study of the literary structure of the *Kuzari* is Eliezer Schweid’s Hebrew article “Ummanut ha-di’alog bi-sefer ‘ha-Kuzari’ u-mashma ‘utah ha-‘iyyunit,” in *Ṭa’am ve-haqashah* (Jerusalem, 1970). Aryeh L. Motzkin’s “On Halevi’s *Kuzari* as a Platonic Dialogue,” *Interpretation* 9 (August 1980): 111–124, is a valuable study of ha-Levi’s philosophical aims in employing the dialogue form. Two works focusing on ha-Levi’s use of Arabic sources in connection with various issues in the *Kuzari* are Herbert A. Davidson’s “The Active Intellect in the *Kuzari* and Halevi’s Theory of Causality,” *Revue des études juives* 131 (June–December 1972): 351–396, and Shlomo Pines’s “Shiite Terms and Conceptions in Judah Halevi’s *Kuzari*,” *Jerusalem Studies in Arabic and Islam* 2 (1980). A valuable resource for the study of ha-Levi’s religious poetry is Matitiah Tsevat’s “An Index to the Religious Poetry of Judah Halevi,” *Studies in Bibliography and Booklore* 13 (1980).

BARRY S. KOGAN (1987)
Revised Bibliography

YEHUDAH HA-NASI' (135?–220?), called "Rabbi" or "Our Holy Rabbi," was a Palestinian tanna. Yehudah was the son of Shim'on ben Gamli'el of Yavneh. With Yehudah the office of *nasi'* (patriarch, head of the court) reached its zenith. Reestablished by the Romans after the disastrous defeat of the Bar Kokhba Revolt in 135 CE, the position of *nasi'* by the end of the century afforded Yehudah an authority recognized by Jews and Romans alike. Even the Jewish community in Babylonia looked to him as the head of the Jewish people.

As *nasi'* Yehudah first established his court in Beit Shearim. However, for reasons of health he spent the last seventeen years of his life in Sepphoris (J.T., *Ket.* 12.3, 35a). Yehudah's major task as *nasi'* was to secure the economic recovery of Israel after the destruction caused by the Bar Kokhba Revolt. He and his court exempted several places from tithes (J.T., *Dem.* 2.1, 22c–d), enacted laws that allowed Jews to regain ownership of land confiscated by the Romans during the Bar Kokhba Revolt (B.T., *Git.* 58b), eased the laws of the sabbatical years to increase the food supply in Israel (J.T., *Ta'an.* 3.1, 66c), took over the important task of proclaiming the new month and intercalating the year (J.T., *San.* 1.2, 18c), and introduced regulations that eased taking testimony and dispatching messengers to declare the court's decision concerning the new months (J.T., *R. ha-Sh.* 2.1, 58a). His support of the rabbinic class found expression in his exempting the sages from some taxes (B.T., *B. B.* 8a).

The significance of Yehudah's tenure as *nasi'* is seen in the many stories that depict his close relationship with the Roman emperor (B.T., *A. Z.* 10a–b, *San.* 9 1a–b; J.T., *Meg.* 1.11, 72b; J.T., *San.* 10.5, 29c; *Gn. Rab.* 11.4, 67.6, 75.7, 84.3). For example, the following is in *Berakhot* 57b of the Babylonian Talmud: "And YHVH said to her, 'Two nations are in your womb' [*Gn.* 25:23]. Do not read nations [*goyim*], but 'lords' [*ge'im*], and Rav Yehudah [third-century amora] said in the name of Rav: 'These are [Marcus Aurelius] Antoninus and Rabbi, whose table never lacked either radish, lettuce or cucumbers either in summer or winter.'" These many stories are meant to equate Yehudah (Rabbi) with the leader of the most powerful political force of his time. Whether or

not the conversations reported in these texts actually occurred is open to question. However, the point they make is clear: Our patriarch is as powerful and important as their emperor.

At the same time that the sages picture Yehudah as an outstanding political leader, they also describe him as an exceptionally learned rabbi. One proverb stated that "from the days of Moses until the days of Rabbi we did not find both Torah and Greatness in one place" (B.T., *Git.* 59a). It is recorded that Yehudah wandered from academy to academy so he might learn from all five of 'Aqiva' ben Yosef's major students as well as from the other leading sages of his time (B. T., *Eruv.* 53a, *Yoma*' 79b, *Yev.* 84a, *Shab.* 147b, *Meg.* 20a).

In addition Yehudah ha-Nasi' exhibited the qualities of the "ideal sage." Shi'mon ben Menasya' said, "All of the seven characteristics which the sages attributed to the righteous—comeliness, strength, riches, wisdom, old age, honor, and children—all of them were established in Rabbi and his sons" (*Avot* 6.9). Although Yehudah was so wealthy that his house steward was said to be richer than the Persian ruler Shāpūr I (r. 241–272 CE; B.T., *B. M.* 85a), his generosity was also well known. He invited the sages to his table, and during years of need he opened his private storehouses to the hungry (B.T., *Eruv.* 73a, *B. B.* 8a). When a person strayed from the correct path, Yehudah was there to guide him or her gently back to God (B.T., *B. M.* 85a). He showed kindness and compassion to all of God's creatures, even to the insects (*Gn. Rab.* 33.3). He was willing to learn from all, and he never treated his contemporaries with disrespect or contempt; he often accepted their teachings when those differed from his own (B.T., *Ket.* 93a). One proverb stated that "when Rabbi died humility and fear of sin ceased" (B.T., *Sot.* 49b). He was noted for his support of the Hebrew language (in place of the vernacular Aramaic). It was claimed that he spoke only Hebrew in his house and that the sages came to him seeking explanations of Hebrew words and phrases (B.T., *B. Q.* 82b, *R. ha-Sh.* 26b; J.T., *Shevi'it* 9.1 38c).

No other political leader so captured the minds and imaginations of the ancient rabbis. Upon Yehudah's death the sages decreed a fast and offered prayers of supplication, and a voice from heaven proclaimed that "whoever has been present at Rabbi's death is destined to enjoy life in the world to come" (B.T., *Ket.* 103b–104a). His burial place in Beit Shearim was visited by generations of Jewish pilgrims.

Among the tannaim and the amoraim, only Yehudah is pictured as combining the learning of a rabbinic sage who mastered the oral Torah with the skill of a seasoned politician who was an equal to the emperor of Rome. Other sages interacted with Roman and Sassanian leaders, while other rabbis were noted for their areas of knowledge. But Yehudah alone among the rabbis is praised equally for his knowledge and piety and for his political skills. His uniqueness is attested by his often being cited merely as Rabbi, the only sage who is cited merely by title without a reference to his name. Simi-

larly he is the only patriarch known as Ha-Nasi, the Patriarch, par excellence. The tradition presents a unique rabbi whose knowledge of the rabbinic tradition and whose political skills permitted him to bring together the rabbinic and nonrabbinic classes of society and to rebuild the Palestinian Jewish community after the devastating defeat of Bar Kokhba. Even though he could be intimidating and arrogant (B.T. *Ket.* 103b, *Yeb.* 9a, J.T. *Naz.* IX:57d), these traits are played down by the tradition.

During Yehudah's tenure as *nasi*, the foundation document of postbiblical rabbinic Judaism, the Mishnah, was created. This collection of primarily legal statements formed the basis of both the Babylonian and the Jerusalem (Palestinian) Talmuds, repositories of Jewish law and lore from the first six centuries of the common era organized as commentaries on the Mishnah. The appearance of the Mishnah also marked a crucial stage in the process of the development of Judaism from a temple-oriented cult to a Torah-oriented culture of study and exposition.

Generations of scholars have maintained that Yehudah was the sole editor of the Mishnah. Many have attempted to explain the processes by which he created this document from sources composed by Hillel the Elder, 'Aqiva' ben Yosef, and Me'ir. Basing their theory largely on the letter of Sherira' Gaon (tenth century CE), these scholars have argued that Yehudah merely did what others before him had done—he faithfully preserved and transmitted what he had received from his teachers. Although nothing was written down before Yehudah, the earlier oral traditions were part of a memorized corpus that was carefully preserved and that included the names of those who had written opinions or of the majority. Yehudah organized this material into a unified text according to comprehensive principles.

Jacob Neusner, in *Judaism: The Evidence of the Mishnah* (1981), concluded, on the basis of detailed literary analyses, that the Mishnah is not the work of one person. However, there is no doubt that the Mishnah's reputation was enhanced by its completion at Yehudah's court and that its importance in the history and development of Judaism stems from the central place Yehudah and his colleagues occupied in the minds and imaginations of subsequent generations of Jews.

GARY G. PORTON (1987 AND 2005)

YE SHES MTSHO RGYAL (YESHE TSOGYAL) (777–873) is a leading female figure and role model for Tibetan Buddhists. She is especially important for the Rnyingma (Nyingma) school of Tibetan Buddhism as a key figure in myth, dreams, iconography, and meditative practice. But she is also significant for Tibetans more generally, especially for her role in the stories of the establishment of Tibetan Buddhism in the eighth century CE.

Yeshe Tsogyal is said to have been one of the queens of the pivotal Tri Songde Tsan (eighth century), the king who brought Indian masters of Buddhism to Tibet and who built the first monastic community at Bsam yas (Samye). There are no contemporary inscriptions that mention her, and so there is some question about whether she is really a historical figure. But she appears at a relatively early point—by at least the twelfth century—in the mythologized accounts of the conversion of Tibet to a Buddhist country, and references to her clan title Mkhar chen Bza' (Karchen Za) also make her historicity credible. It is certainly possible that there was such a queen who became involved in Buddhist meditative practices, even if her story was elaborated greatly as the narrative of Tibet's conversion developed.

The earliest known reference to her life appears in a one-page notice in a history by the Treasure-discoverer Nyangrel Nyima Özer (1136–1204). A full-length presentation of her life from the fourteenth century has recently been identified, but she is best known for the version by Tagsham Nuden Dorje (b. 1655), a visionary of the seventeenth century. This work has been translated into English twice. In this story her early rejection of suitors and her desire to practice Buddhism are recounted, placing her story squarely within the norms of standard Buddhist hagiography, albeit with a number of twists specific to women's situations. Yeshe Tsogyal's plight is noticed by King Tri Songde Tsan, who takes her as one of his queens, but he soon offers her in turn to the Indian Tantric master Padmasambhava, whom the king had invited to Tibet to teach Tantric Buddhism. Padmasambhava and Yeshe Tsogyal become a Tantric couple and Padmasambhava transmits to her the full range of Tantric teachings. Early lineage stories of one of those teachings, on the Indic deity Vajrakā, lists Yeshe Tsogyal as a primary lineage holder.

Yeshe Tsogyal then proceeds alone to a mountain hermitage to practice what she has learned. She practices austerities and endures extreme hardship, reaching key stages of realization. At a certain point she is advised through visionary means to take a Tantric consort of her own. In a rare twist

from the usual androcentric rendition of this stage on the path, Yeshe Tsogyal sets out to procure a partner, who turns out to be an attractive but indigent man in Nepal, and she brings him back to the caves of Tibet to teach him the requisite techniques of sexual yoga.

Yeshe Tsogyal's hagiography deals with several specifically female situations, one of which is found in its provocative account of her rape by seven bandits. During this ordeal she turns the situation into a teaching for the bandits and ultimately helps them on their own path to buddhahood. She also continues to serve as a premier disciple of the master Padmasambhava. An important element of her story is that she assists the master in recording and then concealing Treasure (*gter ma*) teachings for future generations of Buddhists in Tibet. After Padmasambhava's departure to the Pure Land, Yeshe Tsogyal remains as a teacher of many, and finally dies surrounded by a large number of disciples.

One more element of her life story in the Tagsham version is that she defeats in debate certain rival teachers from the Bon religion. This episode seems to be missing in earlier renditions of her life, but it connects her to larger conceptions about Tibet's past and its identity vis-à-vis Buddhism. Nonetheless, Yeshe Tsogyal was also adopted as a heroine for Tibetan followers of Bon, and another full-length version of her life was recently identified in the Bonpo canon of scriptures.

The appeal of Yeshe Tsogyal is undoubtedly tied primarily to her image as a female master of meditation and yoga. That she serves as a role model for Tibetan women involved in the lay yogic path can be seen from the fact that outstanding female religious leaders in Tibet have been regularly identified as her "emanation," up to the twenty-first century. But she is also a popular source of visionary revelation for both male and female meditators. Yeshe Tsogyal often appears in the dreams and visions of yogis of the Nyingma school, during which she gives indications of how to uncover a Treasure revelation of their own, along with other key teachings. In addition, practitioners of visualization meditation in the Nyingma tradition will often use her image as the object of their imagination in the Tantric rites known as *sādhana* meditation. One of the most popular cycles of meditation that contains instructions for visualization of Yeshe Tsogyal is the Heart Sphere Teachings (Klong chen Snying thig), revealed by Jigme Lingpa (1729–1798) in the eighteenth century. Tantric empowerment rites that focus on her image continue to be given to students in Tibet today, as well as in the exile communities of Tibetan Buddhists in South Asia.

YESHIVAH. In contemporary usage, the Hebrew term *yeshivah* refers to an academy for the advanced study of Jewish religious texts, primarily the Talmud. Since the destruction of the Second Temple in 70 CE, the *yeshivah* has been one of the most important institutions of Jewish communal life. Although many *yeshivah* students go on to become rabbis and although the texts taught in *yeshivot* are among those a rabbi is expected to master, it should be emphasized that a *yeshivah*, an all-male institution, is not a rabbinical seminary. Its function is not to train professional religious leaders but rather to provide a framework for study. In the Jewish religious tradition, study of the Torah is seen as a central and meritorious religious act in and of itself, regardless of its relevance to the student's career plans. While *yeshivot* have been a common feature of Jewish communities, they have not been equally prevalent in every location and time. In various communities and at various times, aspiring scholars would study individually under the guidance of more advanced scholars and rabbis without taking part in a formal educational framework. The *batei midrash*, or communal study halls, that were common in many communities facilitated this practice. However, for much of Jewish history, advanced study rarely occurred outside the framework of the *yeshivot*.

The term *yeshivah* appears in tannaitic sources, where it refers to a rabbinical court (*beit din*), not to an institution of learning. The Jews of Palestine in the first and second centuries CE made no distinction between higher education and judicial activity, and they had no tradition of academic career training. Study of Jewish law (*halakhah*) was not seen as something that could or should be isolated from its practical applications.

Little is known of the precursors of the *yeshivot*. *Yeshivot* became central institutions in Palestine after the destruction of the Second Temple and in the absence of other central institutions. The academy founded by Yoḥanan ben Zakk'ai at Yavneh in 68 CE and its successors, first in Judaea and later in the Galilee, functioned, according to rabbinic tradition, as the continuation of the Sanhedrin (the legislative body

that convened in the Temple) and as the training ground for future scholars and leaders.

YESHIVOT IN BABYLONIA. After the death of Yehuda ha-Nasi², the patriarch of Judaea (c. 220 CE), the *yeshivot* of Babylonia began to grow in importance and soon became the most highly esteemed authorities in the Jewish world. For a period of eight hundred years, Babylonian *yeshivot* functioned not only as the central religious-legal institutions of Babylonian Jewry, alongside the lay authority of the exilarchate, but also as the final arbiters of halakhic questions for most of the Jewish communities of the world.

Amoraic period. At any given time during the Talmudic period, there were usually two leading *yeshivot* that often competed for honor and prestige. The first of these was the *yeshivah* of Nehardea, which flourished in the first half of the third century under the leadership of the Babylonian sage Shemu'el (d. 263?). Although the date of its foundation is unknown, it was already regarded in Shemu'el's time as a venerable institution and as an important center for the transmission of Babylonian Jewish traditions. In 219 Abba' bar Ayyvu (c. 155–247), known as Rav, a Babylonian who had spent many years in Palestine and was familiar with Palestinian traditions, settled in Nehardea. Shortly after, he moved to the town of Sura and opened a *yeshivah* there. Both Rav and Shemu'el had able successors, and even though the institutions they led sometimes changed location or were temporarily closed, they endured until perhaps the thirteenth century. The *yeshivah* of Nehardea moved to Pumbedita in the wake of the destruction of Nehardea in 259, and in the late ninth century it moved to Baghdad, followed soon after by the *yeshivah* of Sura.

The degree to which these Babylonian *yeshivot* (or *meivivot*, as they were known in Aramaic) can be classified as educational institutions is still a subject of debate. They certainly continued to function as courts, and the scholars who were clustered around them formed an equivalent to the Sanhedrin. It would appear, though, that from early on young students came to study with the eminent *ro'shei yeshivah* (masters of the *yeshivah*) and that the pedagogic function of the *yeshivah* was seen as important.

According to later sources (which may not be completely reliable), the *ro'shei yeshivot* in Babylonia were often appointed by the exilarch (*ro'sh ha-golah*, lit., “head of the exile”). The veteran scholars of the *yeshivah* sat at assigned seats in the study hall in a seating order based on age and scholarly reputation, wherein the more advanced sat in the front rows (this seating plan was also characteristic of non-Jewish academies in Babylonia). The contact between the *ro'sh yeshivah* and the students was often indirect. It was apparently a common practice for the *ro'sh yeshivah* to deliver his lecture in a soft voice and to have his words declaimed by an *amora'* (speaker) in a loud voice. Since many of the authoritative teachings of the Jewish tradition were transmitted orally, recourse was made to *tanna'im* (repeaters) who had committed them to memory.

Twice a year, in the spring and the fall, this pattern of study changed radically, with Jewish laymen flocking to the *yeshivot*, apparently by the thousands, for a month of popular and intensive study. These months were known as *yarhei kallah* (“months of assembly”).

Geonic period. From roughly 550 to 1050 CE, Babylonian *yeshivot* continued to flourish as centers of both education and legal decision making. Students came not only from Babylonia but from Egypt, North Africa, Spain, Italy, and elsewhere to study and to prepare themselves for leadership roles in their home communities. Legal questions (accompanied by donations) were sent from many Jewish communities in the Mediterranean basin, and the *responsa* were copied down for the guidance of later generations. The Geonim, as the heads of the *yeshivot* were called in the post-Talmudic period, wrote legal treatises and other works that were widely distributed. The widespread respect and authority that the Geonim enjoyed no doubt contributed to the acceptance of the Babylonian Talmud as the authoritative source of Jewish legal and aggadic thought. Their institutions were funded not only by donations but by tax revenues from certain Babylonian Jewish communities. Much less is known about the *yeshivot* in the Land of Israel in this period.

The general decline of the Abbasid empire, long centered in Baghdad, anti-Jewish persecutions in the tenth and eleventh centuries in Iraq, and the rise of new Jewish centers elsewhere led to the decline of the Babylonian *yeshivot* and a corresponding rise in the importance of *yeshivot* in other locations. However, none of these newer *yeshivot* achieved the centrality and influence that the *yeshivot* of Babylonia had enjoyed. According to Avraham ibn Daud's account in *Sefer ha-qabbalah* (The book of tradition; c. 1161), around the year 990 a ship bringing four scholars to a *kallah* month was captured by pirates. Three of the scholars were sold as slaves in various ports—one in Egypt, one in North Africa, and one in Spain (the fourth met an unknown fate)—where each became the leader of an important *yeshivah*. While the legend is not a reliable historical source, it does illustrate the continuity between later *yeshivot* and their Babylonian predecessors as well as the weakening of the ties between other Jewish communities and Babylonia.

YESHIVOT IN THE MEDIEVAL DIASPORA. From the tenth century onward, *yeshivot* were to be found in most Jewish communities. In Spain, one of the first important *yeshivot* to develop was that of Cordova; others were located in Lucena, Toledo, Barcelona, and elsewhere. These *yeshivot* were often located in or near community structures such as synagogues. The curriculum of these *yeshivot* centered on the Babylonian Talmud and its legal application and at times included qabbalistic literature. The well-known interest of some Spanish Jews in secular subjects found no expression in the *yeshivot*; their study of languages and sciences was usually carried out with the help of tutors or, occasionally, through enrollment in a non-Jewish school. The size and importance of a *yeshivah* was directly related to the fame and prestige of its head, the

ro'sh yeshivah. Most of the central rabbinical figures of Spanish Jewish history, including Nahmanides (Mosheh ben Nahman, c. 1190–1270), Shalomoh ben Avraham Adret (c. 1235–1310), and Nissim Gerondi (d. 1380?), headed *yeshivot*. The notes taken by students were passed from hand to hand and formed the basis for many of the Spanish glosses on the Talmud.

In North Africa, *yeshivot* were often located close to Muslim academies, though the question of intellectual relations between Jewish and Muslim schools has yet to be explored. The first important *yeshivah* in North Africa was that of Kairouan, which had close ties with Babylonian *yeshivot*. The *yeshivah* of Kairouan rose to importance in the tenth century and upon its decline in the following century, the *yeshivot* of Fez and Tlemcen in Morocco became prominent. Fustāt, near present-day Cairo, was also the site of an important *yeshivah*.

In the Ashkenazic communities of northern Europe, the great intellectual flowering that produced Gershom ben Yehudah (c. 965–1028), Rashi (Shelomoh ben Yitshaq, 1040–1105), and the Tosafists was achieved to a large extent within the *yeshivot*. These *yeshivot* differed from their predecessors in that they were chiefly educational institutions and no longer functioned as courts or as facilities for scholarly assembly. They tended to be small institutions with just a few tens of students who often lived with the *ro'sh yeshivah* and studied in a separate room in his house. Many of these students were Talmudic scholars in their own right, and they were not so much disciples of the *ro'sh yeshivah* as his partners in study. Beginners would prepare for admission to the *yeshivah* by studying with special teachers. The course of study in the *yeshivot* centered on Talmud and led to the conferment of formal degrees. The lowest, corresponding roughly to the bachelor of arts degree granted by universities of the time, was that of *haver* (“fellow”), while more advanced students looked forward to receiving the title *morenu* (“our teacher”), which entitled them to open their own *yeshivot*. As in the medieval universities, the curriculum emphasized discussion and disputation rather than literary creativity; this phenomenon is reflected in the Jewish scholarly literature of the period, which was mainly in the form of commentaries and glosses and not extended expository works. Like their counterparts in the universities, *yeshivah* students were highly mobile and often studied in many schools in the course of their academic careers.

Both in Mediterranean countries and in northern Europe, *yeshivot* stressed creative study for their advanced students rather than rote learning. Often students were required to resolve logical problems and contradictions in a text, or between authoritative texts, in a manner that led to a deeper understanding of the issues. In a very real sense, this kind of intellectual development was an organic continuation of earlier patterns. The members of the medieval *yeshivah* related to the Talmud in very much the same way as the tannaim (the rabbis whose teachings are collected in the Mishnah) re-

lated to the Hebrew Bible and as the amoraim (the rabbis whose teachings are collected in the *gemara*) related to the Mishnah.

There was a significant flow of ideas between the *yeshivot* of various areas. Rashi, who lived in northern France, was accepted in Spain and North Africa as the authoritative commentator on the Talmud, and the work of his successors in northern Europe, the Tosafists, was eventually carried on in Spain. This tradition concentrated on reconciling texts and statements scattered through the rabbinic literature so that it would form a harmonious whole.

One of the distinctive characteristics of the curriculum of the late medieval Ashkenazic *yeshivah* (thirteenth to seventeenth century) was the development of *pilpul*, a type of argumentation that uses highly contorted, often hair-splitting reasoning to resolve hypothetical cases or to reconcile opposing views. Most *pilpul* took place in oral debates, and few texts from the period survive. Many scholars found *pilpul* a fascinating intellectual stimulus, but others criticized it for its artificiality. *Pilpul* was eventually abandoned in favor of the more logical approach of the Spanish scholars, whose works were widely disseminated in northern Europe after the development of the printing press. Another activity popular in *yeshivah* circles of the time was the collection and study of *minhagim*, or local customs.

YESHIVOT IN THE MODERN WORLD. The continuity of the Ashkenazic *yeshivah* was broken in the seventeenth and eighteenth centuries in two different ways. In German-speaking lands, there was a gradual decline of interest in Talmudic and rabbinic literature, exacerbated by the Haskalah (Jewish Enlightenment movement) and the increasing assimilation of Jews into the general community. In Polish lands there was a sharper break that was associated with (but not totally explained by) the Cossack rebellion of 1648, which destroyed many communities and their *yeshivot*. The failure of the Polish Jewish community to reestablish the network of *yeshivot* immediately after the rebellion was due, in part, to the economic decline of the Jewish community and perhaps also to the spread of Hasidism, which encouraged the study of Talmud but placed less emphasis on formal education.

The nineteenth century saw important growth in the number and role of European *yeshivot*. In central Europe a key part was played by Mosheh Sofer (1762–1839), the rabbi of Pressburg, Hungary (now Bratislava, Slovakia). He was appointed to the position in 1806, and as his fame grew he became a major force in developing an active Orthodoxy in reaction to the Reform movement, which was gaining adherents in his native Germany and Hungary. One of the elements of his program was the development and expansion of the Pressburg *yeshivah*, whose student body soon numbered several hundred. Sofer's students went on to occupy many of the important rabbinical posts in the Habsburg Empire. The *yeshivot* they founded were a great influence on the lives of students who studied there during their formative adolescent years and were a major factor in the stability and co-

hesiveness of Hungarian Orthodoxy. In Germany, however, no major *yeshivot* developed. The rapid pace of acculturation, the need for a general education for economic advancement, and the lack of prestige for Talmudic knowledge among wide sectors of the Jewish community were largely responsible for this.

The revival of *yeshivot* of eastern Europe began in the early nineteenth century with the foundation in 1803 of a *yeshivah* in Volozhin, White Russia, by Hayyim ben Yitshaq (1749–1821). It differed from earlier Ashkenazic *yeshivot* in that it was neither a private institution nor a communal one, but rather a regional institution supported by donations collected by fundraisers from Jews throughout Lithuania and later even farther afield. As such, the *yeshivah* of Volozhin was free from local pressures. This organizational model was not immediately imitated, and most Talmud students continued to study in *batei midrash* (local study halls). In the latter part of the nineteenth century there was a sharp rise in the number of *yeshivot* that were founded to counteract the appeal of secular education and Haskalah. Important *yeshivot* were founded in Telz, Slobodka, Ponevezh, Slutsk, Novorodok, and elsewhere. Many were founded to advance the aims of the Musar movement, founded by Yisra'el Salanter (1810–1883), which called for the study and practice of ethical behavior. These *yeshivot* appointed special preceptors (*mashgihim*) to teach and supervise ethical behavior; they functioned alongside the standard Talmud teachers, not always without friction. Other *yeshivot* emphasized new methods of study that stressed analysis of texts rather than legal casuistry. At the same time, and because of the same stimulus of competition from secular education and nontraditional influences, the Hasidic communities also began to establish *yeshivot*.

In the period between the world wars, all *yeshivot* in areas controlled by the Soviet Union were closed. However, in Poland, Lithuania, Hungary, and Czechoslovakia, *yeshivot* continued to flourish. These *yeshivot* were funded largely by subventions from Jews in the United States. The Holocaust led to the destruction of all of these institutions.

Today the two main centers of *yeshivot* are Israel and the United States. Until after World War II, *yeshivot* in the United States were relatively unsuccessful in attracting students and had little influence on Jewish life. Most of the Jews who came to America from eastern Europe in the late nineteenth and early twentieth century were not well educated, and the conditions of immigrant life in America were not conducive to the perpetuation of traditional customs. Those *yeshivot* that did exist followed the established patterns of the Old World. One important exception was the Rabbi Isaac Elhanan Theological Seminary, which grew into Yeshiva University. This institution, founded in the late nineteenth century in New York City, successfully introduced a new curriculum that included traditional Talmudic studies in the morning and secular studies, leading to the bachelor of arts degree, in the afternoon. After World War II there was a major increase

in the number of American *yeshivot* and in the size of their student populations, as well as an improvement in the quality of instruction. These changes were due in part to the arrival of refugees from eastern Europe, who brought with them a strong commitment to tradition and expertise in Talmudic learning, and in part to the emergence of a native-born and self-confident American Jewish Orthodox community.

A similar pattern is found in the Land of Israel. In the early modern period, Sefardic Jews and Jewish communities in North Africa and Asia continued their traditional practice of financially supporting *yeshivot*, many of which were in the Land of Israel. They tended to be academies of established scholars rather than educational institutions in the Ashkenazic mold. These *yeshivot*, with their mature student bodies, often emphasized the study of Qabbalah or of Jewish law, not Talmudic study exclusively. The scholars who constituted the membership of the *yeshivot* were given stipends. When the Ashkenazic immigration to the Land of Israel began in the late eighteenth century, Ashkenazic *yeshivot* began to appear. They were intended for younger students, and the program of study was devoted almost completely to Talmud.

As the Jewish community in Palestine grew, there was a corresponding growth in the number of *yeshivot*. In the interwar period there was even a case of a *yeshivah* that was transferred *in toto*—student body and staff—from Slobodka in Lithuania to Hebron in Palestine. After the establishment of the State of Israel in 1948 this growth continued, now with the financial support of the Israeli government. As in America, the *yeshivah* high schools drew many of the sons of observant families. The special security problems of Israel led to the establishment of *yeshivot* for soldiers, who were permitted to interrupt their military service for periods of Talmud study.

Today almost all *yeshivah* students are unmarried. Another institution, the *kolel* (pl., *kolelim*), provides married students with stipends to enable them to study full-time. Unlike *yeshivah* students, they usually study independently, without formal guidance or supervision. The *yeshivot*, with the *kolelim*, are now among the most important institutions of contemporary Orthodoxy. They play a major role in securing the loyalty of the younger generation to traditional patterns and values. It has become standard practice for groups within the Orthodox community to establish separate *yeshivot* for their youth. Now, for example, every Hasidic sect has its own *yeshivah*. *Ro'shei yeshivah* are among the most important leaders of Orthodox Jewry, and they often supplant the authority of communal rabbis.

There are probably more young men studying Torah (and especially the Talmud) full-time today than ever before. Only a small minority go on to serve as rabbis. While in traditional *yeshivot* the student body continues to be all male, similar institutions of study for women have been developed. Recently, the term *yeshivah* has often been applied to Jewish day schools, on both the elementary and high school level, that have a program that includes general studies as well as

Jewish studies. But the Orthodox *yeshivot* have managed to adapt to new conditions without compromising their basic commitment to the perpetuation of tradition.

BIBLIOGRAPHY

Relatively few works have been written that deal specifically with *yeshivot*. However, almost anything written on the history of Jewish education touches on *yeshivot*, and so do many studies of Jewish history or religion. The best starting point for bibliographies on particular *yeshivot* or on higher education in a given community or area is Shlomo Shunami's *Bibliography of Jewish Bibliographies*, 2d ed. (Jerusalem, 1965; suppl., Jerusalem, 1976), which directs the reader to bibliographies on almost any topic of Judaica. The most useful guides to current literature are *Kiryat Sefer*, a quarterly listing of recent books of Judaica and Hebraica, and the annual *Index of Articles on Jewish Studies*. Both are arranged topically and are published by the Jewish National and University Library in Jerusalem.

There are a number of valuable monographs on *yeshivot*. The most recent book on the Babylonian *yeshivot* is David M. Goodblatt's *Rabbinic Instruction in Sasanian Babylonia* (Leiden, 1975). For the other end of the time spectrum, William B. Helmreich's *The World of the Yeshiva* (New York, 1982) provides a useful description of modern American *yeshivot*. A number of unpublished Ph.D. dissertations are relevant: Armin Harry Friedman's "Major Aspects of Yeshiva Education in Hungary, 1848–1948" (Yeshiva University, 1971), M. Breuer's "The Ashkenazi Yeshiva toward the Close of the Middle Ages" (Hebrew University, 1967), I. Gafni's "The Babylonian Yeshiva" (Hebrew University, 1978), and my own "Three Lithuanian Yeshivot" (Hebrew University, 1982); the latter three are in Hebrew with detailed English summaries. The most valuable collection of primary sources on the history of Jewish education, which includes a great deal of material on *yeshivot*, is Simha Assaf's *Megorot le-toledot ha-hinukh be-Yisra'el*, 4 vols. in 2 (Tel Aviv, 1936–1954).

YI SEE REN AND YI

YIJING (635–713), Chinese Buddhist translator and traveler to India. Born Zhang Wenming, a native of Qizhou (modern Shandong province), Yijing left his family at the age of seven and lived in a Buddhist monastery, where he studied under the guidance of two monks, Shanyu (d. 646) and Huizhi. The former was a learned scholar with a broad range of religious and secular knowledge; the latter was an expert on monastic discipline (Vinaya). Yijing was ordained at the age of fourteen and was urged by Huizhi to follow the Vinaya strictly. He studied the monastic rules for another five years and became well versed in its regulations as well as in the interpretations given by Fali (d. 635) and Daoxuan (d. 667), the two leading and influential masters of monastic discipline. He was then allowed to lecture on the subject at the monastery. With the encouragement of his teacher, Yijing left the monastery for Chang'an, the capital of Tang-dynasty China. It was a time when Xuanzang's (d. 664) famed journey to India and his translation of Buddhist texts into Chinese were still held in highest esteem, especially in the capital. Xuanzang's legacy inspired Yijing to make his own mission to India. He first returned to his monastery at Qizhou, then proceeded to Guangfu (Canton) with the blessings of his teacher. Although other monks had planned to join Yijing, all but one dropped out at the last moment.

In 671 the two monks boarded a Persian merchant ship and arrived at the kingdom of Śrīvijaya (South Sumatra), where Yijing's companion died. Yijing stayed on for six months and then embarked alone for Tāmraliptī in eastern India via the kingdoms of Malayu, Kacha, and one of the Nicobar islands. At Tāmraliptī he studied Sanskrit for a year. He then traveled to Nālandā with another Chinese monk, Dachengdeng (d. 675). They went on pilgrimages to Ḡṛḍhrakūṭa at Rājagrha and to Mahābodhi at Bodhi Gayā. Thereafter, they traveled to Vaiśālī, Amaraba, and Kāśī (Banaras), visited Jetavana Monastery at Śrāvastī and the "heav-

enly stairs” (said to have been built by the god Śakra for the Buddha to use in descending from Heaven) at Sāmkāśya, and journeyed to Sārnāth and Kukkuṭapāda.

At the end of his journey, Yijing settled at Nālandā, where for a period of nine years he studied the five prevailing Buddhist curricula. These were Buddhist logic, the *Abhidharmakośa*, monastic discipline (Vinaya), and the Mādhyamika and Yogācāra philosophies. Yijing pointed out that each of these disciplines is for a specific purpose, but that none is absolute by itself.

With the manuscripts he had collected at Nālandā, Yijing left central India for Tāmraliptī in 685. He embarked on a ship from the same port in 686, and after short stops at Kacha and Malayu, arrived at Śrīvijaya in 687. When he had been there a little over two years, however, Yijing found himself short of supplies for copying Sanskrit manuscripts. He went to the port to send word to China for supplies, but the ship that was to carry his message unexpectedly set sail while he was still on board. This accident brought Yijing back to Guangfu on August 10, 689, leaving behind his collection of Sanskrit manuscripts, amounting to half a million words. He recruited four assistants and returned to Śrīvijaya on December 18, 689. Yijing remained in the country, copied scripture, and studied under the distinguished teacher Śākyakīrti. He also wrote an account of Buddhist practices and a report regarding a group of Chinese monks who had traveled to India in search of Buddhism. Yijing sent these reports, together with his translations of Buddhist texts, to China through one of his assistants in 692.

Accompanied by two assistants, Yijing himself returned to Guangfu in 694. Five months later he traveled to Luoyang, the eastern capital, where in 695 he was personally received with great honor by the empress Wu Zetian (r. 684–704). He was accommodated at Foshouji Monastery and worked as an assistant translator in the bureau of translations headed by Siksananda. From 700 until his death, Yijing headed his own bureau of translation of Buddhist canons at Luoyang and Chang’an. Altogether he translated fifty-six works in 230 fascicles, among them scriptures, commentaries, and Vinaya texts. The empress and her successors patronized his work and even provided forewords to Yijing’s translations. Various honors and rewards were bestowed upon the monk, and he was awarded the title “Master of the Tripiṭaka.”

The works translated by Yijing include a broad range of Buddhist texts, including the Āgamas, the Avadānas, and Mahāyāna sūtras and *sastras*. Also translated were eleven Buddhist *tantras* and eighteen works on monastic discipline, as well as exegetic works that are important not only for Chinese Buddhism but also for the religion as a whole. His version of the *Suvarṇaprabhāsa-uttamarāja Sūtra* (Golden light sūtra) is widely acknowledged by scholars as the best Chinese translation of that scripture and one that has influenced all East Asia. His translation of the Sarvāstivāda Vinaya texts has systematically preserved one of the most influential monastic

traditions in India. His translations of the Yogācāra texts and of Buddhist logic are quite significant. Yijing’s own writings are also valuable. His two records, of Buddhist practices in South Asia and of Chinese monks who traveled to India in the seventh century, are extremely important sources for historians of religion. His glossary, the *Fanyu qianziwen* (A thousand Sanskrit words), is the earliest extant Sanskrit-Chinese dictionary. Although Yijing’s translations have been overshadowed by those of his predecessor, Xuanzang, a sample examination of both renderings of the *Vimśatikā* (Liebenthal, 1934) concluded that Yijing was a better translator than Xuanzang.

Yijing died on February 16, 713. He was buried with grand honors, and was posthumously honored with the title Director of Foreign Office (*honglu qing*). A memorial inscription was composed by Lu Can at imperial request. A temple called Jin’guangming (“gold light”) was raised at his burial site in 758.

YIN-YANG WU-HSING SEE YINYANG WUXING

YINYANG WUXING. *Yinyang* (umbral and bright) and *wuxing* (Five Phases: water, fire, wood, metal, and earth) are the core concepts of traditional Chinese cosmology. This cosmology perceives the universe as an organic whole, in which the spiritual, natural, and human worlds are ordered into a single, infinitely interconnected system. Modern scholars retrospectively call it *correlative cosmology*, since it is based on “correlative thinking.”

Correlative thinking is by no means uniquely Chinese; it has appeared in all civilizations and still underlies the operations of language and serves as one of the building blocks of thought. Chinese cosmology is a distinctive and extraordinary elaboration of such a mode of thinking. It groups phenomena into heuristic or analogistic categories, within and among which relationships are held to be relatively regular and predictable. Eventually, all things in the universe are categorized and correlated, and everything affects everything else. Entities, processes, and classes of phenomena found in the human world (the human body, behavior, morality, the sociopolitical order, and historical change) are set in correspondence to various entities, processes, and classes of phenomena in nature (time, space, the movements of heavenly bodies, seasonal change, plants and animals, etc.).

This elaborate classification and correlation structure is based on various numerical systems, such as interlaced pairs (correlated to *yinyang*), sets of fours (correlated to the four directions and four seasons, and further divided into twelve months, twelve Earthly Branches, and *jieqi* seasonal nodes), sets of fives (correlated to *wuxing* or Five Phases), and sets of eights (correlated to the Eight Trigrams). While these numeral systems had different origins and represented divergent ways of classification and correlation building, the systems of *yinyang* and *wuxing* were combined and used to synthesize all other systems into an elaborate and coherent cosmology. Therefore the Chinese have used *yinyang* and *wuxing* as a general term to refer to this cosmology as a whole and the correlative thinking beneath it.

ORIGIN AND DEVELOPMENT. The words *yin* and *yang* first appeared in texts of the Warring States period (403–221 BCE), with their root meanings of “a hillside in shade” and “a hillside in sunlight,” or, by extension, “cool” and “warm.” A reference to a physician named Ho, in his speech dated 541 BCE, shows the first link of *yin* and *yang* to the six *qi*, the energetic fluids in the atmosphere and inside of the body. With this linkage to the *qi*, *yin* and *yang* acquired cosmological meaning. By the third century BCE, a wide variety of dualistic phenomena were being characterized in terms of *yin* and *yang*, as demonstrated in a comprehensive list (see Table 1) from an excavated text from Mawangdui.

The chain shown in Table 1 could go on infinitely, until everything is paired and divided accordingly. More often the *yang* chain is superior to the *yin* chain, but the two are mutually dependent. The use of the terms *yin* and *yang*, with their connotations of the changing ratio of shadow and sunshine on a hillside during the course of a day, aptly suited the Chinese concept of dualism, which was never absolute or antagonistic. Chinese culture tends to treat opposites as relativistic and complementary, while the West treats them as conflicting. Coolness exists only relatively to its complement, warmth—a minister is *yin* in relation to his ruler, but *yang* in relation to his wife. The *yin* of winter moves inevitably to the *yang* of summer, and back again: each contains the germ of the other.

Wuxing, the categories of five, also appeared during the Warring States period. Like *yinyang*, these categories had ancient roots. They may derive from astronomical considerations of the five visible planets, or from the numerology of the magic squares (a 3 x 3 grid arrangement of the integers 1 through 9, with 5 at the center; each row, column, and diagonal yields a sum of 15), or more likely, from the ancient spatial concepts of the four quarters of the world and four cardinal directions, with a fifth, the center, added to the four.

Towards the end of the Warring States period and during the first empires immediately following (221 BCE–220 CE), *yinyang* and *wuxing* were integrated and elevated to become the core system for synthesizing the divergent classification systems. From their initial appearance as loosely defined and unsystematically used terms, and through the long process of synthesis and standardization, these concepts went through many changes. Their meanings varied in different historical periods, as well as in different applications during the same period. For example, the Chinese term *wuxing* literally means five “goings,” “doings,” or “conducts.” The Confucians used the term to refer to the Five Virtues (benevolence, righteousness, propriety, wisdom, and sagehood), rather than water, fire, wood, metal, and earth. At the same time, the set of water, fire, wood, metal, and earth were called by different terms, including *wuxing*, *wucai* (Five Materials), *wude* (Five Powers), and *wuwei* (Five Positions).

This is why the translation of these concepts is extremely controversial. While *yin* and *yang* are left untranslated, *wuxing* has many translations: formerly as Five Elements, and then as Five Materials, Five Forces, Five Agents, Five Entities, Five Powers, Five Processes, or Five Phases (“Five Phases” has gained increasing acceptance). But the term is only appropriate from the Han (206 BCE–220 CE) onward, referring to cosmic cycles; using “Five Phases” to translate *wuxing* in pre-Han sources poses the danger of anachronism. Scholars more often prefer to leave *wuxing* untranslated, so that its exact meaning can be determined by the specific historical period and context.

Like *yinyang*, the term *wuxing* was used to classify phenomena that shared a common attribute (see Table 2). Although lacking the apparent inevitability found in the binary oppositions of *yinyang*, the classification of phenomena into categories of five spread widely throughout Chinese civilization. Medical practitioners described Five Viscera, musical experts worked with a scale of Five Tones, political theorists spoke of Five Powers of dynastic transmission, religious specialists named Five Gods.

More than just categories for classification, *yinyang* and *wuxing* explain the changes in all the phenomena and interactions among them. Things within the same category affect one another through resonance, because they share the same kind of *qi*. For example, if a ruler acts benevolently during the months of spring, the *qi* of the wood phase that is thus engendered will encourage the growth of plants. If, on the contrary, during the spring months he inappropriately en-

gages in war and punishment, thus generating the metallic *qi* of autumn, then the springtime growth of plants will be hindered.

Yinyang and *wuxing* are seen as existing in interactive cycles of succession, through which things in different categories interact and transform one another. These cycles are regular and predictable, various permutations of the pair and the set of five formed cyclical orders to be applied in specific circumstances. *Yin* and *yang* were used to describe cyclical dualistic phenomena, such as the shifting proportions of sunlight and darkness throughout the solar year and the waxing and waning of the seasons. The Five Phases exist in various kinds of cycles, and the two most common and widely used were the mutual conquest and mutual generation cycles. In the former, water conquers fire (extinguishing), fire conquers metal (melting), metal conquers wood (chopping), wood conquers earth (plowing), and earth conquers water (damming). In the latter, wood generates fire (burning), fire generates earth (ash), earth generates metal (ore), metal generates water (melting), and water generates wood (irrigation). The conquest cycle was applied to, for example, the sequential planting and harvesting of crops throughout the growing year, and the generation cycle was applied to the succession of the seasons.

The inventor of the *yinyang* and *wuxing* system remains unknown. Traditionally, the invention was attributed to Zou Yan (fourth century BCE), the believed founder of a school of “naturalist” philosophy called *yinyang* and *wuxing jia*, a philosophical system that combines science and magic. But archaeological discoveries in the last decades of the twentieth century provided a body of new sources challenging this attribution. Some scholars identified affiliations of *yinyang* and *wuxing* with other philosophical schools, such as Confucianism. But many others found ample evidence in the new sources that the cosmology originated from the world outside of philosophical schools, the world of technical tradition occupied by court historians, astronomers, diviners, physicians, and music masters. Scholars have been debating whether the cosmology originated from technical professions and later was adopted and synthesized by philosophers, or whether it entered the technical world from philosophy. But whether the technical tradition and philosophy had such a clear distinction in the Warring States period is itself a debatable question. Even if they were differentiated, they both were overwhelmingly concerned with politics, history, and morality, rather than pure technical or philosophical speculations.

SIGNIFICANCE IN CHINESE CIVILIZATION. *Yinyang* and *wuxing* have played a significant role in Chinese civilization; as a twentieth-century Chinese scholar put it, they are “the law of Chinese thinking.” During the formation of the first empires, *yinyang* and *wuxing* formed the cosmological foundation for the imperial ideology. Zou Yan and his followers used the conquest cycle of Five Phases to articulate their theory of dynastic transmission. According to this theory, a

dynasty that was ruled by the power of the wood phase would be conquered by a new ruling house associated with metal, which in turn would be conquered by a dynasty of fire. For the rise of each new dynasty, heaven would show favorable signs to verify its legitimacy. The sign would be yellow for a dynasty ruled by the power of earth, and green for a dynasty of wood. Accordingly, Zou Yan arranged ancient history in such a cycle of conquest and predicted that a new dynasty of water, in black color, was due to rise. The first empire of Qin (221–206 BCE) adopted this theory and claimed the phase water and the ritual color black.

This imperial ideology was by no means a homogenous one. *Yinyang* and *wuxing* provided the shared discourse for political debates and struggles throughout the Han dynasty. The dispute over the two cycles of the Five Phases, conquest and generation, articulated the competition between two concepts of sovereignty and two ways of government. The conquest cycle represented a sovereignty based on force and punishment, and the generation cycle represented one based on ethical principles, rituals, and hierarchies. Confucian philosopher Dong Zhongshu (179–104 BCE) rejected the implication of Zou Yan’s theory that there are different ways of government, each legitimate. He stated that a change of government would serve only to illuminate the Dao of heaven, rectifying the deviations from it by the preceding dynasty. Dong’s followers further used the generation cycle of Five Phases to explain dynastic transmission, thus shifting the ground for imperial sovereignty from conquering force to nurturing morality. This system of dynastic transmission and imperial symbolism was adopted by Wang Mang in establishing the New Dynasty (Xin, 9–23 CE), and was continued by the later Han (25–220 CE) and all dynasties of the remaining imperial history.

Outside of political ideology, *yinyang* and *wuxing* were fully integrated into every domain of Chinese culture and the

everyday practice of the people, becoming a common property of Chinese philosophy, religion, medicine, and science as a whole. *Yinyang* and *wuxing* were used by court historians, astronomers, diviners, ritual experts, physicians, and music masters in predicting, planning, and checking government functions. By ordering time, space, body, and all phenomena into a single predictable order, the state used this cosmology as the means of creating a tightly integrated order and of controlling the actual daily practice of administration. *Yinyang* and *wuxing* also penetrated a wide terrain of technical, mantic, and religious practice; they were integrated into the calendar, medicine, and divination, and were used to order the daily affairs of the populace in marriage, funerals, rituals, travel, diet, healing, trade, house building, farming, hunting, and the making of food, wine, and clothing. Even after the introduction of modern science and the decline of *yinyang* and *wuxing* as a political ideology towards the end of the imperial era, *yinyang* and *wuxing* remained the conceptual foundation of popular religion, martial arts, geomancy, and traditional Chinese medicine, all of which are still operating today.

AIHE WANG (2005)

YISHMA'EL BEN ELISHA' (c. 50–c. 135 CE), Palestinian tanna. Yishma'el was 'Aqiva' ben Yosef's most famous contemporary; rabbinic tradition has constantly placed the sayings of these masters in opposition to each other.

Although some have argued that Yishma'el was a member of the priestly class, nothing in the traditions attributed to him supports this claim except for a number of dubious passages (B.T., *Ber.* 7a, *Hul.* 49a–b; Tosefta *Hal.* 1.10; *Avot de-Rabbi Natan* 38 [cf. *Mekhilta' de-Rabbi Yishma'el*, *Nez.* 18]). One story recalls that as a child he was captured by the

Romans and placed in prison, where he was discovered by Yehoshu'a, who predicted great things for the child (B.T., *Git.* 58a); however, not all manuscripts containing this story mention Yishma'e'l, and his appearance here is suspect. He is said to have studied with Yehoshu'a, Eli'ezer, and, especially, Naḥunya' ben ha-Qanah, who is said to have taught him the importance of exegesis of the Torah by means of logical arguments (B.T., *Shav.* 26a). The Talmud states that he rejected the study of Greek wisdom; he argued that one should study Torah day and night (B.T., *Men.* 99b), and his sayings demonstrate a tendency to reject Gentiles and their wisdom (*A.Z.* 1.2, 2.3, 4.1).

Yishma'e'l's importance has been based on his role as a biblical exegete. The opening of *Sifra*, a collection of exegetical comments on *Leviticus*, states that Yishma'e'l's exegesis of the Bible relied on thirteen principles. Based on this passage, most scholars of rabbinic Judaism have contrasted Yishma'e'l's "logical" method of interpreting scripture with the more "imaginative" techniques employed by 'Aqiva.' Yishma'e'l is said to have ignored such things as the repetition of words or phrases in biblical verses and the appearance of certain adjectives, adverbs, and conjunctions, while these supposedly were crucial to the exegetical enterprises of 'Aqiva.' Yishma'e'l's statement that such features of biblical Hebrew should be ignored because "Scripture speaks in the language of common men" (*Sifrei Nm.* 112) is taken as the underlying assumption of his exegetical techniques. However, recent scholarship has challenged this traditional picture.

It has been demonstrated that Yishma'e'l and 'Aqiva' often used the same "logical" exegetical techniques normally attributed to Yishma'e'l and that they both employed the more "imaginative" exegetical methods usually assigned to 'Aqiva.' In addition, it has been shown that we have no evidence that Yishma'e'l employed the majority of the thirteen exegetical techniques attributed to him in the opening of *Sifra*. In fact, he most often employed methods not found in that list, such as the analogy, but that were commonplace among the Hellenistic rhetoricians of his age.

Given the fact that the traditions attributed to Yishma'e'l and 'Aqiva' do not support the common scholarly picture, we must consider what has happened. It is likely that toward the end of the rabbinic period, two major schools of biblical exegesis had developed, one "logical" and one "imaginative." In an attempt to claim that these opposing views were very old, the later sages attributed their creation to Yishma'e'l and 'Aqiva,' for the importance of 'Aqiva' in all areas of rabbinic thought, including biblical exegesis, had by then been well established. Thus Yishma'e'l's importance probably stems from the frequent juxtaposition of his sayings with those of 'Aqiva,' one of the most important sages of Jewish history, and not from anything he actually said or did, or at least not from anything attributed to him in the sources we have at hand.

YISRA'EL BEN ELI'EZER SEE BA'AL SHEM TOV

YI T'OEgyE, pen name of Yi Hwang (1501–1570), founder of the Yōngnam school of Korean Neo-Confucianism. T'oege is credited with having established in Korea the orthodox Neo-Confucian tradition as propounded by the Cheng-Zhu school, so-called after its putative founders Cheng I (1033–1107) and Zhu Xi (1130–1200), and is widely regarded as the greatest of all Korean Neo-Confucian thinkers.

Yi T'oege was born in Yean in Kyongsang Province, in the southeastern part of Korea. He began his studies with his uncle, Yi U, and continued them at the Royal College in Seoul, which he entered in 1523. He passed the preliminary civil service examination in 1528 and the final examination in 1534, after which he joined the small governing elite by embarking upon a long official career. His career, which followed the pattern typical of the elite of the period, included posts in such metropolitan bureaus as the Office of Diplomatic Correspondence, the Censorate, the Office of the Crown Prince Tutorial, and the Royal College. He also

served as a magistrate in local government. Despite the rather volatile political atmosphere of the time, his career was a smooth one. The highest positions he held included appointments as Minister of Rites, Fifth State Councillor, Director of the Office of Royal Decrees, and Director of Special Councillors. In 1569 he retired from public life and returned to his place of origin. The kings he served, Chungjong (r. 1506–1544), Myōngjong (r. 1545–1567), and Sōnjo (r. 1567–1608), all treated him with great respect. Legend has it that King Myōngjong, to whom T'oegye submitted his celebrated *Ten Diagrams of Sage Learning* (*Sōnghak sipto*), was supposed to have been a devotee.

Despite his long and illustrious public career, T'oegye is remembered as having maintained, or perhaps even initiated, the tradition of scholarly independence from the state. While he did not shy away from public life, T'oegye seems to have been constantly attracted to independent scholarship and educational activity. He frequently professed his desire for the life of a private scholar devoted to learning and teaching. Whenever possible, either between official posts or during his service, he attempted to pursue this ideal. During his tenure as the magistrate of P'unggi County, T'oegye successfully campaigned for government support of a private academy in the area, setting a frequently observed precedent. Eventually, he founded the Tosan Academy in his place of birth, which attracted numerous students through the generations. It was to this academy that he retired periodically in pursuit of scholarship. His alleged preference for the scholarly life influenced the attitudes of later scholars; indeed, the majority of the scholars of the Yōngnam school (School of Principle) remained private scholars. This of course reflected political realities such as violent factionalism and fierce competition for office. But these scholars also preserved a certain pride in their independence from the state and in their exclusive devotion to scholarship. They believed they were true heirs of T'oegye not only in their scholarship but also in their mode of life.

T'oegye based his philosophy largely on that of Zhu Xi. He endorsed Zhu Xi's dual theory of *li* (Kor., *i*; "principle") and *qi* (Kor., *ki*; "material force"), but labored over the question of whether Zhu Xi's priority of principle over material force referred to a valuative or existential priority. He concluded that the priority of principle obtained in the realm of values. His belief in the superiority of principle, which he identified with original nature and the moral mind, defined his position on the *sadan* (Chin., *ssu-tuan*; "four beginnings") and the *ch'ilchong* (Chin., *qi-qing*; "seven emotions") in the famous debate with Ki Taesung (1527–1572). Here, T'oegye argued for their separate origins, proposing that the Four Beginnings were initiated by principle and the Seven Emotions by material force. In order to maintain this position, however, T'oegye saw principle as having a generative power of its own. This position became a focus of the scholarship of the Yōngnam school.

A perhaps more meaningful aspect of his scholarship is his position on moral cultivation. Dismissing Wang Yang-

ming's (1472–1529) theory of the unity of knowledge and action as irresponsible in its disregard for the rationality of man, T'oegye was firmly committed to the need for a daily regimen of moral cultivation, a slow and painstaking process. He regarded sincerity and reverence as fundamental necessities in the acquisition of knowledge, which could be sought only through laborious step-by-step inquiry and meditation. The rather quiescent and meditative quality of his scholarship was inherited by his followers and remained a distinctive feature of the Yōngnam School.

Revised Bibliography

YI YULGOK pen name of Yi I (1536–1584), Korean Neo-Confucian thinker whose stature in the tradition is equalled only by that of Yi T'oegye. Yulgok is credited with having established the Kiho ("material force") school in Korea. Born in Kangnūng in Kangwon Province in western central Korea, not far from the capital, Yulgok began his studies with his mother, Sin Saimdang, a well-known poet and painter. Her death when he was sixteen seems to have brought about a profound personal crisis. After three years of mourning, Yulgok retreated into a Buddhist mountain temple intending to become a monk. Although he changed his mind after a year of studying the Buddhist scriptures, his resulting familiarity with Buddhism supposedly influenced his scholarship. In 1564 he placed first in both the preliminary and final civil service examinations and thus acquired

the nickname Lord First Candidate of the Nine Examinations. His ensuing reputation as a brilliant scholar and a quick study led to his meteoric rise in the bureaucracy. He served in numerous offices in both metropolitan and provincial government. In 1568 Yulgok traveled to China on an ambassadorial mission. His official posts included appointments as minister of military affairs, minister of public works, and minister of personnel, in which post he died at the age of forty-nine. He enjoyed a close relationship with King Sŏnjo (r. 1567–1608), whom he served as a royal tutor.

As was typical of Yi dynasty officials, Yulgok's illustrious public career was interrupted by short periods of retirement either for personal reasons or because of an unfavorable political climate at court. Nevertheless, he is regarded as representing the activist tradition of Confucian scholar-statesmanship. In this respect, Yulgok is viewed as the opposite of T'oegye, his scholarly rival, who is known for his preference for private life. This reputation seems to be based on Yulgok's wide range of interests and concerns. Unlike T'oegye, whose scholarship was confined mainly to philosophical issues, Yulgok was keenly interested in the practical aspect of government. He wrote copiously on such matters as fiscal reform, the problems of resettlement of landless peasants, military organization and finance, questions of disseminating Confucian mores to the populace, the relationship of the monarch and the bureaucracy and their respective roles, potential frictions within the bureaucracy, and the regulation and curricula of private academies. His proposal for a strong army of one hundred thousand, although unheeded, is often cited as prophetic in view of the disastrous Japanese invasions of the 1590s. He is said even to have written a memorial on his deathbed emphasizing the need for more effective government policies. His successors, the scholars of the Kiho school, inherited this activist tradition, and perhaps it is not purely coincidental that they maintained power throughout the Yi dynasty.

While Yulgok remained within Cheng-Zhu orthodoxy (named for the Chinese thinkers Cheng I and Zhu Xi) he rejected the dual theory of *i* (Chin., *li*; "principle") and *ki* (Chin., *qi*; "material force") held by Zhu Xi and T'oegye. While he accepted a conceptual distinction between the two, he maintained that they were inseparable in both function and manifestation. Rather than seeing principle as one, unchanging and immanent in all things, he saw the principle in each thing as distinct, conditioned by its material force and thus always changing. His belief in the primacy of material force as the determinant of an entity led to a corresponding theory of the *sadan* (Chin., *situan*; "four beginnings") and the *ch'ilchŏng* (Chin., *qi-qing*; "seven emotions"). Taking issue with T'oegye's position that the Four Beginnings and the Seven Emotions had separate origins, Yulgok insisted that they are both manifestations of material force that contain principle. Moreover, he held that the Four are "good" manifestations of material force. The difference between the Four and the Seven lies in how they are manifested, that is,

the Four Beginnings are the Seven Emotions themselves manifested as good. This was a clear departure from the idea that principle and material force were the sources, respectively, of good and evil. The scholars of the Kiho school continued to develop the primacy of material force, posing a scholarly as well as political alternative to the Yongnam school of Yi T'oegye.

Revised Bibliography

YOGA. Etymologically, the Sanskrit word *yoga* derives from the root *yuj*, meaning "to bind together," "hold fast," or "yoke," which also governs the Latin *iungere* and *iugum*, the French *joug*, and so on. In Indian religion the term *yoga* serves, in general, to designate any ascetic technique and any method of meditation. The "classical" form of yoga is a *darśana* ("view, doctrine"; usually, although improperly, translated as "system of philosophy") expounded by Patañjali in his *Yoga Sūtra*, and it is from this "system" that this article must set out if the reader is to understand the position of yoga in the history of Indian thought. But side by side with classical Yoga there are countless forms of sectarian, popular (magical), and non-Brahmanic yogas such as Buddhist and Jain forms.

Patañjali is not the creator of the Yoga *darśana*. As he himself admits, he has merely edited and integrated the doctrinal and technical traditions of yoga (*Yoga Sūtra* 1.1). Indeed, yogic practices were known in the esoteric circles of Indian ascetics and mystics long before Patañjali. Among these practices Patañjali retained those that the experiences of centuries had sufficiently tested. As to the theoretical framework and the metaphysical foundation that Patañjali provides for such techniques, his personal contribution is of the smallest. He merely rehandles the Sāṃkhya philosophy in its broad outlines, adapting it to a rather superficial theism and exalting the practical value of meditation. The Yoga and Sāṃkhya *darśanas* are so much alike that most of the assertions made by the one are valid for the other. The essential differences

between them are two: (1) Whereas Sāṃkhya is atheistic, Yoga is theistic, since it postulates the existence of a “Lord” (Īśvara); (2) Whereas according to Sāṃkhya the only path to final deliverance is that of metaphysical knowledge, Yoga accords marked importance to techniques of purification and meditation.

Thanks to Patañjali, Yoga, which had been an archaic ascetic and mystical tradition, became an organized “system of philosophy.” Nothing is known of the author of the *Yoga Sūtra*, not even whether he lived in the second or third century BCE or in the fifth century CE, although claims to both datings have been vigorously defended. The earliest commentary known is the *Yogabhāṣya* of Vyāsa (seventh to eighth century CE), annotated by Vācaspatimiśra (ninth century) in his *Tattvavaiśāradī*. These two works, indispensable for understanding the *Yoga Sūtra*, are complemented by two works of later centuries. At the beginning of the eleventh century King Bhoja wrote the commentary *Rājamārtanḍa*, which is very useful for its insights into certain yogic practices, and in the sixteenth century Vijñānabhikṣu annotated Vyāsa’s text in his remarkable treatise the *Yogavārttika*.

IGNORANCE AND SUFFERING. “All is suffering for the sage,” writes Patañjali (*Yoga Sūtra* 2.15), repeating a leitmotif of all post-Upanṣadic Indian speculation. The discovery of pain as the law of existence has a positive, stimulating value. It perpetually reminds the sage and the ascetic that the only way to attain freedom and bliss is withdrawal from the world, radical isolation. To liberate the self from suffering is the goal of all Indian philosophies and magico-mystical techniques. In India, metaphysical knowledge always has a soteriological purpose, for it is by knowledge of ultimate reality that humanity, casting off the illusions of the world of phenomena, awakens and discovers the true nature of spirit (*ātman*, *puruṣa*). For Sāṃkhya and Yoga, suffering has its origin in ignorance of spirit, that is, in confusing spirit with psychomental states, which are the most refined products of nature (*prakṛti*). Consequently, liberation, absolute freedom, can be obtained only if this confusion is abolished. As the structure and unfolding of nature and the paradoxical mode of being of the self (*puruṣa*) are discussed elsewhere, here only the yogic practices themselves will be examined.

The point of departure of yogic meditation is concentration on a single object: a physical object (the space between the eyebrows, the tip of the nose, something luminous, etc.), a thought (a metaphysical truth), or God (Īśvara). This determined and continuous concentration, called *ekāgratā* (“on a single point”), is obtained by integrating the psychomental flux, *sarvārthatā* (“variously directed, discontinued, diffused attention”; *Yoga Sūtra* 3.11). This is the precise definition of yogic technique, and is called *cittavṛtti-nirodha*, “the suppression of psychomental states” (*Yoga Sūtra* 1.2). The practice of *ekāgratā* tends to control the two generators of psychomental life: sense activity (*indriya*) and the activity of the unconscious (*samskāra*). A yogin is able to concentrate his or her attention on a single point

and become insensible to any other sensory or mnemonic stimulus. It goes without saying that *ekāgratā* can be obtained only through the practice of numerous exercises and techniques. One cannot obtain *ekāgratā* if, for example, the body is in a tiring or even uncomfortable posture, or if the respiration is disorganized, unrhythmical. This is why yogic technique implies several categories of physiological practices and spiritual exercises, called *aṅgas*, “members,” or elements. The eight “members” of classical Yoga can be regarded both as forming a group of techniques and as being stages of the ascetic and spiritual itinerary whose end is final liberation. They are (1) restraints (*yama*), (2) disciplines (*niyama*), (3) bodily attitudes and postures (*āsana*), (4) rhythm of respiration (*prāṇāyāma*), (5) emancipation of sensory activity from the domination of exterior objects (*pratyāhāra*), (6) concentration (*dhāraṇā*), (7) yogic meditation (*dhyāna*), and (8) enstasis (*samādhi*; *Yoga Sūtra* 2.29).

In addition to this classical Yoga comprising eight *aṅgas*, there exist a number of *śaḍaṅgayogas*, that is, yogic regimens having only six members. Their main characteristic is the absence of the three first *aṅgas* (*yama*, *niyama*, *āsana*) and the introduction of a new “member,” *tarka* (“reason, logic”). Attested already in the *Maitrāyani Upaniṣad* (second century BCE-second century CE), the *śaḍaṅgayoga* appears especially in certain sects of Hinduism and in the Buddhist Tantras (Grönbold, 1969, 1983).

RESTRAINTS AND DISCIPLINES. The first two groups of practices, *yama* and *niyama*, constitute the inevitable preliminaries for any asceticism. There are five “restraints,” namely, *ahiṃsā* (restraint from violence), *satya* (restraint from falsehood), *asteya* (restraint from stealing), *brahmacarya* (restraint from sexual activity), and *aparigraha* (restraint from avarice). These restraints do not bring about a specifically yogic state but induce in the adept a purified state superior to that of the uninitiated. In conjunction with the *yamas*, the yogin must practice the *niyama*, that is, a series of bodily and psychic disciplines. “Cleanliness, serenity, asceticism [*tapas*], study of Yoga metaphysics, and an effort to make Īśvara [God] the motive of all his actions constitute the disciplines,” writes Patañjali (*Yoga Sūtra* 2.32). Obviously, difficulties and obstacles arise during these exercises, most of them produced by the subconscious. The perplexity arising from doubt is the most dangerous. To overcome it, Patañjali recommends implanting the contrary thought (*Yoga Sūtra* 2.33). To vanquish a temptation is to realize a genuine, positive gain. Not only does the yogin succeed in dominating the objects that he or she had renounced, but also obtains a magic force infinitely more precious than all these objects. For example, he who successfully practices *asteya* “sees all jewels coming near to him” (*Yoga Sūtra* 2.37).

ĀSANA AND PRĀṆĀYĀMA. The specifically yogic techniques begin with *āsana*, the well-known bodily posture of the Indian ascetics. *Āsana* gives a rigid stability to the body while at the same time reducing physical effort to a minimum and finally eliminating it altogether. *Āsana* is the first concrete

step taken with a view to abolishing the modalities peculiar to the human condition. On the bodily plane, *āsana* is an *ekāgratā*; the body is “concentrated” in a single position. Thus, one arrives at a certain neutralization of the senses; consciousness is no longer troubled by the presence of the body. Furthermore, a tendency toward “unification” and “totalization” is typical of all yogic practices. Their goal is the transcendence (or the abolition) of the human condition, resulting from the refusal to obey one’s natural inclinations.

The most important—and certainly the most specifically yogic—of these various “refusals” is the disciplining of respiration (*prāṇāyāma*), the refusal to breathe like the majority of humankind, that is, unrhythmically. Patañjali defines this refusal as follows: “*Prāṇāyāma* is the arrest [*vicchedā*] of the movements of inhalation and exhalation and it is obtained after *āsana* has been realized” (*Yoga Sūtra* 2.49). He speaks of the “arrest,” the suspension, of respiration; however, *prāṇāyāma* begins with making the respiratory rhythm as slow as possible; and this is its first objective.

A remark in Bhoja’s commentary (on *Yoga Sūtra* 1.34) reveals the deeper meaning of *prāṇāyāma*: “All the functions of the organs being preceded by that of respiration—there being always a connection between respiration and consciousness in their respective functions—respiration, when all the functions of the organs are suspended, realizes concentration of consciousness on a single object.” The special relation of the rhythm of respiration to particular states of consciousness, which has undoubtedly been observed and experienced by yogins from the earliest times, has served them as an instrument for “unifying” consciousness. By making respiration rhythmical and progressively slower the yogin can penetrate—that is experience in perfect lucidity—certain states of consciousness that are inaccessible in a waking condition, particularly the states of consciousness that are peculiar to sleep.

Indian psychology recognizes four modalities of consciousness (besides enstasis): diurnal consciousness, consciousness in sleep with dreams, consciousness in sleep without dreams, and “cataleptic consciousness.” Through *prāṇāyāma*, that is, by increasingly prolonging inhalation and exhalation (since the purpose of this practice is to allow as long an interval as possible to elapse between the two phases of respiration) the yogin can experience all the modalities of consciousness. For the uninitiated, there is a discontinuity between these several modalities; one passes from the state of waking to the state of sleeping unconsciously. The yogin must preserve continuity of consciousness; that is, he must penetrate each of these states with determination and awareness.

But the immediate goal of *prāṇāyāma* is more modest; it induces the respiratory rhythm by harmonizing the three “moments” of breathing: inhalation (*pūraka*), retention (*kumbhaka*), and exhalation (*recaka*) of the inhaled air. These three moments must each fill an equal space of time. Practice enables the yogin to prolong them considerably. The yogin

begins by holding his or her breath for sixteen and a half seconds, then for thirty-three seconds, then for fifty seconds, three minutes, five minutes, and so on. (Similar respiratory technique were familiar to the Daoists, to Christian hesychasts, and to the Muslim contemplatives; see Eliade, 1969, pp. 59–65).

YOGIC CONCENTRATION AND MEDITATION. Making respiration rhythmical and, as far as possible, suspending it greatly promotes concentration (*dhāraṇā*; *Yoga Sūtra* 2.52–53). The yogin can test the quality of his concentration by *pratyāhāra*, a term usually translated as “withdrawal of the senses” or “abstraction” but more accurately rendered as the “ability to free sense activity from the domination of external objects.” According to the *Yoga Sūtra* (2.54) and its commentators, the senses, instead of directing themselves toward an object, “abide within themselves” (Bhoja, on *Yoga Sūtra* 2.54). When the intellect (*citta*) wishes to know an exterior object, it does not make use of sensory activity; it is able to know the object by its own powers. Being obtained directly, by contemplation, this knowledge is, from the yogic point of view, more effective than normal knowledge. “Then the wisdom [*prajñā*] of the yogin knows all things as they are” (Vyāsa, on *Yoga Sūtra* 2.45). Thenceforth, the yogin will no longer be distracted or troubled by the activity of the senses, by the subconscious, and by the “thirst of life”; all activity is suspended. But this autonomy of the intellect does not result in the suppression of phenomena. Instead of knowing through forms (*rūpa*) and mental states (*cittavṛtti*) as formerly, the yogin now contemplates the essence (*tattva*) of all objects directly.

Such autonomy allows the yogin to practice a threefold technique that the texts call *saṃyama*. The term designates the last three “members” of yoga (*yogāṅga*), namely concentration (*dhāraṇā*), yogic meditation (*dhyaṇa*), and stasis (*samādhi*). They do not imply new physiological practices. *Dhāraṇā*, from the root *dhṛ*, meaning “to hold fast,” is in fact an *ekāgratā*, undertaken for the purpose of comprehension. Patañjali’s definition of *dhāraṇā* is “fixation of the thought on a single point” (*Yoga Sūtra* 3.1). According to some authors (cf. Eliade, 1969, pp. 66–68), a *dhāraṇā* takes the time of twelve *prāṇāyāmas* (i. e., twelve controlled, equal, and delayed respirations). By prolonging this concentration on an object twelve times, one obtains yogic meditation, *dhyaṇa*. Patañjali defines *dhyaṇa* as “a current of unified thought” (*Yoga Sūtra* 3.2) and Vyāsa adds the following gloss to the definition: “continuum of mental effort to assimilate the object of meditation, free from any other effort to assimilate other objects.” It is unnecessary to add that this yogic meditation is absolutely different from any secular meditation.

SAMĀDHI AND THE LORD OF THE YOGINS. Yogic enstasis, *samādhi*, is the final result and crown of all the ascetic’s spiritual efforts and exercises. The term is first employed in a gnoseological sense: *Samādhi* is the state in which thought grasps the object directly. Thus, there is a real coincidence between knowledge of the object and the object of knowl-

edge. This kind of knowledge constitutes an enstatic modality of being that is peculiar to yoga. Patañjali and his commentators distinguish several sorts, or stages, of *samādhi*. When it is obtained with the help of an object or idea (that is, by fixing one's thought on a point in space or on an idea), it is called *samprajñāta samādhi*, "enstasis with support." When, on the other hand, *samādhi* is obtained apart from any relation to externals, when it is simply a full comprehension of being, it is *asamprajñāta samādhi*, "undifferentiated stasis."

Because it is perfectible and does not realize an absolute and irreducible state, the "differentiated enstasis" (*samprajñāta samādhi*) comprises four stages, called *bīja samādhi* ("samādhi with seed") or *sālambana samādhi* ("samādhi with support"). By accomplishing these four stages, one after the other, one obtains the "faculty of absolute knowledge" (*ṛtambharāprajñā*). This is in itself an opening toward *samādhi* "without seed," pure *samādhi*, for absolute knowledge discovers the state of ontological plenitude in which being and knowing are no longer separated. According to Vijñānabhikṣu, *asamprajñāta samādhi* destroys the "impressions [*saṃskāra*] of all antecedent mental functions" and even succeeds in arresting the karmic forces already set in motion by the yogin's past activities (Eliade, 1969, p. 84).

Fixed in *samādhi*, consciousness (*citta*) can now have direct revelation of the self (*puruṣa*). For the devotional yogins, it is at this stage that the revelation of the Supreme Self, Īśvara, the Lord, takes place. Unlike Sāṃkhya, Yoga affirms the existence of a God, Īśvara. He is not a creator god, for the cosmos, life, and humanity proceed from the primordial substance, *prakṛti*. But in the case of certain persons (i. e., the yogins), Īśvara can hasten the process of deliverance. Īśvara is a self (*puruṣa*) that has been eternally free. Patañjali says that the Īśvara has been the guru of the sages of immemorial times (*Yoga Sūtra* 1.26) and that he can bring about *samādhi* on condition that the yogin practice *īśvarapraṇidhāna*, that is, devotion to Īśvara (*Yoga Sūtra* 2.45). But it has been seen that *samādhi* can be obtained without such mystical exercises. In the classical Yoga of Patañjali, Īśvara plays a rather minor role. It is only with the later commentators, such as Vijñānabhikṣu and Nilakaṇṭha, that Īśvara gains the importance of a true God.

THE YOGIC POWERS; DELIVERANCE. By practicing *saṃyama*—that is, by means of concentration, meditation, and the realization of *samādhi*—the yogin acquires the "miraculous powers" (*siddhis*) to which book 3 of the *Yoga Sūtra*, beginning with *sūtra* 16, is devoted. The majority of these powers are related to different kinds of supranormal or mystical knowledge. Thus, by practicing *saṃyama* in regard to his or her own subconscious residues (*saṃskāra*), the yogins come to know their previous existences (*Yoga Sūtra* 3.105). Through *saṃyama* exercised in respect to "notions" (*pratyaya*), the yogin knows the mental states of other people (3.19). *Samyama* practiced on the umbilical plexus

(*nābhicakra*) produces knowledge of the system of the body (3.28), on the heart, knowledge of the mind (3.33), and so forth. "Whatever the yogin desires to know, he should perform *saṃyama* in respect to that object," writes Vācaspatiśra (on *Yoga Sūtra* 3.30). According to Patañjali and the whole tradition of classical Yoga, the yogin uses the innumerable *siddhis* in order to attain the supreme freedom, *asamprajñāta samādhi*, not in order to obtain a mastery over the elements (*Yoga Sūtra* 3.37). A similar doctrine is found in Buddhism (Eliade, 1969, pp. 177–180; Pensa, 1969, pp. 23–24).

Through the illumination (*prajñā*) spontaneously obtained when reaching the last stage of his or her itinerary, the yogin realizes "absolute isolation" (*kaivalya*), that is, liberation of the self (*puruṣa*) from the dominance of nature (*prakṛti*). But this mode of being of the spirit is not an "absolute emptiness"; it constitutes a paradoxical, because unconditioned, state. Indeed, the intellect (*buddhi*), having accomplished its mission, withdraws, detaching itself from the *puruṣa* and returning into *prakṛti*. The self remains free, autonomous; that is, the yogin attains deliverance. Like a dead person, the yogin has no more real relation with life, but is a *jīvanmukta*, one "liberated in life." The yogin no longer lives in time and under the domination of time, but in an eternal present.

To recapitulate, the method recommended by the classical form of Yoga comprises a number of different techniques (physiological, mental, mystical) that gradually detach the yogin from the processes of life and the rules of social behavior. The worldly person lives in society, marries, establishes a family; Yoga prescribes solitude and chastity. In opposition to continual movement, the yogin practiced *āsana*; in opposition to agitated, unrhythmical, uncontrolled respiration, the yogin practices *prāṇāyāma*; to the chaotic flux of psychomental life, the yogin replies by "fixing thought on a single point"; and so on. The goal of all these practices always remains the same—to react against normal, secular, and even human inclinations. The final result is a grandiose, although paradoxical, mode of being. *Asamprajñāta samādhi* realizes the "knowledge-possession" of the autonomous Self (*puruṣa*); that is, it offers deliverance, freedom, and, more specifically, the consciousness of absolute freedom.

- YOGĀCĀRA.** The Yogācāra school is, with the Mādhyamika, one of the two main traditions of Indian Buddhism. As the name indicates (*yogācāra* means "one whose practice is yoga"), this school attaches importance to the religious practice of yoga as a means for attaining final emancipation from the bondage of the phenomenal world. The stages of yoga are systematically set forth in the treatises associated with this tradition. The particular doctrinal stance of the school is suggested by its alternate name, Vijñānavāda, or the "doctrine" (*vāda*) that all phenomenal existence is fabricated by "consciousness" (*viññāna*).
- In concert with those who uphold the doctrine of "voidness" (*śūnyatā*), the Vijñānavādins maintain that phenomenal existences are devoid of intrinsic nature, but unlike the Mādhyamika, they admit the reality of the consciousness by which phenomenal existences, subjective as well as objective, are fabricated. This consciousness, however, is not deemed to exist in the ultimate sense. It subsists for but a moment and is replaced by the consciousness in the next moment. It has no substantiality and its origination is dependent on the consciousness of the preceding instant. To use the Yogācāra terminology, consciousness is of dependent nature (*paratantra-svabhāva*) and, as such, is not ultimately real. The Prajñāpāramitā Sūtras teach the voidness, or the nonexistence, of all entities. However, it is a fact of experience that phenomenal existences appear as if they were real. By admitting the reality of the consciousness, the Yogācāra clarified the foundation of our daily experience.
- According to the *Samdhinirmocana Sūtra*, a Yogācāra text, the Buddha set the "wheel of the doctrine" (*dharmacakra*) in motion three times. On the first turning, the Buddha taught the doctrine of the four noble truths (*catvāry āryasatyāni*), the Hīnayāna path culminating in arhatship; on the second, he taught the doctrine of universal voidness designed to advance practitioners along the path to Buddhahood. But because the complete meaning of the Buddha's teaching was not fully elucidated during these "turnings," the Buddha set the wheel in motion a third time, with the intention of making explicit (*nītārtha*) what was only implicit (*neyārtha*) in the *sūtras* composed in earlier times.
- FORMATIVE PERIOD.** The Yogācāra philosophy was systematized by Aśaṅga and Vasubandhu, thinkers who lived in the fourth or fifth century. However, some important Yogācāra works, namely, the *Samdhinirmocana Sūtra*, the *Yogā-*

cārabhūmi, and the treatises ascribed to Maitreya(nātha), predate them.

The *Samdhanirmocana Sūtra*'s major contribution to the Yogācāra school is its formulation of the doctrine of the three "characteristics" (*lakṣaṇa*) of entities: the imaginary character (*parikalpita-lakṣaṇa*), the dependent character (*paratantra-lakṣaṇa*), and the perfected character (*pariniṣpanna-lakṣaṇa*). (All are explained in chapter 6.) The imaginary character is the assignation of conventional names to things with respect to their intrinsic nature (*svabhāva*) and specific qualities (*viśeṣa*). The dependent character is the conditioned origination (*Pratītya-samutpāda*) of things. The perfected character is the "thusness" (*tathatā*) of things or the emptiness of intrinsic nature in things. These three characteristics are closely related to the "triple unreality" discussed in chapter 7. Since the characteristic features of things are established merely by the act of assigning them conventional names, these features are ultimately unreal. Thus, the imaginary character of things is related to the unreality of their characteristic features (*lakṣaṇa-niḥsvabhāvata*). Since the origination of things is dependent on causes and conditions, it is also not real. Thus the dependent character is related to the unreality of origination (*utpatti-niḥsvabhāvata*). The ultimate reality is manifested through the thusness of things or the emptiness of intrinsic nature in things. Thus, the perfected character is related to the unreality of intrinsic nature, which is the ultimate reality (*paramārtha-niḥsvabhāvata*).

The doctrine of three characteristics and triple unreality expresses what the Buddha had in mind when, in the Prajñāpāramitā Sūtras, he taught that all entities are devoid of intrinsic nature. It is understood that the Prajñāpāramitā Sūtras put forth a teaching, the meaning of which is inexplicit and must be drawn out (*neyārtha*). The *Samdhanirmocana Sūtra* unfolds (*nirmocana*) the "intention" (*saṃdhi*) of the Buddha that was hidden in the doctrine of voidness. This purpose is brought to full expression through the doctrine of triple unreality. Thus, this *sūtra* is of explicit meaning (*nītārtha*).

Chapter 5 of the *Samdhanirmocana Sūtra* presents the concept of *ālaya-vijñāna* ("storehouse consciousness"), which is characteristic of the Yogācāra teachings. It describes this consciousness as possessing "all the seeds" (*sarvabījaka*) from which future phenomenal existences will grow. The storehouse consciousness is attached to the sense faculties and to the impressions of "differentiations" (*prapañca*) left by the conventional usages regarding phenomenal existences and is called "attachment consciousness" (*ādāna-vijñāna*). Chapter 9 gives a detailed explanation of the practices of tranquilization (*śamatha*) and contemplation (*vipaśyanā*) through which a practitioner acquires the ability to concentrate his mind on certain ideas and to visualize and efface them at will. This practice forms the basis of the Yogācāra view that there is no external object.

The *Yogācārabhūmi* (Stages of the follower of yoga practice) is a voluminous, comprehensive work comprising five

parts. The main part, which is called "Basic Text of the Stages," treats the seventeen stages (*bhūmi*) to be successively passed through by a follower of yoga practice. It begins with the stage of sense perceptions, proceeds through many stages of meditation and other practices, reaches the stage of "disciples" (*śrāvaka*), then of "isolated Buddhas" (*pratyekabuddha*), then of *bodhisattvas*, and ends with the stage of complete *nirvāṇa* (*nirupadhiṣeṣa-nirvāṇa*, or "*nirvāṇa* with no residue"), the ultimate goal.

The Buddhist tradition in China attributes this work to Maitreya, but in Tibet it is known as a work of Asaṅga. Regarding the composition of a treatise dealing with seventeen stages, Paramārtha's *Life of Vasubandhu* (T.D. no. 2049) and Xuanzang's *Da Tang xiyu ji* (T.D. no. 2087) provide the following account. Asaṅga often went up to the Tuṣita Heaven, where he was taught the Mahāyāna doctrines by the *bodhisattva* Maitreya. Complying with the request of Asaṅga, who wanted Mahāyāna Buddhism to spread among the people, Maitreya came down to the continent of Jambudvīpa and gave a series of lectures on the seventeen stages. He lectured every night for four months; the next day Asaṅga, for the sake of the other attendants, gave a full explanation of what the *bodhisattva* had taught. (Asaṅga was the only attendant who had access to the *bodhisattva*; the others could merely hear him from afar.) This account may explain why the Chinese and the Tibetan traditions differ on the authorship of the *Yogācārabhūmi*. Some scholars assume that Maitreya, from whom Asaṅga is said to have received instruction on the Yogācāra doctrine, was a historical person; others, however, debate Maitreya's historicity. Recent studies of the *Yogācārabhūmi* have proved that it was not the work of a single person; it is now supposed that the text was gradually enlarged by successive generations of Yogācāra scholars.

The *Yogācārabhūmi* enumerates, classifies, and explains all elements that relate to the practice of each of the seventeen stages in the same manner as that of Abhidharma treatises. The doctrine of *ālaya-vijñāna* is found in the first two chapters of the "Basic Text" and in some sections of the "Compendium of Ascertainment" (an auxiliary division), while the doctrine of the three characteristics of entities is mentioned only in the latter division. The chapter dealing with the "stage of *bodhisattvas*" (*bodhisattvabhūmi*) is devoted to the detailed analysis of the religious practices of *bodhisattvas*, systematically explaining the matters with which their practices are concerned, the ways that their practices are to be conducted, and the results to be attained by the practices. It is known that this chapter once existed as an independent text.

In the Tibetan Buddhist tradition the following five works are ascribed to Maitreya(nātha): *Mahāyānasūtrālamkāra*, *Madhyāntavibhāga*, *Dharmadharmatāvibhāga*, *Ratnagotravibhāga*, and *Abhisamayālamkāra*. The last two are not considered Yogācāra works.

The *Mahāyānasūtrālamkāra* (Ornament of Mahāyāna Sūtras), which presents a systematic exposition of the prac-

tices of *bodhisattvas*, consists of about 800 verses and is divided into 21 chapters. According to the Tibetan tradition, the verse text was written by Maitreya and the prose commentary by Vasubandhu; the Chinese tradition assigns both to Asaṅga. This treatise has the same structure as the chapter in the *Yogācārabhūmi* dealing with the stage of *bodhisattvas* (*bodhisattvabhūmi*). The subject matter of chief concern to *bodhisattvas*—ultimate reality—is expounded in chapter 6, and the state of having attained the ultimate reality—enlightenment (*bodhi*)—is elucidated in chapter 9. The theoretical basis of the practices of *bodhisattvas* is given in chapter 11. The *Madhyāntavibhāga* (Discrimination of the middle and the extremes), which gives the Yogācāra interpretation of the doctrine of voidness (*śūnyatā*), consists of about 110 verses and is divided into 5 chapters. Both the Chinese and the Tibetan traditions ascribe the verse text to Maitreya and the prose commentary to Vasubandhu. This treatise places voidness in the middle (*madhya*) of the two extremes (*anta*), that is, existence and nonexistence. The *Dharmadharmatāvibhāga* (Discrimination of phenomenal existence and ultimate reality), a short treatise written in concise *sūtra* style, is commented upon by Vasubandhu. It was not transmitted to China. It shows that phenomenal existences, which are characterized by the duality of subject and object or of denoter and denoted, are in reality modifications of a conscious principle called “unreal imagination” (*abhūta-parikalpa*). Through the cognition of the true nature of phenomenal existences, the ultimate reality—the “thusness” (*tathatā*) that is free from the duality—is realized.

These works, attributed to Maitreya, describe the ultimate reality with such positive terms as “sphere of religion” (*dharmadhātu*), instead of characterizing it merely as “void” or “empty” (*śūnya*). Like space, ultimate reality is all-pervasive, and there is no phenomenal existence independent of it. It is also called the “essence of phenomenal existences” (*dharmatā*). The idea that the mind (*citta*) is essentially pure (*prakṛti-viśuddha*) and brilliant (*prabhāsvara*), a stance neglected in the dogmatics of the Abhidharma treatises, is fully supported, and the ultimate reality is identified with this pure and brilliant mind.

Whereas the concept of *ālaya-vijñāna* is not found in these works, the concept of “unreal imagination” (*abhūta-parikalpa*) plays an important role. The opening verse of the *Madhyāntavibhāga* clearly states that in emptiness (*śūnyatā*) there exists the unreal imagination. However, the unreal imagination is not admitted to exist in the ultimate sense. It is essentially “unreal,” but it is supposed to exist as the basis of the wrong assumption of the reality of phenomenal existences, which are characterized by the duality of subject and object, denoter and denoted, and so on. Much importance is attached to the doctrine of the three characteristics (*lakṣaṇa*) or natures (*svabhāva*) of entities. In chapter 3 of the *Madhyāntavibhāga* this doctrine is considered the fundamental truth (*mūlatattva*), and some important doctrines, such as that of the four noble truths, the two

truths (ultimate and conventional), and so on, are elucidated in terms of the three natures. The stages of yogic practice (*yogabhūmi*) through which a practitioner is led to the “transformation of the basis of his existence” (*āśraya-parāvṛtti*) and attains the ultimate reality, are explained systematically in chapter 11 of the *Mahāyānasūtrālaṅkāra*.

PERIOD OF SYSTEMATIZATION. Asaṅga and Vasubandhu are the most prominent figures in the history of the Yogācāra school. Asaṅga first belonged to the Mahīśāsaka school of Hīnayāna Buddhism, but later, under the influence of the *bodhisattva* Maitreya, he became an advocate of the Mahāyāna. His treatises combine Abhidharmic analysis of the elements constituting phenomenal existences with Mahāyāna ideas. He composed, among others, the *Mahāyānasamgraha* (Compendium of the Mahāyāna), a comprehensive work on Yogācāra doctrines and practices. In the first two chapters of this work he gives a full treatment of the doctrines of *ālaya-vijñāna* and of the three natures (*trisvabhāva*) of entities, thus laying the firm foundation of the philosophical system of the Yogācāra school.

According to Paramārtha’s *Life of Vasubandhu*, Vasubandhu was a younger brother of Asaṅga. He wrote two Yogācāra treatises: the *Vimśatikā* (Treatise of twenty verses) and the *Triṃśikā* (Treatise of thirty verses). The *Vimśatikā* repudiates the realist view that the image of an object in the consciousness has a corresponding reality in the external world and demonstrates that the image of an object appears in the consciousness as the result of a particular change (*pariṇāma-viśeṣa*) that occurs in the stream of the successive moments (*saṃtati*) of consciousness. The *Triṃśikā* presents a lucid, concise exposition of Yogācāra dogmatics. The first half of this treatise analyzes the structure and the function of consciousness; the second elucidates the three-nature doctrine and the stages of practice. Regarded as the standard textbook of the Yogācāra school, the *Triṃśikā* has been the subject of many commentaries by post-Vasubandhu scholars. Vasubandhu also composed a short treatise in verse dealing with the three-nature doctrine, the *Trisvabhāvanirdeśa*.

A number of other Yogācāra works have been handed down under the name of Vasubandhu, such as commentaries on the treatises attributed to Maitreya, on the *Mahāyānasamgraha* of Asaṅga, and on some Mahāyāna *sūtras*. The philosophical ideas expressed in these commentaries are not identical with those presented in the *Vimśatikā* and the *Triṃśikā*. In the last two works, the influence of the Sautrāntika school of Hīnayāna Buddhism is noticeable, but this is not the case with the commentaries. Accordingly, some modern scholars believe that there were two Vasubandhus: one, Asaṅga’s brother, composed the commentaries on *sūtras* and treatises; the other, the author of the *Vimśatikā* and the *Triṃśikā*, also wrote the *Abhidharmakośa*, a summary of Sarvāstivāda dogmatics, and an autocommentary written from the Sautrāntika viewpoint. However, further investigations must be made before a more definite conclusion can be drawn. The fundamental doctrines of the Yogācāra school

as formulated by Asaṅga and Vasubandhu are surveyed below.

Representation only (vijñaptimātra). The Yogācāras maintain that phenomenal existences, which are generally supposed to have objective reality in the external world, are no other than the “representations” (*vijñapti*), or images, of objects appearing in our consciousness (*vijñāna*). According to the Yogācāras, the image of an object is produced by the consciousness itself; there is no external object independent of the consciousness.

The *Mahāyānasamgraha* indicates that the image of an object in the consciousness does not presuppose the existence of the object in the external world. Some of the reasons mentioned are as follows;

1. The one and the same thing is represented differently by beings in different states of existence; for instance, that which is perceived by a man as a stream of clean water is represented as a flaming river by an inhabitant of hell and as a stream of pus and filth by a *preta*. This shows that an object represented in the consciousness is a product of mental construction.

2. It is a fact of experience that a cognition arises even when there is no object, as in the case of a recollection or dream. It is also known that a person who has advanced in yoga practice perceives a future object.

3. Through the practice of meditation (*dhyāna*) or tranquilization of the mind (*śamatha*), man comes to acquire the ability to visualize an object at will.

4. A practitioner who has stepped into the “path of insight” (*darśana-mārga*) attains “supermundane cognition” (*lokottara-jñāna*), in which there is no image of an object. This cognition, which has no corresponding reality in the external world, is thus experienced in daily life as well as in the process of religious practice.

Consequently, it is known that the form of an object that appears in the consciousness does not belong to a thing in the external world but is attributed to the consciousness itself.

Modification of consciousness (*vijñāna-pariṇāma*). The Yogācāra maintains that human beings and objective things, to which various terms—such as “self” (*ātman*), “living being” (*jīva*), “pot,” and “cloth”—are applied, are in reality the “modifications of consciousness.” The consciousness that undergoes modification consists of three strata: (1) the six kinds of consciousness produced through the visual, auditory, olfactory, gustatory, and tactile senses and the mind; (2) the “I-consciousness,” called *manas*, which accompanies the six kinds of consciousness; and (3) the subliminal consciousness, called *ālaya-vijñāna* (“store consciousness”), in which the “impressions” (*vasana*) of past experiences are accumulated as the “seeds” (*bija*) of future experiences. While the *ālaya-vijñāna* is latent, the six kinds of consciousness and the I-consciousness are in manifest activity and are

thus called the “consciousness-in-activity” (*pravṛtti-vijñāna*). The *ālaya-vijñāna* and the consciousness-in-activity are dependent on each other: the latter is produced from the seed preserved in the former and leaves, in turn, its impression on the former. Thus the *modification* (*pariṇāma*), or “change,” of consciousness takes place in two ways: (1) a seed planted by the consciousness-in-activity becomes ripe in the *ālaya-vijñāna*; and (2) the consciousness-in-activity arises from the seed. The term “modification” was first used by Vasubandhu, but the idea of the mutual dependence of the *ālaya-vijñāna* and the consciousness-in-activity was formulated by Asaṅga in the *Mahāyānasamgraha*.

The *ālaya-vijñāna* subsists only for a moment, then is replaced by another consciousness in the next moment. The successive moments of the *ālaya-vijñāna* form a stream that continues to flow until the seeds planted in it are completely destroyed. In each moment there arises the consciousness-in-activity, and thus a consciousness complex is formed. A human being is a stream of the consciousness complex, and the things that are thought to exist in the external world are but the images that appear in this stream of consciousness.

Three natures (*trisvabhāva*). The three natures of entities, that is, the imagined nature (*parikalpita-svabhāva*), the dependent nature (*paratantra-svabhāva*), and the perfected nature (*pariṇiṣpanna-svabhāva*), were expounded in the *Samdhibhīrmocana Sūtra*, but this text does not discuss the interrelation of the three natures and consequently the doctrine’s religious significance is not quite clear. In the *Mahāyānasamgraha*, in which the three-nature doctrine is a major topic, Asaṅga sets forth the view that the imagined and the perfected natures are two aspects of the dependent nature; the dependent nature, he explains, appears as the imagined nature by dint of a false imagination and as the perfected nature when the false imagination is removed. It is thus shown that the three-nature doctrine is closely related to Yogācāra soteriology. The doctrine, as formulated by Asaṅga and Vasubandhu, may be briefly summarized as follows. The consciousness that arises in each moment with the image of an object is of dependent nature because its origination is dependent on the impressions of past experiences preserved in the *ālaya-vijñāna*. Because of his false imagination, man ordinarily takes this image for a real object and applies a name to it. The object thus superimposed upon the image in the consciousness is of imagined nature. When the false imagination is completely removed through the practice of yoga, man realizes the absence of the superimposed object, that is, the perfected nature.

TRANSFORMATION OF THE BASIS (*ĀŚRAYA-PARĀVṚTTI*). The stages of yogic practice leading to the “transformation of the basis of existence” are systematized in some early Yogācāra works, and no substantial changes were made by Asaṅga and Vasubandhu. After passing the stage of accumulating merits and learning the Buddha’s teaching, a yogācāra proceeds to the stage of “preparatory exercise” (*prayoga*). Through this stage he comes to understand clearly that a name or a concept

has no corresponding reality in the external world and that the intrinsic nature and specific qualities of things are products of subjective construction. Thus, he realizes that there is no real object to be “seized” (*grāhya*) and, consequently, that the consciousness as the “seizer” (*grāhaka*) is also devoid of reality. At this moment he steps forward into the “path of insight” (*darśana-mārga*) and attains the immediate awareness of the ultimate reality. There arises in him the force to destroy the seeds of defilement that have accumulated from beginningless time in the *ālaya-vijñāna*. This force gradually becomes more powerful as he proceeds to the “path of intensive practice” (*bhāvanā-mārga*). Finally, the seeds are completely destroyed and the stream of the *ālaya-vijñāna* no longer constitutes the basis (*āśraya*) of his existence. In its place the ultimate reality reveals itself as the real, undifferentiated basis of all living beings. Through this transformation of the basis (*āśraya-parāvṛtti*) the *yogācāra* reaches the final stage of his yogic practice and attains Buddhahood.

LATER PERIOD: TRANSMISSION INTO CHINA AND JAPAN.

After Vasubandhu, scholars in the Yogācāra school formed two subschools. One maintained that the consciousness (*vijñāna*) is necessarily endowed with the “form” (*ākāra*) of an object and that of a subject; the other held that the forms of object and subject are of imagined nature and false and that the consciousness itself, which is a pure luminosity, is real. Proponents of the former were called, from the eighth century onward, the Sākāra-vijñānavādins (that is, the upholders of the doctrine that the consciousness is endowed with forms) and proponents of the latter were termed the Nirākāra-vijñānavādins (that is, the upholders of the doctrine that the consciousness possesses no form). Dignāga (c. 480–540) and Dharmapāla (c. 530–561), prominent scholars in Nālandā, are recognized as the early representatives of the former and Sthiramati (c. 510–570) in Valabhī as an advocate of the latter. The Sākāra-vijñānavāda is doctrinally related to the Sautrāntika school, and a branch of the Nirākāra-vijñānavāda, represented by Śāntirakṣita (c. 725–788) and Kamalaśīla (c. 740–795), is united with the Mādhyamika. Scholarly activities continued in both subschools until the twelfth century, when Buddhism declined in India. In the last period, Ratnakīrti and Jñānaśrīmitra (eleventh century) maintained the former, and Ratnakārasanti (c. eleventh century) was a powerful advocate of the latter. Dharmakīrti (c. 600–660) and Prajñākāragupta (c. eighth century) are recognized by both subschools as exponents of their respective doctrines.

As early as the fifth century some Yogācāra works were translated into Chinese, but a real interest in Yogācāra was not aroused until Bodhiruci (?–527) arrived in China in 508 and translated Vasubandhu’s commentary on the *Daśabhūmika Sūtra*, the *Shi di jing lun* (T.D. no. 1522), in which the doctrine of the *ālaya-vijñāna* is presented. This work was accepted as an authority among Buddhist circles in North China, and gave rise to the Dilun sect. In the meantime, Paramārtha (c. 499–569), who came to South China in 546, introduced several Yogācāra treatises to the Buddhist

circles. He attached importance to the *Mahāyānasamgraha*, and his translation of this treatise, namely, the *She dasheng lun* (T.D. no. 1593), was treated as the basic text of the Shelun sect. In the seventh century, Xuanzang (602–664) traveled to India and studied Yogācāra doctrines at Nālandā under Śīlabhadra, a disciple of Dharmapāla. After returning to China in 645, Xuanzang translated a number of important Yogācāra works. In his translation of Dharmapāla’s commentary on the *Triṃśikā Vijñaptimātratāsiddhiḥ* of Vasubandhu, he incorporated the views of ten other commentators and composed the *Cheng weishi lun*. This work was recognized as authoritative for Yogācāra dogmatics by the Faxiang sect, which was founded by Kuiji (632–682), a disciple of Xuanzang. Both the Dilun sect and the Shelun sect were absorbed into and replaced by the Faxiang sect, which itself soon declined under the new trend of Buddhism represented by the Huayan and Chan sects.

The dogmatics of the Faxiang (Jpn., Hossō) sect were introduced into Japan during the Nara period (710–784) by some monks who had studied in China. The *Cheng weishi lun* was earnestly studied there by Buddhist scholars of different sects until recent years.

HATTORI MASAOKI (1987 AND 2005)

YOGANANDA (1893–1952) was one of the earliest and most influential of the Hindu gurus to come to the West.

Growing up in Calcutta in Bengal, India, he was a product of the Bengali Neo-Vedāntic Renaissance and was influenced by the saint Sri Ramakrishna (1836–1886).

The Neo-Vedāntic Renaissance originated in Bengal, one of the areas of India with the most exposure to Western culture as a result of British colonialism. The movement sought to reassert the vigor and worth of Hindu spirituality and philosophy while being open to influences from other religions and Western science and values. Yogananda was affiliated with a lineage of gurus that sought to integrate Hindu spirituality with a modern, Western-influenced lifestyle. Yogananda felt that he had a special destiny: to introduce Hindu concepts and spiritual techniques to westerners. He did this by disseminating a practice called *kriyā yoga* through his organization, the Self-Realization Fellowship, and by the publication of his books. His most famous published work is his *Autobiography of a Yogi*, first published in 1946, which has been translated into eighteen languages.

YOUTH IN INDIA. Yogananda was born Mukunda Lal Ghosh, the son of a railway executive in Bengal. His parents were disciples of Lahiri Mahasaya (1828–1895), a household guru (he continued his married family life while being a guru) who taught a spiritual technique called *kriyā yoga*.

As a boy, Mukunda's first mentor in spirituality was "M." or Mahendra Nath Gupta, a disciple of Sri Ramakrishna and author of *Śrīśrīrāmākṣṇakathamṛta*, which was shaped by Swami Nikhilananda into *The Gospel of Sri Ramakrishna*. M. took Mukunda to worship at the Kālī temple at Dakshineswar, which had been Ramakrishna's residence, and stimulated Mukunda's first mystical experience. One day after M. and his young protégé were exiting a bioscope (an early motion picture), M. tapped Mukunda on his chest. Suddenly all noise on the busy street stopped for Mukunda. He saw the pedestrians and vehicles, but all was silent, and he observed a luminous glow emanating from all phenomena. This experience was the basis of Yogananda's later teaching that the physical world has the reality of a motion picture or a dream.

In 1910 Mukunda became the disciple of Swami Sri Yukteswar (1955–1936), who was a direct disciple of Lahiri Mahasaya. Mukunda completed his A.B. degree at Serampore College. He then took vows of *sannyasa* (renunciation) and became Swami Yogananda. In 1917 Yogananda demonstrated his considerable administrative ability by founding a boys' school, which he ran under the auspices of an organization he named the Yogoda Satsanga Society.

MISSION IN THE UNITED STATES. After Swami Yogananda came to the United States from India in 1920, he attracted numerous disciples by means of his public lectures and writings. Yogananda built up an organization called the Self-Realization Fellowship (SRF) to disseminate his presentation of the wisdom and spiritual techniques of Hinduism. Yogananda first came to the United States to deliver an invited lecture to the International Congress of Religious Liberals, sponsored by the American Unitarian Association. He subse-

quently spoke to large audiences across the United States from 1924 to 1927. In 1925 an estate was acquired at Mount Washington in Los Angeles, California, to be the headquarters of his organization, which was incorporated in 1935 as the Self-Realization Fellowship. In that same year his guru gave him the title Paramahansa ("supreme swan") indicating that he had achieved the highest enlightenment and, while in India on a visit, he initiated Mohandas Gandhi into *kriyā yoga*. In 1946 Yogananda published his most famous book, *Autobiography of a Yogi*, in which he describes his meetings with Eastern and Western saints and discusses visions and miracles that demonstrate the availability of supernatural powers and enlightenment to adepts of all religious traditions. In the ensuing years the SRF established a hermitage at Encinitas, California, a temple in San Diego, the Church of All Religions in Hollywood, and the Lake Shrine at Pacific Palisades, California, where a portion of Gandhi's ashes are kept. By 2004 the SRF additionally had forty-four centers and meditation groups in the United States as well as centers and groups in seventeen other countries.

Yogananda is regarded by his disciples as a *prematatār*, an incarnation of divine love. Yogananda stressed the deep emotional love for God that is associated with Hindu *bhakti yoga*. Members of the SRF revere Krishna and Christ as the two great gurus from whose works the teachings of Yogananda's lineage of gurus are derived. The SRF offers instruction in *kriyā yoga* and related philosophy and practices conveyed in a correspondence course called the SRF Lessons. Students pledge to keep the *kriyā yoga* technique secret from non-initiates. The SRF also has a monastic order for women and men headquartered at Mount Washington.

Yogananda passed away on March 7, 1952, after speaking at a banquet of the India Association of America at the Biltmore Hotel in Los Angeles. His devotees believe that the lack of corruption displayed by his body for twenty days after his death was the physical manifestation of his yogic mastery. Rajarsi Janakananda (formerly James J. Lynn) took over the leadership of the SRF until his death in 1955. An American woman, Sri Daya Mata, has served as SRF president since 1955. The Self-Realization Fellowship continues to disseminate Yogananda's books and to offer instruction in *kriyā yoga* and other spiritual techniques. Although Yogananda has passed from the material world, he is regarded as a still-living master who continues to guide his disciples.

CATHERINE WESSINGER (2005)

YOĤANAN BAR NAPPAĤA' (d. 279?), leading Palestinian amora. Yoĥanan's father and mother had both died by the time he was born (B.T., *Qid.* 31b), and his apparent patronymic refers either to his trade as a smith (*nappaĥa'*) or to his legendary, "inflaming" good looks. Yoĥanan is always referred to either by his given name or by the epithet *bar Nappaĥa'*, never both.

Yoĥanan's studies began during the lifetime of Yehuda ha-Nasi', known as "Rabbi," the redactor of the Mishnah. Later, Yoĥanan remembered having attended Rabbi's lectures and not understanding them (B.T., *Hul.* 137b). A native of Sepphoris, Yoĥanan began his studies there, but ultimately he became head of a prestigious rabbinic academy in Tiberias, where he spent the major part of his career. The only Babylonian for whom he spontaneously expressed respect was Rav, with whom he had studied under Yehuda ha-Nasi'; he later came to acknowledge the mastery of Shemu'el (B.T., *Hul.* 95b), but the two never met. In general, Yoĥanan's career was limited to the rabbinate of the Land of Israel, though his reputation traveled far beyond that country and even in Babylonia equaled that of the great Babylonian masters (B.T., *'A.Z.* 40a).

Yoĥanan inherited a considerable amount of wealth but was said to have allowed it to dissipate in his pursuit of advanced learning. He became the teacher, senior colleague, and brother-in-law of Shim'on ben Laqish. The latter, according to Talmudic tradition, was originally attracted to Yoĥanan because he was so handsome. Shim'on became Yoĥanan's colleague and eventually the two were inseparable. It is recorded that Shim'on died because of a slight from his companion. Later legend explained Yoĥanan's own death as the result of his grief over this incident. Yoĥanan was also embittered by the death within his lifetime of ten of his children (B.T., *B.M.* 84a, *Ber.* 5b).

In his halakhic teaching, Yoĥanan devised a number of rules for determining which of several conflicting opinions in the Mishnah was to be followed—for example, when Me'ir and Yehuda disagree, the *halakhah* ("law") follows Yehuda; when Yehuda and Yose disagree, the *halakhah* follows Yose (B.T., *'Eruv.* 46b); whenever Shim'on ben Gamli'el

gives a ruling in the Mishnah, the *halakhah* follows him except in three cases (B.T., *Git.* 75a); when Yehuda ha-Nasi disagrees with his colleagues, the *halakhah* follows him (J.T., *Ter.* 3.1, 42a). He also formulated the much-quoted norm that the law always follows anonymous Mishnaic rulings (see, for instance, B.T., *Shabbat* 46a, and J.T., *Shabbat* 3.7, 6c). Yoĥanan's influence on the development of rabbinic scholarship in the Land of Israel was so great that Moses Maimonides considered him the redactor of the Jerusalem Talmud, although this is surely an exaggerated report.

According to one tradition, the custom of placing decorative art on walls (probably the walls of synagogues) arose in Yoĥanan's time "and he did not object" (J.T., *A.Z.* 3.3, 42d). Yoĥanan also became an authority on calendrical astronomy (J.T., *R. ha-Sh.* 2.6, 58a-b; B.T., *Hul.* 95b). With respect to nonlegal lore, Yoĥanan was known as a student of *merkavah* mysticism, which he unsuccessfully offered to teach to his own student El'azar ben Pedat. The long *aggadah* (nonlegal rabbinic thought) on the destruction of Jerusalem that starts in the Babylonian Talmud tractate *Gitin* 55b is attributed to him, as are other narratives that purport to recount important events in the history of the rabbinate (B.T., *Hor.* 13b) or the circumstances that gave rise to particular rabbinical enactments (B.T., *B.Q.* 94b, *Bekh.* 30b). Yoĥanan also gave considerable attention to the etiquette of prayer and to methods for increasing its effectiveness. According to legend, his final instructions were that he was to be buried in neither a black nor a white shroud so that he would not be ashamed to find himself in the company of either the righteous or the wicked.

ROBERT GOLDENBERG (1987)
Revised Bibliography

YOĤANAN BEN ZAKK'AI (c. 1–80 CE), sage and leader of Judaism in the Land of Israel after the destruction of the Jerusalem Temple in 70 CE. Known to us only from sources brought to closure two and more centuries after his death, beginning with the Mishnah (c. 200), two facts about his life are certain: he lived before the destruction, and survived it.

Yoĥanan was the principal figure in the formation, in the aftermath of the calamity, of a circle of disciples with whom he laid the foundations of the Judaism presented by the Mishnah. This work of legal-theological formation defined Judaism as it would be known from the second century onward. Yoĥanan himself is represented in the Mishnah principally through attributions to him of certain temporary ordinances, meant mostly to take account of the destruction of the Temple as an event in the sacred calendar of Judaism. These reforms, involving very trivial matters, signified a policy of surviving and carrying on. They meant that even without the Temple it would be possible to worship God and observe the festivals formerly focused upon the Temple. To Yoĥanan are attributed, also, certain interpretations of biblical stories, one of which stressed that Job had served God out of awe and reverence, not (merely) love. Finally, he is represented as having attempted to exercise authority even over the priesthood, which had formerly run the country. His rulings in matters of genealogy, on which priestly authority rested, indicate that he held that sages' mastery of Torah was paramount, priests' genealogical standing derivative. In these aspects Yoĥanan carried forward the position of the Pharisees of the period before the destruction. They had maintained that lay people might observe at home certain rules that were kept by the priests in the Temple, so indicating that the priests enjoyed no monopoly over access to the sacred.

In compilations of stories produced much later than the Mishnah, Yoĥanan's career is fleshed out. His surviving the destruction is represented as an encounter between Israel, the Jewish nation, and Rome, with a sage, Yoĥanan himself, negotiating on behalf of the Jews with a Roman general. In the principal version Yoĥanan is portrayed as having escaped from Jerusalem before it was fully invested and as having come before the Roman general Vespasian. He asked for the right to go to Yavneh, a coastal town where loyalists were held. There he would teach his disciples, establish a house of prayer, and carry out the commandments, the religious deeds of Judaism. He further informed Vespasian that the general would become emperor. (In other versions Yoĥanan is supposed to have asked for "the chain of Rabban Gamli'el and physicians to heal Rabbi Tsadoq.")

Yoĥanan's message to Israel, portrayed in other late sources, involved three elements. First, not to take too seriously the claims of messiahs: "If you have a sapling in your hand and people say to you, 'Behold, there is the Messiah,' go on with your planting, and afterward go out and receive him." Second, to obey God's will as the response to defeat: "Happy are you, O Israel! When you obey the will of God,

then no nation or race can rule over you! But when you do not obey the will of God, you are handed over into the hands of every low-born people." Third, what God wants is acts of loving kindness. Yoḥanan held that even though sin could no longer be atoned through sacrifice in the Temple, "We have another atonement as effective as this. And what is it? It is acts of loving-kindness, as it is said, 'For I desire mercy, not sacrifice'" (*Hos.* 6:6).

Whether or not these tales go back to the person, or even the time, of Yoḥanan ben Zakk'ai, we do not know. But they are the foundation legends of the kind of Judaism that has been paramount from the second century to the present, and Yoḥanan, above all, is credited with the definition of that Judaism.

BIBLIOGRAPHY

The most original and important scholarship on Yoḥanan ben Zakk'ai is in Gedalyahu Alon, *Jews, Judaism and the Classical World*, translated from the Hebrew by Israel Abrahams (Jerusalem, 1977), pp. 252–343. The principal tales appear in *The Fathers according to Rabbi Nathan*, translated from the Hebrew by Judah Goldin (New Haven, 1955). This work is a compilation of rabbinical fables, loosely organized around the Mishnah tractate *Avot*. Two works of my own concern Yoḥanan: all of the sources on the man are collected and analyzed, in the rough sequence of their formation, in *Development of a Legend: Studies on the Traditions concerning Yoḥanan ben Zakkai* (Leiden, 1970) and are collected into a biography in *A Life of Yoḥanan ben Zakkai, ca. 1–80 C.E.* (Leiden, 1970).

YOM KIPPUR SEE RO'SH HA-SHANAH AND YOM KIPPUR

YONI is a Sanskrit word with various meanings such as "womb, vulva, vagina; place of birth, source, origin, spring; abode, home, lair, nest; family, race, stock, caste," and so on. It is etymologically derived from the verbal root *yu* ("join, unite, fasten, or harness"), from which is derived the English

yoke; *ni* is added to the root to form a noun with active meaning. Thus *yoni* is "what joins or unites." The word *yoga*, derived from the same root, means "union, connection." The two words *yoni* and *yoga* are thus similar to the word *religion*, from the Latin *religio* ("binding, fastening, reuniting, or re-linking").

Icons representing the *yoni* alone or in conjunction with the male generative organ, the *liṅga*, are widespread in both popular Hinduism and in the Tantric traditions of India; such images, known in English as yonis and lingams, stand for the generic goddess, Devī, in her many aspects, and the god Śiva. These traditions are the heirs of a female-dominated symbol system characteristic of the pre-Vedic worldview. Before the Indus and Ganges valleys were populated from the north by Aryan pastoral nomads, bearers of a more androcentric religion, there flourished an agricultural civilization known as the Indus Valley civilization (c. 4000–1000 BCE). Archaeological remains from the sites at Harappa and Mohenjo Daro abound in mother-goddess figurines, large stone yonis (and lingams), and a variety of seals. One of the most intriguing of these seals bears the figure of a man in a cross-legged posture typical of yogic discipline. The religious complex of ideas and practices called *yoga* has been identified as being pre-Vedic in origin; the yogic posture of the figure on this Indus Valley seal is one of the strongest pieces of evidence for the pre-Vedic origins of yoga. Scholars have until recently identified this horned yogic person as a proto-image of Śiva. More recent research has identified the scene depicted on the seal as being linked with an archaic form of the still-practiced buffalo sacrifice to the Goddess. On the seal the Goddess is represented next to her mount, the lion, which is shown in a dynamic posture facing the seated figure on its right, corresponding to the northern direction with the Goddess. The yogic posture of the buffalo-horned god has been interpreted as expressive of the destructive and creative power entailed by the sacrifice. The sacrifice itself aims at a symbolic unification with the Goddess. In many popular South Indian myths concerning this sacrifice, the buffalo is depicted as desiring or actually uniting with the Goddess in the guise of a lower-caste husband or suitor. As David Shulman has shown in his discussion of South Indian mythology (1980), Śiva becomes the buffalo. Through sacrificial death, Śiva as the buffalo consort of the goddess is reborn from her. In these myths and representations one seems to be able to apprehend the common etymology of the terms *yoni* and *yoga*. Union with the Goddess is the ultimate aim of the sacrifice; it is at one and the same time an abstract concept and a concrete act of union with the Goddess's icon, namely her yoni.

The symbolism on this famous Harappan seal, thus interpreted in the light of contemporary ritual practices and myths, brings up the extremely widespread symbolic themes of the mysterious and potent link between the yoni and death, and sacrificial death in particular. Perhaps the earliest evidence of the theme is to be found in the European Paleo-

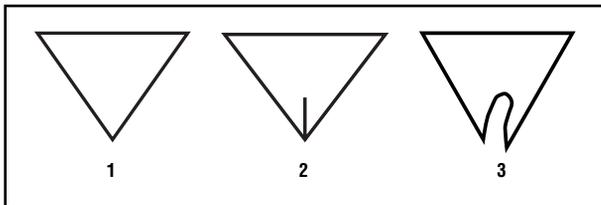

FIGURE 1. Yoni symbols.

lithic caves dating from about 20,000 to 11,000 BCE. Yoni symbols have been found in profusion in these caves, many of them identical to some of the Indian representations of the *yoni*. The most often found Paleolithic *yoni* symbol is the same as the Tantric symbol, namely a downward-pointing triangle (see figure 1.1), with variations (figure 1.2, 1.3). What is even more remarkable is the association between the yonic triangle and representations of the bison found at several Paleolithic caves, since the bison is the Western cousin of the Eastern buffalo.

The most striking such representation is the one found at the Abri du Roc aux Sorciers at Angles-sur-Anglin, France, dating from about 13,000 to 11,000 BEC. A colossal group of three female torsos with exaggerated *yonis*, all represented as cleft downward-pointing triangles (figure 1.2), are etched in the living rock wall. The three female figures are standing on a bison. The relief of two recumbent female figures dates from the same period; they flank both sides of the entrance to a shallow cave at La Madeleine in France. The figure to the right has at its center the same downward-pointing cleft triangle to represent the *yoni* (the left image is too damaged to discern the sexual parts); below the figure on the left is a bison.

The famous “Woman with the Horn,” dating some five to seven thousand years earlier, depicts a nude female holding a bison horn in her right uplifted hand; it is incised on the rock wall of a shelter at Laussel in France. The bison horn is marked with thirteen lines, most likely representing the thirteen lunar months in the year. The crescent shape of the horn bears an unmistakable likeness to the lunar crescent. The analogy between the cycles of the moon and the menstrual cycle of women is found in most cultures of the world. The parallelism is most directly stated by the !Kung hunters and gatherers of the Kalahari Desert of southern Africa, among whom the menses are simply called “the moon.”

Only a few miles from the Laussel rock shelter is situated the most grandiose of all Paleolithic painted caves, that of Lascaux. That caves were symbolic of the earth’s womb is strongly suggested by the cave at La Madeleine, with its entrance flanked by two nude women. On the rim of the entrance to the Lascaux cave is incised a cluster of what André Leroi-Gourhan has termed “female vulvas in the shape of claviforms.” Thus to enter a cave was to enter the deep, labyrinthine, dark womb of Mother Earth.

In India in the early twenty-first century there are several popular pilgrimage sites where the icon of the Goddess is situated deep in a cave whose access is through an extremely narrow, dark, and winding passageway. The most famous such natural icon of the Goddess’s *yoni* is found in Assam in eastern India, at the shrine of Kāmakhya Devī. It is a natural cleft in the rock that is said to menstruate once per year, the period coinciding with the main festival of the Goddess in June at the time of the arrival of the monsoon. The shrine of Kāmakhya Devī is linked with the myth of Satī, the consort of Śiva, who immolated herself after her father scorned her husband by not inviting him to a great sacrifice. The disconsolate Śiva carried Satī’s corpse with him in his wanderings, and parts of her body fell to earth. Her *yoni* fell where the shrine of Kāmakhya Devī is located. At the shrine of Vaishno Devī in Jammu, pilgrims crawl on their bellies along a dark and wet narrow corridor to reach the cave of the Goddess. A spring originates there, completing the birth-rebirth imagery. Clearly the yonic symbolism of caves is extraordinarily ancient.

The cave at Lascaux is immense, with several corridors and large chambers covered with spectacular rock paintings of animals. These caves were not habitats but ritual centers for the Paleolithic hunters and gatherers. The painted herds found in their depths, visible only by the flickering light of torches, may represent the animals in the earth’s womb out of which animals come in the daylight and into which they return at night, only to reemerge in the morning. A painted scene in the innermost recess of this complex of caves, called “the Crypt” because it is sixteen feet below the general level of the cavern floor, has been interpreted by Joseph Campbell as representing a similar theme, that of the regenerative power of death. The scene shows a bison with a spear entering through its anus and emerging from its genitals, where its entrails hang out in the form of four concentric ovals. Next to the bison lies a bird-headed or bird-masked ithyphallic man and next to him a spear-thrower and a bird-topped staff. The figure in all likelihood represents a shaman, since birds are in contemporary shamanistic contexts the typical vehicles for the shaman’s trance flight to the underworld or the heavens.

The symbolic equivalence between spear and phallus is ethnographically widespread, as is the analogy between concentric ovals or other labyrinthine or spiral patterns and the female generative organs. The association between the *yoni* and a wound is widespread as well. It is an analogy still expressed today in South India and Sri Lanka. An ancient Tamil poem brings together the phallus-spear and *yoni*-wound analogies by depicting a man who views his newborn son for the first time wearing full warrior attire, a bloody spear in his hand and a freshly self-inflicted wound on his neck. Leroi-Gourhan, who has made an intensive study of the Paleolithic cave paintings, identifies the bison’s hanging entrails as a *yoni* symbol. The speared bison, most probably a sacrificial victim, represents in death a sexual union. The

scene is hauntingly reminiscent of the sacrifice of the buffalo-man to the Indian Goddess, also equivalent to sexual union. The womb-cave of the earth is a generative power, which brings forth life through death.

The view of the womb as the originator of both life and death is succinctly captured in the following Hindu saying: "Again birth, again death, again sleep in the mother's womb." In many so-called primitive cultures, the departed ancestors live in a place from which they come back to enter the *yonis* of women to be reborn. In the Trobriand Islands of Melanesia unborn and the dead are the very same beings. After death and the observation of the proper funerary rituals, the departed ancestor or ancestress goes to the island of Tuma. It is from that island that the departed return in the form of the soul of unborn children to enter the *yonis* of Trobriand women. In aboriginal Australia, the sacred engraved ancestral stones called *tjurungas* are hidden in hollows and caves; by visiting these sites the women become impregnated. It is in the light of such cyclical views of generation and regeneration that one can understand rituals in which death and the act of generation are made to coincide as they apparently do in the Lascaux crypt; the end is also the beginning.

Entering the womb/caves of the Paleolithic hunters and gatherers must have been a numinous experience for the participants, who had to creep through dangerously narrow, dark passageways to a world beyond night and day, beyond time itself. It is indubitable that the nearly universal analogy between the earth and woman implicit in the womb/cave identification is at least as old as those remotest of cultures.

The theme of the earth as a womb into which the dead are placed is found throughout the Neolithic period. In her work summarizing the archaeological finds in southeastern Europe and the eastern Mediterranean areas (6500 to 3500 BCE), Marija Gimbutas (1982) gives ample evidence of the prominence of triangular *yni* designs as well as of goddess images in the act of giving birth, legs wide apart. The dual nature of the goddess as both giver and taker of life is most vividly represented in the many shrines found at the site of Çatal Hüyük in Anatolia. Breasts rising out of the shrine wall have open nipples out of which vultures' beaks protrude; the skull of the vulture is inside the breast. The wall paintings in these shrines show vultures pecking at the flesh of headless corpses. The evidence from burial sites in the shrines led the excavator of Çatal Hüyük, James Mellaart, to the conclusion that before burial in the earth, the corpses were exposed on elevated platforms for the purpose of excarnation. This is a practice still followed by Zoroastrians. In some of the shrines, images of the naked goddess are represented giving birth to a bison or a ram's head. In other sites of this area, designated by Gimbutas as Old Europe, the dead are placed in egg-shaped pithoi in a fetal position. Like the grave pit, the pithos was considered to be a womb from which the child or adult could be born again. Often the body was sprinkled with red ocher, a symbol of blood, to assure the restoration of life.

Cave mouths and clefts in rock walls are not the only yonic associations one encounters cross-culturally. Mountains themselves have been associated with the *yni*, as the Latin term *mons veneris*, meaning the yonic triangle, attests, since it literally means "mountain of Venus." Springs, rivers, ponds, lakes, and seas have female meanings in many cultures of all levels of complexity. From the *yni* gush forth the maternal waters at the time of birth. The earth's stones and metals have been analogized to the Goddess's bones. In the realm of vegetation some of the best-known yonic icons are fruits whose shape are in some ways analogous to that of the *yni*. Some of the best-known are the pomegranate (Europe and West Asia), the mango (South Asia), the kidney bean (Rome), the fig and the almond (the Mediterranean world), and the peach and the apricot (Europe).

The active character of the etymology of the word *yni* reveals itself in the mythological realm as the *śakti*, or power of the Goddess. These are contemporary Hindu concepts that seem to be the heirs of one of the oldest religious traditions of humankind. In the Tantric tradition—and much popular Hinduism as well—the Goddess is the active principle in the cosmos without whom her male consort Śiva would be just a corpse. The life-giving, animating power of the cosmos is Śakti, a personification that in its most concrete manifestation resides in the *yni*. In the esoteric Tantric traditions in both Hinduism and Buddhism, the *yni* is worshiped in an elaborate secret ritual in the form of several symbolic representations. It is worshiped literally as well: a woman sits nude and cross-legged, exposing her *yni*, to which the worshipper makes a series of offerings. For Tantrics, all women are living incarnations of the Goddess. In popular Hinduism, the *yonis* of sculpted female figures on entrance gates are ritually fingered by worshipers as they enter a place of worship.

Popular belief in Hindu India holds that vaginal fluids enter the man's penis during intercourse. This belief corresponds to the standard Indian poetic image for sexual union, that of the male bumblebee gathering honey in female flower buds. In intercourse, through the woman's vaginal fluids a man receives the *śakti* that is his wife's. Such ideas underlie the custom of the establishment of concubines for kings, chiefs, and other important males, a practice found not only in India but in certain West African and Pacific cultures as well. These ideas are by no means encountered solely among complex cultures based on agriculture, such as traditional Hindu India, but are also found among hunters and gatherers. A !Kung woman from the Kalahari Desert, named Nisa by her anthropologist biographer (Marjorie Shostak), says the following about women's genitals: "Women possess something very important, something that enables men to live: their genitals. A woman can bring a man life, even if he is almost dead. She can give him sex and make him live again. If she were to refuse, he would die!"

The life-giving power of vaginal fluids is most concretely exemplified among the Kiwai people of New Guinea. Vag-

inal secretions are used extensively in garden rituals. For example, when the first shoots of yams, the culture's staple diet, have sprouted above ground, the mother of the owner of the garden smears her hands with her vaginal fluids and tugs at one of the shoots. At the time of planting taro, the mother lies down nude in the garden; and her husband inserts the digging stick in her vulva and then digs the hole in the ground between her legs. The fertile powers of the vulva and its secretions could not possibly be more concretely stated.

In most agricultural societies the furrow or the seed hole stand for the vulva. The seed stands for semen, and the plough or digging stick for the phallus. *Sītā*, the heroine of the Indian epic the *Rāmāyaṇa*, was born in a furrow; indeed, her name means "furrow." When she was abducted by the demon king Rāvaṇa, the vegetation wilted and the animals ceased to reproduce. Rāma, her royal husband, unable to unite with her, had to endure a barren realm until he was able to bring her back.

Underlying the symbolic associations between the earth, its caves, furrows, and waters and the vulva is the notion of the transformative powers of female sexuality. In the furrow the seed transforms itself into fruit or grain; in the cave/womb of the earth death transforms itself into life; in the womb of woman, male and female sexual fluids transform themselves into a human being. The transformative powers of the vulva account for much of the symbolism of initiation rites cross-culturally. The transformation of a child into a sexually potent adult or of an uninitiated person into an initiated one is very often effected by a symbolic return into the womb, the original transformative matrix. It is interesting to note that in Hindu India both the Vedic initiation for a *brahman* male and the Tantric initiation rite use basically the same womb symbolism. The following passage from the *Aitareya Brāhmaṇa* (1.3), most graphically describes this process:

Him whom they consecrate the priests make into an embryo again. He should be bathed in water. . . , anointed with *navanita* or clarified butter [a symbol of embryo, according to the text] and purified with *darbha* or *kusa* grass. Then collyrium is to be put in his eyes, just as it is in the eyes of the new born. After this, the candidate will have to enter and stay in a hut shaped like a female organ.

The absence of any other openings except for the eastern entrance can only be explained in terms of a womb symbolism. The native North American Navajo myth of Changing Woman makes it clear that impregnation by the Sun took place through the hogan's eastern entrance. Thus the initiate is transformed into a bringer of fertility to herself, the people, and the earth in a fashion identical to that of Changing Woman. The transformation was accomplished through a stay in a symbolic vulva that, through song, became the primordial hogan at the womb-gate of the earth.

Aside from the transformative religious mysteries of sacrifice and initiation, the obvious life-giving and growth-

promoting powers of the vulva and its secretions have given rise to a widespread use of representations of the female genitalia as apotropaic devices. The custom of plowing a furrow for magical protection around a town was practiced all over Europe by peasants. It was still observed in the twentieth century in Russia, where villages were thus annually "purified." The practice was exclusively carried out by women, who, while plowing, called on the moon goddess. A similar apotropaic function seems to have prompted the placing of squatting female figures prominently exposing their open vulvas on the key of arches at church entrances in Ireland, Great Britain, and German Switzerland. In Ireland these figures are called Sheelagh-na-gigs. Some of these figures represent emaciated old women. These images are illustrations of myths concerning the territorial Celtic goddess who was the granter of royalty. When the goddess wished to test the king-elect, she came to him in the form of an old hag, soliciting sexual intercourse. If the king-elect accepted, she transformed herself into a radiantly beautiful young woman and conferred on him royalty and blessed his reign. Most such figures were removed from churches in the nineteenth century.

This Celtic tradition bears a remarkable resemblance to certain Hindu myths and rites. The goddess Lakṣmī is also a granter of sovereignty. In union with her, a man becomes a king. If she leaves such a man, he loses his sovereignty and/or the power to ensure the fertility and well-being of his realm. Lakṣmī's iconography is intimately associated with the lotus, one of the most ubiquitous South Asian *yoni* symbols. The lotus itself can stand for Lakṣmī. Her consort, Viṣṇu, who is an embodiment of sovereignty, has as one of his four attributes the lotus, which he holds in one of his hands. This denotes his union with the Goddess, the source of his sovereignty. Such beliefs underlie the apotropaic character of the couples engaged in sexual intercourse often found sculpted on the outer walls and entrances of Hindu temples. The magical protective function of the female genitalia is dimly preserved in the European folk custom of hanging a horseshoe over the threshold. The horseshoe, made from a substance from deep inside the womb of the earth—iron—is shaped like the loop in the yonic triangles.

A remarkable parallel to the Celtic Sheelagh-na-gig is found in the Palauan archipelago. The wooden figure of a nude woman, prominently exposing her vulva by sitting with legs wide apart and extended to either side of the body, is placed on the eastern gable of each village's chiefly meeting house. Such figures are called *dilugai*. Interestingly, the *yoni* is in the shape of a cleft downward-pointing triangle. These female figures protect the villagers' health and ward off all evil spirits as well. They are constructed by ritual specialists according to strict rules, which if broken would result in the specialist's as well as the chief's death. It is not coincidental that each example of signs representing the female genitalia used as apotropaic devices are found on gates. The vulva is the primordial gate, the mysterious divide between nonlife and life.

A final major cluster of meanings associated with the vulva relates to its association with wealth. Such an association expresses itself in a broad variety of cultures and in different ways. Shells in general have been and still are symbols of the vulva; the earliest known example is a Magdalenian (Upper Paleolithic) fragment of bone from Arudy in southwestern France depicting a horse's head in the act of licking a yonic shell. However, the link between the vulva and wealth has been represented perhaps most prevalently by the cowrie shell, which has served as a medium of economic exchange in several cultures, particularly in West Africa and India. This smooth univalve bears in its shape and coloring an unmistakable resemblance to the vulva, which undoubtedly accounts for the association in as widely separated regions as West and North Africa, South Asia, Japan, and the Pacific Islands.

The complex of ideas relating wealth and fertility to the vulva is further illustrated by an example from the West African Tiv culture. One of their most sacred objects, symbolizing the fertility of their tribal land and the well-being of its inhabitants, is a human tibia, decorated and ornamented in the shape of a woman, with cowrie shells for the eyes and sometimes on the front of the body as well. It has a hole at the place of the navel; the decorations around it are the same as the scarifications produced on women's bodies at puberty. When disaster threatens or has taken place, and also in annual renewal ceremonies, this object, called the *imborivungu* ("owl pipe") is used ritually. In a secret ritual the elders pour blood from a miscarried fetus into its navel hole. The *imborivungu* is then shaken over fields and in wells to ensure the fertility of the land and of the women. In this example, the yonic cowries, along with the abdominal designs, identify the sacred object as a fertile woman. The ritual is intended to bring about both material abundance—since good crops are the primary source of wealth in agricultural societies—and the fertility of women. Here again one finds the nearly universal equation between the fertility of the earth, the source of wealth, and the fertility of women.

BIBLIOGRAPHY

There is no single work available that deals primarily with this topic. Information is widely scattered in many different works of ethnography, history of religion, and art history, to mention the most relevant disciplines. On the Tantric religion of India a thorough and reliable work is N. N. Bhattacharyya's *History of the Tantric Religion* (New Delhi, 1982). A useful study of female initiation rites in five cultures—India, Navajo, Tiv, Amazon Basin, and ancient Greece—is Bruce Lincoln's *Emerging from the Chrysalis: Studies in Rituals of Women's Initiation* (Cambridge, Mass., 1981). For an inspiring and superbly illustrated treatment of the Paleolithic cave paintings, Joseph Campbell's *The Way of the Animal Powers*, vol. 1 of his *Historical Atlas of World Mythology* (New York, 1983), provides an excellent summary of scholarly re-

search to date. Marija Gimbutas's book *The Goddesses and Gods of Old Europe, 7000–3500 B.C.: Myths, Legends, Images* (Berkeley, Calif., 1982) is a must for a richly illustrated and clearly presented treatment of goddess imagery during the Neolithic period in Europe. *Primitive Erotic Art*, edited by Philip S. Rawson (New York, 1973), has seven essays covering prehistory, Celtic and northern regions, North America, Mesoamerica, the Central Andean region, Africa south of the Sahara, and the equatorial islands of the Pacific. Rawson's own essay on Paleolithic and primitive symbolism is an excellent introduction and can be used for further research. For a convenient compendium of information on female-centered religious myths and rituals, Barbara G. Walker's *The Woman's Encyclopedia of Myths and Secrets* (San Francisco, 1983) is quite useful; each entry is footnoted, and the bibliography is extensive. Elinor Gadon's *The Once and Future Goddess* (San Francisco, 1989) has an excellent survey of Goddess' icons, including the *yonis* throughout prehistory and history. An important article on a reevaluation of the so-called proto-Śiva Harappan seal is Alf Hildebeitel's "The Indus Valley 'Proto-Śiva,' Reexamined through Reflections on the Goddess, the Buffalo, and the Symbolism of *Vahanas*," *Anthropos* 73 (1978): 767–797. For a comprehensive treatment of the links between the West Asian, the Harappan and the Hindu Goddess see the following three articles by the vedic scholar Asko Parpola: "The Metamorphoses of Mahisa Asura and Prajapati" in Hoek, A. W. van den, D. H. A. Kolff and M. S. Oort (1992): 275–308; "Vac as a Goddess of Victory in the Veda and Her Relation to Durga" *Annals of the Institute for Research in Humanities, Kyoto University* 1999: 34(2): 101–143; "Pre-Proto Iranians of Afghanistan as initiators of Sakta Tantrism: On the Scythian/Saka affiliation of the Dasas, Nuristanis and Magadhans" *Iranica Antiqua* 37 (2002): 233–324. On the royal symbolism of goddess Lakṣmī, see Frédérique Apffel, *Marglin Wives of the God-King: The Rituals of the Devadasis of Puri* (Oxford, 1985). For an in-depth treatment of yonic rituals in Tantric Buddhism, see Miranda Shaw, *Passionate Enlightenment* (Princeton, N.J., 1995). For an exhaustive treatment of the theme of sacrificial death, sexual union, and rebirth, David Dean Shulman's *Tamil Temple Myths: Sacrifice and Divine Marriage in the South Indian Saiva Tradition* (Princeton, N.J., 1980) is indispensable.

FRÉDÉRIQUE APFFEL-MARGLIN (1987 AND 2005)

YORUBA RELIGION. The twelve to fifteen million Yoruba people of southwestern Nigeria, the Republic of Benin (formerly Dahomey), and Togo (topographically the area is defined as that between 6°0–9°5' 2°41'–6° east longitude) are the heirs of one of the oldest cultural traditions in West Africa. Archaeological and linguistic evidence indicate that the Yoruba have lived in their present habitat since at least the fifth century BCE. The development of the regional dialects that distinguish the Yoruba subgroups and the process of urbanization, which developed into a social system unique among sub-Saharan African peoples, took place during the first millennium BCE. By the ninth century the ancient city of Ile-Ife was thriving, and in the next five centuries

Ifẹ artists would create terracotta and bronze sculptures that are now among Africa's artistic treasures.

Both Yoruba myth and oral history refer to Oduduwa (also known as Odua) as the first king and founder of the Yoruba people. Some myths portray him as the creator god and assert that the place of creation was Ile-Ifẹ, which subsequently became the site of Oduduwa's throne. Oral history, however, suggests that the story of Oduduwa's assumption of the throne at Ifẹ refers to a conquest of the indigenes of the Ifẹ area prior to the ninth century by persons from "the east." While it is increasingly apparent that the sociopolitical model of a town presided over by a paramount chief or king (*oba*), was well established in Ifẹ and present among other Yoruba subgroups, the followers of Oduduwa developed the urban tradition and enhanced the role of the king. In later years, groups of people who sought to establish their political legitimacy (even if they were immigrants) were required to trace their descent from Oduduwa. Such people were known as "the sons of Oduduwa," and they wore beaded crowns (*adenla*) given to them by Oduduwa as the symbol of their sacred authority (*aṣẹ*).

Origin myths, festival rituals, and oral traditions associate the indigenous peoples with Ọbatala, the deity (*oriṣa*) who fashions the human body. And because he too was an *oba*, his priests wear white, conical, beaded crowns similar to those reserved for "the sons of Oduduwa." The myths and rituals also refer to a great struggle between Ọbatala and Oduduwa at the time of creation, following Oduduwa's theft of the privilege granted by Ọlórún (Olodumare), the high god, to Ọbatala to create the earth and its inhabitants. In the town of Itapa, the sequence of rituals that composes the annual festival of Ọbatala reenacts a battle between Oduduwa and Ọbatala, Oduduwa's victory over and the banishment of Ọbatala, and the rejoicing that took place among the gods and humankind with the return of Ọbatala at the invitation of Oduduwa. And there is the tradition among the Ọyọ Yoruba of the unwarranted imprisonment of Ọbatala by Ẓango and the thunder god's release of the wandering, ancient king after famine and barrenness threatened field and home.

In these myths and rituals there is a historical remembrance of a usurpation of power and the acknowledgment that a violent conflict and a tenuous reconciliation gave birth to modern Yoruba culture. The remembrance, however, has not only to do with a past time, with historical and cultural origins; it is also a statement about the nature and limits of the authority of kings in defining the moral basis of Yoruba society. It is also about the importance of Ile-Ifẹ as the symbol of Yoruba cultural homogeneity, while acknowledging the distinctiveness and the independence of other Yoruba subgroups.

There are approximately twenty subgroups, each identifiable by its distinctive variation in linguistic, social, political, and religious patterns born of the history of the region. Among the principal groups are the Ẹgba and Ẹgbado in the southwest, the Ijebu in the southern and southeast, the Ọyọ

in the central and northwest, the Ifẹ and the Ijẹṣa in the central, the Owo in the eastern, and the Igbomina and Ekiti in the northeast regions. Throughout Yorubaland, the social system is patrilineal and patrilocal, although among the Ẹgba and Ẹgbado there are elements of a dual descent system. The extended family (*idile*), which dwells in the father's compound so long as space and circumstance permit, is the essential social unit and the primary context in which self-awareness and social awareness are forged. Thus, Ọdun Egungun, the annual festival for the patrilineal ancestors, is the most widespread and important festival in the Yoruba liturgical calendar. Elaborate masquerades (*egungun*), are created of layers of cloths of dark colors with white serrated edges. The costume covers the dancer, who moves about the compound or town with stately pace, occasionally performing whirling movements, causing the cloths to splay out in constantly changing patterns. In movement and appearance the masquerade depicts the presence and power (*aṣẹ*) of the ancestors. The ancestors are those persons who established the "house" (*ile*) and the family and who continue to stand surety for its integrity and survival against threats of witchcraft and disease, so long as their heirs acknowledge the ancestral presence.

While masquerades for the patrilineal ancestors are found among all the Yoruba, there are other masked festivals that are distinctive to particular areas, reflecting the regional history that has shaped the Yoruba experience. The Yoruba peoples of the southwest (the Anago, Awori, Ẹgbado, Kẹtu, and Ẹgba) celebrate the Gẹlẹdẹ festival at the time of the spring rains. The festival honors *awon iya wa* ("the mothers"), a collective term for the female power (*aṣẹ*) possessed by all women but especially manifest in certain elderly women and in female ancestors and deities. It is the awesome power of woman in its procreative and destructive capacities that is celebrated and acknowledged. Among the Ijebu peoples of the south the annual festival for Agẹmọ, an *oriṣa* whose power is represented by the chameleon, brings sixteen priest-chiefs famed for their magical or manipulative powers from towns surrounding the capital city of Ijebu-Ode into ritual contests of curse and masked dance with one another and then into the city, where they petition and are received by the Awujale, the *oba* of Ijebu-Ode. The secret power of the priest-chiefs meets the sacred power of the crown. Each is required to acknowledge the role of the other in the complex balance of power that constitutes Ijebu political life. The Ẹlẹfon and Ẹpa festivals are masquerades performed in the towns of such Yoruba subgroups as the Igbomina and Ekiti in honor of persons and families whose lives embodied the social values by which Yoruba culture has been defined in the northeastern area. The helmet masks with their large sculptures are balanced on the dancers' heads and are the focus of ritual sacrifice (*ebọ*) and songs of praise (*oriki*) throughout the festival. They are images of the sacred power of those who founded the town or contributed to its life in important ways. Thus, while individual masks are associated with particular families, they also refer to the roles of hunter,

warrior, king, herbalist-priest, and leader of women, roles that transcend lineage ties and express in their collectivity cultural achievement. Their powers are akin to those of the *oriṣa*, the gods of the Yoruba pantheon.

According to the Yoruba, there are 401 *oriṣa* who line the road to heaven. All of them are thought to have been humans who, because they led notable lives, became *oriṣa* at the time of their death. For example, Ṣango, the god of thunder, was a legendary king of Oyo before he became an *oriṣa*. The extraordinary number of *oriṣa* reflects the regional variation in their worship. Ṣango is the patron deity of the kings of Oyo, and his shrines are important in those towns that were once part of the old Oyo empire (c. 1600–1790). But in Ile-Ife, or in communities to the south and east, the role of Ṣango and the degree to which he is worshiped diminishes markedly. As one moves from one part of Yorubaland to another, it will be Oṣun, goddess of medicinal waters, or Oko, god of the farm, or Erinle, god of forest and stream, or Qbatala or Agemọ whose shrines and festivals shape the religious life of a people. Furthermore, the *oriṣa* have multiple names. Some call Ṣango Qba Koso (“king of Koso”); others greet him as Balogunni Ado (“leader of warriors at Ado”). Ṣango is also addressed as Abinufarokotu (“one who violently uproots an *iroko* tree”), Oḳo Iyemonja (“husband of Iyemonja”), or Lagigaoogun (“he who is mighty in the use of magical powers”), names that reveal the varied and distinctive experiences of his devotees and their relationship to the *oriṣa*. The multiplicity (or fragmentation) of the *oriṣa* is also a consequence of the historical dislocation of peoples that occurred during the intertribal wars of the nineteenth century. When persons and groups were forced to move from one area to another, their *oriṣa* went with them, shaping and being shaped by the new world of their devotees’ experience.

Of all the *oriṣa* it is Ogun, god of iron and of war, whose worship is most widespread. It is said that there are seven Ogun, including Ogun of the blacksmiths, Ogun of the hunters, Ogun of the warriors, and Ogun Onire. Ire is a town in northeast Yorubaland where Ogun was once the leader of warriors and where he “sank into the ground” after killing persons in a great rage, having misunderstood their vow of ritual silence as a personal affront. As with other *oriṣa*, Ogun expresses and shapes a people’s experience with respect to a particular aspect of their lives. In the case of Ogun, it is the experience of violence and culture: His myths and rituals articulate for the Yoruba the irony that cultural existence entails destruction and death. One must kill in order to live. And such a situation carries with it the danger that the destruction will go beyond culturally legitimate need, destroying that which it should serve. Thus, to employ Ogun’s power, one must be aware of Ogun’s character (*iwa*) and be cognizant that the beneficent god can become the outraged *oriṣa* who bites himself.

As with Ogun, each of the *oriṣa*, in the diversity and individuality of their persons and attributes, may be understood as providing an explanatory system and a means of

coping with human suffering. Rarely does only one *oriṣa* lay claim to a person. Ogun or Ṣango or Oṣun may dominate one’s life and shape one’s perception of self and world, but other *oriṣa* will have their artifacts on the shrine, as well as their claims and influence upon one’s life. Just as the Yoruba dancer must respond to the multiple rhythms of the drums, so must the soul attentive to the powers of the *oriṣa* respond to their diverse claims. The complexity of the response may overwhelm one. But as in the ability of the dancer to be conscious of and respond to every instrument of the orchestra, so in sacrificing to all the *oriṣa* who call, the worshiper (*olusin*, “he who serves”) can know the richness of life and its complexity and can achieve the superior poise, the equanimity of one who possesses *ase* amid the contradictions of life. Thus, when one considers the configuration of *oriṣa* symbols on a devotee’s shrine or the cluster of shrines and festivals for the *oriṣa* in a particular town or the pantheon as a whole, as a total system, one discerns that the total assemblage of *oriṣa* expresses in its totality a worldview. And it is in the reality of this worldview that Yoruba experience, at the personal and social levels, is given coherence and meaning.

In addition to the *oriṣa* of the pantheon, there is one’s personal *oriṣa*, known as *ori inun* (“inner head”), which refers to the destiny that one’s ancestral guardian soul has chosen while kneeling before Olorun prior to entering the world. It is a personal destiny that can never be altered. Birth results in the loss of the memory of one’s destiny. But one’s “*ori*-in-heaven,” which is also referred to as *ekejimi* (“my spiritual other”), stands surety for the possibilities and the limits of the destiny that one has received. Hence, one must make one’s way in life, acknowledging one’s *ori* as an *oriṣa* who can assist one in realizing the possibilities that are one’s destiny. One can have an *ori buruku* (“a bad head”). In such a case a person must patiently seek to make the best of a foolish choice and seek the help of the other *oriṣa*.

In *oriṣa* worship it is the wisdom of Orunmila, the *oriṣa* of Ifa divination, and the work of Eṣu, the bearer of sacrifices, that stand for the meaningfulness of experience and the possibility of effective action. The vast corpus of Ifa poetry, organized into 256 collections called *odu* (also known as *oriṣa*) is a repository of Yoruba cultural values. It is the priest of Ifa, the *babalawo* (“father of ancient wisdom”), who knows Ifa and performs the rites of divination. Using the sixteen sacred palm nuts or the *opele* chain, the priest divines the *odu* whose verses he will chant in addressing the problem of the suppliant and determining the sacrifices that must be made. For the Yoruba, every ritual entails a sacrifice, whether it is the gift of prayer, the offering of a kola nut, or the slaughter of an animal. In the Ifa literature, sacrifice (*ḳbo*) has to do with death and the avoidance of such related experiences as loss, disease, famine, sterility, isolation, and poverty. It is an acknowledgment that human existence is ensnared in the interrelated contradictions of life and death. But sacrifice is also viewed as the reversal of the situation of death into life. Sacrifice is the food of the *oriṣa* and other spirits, and one sacri-

fices that which appropriately expresses the character (*iwa*) of the particular *oriša* or spirit of one's concern. Hence, Ogun receives a dog, the carnivorous animal that can be domesticated to assist the hunter and warrior. Sacrifice is the acknowledgement of the presence of powerful agents in the world, and the sacrificial act brings the creative power of the *oriša*, the ancestors, or the mothers to the worshiper; sacrifice can also temporarily stay the hand of Death and ward off other malevolent spirits (*ajogun*). Such is the power of Eṣu, the bearer of sacrifices, the mediator and guardian of the ritual way, the "keeper of *ase*."

Those who have observed the ritual way and achieved the status of elders in the community may also become members of the secret Oṣugbo (Ogboni) society. Although Oṣugbo is found throughout Yorubaland, its role and rituals vary from one region to another. Oṣugbo members, who come from various lineage groups, worship Onile ("the owner of the house"). The "house" (*ile*) is the image of the universe in its totality, of which the Oṣugbo cult house is a microcosm. The *edan* of the Oṣugbo society, which are small, brass, linked staffs that depict male and female figures, are the sign of membership and the symbol of the Oṣugbo understanding of reality. The secret of the Oṣugbo appears to be that its members know, and are in touch with, a primordial unity that transcends the oppositions characterizing human experience. Expressing the unity of male and female, the *edan* and their owners possess the power of adjudicating conflicts among persons or groups; when blood has been shed illicitly (as in a murder) it is the Oṣugbo members who must atone for this "violation of the house."

The worldview of the Yoruba is a monistic one. The universe of their experience is pervaded by *aṣẹ*, a divine energy in the process of generation and regeneration. *Aṣẹ* is without any particular signification and yet invests all things and all persons and, as the warrant for all creative activity, opposes chaos and the loss of meaning in human experience. Thus, for the Yoruba the universe is one, and it is amenable to articulation in terms of an elaborate cosmology, to critical reflection, and to innovative speculation.

BIBLIOGRAPHY

The best general introductions to Yoruba religion are E. Bòlaji Idowu's *Olódumarè: God in Yoruba Belief* (London, 1962) and Robert Farris Thompson's *Black Gods and Kings: Yoruba Art at UCLA*, 2d ed. (Bloomington, Ind., 1976). Idowu's study contains a wealth of primary data and is an important contribution by a Yoruba scholar, although the presentation is compromised by an uncritical use of Christian theological concepts and categories. Thompson's highly readable, insightful, and brief essays analyze the Yoruba worldview in terms of Yoruba art. This approach has been further developed by William B. Fagg and John Pemberton III in *Yoruba Sculpture of West Africa*, edited by Bruce Holcombe (New York, 1982). In addition to an anthology of Fagg's essays on Yoruba art, this volume includes texts by Pemberton, which discuss seventy works of art in the context of Yoruba history, rituals, and cosmology, and an extensive bibliography.

The most important specialized studies on Yoruba religious thought and practice include those on Ifa poetry and divination rites by Wande Abimbola, *Ifá: An Exposition of Ifá Literary Corpus* (Ibadan, 1976), and William R. Bascom, *Ifá Divination: Communication between Gods and Men in West Africa* (Bloomington, Ind., 1969). Abimbola has edited an extensive collection of essays, *Yoruba Oral Tradition* (Ifé, 1975), that provides an excellent introduction to Yoruba scholarship in the areas of archaeology, history, art, and religion. Of special note for their substantive and methodological contribution are the essays by Babatundi Agiri on the early history of Oyo and by Rowland Abiodun on Ifa art objects. Specialized studies of *oriša* worship by John Pemberton III and Karin Barber offer contrasting approaches and alternative interpretations to that of Idowu; Pemberton's "A Cluster of Sacred Symbols: *Oriša* Worship among the Igbo Yoruba of Ila-Orangun," *History of Religions* 17 (August 1977): 1–26, pursues a structuralist analysis, and Barber's "How Man Makes God in West Africa: Yoruba Attitudes towards the *Oriša*," *Africa* 51 (1981): 724–745, combines a sociological with an oral history approach. The best study of masked festivals is Henry John Drewal and Margaret T. Drewal's *Gèlèdè: A Study of Art and Feminine Power among the Yoruba* (Bloomington, Ind., 1983). See also the special issue of *African Arts* 11, no. 3 (April 1983), edited by Henry John Drewal, on the arts and festivals for Egungun.

JOHN PEMBERTON III (1987)
Revised Bibliography

YOSE BEN HALAFTA' (second century CE), Palestinian tanna. Born in Sepphoris, Yose was a student of Yoḥanan

ben Nuri, 'Aqiva' ben Yosef, and Tarfon. Like many of his contemporaries, he worked at a humble occupation—he was a tanner (B.T., *Shab.* 49a–b)—but he was also a leader of the rabbinic court at Sepphoris (B.T., *San.* 32b). He is associated with early mystical traditions, and it is said that he studied with Elijah the prophet (B.T., *Ber.* 3a, *Yev.* 63a).

Numerous traditions attributed to Yose are preserved in rabbinic literature. He is one of the most frequently quoted authorities of his generation, along with Me'ir, Shim'on, and Yehudah. Jacob Epstein believes that the corpus of his traditions was one of the primary documents used in the redaction of the Mishnah.

Yose was a product of rabbinic learning and culture in a time of adjustment after two devastating wars with Rome. His rulings and teachings, like those of other rabbis of the time, reflect the struggle to overcome the uncertainty of Jewish life in the Land of Israel and the attempt to establish a sense of order in religious and social life. Yose's legal, exegetical, and theological sayings contributed greatly toward this goal.

Yose's traditions evince a special interest in the events of biblical history, as well as in the entire range of theological topics, including the nature of God, the centrality of the Torah, and the special nature of Israel. His legal rulings reflect the concerns and activities of the rabbis of his generation, from agricultural taboos, table manners, and rules for holidays and family life to regulations for the rabbinic system of purities. Yose is associated, for example, with legislation concerning the recitation of blessings over foods in which he rules that one who alters the formula for blessings established by the sages does not fulfill his obligation (*Tosefta*, *Ber.* 4.4).

To date, no systematic analysis has been made of Yose's traditions, probably because of the sheer size of the corpus of sayings attributed to him.

SEE ALSO Tannaim.

BIBLIOGRAPHY

Jacob N. Epstein's *Mavo' le-sifrut ha-tanna'im* (Jerusalem, 1957) discusses the role of Yose's materials in the formation of the Mishnah. In *Rabbi Yose ben Halafita'* (in Hebrew; Jerusalem, 1966), Israel Konovitz collects all the references to Yose in rabbinic literature. My own *Studies in Jewish Prayer* (1990) analyzes the role of Yose's rulings in the development of early rabbinic liturgy.

TZVEE ZAHAVY (1987)
Revised Bibliography

YOUNG, BRIGHAM (1801–1877), second president of the Church of Jesus Christ of Latter-day Saints (hereafter

LDS); chief architect of the form of Mormonism that flourished in the intermountain region of the western United States in the nineteenth century and expanded throughout the United States and into many other countries.

Although he insisted on baptism by immersion, which he thought scripture required, Brigham Young joined the Methodists several years before he heard about Joseph Smith's "golden bible." A skilled carpenter, painter, and cabinetmaker, Young came from a family of devout Methodists whose extreme poverty impelled them to leave New England for western New York, a family history that paralleled that of the Smith family. While Mormonism attracted many of his family members, Young held back. He read the *Book of Mormon* soon after its publication in 1830 but waited two full years before becoming a Latter-day Saint. Thus he was not converted in the very beginning when Mormonism's primary appeal was its claim that it had restored the priesthood of ancient Israel and that it was the only true church of Jesus Christ. He became a follower of the Mormon prophet, Joseph Smith, in 1832, when the character of the new movement was becoming as Hebraic as it was Christian, given the emphasis being placed on its "gathering" doctrine, its temple-building plans, its patriarchal office, and its assertion that Mormons are God's only chosen people. Convinced that these elements separating Mormonism from traditional Christianity were scripturally correct, Young accepted them wholeheartedly. Moreover, when temple ordinances were introduced that added plural marriage and baptism for the dead to Mormonism, and when the movement organized itself into a political kingdom, he accepted these innovations as well, albeit somewhat less enthusiastically.

After his rebaptism, Young devoted his entire energies to Mormonism. Following a preaching mission in the eastern United States, he moved to Ohio, assisting with the construction of the Kirtland temple and much else. He went with Zion's Camp, a paramilitary expedition that failed to rescue beleaguered Missouri Saints from their enemies, but nevertheless tested the mettle of future LDS leaders. Called to the highest council in Mormondom, the Quorum of the Twelve, in 1835, and made its president in 1841, Young rendered signal service, particularly in organizing the exodus when the Saints were driven from Missouri in 1839 and in establishing a successful Mormon mission in England in the early 1840s. In Nauvoo, Illinois, during the final years of Smith's life, Young served in the prophet's inner circle as the LDS political kingdom was organized and the secret practice of plural marriage instituted.

The struggle for succession to LDS leadership after Smith's murder in 1844 intensified a division within the movement. On one side were Saints who, regarding Mormonism as an idiosyncratic version of primitive Christianity, opposed plural marriage and the political organization of a kingdom in an Old Testament mode; on the other were Saints who supported these innovations as a part of the restoration of the "ancient order of things." Although most his-

torical accounts present Young as the clear winner in this succession struggle, recent demographic studies reveal that he was the acknowledged leader of the latter group, but that he by no means led the whole of the LDS community after Smith's death.

For the thousands who followed him, however, Young managed to effect the transfer of Mormon culture from Illinois to the Great Salt Lake Valley while preserving the vision of Mormonism that Joseph Smith held at the end of his life. He did this by assuming ecclesiastical, political, and spiritual leadership of his followers. In Nauvoo, he took practical charge of the chaotic situation and arranged the departure of the Saints. In 1847, he was sustained as president of the church by those who went west with him. In 1851, the federal government recognized his leadership by appointing him as governor of Utah Territory. From these dual positions of power, he established a new "Israel in the tops of the mountains" in which, in the manner of Solomon of old, he reigned supreme as prophet, church president, and political leader. Unlike Joseph Smith, however, Young was not a prophet who delivered new revelations and added lasting theological elements to the movement he headed. His great contribution was realizing Smith's vision through the creation of a literal LDS kingdom. Even changed, as it was at the end of the nineteenth century, this kingdom continues to animate and inspire Mormonism in much the same way that Solomon's kingdom has animated and inspired Judaism and Christianity across the ages.

SEE ALSO Mormonism.

BIBLIOGRAPHY

Until very recently, historical accounts of Young's life and career were either faith-promoting paeans of praise, based on nineteenth-century official LDS publications, or ill-concealed attacks, based on published sources unfriendly to the Mormons. Neither genre has disappeared, but as much of the primary source material on which studies of Young must rely is now available to scholars, new studies presenting a more balanced assessment of this important Mormon leader are appearing. The most significant of these new studies are Leonard J. Arrington's *Brigham Young: American Moses* (New York, 1985); Newell G. Bringhurst's *Brigham Young and the Expanding American Frontier* (Boston, 1985); and Ronald K. Esplin's "The Emergence of Brigham Young and the Twelve to Mormon Leadership, 1830–1841" (Ph. D. diss., Brigham Young University, 1981). Two valuable editions of primary source materials are *Letters of Brigham Young to His Sons*, edited by Dean C. Jesse (Salt Lake City, 1974); and *Diary of Brigham Young, 1857*, edited by Everett L. Cooley (Salt Lake City, 1980). Stanley P. Hirshson's *The Lion of the Lord: A Biography of Brigham Young* (New York, 1969) is not recommended; despite its reputable publisher and respected author, it is based on published sources, most of which are unfriendly to the Mormons.

The results of recent demographic studies are reported in Dean L. May's "A Demographic Portrait of the Mormons, 1830–1980," in *After 150 Years: The Latter-day Saints in Sesquicent-*

ennial Perspective, edited by Thomas G. Alexander and Jessie L. Embry (Provo, Utah, 1983).

JAN SHIPPS (1987)

YOUTH, FOUNTAIN OF SEE REJUVENATION

YU, also known as Yu the Great; demiurge who rid China of a great flood, legendary founder of the Xia dynasty, and oldest pan-Chinese culture hero. (Huangdi, Yao, and Shun are in fact of later origin.) According to traditional accounts, Yu combated the flood by following the examples found in nature. Draining fields, dredging rivers, and cutting passes through the mountains, he thus succeeded where his father, Kun, who used dikes to restrain the floods and block their course, had failed (*Shu jing, Yu gong, Shi ji*). Credited with the shaping of China's waterways and irrigation systems, he became the patron saint of all hydraulic engineering (*Shi zi, Huainanzi*). Yu also was a miner and a master of metals. He invented bronze weapons and cast the Nine Caldrons of Xia, symbols of his sovereignty, on which the various regions of his empire were pictured (*Zuo zhuan*). The famous *Shanhai jing* (Book of Mountains and Seas) is said to be the text corresponding to these images. Founder of metal-working fraternities, Yu is the patron saint of esoteric and magical arts that are at the roots both of alchemy and of Daoist longevity techniques.

Yu is one of the legendary model sovereigns upon whom the Yellow River and the Luo River deities bestowed the mystical diagrams Hetu ("river chart") and Luoshu ("Lo writing"). In Daoist traditions, these sacred emblems were reinterpreted into the *lingbao wufu* ("five talismans of *lingbao*"), which Yu received from a god as a source of magical aid in his Herculean labors. He is said to have hidden them in a sacred mountain, whence they were rediscovered to become the nucleus of a Daoist corpus of sacred scriptures (*Wu Yue chungiu, Lingbao wufu xu*).

One of the oldest rituals of Chinese culture, still practiced today by Daoist priests, is the Yubu, or "pace of Yu." Exhausted by his labors, Yu is said to have been stricken by hemiplegia, which gave him a limping gait (*Shi zi*). Others say that spirits gave him control over men and nature by teaching him a hopping dance with one foot trailing behind the other. The ancient sovereigns danced in order to subdue rebels (*Huainanzi*), and sorcerers performed this dance to enter into trance. The Daoists adopted the Pace of Yu both to gain access to supernatural powers such as those granted by plants that confer immortality and to overcome demonic forces (*Baopuzi*). For them, it was not merely the gait that was important but also the labyrinthine pattern traced by the officiant's feet, the pattern of a hexagram, or, more often, the meander of the Big Dipper. The Pace of Yu or the "shaman's pace" (*wubu*) is considered to contain the magic rhythm for

creating cosmic order and for summoning and subduing gods and demons. It became the favorite gait for the *daoshi's* liturgical procession through the heavens (*Daozang* 987, *Tai-shang zongzhen biyao* 8, 1116 CE). The Pace of Yu is still performed today as part of Daoist rituals in Taiwan.

SEE ALSO Chinese Religion, article on Mythic Themes.

BIBLIOGRAPHY

The myths of Yu the Great have been studied by Marcel Granet in his *Danses et légendes de la Chine ancienne* (1929; reprint, Paris, 1959), pp. 466–590. His role in Daoism is mentioned in Max Kaltenmark's "Ling-pao: Note sur un terme du taoïsme religieux," *Mélanges publiés par l'Institut des Hautes Études Chinoises*, vol. 2 (Paris, 1960), pp. 561–565. Granet has used the Pace of Yu as an example demonstrating the roots of the Daoist religion in the rituals of high antiquity. See his "Remarques sur le taoïsme ancien," *Asia Major* 2 (1925): 146–151, reprinted in *Études sociologiques sur la Chine* (Paris, 1953). Much information on Yu is to be found also in volumes 2, 3, and 4 of Joseph Needham's *Science and Civilisation in China* (Cambridge, 1956–1971).

ANNA SEIDEL (1987)

YUHUANG, the Jade Emperor, has been the supreme deity of the Chinese popular pantheon since at least the tenth century CE.

An essential and deeply rooted feature of Chinese culture is the concept of a single, centralized empire under the sovereignty of an emperor who is a sacerdotal as well as a secular ruler. This concept influenced religion in many ways. Both the Daoist and the popular pantheon are modeled on the civil bureaucracy of the Chinese state. Communication between the gods and encounters between deities and mortals often involve ritual similar to that between the vassal and his sovereign or the administrator and his superior.

The highest deity of the religion of antiquity, the Emperor on High (Shangdi) already was the ruler of a heavenly court. About the supreme deity of folk religion we know nothing until the ninth century CE. Belief and cult of the Jade Emperor took shape during the time of the most perfect realization of the bureaucratic universal empire, the Tang dynasty (618–906). Poems and paintings of the tenth century attest to a fully developed myth, in which the Great Jade Emperor (Yuhuang Dadi) is attended by his heavenly court composed of all the deities who rule above and below the earth, the gods of stars, wind, rain and thunder, mountains and lakes, and others. The Song emperor Zhenzong (r. 998–1022) reinforced his own authority by claiming descent from mythical culture heroes, a lineage that had been revealed to him by an emissary of the Jade Emperor. In 1017, a state cult was instituted for the Jade Emperor, and he was canonized under the title Great Heavenly Emperor, Majesty of [the Heaven of] Jade Purity (Yuqinghuang Da tiandi).

Jade Emperor is not a name but the title of a ruler with a particular function. Patterned after the terrestrial emperor,

the Jade Emperor is the supernatural ruler of the universe, including the divine pantheon. His foremost role is to confer all advancement in the supernatural bureaucracy and in the religious hierarchies of this world, and to oversee the investiture of emperors and of gods, as in the popular novel *Fengshen yanyi* (The Investiture of the Gods). Supreme arbiter, judge, and sovereign of the universe, he is nevertheless merely the executor of orders emanating from the highest heavenly triad, the Daoist Three Pure Ones (San Qing) who are deities too remote and formidable for the popular cults.

His feast day is the ninth day of the first lunar month. His popular name is Master Heaven (Tiangong). He is represented in the dragon-embroidered robe and pearly headgear of the Chinese emperor, seated on a throne and surrounded by his courtiers. His canonical scripture, the *Yuhuang benxing jing* (twelfth to thirteenth century; *Daozang* nos. 10, 11, 12), plays an important role in Daoist ritual.

BIBLIOGRAPHY

There is yet no monograph on this important deity. The best description is still that by Henri Maspero in "The Mythology of Modern China," in *Taoism and Chinese Religion*, translated by Frank A. Kierman (Amherst, Mass., 1981). Some additional material has been presented by H. Y. Feng in "The Origin of Yü Huang," *Harvard Journal of Asiatic Studies* 1 (1936): 242–250.

ANNA SEIDEL (1987)

YULUNGGUL SNAKE. Yulunggul is the Great Python of north-central Arnhem Land, who swallowed the Wawalag sisters and their child(ren). Yulunggul is most often identified as male, with or without female counterparts. One northeastern Arnhem Land version specifies Yulunggul as female but with symbolic male (phallic) implications.

William Lloyd Warner's account (1937, e.g. p. 257) notes a variety of snakes, goannas, and snails as sons of Yulunggul. In a couple of women's versions, Yulunggul's python children, who live in the water hole with him, ask him to regurgitate what he has eaten so that they can eat it too. Warner refers to Yulunggul as "great father" (Yindi Bapa or Bapa Yindi), but it is possible that he misheard the more usual expression, "great snake" (Yindi Baapi).

Unlike so many of the great mythic characters, who came from elsewhere to sites that were to be spiritually associated with them, Yulunggul had always been at his special water hole, known as Mirara-minar and Muruwul; there is a cluster of names and waters in that area. The Wawalag sisters, in contrast, were travelers from a distant country and were strangers: the kinship terms identifying them as sisters of Yulunggul's were not consanguineously based. Nevertheless, all of the mythic Snakes in north and northeastern Arnhem Land, including Yulunggul, were good site guardians and knew who the travelers were.

The Wawalag sisters brought with them inland-type songs. These are in the compressed, key-word style typical of the Kunapipi (Gunabibi)—unlike the long, drawn-out songs of north-central and northeastern Arnhem Land, such as Yulunggul sang. The longer songs include names for physical and other attributes of the Snake that are used as personal names by present-day Aborigines of appropriate social and territorial status, and they include singing words for the monsoon, the coasts and offshore islands, and the rough seas. This introduction to inland people and inland songs and religious rites was not achieved without trauma, in the context of the myth, but it marked the acceptance of “new” items on a longterm basis.

In one of his roles Yulunggul is, explicitly, a culture-area indicator, or a boundary marker. During his conversation with the other great Snakes after he has swallowed the Wawalag, he faces east. This conversation is like a statement about a broad cultural zone that shares a range of common understandings and rules, though there are local variations. Its principal binding force is its religious system, actively expressed through ritual collaboration. The Snakes (in Warner’s version, p. 253) underline this accord, agreeing that although they speak “different languages” (dialects), they share the same religious commitments. Significantly, then, Yulunggul looks to and talks to his counterparts in the east, turning his back on western Arnhem Land. That region is clearly outside the eastern Arnhem Land bloc, notwithstanding its mythic swallowing and vomiting Rainbow Snakes and some cultural exchange and transmission; traditionally the westerners did not circumcise, and their marriage rules and language patterns were very different.

There are divergent views on whether Yulunggul is a Rainbow Snake manifestation. In the Milingimbi versions, when the two men from Wawalag country came to Mirraminar, the water “shone like a rainbow. When they saw this they knew there was a snake there.” (Warner, p. 258, also 385). Where his Rainbow Snake identification is not accepted, mainly on the eastern side of Arnhem Land, it is sometimes explained with, “Yulunggul is separate: he is *himself*.”

As a weather symbol, Yulunggul has his own personal niche in the pantheon of deities (Warner, p. 378). He has both freshwater and saltwater affiliations. Although he is anchored spiritually to a special site, he is also spiritually mobile. He is the spirit of the monsoon, the west and northwest wind that brings the fertilizing rains of the wet season. Just as the copulations of the Snakes and clouds during the wet season ensure fertility in the dry season, so Yulunggul’s “union” with the Wawalag transformed him into a symbol of seasonal fertility. He continued to inhabit his water hole but gained prominence in two additional dimensions. One was his role in the ritual constellations “given” to posterity by the Wawalag sisters. The other was spiritual mobility. In some Milingimbi versions (Warner, p. 254), he flies across the country with the Wawalag and their child(ren) inside him, naming various places and allocating local dialects.

More generally, in all available versions he is identified in spirit with the *baara*, the fast-moving, rain-bearing monsoon storms and clouds from the west and northwest.

The full force of the monsoon can have a formidable impact on the people, creatures, landscape, and waters in its path. A skillful storyteller can convey the force dramatically in narrative versions of the Yulunggul myth. Warner (pp. 379–381) tried to communicate the power of the monsoon through a quotation from a geographer about the Darwin area, but the cycle of the seasons is much less “uniform” than his source suggests. It is the variability and unpredictability of the monsoon that has convinced Aborigines of the need to work ritually to regularize it.

In his Milingimbi study, Warner (pp. 381–382) mentions a number of named seasons, but his whole emphasis is on a twofold division between “wet” and “dry.” Men are identified with the Snake, as a “purifying element” (p. 387), “with the positive higher social values,” ritual cleanliness, the sphere of “the sacred” (p. 394), women with the dry season, “uncleanliness,” and “the profane.” Lévi-Strauss recognized the contradiction between these statements and the claim that Aborigines regarded the wet season as bad (too much rain, no food) and the dry season as good (plenty of food, greater mobility). But the seasonal picture and other suggested dichotomies are oversimplified and unreal.

Yulunggul’s territorial, seasonal, and religious-ritual roles make him a powerful and majestic figure. Much of his ritual symbolism is secret-sacred, not to be discussed publicly, but his public persona is awesome enough. All of this gives rise to some intriguing questions. For example, in a Milingimbi version that is found only in Warner, after Yulunggul had regurgitated the sisters and they lay “dead,” a great Yulunggul *didjeridu* (drone pipe) came out of Yulunggul’s water hole of its own volition and revived them with the help of green ants. Yulunggul was angry. He “killed” the sisters and swallowed them again. The *didjeridu* that features so prominently in Kunapipi and associated rituals, however, is Yulunggul, and its sound is his voice. How to reconcile the contradiction? Contradiction is, up to a point, the essence of myth, and perhaps it merely reflects the approach of Yulunggul to the Wawalag sisters in the events of the myth as usually told and interpreted, in a relationship about which there is still much more to be said.

Hiatt, L. R. “Swallowing and Regurgitation in Australian Myth and Rite.” In *Australian Aboriginal Mythology*, edited by L. R. Hiatt, pp. 143–162. Canberra, 1975. Summarizes a number of Aboriginal myths, including two versions of the Wawalag myth, and discusses various interpretations of the swallowing and regurgitation behavior attributed to certain mythic characters, among them Snakes and old woman (mother) figures who are “also cosmic creators.”

Lévi-Strauss, Claude. *La pensée sauvage.* Paris, 1962. Translated anonymously into English with the unfortunate title *The Savage Mind* (London, 1966). The references to Yulunggul and the Wawalag myth are on pages 91–94 and 96. Lévi-Strauss follows Warner’s interpretation, reframing it to some extent but accepting his statements and his male-dominated perspective.

Munn, Nancy D. “The Effectiveness of Symbols in Murngin Rite and Myth.” In *Forms of Symbolic Action*, edited by Robert F. Spencer, pp. 178–207. Seattle and London, 1969. This perceptive analysis of the Wawalag myth and other features of northeastern Arnhem Land culture, ritual and social relationships includes an examination of the role of the Snake and its bearing on power relations between men and women, and between older and younger men.

Warner, William Lloyd. *A Black Civilization: A Study of an Australian Tribe* (1937). New York, 1958. Devotes a great deal of attention to Yulunggul (Yurlunggur, in his spelling) in the context of the Wawalag myth and associated rituals and their social and environmental implications.

CATHERINE H. BERNDT (1987)

YUNUS EMRE (d. 1321), Turkish mystic, initiator of popular mystic poetry in Turkish literature, and one of the greatest poets in that language. Apart from a few notes in sixteenth-century biographical works, the life of Yunus Emre remains shrouded in legend. More reliable biographical data can be gathered from his own corpus, which recent research (particularly by Abdülbâki Gölpınarlı) has sifted out from the mass of poems produced by contemporary or later anonymous authors who attributed their own work to him.

According to available evidence, he was born in the village of Sarıköy (modern Emre) in central Anatolia, educated in the classical Islamic sciences, and later trained in the mystic path by a certain Tapduk Emre, whom he often mentions in his poems with great veneration. He seems to have lived

mostly in the region of his birth and to have died and been buried in the same village. There is also evidence that he traveled to Syria and Azerbaijan, as well as to Konya, where he may have met the great mystic poet Jalâl al-Dîn Rûmî, whose thought and mystic fervor exercised considerable influence on him.

Yunus Emre’s writings include a short didactic *mathnavî* and his *dîvân*, or collected poems. The *mathnavî*, *Risalet ün-nushiyye* (Book of Counsels), written in 1307, is an allegorical poem of 575 couplets in classical Persian meter, with a prose introduction. Elaborating on certain human virtues and vices along orthodox Muslim lines, it is rather sober and uninspired in style and not typical of his work. Rather, his fame rests primarily on his *dîvân*, which is the first one in Turkish literature. It consists of about 350 poems, most of which dwell on variations of pantheistic thought, the tribulations of the initiate, the various stages of the mystic path, guidance to the “straight path,” the nature of real knowledge (*‘irfân*) as different from worldly science (*‘ilm*), the confession of one’s errors and shortcomings and the enjoyment of self-accusation (*melâmet*), and nostalgic and evocative themes of the years away from home. Smaller numbers elaborate on orthodox religious themes, with frequent reference to the Qur’ân and the traditions of the Prophet, and to popular stories of prophets and saints, or address the obsessive idea of death, otherworldliness, and eternity.

These poems are addressed to the masses of ordinary people. They are mainly written in the spoken Turkish of the early fourteenth century, with a moderate number of Arabic/Persian loanwords, and the predominant meter follows the traditional Turkish syllabic form. Their great popular appeal over the centuries can be ascribed to Yunus’s simple and direct style, his enthusiastic lyricism, and the skill with which he made mystic and pantheistic philosophy accessible. Both the style and the language of his poems continued to exert a tremendous influence on most of the popular mystic poets down to the eighteenth century.

FAHIR IZ (1987)

YURUPARY is the lingua franca name for an Amazonian culture hero who established order in nature and society and

taught men rules of ritual conduct. The term refers also to sacred flutes and bark trumpets, taboo to women and children, played in a secret men's cult into which boys are periodically initiated, and to the celebrations held by the cult. These instruments, kept hidden under water, represent Yurupary in spirit form, and their sound is his voice. By extension the term is used throughout Amazonia to refer to cannibal forest spirits. Christian missionaries have also erroneously identified Yurupary with the devil and attempted to eradicate his cult.

The Yurupary cult is found among nearly all the Indians of northwest Amazonia living in the area of the Japurá, Negro, and middle Orinoco rivers. In particular, it is characteristic of the Arawakan groups (Baniwa, Baré, etc.) of the upper Río Negro and of their Tucanoan-speaking neighbors (Cubeo, Tucano, Desána, Barasana, etc.) of the Uaupés, whose culture shows strong Arawakan influence. The Arawakans call Yurupary Kowai, and a number of other names are used by the Tucanoans. These Indians share many cultural features, including division into patrilineal, exogamous phratries made up of a series of ranked clans, patrilocal marriage, and residence in communal longhouses.

Similar secret men's cults with flutes, trumpets, bullroarers, and masks are a typical feature of many Indian groups of lowland South America, most notably the Mundurucú of the lower Tapajós, the Yagua and Tikúna of the upper Amazon, the tribes of the upper Xingu, and the nearly extinct Selk'nam of Tierra del Fuego.

YURUPARY MYTH. Numerous versions of the Yurupary myth have been published. What follows is a synthesis of these myths, designed to bring out the major episodes and themes. Yurupary was the child of Ceucy (the Pleiades), who was made pregnant by the juice of a *caimo* (*Pouteria caimito*) or *cucura* (*Pourouma cecropiaefolia*) fruit. She was a virgin, and a disguised incestuous union with a father, brother, or son identified with the sun, moon, thunder, or the constellation Scorpius is implied. Yurupary is himself often identified with the Sun. Lacking a vagina, Ceucy had a painful labor and had to be pierced by a fish. Her baby, taken from her at birth, was brought up by his shaman father or brother. Yurupary had no mouth so he had to be fed on tobacco smoke. He was asked if he was man, animal, or fish, but by shaking his head he indicated that he was none of these. Only when asked if he was Yurupary did he nod his head in agreement, an agreement that, by a process of elimination, also suggested that he was connected with the vegetable world. When given a mouth, he emitted a terrible sound, and sounds emerged from holes in his body, which was that of a monkey but with human face, feet, and hands.

He grew very rapidly and became a shaman leader who taught his people rituals and a regime of taboos and fasts and decreed that no woman should see him or hear his secrets on pain of death. He ordered the men to collect fruit from trees, and he conducted the first initiation rite, at which young boys saw him dressed in full costume.

While the boys were still under initiation taboos, he took them to collect *uacú* fruit (*Monopteryx angustifolia*), which, despite prohibitions, they roasted and ate. Angered by their disobedience, Yurupary sent a thunderstorm, and the boys took shelter in his mouth (or, in some versions, his anus), which they mistook for a cave. Having ingested all but one of them, Yurupary disappeared to his house in the sky, and the lone survivor returned home with the dreadful news.

The parents, angered by their loss and fearful of this cannibal monster, resolved to kill him. They tempted him back with offers of ever more exotic kinds of beer until, offered one he had never tried, Yurupary agreed to return. He knew they wished to kill him and made it known that he could be killed only with fire.

Arriving at dusk, Yurupary vomited up the boys (or their bones), into either an initiates' seclusion enclosure or flat baskets, along with the fruit the boys had collected. He danced and sang all night, getting increasingly drunk on beer and *yagé*, a hallucinogenic drink, and at dawn his hosts threw him on a fire. There followed a huge conflagration, which was the prototype of all future slash-and-burn fires. The burning of a cultivation site is now identified with this first fire. As he died, Yurupary announced that henceforth, though he would be immortal, all men would die.

From the ashes a *paxiuba* palm (*Iriartea exorrhiza*) grew, together with vines for ritual whips and for poison and stinging ants, snakes, and other noxious creatures that shed their skins. The palm was his bone, and the poisonous plants and animals were his soft parts. The palm ascended rapidly to the sky, taking with it Yurupary's soul, which became a star in the constellation Orion. Squirrels cut the palm into sections, which were distributed among men and animals as their different voices. This distribution marked the differentiation of men from animals and, among men, the distinction between the different clans and phratries, which have corresponding linguistic differences. The sections of *paxiuba* palm, which correspond to paired parts of Yurupary's anatomy—arm and leg bones and fingers—make up the *yurupary* instruments, which are also in pairs, and their sound is his voice. From other parts of his body—skull, brain, tongue, and so on—were made gourds, tobacco snuff, coca, and beeswax, which play an important role in the rites.

Later on, the Sun told his son to rise early and play the *yurupary* instruments at the river. His daughter overheard and got up while her lazy brother slept on. She found the instruments and ran away with them, accompanied by the other women. With the women in possession of the instruments, the social order was reversed: While the women dedicated their lives to ritual, the men menstruated and did all the heavy agricultural work.

The men then set about regaining the stolen flutes. With the aid of ritual whips and small piston whistles, they frightened the women into submission. In punishment for the rebellion, the men caused the women to menstruate and

declared that if women should ever see the Yurupary rites and instruments they would be killed.

YURUPARY CULT. A number of themes emerge from this myth that relate to the symbolic significance of the cult. Most notable are the astronomical character of the major protagonists; the importance of the vegetable world and its links with human fertility and growth; the links between periodicities in the human and natural worlds; the contrasts between men and women, humans and animals, life and death, and hard and soft parts of the body; and the ambiguity of Yurupary as both benevolent lawgiver and cannibal monster. The myth also serves as a charter for rituals which form the most important expression of the religious life of the people concerned and accounts for the origin of the sacred objects used by them.

There are two kinds of Yurupary ritual, one less sacred than the other. In the former, quantities of forest fruit, gathered by the men, are brought to the longhouse to the sound of the flutes and trumpets. During the day women and children are excluded from the house, but at dusk the instruments are removed and the women join the men to dance and drink manioc beer. The men chant origin myths and drink *yagé* to put them in contact with the spirit world. They also whip one another and the women and children to make them grow strong. The rites are held to increase the abundance of fruit and mark the ripening of each species. They also represent an exchange, in that the fruits are a gift from the spirits and in that fruit is often exchanged between longhouse communities.

These rites also form the first stage of initiation into the cult. Young boys are brought into the house along with the fruit, shown the flutes, given coca, snuff, and *yagé*, and whipped to make them grow. After participation in one or more such rites they then graduate to the more sacred rites, which are held once per year at the start of the rainy season as the Pleiades set at dusk. For these latter rites greater numbers of more sacred instruments are used, together with gourds of snuff, coca, and beeswax. These and other items, when assembled together, make up the body of the first ancestor, Yurupary or his equivalent. At the climax of the rites the ancestor appears in the form of two men dressed in full ceremonial regalia and adopts the initiates as his sons. The boys are shown the flutes and whipped, then taken to the river to bathe while water poured from the flutes is "vomited" over their heads.

The initiates are then secluded for two months in an enclosure that is out of sight of the women. They must fast; rigid taboos govern various aspects of their behavior; and they are taught to make baskets, an exclusively male task. The adult men are also under strict taboos and all are in a state described as being like that of menstruating women. The women fend for themselves and a state analogous to the matriarchy of the myth pertains. This period is brought to an end when the initiates are given chili peppers to eat and hot liquids to drink, ending a taboo on contact with sources

of heat. There follows a festive dance at which the initiates give women the basketry they have made, and thereafter the food taboos are progressively lifted and life returns to normal.

THEMES AND INTERPRETATIONS. A number of different interpretations have been proposed for this cult and, given the simultaneous operation of a number of different symbolic levels, they are not necessarily incompatible. At a sociological level, the cult involves the ritualized opposition between men and women, an opposition that permeates the Indians' secular and ritual life. The *yurupary* instruments are the means whereby men dominate women. Not only are women excluded from important rituals but they are also excluded from the knowledge of mythology and shamanism that this entails. Such knowledge is also a source of prestige and power. In the same vein the cult emphasizes the equivalent status of women and uninitiated children and allows the subjection of young men by their elders, who have greater ritual knowledge and experience.

Among the Tucanoan Indians Yurupary is also an ancestral cult related to their patrilineal ideology. The death of the ancestor and the distribution of his flute-bones provides a model for the division of human society into discrete phratries and, at a lower level, for the segmentation of each phratry into a number of clans descended from a common ancestor. The ritual adoption by the ancestor of his sons, the initiates, each one the potential founder of a new patriline, reenacts and repeats this initial process of segmentation. The instruments, each set of which is owned by a clan, are the sons of the ancestor and founders of the clans, and they bear the names of these ancestors.

The exclusion of women further emphasizes clan solidarity and patrilineal ideology by implying that the clan can reproduce itself without the intervention of women from outside. Latent in the Yurupary and related myths is a tension between the extremes of incest—as in the start of the myth—and its opposite, reproduction without the intervention of women—as when Yurupary is burned and becomes his sons, the flutes. Note too that Yurupary's bones become masculine flutes while his soft parts become things with feminine (and poisonous) connotations. This tension relates to that between a patrilineal ideology and the requirement that women must be brought in from outside for sexual reproduction. The symbolism of the cult plays upon this by dividing men and women into opposed groups while stressing the complementarity between male and female principles.

The Yurupary rituals can be seen as reenactments of elements of the central myth, and the symbolism of swallowing and regurgitation, a familiar theme of many initiation rites, is clearly present. The ritual, the myth, and statements by indigenous informants all suggest that the initiates are killed and swallowed and reborn by being vomited up again, a theme that can be linked to the etymology of Yurupary—from *yuru* ("mouth") and *pary* (initiates' enclosure, or a trap made of woven palm splints). The vegetable nature of Yuru-

pany, shown in his fast growth and his associations with fruit, is clearly related to the association of the initiates with fruit and the stress on their growth. The cult involves magic designed to increase the fertility of nature and to ensure the growth and fertility of human beings. Whipping to promote growth is common throughout Amazonia, as is the use of stinging ants for the same purpose.

The myth accounts for the origin of human mortality and links it with human and natural periodicity. While death is final, society endures through sexual and social reproduction. Ritually this process is accomplished by a symbolic death and rebirth whereby young boys come to replace their ageing elders. The myth implies that death is not final: Yurupary's soul becomes an immortal star and his bones become flutes, and are his representatives on earth. The myth draws a parallel between his death and slash-and-burn agriculture, whereby new plants grow from the ashes of dead trees. The instruments thus mediate between life and death and turn their opposition into an alternating cycle.

The theme of periodicity also relates to that of menstruation, which figures in both the myth and the rites. The myth implies that menstruation and possession of the flutes are equivalent but inversely distributed between the sexes. Women are held to approximate Yurupary's immortal state both because they reproduce themselves through their children and because menstruation is seen as analogous to the sloughing of their skins by the immortal snakes and other creatures who came from Yurupary's ashes. Though men lost the power to menstruate they gained the *yurupary*, which, although clearly masculine symbols, have an important feminine aspect appropriated and controlled by the men. The cult implies that whereas women give birth to children, only men can "give birth" to fully social adults.

That Yurupary and his mother and father are all identified with heavenly bodies further relates to this theme of periodicity. The myths and rites relate to the apparent movement of the stars in relation to that of the sun. The azimuth of the Pleiades corresponds with the winter solstice, Orion moves along the celestial equator, the azimuth of Scorpius corresponds with the summer solstice, and the heliacal rise of the Pleiades corresponds with the setting of Scorpius. Throughout northwest Amazonia the Pleiades are a seasonal marker, their heliacal rise coinciding with the start of the dry season and their setting with the rains, and the "opposition" between the Pleiades and Scorpius is a common symbolic theme in South American Indian cultures. Yurupary himself has both solar and masculine characteristics and a lunar, more feminine side.

Many of the themes mentioned above reappear in secret men's cults elsewhere in lowland South America. Among the Mundurucú the opposition between the sexes is more pronounced and antagonistic and corresponds with an apparent fear and jealousy of female sexuality and reproduction on the part of the men. With them, as with the Yagua, the link between sacred instruments and fruit is replaced by a link be-

tween the instruments and game animals. The flutes guarantee an abundance of game and luck in the hunt, in return for which they must be constantly fed. In the Xingu area the cults are again linked with the fertility of fruit. Among the Tikúna, sacred instruments are associated with female initiation involving the pulling out of the girls' hair. Female hair figures also in the Yurupary cult, for sacred masks representing Yurupary were made from hair shorn from girls at first menstruation. Finally, myths of matriarchy are common to all these groups.

BIBLIOGRAPHY

Of the many versions of the Yurupary myth published to date, the most complete is contained in *La leggenda del Jurupary e outras lendas amazonicas* (São Paulo, 1964) by Ermanno Stradelli (1852–1926). Wilhelm Saake's article "Die Jurupari-legende bei den Baniwa des Rio Issana," in *Proceedings of the Thirty-second International Congress of Americanists, Copenhagen 8–14 August 1956* (Copenhagen, 1958), pp. 271–279, is also an important source. This version is translated into English in Robin Michael Wright's work "History and Religion of the Baniwa Peoples of the Upper Río Negro Valley," 2 vols. (Ph.D. diss., Stanford University, 1981), which also contains another very full version of the myth, an ethnography of Baníwa religion, and some important material on the links between the Yurupary cult and messianic movements. Jonathan David Hill's study "Wakuenai Society: A Processual-Structural Analysis of Indigenous Cultural Life in the Upper Rio Negro Region of Venezuela" (Ph. D. diss., Indiana University, 1983) gives an ethnography of the Wakuenai (Curipaco) with good material on Yurupary and a valuable ethnomusicological analysis.

No really full and general account of the Yurupary cult, dealing equally with mythology, ritual, and its social structural context, exists. Silvia Maria da Carvalho's *Jurupari: Estudos de mitologia brasileira* (São Paulo, 1979) is a comparative analysis of the Yurupary and related myths. The analysis, while not based on primary field research, provides a comprehensive survey and makes a number of significant points of interpretation but is marred by thinly supported discussions concerning population movements, evolution, and diffusion. Hector Orjuela's *Yurupary: Mito, leyenda y epopeya* (Bogotá, 1983) relies also on published works and again provides a valuable compilation of the relevant myths. The interpretation is, however, patchy, and includes unsubstantiated assertions concerning the supposed Colombian origins of the myth. Jacqueline Bolens's "Mythe de Jurupari: Introduction à une analyse," *Homme* 7 (1967): 50–66, is a structuralist analysis of several classic versions of the Yurupary myth that, though short, contains some important insights concerning the symbolism involved.

My book *The Palm and the Pleiades: Initiation and Cosmology in Northwest Amazonia* (Cambridge, 1979), based on field research, provides a full account of Yurupary myths and rituals among the Tucanoan Barasana and their neighbors and is perhaps the most accessible and rounded interpretation of the cult. It also gives a comprehensive bibliography.

There is no general account of secret men's cults in South America, but Yolanda Murphy and Robert F. Murphy's *Women of*

the Forest (New York, 1974) and Anne Chapman's *Drama and Power in a Hunting Society: The Selk'nam of Tierra del Fuego* (Cambridge, 1982) provide accounts and interpretations, both based on primary research of such cults among the Mundurucú and Selk'nam.

Finally, *Rituals of Manhood*, edited by Gilbert H. Herdt (Berkeley, Calif., 1982), describes secret men's cults, this time in the New Guinea highlands, which show striking parallels with their South American counterparts.

STEPHEN HUGH-JONES (1987)
Revised Bibliography

Z

ZAEHNER, R. C. (1913–1974), was an English Orientalist and historian of religions. Robert Charles Zaehner, born April 8, 1913, began studies in Persian while on a scholarship in classics at Oxford and received a master's degree in Oriental languages. After leaving his position as research lecturer at Christ Church, Oxford, in 1939, he entered government service and was attached to the British embassy in Tehran during World War II. He accepted appointment as lecturer in Persian at Oxford in 1950; and, after serving briefly as acting counselor in the British embassy in Tehran, he was designated to succeed Sarvepalli Radhakrishnan as Spalding Professor of Eastern Religions and Ethics at Oxford in 1952, a professorship he held until his death on November 24, 1974.

At the least, Zaehner was a controversial figure during his remarkably productive two-decade career as Spalding Professor, and an altogether equitable assessment of his substantial publications on mysticism, the religions of India, Islam, and the comparative study of religions is difficult. If a historian of religion should be thoroughly grounded as a specialist in at least one major religious tradition, then Zaehner's credentials, in this respect, can scarcely be criticized: His primary research on Zoroastrianism, especially evident in his invaluable *Zurvan* (1955), unquestionably demonstrated his specialist's knowledge. If, too, a historian of religions may be expected to learn the original language or languages of primary sources in traditions that have special significance for his research, then Zaehner's study of Sanskrit in order to read classical Hindu sources again adds to his credentials. And, if an unwavering concern to allow source materials to speak in their own voices is essential to the prospering of serious primary and comparative investigations of religions, then Zaehner served his field of study well.

But if it is supposed that proper comparative history of religions must be so conducted as almost to render invisible the interpreter's presence, then Zaehner poses a problem. He is neither bland nor unobtrusive. In an age of increasingly "objective" and almost anonymous scholarship, Zaehner seldom left his readers uncertain of his position. He lauded, lamented, scolded, praised, and condemned. Unquestionably, he took seriously the materials he studied. Above all, he seems to have wanted the sources to present them-

CLOCKWISE FROM TOP LEFT CORNER. Relief of the third-century Zoroastrian high priest Kerdēr. Naqsh-e-Radjab, Iran. [*The Art Archive/Dagli Orti*]; Bronze Zeus or Poseidon from the Artemisius at Cape Sounion, 460 BCE. National Archaeological Museum, Athens. [*Erich Lessing/Art Resource, N.Y.*]; Relief depicting the Zoroastrian god Ahura Mazda at the ruins of Persepolis. Takht-i Jamshid, Iran. [*Charles & Josette Lenars/Corbis*]; Zen garden at Ryoanji in Kyoto, Japan. [*Archivo Iconografico, S.A./Corbis*]; Ziggurat of Nanna at Ur, c. 2100 BCE. Iraq. [*Charles & Josette Lenars/Corbis*].

selves fully and authentically and not partially or tendentially. What Zaehner himself took to be authentic, of course, was disputed on more than one occasion. Thus, for example, Zaehner's struggle with the specter of Sarvepalli Radhakrishnan's happy Neo-Hindu universalism provoked counter-assertions from Zaehner about the theistic dimension of Hindu thought that have been found extreme by many specialists.

For Zaehner, his source documents and what they represented were alive and not safely dead or distant. Misunderstood, his attitude could appear to be no more than a throwback to apologetic comparative studies of an earlier day. And it often was misunderstood. But in fact it seems that—his conversion to Roman Catholicism in the mid-1940s notwithstanding—Zaehner conceived his own "mission" to be the pursuit of comparative religious studies in ways that would not violate the uniqueness and integrity of the individual religions he studied. Unshakably convinced of the authenticity of his own youthful mystical experiences and the truth of his conversion (as he was certain that chemically induced altered states of consciousness were worse than bogus mysticism), Zaehner was altogether ready to take religious documents completely seriously. And, believing himself to be a religious man, he had no difficulty accepting the existence and (occasionally wrongheaded) sincerity of other religious men.

BIBLIOGRAPHY

Zaehner's command of Zoroastrian material is indisputably documented in *Zurvan: A Zoroastrian Dilemma* (Oxford, 1955) and his more accessible and wide-ranging *The Dawn and Twilight of Zoroastrianism* (London, 1961). Among the latter's several strengths not the least is its thorough and unusually entertaining bibliography. Zaehner's *Hinduism* (London, 1962) is among the most helpful overviews; and his *The Bhagavad-Gīta*, a translation and commentary (Oxford, 1969), is one of the most significant scholarly encounters with this text. Vigorous and insightful also are Zaehner's Jordan Lectures, *Hindu and Muslim Mysticism* (London, 1960) and his *Mysticism: Sacred and Profane* (Oxford, 1957). The complex range of Zaehner's thought and style is nowhere better illustrated than in his stimulating and controversial Gifford Lectures, *Concordant Discord* (Oxford, 1970). Possibly the most engaging introduction to Zaehner's work, however, may be the eight late essays published posthumously as *The City within the Heart* (London, 1980), which is introduced by philosopher Michael Dummett's warm tribute.

G. R. WELBON (1987)

ZAKĀT is a Qur'anic term that signifies the specific obligation of giving a portion of an individual's wealth and possessions for primarily charitable purposes. The word is derived from a root meaning "to be pure" and also carries additional connotations of "increase" and "virtue," as well as "giving." It is also used in the Qur'an together with other terms such as *ṣadaqāt* that also carry the connotation of giving and of charity.

The Qur'an links *zakāt* to other primary acts of belief: "Piety does not consist of merely turning your face to the east or to the west. Rather, the pious person is someone who believes in God, the last day, the angels, the book, and the prophets and who out of his love gives his property to his relatives, orphans, the needy, travelers, supplicants, and slaves; and who performs the required prayers and pays the *zakāt*" (Qur'an 2:177).

The verb *zakā* suggests the idea of growth to emphasize that the giving of one's resources is simultaneously an act that entails the cleansing of oneself and one's property and, through sharing, an enhancement of the capacity of others. More specifically, this kind of giving is considered in the Qur'an to be analogous to a fertile garden whose yield is increased by abundant rain (Qur'an 2:265). It is this multiple connotation of *zakāt* that is reflected in subsequent interpretations in the institutionalization of the principle in Muslim thought and practice. The centrality of *zakāt* is underscored by the many times it is coupled with the command for prayer and also identified as a continuation of the practice of past prophets.

It is clear that the Qur'an envisaged a broad framework both for those who might benefit from the more formalized practice that was evolving in the early Muslim community and for the fiscal support of the community's needy. *Zakāt* and other forms of giving served to benefit the early Muslims who had migrated from Mecca with the Prophet. It was also used to encourage others to join the Muslim community and to support the Muslims in the conflict against Mecca. The Qur'an specifies the types of recipients who ought to benefit from it: those afflicted by poverty; those in need and incapable of assisting themselves; those who act, sometimes in a voluntary capacity, as stewards and custodians to ensure the collection and appropriate expenditure of funds; those who should be attracted to the faith; captives who need to be ransomed; debtors; travelers; and finally those engaged in serving God. All of these categories came to be strictly defined in later legal and exegetical literature. But other verses also suggest broader uses that might include those who during periods of hardship or transitions were not visibly in need and who nonetheless either required assistance to enhance their livelihood or needed to be directed towards new occupations and economic opportunities. While one aspect of *zakāt* was clearly projected towards charitable acts for the poor and the needy, the practice also encompassed the wider goal of applying the donations to improve the general condition and economic well-being of other recipients and constituencies and those working to foster the growth of the new community.

The fact that the Prophet eventually organized the collection and distribution of *zakāt* suggests that the process was being cast into specific institutional forms even in his day. It was, according to early Muslim sources, applied to crops, animals, merchandise, gold and silver, and so on. Such wealth and possessions qualified only when they were above a certain minimum number or amount. The collector was

urged to be fair and to persuade rather than impose. According to the Qurʾān, some of the Bedouin groups that had converted to Islam remonstrated about the paying of *zakāt*. Al-Bukhārī (d. 870), the compiler of the most respected collection of Sunnī prophetic *ḥadīth*, cites a report in which the Prophet sent a representative to Yemen to invite the local tribes to convert to Islam and pay *zakāt*. When Abū Bakr became caliph after the Prophet's death, a number of tribes refused to pay the *zakāt* because they felt that the death of the Prophet absolved them from the obligations contracted with him. In order to ensure adherence to the practice and to put down the rebellion Abū Bakr was compelled to send forces against the rebels, restoring order and proper remission of *zakāt*. It appears therefore that based on the example of the Prophet and the early Muslim community, while the practice of *zakāt* had become well-established, its particulars and regularization were still in the process of development.

The juristic literature produced by succeeding generations of scholars further formalized the collection and disbursement of *zakāt* as part of the larger systematization of legal obligations. While in some instances rulers and states collected *zakāt*, inefficiencies and corruption resulted throughout Muslim history in a variety of collection practices, so that individuals were still free to disburse *zakāt* as individuals or in community contexts through appropriate intermediaries.

The work of the Hanafī jurist Abū Yūsuf (d. 808), *Kitāb al-Kharāj*, which was written during the reign of the Abbasid caliph Hārūn al-Rashīd (r. 786–809), is an instructive example of the collaboration between jurists and rulers to appropriate and extend such practices as *zakāt* as part of the fiscal working of the state. A jurist such as al-Shāfiʿī (d. 820) was able to systematize and rationalize prevailing practice in his work. Generally, such works built upon the references to *zakāt* and *ṣadaqāt* in the Qurʾān, detailing the payments based on the ownership of property, possessions, precious stones and money, animals, and income generated from farming and trading. They prescribed when an amount was to be paid and to whom, as well as what minimum amounts were due in each category. It is interesting to note that the *zakāt* was also extended to include underground resources, such as minerals and treasure troves. These juristic works enumerate in great deal the character and terms of *zakāt*, developing into an elaborate formalized obligation, presented as a religious duty. Many of the sources however continue to emphasize the moral agency of the act, linking its obligatory character to religious merit and reward. Moreover, they often identified *ṣadaqāt* and *zakāt* as a means of seeking God's pleasure and the reward of the afterlife.

Developments in legal theory also reflect the way different groups in Islam interpreted *zakāt*. Shīʿī sources, citing ʿAlī ibn Abī Tālib and the other early *imāms*, emphasize the need to pay the *zakāt* to the rightful authorities. Among the Shīʿah, this was to be entrusted to the *imām* or those designated by him and disbursed in accordance with the spirit of

Qurʾanic values. Among the Ithna Ashari Shīʿah, who believe that the *imām* is in a state of physical absence from the world (*ghayba*), *zakāt* was to be entrusted to those considered his trusted worldly representatives. Their role was to ensure that *zakāt* reached the appropriate recipients. Among the Ismāʿīlī Shīʿah, *zakāt*'s formal aspect is complemented by a spiritual significance, and it was the role of the *imām* to interpret and sustain the values of *zakāt* in changing contexts. The Zaydi tradition insisted that it must be paid to official collectors representing the Zaydi state under a legitimate *imām*.

The Sūfīs emphasize the mystical value of *zakāt*. In certain circles, individuals were known to distribute their entire possessions as *zakāt*. Some groups sanctioned the acceptance of *zakāt* as a gift emanating directly from God. Over the period of Muslim history, the practices relating to *zakāt* evolved into various forms, but it remained an important practice, mirroring beyond all the formal details the principle and moral commitment to share one's wealth.

As Muslims seek to address questions of identity and development in the modern world, *zakāt* has afforded them the opportunity to rethink the relevance of past practices within their changed contexts, which include living in nation-states or as minorities in many parts of the world. A majority of Muslims live in areas of the world that are considered to be less developed than the more industrialized regions. Hence, issues of social justice and the equitable distribution of resources figure prominently in discussions of the present-day significance for building civil society according to the values of past tradition. Some Muslim theorists have advocated the reintroduction of the obligatory *zakāt* tax as one element of a general tax policy to add the moral aspect of social benevolence to a modern economic policy.

Additionally, some countries have developed nonstate financial agencies to allow for individuals to voluntarily contribute *zakāt*. In Pakistan, Saudi Arabia, Sudan, and Yemen, legislation was created to encompass *zakāt* as part of the state fiscal practice. The majority of Muslims, however, continue the practice of *zakāt* as a voluntary act of giving and as an expression of personal faith, intending it to serve the needs of those less privileged in their communities and elsewhere in the world.

ZALMAN, ELIYYAHU BEN SHELOMOH

SEE ELIYYAHU BEN SHELOMOH ZALMAN

ZALMOXIS was the founder, possibly legendary, of a priestly line of succession closely linked with kingship of the Getae and the Dacians, the northernmost Thracian peoples of the ancient world. Whether he is a figure of legend or of history is moot, as are questions of his religious functions. Associated both with priesthood and with kingship, he was divinized and became the object of a widespread cult among both northern and southern Thracian peoples.

NAME. The name *Zalmoxis* is attested by ancient authors from Herodotus and Plato (fifth-fourth centuries BCE) to Diodoros of Tyre (second century CE) and Jordanes (sixth century CE). Herodotus spells the name *Salmoxis*; Strabo gives it as *Zamolxis*. The genuine form, however, is *Zalmoxis*, support for which is found in such Thracian names as *Zalmodegikos* and *Zelmutas* and in numerous composites formed with *-zelmis*, *-zelmos*, and *-selmios*. *Zamolxis* is only a metathesis, frequent since Strabo (first century BCE), with no parallels in Thracian onomastics.

Porphyry (third century CE) explains the etymology of *Zalmoxis* through the Thracian word *zalmos* (“skin”; Gr., *dora*), and in supporting this thesis he offers an etiologic legend that tells of the covering of Zalmoxis at birth with a bearskin (*Life of Pythagoras* 14–15). Dimiter Detschew (1957, p. 175) has proved that Indo-European correspondents of *zalmos* also mean “shield, protection,” which is perfectly fitting to both a god and the highest priest. But Porphyry also gives another explanation of the meaning of the name: “foreigner” (Gr., *xenos aner*). On this basis Paul Kretschmer

compared the metathetical form *Zamolxis* with the Phrygian *zemelen* (“barbarian slave”; Gr., *barbaron andrapodon*), with *Zemelo*, the name of a Thracian-Phrygian earth goddess (compare the Greek *Semele*), and with the Slavic *zemlja* (“earth”) and thus explained *Zamolxis* as meaning “lord of men” (for *-xis*, compare the Avestan *xshaya-*, “lord, king”). Hence was developed (mainly by I. I. Russu) the theory of the chthonic character of this god, which led to the ongoing dispute over his real functions.

According to Herodotus (*Histories* 4.94), some Getae also gave Zalmoxis the name *Gebeleizis* or *Beleizis*, which Kretschmer has related to the same Indo-European root, **gʰhem-el-* (“earth”), that he traced in *Zamolxis*. Given that Herodotus spoke about a thundering god, Wilhelm Tomaschek corrected the name to *Zibeleizis*, meaning “thunder sender” (compare the Lithuanian *žaibas*, “thunderbolt,” which has no clear etymology). More recently, Cicerone Poghiric (1983) has proposed, for reasons of textual criticism, the reading *Nebeleizis*, meaning “god of the [stormy] sky” (compare the Slavic *nebo*, “sky,” and the Greek *nephele*, “cloud”).

TESTIMONIES. Herodotus (4.95) refers to a story told by the Greeks in the Pontic colonies (on the western shore of the Black Sea) according to which Zalmoxis was a Getic slave of the Greek Pythagoras, who lived in Samos. After Zalmoxis was freed, he became wealthy and went back to his native country, where he taught the northern Thracians the Greek way of life based on Pythagorean ideas about immortality, vegetarianism, and so forth (see Strabo, *Geography* 7.3–5). In his homeland Zalmoxis had an *andreion* built (a room for the exclusive use of men), where he received the chiefs of the Getae and taught them that neither they nor their posterity would die. This concept of immortality refers in all probability to a paradise where warriors would enjoy eternal life and everlasting pleasure after death. While he imparted this teaching of the afterlife, Zalmoxis had an underground chamber constructed. When it was finished, he retired to it for three years, during which the Thracians mourned his death, but in the fourth year he reappeared, showing that death is not irreversible.

With slight variations, this legend is repeated by several Greek and Latin writers. Herodotus, however, opines that Zalmoxis was not a slave of Pythagoras but did in fact live long before him. Strabo adds that Zalmoxis learned from Pythagoras and from the Egyptians, whom he visited. He says that Zalmoxis was a prophet who became a priest of the principal god of the Getae and an associate of the king; later he was divinized. He dwelled in a cave, on the holy mountain Kogaionon, where scarcely anyone but the king and his messengers could join him (7.3–5). The kingship of Zalmoxis and his teaching on immortality are confirmed by Plato (*Charmides* 156d–e), who adds further that Zalmoxis had taught a highly praised method of psychosomatic medicine based on charms (*epoidai*, 157a).

Another piece of basic information provided by Herodotus (4.94) concerns the principal rite of the Getae, which consisted of killing a messenger every four years (or five years, according to Greek computation). A man chosen by lot from among the warriors was given a message to be delivered to the god. Then he was cast on top of three spears. If he died instantly, this was interpreted as a good omen. If he failed to die, the sacrifice had to be repeated, and the first messenger was cursed. This cursing suggests that purity of some kind was required.

According to the Roman geographer Pomponius Mela (first century CE), Getic warriors were not afraid of death. Pomponius gives three different explanations for their contempt of life, each one believed by some among them: belief in metempsychosis (reincarnation); belief that the soul survives after death in a happy place; and belief that life is worse than death, although the soul is mortal. Of these interpretations, only the second refers to the genuine teaching of Zalmoxis according to Herodotus (4.95).

Herodotus's reference to Zalmoxis/Gebeleizis introduces the latter as a heavenly god. This description is supported by the claim that during thunderstorms the Getae shot arrows into the sky, thus threatening their god (4.94).

Decaeneus (also known as Dekaineus, Deceneus, and Dicineus), a high priest of Zalmoxis during the reign of the Getic king Burebista (c. 80–44 BCE), is mentioned in an account by Strabo (7.3–5), his near contemporary. According to a Greek commonplace, Egypt was a land where wisdom could be acquired, and Strabo also says that Decaeneus wandered there and learned soothsaying (7.3–11). The story that he ordered grape vines cut down in the kingdom of Burebista and an allusion to the vegetarianism of the Getae may be based on actual facts. It is also not impossible that Decaeneus was acquainted with the idea of metempsychosis, which fits well in the Pythagorean pattern of the religion of the Getae. An authentic feature of Getic high priesthood was Decaeneus's dwelling in a cave on Mount Kogaionon (Strabo, 7.3–5).

INTERPRETATIONS. The history of the interpretations of Zalmoxis is somewhat disappointing. Distinguished scholars have disagreed about whether Zalmoxis's cult was a form of monotheism or of polytheism (it was not more monotheistic than, say, the Cretan cult of Zeus Idaeus); about whether Zalmoxis was a god or a man, perhaps a religious reformer; and about whether he was connected with the earth or with the sky (in fact he was associated with both). Spiritualistic evolutionists have tried to show that the cult of Zalmoxis represented for the Daco-Roman population a sort of primordial revelation and a *praeparatio evangelica*. Rationalists and Marxist evolutionists have tried to demonstrate that it was, on the contrary, much more "primitive" than some testimonies indicate. Hadrian Daicoviciu, for instance, shared this last hypothesis even though it contradicted his own pertinent interpretation of the calendar temple of Sarmizegetusa Regia (modern-day Gradistea Muncelului, Romania), ac-

ording to which the Dacian priests were steeped in sophisticated astronomical speculations (*Dacii*, 2d ed., Bucharest, 1972).

The excellent study *Zalmoxis, the Vanishing God* (Chicago, 1972) by Mircea Eliade put an end to these discussions by showing that the testimonies concerning the cult of Zalmoxis have to be trusted and interpreted on the basis of a close comparison with other religious materials. According to Eliade, Zalmoxis was a mystery god in whose cult the divinity's "occultation" and "epiphany" were celebrated. In his attempt to decipher the Greek interpretation of Zalmoxis in its genuine dimensions, Eliade established important links between Zalmoxis and Archaic Greek traditions concerning soothsayers and medicine men like Pythagoras himself.

ZALMOXIS AND THE GREEK SEERS. In the most ancient testimonies, Zalmoxis is constantly related to Pythagoras. Pythagorean features of his cult are further specified until the times of Strabo and Pomponius. A corpus of these features can be established as follows: Zalmoxis has an underground chamber built, disappears for three years, and then reappears (katabasis, occultation, and epiphany); he makes prophecies; he and his priests and successors live in a mountain cave, practice psychosomatic medicine, and make astronomical computations; there is among the Getae a group of ascetics who live in poverty and continence, abstaining from animal food. The core of the Zalmoxean teaching is the doctrine of immortality of the soul, which should actually be interpreted as a promise to the brave warriors that they would survive in paradise. Later, some among the Getae may have been acquainted with the idea of metempsychosis. All this sounds so Pythagorean that the Greeks were even disposed to understand the less attractive practice of human sacrifice without much ethical comment.

One of the false problems connected with Zalmoxis that has received much attention from scholars is whether the god—if he was a god at all—ought to be interpreted as a chthonic or as a heavenly divinity. In fact, from the perspective of the history of religions, this is not a logical contradiction, since divinities of the sky can be strongly connected with the earth, and vice versa. Furthermore, even in Greek religion, which is usually the model according to which Zalmoxis is interpreted, such heavenly divinities as Zeus and Apollo were worshiped in caves, whereas such a typically chthonic divinity as Persephone was associated very early with heavenly immortality. Pythagoras himself, who was apparently connected with Apollo of Hyperborea, is also the character who descends to the underworld and who exhibits important features that establish his relationship with a chthonic goddess, or "great mother." Zalmoxis's "Pythagorean" structure connects him with both the earth and the sky.

Among the Greek characters belonging to the same class of seers, soothsayers, medicine men, and semidivinities as Pythagoras, the one who most closely resembles Zalmoxis is Epimenides of Crete, worshiped as a god in a local cult. Epimenides is said to have dwelled in the grotto of the infant

Zeus on Mount Ida, where he slept for several decades. He avoided food and used only a plant called *alimos*, or hungerbane, to keep hunger in abeyance. He could foretell the future, he practiced purifications, and he was able to remember his previous existences as a human being. In one of these incarnations he was Aeacus, brother of Minos, who was a son of Zeus. Minos visited his godly father in the Idaean cave every eight years, and thus it is not surprising that Epimenides used this place for incubation. During his catalepsy, his soul was reported to be together with the gods, listening to their speeches.

According to another legend, once when Epimenides was about to dedicate a sanctuary to the nymphs a heavenly voice instructed him to dedicate it to Zeus instead. This could be interpreted as an indication that the Idaean cave did not belong to the sphere of influence of those divinities who normally preside over such places, that is, the nymphs, but to the heavenly god *par excellence*, Zeus. In fact, Epimenides was considered a “new infant” (*neos kouros*), the Idaean Zeus reborn. It is, then, no surprise to learn that he was the guide of Pythagoras when the latter descended into the Idaean cave. Nor is it surprising that Epimenides, the author of oracles and theogonies, worshiped by the Cretans as a god, was nevertheless transformed by the Neoplatonic Iamblichus (c. 250–330 CE) into a pupil of Pythagoras in precisely the same way as this happened with Zalmoxis; among Greek seers of pre-Socratic times Pythagoras was simply more famous than Epimenides.

The chthonic side of Epimenides is revealed by his dwelling in a cave and by his relationship with the nymphs. In the legends of Pythagoras and Zalmoxis this chthonic side is revealed by a detail that has only recently received a consistent interpretation. Walter Burkert (1972) has shown that Pythagoras was probably viewed as a representative of the chthonic goddess Demeter, a hypothesis confirmed by the tradition that Pythagoras once exhibited a “golden thigh.” This probably means that the legend attributed to Pythagoras a tattoo on his thigh, which was the mark, or seal, of the Anatolian great goddess. At the same time it was an indication that Pythagoras could travel to Hades (Burkert, 1972, pp. 160–161).

In his *Life of Pythagoras* (15), the Neoplatonist Porphyry reports a strange legend according to which Zalmoxis was a disciple of Pythagoras; at the time of the revolt of the citizens of Croton against Pythagoras, Zalmoxis was captured by bandits who tattooed him on his face, which he kept covered ever after. This brief account seems to be extremely important, since tattooing among southern Thracian nobles is attested as early as Herodotus (5.6) and confirmed by several testimonies, and yet Artemidorus of Ephesus (fl. 100 BCE) reports that, whereas the southern Thracian nobles had their children tattooed, the Getae tattooed only the children of their slaves. From a fragment attributed to Clearchus of Soloi (sixth century BCE) one could infer that Getic women were tattooed over the whole body. The rhetorician Dio Chrysos-

tom (first century CE) specifies that only the wives of Thracian nobles were tattooed, with red-hot irons.

Tattooing among the Thracians was probably a religious mark; among the northern Thracians, the Getae and the Dacians, it could have been associated with the pain once inflicted upon Zalmoxis by his captors. Since tattooing among the Getae is twice mentioned in relationship to slavery, one could infer that the ancient legend making Zalmoxis a slave was based on this character’s genuine myth, which might have originally included suffering and imprisonment. Plutarch of Chaeronea (first century CE) reports that the Thracians tattooed their women in order to avenge the sufferings inflicted by Thracian women upon Orpheus. Plutarch, who was far better acquainted with Orpheus than with Zalmoxis, could have misinterpreted here an actual tradition connected with Zalmoxis. It is possible to a certain extent to state that the Getae tattooed their slaves and perhaps their wives as a religious record and possibly as revenge for the mark impressed upon Zalmoxis while he was a captive.

Much less convincing is the interpretation of Rhys Carpenter in his *Folk-Tale, Fiction, and Saga in the Homeric Epics* (Berkeley, Calif., 1946), which is based on the testimony of Porphyry (*Life of Pythagoras* 14), according to which a bear-skin was put on Zalmoxis at his birth. According to Carpenter, Zalmoxis actually was a bear, whose hibernation (i.e., occultation) was taken by the Getae as a religious model.

CONCLUSION. God or man, possibly also a religious reformer of the Getae, Zalmoxis fits almost perfectly into the Pythagorean pattern of a Greek seer and medicine man such as Epimenides, who was also worshiped as a god. His myth is scarcely known, but it could have contained an episode of captivity and, possibly, suffering. Ritual tattooing among the Getae was related to this episode, and might have been inflicted upon slaves and women as an expiation of a mythical sin. Zalmoxis probably taught immortality for valiant warriors. He was worshiped in a grotto, which might have played an important part in the initiation of priests and warriors. A chief priest, his representative in the grotto, was considered a prophet, and he gained such influence in political matters that the state of Burebista could be properly called a theocracy. A sanctuary, possibly the old sanctuary with an underground chamber at Sarmizegetusa Regia, described by Ion Horațiu Crișan in *Burebista and His Time* (Bucharest, 1977), was provided with a subterranean room, a substitute for the grotto. This indicates that the legend of the occultation of Zalmoxis referred to by Herodotus was connected with the existence of such an ancient sanctuary.

Revised Bibliography

ZAMAKHSHARĪ, AL- (AH 467–538/1075–1144 CE), fully Abū al-Qāsim Maḥmūd ibn ʿUmar al-Zamakhsharī; Muslim philologist and Qurʾān commentator. Born in Khorezm in northern Persia, al-Zamakhsharī traveled little outside his native province except for several years spent studying and writing in the holy city of Mecca. He was a native Persian speaker, but he believed strongly in the superiority of the Arabic language and excelled in Arabic philology. According to various historical records, he wrote some fifty works; thirty of these are known to exist today, a majority of which have been published in the original Arabic. Most of these works deal with the Qurʾān or the Arabic language in general.

Al-Zamakhsharī's major work, and the one for which he is most famous, is his book of Qurʾān interpretation (*tafsīr*), *Al-kashshāf ʿan ḥaqāʾiq ghawāmiḍ al-tanzīl* (The unveiler of the realities of the secrets of the revelation), a work completed during a two-year stay in Mecca around 1134. The work is a phrase-by-phrase philosophical and philological commentary on the entire text of the Qurʾān, written in a concise, careful, and somewhat difficult style. Notable is its lack of tradition-oriented material; virtually no reports are attributed to the early authorities on interpretation; rather, all comments are directly stated with no concern for their authority in the past. Generally, al-Zamakhsharī presents first what he considers to be the obvious meaning of a verse and

then notes other possible interpretations on the basis of grammar and textual variant readings, while always paying full attention to the notion of the rhetorical beauty (*iʿjāz*) of the Qurʾān.

The distinctiveness of al-Zamakhsharī's Qurʾān commentary lies in his Muʿtazilī theological leanings. Beginning in the tenth century, the Muʿtazilah were apparently a powerful theological force in al-Zamakhsharī's birthplace. He states explicitly that *Al-kashshāf* was written in order to provide the needed comprehensive Muʿtazilī commentary to the Qurʾān. The most obvious result of this theological position in the commentary is the way in which he resolves apparent conflict between various verses of the Qurʾān. The Muʿtazilī doctrines of the unity and justice of God and the consequent ideas of the human free will and the need to deanthropomorphize the Qurʾān become the prime themes of the distinctive passages of interpretation. A typical example is found in his treatment of surah 6:125:

Whomever God desires to guide: those upon whom God bestows his benevolence, which only happens with those who are worthy. *He expands his breast to Islam:* bestowing his benevolence on them so that they long for Islam, and their souls feel at home there, and they desire to be Muslims. *Whomever he desires to lead astray:* those whom God leaves alone and wishes to abandon to their own deeds. What is meant is one who is not worthy of his benevolence. *He makes his breast narrow, tight:* He keeps his benevolence from them, so that their hearts harden, and they refuse and resist truth, and thus faith finds no path into them.

Here the emphasis is always upon the prior moral condition of the individual, to which God responds by enhancing the condition that the individual has already chosen.

Likewise the doctrine of the created Qurʾān (as opposed to the orthodox dogma of the preexistent, uncreated Qurʾān) is present throughout al-Zamakhsharī's work; apparently *Al-kashshāf* originally began, "Praise be to God who created the Qurʾān," but this was changed to "God who gave" or "God who sent down" in order to temper the tone somewhat.

Despite its theological argumentation, al-Zamakhsharī's Qurʾān commentary has been widely read and copied, especially in the eastern parts of the Islamic world. The work has consistently been subject to both explication and attack by later authors, who have provided many supercommentaries and derivative commentaries. The work by al-Bayḍawī (d. sometime between 1286 and 1316), *Anwār al-tanzīl wa-asrār al-taʾwīl* (The lights of the revelation and the secrets of the interpretation), is the most famous attempt to distill the essence of al-Zamakhsharī's work while attempting to omit those views which were reprehensible to orthodoxy. For the Muʿtazilah, on the other hand, *Al-kashshāf* represents the peak of intellectual achievement in Qurʾān commentary.

BIBLIOGRAPHY

Al-kashshāf ʿan ḥaqāʾiq ghawāmiḍ al-tanzīl has been edited and published a number of times, but no particular edition has

emerged as the standard one. No extensive portions have ever been translated, and the usefulness of such translations would be quite limited because of the precise and technical nature of much of the original. Short passages of the work are available in English throughout Helmut Gätje's *The Qur'ān and Its Exegesis: Selected Texts with Classical and Modern Muslim Interpretations*, translated and edited by Alford T. Welch (Berkeley, 1976), and in Kenneth Cragg's *The Mind of the Qur'ān: Chapters in Reflection* (London, 1973), pp. 64–69, where the commentary on Qur'ān surah 90 is translated. The most significant and extended treatment of al-Zamakhsharī's work on the Qur'ān is to be found in Ignác Goldziher's *Die richtungen der islamischen Koranlegung* (Leiden, 1920), pp. 117–177. Jane I. Smith's *An Historical and Semantic Study of the Term "Islām" as Seen in a Sequence of Qur'ān Commentaries* (Missoula, Mont., 1975), pp. 89–101, gives a useful summary of al-Zamakhsharī's work, provides examples of his method of interpretation, and locates it within the general historical framework of *tafsīr*. A number of articles by Lutpi Ibrahim have appeared on al-Zamakhsharī and his theological relationship to al-Baydāwī: "Al-Baydāwī's Life and Works," *Islamic Studies* (Karachi) 18 (1979): 311–321; "The Concept of Divine Justice according to al-Zamakhsharī and al-Baydāwī," *Hamdard Islamicus* 3 (1980): 3–17; "The Relation of Reason and Revelation in the Theology of al-Zamakhsharī and al-Baydāwī," *Islamic Culture* 54 (1980): 63–74; "The Concept of *Iḥbāt* and *Takfīr* according to al-Zamakhsharī and al-Baydāwī," *Die Welt des Orient* 11 (1980): 117–121; and "The Questions of the Superiority of Angels and Prophets between al-Zamakhsharī and al-Baydāwī," *Arabica* 28 (1981): 65–75.

ANDREW RIPPIN (1987)

ZAPATISMO AND INDIGENOUS RESISTANCE. The EZLN's (Zapatista Army of National Liberation) seizure of five municipalities on January 1, 1994, in Chiapas follows a tradition of insurrections and armed rebellions dating back to the arrival of Europeans to the region. Examples of these insurrections include the Zoque community rebellion, 1532–1534; Mayan descendants executed a Spanish mayor in 1693; the Cancuquero people, in alliance with other communities, rose up in 1712; and in 1869–1870 the Chamulas and Tzotziles rebelled. San Cristóbal de las Casas, the main city in which the first EZLN uprising played out, is named for Bartolomé de las Casas (sixteenth-century Spanish archbishop and defender of the thesis that the indigenous peoples, contrary to the Catholic Church's position, indeed possessed souls). The experience of the indigenous struggle against the Spanish crown and then the Mexican nation-state took on more clear articulations with the leadership of Emiliano Zapata, who drew upon Zapotec cultural traditions, and the modern anticapitalist conceptualizations of Marxism, Leninism, and anarchism during the Mexican Revolution. Zapata brought the indigenous traditions that informed the politics of the *ejidos* and the autonomy of the land together with modern revolutionary articulations of the

seizure of power. This mode seeks either to maintain the state structure according to Leninist inspiration or to eliminate it according to Bakuninist thought and indigenous beliefs and convictions surrounding land autonomy. Zapata agreed with the anarchist Flores-Magón brothers and favored the dissolution of the state. The most important document of this period (which divides the urban and the *villista* camps from the land-based Zapatista camp during the Mexican civil war) was the "Plan de Ayala," written by the Zapatista Army of the South on December 11, 1911. The plan sustains that the people must remain armed until the land is concretely transferred back into the hands of the indigenous peoples.

In the 1960s, during the worldwide intellectual movements, the student movements, the inspiration of the Cuban revolution, and the Soviet and Chinese forms of Marxism, the ELN (Army of National Liberation) and other groups developed in Mexico. This party became one of the few that remained active in the 1970s after the student massacre at Tlatelolco under the Díaz Ordaz presidency in 1968. When the urban revolutionaries, among them the future subcommandante Marcos, arrived in Chiapas in the early 1980s with the intent to develop an armed Zapatista uprising, they found the region in a state of political agitation. The diocese of San Cristóbal formed part of the political action inspired by Liberation Theology, and the Mayan communities were clear about the urgent need for liberation in order to continue to exist as autonomous cultures with their own worldviews and pertinent social structures. The Zapatista revolutionaries installed themselves in Las Cañadas and learned from the local peoples. The EZLN began to take shape in accordance with the beliefs and worldviews of the people—the value of the word and the ethical responsibility of language making up a central axis of the movement.

President Carlos Salinas de Gortari eliminated Article 27 from the Mexican constitution (which prohibits the privatization of the *ejido* lands) in 1992, making possible the liquidation of these common lands and thus facilitating the pauperization and eventual cultural and physical disappearance of the inhabitants. On January 1, 1994, NAFTA (North American Free Trade Agreement) took effect for the United States, Canada, and Mexico and with it the Anglo-North American exploitation of Chiapas, a state rich in uranium, petroleum, jungle, and hydroelectric resources. The EZLN opened its campaign at dawn with eighteen thousand Mayan men and women—masked and armed with automatic guns, single-shot rifles, and wooden replicas painted black—making known the First Declaration from the Lacandon Jungle against neoliberalism and globalization.

THE WORD. In *Balún Canan* (1957) the Chiapas author Rosario Castellanos wrote of the ongoing plight of the indigenous people of the region:

Y entonces, coléricos nos desposeyeron, nos arrebataron lo que habíamos atesorado: la palabra, que es el arca de la memoria. Desde aquellos días arden y se consumen con el leño en la hoguera. Sube el humo en el viento y se deshace.

Queda la ceniza sin rostro. Para que puedas venir tú y les baste un soplo, solamente un soplo.

And then, furiously they dispossessed us, they carried off what we had treasured: the word, which is the ark of memory. Ever since those days they smolder and are consumed with the logs of the bonfire. The smoke rises in the wind and dissolves. Faceless ash remains. So that you can come, and with only a puff, just a puff. (Castellanos, 1984/1957, p. 9)

Globalization, like other words of its kind—*modernization*, *pacification*, or *industrialization*—connote neutral if not humanitarian processes in the world of mass media and consumer culture; people take them for granted without seeing their morphology and ideological weight. Such words appeal to first world consciousness, and people accept them, act upon them, and live with them as though they were trees that express the passage of time. If one attends the words carefully, looks at the meaning attached to each root, prefix, and suffix, and reinserts them into the memory and the narrative of time, one can reestablish the connection between word and deed, and one can recover meaning.

Within modernization are assumptions of backwardness. Within industrialization lies the classification of inefficiency and “primitive,” small-scale production. Within the idea of normalization is assumed erraticness, abnormality, diversity, and the need to establish patterns in what is unpredictable through Western paradigms. Calling for stabilization attributes chaos to the object of that stabilization and the need to make it secure. Pacification deems the people and place in question warlike. Secularization identifies the necessity to eliminate religious thought and the sacrality of the everyday: sunrise, harvest, slaying animals, and eating. Secularization also proposes science as truth and unideologically suspect.

The postmodern era of the world economy has its socially accepted words, as did the era of modernity and colonial economy. The moral high ground of the civilization depended on the belief in the savagery and cannibalism of the Other. Christianization assumed paganism, idolatry, and witchcraft. Supporting colonization assumed the inferiority of cultures and the inaptitude of targeted “races” for self-government and for the management of the resources of the land they inhabit. Inside the mission of population lies the assumption that the people of the targeted lands are not people.

These words are euphemisms, coded signifiers that say nicely, according to their contemporary social mores, what may otherwise offend the morality and self-image of the people whose cultures promote and support these market-driven processes. This long-standing language strategy belongs to the strategies of discourse and rhetoric, particularly writing discourse in its character of self-reflective materiality and class-constructed hegemony.

When these words are naturalized, they become necessary, indisputable, and unavoidable. Embedded in language,

they form part of the macronarrative into which every culture’s history is made to conform, describing how all the world’s peoples fit into the history of the Western tradition. The words originate in the language of the dominant narrative (Spanish from the sixteenth century to the early nineteenth century and English in the era of the American economic system). These are the words of the macronarrative that deems the social organization of non-Western peoples as “underdeveloped” or “developing.” The unavoidability of the terminology becomes another layer in the mission of modernity, science, and progress—the belief in the superiority of secular society and republican governance. This conviction, bolstered by self-professed objectivity, overlooks the fact that modernity is a historical phenomenon not unlike the previous era’s belief in the Catholic Church.

To see globalization or any other such terms as natural, neutral, or necessary, one accepts the implicit negation that such cultural processes of transformation are dual, involving a subject and an object: the one who globalizes, modernizes, democratizes, and so on and the one that is globalized, modernized, or democratized. They are not horizontal dialogues between subjects as the colorful image of “global culture” suggests. One entity carries out the project, and another entity purportedly receives the benefits. The straightforward characterization of subject and object, however, overlooks the histories that demonstrate quite the opposite, that the modernizer, for example, benefits more economically from the modernization project than does the object of that modernization.

Globalization is a capitalist project requiring expansion in order to grow (key word of the economic vocabulary). Growth, acquired by the institution of profit, is the core of globalization. When internal markets and tariffs become a barrier for the health of accumulation and the movement of the capitalist economical machinery, expansion is imperative. This expansion goes hand in hand with the justification of political and military invasion—a traditional way of creating markets and resource pools with positive industrial and commercial results.

This phenomenon is paradoxical because what is discussed is the globalization of capital, and capital is an object, not a subject. Given that paradox, globalization is not the expansion of the will of a subject over an object but the contrary, the globalization of an object (capital) over subjects (the people and cultures of the world). Globalization is the action of an agent of capital over nature, resources, people, language, ideas, and imagination in order to expand the sphere of influence of that capital to increase the amount of capital in return. It is an operation where humans are agents of an object that oppresses them, that robs them of subjectivity and agency, and that functions through them. The will of the object loosely follows “the economical laws,” it is the invisible hand. In practice, in a highly racialized, socially divided and gendered society, the rationale for participating—ideologically speaking—is given by the most prestigious and

influential part of society. Women, people of color, and other social classes unenfranchised with the international corporate economic forces only participate, consciously or unconsciously, as collaborators or assimilated people. The project is not in their interest but in the interest of inertia. Even though some reap more material benefit as agents of capital, they are all oppressed by it, all doubly objectified.

ZAPATISTA WORLDVIEW. Subcomandante Insurgente Marcos wrote in “Como nace la palabra en la montaña” from *Relatos de El Viejo Antonio*:

Decía el Viejo Antonio que los viejos más viejos de los dioses enseñaron a los hombres a leer el cielo y el suelo. en esas dos grandes hojas del cuaderno del mundo (dijo el Viejo Antonio que dijeron los más grandes dioses, los que nacieron el mundo), los hombres y mujeres verdaderos pueden leer la orientación para que su corazón camine. Cuando el cielo calla, cuando el sol y la luna reinan con silencio, y cuando el suelo se esconde tras su dureza su quehacer interno, los hombres y las mujeres de maíz guardan la palabra y la trabajan pensando. Cuando el techo de la tierra se agrieta con nubes, lluvias y viento, cuando la luna y el sol sólo asoman cada tanto, y cuando la tierra se abre con verde y vida, los hombres y mujeres verdaderos nacen de nuevo la palabra en la montaña que es su casa y camino.

Old Man Antonio used to say that the old ones older than the gods taught men to read heaven and the ground. In those two big pages of the notebook of the world [Old Man Antonio said that the biggest gods said this, the ones who gave birth to the world] the true men and women can read the directions so that their heart can walk. When heaven becomes quiet, when the sun and the moon rule with silence, and when the ground hides its inner workings behind its hardness, the men and women of the corn hold the word and work thinking. When the roof of the earth cracks open with clouds, rain and wind, when the moon and the sun only appear once in a while, and when the earth opens up with green and life, the true men and women bare the word again in the mountains which are their home and their path. (p.131)

The recovery of the word is central to the project of democracy, liberty, and justice for the Zapatistas of Chiapas. Changing the world and countering the force of the global economy that have been destructive to indigenous cultures and their integrated worldviews means changing the word. Achieving democracy, one of the central goals of the movement, necessitates mending the relationship between language (oral and written) and meaning. This recuperation establishes a move from a liberal (formal) democracy to a participative or authentic democracy as signified by the word itself: *demos*, coming from the Greek root meaning “people,” and *-cracy*, meaning “from government.” The search for the true word is the search for collective participation and consensus. The Zapatista practice *mandar-obedeciendo* (to command-obeying) better explains this idea: the leader has to be part of the bases and represent them according to their will. Thus Subcomandante Marcos has a secondary rank (deputy com-

mander) in the Zapatista army, because the *comandante* are the Mayan people of Chiapas. The recovery of the word then means that this subordinated rank of Marcos is not a rhetorical construction to justify his power but instead a word, which represents a real subordination of an individual to the collective.

The recovery of the word is deeply rooted in the historical silence and invisibility in which the original people autochthonous to the Mayan homelands and the Americas were compelled to remain for five hundred years. The silence was enacted by European conquerors, their descendants, and their religious-cultural-governmental structures that are the foundation for the New World governments and institutions that have developed into a dialogical relationship of imitation, counteridentification, and reform with the worldview and corresponding structures of the conquerors. They have established a religion, which separates the natural and the social from the divine. This religion allows for the brutal exploitation of the planet, creating an economic system that separates producers from consumers and making room for profit and poverty, and institutionalizing a political system that has divided the representatives from the represented, allotting space for the burial of local holistic worldviews and the fragmentation of communities.

The weight assigned to the truth in the act of recuperation of the word is a frontal challenge to the hegemonic ideology that sustains itself in the double standard of domination and justification. It is not enough that the word represent reality or that its utterer have honest intentions to do so; only with the practice of horizontal (not hierarchical) dialogue can democracy be held accountable.

The recovery of the word not only implies the return of the original inhabitants to the scene of the continent but also the return of the autochthonous worldviews, which present new ways of dealing with human liberation in the post-modern world. This implies a new praxis beyond the structure of the liberation movements that are born of modernity and based on a historical trajectory anchored in the European, such as Marxism and industrialization.

The Zapatista collective (wearing masks in order to emphasize the collectivity of the group and to reflect the government’s rhetoric of hiding meaning, holding weapons, and taking over five municipalities) forced the dialogic exercise of democracy with the formal democratic government of the Republic of Mexico, which is complicit in global economics. In this way the movement recovered the meaning of the word, putting indigenous beliefs about the necessary connection between language and meaning at the forefront and holding the formal democratic institution accountable to the word with which it describes itself. The Zapatistas are willing to remove their masks if the government does the same: the Zapatista mask functions as a metaphor for the hiding of the true face: “Detrás de nuestras máscaras estamos ustedes (Behind our masks are you),” writes Marcos. The mask is a means for maintaining the memory of the lies behind the of-

ficial truths that are based in different forms of privilege. The purpose of the word is to communicate, to exchange ideas, to understand, and to create consensus. With the social distortion of oppression in any of its forms (class, race, and gender), the word also has been distorted to fulfill the will of the privileged groups, creating the need of ideology or false consciousness to make people collaborate willingly with their own oppressors. Dialogue, on the other hand, set within a horizontal arrangement, is a tool for democracy where participation is exercised with respect and human dignity.

The recovery of the word becomes an ethical imperative in the modern and postmodern world, a world that has privileged economic goals and systematically forgotten the promise of meaning. Proponents of globalization have arranged the world in a way that enables them to live relatively unaffected by the consequences of the enactments of falsely named operations, operations like democratization or stabilization. They have established a monologue and constructed a dehumanized common sense through euphemism and other distortions. Ironically the proponents of globalization have become the emblematic figures for human perfection, spreading the institutionalization of the misuse of words like *democracy* and *peace* in the targeted path of economic expansion. The expansion in turn has fractured the integrated worldviews of the indigenous peoples of the locations of economic homogenization. They have created an equation that imposes a Western particularism as the universal standard: socioeconomic improvement means capitalism, security means militarism, humanity means ideologically in agreement with the globalizing forces.

For the original people, the reintegration of meaning and the word is essential for liberation on all fronts, including the cultural, spiritual, economic, and intellectual. Their naked exploitation at the hands of the agents of capitalism makes the confrontation with meaning inescapable. Their experiences reveal the incongruous relationship between the Western word and its manifestations. The word has to represent reality: killers must be killers, abusers must be abusers, and democracy must be democracy. Original people do not need to sever meaning from word to live. They, because of their place in the structures of globalization, live with the violent consequences of the separation of word and meaning. NAFTA came into being on January 1, 1994. At the dawn the same day the EZLN invaded San Cristóbal de las Casas in Chiapas, Mexico, and the four other municipalities. The NAFTA agreement, they explained, was a sentence to death to more than a million Mayan people and their worldviews. For the NAFTA project, Chiapas was one of the most important states to be incorporated into this new brand of hegemony called globalization due to the unusually rich and diverse natural resources of the land. These natural resources and the Mayan people to work in a new setting of *maquiladoras* were all part of the strategic plan to make southeast Mexico a participant in the global economy. The EZLN understood well the move and confronted the army, starting a rebel move-

ment that has attracted sympathizers from all over the world in its years of resistance, motivating indigenous movements the world over to struggle against globalization.

AMADO J. LÁSCAR (2005)
AMANDA NOLACEA HARRIS (2005)

ZARATHUSHTRA. Zarathushtra (known in the West under his Graeco-Latin name of Zoroaster) is seen by all Zoroastrians and by most modern scholars as the founder or the prophet of Zoroastrianism, the dominant religion in the Iranian world up to the ninth century CE. Since modern scholarship dates the earliest texts of Zoroastrianism (attributed to Zarathushtra himself) to the beginning of the first millennium BCE and there is broad agreement over the fact that these texts were not written down before the fifth century CE, it is not surprising that the historicity of Zarathushtra has been doubted by several modern scholars. Two different approaches are available for an introduction to this pivotal person in the development of one of the oldest and most influential of all religions. The first is based on the Zoroastrian traditions concerning his life and mission and the second on the findings of modern scholarship. These two approaches, which often interlock in both religious and academic writings, need to be discussed separately here not only to avoid anachronisms but also because modern assumptions about Zarathushtra's activities tend to distort the image of the prophet in premodern Zoroastrianism itself. Modern scholars agree on the fact that Zarathushtra can only count as the author of a tiny portion of the corpus of the Avesta. However, in premodern Zoroastrianism the text of the entire Avesta and its commentaries were seen as the revelation brought to the world by Zarathushtra according to the wish of the su-

preme god Ahura Mazdā. Therefore the “sources” available for reconstructing his life and activities cannot be immediately settled.

ZARATHUSHTRA IN ZOROASTRIANISM. The focus here is on the image of Zarathushtra in “classical” Zoroastrianism, that is, the Zoroastrianism of the Pahlavi books (dated to the ninth century CE), with additional materials from earlier texts and evidence from non-Zoroastrian sources. If Zarathushtra counts as the “founder” of Zoroastrianism at all in these sources, it is usually in his capacity of the chosen person who brings Ahura Mazdā’s revelation to the world. This revelation is usually referred to as *dēn*, a word that has a wide range of meanings but most often simply means “religion.” This is not a banal detail: most Zoroastrian texts use the words “it is revealed in the religion” as an introductory formula to the claim that what is being transmitted is part of the “original” revelation of Ahura Mazdā to Zarathushtra. This revelation, the religion, was prepared by Ahura Mazdā even before the work of creation. Small parts of it were revealed by Ahura Mazdā to earlier persons from the mythical history of the Iranians as is told explicitly in the Pahlavi books and follows naturally from the fact that Ahura Mazdā regularly speaks to such important early humans as the first man (Gayōmard), the first human couple (Mašya and Mašyāna), and the first king (Yima). It is also part of the evolved theology of Zoroastrianism: if Ahura Mazdā is good and the religion is necessary for the benefit of humankind, Ahura Mazdā should be protected from the reproach that he had left humankind unaware of his intentions up to the time of Zarathushtra.

Other traditions, however, mention that all “prophets” before Zarathushtra refused to bring his revelation into the world and that it was only Zarathushtra who took this work upon himself. The revelation he brought consisted of the whole Avesta (in its own special language) with its commentaries (in the vernacular). This is evident especially from later texts (in Pahlavi), which had to account for the fact that the religion was formulated and that priestly decisions were based on the *Zand*, the (exegetical) translation of the Avesta, rather than on the Avestan texts themselves (several of which had been lost). The *Gāthās* were occasionally attributed to Zarathushtra in a more direct sense than the other parts of the revelation. In the Avesta, Zarathushtra is presented “while singing the Gāthās” (Y. 9.1), and the recitation of the *Gāthās* in the *Yasna* liturgy is preceded by important introductory formulae. But the suggestion by a nameless heretic that one should accept as Zarathushtra’s revelation only the *Gāthās* is firmly rejected in the *Dēnkard*, one of the most important Pahlavi texts (*Dēnkard* 3.7).

As bringer of the revelation, Zarathushtra occupies a pivotal place in the history of the world. From the early texts onward, this aspect of his life is stressed regularly. In order to emphasize his importance, the world before Zarathushtra is portrayed as a world where demons roam freely. With the first utterance of the sacred Ahuna Vairya-prayer, Zara-

thushta smashed the shape of the demons and repelled them from the face of the earth.

The Zoroastrian tradition has preserved a lengthy legendary biography of the prophet, the value of which is enormous for a proper understanding of Zoroastrianism and its sense of history. Every aspect of his life is characterized by miracles and portents. His coming to the world came to be seen as preordained: his guardian spirit (*fravashi*) was created millennia before his actual birth. His birth in itself was miraculous in many ways: the various constituent elements of his human life (body, soul, guardian spirit, “glory”) were all transmitted by Ahura Mazdā and several of his divine helpers in a very complicated process, which involved his father and mother and various elements from the natural world.

During the pregnancy of his mother, the demons and evil priests were struck by terror and feelings of impending disaster for their ways of life. At birth, Zarathushtra laughed, and as a boy, he showed every sign of great accomplishments. The most crucial episodes from his life took place when he was thirty years old. Having moved to the “land of the Aryans,” he entered a river to draw water for the morning rituals. Purifying himself, he encountered a shining figure on the banks of the river who introduced himself as Wahman (Vohu Manah, “good thought”) and brought him to heaven, before Ahura Mazdā. There were a total of seven meetings between Zarathushtra and Ahura Mazdā. During these, Ahura Mazdā gave Zarathushtra the revelation and ordered him to spread it in the world.

This was not an easy task. Zarathushtra had to overcome the opposition of the wicked priests and their secular overlords of the religion(s) he meant to replace and was, initially, not very successful in doing this. Success only came after a lengthy stay at the court of King Wištāsp. After a series of philosophical debates, an episode of treachery leading to his arrest and incarceration, and Zarathushtra’s success in curing the king’s favorite horse, he finally found an audience willing to listen to his words. He recited the revelation for the king and his family, and they were the first to convert outside his own family. From the conversion of Wištāsp onward, the history of Zoroastrianism was to be a history of growth and success, but hostilities continued nonetheless. According to late traditions, Zarathushtra lived to be an old man but was eventually murdered and received into heaven.

A part of Zarathushtra remained, however: his semen is kept in a lake, where it will rest until the period of the separation of good and evil begins. When this time arrives, a virgin will bathe in the lake and become pregnant, giving birth to Zarathushtra’s son(s), the Savior(s), who will lead humankind in bringing about the Renovation of the world. Thus Zarathushtra is represented, in Zoroastrian traditions, in all periods of world history, from the beginning of creation up to the desired end.

Many elements from these Zarathushtra legends can be found already in the Avesta. His meetings with Ahura Mazdā

are alluded to in what is undoubtedly an old text, the confession of faith (*Fravarānē*, Y. 12). Parts of the Avesta are cast in the literary genre of questions and answers between Zarathushtra (asking the questions) and Ahura Mazdā (giving the answers) and thus stress the fact that he was responsible for the whole revelation. Although the *Gāthās* contain little if any information relevant for his personal life according to modern opinions, many elements from the Zarathushtra legends can be traced back to (often obscure) passages from the *Gāthās*. Although Zarathushtra played a role in the Zoroastrian version of the history of the world that is almost incommensurate with human capacities, there is no evidence that he was ever seen as something other than human.

In contemporary Zoroastrianism, pictures of Zarathushtra are omnipresent in houses as well as fire-temples and sanctuaries. It is not certain how old this custom is, but the iconography used in the Iranian and Parsi communities cannot be traced to a period before the late eighteenth century. Small devotional rituals can be performed in the presence of these pictures: lighting a candle or an oil lamp or decorating the picture with a garland of flowers. On the sixth day of the first month of the Zoroastrian calendar, Zoroastrians commemorate Zarathushtra's birth and the beginning of his meetings with Ahura Mazdā.

In ancient and medieval non-Zoroastrian sources, Zarathushtra is often mentioned. Usually he is presented as the founder of the Persian priesthood (the *magi*) and the founder of the religion of the Persians. From an early period, Zoroaster was also annexed in Western traditions. Among Greeks and Romans, he came to be known as an early sage, who invented magic and astrology. The Western traditions on Zoroaster owe little to Zoroastrian ideas. This is true for antiquity but also for the remarkable popularity of Zoroaster in western European traditions from the Renaissance up to the late eighteenth century.

ZARATHUSHTRA IN MODERN SCHOLARSHIP. The traditional biography of Zarathushtra is of course a myth. This myth is of great importance for a proper understanding of Zoroastrianism, but it yields little information on the historical Zarathushtra. Modern scholars (and indeed most modern Zoroastrians) do not accept the entire Avesta as the work of Zarathushtra, not to mention the vast body of exegetical literature in the *Zand*. When the Avesta and other Zoroastrian texts reached Europe in the late eighteenth century, the study of these texts remained under the influence of traditional Zoroastrian understanding only for a short while. The academic study of Zarathushtra and his message had to disengage itself more and more from the tradition that grew out of it. In the middle of the nineteenth century the German Orientalist Martin Haug demonstrated that a small part of the *Yasna* (sacrifice), the text of the daily high ritual, was written in a different language than the rest of the Avesta; that this language was more archaic; and that the texts in this more archaic language were the only texts that could be accepted as Zarathushtra's own words. These are the *Gāthās* (songs), five

in number, to which modern scholarship has now added a few prayers and a short ritual prose text, all written in the same archaic dialect. These texts have now been recognized as the only possible source of information for the earliest period of Zoroastrianism. They are attributed to Zarathushtra himself by many scholars, but others have voiced doubts about the historicity of Zarathushtra or about the possibility of gaining accurate knowledge about him from these texts.

The corpus of relevant texts is thus small and unfortunately difficult. It is not only full of words of disputed or unknown meaning, but especially the difficulty of the poetic *Gāthās* is seen as intentional. Although earlier scholars thought of these texts as "verse sermons" or solemn declarations of new religious insights, it is now generally assumed that the poems are to be interpreted as visionary poetry composed in a ritual setting. The Old Avestan prose text, by contrast, is much less opaque. Since the texts do not refer to historical or geographical settings known from other sources, the possibility of contextualizing these texts is slim. Even though there is no shortage of speculation on this matter, it seems impossible to date the texts with precision or to situate them in a geographical environment. The texts mention the names of several persons, all known from the later Zoroastrian tradition, but it is a moot point whether that tradition has preserved knowledge of these persons or has invented a narrative in which these persons could fit.

In order to confront these difficulties, most scholars use two different sets of comparative materials. The first of these are the later Zoroastrian traditions, which reflect the religion that grew out of these early texts. The second set of comparative texts is offered by the hymns of the *R̥gveda*, which were composed in a language that resembles Old Avestan closely and are full of set expressions and poetic usages that both traditions share.

There are certain dangers in using either approach to the exclusion of the other. Both sets of *comparanda* are, in a sense, quite far removed from the Old Avestan texts. Using both sets of data in combination seems to be the best option to guard against anachronisms (by reading later developments into the early texts) and against reading into these texts Vedic ideas that may never have been present in them. The truth is that the *Gāthās* are different from the Vedic hymns. There are certain similarities in poetic expressions and in the grammar of the texts, but the poems as compositions are completely different, as are the main components of the contents of the *Gāthās*.

Since contexts are unavailable, only rough indications of dating and localization, based on the content of the texts and the archaisms of their language, can be given. There seems to be a broad agreement that the texts (and therefore Zarathushtra himself) should be dated around the beginning of the first millennium BCE in an eastern part of the Iranian world, perhaps the area known as Bactria-Margiana (present-day Afghanistan and Turkmenistan).

Two names stand out in importance in the *Gāthās*. The first of these is the name of the god who is celebrated in these hymns: Ahura Mazdā, “the Wise Lord.” The second is the name of the most important man in these hymns: Zarathushtra, who occurs regularly as singer of the hymns and as performer of the rituals that the hymns accompanied. Following an established poetic pattern, the singer of the hymns declares that he is going to proclaim certain truths about the gods, the world and reality. In these proclamations, Ahura Mazdā is extolled as the creator of the world, dispenser of justice, lord of all that is good, and rightful recipient of prayer and sacrifice. But he is not alone: there are his children and his (spiritual) creations, personifying mental attitudes and human virtues, who aid him in the struggle against evil, which is taking place in front of one’s own eyes. For there are evil beings in this world and in the spiritual world; although they are worshipped by those of little intellect, they should not be worshipped, for they cause nothing but harm to humankind and to the world at large. These evil beings are called *daēvas* and they too appear to be ruled by a separate being, who is chiefly alluded to as the “evil one,” “the deceitful one,” or “the one of evil doctrine” and who is said to have destroyed existence once (but will not do so again: [Y. 45.1]; the interpretation of this verse is debated). In several passages, two spirits are referred to who are each other’s total opposites and between which humans must choose. If one makes the wrong choice, this has consequences for his or her afterlife. Indeed many passages have a marked focus on the implications of human choices for their fate in the other world.

The marked polarity between good and evil in these texts, focusing chiefly on the options for “righteousness” or “deceit,” also splits human society. Even though some scholars have doubted the interpretation of the *Gāthās* as containing elements from Zarathushtra’s biography, there are many passages that hint at an acute crisis, instigated by enemies and borne by the majority of the people surrounding Zarathushtra. In these passages, various individuals and groups of enemies are mentioned, together with examples of their hostilities. This may reflect an actual struggle between competing groups of religious specialists, divided over matters of ritual and ideas about the gods and reality.

Many passages of the *Gāthās* show that rituals and religious views mattered not only for this world but also for the afterlife. Those who oppose truth will certainly be held accountable for their wrong choice through an ordeal and a judgment of their souls. A blessed existence is promised the righteous ones and a life of woe the wicked.

In a number of passages, all rather cryptic, there are allusions to the most influential of all Zoroastrian ideas: that the world as humans know it will come to an end in a decisive, collective transformation according to the wish of its creator. The most important passage is Y. 30.7–11, which contains the famous words “thus may we be those who will make existence brilliant” (Y. 30.9). Although other suggestions have

been made, it is most likely that these verses indeed refer to the notion that the battle between good and evil, and therefore the world and “history,” will eventually come to an end. This is certainly how it has always been understood in the tradition.

In spite of the many lexical parallels with hymns from the *Rgveda*, these are all aspects from the *Gāthās* for which one would look in vain in the Vedic corpus. The god Ahura Mazdā is absent from India as the important Indian gods are from the *Gāthās*. Although ideas on the importance of ritual for the life and well-being of the people are characteristic for both traditions, the pervasive focus on the distinction between good and evil, their existence as (the only) two “primal” spirits, and their impact on the lives of humans in this world—in the afterlife and in the transformation of the world—is wholly specific for the *Gāthās*. Something resembling the Gathic insistence on the primary nature of Ahura Mazdā and his sole responsibility for the origins of everything—and especially the idea that history would come to an end—is likewise difficult to find in early Indian literature. There are no indications whatsoever that these were ideas that had grown slowly among the Iranians. For these reasons, the idea that a single person, Zarathushtra, was responsible for the *Gāthās* and in a real sense the founder of the religion that grew out of them raises fewer historical difficulties than the idea that such a person did not exist. One can question the suitability of the concept of “originality” in the writing of history but not doubt the possibility of real innovations. All the evidence suggests that the oldest Zoroastrian texts, which were preserved in a different language among a much larger body of ritual literature, offered a new vision of reality, using traditional words and concepts for the (successful) propagation of an innovative message.

BIBLIOGRAPHY

The literature on the subject is enormous and shows a wide variety of approaches and interpretations. The selection given here assembles some fundamental works and examples of the various methods scholars have used to make sense of the data.

There are many translations of the Old Avestan texts, ranging from intensely personal interpretations with an almost mystical message to elaborate philological studies. The most recent of these certainly show great improvements over earlier attempts.

ALBERT DE JONG (2005)

ZĀWIYAH SEE KHĀNAGĀH

ZAYNAB BINT 'ALĪ (c. AH 5–62; 626/7–682 CE), daughter of 'Alī ibn Abī Ṭālib and Fāṭimah al-Zahrā', was the first granddaughter of the prophet Muḥammad. She is best known for her courageous and eloquent role supporting her brother, the second Shī'ah Imām Ḥusayn, at the time of his martyrdom in the Battle of Karbala, and for protecting his family in the following months of Umayyad imprisonment.

LIFE. Zaynab was born in Medina a few years after Muḥammad's immigration thereto in the early days of Sha'bān of the year AH 5 (626 or 627 CE). She was the third child born to 'Alī and Fāṭimah—after Ḥasan (the first Shī'ah imām) and Ḥusayn—with about a year's interval between each child. Her birth was followed by that of a sister, Umm Kulthūm. Tradition states that Zaynab was named by Muḥammad, who attributed her name to divine inspiration.

Little is known of her early life. Muḥammad died when she was about five, followed by Fāṭimah a few months later. She married her paternal cousin 'Abd Allāh (whose father was 'Alī's brother Ja'far al-Ṭayyār ibn Abī Ṭālib, and whose mother was then 'Alī's wife and hence Zaynab's own step-mother, Asmā' bint 'Umays). Zaynab is reported to have had five children with 'Abd Allāh: 'Alī (known as 'Alī al-Zaynabī, whose numerous descendants took pride in tracing their lineage to Zaynab), 'Awn al-Akbar (killed at Karbala), 'Abbās (no information about him), Muḥammad (possibly killed at Karbala), and one daughter named Umm Kulthūm (married to her paternal cousin Qāsim ibn Muḥammad ibn Ja'far ibn Abī Ṭālib, after rejecting the suit of the Umayyad Yazīd ibn Mu'āwiya).

When Zaynab's father 'Alī became caliph in 656 and moved his capital from Medina to Kūfah, Zaynab and 'Abd Allāh accompanied him there. She lived in Kūfah through four years of military confrontations with the insurgent governor of Syria, Mu'āwiya ibn Abī Sufyān, and with the Iraqi Kharijite rebels, until 'Alī was killed in 661 by one of the latter. She was then thirty-five years old.

Zaynab is mentioned a few times in the accounts of 'Alī's caliphate as a devoted and beloved daughter. Moreover, it is reported that 'Alī taught her a devotional poem that she often recited, and that she herself taught Qur'ān interpretation to women in her house in Kūfah. It is thus likely that she was trained by her father (who is considered the most learned of sages), and that she herself played a teaching role among the women of the early Muslim community.

After 'Alī's death, his son Ḥasan stepped down from the caliphate and Mu'āwiya became the first Umayyad caliph. Ḥasan returned to Medina with the family, and was subsequently poisoned by Mu'āwiya in 669. There are reports of Zaynab's caring attendance on Ḥasan during his last few days.

Ḥasan was followed as head of the Prophet's family by his brother Ḥusayn. In 680, Mu'āwiya died, having appointed his son Yazīd to the caliphate. At that time—according to some sources, after consulting with Zaynab—Ḥusayn refused to pledge allegiance to Yazīd, and set off with his family and supporters for Mecca and then Kūfah to meet up with his Kūfan supporters and overthrow Yazīd. Some of Ḥusayn's well-wishers tried to dissuade him from going, and these included Zaynab's husband 'Abd Allāh (who had by then lost his sight, according to some sources), but when Ḥusayn remained adamant, 'Abd Allāh sent Zaynab and his

two sons 'Awn and Muḥammad with him (there is conflicting evidence regarding whether this Muḥammad was 'Abd Allāh's son from Zaynab or another wife).

En route to Kūfah, Ḥusayn's entourage was stopped at Karbala and surrounded by a military unit sent by the Umayyad governor of Kūfah, 'Ubayd Allāh ibn Ziyād. On 10 Muḥarram 61 (680), after three days without food or water in the scorching desert, Ḥusayn, his supporters, all but one of the men from his family, and many of the male children were slaughtered. They were reported to be seventy-two in number, including the family members, who numbered eighteen. 'Awn and Muḥammad were among those killed, according to some reports, encouraged by their mother to fight in defense of their uncle. Zaynab was then fifty-four years old. Her grief-filled speeches are recorded by many historians.

After the massacre, the Umayyad army looted Ḥusayn's camp and set off with his women and children for the court of Ibn Ziyād. Upon reaching Kūfah, Zaynab, with the other women, was paraded unveiled and shackled through the very town where her father had ruled, with the heads of Ḥusayn and his companions raised on spears beside them. Ibn Ziyād then ordered the execution of Ḥusayn's only remaining son, the 23-year-old 'Alī Zayn al-'Ābidīn (the third Shī'ah *imām*); Zaynab protected his life saying Ibn Ziyād would have to kill her before he killed 'Alī, which shamed him into withdrawing the execution order. A moving oration delivered by Zaynab in Kūfah is recorded in some sources. The prisoners were next sent to the court of the Umayyad caliph Yazīd in Damascus, where one of his Syrian followers asked for Ḥusayn's daughter Fāṭimah al-Kubrā, and once again it was Zaynab who came to the rescue and protected her honor. The family remained in Yazīd's prison for a time; the sources do not specify the number of days or months. The first assembly (*majlis*) of mourning for Ḥusayn is said to have been held by Zaynab in prison. In Damascus, too, she is reported to have delivered a poignant oration.

Zaynab and her family were eventually released and escorted back to Medina. After her return to Medina, little is known of her in the year and a half before her death, except through much later, conflicting reports. According to one report, she stayed and died there. Another report states that due to persecution from the governor of Medina, she traveled to Fustat (later Cairo) in Egypt with several other women from the family of the Prophet; she lived in Fustat for over a year, narrating the Karbala tragedy and preaching the love of the family of the Prophet, and died there. A third report states that she went with her husband to his Syrian estates in a year of drought and died there. Sources also differ as to the year of her death. According to most of them, she died on 15 Rajab AH 62 (682 CE), when she was fifty-six years old.

ROLE IN MUSLIM PIETY. Zaynab is best remembered for her role in Karbala. Through the centuries, she has continued to hold a prominent place in Muḥarram orations, as well as in

lamentation poetry composed in Arabic, Persian, Urdu, and other languages commemorating the Karbala tragedy. She is portrayed in these variously as an object of pity, a compassionate saint, and a powerful intercessor. On a somewhat more militant note, she was used in pre-revolution Iran as a model for inspiring political opposition among women—in the Iranian revolution of 1979, female commandos came to be known as “the commandos of her holiness Zaynab” (*Komāndo-hāye Hazrat-e Zaynab*).

Every day, hundreds of Muslim men and women, but especially women, visit the mausoleums dedicated to Zaynab in Damascus and Cairo. In fact, some scholars call Zaynab the patron saint of Muslim women. At the shrine, visitors ask for her help (*madad*), and they beseech her intercession (*shafa'a*) with God on their behalf for a myriad of petitions, such as curing illness, passing school examinations, or finding a good husband or wife for themselves or their children. Many miracles are attributed to her, such as the curing of chronic illness. Mostly Shī'ah visit the Damascus shrine, and Egyptian Sunnīs of a Ṣūfī bent visit the Cairo shrine, where tens of thousands celebrate Zaynab's birthday (*mawlid*) for seven days annually.

Zaynab is known by several titles. She is called Zaynab al-Kubrā (the senior Zaynab) to distinguish her from Zaynab al-Ṣuḡhrā (the junior Zaynab, the name of her full sister, Umm Kulthūm, and also perhaps of another half-sister). Zaynab is called al-'Aqīla (literally, “secluded one,” or “pearl,” perhaps connected to a suggested etymology of her name: *zayn* + *ab*, “adornment of father”), as well as Thānī-ye Zahrā' (the second Fāṭimah Zahrā'). In Egypt she is known as al-Ṭāhirah (the pure one) and by a number of “mother” epithets (Umm Hāshim, mother of the Prophet's family; Umm al-'awājiz, mother of the weak; Umm al-masākīn, mother of the poor; Umm al-yatāmā, mother of the orphans; and Umm Miṣr, mother of Egypt). She is also known simply as al-Sayyida (the Lady), a fitting title for a woman who came to be considered a role model for Muslim women, typifying courage, fortitude, leadership, eloquence, devotion, and faith.

BIBLIOGRAPHY

The primary source of information on the Karbala tragedy, and of Zaynab's role in it, is the account of the Umayyad author Abū Mikhnaḥ Lūṭ ibn Yaḥyā preserved in the early medieval historical works; Abū Mikhnaḥ's original work *Maqṭal al-Ḥusayn* (The killing of al-Ḥusayn) is probably lost, and the various manuscripts and editions thereof are most likely reworked and corrupted versions (see Ursula Sezgin, *Abū Miḥnaḥ: Ein Beitrag zur Historiographie der umayyadischen Zeit*, Leiden, 1971, pp. 116–123). Much of the original Abū Mikhnaḥ account rendered by al-Ṭabarī is found in English translation in *The History of al-Ṭabarī: An Annotated Translation*, vol. 19, *The Caliphate of Yazīd b. Mu'awiyah*, translated by I. K. A. Howard (Albany, N.Y., 1990). Al-Balādhurī also narrates the Karbala tragedy on Abū Mikhnaḥ's authority in *Ansāb al-Ashraf*; vol. 2, edited by M. B. al-Maḥmūdī (Beirut, 1977). The text of Zaynab's Damascus oration is re-

corded by the early scholar Aḥmad ibn Abī Tāhīr Tayfūr in his *Kitāb Balāghāt al-nisāʾ*, edited by ʿAbd al-Ḥamīd Hindāwī (Cairo, 1998, pp. 70–73). A book devoted to the Karbala tragedy that includes the texts of Zaynab’s Kūfah and Damascus orations (pp. 56–57, 69–71) is *al-Lubūf fi qatlā al-ṭufūf* (Beirut, 1992) by the later medieval historian Ibn Ṭāwūs al-Ḥusaynī, who also bases his narrative on Abū Mikhnaf’s authority.

In European languages, there are no monographs about Zaynab’s life. There is one anthropological study of her birthday celebrations in Cairo and the rituals associated with visiting her shrine: Nadia Abu Zahra, *The Pure and Powerful: Studies in Contemporary Muslim Society* (Berkshire, U.K., and Ithaca, N.Y., 1997). There are also several articles about various aspects of Zaynab’s role in Muslim piety, including David Pinault, “Zaynab bint Alī and the Place of the Women of the Households of the First Imāms in Shiʿite Devotional Literature,” in *Women in the Medieval Islamic World: Power, Patronage, and Piety*, edited by Gavin Hambly (New York, 1998), pp. 69–98; Diane D’Souza, “The Figure of Zaynab in Shiʿi Devotional Life,” *Bulletin of the Henry Martyn Institute of Islamic Studies* 17, no. 1 (1998): pp. 31–53; Andreas D’Souza, “Zaynab I Am Coming! The Transformative Power of Nawḥah,” *Bulletin of the Henry Martyn Institute of Islamic Studies* 16, nos. 3 and 4 (1997): 83–94; Anna Madoeuf, “Quand le temps revele l’espace: Les fetes de Ḥusayn et de Zaynab au Caire,” *Geographie et Cultures* 21 (1997): 71–92; Irene Calzoni, “Shiʿite Mausoleums in Syria with Particular Reference to Sayyida Zaynab’s Mausoleum,” *Convegno sul tema la Shiʿia nell’Impero Ottomano* (Rome, 1993): 191–201; and Valerie J. Hoffman-Ladd, “Devotion to the Prophet and His Family in Egyptian Sufism,” *International Journal of Middle Eastern Studies* 24 (1992): 615–637.

In Arabic, there are several monographs about the life of Zaynab, and these also address the issue of her burial place with differing conclusions. These include: Ḥasan Mūsā Ṣaffār, *al-Marʾa al-ʿAẓīma: Qirāʾa fi Ḥayāt al-Sayyida Zaynab bint ʿAlī* (London and Beirut, 2000); Aḥmad Shukr al-Ḥusaynī, *al-Shams al-Ṭālīʾa wa al-Anwār al-Sāṭiʾa: Aqīlat al-Imāma wa al-Wilāya al-Sayyida Zaynab al-Kubrā* (Beirut, 1999); Muḥammad Ḥasanayn al-Sābiqī, *Marqad al-ʿAqīla Zaynab* (Beirut, 1979); and ʿAlī Aḥmad Shalabī, *Ibnat al-Zahraʾ Baʿṭalat Karbalāʾ Zaynab raḍīya Allāh ʿanhā* (Cairo, 1972). An encyclopedia entry on Zaynab is provided by Ḥasan al-Amīn in his *Aʿyān al-Shiʿa*, vol. 7 (Beirut, 1983), pp. 137–142.

B. TAHERA QUTBUDDIN (2005)

ZEALOTS. The Zealots were Jewish revolutionaries in first-century Israel whose religious zeal led them to fight to the death against Roman domination and to attack or kill other Jews who collaborated with the Romans. Scholars disagree as to whether the name *Zealots* designated all revolutionary groups of the first century or only one of the factions active during the Roman-Jewish War of 66–70 CE. Josephus Flavius (37–c. 100 CE.), the Jewish general who surrendered to the Romans and whose official Roman history of the war furnishes the major source, is ambiguous in his use of termi-

nology. References in the New Testament, the Pseudepigrapha, and the rabbinic literature add to the confusion.

In 6 CE, Judah (Yehudah) the Galilean showed zeal for God’s law and land when he led a revolt against the Roman census in Judaea. He and his followers fought to cleanse the land by taking vengeance against Jews who cooperated with the Romans. Judah considered such cooperation to be idolatrous recognition of a lord (Caesar) other than God. By such vengeance, he and his followers sought to appease God, who would thereby honor their cause against the Romans. The revolt failed, but Judah had originated the so-called Fourth Philosophy (“No Lord but God”) based on the first commandment. Judah’s descendents emerged again after all of Judaea became a Roman province in 44 CE. Their subsequent revolutionary actions against the corrupt and incompetent Roman authorities contributed to the outbreak of war in 66 CE. Josephus usually refers to Judah’s group as Sicarii, after the *sikkah* (“dagger”) used in assassinations.

Although Josephus refers to Judah’s faction as a Jewish sect, it is not clear that his group is to be identified with a revolutionary faction called the Zealots or indeed that there was such an organized group early in the first century. Many Jews venerated “zealous action” as a model of piety, using the biblical figure Phineas as a prototype (*Num* 25:1–15). Such persons endured persecution for the Law or sought to destroy those who violated the Law as a means to cleanse the land of defilement and thereby turn back God’s wrath. Individuals, such as Simon the “zealot” (a disciple of Jesus: *Luke* 6:15; *Acts* 1:13), were zealous for God over a variety of legal issues. Sometimes, as was the case with the Maccabean revolt in 167–142 BCE, zeal was a dominant motivation for revolution. However, not all zealots were revolutionaries, and not all revolutionaries were motivated by zeal. It is not until his account of the war period that Josephus refers to one of the wartime revolutionary groups formally as “the Zealots.”

Amid the growing unrest in the decades leading up to the war, there was broad resistance to Roman occupation, including protests against provocative actions by the procurator Pilate (ruled 26–36 CE), a threatened strike against raising crops for the Romans when the emperor Gaius Caligula sought to put a statue of Zeus in the Temple (41 CE), riots at feast time in Jerusalem in reaction to offenses by Roman soldiers, official delegations to Rome protesting inept procurators, prophetic actions and oracular pronouncements by apocalyptic figures, banditry, kidnappings, and assassinations. Resistance to Roman rule was widespread and cut across all sectors of society. The war broke out in 66 CE when the procurator Florus tried to seize money from the Temple treasury, after which the populace drove Florus out of Jerusalem and successfully held off Cestius Gallus, the Legate of Syria, when he arrived to restore Roman order. The Jewish declaration of war came when the lower priests ceased the sacrifices to God on behalf of the emperor. Subsequently, the traditional high priests assumed control of the wartime government and prepared for the Romans to return.

For the war period, Josephus identifies (in addition to the wartime government) five revolutionary groups, each with its own social and geographic origins, motivations, methods, and goals (*Jewish War* 7:262–267). Not all the groups embraced a “zealous” mentality, and they were often in conflict with each other except when confronted with the common Roman enemy. Josephus mentions the Zealots last in order.

1. The Sicarii fought for “No Lord but God” under the messianic leadership of Judah the Galilean’s descendants. When other revolutionary groups forced them out of Jerusalem in 66 CE, they remained during the rest of the war on the fortress Masada, where in 74 CE they chose suicide rather than capture by the Romans.
2. John of Giscala (Yohanan ben Levi), leader of a Galilean contingent, gained the confidence of the wartime government, which he then betrayed to the Zealots.
3. Simeon bar Giora, from Gerasa in the Decapolis, raised an army of freed slaves and peasants, then overran Idumea. In 69 CE, he was joined by some nobles and seized most of Jerusalem. A messianic strongman, Simeon led the coalition of revolutionary groups in the defense of Jerusalem in 70 CE.
4. The Idumeans, a local militia, helped the Zealots to overthrow the provisional government.
5. The Zealots, primarily priests from Jerusalem and the Judean peasantry, declared war by stopping the official sacrifices for Caesar. Later, under democratic leadership, they occupied the Temple, chose a high priest by lot, and, in 68 CE, overthrew the wartime government.

The war lasted four years. From 66 to 68 CE, the Roman general Vespasian overran the countryside of Galilee and Judaea, thereby isolating Jerusalem. When he became emperor in 69 CE, his son Titus assumed the siege of Jerusalem, eventually destroying the city in 70 CE, burning the Temple, executing Jewish warriors, and consigning many families to slavery after a triumphal procession in Rome. Flavius Silva led Roman troops to overcome Jewish holdouts in a few fortresses, including Masada, by 74 CE.

The causes of the war were many and complex: incompetent and corrupt Roman governors, deteriorating Roman policies toward Jews, a determined Jewish opposition to foreign domination, economic exploitation of peasants (the war was also a peasant revolt against the Jewish elites), widespread banditry, apocalyptic expectations, the conviction that God would honor the Jewish cause, and a zealous commitment to cleanse the land of idolatry.

Major scholarly controversies, arising primarily from the biased and often unreliable accounts of Josephus (in *The Jewish War*, as well as his *Jewish Antiquities* and *The Life*), have centered on the ancient usage of the term “Zealot,” the extent of religious zeal among the revolutionaries and the populace, the nature and makeup of each revolutionary

group, whether the wartime government was moderate or revolutionary, and the relative importance of social, economic, political, and religious factors as causes of the war.

A balanced treatment claiming that the Sicarii had prewar connections with those who came to be called Zealots and that it is appropriate to speak about a Zealot movement and yet appreciate the uniqueness of each revolutionary group.

DAVID M. RHOADS (1987 AND 2005)

ZEKHUT AVOT (Ancestral merit). *Zekhut avot* is a Hebrew phrase that refers to the merits of the ancestors of Israel. Biblical teaching frequently presupposes that reward and punishment have a collective dimension. Many passages are directed to the people of Israel as a whole—for example, *Deuteronomy* 11:13–17. Some passages suggest that later generations benefit or suffer as a result of the actions of their ancestors, as in *Exodus* 20:5–6 and 34:7; *Deuteronomy* 7:8–10; and *Lamentations* 5:7. Other statements that deny or downplay transgenerational recompense, such as *Ezekiel* 14 and 18, balance these judgments. Later rabbinic and medi-

eval interpretation tended to restrict the penal aspect, limiting it to grievous sins like idolatry and to cases in which the sons perpetuated the sins of their fathers. Examples include B.T. *Makkot* 24 and the commentaries of Abraham Ibn Ezra (1093–1167) and Nahmanides on *Exodus* 20. Some biblical verses single out the particular benefit derived from the merit of the patriarchs Abraham, Isaac, and Jacob, as in *Leviticus* 26: 42. Several rabbinic debates argued for and against the possibility that the attainments of later generations justified divine solicitude for their forebears.

The rabbinic concept of *zekhut avot* (merits of the fathers, with occasional mention of their wives) in the narrow sense of the term derives from the special standing of the original progenitors. Nonetheless, the term is occasionally applied to other Jewish figures such as the sons of Jacob, to Noah's merit in preserving humanity, or to any kind of inherited merit. Examples of the latter can be found in *M Eduyot* 2:9 and Maimonides' commentary. Some sources speak of the merit of descendants justifying the fathers; others disagree. To the extent that *zekhut avot* is construed narrowly, it is distinguished from universal philosophical concepts of divine justice; it belongs rather to concepts related to the idea of election. When *zekhut avot* is assimilated to natural mechanisms of collective or transgenerational deserving, it is more easily regarded as an application of general principles. In this framework one must also consider the negative impact of unworthy parents on their children's destiny.

Solomon Schechter's century-old dictum that ". . . the notion of imputed righteousness and imputed sin. . . have. . . never attained such significance in Jewish theology or in Jewish conscience as is generally assumed" remains true. (Schechter, 1909, p. 170) Consequently the rabbinic material has not generated a systematic theological consensus. In classic medieval Jewish philosophy, *zekhut avot* is not central to the major discussions of providence and theodicy. The explorations of exegetes, nonphilosophical theological thinkers, and modern academic scholars have shed light on aspects of the theme by adopting both synchronic and diachronic approaches.

TERMINATION OF ZEKHUT AVOT. Several amoraim (third- and fourth-century interpreters of the Mishnah) claimed that *zekhut avot* no longer applies, although they differed as to the date in the First Temple period when it ceased to operate (B.T. *Shab.* 55a and *Leviticus Rabba* 36). These views limited appeal to the merits of the fathers; they are better suited to conceptions of *zekhut avot* rooted in the principle of election than to universal models of reward and punishment. Medieval commentators noted that the cessation of *zekhut avot* flies in the face of Jewish liturgy, which frequently cites *Leviticus* 26:42, especially in the *selibot* (penitential) service. Rabbi Jacob Tam, who was a twelfth-century French commentator, posited that while the merits of the fathers were depleted, the covenant with them (*berit avot*) is irrevocable (*Tosafot Shab.* 55). He thus shifted a crucial employment of the concept from consideration of merit by itself to the abiding remembrance of divine promise.

DIACHRONIC FACTORS. Some scholars have detected an evolution in rabbinic thought regarding the specific merits of the patriarchs behind the concept of *zekhut avot*. Thus Urbach maintains that statements made after Bar Kokhba's revolt (132–135 CE), were more likely to anchor the *zekhut* in willingness to offer up one's life in obedience to God, in accordance with the increasing emphasis on martyrdom in the second century. At this stage the binding of Isaac described in *Genesis* 22 became the paradigm of *zekhut avot*. The liturgy described in the Talmud refers to the merit of the ashes of Isaac's virtual immolation; one passage, commenting on *Isaiah* 63:16, imagines Abraham and Jacob declining to intervene on behalf of Israel while Isaac alone offers his merit (B.T. *Shab.* 89b). Kasher likewise discerns a movement away from defining Abraham's merit as faith towards an emphasis on heroic action, a development interpreted as a reaction against the early Christian understanding of *Genesis* 15:6.

It has also been argued that different sources offer different accounts of the benefits of *zekhut avot* for the people of Israel. Goshen-Gottstein observes that biblical sources stress the value of patriarchal merit in the inheritance of the land of Israel. This theme, however, is downplayed in the rabbinic literature.

ZEKHUT AVOT AND COLLECTIVE RESPONSIBILITY. Rabbi Avraham Yitshaq Kook (1865–1935) developed an influential theory regarding the place of *zekhut avot* in Jewish theology. For Kook, *zekhut avot* finds its place within a metaphysical doctrine of social organisms. Inherited spiritual traits affect the Jewish people, as well as non-Jewish social entities and humanity as a whole. Negative traits also leave their imprint on later generations. Faithful to the rabbinic principle that "the measure of beneficence is greater than that of retribution," Kook maintained that the favorable impact far exceeds the negative (*Yoma*, 76a). With the Babylonian exile it was judged preferable to loosen the ties between the generations; this interpretative development is reflected in *Ezekiel* 18 and B.T. *Makkot* 24a.

An earlier Hasidic master, Rabbi Judah Alter of Gur (1847–1905), likewise reflected a metaphysical orientation presented from a social perspective. He insisted that even if one accepts the view that *zekhut avot* ended, the merit of the seventy grandchildren of Jacob who arrived in Egypt remains operative. That is because the passage of time weakens the Jewish people's connection to the forefathers, but not their connection to the more "accessible" merit of the intermediate generations.

ZEME. In Baltic religion, earth (Latv., *zeme*; Lith., *žeme*) is sacralized. On this basis, the Latvian goddess Zeme and the Lithuanian goddess Žemyna (diminutive, Žemynele) evolved. Called in Latvian Zemes Māte (“earth mother”), she takes a central place in the religious system of the Baltic peoples. Attested by Tacitus, who reports that the ancient Balts venerated a *deum matrem*, her role is determined by her femininity: Like a mother she is connected with the promotion of fertility. Everything in nature that is born, grows, and dies belongs to her. Thus humanity, too, is drawn into this all-embracing cult, beginning at birth and ending with death.

Description of Zeme as *māte* is dependent on which of a variety of mother roles she plays, a variety that can be seen particularly clearly in Latvian traditions. Here appear such descriptions as *Lauku māte* (“field mother”), *Meža māte* (“forest mother”), *Krūmu māte* (“bush mother”), *Ogu māte* (“berry mother”), and *Sēņu māte* (“mushroom mother”), among a number of others. In the main, these are poetic personifications of aspects of nature without any religious connotations. The juxtaposition of religious and poetic personifications is a well-known occurrence, but this does not deny that in differentiating the variety of functions of Zeme as *māte*, new beings are created. These then become independent and assume the particular specialized function that is appropriate in a given tradition.

The central place of Zeme is revealed especially in cultic practices; together with those of Laima, these are the most fully developed in Baltic religion. There was, for example, a notion that children are created from springs, lakes, trees, and hills, all places that are connected with the earth. It is therefore understandable that at the birth of a child offerings were made to Zeme. These offerings were placed either by trees and stones close to the home or were thrown into the hearth fire. The offerings were accompanied by prayers: “My dear earth, my mother, sustain me, feed me.” More widespread still were rituals concerned with encouraging fertility in both crops and animals. Thus, at the commencement of work in the fields in spring, the farmer plowed a piece of

bread into the first furrow. On this day, too, a special meal was eaten at which the first measure of ale was thrown on the earth together with a small piece of meat. In the spring, when the animals were sent out to pasture for the first time, offerings were made, normally eggs, a special gruel, and ale. The entire household, led by the paterfamilias, joined in the sacral meals, for which a piglet or cockerel was occasionally slaughtered.

More frequent still were rituals connected with the gathering of the harvest in autumn. After the last sheaf had been taken in, bread and salt were buried in the soil in its place, to the accompaniment of a prayer: “Dear earth, as you have given, so also do I give to you.” A kind of cultic drama, in two parts, was then enacted. The first part, in which the female head of the household also generally participated, took place in the field. A festive meal was eaten, including special cakes, and, as at all country feasts, ale was drunk. This meal of thanksgiving was made festive by singing and dancing. The songs were commonly characterized by bravado directed at neighboring farmers who had not yet succeeded in harvesting their crops. After the feast, the participants returned home crowned with garlands made from ears of grain and bearing their tools, scythes and rakes, similarly decorated. The second part of the drama took place at the homestead. At the gate, the workers were met by the head of the household, who offered them a drink, usually ale, but often vodka in a later tradition. Afterward, the festivities continued inside the house, with more singing and dancing.

This résumé of the fertility cult of the Baltic earth mother shows that it embraced the countryman’s whole life from the time of his birth, including all aspects of his activities at work. The practice of customary rites attests to the fact that by following them the individual believed that he secured the patronage of Zeme, the mother goddess. So intensive was this cult that even until the eighteenth century country people first said prayers to the earth and then kissed it both in the morning, at the beginning of their work, and in the evening, when their work was done. In these religious instances, the holy earth is the mother of all life. As the extensive collection of nineteenth- and twentieth-century folklore materials demonstrates, this understanding was never completely lost, in spite of centuries of Christian missionizing.

Complementing this positive aspect of the cult of the sacred earth, the giving of life, is its negative counterpart, the taking of life, for the rhythm of nature shows that everything that comes from the earth must at some point return to it. Zeme, the mother of life, is ruler of everything created on earth and of everything that takes place there. That is her positive aspect. Yet experience of life forces the conclusion that the earth is also responsible for the individual’s negative experiences, that is, death and one’s fate thereafter. Thus the earth goddess adopts simultaneously her other morphological role, that of a chthonic goddess. In this role she rules what takes place below the earth, and she is given titles appropriate to this function. In Latvian she is called Smilšu Māte (“sand

mother”), a name arising from the custom of burying the dead in sandy knolls, or she is described directly as Kapu Māte (“mother of the grave”) or Nāves Māte (“death mother”). Thus the mother of life, promoter of bounty and fertility, becomes her opposite, the mother of death. Although paradoxical, this morphological transformation is nonetheless understandable, for in the eyes of the Baltic farmer the processes of birth and death were manifest both in nature and in his immediate and extended families. The dead were buried in a nearby grave mound, and were thus ever-present as a reminder to the living.

In Baltic religion there is no metaphysical ontology contrasting the notions of life and death. Instead, these notions are simply two aspects of a single goddess. In the sources this is stated metaphorically: Not only may one address petitions and give thanks to Zeme as Zemes Māte, but one may have an amicable discussion with her as Nāves Māte, offering her substitutes for a dying person—an oak log to decompose or an ax or a plow to rust away. This final, unique trait of the Baltic earth goddess is explicable by reference to the farmer’s close ties to the land.

HARALDS BIEZAIS (1987)
Revised Bibliography

ZEN. [This article treats the development of the Zen sect in Japan. The historical antecedents of this school, the practices and institutions of Chinese Chan Buddhism, are discussed in Chan.]

The Zen Buddhist sect in Japan consists of three main schools and several additional smaller movements. The largest denomination is the Sōtō school, founded by Dōgen Kigen (1200–1253), which has two head temples, Eihei-ji in Fukui prefecture and Sōjiji in Kanagawa prefecture, and

claims nearly fifteen thousand temples, over thirty monasteries and (six) nunneries, and more than eight million adherents, making it one of the largest of the traditional Japanese Buddhist schools. The second largest Zen denomination is the Rinzai school, founded by Myōan Eisai (1141–1215), which is divided into fifteen streams associated with different head temples and claims about six thousand temples, forty monasteries and (one) nunnery, and two million adherents. The largest of the streams is Myōshin-ji temple in Kyoto, which claims about half of the total Rinzai temples and monasteries and over one-third of the adherents. The third Zen school is the Ōbaku school, founded by Yinyuan Longqi (Jpn., Ingen Ryūki, 1592–1673), which has a head temple of Manpuku-ji in the town of Uji outside Kyoto and claims nearly five hundred temples, two monasteries, and under half a million adherents. In addition, there are several modern movements or “brotherhoods” (*kyōdan*) based on Zen meditation or other training techniques that all together claim about one hundred temples and 200,000 adherents.

The Zen sect was first established in the early medieval period as a controversial form of “New Kamakura Buddhism,” along with the fledgling Pure Land and Nichiren cults. Zen was proscribed in the 1190s for a few years, and for several decades thereafter it was vigorously opposed by the dominant Tendai sect at Enryaku-ji temple located on Mount Hiei to the northeast of Kyoto. During the 1240s and 1250s, major Rinzai and Sōtō Zen temples were built in Kyoto, Kamakura, and Echizen province, and by the beginning of the fourteenth century, Zen had become the leading religious institution in Japan with an ever-expanding network of temples and a wide-ranging, nearly all-pervasive influence on many different levels of society and culture.

During the late medieval and early modern eras, Zen underwent various periods of apparent decline and renewal, especially when it stood in competition with diverse forms of Japanese religiosity in other Buddhist, as well as Shintō and Confucian, movements during the Tokugawa era (1600–1868). In the modern period, Zen has spread to become a worldwide phenomenon greatly admired for its unique features of spiritual practice, including strict monastic discipline and contemplation of pedagogical riddles, or *kōans*, that have a resonance with contemporary spiritual and intellectual trends in psychotherapy, phenomenology, and environmentalism. At the same time, the Zen sect has received criticism both from within and outside of Japan for contributing to social ills ranging from nationalism and nativism to discrimination against women and outcasts.

FORMATIVE PERIOD (LATE TWELFTH AND THIRTEENTH CENTURIES). The origins of Zen in Japan stem from the Nara and early Heian eras, when sitting meditation and some representative early Chan texts were introduced by monks who had traveled to China, including Saichō (767–822), and were practiced or studied for several centuries under the auspices of the Tendai sect as one of several styles of training available to novices. Zen began to be established as a sepa-

rate, autonomous sect by the end of the twelfth century (corresponding to the beginning of the Kamakura era) when several prominent Tendai monks made pilgrimages to the mainland in search of authentic Buddhism after a hiatus in exchange with China that lasted nearly two hundred years. These monks, including Eisai and Dōgen, returned with the newly fashioned Song dynasty (960–1279) approach to Chan. The style of Song Chan that was brought to Japan included an emphasis on monastic institutional structure and rules of conduct, as well as voluminous texts containing biographies of eminent monks and records of their sayings and dialogues, in addition to extensive poetic and prose commentaries on *kōan* cases.

The earliest Zen schools were created either by Japanese monks who went to China and returned to establish important temples and lineages or by Chinese monks who came to Japan and played a crucial role in the rapid development of Zen. Monks in the first category, in addition to Eisai and Dōgen, include: Enni Ben'en (1202–1280), who studied at Mount Jing, the leading temple of the Chinese Chan Five Mountains (Chin., *Wushan*; Jpn., *Gozan*) system and became abbot of Tōfukuji temple in Kyoto; Shinchi Kakushin (1207–1298), who introduced to Japan the most prominent *kōan* collection, the *Wumen guan* (Jpn., *Mumonkan*); and Nampo Jōmin (also known as Daiō Kokushi, 1235–1308), who received transmission from the Chinese master Xutang (1185–1269) and created the lineage that founded Daitokuji temple in Kyoto.

Notable among Chinese monks who came to Japan are: Lanxi Daolong (Jpn., Rankei Dōryū, 1213–1278), who was the founding abbot of Kenchōji temple in Kamakura in 1253 with the support of regent Hōjō Tokiyori (1226–1263); Wuan Puning (Jpn., Gotta Run'ei, 1197–1276), who came at the request of Tokiyori but spent only four years in Japan trying to introduce authentic Chinese-style Zen, serving for a time as abbot of Kenninji temple, which Eisai had founded in Kyoto in 1202 as the first major Zen monastery in Japan; Daxiu Chengnian (Jpn., Daikyū Shōnen, 1214–1289), who founded Jōchiji temple in Kamakura; and Wuxu Zuyuan (Jpn., Mugaku Sogen, 1226–1286), who was the founding abbot of Engakuji temple in Kamakura with the support of regent Hōjō Tokimune (1251–1284).

Even before Eisai spent four years studying Chan during his second trip to China, which lasted from 1187 to 1191, a monk named Kakua (b. 1142) reached the Chinese mainland in 1171 and, on his return, had an audience with Emperor Takakura (1161–1181). In response to a question about the meaning of Zen, Kakua responded by simply playing his flute, while the emperor and his retainers looked on in puzzlement. This anecdote is contained in the valuable historical record of Buddhism in Japan, the *Genkō shakusho*, produced by the Zen monk, Kokan Shiren (1278–1345).

Around the time of Kakua's and Eisai's travels, an anomalous monk not mentioned in Kokan's record, Dainichi Nōnin (d. 1196?), started the first organized Zen

movement, known as the Daruma school. Nōnin was not considered legitimate because he never traveled to China, but instead sent two of his disciples to receive transmission from Zhuan Deguang (1121–1203) of the Dahui Zonggao lineage. His movement was prohibited by imperial decree in 1194, and its temples were destroyed, although some followers persisted at Hajakuji, a Tendai temple in remote Echizen province (currently Fukui prefecture) until 1241 when they all joined Dōgen's upstart Sōtō school. Nōnin sought to create a pure Zen school free of Tendai esoteric ritualism, but by abandoning requirements to follow the precepts or practice meditation, his approach was accused of antinomian tendencies by both Eisai and Dōgen, as well as by Tendai leaders.

Early Rinzai school. Eisai, who is probably best known for introducing tea to Japan, received transmission in the Huanglong (Jpn., Ōryū) lineage of the Linji (Jpn., Rinzai) school of Chan and, like Nōnin, tried to create a pure Zen approach in Japan. However, to distinguish his role from Nōnin's and gain acceptance from the mainstream Buddhist institution, in the *Kōzen gokokuron* that was composed in 1198 Eisai repudiated the Daruma school's antinomianism and argued for the consistency of Zen meditation with established Tendai practices. Eisai also emphasized the importance of following the Chinese Chan way of administering the mixed precepts (that is, the 250 Hinayāna and forty-eight Mahāyāna precepts), after several centuries in Japan during which only the bodhisattva vows were followed. In the two main temples Eisai established with the support of Hōjō Masako (1157–1225)—Kenninji and Jufukuji in Kamakura—there was an eclectic training known as *Enmitsuzenkai* that combined Tendai perfect practice (*engyō*) and esotericism (*mitsu* or *mikkyō*) with Zen-style sitting meditation (*zazen*) and disciplinary rules (*jukai*).

The next major development in the spread of Rinzai Zen involved Enni Ben'en, who like Eisai and Dōgen started out studying Tendai Buddhism in Japan and traveled to China from 1235 to 1241 to gain transmission from the Five Mountains temple system. On his return, Enni was awarded the abbacy of Tōfukuji temple, constructed along the lines of a grand Song Chan compound. For the first time in the three-quarters of a century since Kakua, a major temple was built exclusively for Zen training with the support of Buddhist and imperial authorities. However, in the end, Tōfukuji also provided facilities for the observance of Shingon and Tendai rituals, in accord with the wishes of its patron, Fujiwara Michiie (1192–1252). Since it was located near Kenninji, Enni often made daily visits and tried to restore the authentic Zen practice that had declined somewhat following the death of Eisai. Tōfukuji was also situated near Dōgen's first temple, Kōshōji, in southeast Kyoto. In the following years, Shinchi, who traveled to China from 1249 to 1254, was frequently summoned to lecture on *kōans* and related Zen topics before the imperial court, which further legitimated the Rinzai school.

Based on the intense interest of Hōjō Tokiyori in promulgating Zen by building Song-style temples and lending other forms of patronage and support, Zen became firmly ensconced in Kamakura, which was the temporary capital for several decades in the thirteenth century. For Tokiyori, Zen was the ideal ideology for the emerging samurai class because of its focus on self-control and creative self-expression in a highly disciplined communal environment. Lanxi and the other monks who arrived from China tended to emphasize the importance of monastic discipline governing every aspect of the daily behavior of monks. Because of their Chinese provenance, the Kamakura temples became the most prominent ones in the Japanese version of the Five Mountains system, outranking Kyoto temples, with the exception of Nanzenji.

Early Sōtō school. Whereas numerous prominent Japanese and Chinese monks were involved in the establishment of the Rinzai school, the development of the Sōtō school was primarily based on the efforts of Dōgen, who traveled to China from 1223 to 1227 with one of Eisai's disciples, Myōzen (1184–1225). After an itinerant phase during which he traveled around several of the Five Mountains Chan temples in search of an authentic teacher, in the summer retreat of 1225 Dōgen gained enlightenment under the tutelage of Caodong (Jpn., Sōtō) school master Ju-ching through the experience of “casting off body-mind” (*shinjin datsuraku*). On returning to Japan, Dōgen stayed for a few years at Kenninji before opening Kōshōji, which was the first Zen temple in Japan to have a Chan style monks' hall for *zazen* training, where Dōgen began delivering sermons and indoctrinating disciples in Chinese discipline. He preached a message of the universality of enlightenment for all those who practice “just sitting” (*shikan taza*), including women and laypersons.

At the peak of his career in the summer of 1243, Dōgen departed from his temple in Kyoto with a small, dedicated band of disciples and moved to Echizen province, where he established Eiheiiji temple. The reasons for the move are obscure, but it seems to be connected with several factors that occurred in the couple of years previous. These include the rapid ascendancy to the Tōfukuji abbacy of Enni after his return from China, which may have intimidated Dōgen since the massive Rinzai temple dwarfed Kōshōji, and the conversion of former Daruma school monks at Hajakuji to Dōgen's movement, which may have given him an incentive to take up residence in Echizen. Dōgen's patron Hatano Yoshishige also owned land in the Echizen region, which was the vicinity of the sacred mountain Mount Hakusan, long a center of *yamabushi* activity affiliated with a branch of the Tendai sect centered at Onjōji (also known as Miidera) temple, east of Kyoto and near Lake Biwa.

During a transitional year, until he settled in the summer of 1244 in his new temple, Dōgen was extremely creative in producing over a third of the fascicles included in his major text, the *Shōbōgenzō*, which consists of informal sermons delivered in the vernacular (*kana*) in the abbot's

quarters. At Eiheiiji, Dōgen turned to another style of literature that was included in the *Eihei kōroku*, which consists of formal sermons delivered in the dharma hall in Sino-Japanese (*kanbun*), as prescribed by Chinese Chan monastic rules texts. During the Echizen/Eiheiiji period, Dōgen stressed that enlightenment is available only for male monastics, but he also developed methods for evangelizing and administering precepts to the lay community. According to some reports, Dōgen visited Hōjō Tokiyori in Kamakura for half a year in 1247 to 1248, but he turned down an invitation to head a temple there due to misgivings about the mixing of Zen and the new samurai lifestyle. This would have occurred just a few years before Kenchōji was constructed and became a leading Rinzai center under Lanxi.

ZEN PRACTICE AND TRAINING. Much of the difference in the styles of theory and practice that has evolved between the Rinzai and Sōtō schools, such as the Rinzai emphasis on *kōan* training and the Sōtō emphasis on just-sitting meditation without a focus on *kōan* cases, reflects historical developments subsequent to the formative period of Zen in Japan. The differences tend to stem especially from the Tokugawa and early Meiji eras, periods when all forms of Buddhism had to define themselves in distinctive ways in a competitive religious environment strictly supervised by civil authorities. Discrepancies in style should not be imposed retrospectively, which might obscure the fact that the two schools are linked by fundamental similarities in approach.

On the level of doctrine, both schools stress the importance of post-enlightenment cultivation, as found in Dōgen's teaching of *shushū ittō* (oneness of practice and realization) and the doctrine proclaimed by Daitō Kokushi (Shūhō Myōchō, 1282–1337) of *shōtaichōyō* (sustained nurturing of the seed of truth). Genuine practice must not end at the time of realization, but should continue after the initial experience of enlightenment and be integrated with each aspect of daily life. This practice can take the form of meditation, performing daily chores on the monastic compound, collecting alms from the lay community (*takuhatsu*), participating in the way (*dō* or *michi*) of the arts, communing with nature during a mountain retreat (*yamazato*), or residing in a secluded hermitage on or off the temple grounds.

Monastic regulations. For both schools, all aspects of monastery life are governed by the codes of discipline and ethics, as covered in detail in an extensive body of texts dealing with monastic regulations (*shingi*). These codes were originally imported from China, most notably the 1103 text, *Chanyuan qinggui* (Jpn., *Zen'en shingi*), which was derivative of early Buddhist Vinaya rules and supposedly based on a much shorter source text attributed to the Tang dynasty master Baizhang (749–814), known for his injunction, “a day without work is a day without food.” The *Chanyuan qinggui* was adapted in Japanese texts and required for all monks by numerous thirteenth-century Rinzai and Sōtō leaders, including Eisai in 1195, Dōgen with several texts beginning in 1237, Lanxi in 1278, and Enni in 1280. The seminal

source of Chan rules was also referenced in *shingi* texts by Sōtō master Keizan Jōkin (1264–1325) in 1325, Rinzai master Musō Sōseki (1275–1351) in 1339, and the *Ōbaku shingi* in 1672.

Whether or not it was literally followed, the spirit of “no work, no food” pervades the *shingi* collections, which include rules on the observance of precepts and ethical conduct, as well as on daily activities and annual ceremonies. These works depict a communal life of meditation, frugality, manual labor, and active debate between master and disciple, with regularly scheduled public assemblies and impromptu lectures and instruction. They also describe the functions of abbot, officers, stewards, rank-and-file monks, and novices, in addition to the management of kitchens, the dharma hall, and the larger monastery estate. The *shingi* rules provide requirements for the dharma transmission and awarding of seals (*inka*), as well as commissioning portraits of masters (*chinsō*) and selecting successors to the abbot. Topics such as quarreling and discipline, wandering, and the role of women are given careful consideration. Furthermore, the relation between a school’s head temple (*honji*) and branch temples (*matsuji*) is delineated in both the *shingi* records and the laws of the civil society.

Zen monasteries in Japan follow the style of the “seven-hall compound” (*shichi-dō garan*) originally developed in China. The schema below bears anthropomorphic symbolism in that each of the seven buildings is associated with a part of the Buddha’s body, so that entering the temple grounds is considered the equivalent of communing directly with the Buddha. The halls include on the main axis: the mountain gate or entrance associated with the groin, the Buddha hall for displaying icons and hosting banquets associated with the heart, and the dharma hall for sermons before the assembly associated with the head. The right leg is associated with the bathhouse and the right arm with the kitchen, whereas the left leg is associated with the latrine and the left arm with the monks’ hall.

Four additional mainstays of the structure of Zen temples are: the abbot’s quarters, known as the “ten-foot square hut” (*hōjō*), following a passage in the *Vimalakīrti Sūtra* in which an informed layman holds forth in a humble abode with the ability to outsmart bodhisattvas; the hall to commemorate the local earth deity (*dōjishin*) associated with protection of the temple grounds; a bell tower that houses a large Buddhist bronze bell rung at the New Year and other festivals, as well as purification ceremonies; and a reading room for the study of sūtras and related Buddhist and literary works. The abbot’s quarters is usually located above the dharma hall, with the earth deity hall and bell tower to the right, and reading room to the left.

Zazen and kōan practice. Life in Zen monasteries is centered on *zazen* meditation, which is conducted at least four times daily, as well as for longer, more intensive week-long sessions known as *sesshin*, especially on special occasions such as Rohatsu (December 8 celebration of the anniversary

of the Buddha’s enlightenment). During these special occasions, meditation may be prolonged for up to twenty hours a day, leaving time only for minimal sleeping and eating. In addition to the traditional seated posture, there is a form of meditation known as *kinhin*, which is a walking exercise developed in Japanese Zen.

Another main ingredient of Zen practice is the use of *kōans* as both a literary device and a tool for contemplative training. Diverse styles of commentary were developed during the medieval period (discussed below), involving the use of prose, poetic, and sometimes diagrammatic remarks on the inner meaning of case narratives found in a handful of collections preserved from China, such as the *Wumen guan*, *Biyan lu* (Jpn., *Hekiganroku*), and *Zongrong lu* (Jpn., *Shōyōroku*). A new *kōan* exercise developed in Japan is the brief face-to-face interview of the disciple by the master. This is known in the Rinzai school as *dokusan* (literally “individual study”), which is similar to the Sōtō school practice of *nyūshitsu* (literally “entering the room [of the abbot]”). Both terms refer to private instruction in which the teacher evaluates and motivates the aspiring student to attain a higher level of understanding.

Furthermore, nearly all Japanese Zen monasteries and temples have performed a myriad of functions related to the spirits of the dead, including funerary rites that bestow a posthumous ordination name (*kaimyō*) to ensure that the deceased attains *nirvāṇa* (*nehan*) in the afterlife. Zen temples are also involved in memorial services, as well as the annual Obon or Ghost Festival, held either on July 15 or August 15 (the ceremony was originally held at the time of the full moon of the seventh month of the Chinese calendar). It is believed that during this period the spirits of deceased ancestors visit the living, and Buddhist rituals play an important purification function. Despite an apparent emphasis on uniformity and ritualism, several of the most prominent masters of the medieval period were known for a rugged individuality and eccentricity in their commitment to a life of poverty and reclusion, as well as the creative expression of self-awareness.

MEDIEVAL PERIOD (TO 1600). Beginning with the rise of the new political leadership of the Ashikaga government in 1338, which consolidated its power through alliances with Zen clergy and consciously emulated the Song way of propagating the religion, Zen became a dominant force affecting both the aristocratic elite in the urban centers and the rural population. Zen contributed to the fine, literary, applied, performing, and martial arts, ranging from calligraphy, poetry, gardening, tea ceremony, theater, and sword fighting, among numerous other forms, and also assimilated and domesticated many aspects of popular religion and folklore, including autochthonic gods, demons, and exorcistic rites. Furthermore, Zen began its involvement in constructing the *bushidō* code of honor and loyalty to the warlord by integrating and adapting traditional art of war strategies to monastic training. Nō theater, which is often based on plays dealing with ghosts of defeated samurai wrestling with demons in the

afterlife, and which is written and performed with an uncannily studied contemplative simplicity, represents a realm of the arts where many of these cultural elements have converged.

The developments that took place in establishing Zen in the thirteenth century ensured that the Rinzaï school would grow mainly in the Kyoto and Kamakura areas with the support of the shogunate, whereas the Sōtō school would spread in the northwestern region, as well as other outlying territories, based on proselytizing to an agrarian population. The two schools were separated by other factors in addition to geography and patterns of patronage and participation, yet there were underlying points of connection both institutionally and in terms of styles of religious practice disseminated through a network of temples known as the *Rinka* monasteries.

Five Mountains system. The Rinzaï school formed the main hierarchical institutional structure known as the Five Mountains system, which was patterned after the Chinese Chan monastery system. At its peak it claimed a network of over three hundred temples centered at Nanzenji in Kyoto under the protection of the military regime (*bakufu*). The third Ashikaga shogun, Yoshimitsu (1358–1408), established in 1386 a definitive ranking of five temples each in Kyoto (Tenryūji, Shōkokuji, Kenninji, Tōfukuji, Majuji) and Kamakura (Kenchōji, Engakuji, Jufukuji, Jōchiji, Jōmyōji). A head administrative monk (*sōroku*) was appointed superintendent or the supreme official ruling over the system.

The hallmark of the Five Mountains system was the creation of multiple artistic forms referred to collectively as *Gozan bunka*, with special emphasis on literature, especially *kanbun* poetry, known as the tradition of *Gozan bungaku*. *Gozan* poetry, which usually consists of four-line verses containing seven characters (*kanji*) in each line, deals with Buddhist doctrines and practice, as well as themes that are more general and are used to articulate indirectly an understanding of Zen awareness. One of the main topoi is the contemplation of nature as perceived in secluded landscapes or mountain retreats, as in the following verse by one of the luminaries of the movement, Musō Sōseki (1275–1351):

Autumn's colors dropping from branches in masses of falling leaves, Cold clouds bringing rain into the crannies of the mountains: Everyone was born with the same sort of eyes—Why do *mine* keep seeing things as Zen *kōans*? (Pollack, 1985, p. 37).

Musō, founder of Tenryūji temple in Kyoto, was immensely successful and popular with all factions as an abbot who gained the attention of Emperor Hanazono and political leaders, monks in training, and the general populace. His book *Muchū mondō* (Dialogues in a dream) explains Zen in everyday language in response to questions raised by the warrior Ashikaga Tadayoshi. He was said to have left ten thousand followers at the time of his death. However, Musō was also criticized by rivals such as Daitokuji master Daitō for

not rising above a doctrinal understanding of Zen—that is, for failing to embody a genuinely creative Zen approach that was evident in some of the leading Rinka temple masters.

Rinka monasteries. In addition to the Five Mountains temples of the Rinzaï school, which were considered the leading rank in the Zen network, another series of temples that included representatives from both the Rinzaï and Sōtō schools was known as *Rinka* or *Sanrin* temples; both designations refer to “forests” (*rin*) of Zen monks. The term, which implies the legions of monasteries in the countryside or hinterlands that were outside, and probably resentful of, the domain of the shogun, is perhaps applied most accurately to Eiheiji and other Sōtō temples. But the term is at least in part a misnomer because this group also included prominent Rinzaï temples in Kyoto that enjoyed imperial patronage, especially Daitokuji of the Daiō-Daitō line and Myōshinji temple. Myōshinji was impressively developed by Daitō's disciple, Kanzan Egen (1277–1360), and eventually it broke off to become an independent head temple that surpassed Daitokuji in the size and scope of its network.

Whereas the Five Mountains temples were known for their poetry, one of the main features of the Rinka temples was the formation of a curriculum of *kōan* studies that took on many different dimensions. Daitō is particularly notable for writing two commentaries on the *Biyān lu* collection of 100 *kōan* cases by using the style of capping phrases (*jakugo*), originally developed by Chinese Chan commentators as ironic remarks that illuminate each line of the case narrative. In Sōtō Zen, there were various styles of commentary known as *shōmono*, which included formal/public and informal/private styles. One of the main examples of *shōmono* literature was the subgenre of *kirigami* (literally “strips of paper”) commentaries, in which a master would write down quickly an esoteric comment, usually accompanied by a drawing or illustration, that was handed to a disciple as a training tool or an emblem of attaining transmission. Given the transitory quality and secretive nature of this style, the *kirigami* were left uncollected and were lost until recent scholarship rediscovered and interpreted numerous examples.

A prominent example of medieval Zen art is the famed rock garden at Ryōanji temple in Kyoto, which was perhaps designed by the painter Sōami (1472–1525). A classic of the *kare-sansui* (dry mountains-rivers) style that contains only rocks and sand constructed in patterns but no living form except moss, the Ryōanji garden is surrounded by earthen walls in three directions and faced with the corridor of the *hōjō* (abbot's quarters) building. In the rectangular space measuring thirty meters from east to west and ten meters from north to south, fifteen rocks of various sizes are arranged on white sand in five groups, each comprising five, two, three, two, and three rocks. The most popular explanation of this garden is that the rocks represent a mother tiger and her cubs, swimming in the river of the white sand toward a fearful dragon. The asymmetric composition achieves a certain balance and harmony that creates energy and rhythm in the midst of subtlety and simplicity.

Another important development of the Rinka period was the way creative Rinzaï masters sought to recapture the iconoclasm and eccentricity of early Chinese Chan figures, as epitomized by Ikkyū (1394–1481), who was said to have destroyed his transmission seal for being an empty symbol devoid of significance and to have refused to award such a symbol to any of his disciples. Ikkyū became an acolyte at the age of five and excelled at Chinese poetry and calligraphy as well as painting. Throughout his life he railed against the corruption of priests and the meaningless formalities of Zen monastic life, yet he succeeded to the abbacy of Daitokuji and also won widespread acceptance by the common folk for his inventiveness and independence.

One of Ikkyū's noted calligraphies contains the saying, "Entering the realm of Buddha is easy, entering the realm of the demon [*mā*] is difficult." On one level, this expression, along with Ikkyū's lifestyle, which included the celebration of visits to brothels and the "red thread" of passion, could be interpreted as endorsing the kind of antinomianism that was consistently rejected by Zen monastic leaders. However, another implication of the saying is that, for Ikkyū, asserting the priority of purity while occupying a state of transcendence is a relatively simple task that is not necessarily as demanding as maintaining a genuinely authentic state of mind while being tempted and tested in the midst of impurity. An underlying theme is that Buddha and demon are not distinct, but symbolize interior forces of wisdom and delusion that are inextricably and dialectically linked as complementary opposites embraced by a deeper level of nondual awareness.

Sōtō school assimilationism. Within the Sōtō school, the fourth generation patriarch Keizan maintained Dōgen's twin emphasis on continuing a commitment to rigorous meditation and adhering to monastic regulations, but he also assimilated many elements of Tendai esotericism, as well as folklore religiosity in his approach to Zen. Before joining Sōtō, Keizan had been a follower of the remnants of the Daruma school. Through Keizan's efforts, Sōtō Zen spread primarily northward from Echizen to the Noto peninsula, where Sōjiji temple was established. Long a rival with Eiheiiji for the designation of the school's head temple—Eiheiiji enjoyed the prestige of the founder's legacy, but Keizan's temple could claim more than nine times as many branch sites—Sōjiji was moved at the end of the nineteenth century. It was relocated in a neighborhood outside Yokohama in the Kanto region, which had become over the centuries a major center of Sōtō school activity.

A key to the success of this lineage was Keizan's evangelical disciple Gasan Jōseki (1275–1365), who was abbot of Sōjiji for forty years. Along with his followers, such as Tsūgen Jakurei (1322–1391), Gasan helped the rapid spread of Sōtō Zen in the countryside areas by taking over many abandoned Tendai and Shingon temples and assimilating folklore divinities, which were called upon to protect the welfare of the sacred sites. While equally concerned with con-

struction projects for bridges, dams, and irrigation canals to help win popular support, Gasan was also a scholastic monk who promulgated the dialectical doctrine of the "five ranks" (*go-i*) rooted in Chinese texts.

One of the legacies of the popularization campaign is that some of the most prominent Sōtō temples are associated with shamanistic and esoteric practices. They are best known to their congregations of lay followers for espousing a syncretic approach to attaining worldly benefits (*genze riyaku*), such as prosperity, fertility, or safety during travels, rather than for traditional Zen practices of meditation and monastic discipline. A prime example is Saijōji temple near the town of Odawara, which was founded by Ryōan Emyō (1337–1411), who was said to have transformed into a winged *tengu* (the mountain goblin of Japanese lore) to enhance his powers for protection of the temple grounds.

Another such example is Myōgonji temple in the town of Toyokawa in Aichi prefecture, anomalously affiliated with Eiheiiji rather than Sōjiji, which is also called Toyakawa Inari because the main icons on the compound are not images of Buddha but rather the fox deity (Inari), originally a Shintō fertility symbol that became a force spiritually protecting the Buddhist teachings. Followers who flood these prayer temples (*kitō jiin*) for New Year's Day or other annual festivals may not even be aware that rituals and chants are being performed by monks trained at head temples or monasteries, where the primary training is in meditation with the aim of overcoming worldly attachments.

One of the features of medieval Sōtō Zen was the role played by female monastics at several nunneries who sought to keep alive the integrity of the tradition of clerical discipline espoused by Dōgen, and who also developed unique rituals for healing and purification. It is unclear, however, whether and to what extent Dōgen himself endorsed the equality of women, as there are several seemingly contradictory passages in his writings on this topic.

EARLY MODERN PERIOD (1600–1868). Zen Buddhism during the Tokugawa era was affected by several trends that influenced all Buddhist schools, including the rise of Confucianism and the return to prominence of Shintō under the banner of National Learning (*kokugaku*) thought. Both ideologies were taught at academies that helped support the role of the shogunate. The *danka* (loosely "parish") system in which all families were assigned to a Buddhist temple strengthened the numbers of Buddhist affiliates but tended to weaken the spirituality and integrity of Zen monastic life. It has long been said that Zen apparently entered a prolonged period of decline (*daraku*), but the early modern period was actually characterized by many important luminary figures and elements of revitalization.

Ōbaku school. One of the new developments was the formation of a third movement, the Ōbaku school, which was based on the teachings of Chan masters of the Ming dynasty (1368–1644). The reintroduction of Chinese reli-

gion and culture was an anomalous event, since the Tokugawa regime restricted all foreign travel, but Yinyuan and his followers were able to enter Japan after receiving an invitation from Sōfukuji in Kyushu and exert great influence. This school emphasizes the preservation of the sūtras, as well as the combination of *zazen* meditation with Pure Land, other-power (*tariki*) practices for the veneration of Amida (Skt., Amitābha) Buddha, and the recitation of the *nembutsu* chant, which is generally thought to stand in contrast with the Zen self-power (*jiṛiki*) approach.

Rinzai monks. The Rinzai school of this period featured several prominent monks, including Takuan Sōhō (1573–1645), whose writings synthesize Zen principles of mental cultivation and swordsmanship. This is a form of training in which a warrior must be able to respond to a rival or threat spontaneously and with an unclouded and imperturbable mind that can be attained through meditation. According to Takuan, controlling the battleground and the sense of winning and losing is a matter of mastering the impulses of the mind and casting off fetters and delusions. While Takuan found the Zen mind in the highly specialized world of the warrior, another key monk of the day, Bankei Yōtaku (1622–1693), stressed the role of the mind manifested in ordinary activity, such as walking, standing, sitting, and lying down, which are all exemplary of the imperishable “unborn” Zen state of awareness.

The most important monk of the Tokugawa era was Hakuin Ekaku (1686–1768), who single-handedly reformed Rinzai school practice in a way that has persisted for over three centuries. Hakuin was known for both his appropriation of the strict training style of the Chinese masters of the Tang and Song periods and his appeal to the common folk, who found him a charismatic spiritual leader. Hakuin perfected a new system of *kōan* study by cataloging and rating the challenging quality of several hundred cases available in the primary collections, as well as creating one of the most famous riddles, “We know the sound of two hands clapping, what is the sound of one hand?” Hakuin gave form to a training method that integrates the techniques of practice sessions (*sesshin*) and master-disciple pedagogy (*dokusan*), along with public sermons (*teishō*) and capping phrase (*jakugo*) commentary provided by the master.

Hakuin also emphasized the role of intense mystical experience in developing Zen awareness. The experience begins with the Great Doubt, in which all perceptions are called into question and stripped away of conventional attitudes. The Great Doubt may seem to lead to a nihilistic state of perpetual anxiety, and this condition is identified by Hakuin as the Zen Sickness, which can affect enlightened and unenlightened alike. However, the goal of the spiritual path is to move beyond debilitating anxiety and attain a more advanced level of insight through experiences that are sudden and dramatic. Hakuin had several instances of subitaneous awakening; for example, it is recorded in his biography, “One night, he sat up in complete absorption until dawn.

Suddenly, he heard the bell from a far off temple. As soon as this distant sound entered his ears, it penetrated to the core and made all perceptions of the external world fall away. It was like the ringing of a magnificent bell resounding in his ears.”

Sōtō scholasticism. The Sōtō school underwent a significant revival of scholastic studies, producing many new editions and interpretations of the seminal works by and about Dōgen’s life and thought. Manzan Dōhaku (1636–1714) was the originator of this movement and was responsible for acquiring a new rule of transmission and succession for the post of temple superior from the shogun government. Tenkei Denson (1648–1735) developed a novel, if idiosyncratic, view of Dōgen’s *Shōbōgenzō* by favoring the controversial 60-fascicle edition, and Menzan Zuihō (1683–1769) was the premier cataloger and revisionist of the writings and biographies of Dōgen. The Sōtō school also published a comprehensive 95-fascicle edition of the *Shōbōgenzō* in 1690, which was reissued in the early nineteenth century, although the authenticity of this version has been questioned by modern scholars.

The Tokugawa era also saw several highly creative Zen spirits, including the lay practitioner and humanist thinker Suzuki Shōsan (1579–1655), who practiced an unorthodox style of meditation that owed to both samurai culture and Buddhist chanting rituals; the great *haiku* poet Bashō (1644–1694), who followed a Zen lifestyle as a lay disciple that influenced the inspiration and manner of his verse; and Ryōkan (1758–1831), a Sōtō monk affectionately called the Great Fool (Daigu) for the childlike innocence expressed in deceptively simple poems that celebrated the Zen values of poverty and nonattachment. Like other early modern Zen leaders who paid obeisance to Chan and early medieval Zen heroes and icons, Ryōkan expressed his gratitude for Dōgen in some of his poetry.

MODERN PERIOD (1868–PRESENT). Zen Buddhism in the Meiji era (1868–1912) was greatly affected by the response of Japanese society to modernization and westernization that resulted in the emerging of a nationalistic, pro-Shintō stance and the suppression or modification of traditional Buddhist institutions in several campaigns. These included the persecution of *haibustu kishaku*, which led to the destruction of Buddhist iconography, the new regulations of *shinbutsu bunri*, or the separation of Buddhist temples from Shintō shrines that had long been amalgamated; and the legislation of *nikujiki saitai*, forcing marriages and meat-eating upon Buddhist clergy and nearly ending centuries of celibacy and pacifism.

Reactions to modernity. One reaction to the disturbing trends was embodied by Ōtori Sessō (1814–1904), a Sōtō monk who worked for the Ministry of Doctrine to modernize Buddhism and eliminate the dissonance between traditional monasticism and secularized, industrialized society. Ōtori was also active in creating linkages between monks and laypersons, and in 1891, the Sōtō sect produced an ab-

breviated version of Dōgen's *Shōbōgenzō* as a source of guidance for lay practitioners. This very short text, the *Shushōgi*, does not even mention the need for *zazen* but instead emphasizes a life of gratitude and penitence. Several lay or *kyōdan* organizations became established as autonomous movements.

By the end of the nineteenth century, Zen had begun to emerge out of the cocoon of the Asia/Pacific cultural context to become a religious phenomenon that was spreading worldwide. Several factors influenced this development. One factor was that immigrant communities in Hawai'i, the American West Coast, and Brazil were serviced by missionaries and international outreach components of Zen temple institutions, especially for funerals and memorials.

Another factor was that non-Japanese were introduced to and became fascinated with the philosophy and practice of Zen. A key turning point was the 1893 World Parliament of Religions in Chicago, an interreligious congress that was attended by the widely traveled Shaku Sōen (1859–1919), a disciple of the eminent Rinzai monk, Imakita Kōsen (1816–1892), who was abbot of Engakuji temple in Kamakura. The parliament was also attended by the young D. T. Suzuki (1870–1966), who served as Sōen's interpreter. Suzuki went on to stay for long periods in the United States and have a lengthy career as the main exponent of Zen Buddhism in the West. He published dozens of books in English on various dimensions of Zen in relation to Japanese culture as seen from comparative theoretical perspectives. He also greatly influenced the famous 1956 essay by Alan Watts (1915–1973) on different styles of the appropriation of Zen practice in the West, "Beat Zen, Square Zen, and Zen." Famous American Beat poets were indebted to Suzuki, whose role was inherited by Masao Abe (b. 1915), who specialized in interfaith dialogue involving various Western religious traditions.

In the post–World War II period, historical accounts of Chan and Zen were significantly improved through the scholarship of Yanagida Seizan (b. 1922), a professor of Kyoto University, who was associated with scholars at Komazawa University in Tokyo, which specialized in Sōtō studies. Yanagida established an institute for international studies of Zen, as well as mentoring a number of influential Western scholars.

In addition to the efforts of Suzuki, Yanagida, and Abe, among others the spread of international interest in Zen was enhanced by the comparative philosophy of the Kyoto school led by Nishida Kitarō (1870–1945) and his main follower, Nishitani Keiji (1900–1990). Their works explicating the notion of "absolute nothingness" (*zettai mu*) as the key to understanding the Zen experience of enlightenment have been analyzed in relation to leading Western philosophers from ancient to modern times. The significance of Zen thought is now frequently examined in conjunction with the main trends of Western thought.

SOCIAL CRITICISMS OF ZEN. At the same time, since the 1970s a social criticism of Zen's role in relation to political and cultural affairs has been taken up by commentators in Japan and the West. Ichikawa Hakugen (1902–1986) was a Rinzai monk writing during the Vietnam War era. Ichikawa reflected on the role of Japan as an aggressor against China in World War II and argued that leaders of Zen, including Kyoto school thinkers who treated the theme of national polity in their works during the 1930s, when they were under considerable political pressure, needed to accept responsibility for contributing to prewar nationalism and imperialism. A movement that began within the Sōtō school in 1985 known as Critical Buddhism (*Hihan Bukkyō*) has demanded that Zen temples reform the practice of distributing posthumous ordination names because it discriminates against the outcaste (*burakumin*) community. In a related development, Sōtō nuns have criticized the misogynist aspect of Zen rules and customs as part of a broader gender criticism of Japanese Buddhism.

A wave of books published in the West beginning in the 1990s, including Brian Victoria's *Zen at War* (1997), James W. Heisig and John C. Maraldo's *Rude Awakenings* (1995), Jamie Hubbard and Paul L. Swanson's *Pruning the Bodhi Tree* (1997), Christopher Ives's *Zen Awakening and Society* (1992), and Bernard Faure's *Chan Insights and Oversights* (1993), has called attention to apparent limitations in the Zen view of transcendence. In striving to rise above the pettiness of worldly strife and conflict, Zen may overlook—and therefore implicitly sanction—problematic issues in everyday society. Some elements of this critique were anticipated in the famous novel *Temple of the Golden Pavilion* (*Kinkakuji*, 1956) by Yukio Mishima (1925–1970), which is based on the true story of an acolyte who burned down the most elegant temple in Kyoto. In that sense, the charge of antinomianism leveled at the fledgling Zen movements at the end of the twelfth century has resurfaced in a contemporary context.

BIBLIOGRAPHY

To cite some representative examples of the voluminous literature on Zen in Japanese, important reference works include *Zen-gaku daijiten* (Tokyo, 1978); *Ōbaku bunka jinmei jiten*, edited by Ōtsuki Mikio, Katō Shōshun, and Hayashi Yukimitsu (Kyoto, 1988); and *Zengo jiten*, compiled by Koga Hidehiko (Kyoto, 1991). Also, *Kōza Zen*, edited by Nishitani Keiji (Tokyo, 1974) is an important collection of essays, and two historical studies by Tekenuki Genshō are *Nihon shushūshi* (Tokyo, 1989) and *Nihon Zenshūshi no kenkyū* (Tokyo, 1993). Collections of original sources include *Nihon no Zen goroku*, 20 vols. (Tokyo, 1977), and two collections edited by Yanagida Seizan, *Zengaku sōsho*, 13 vols. (Kyoto, 1973–1980), and *Zen no goroku*, 17 vols. (Tokyo, 1969–1981).

Information on Zen demographics is included in T. Griffith Foulk, "The Zen Institution in Modern Japan," and in Kenneth Kraft, ed., *Zen Tradition and Transition: A Sourcebook by Contemporary Zen Masters and Scholars* (New York, 1988), pp. 157–177. Standard historical studies in English include Heinrich Dumoulin, *Zen Buddhism: A History*, Vol. 2: *Japan*, translated by James W. Heisig and Paul Knitter (New York, 1989), and Daigan Matsunaga and Alicia Matsunaga, *Foundation of Japanese Buddhism*, Vol. 2: *The Mass Movement* (Los Angeles, 1978). Cultural criticism of Zen is explored in Bernard Faure, *The Rhetoric of Immediacy: A Cultural Critique of Chan/Zen Buddhism* (Princeton, 1991).

Illustrated materials on the early history of the Rinzai school are contained in a partially bilingual catalogue prepared for an exhibit at the Tokyo National Museum of Art on *Kamakura Zen no genryū* (*The Art of Zen Buddhism*; Tokyo, 2003). An analysis of the interactions among early Zen movements is discussed in Bernard Faure, "The Daruma-shū, Dōgen, and Sōtō Zen," *Monumenta Nipponica* 42, no. 1 (1987): 25–55. Works on Dōgen include Hee-Jin Kim, *Dōgen Kigen—Mystical Realist* (Tucson, Ariz., 1975); Carl Bielefeldt, *Dōgen's Manuals of Zen Meditation* (Berkeley, 1988); and Steven Heine, *Dōgen and the Kōan Tradition: A Tale of Two Shōbōgenzō Texts* (Albany, N.Y., 1994). A selection of Dōgen's writings in translation is found in Kazuaki Tanahashi, ed., *Moon in a Dewdrop: Writings of Zen Master Dōgen*, translated by Robert Aitken et al. (San Francisco, 1985).

Institutional practices are discussed in Martin Collcutt, *Five Mountains: The Rinzai Zen Monastic Institution in Medieval Japan* (Cambridge, Mass., 1981). Intellectual practices of Zen are discussed in T. P. Kasulis, *Zen Action/Zen Person* (Honolulu, 1980); Miura Isshū and Ruth Fuller Sasaki, *Zen Dust: The History of Kōan Study in Rinzai (Lin-chi) Zen* (New York, 1966); Robert Aitken, trans. and ed., *The Gateless Barrier: The Wu-men kuan (Mumonkan)* (New York, 1991); and Ishikawa Rikizan, "Transmission of *Kirigami* (Secret Initiation Documents): A Sōtō Practice in Medieval Japan," in *The Kōan: Texts and Contexts in Zen Buddhism*, edited by Steven Heine and Dale S. Wright (New York, 2000), pp. 233–243. Syncretic practices are discussed in a book dedicated to the 500th anniversary of Saijōji, a Sōtō temple, *Daiyūzan: Saijōji kaisō roppyakunen hōzan* (Kanagawa-ken, Japan, 1994), and Karen Smyers, *The Fox and the Jewel: Shared and Private Meanings in Contemporary Japanese Inari Worship* (Honolulu, 1998).

The poem by Musō is cited from David Pollack, *Zen Poems of the Five Mountains* (New York, 1985). *Muchū mondō* is translated by Thomas Cleary in *Dream Conversations* (New York, 1994). Other works on this period of Rinzai Zen include Joseph Parker, *Zen Buddhist Landscape Arts of Early Muromachi Japan (1336–1573)* (Albany, N.Y., 1999); Kenneth Kraft, *Eloquent Zen: Daitō and Early Japanese Zen* (Honolulu, 1993); and Sonja Arntzen, *Ikkyū and the Crazy Cloud Anthology: A Zen Poet of Medieval Japan* (Tokyo, 1987). For an examination of the Sōtō school, see William M. Bodiford, *Sōtō Zen in Medieval Japan* (Honolulu, 1993).

An analysis of the development of the Ōbaku school is in Helen Baroni, *Ōbaku Zen: The Emergence of the Third Sect of Zen in Tokugawa Japan* (Honolulu, 1998). Zen's relation to sam-

urai culture is discussed in Takuan Sōhō, *The Unfettered Mind: Writings of the Zen Master to the Sword Master*, translated by William Scott Wilson (New York, 1988), and Winston L. King, *Zen and The Way of the Sword: Arming the Samurai Psyche* (New York, 1993). Translations of Hakuin's writings are contained in Philip B. Yampolsky, *Zen Master Hakuin: Selected Writings* (New York, 1971), and Norman Waddell, *Essential Teachings of Zen Master Hakuin* (New York, 1994). William M. Bodiford's article treats changes in the transmission process in the Sōtō school, "Dharma Transmission in Sōtō Zen: Manzan Dōhaku's Reform Movement," *Monumenta Nipponica* 46, no. 4 (1991): 423–451. A translation of Ryōkan is found in *Great Fool: Zen Master Ryōkan: Poems, Letters, and Other Writings*, translated by Ryūichi Abe and Peter Haskel (Honolulu, 1999).

On changes in Meiji era Zen, see Richard Jaffe, *Neither Monk Nor Layman: Clerical Marriage in Modern Japanese Buddhism* (Princeton, 2001), and Steven Heine, "Abbreviation or Aberration? The Role of the *Shushōgi* in Modern Sōtō Zen Buddhism," in *Buddhism and the Modern World: Adaptations of an Ancient Tradition* (New York, 2003). The advent of Zen in the West is discussed in Rick Fields, *How the Swans Came to the Lake: A Narrative History of Buddhism in America*, rev. ed. (New York, 1986). The outlook of modern Zen in a comparative religious context is expressed in Masao Abe, *Buddhism and Interfaith Dialogue: Part One of a Two-Volume Sequel to Zen and Western Thought* (Honolulu, 1995). For Kyoto school philosophy, see James W. Heisig, *Philosophers of Nothingness: An Essay on the Kyoto School* (Honolulu, 2002), and Michiko Yusa, *Zen and Philosophy: An Intellectual Biography of Nishida Kitarō* (Honolulu, 2002).

On social criticism, see Ichikawa Hakugen, *Bukkyōsha no sensō-sekinin* (Tokyo, 1970), and a special (*tokushū*) issue of the journal *Bukkyō* 14, no. 5 (1994). Some of the recent works on a social criticism of Zen in English include Brian A. Victoria, *Zen at War* (New York, 1997); James W. Heisig and John C. Maraldo, eds., *Rude Awakenings: Zen, the Kyoto School, and the Question of Nationalism* (Honolulu, 1995); Jamie Hubbard and Paul L. Swanson, eds., *Pruning the Bodhi Tree: The Storm over Critical Buddhism* (Honolulu, 1997); Christopher Ives, *Zen Awakening and Society* (Honolulu, 1992); and Bernard Faure, *Chan Insights and Oversights: An Epistemological Critique of the Chan Tradition* (Princeton, 1993). Also, a translation of Mishima's novel *Kinkakuji* (Tokyo, 1956) is by Ivan Morris, *The Temple of the Golden Pavilion* (New York, 1959; reprint, 1994).

STEVEN HEINE (2005)

ZEUS, the son of Kronos and Rhea, is the main divinity of the Greek pantheon. Besides Hestia, he is the only god in the Greek pantheon with an undisputed Indo-European provenance, to judge from his name: it derives from the root **diéu-* (day; Latin *dies*, meaning "[clear] sky") and has close parallels in the Latin *Iu-piter* or the Ancient Indian (*Rgveda*) *Dyaus* (*pitar*). The Homeric and later epithet *pater* (father) closely corresponds to the Latin or early Indian way his name is expanded: his mythical and religious role as father must be already Indo-European. Despite the frequent Homeric

formula “Zeus, father of men and gods,” however, Zeus is father not in a theogonical sense, but, as the Homeric variant Zeus *anax* (Lord Zeus) shows, in the sense of having the power of a father in a strict patriarchal system. This explains why all the Olympian gods are either his siblings (Poseidon, Hera, Demeter) or his children by different mothers (Athena, Apollo, Artemis, Hermes, Dionysos, Aphrodite, Ares, Hephaistos). This role—which implies unrestricted power over all members of the family, but also its check through father-like benignity—continues as the fundamental role of Zeus throughout antiquity and finds its expression in the standard iconography of Zeus as a bearded and powerful middle-aged man.

MAIN FUNCTIONS. In Greece, however, the Indo-European role of Zeus as the god of the bright sky is transformed into the role of Zeus as the weather god, whose paramount place of worship is a mountaintop; cult worship in such a peak sanctuary is specific to him. Among the many mountains connected with Zeus, many are reflected only in an epithet that does not necessarily imply the existence of a peak sanctuary, since few such sanctuaries are excavated. Those attested in literature are mainly connected with rain rituals (Zeus Hyetios or Ombrios), although the sanctuary on the Arcadian Mount Lykaion had a much wider function: it preserves traces of earlier initiatory rituals, and it turned into the federal sanctuary of all Arcadians, just as the sanctuary of Jupiter Latiaris on the top of the Mons Sacer, the “Sacred Mountain,” was the federal sanctuary of the cities of archaic Latium. As Zeus “the Gatherer of Clouds” (*nephelēgeretas*, a common Homeric epithet), he was generally believed to cause rain, both in serious expressions (“Zeus rains”) and in the comic parody of Aristophanes (*Clouds* 373). With the god of clouds comes the god of thunder (*hupsibremētēs*, or “He Who Thunders High Up”) and of lightning (*terpsikēraunos*, or “He Who Enjoys Lightning”). A spot struck by lightning and thus touched by the god is inaccessible for humans (*ábaton*) and often sacred to Zeus Kataibates (“He Who Comes Down”). As the Master of Lightning, Zeus has the Cyclopes at his command, the divine blacksmiths who fabricate for him the lightning as his main weapon. As the Master of Tempest, he also is supposed to give signs to mortals through thunder and lightning, and to strike evildoers, as he struck the giants and the monstrous Typhon at the beginning of his reign.

This entire complex finds expression in the myth that Zeus has his (palatial) home on Mount Olympus, together with all the gods of his household. Olympus had been transformed from a real mountain into a mythical place even before Homeric poetry. Homer described it as a place that “neither winds assail nor rains drench nor snow covers, but cloudless clarity and brilliant light surround it” (*Odyssey* 6.43). The myth, in turn, generated cult on one of the several peaks of the mountain (Hagios Antonios) that is archaeologically attested for the Classical period.

But for the early archaic Greeks, and conceivably for the Mycenaeans, Zeus was a much more fundamental divinity.

According to the succession myth in the Hesiodic *Theogony*, Zeus deposed his father Kronos—who in turn had deposed and castrated his father Uranus, and who had swallowed all his children to prevent them from deposing him. Baby Zeus escaped only because his mother Rhea fed Kronos a swaddled stone in place of the infant. After his accession to power, Zeus fought the giants and the monster Typhon who attacked his reign, and he disposed the actual order of things by attributing to each divinity his or her respective sphere: to his brothers Poseidon and Hades/Plouton, he allotted two-thirds of the cosmos—to Poseidon the sea, and to Hades the netherworld; to his sisters Hera (who was also his wife) and Demeter and to his many divine children he gave their respective domains in the world of the humans (mankind had been preexistent to Zeus’s reign). The main outline of this myth is known also in the Homeric poems that either precede or follow Hesiod’s *Theogony* closely; thus, early Greek narrative poetry, and through it, early Greek society, shared this fundamental myth. It makes Zeus the ruler (“king”: *anax* or, after Homer, *basileus*) over both the other gods (whom he overrules by sheer force, if necessary) and the world of man: the order of things as they are now is the order of Zeus.

Closely related succession myths are attested from Hittite Anatolia and from Mesopotamia. In Hittite mythology, the succession passed through Anu (Sky), who was deposed and castrated by Kumarbi, finally to Teshub, the storm god, who corresponds to Zeus; other myths tell of the attacks of Kumarbi and his followers on Teshub’s reign, which corresponds to the Greek myths of how young Zeus had to defend his rule against Typhon and the Titans. Myths from Mesopotamia present a similar, though more varied structure; the Babylonian *Enuma elish* moves from a primeval pair, Apsu and Tiamat, to the reign of Marduk, the city god of Babylon and in many respects a Zeus-like figure. A later version of the Typhoeus myth (preserved in Apollodorus’s *Bibliothēke* 1.6.3) locates part of it on Syrian Mount Kasion (Phoen., Sapon), the seat of a peak cult of Baal Saphon, who the Greeks named Zeus Kasios; Baal shares traits also with Marduk. The Greek concept of Zeus the kingly ruler of the present world is as unthinkable without Oriental influence as is the figure of Zeus the Master of Storms.

In many instances, human affairs follow the plan of Zeus (for example, the Trojan War, or the return of Odysseus in Homeric poetry), despite apparent setbacks. He might help to bring things to perfection, if asked in a prayer to do so (Zeus Teleios, “He Who Perfects”), and he might signal his will, either asked for or not, in dreams, augural signs, or thunder and lightning, but also but by provoking ominous human utterances (*pheme*). In cult, this function is expressed in rare epithets such as Phanter (He Who Signals), Terastios (He of the Omina), and Phemios or Kledonios (He Who Gives Oracular Sayings).

CULTS. Zeus has few major polis festivals, and only a few month names attest an important early festival of Zeus: the

Bronze Age month Diwos (attested in Knossos on Crete) to which the Macedonian, Aetolian, and Thessalian month name Dios corresponds; the Attic month Maimakterion which derives from the minor festival of a rather shadowy Zeus Maimaktes (presumably a storm god); the Cretan month [V]elchanios which belongs to a typically Cretan (Zeus) Velchanos who perhaps originally was an independent storm god. Of some interest among city festivals are also the sacrifice of a bull of Zeus Polieus in Kos and the festival of Zeus Sosipolis in Magnesia on the Maeander, both attested by sacrificial prescriptions preserved by Hellenistic inscriptions; these texts show the pomp with which Hellenistic cities celebrated the god whose cult expressed their identity and their hopes for the future. In both cases, the texts emphasize the choice and importance of the sacrificial animal as the center of Zeus's cult.

The Diasia, "the greatest Athenian festival of Zeus" (Thucydides 1.126.6), had a much less auspicious character. The festival was celebrated in honor of Zeus Meilichios, who took the form of a huge bearded snake. The cult place was outside the town, and the cult contained either animal sacrifices or bloodless cakes; sacrificial animals were entirely burnt. This meant that the festival did not culminate in a common banquet that released the tension of the sacrifice. Instead, there is evidence of common meals in small family circles and of presents given to the children—in this phase of the ritual, the community has disintegrated and nuclear families have become highly visible. Such a mood fits the date of the festival, Anthesterion 23 (February/March); the main event of the month had been the Anthesteria, which had a similar, but even more marked character of uncanny disintegration: on its first day, every participant was drinking, and ghosts were roaming the city. Phenomenologically, both festivals belong to a New Year-like transition at the turn from winter to spring.

Thus, although Zeus's polis festivals were not very widespread, he was from early times prominent as a Panhellenic deity who transcends the single polis (as he is the only Olympic divinity who, in the Homeric poems, sides with neither side in the war). The *Iliad* mentions the oracular sanctuary of Dodona in northwestern Greece that was dedicated to Zeus Naios, and its strange, barefoot priests who slept on the ground (*Iliad* 16.233–5, *Odyssey* 19.296–301); later, priestesses derived the oracles from the sound of a holy oak, the flight of doves, and the sound of a bronze basin. Questions from and answers to the many private worshipers were written on lead tablets that are preserved in considerable number. But Zeus's main Greek sanctuary was in Olympia, in the southwestern Peloponnese, with its games that were held every four years. The games began with an impressive sacrifice to Zeus Olympios on an ash altar whose growing height made it an impressive sight; a Panhellenic contest followed whose main events were a foot race and a chariot race. Their foundation (in the year 776 BCE, according to tradition) marked the end of the isolation of the Dark Age communi-

ties; the common festival took place at a spot well-removed from a single polis and was under the protection of a superior god. The analysis of the sacrifices points to an origin in initiation rituals of young warriors. The sanctuary contained an archaic temple of Hera and a large temple of Zeus, built in the 460s BCE; its cult state, an enthroned Zeus, was a major work of the Athenian sculptor Phidias and evoked wonder and admiration throughout antiquity.

Inside the polis, Zeus has his own specific province and cares for the smaller units whose lawful unification forms the polis. His own domain is the agora: as Zeus Agoraios, he presides over the just political dealings of the community; in this function, he can be counted among the main divinities of a city, including Hestia Prytaneia and Athena Poliouchos, or Polias. On the level of smaller units, he is one of the patrons of phratries (Zeus Phratrios or Zeus Patr[o]ios), sometimes together with Athena Phratria or Patr[o]ia (see Plato, *Euthydemus* 302d); or of clans (Zeus Patr[o]ios). In this function, he also protects the single households. As Zeus Herkeios (He in the Yard), he receives sacrifices on an altar in the courtyard, which had to be in every Athenian family home (Aristotle, *Constitution of Athens* 55); as Zeus Ephestios (He on the Hearth), sacrifices were offered on the hearth of a house.

There are functions of Zeus on the level of the family that easily are extended both to individuals and to the polis. Since property is indispensable for the constitution of a household, Zeus is also Zeus Ktesios, the protector of property. As such, he receives cults from families, from cities, and from individuals. In many places, Zeus Ktesios has the appearance of a snake—property is bound to the ground, at least in the still-agrarian conception of ancient Greece, and its protectors belong to the earth (see Ploutos ["Riches"], whose mother is Demeter, and Plouton ["The Rich One"] one of the many names of the god of the netherworld). The same holds true for Zeus Meilichios (The Gentle One). On the level of the individual, Xenophon attests Zeus Meilichios's efficiency in providing funds (*Anabasis* 7.8.1), and in many communities, Zeus Melichios protects families or clans. In Athens he receives the polis festival of the Diasia; there and elsewhere, he also has the form of a snake. And finally, one might add Zeus Philios, protector of friendship between individuals (as among an entire polis).

The Zeus cults of Crete fit only partially into this picture. Myth places both his birth and his grave in Crete: according to Hesiod, in order to save him from Kronos, Rhea gave birth to Zeus, then entrusted the baby to Gaia, who hid it in a cave near Lyktos, on Mount Aigaion (Hesiod, *Theogony* 468ff.). Later authors replaced Gaia by the Kouretes—armed demons, whose noisy dance kept Kronos away—and name other mountains, usually Mount Ida or Mount Dikte. This complex of myths reflects cult in caves that partly go back to Minoan times, and armed dances by young Cretan warriors, like those attested in the famous hymn for Zeus from Palaikastro (sanctuary of Zeus Diktaios), which belong in the context of initiatory rituals of young warriors; in the

actual oaths of Cretan ephebes, Zeus plays an important role. In this function, Zeus exceptionally can be young: the Palaikastro hymn calls him *koûros* (young man); the statue in the sanctuary of Zeus Diktaios was beardless, and coins from Knossos show a beardless (Zeus) Welchanos. There certainly are Minoan (and presumably Mycenaean) elements present in the complex, but it would be wrong to separate Cretan Zeus too radically from the rest of the Greek evidence; both the cults of Mount Lykaïos and of Olympia contain initiatory features.

THEOLOGICAL REFLECTIONS. In Homer's epics (much more than in actual cult), Zeus had reached a nearly overpowering position. During the Classical and Hellenistic ages, religious thinkers developed this into a sort of "Zeus monotheism." By the time of Aeschylus (525–456 BCE), Zeus had begun to move away from simple human knowledge ("Zeus, whoever you are . . .," *Agamemnon* 160) to a nearly universal function ("Zeus is ether, Zeus is earth, Zeus is sky, Zeus is everything and more than that," *Fragment* 105); and Sophocles (c. 496–406 BCE) sees Zeus's hand in all human affairs ("Nothing of this which would not be Zeus," *Women of Trachis* 1278). The main document of this monotheism is the hymn to Zeus by the Stoic philosopher Kleantes (d. 232/231 BCE), where Zeus, mythical image of the Stoic logos, becomes the commander over the entire cosmos ("no deed is done on earth . . . without your office, nor in the divine ethereal vault of heaven, nor at sea") and its "universal law," while at the same time he is the guarantor of goodness and benign protector of man ("protect mankind from its pitiful incompetence"). This marks the high point of a development—other gods, though briefly mentioned, become insignificant beside universal Zeus.

FRITZ GRAF (2005)

ZHANG DAOLING, semilegendary figure of the second century CE, depicted in hagiographies as a master of long

life (*changsheng*) who put his disciples to tests, vanquished demons, and prepared the elixir of immortality. He is said to have received in 142 CE a revelation from Taishang Laojun the deified Laozi, who bestowed on him the title of Celestial Master (*tianshi*). The god gave him the "Doctrine of the Orthodox One [Resting on] the Authority of the Alliance" (*zhengyi mengwei dao*), revealing that the demoniac Six Heavens had been abolished and their reign replaced by a golden age governed by the Three Heavens. The people were to honor no gods other than those of the Alliance, the masters were to eschew all payment, and blood sacrifices were to be banished.

Subsequently, Zhang Daoling gathered together many disciples in Sichuan and launched a campaign for the reform of the religious practices of a people described as having lapsed into degeneracy. He started a health cult and wrote several books; however, his works are now lost and consequently nearly nothing is known about his doctrines. He is said to have established the basis of a theocratic state divided into twenty-four parishes corresponding to the twenty-four breaths of the year (one every fifteen days). This was later altered to twenty-eight, to correspond to the divisions of the Chinese zodiac. The followers of the sect were obliged to pay a tax of five pecks of rice, whence came the description of the sect as the Way of Five Pecks of Rice (Wudoumi Dao).

Zhang Daoling is considered the founder of the Daoist sect of the Celestial Masters (Tianshi Dao). His eldest son, Zhang Heng, succeeded him, and Zhang Heng in turn was succeeded by his son, Zhang Lu. Under Zhang Lu's leadership the movement rose in rebellion against the Han. The Way of the Celestial Masters was the first organized Daoist movement and has continued down to the present day in Taiwan through a succession of Daoist masters who are allegedly lineal descendants of Zhang Daoling. Many texts in the *Daozang* (the Daoist canon) derive from this religious movement, whose tendency is liturgical, demonological, and more or less shamanistic.

ISABELLE ROBINET (1987)

ZHANG JUE (d. 184 CE), founder of the Yellow Turban sect. Zhang Jue was heir to the doctrines of Yu Ji, a sorcerer and healer who preached and practiced in Shandong and who was probably the author of the *Taiping qingling shu* (Book of Great Peace, or Book of Great Equality), a text now

lost. Having received a revelation that the “blue heaven” of the Han dynasty was to be replaced by a “yellow heaven” (yellow is the color of the Center) in the first (*jiazi*) year of the next new cycle of sixty years (i.e., 184 CE), around the year 175 Zhang Jue dispatched eight apostles to convert the people of the central and eastern provinces of China. They preached doctrines closely related to those of the Five Pecks of Rice sect in Sichuan. Like the leader of the latter sect, Zhang Lu, Zhang Jue healed the sick by group confession (sins were believed to be the cause of sickness), organized collective worship under a quasi-military church hierarchy, and used sexual techniques to achieve sanctity.

Zhang Jue’s followers were called Yellow Turbans (Huangjin) from the yellow kerchiefs they wore on their heads in token of their expectation of the “yellow heaven.” They worshiped Huang-Lao and were intent on inaugurating a golden age—the age of Great Peace—and a utopian state based on egalitarian ideas, as opposed to the Confucian ideas of social hierarchy. They regularly retired to oratories (“pure chambers,” *jingshi*) where they healed the sick by confession of sins and recitation of sacred scriptures. The followers of the sect were governed by moral codes and divided into thirty-six *fang* (a word that means both “regions” and “magic recipes”), local communities headed by “generals.” The “three Zhangs,” Zhang Jue and his two brothers, Liang and Bao, were respectively generals of Heaven, Earth, and Man, symbolizing their embodiment of the all-embracing triad.

Over a ten-year period, Zhang Jue enjoyed great success. He had several hundred thousand followers in eight provinces by the time he initiated the Yellow Turban rebellion in 184. Although Zhang Jue and his brothers were caught and executed in the same year, they left behind a great number of communities of believers, and as late as 205 the Yellow Turbans still posed a military problem for the government. The Yellow Turban uprisings in eastern and northern China, taken together with Zhang Lu’s uprisings in the west, weakened the Han dynasty and contributed to its fall.

ISABELLE ROBINET (1987)

ZHANG LU (fl. 184–220), grandson of Zhang Daoling, founder of the sect of the Celestial Masters, and the sect’s third Celestial Master. In 184 CE Zhang Lu led the sect in rebellion against the Han dynasty and established an independent state in Hanzhong, in the west, which he governed for thirty years. In 215 he surrendered to the Han general Cao Cao and was rewarded with honors that included a fiefdom. After the founding of the Wei dynasty in 220 by Cao Cao’s son, Zhang Lu lived some years at the Wei court. It may be said that both the existence of the sect as an organized church and its official recognition by the government were due to his efforts. The Celestial Masters sect became the first institutionalized Daoist movement, distinguished on this point from the other popular beliefs and messianic movements of the time, and especially from the Daoist seekers after long life, who were unorganized and scattered. The movement of the Celestial Masters spread to North China by the end of the third century and, by the end of the fourth century, to all of China. It counted among its adherents many powerful families.

The church was divided into twenty-four dioceses (later twenty-eight), corresponding to the twenty-four breaths of the year (one every fifteen days) and, later, to the twenty-eight divisions of the Chinese zodiac. The hierarchy of the church and its way of addressing the powers on high were modeled on imperial and bureaucratic usages. The church set up wayside inns all over the state where food and shelter were available to travelers at no charge. Each household of followers contributed a tax of five pecks of rice, whence the name of the sect, the Way of Five Pecks of Rice (Wudoumi Dao).

The focal center of each diocese was the oratory, presided over by “libationers” (*jijiu*), a married hereditary priesthood. These priests mediated between the faithful and the divine and knew as well how to ward off demons. The petitions of the faithful, transmitted by the rising smoke of incense and by the spirits exteriorized from the priest’s body, were borne to the Three Heavens. Letters could be sent to the Three Officials of Heaven, Earth, and Water (*san guan*). One copy, placed on a mountain, rose to Heaven, another was buried in the ground for the Earth official, and a third was cast into the river for the Official of Water. Other rituals involve talismans drawn by priests; these were burned, their ashes were mixed with water, and the talismanic holy water was then drunk by believers. The sung liturgies were based on religious texts, in particular on the *Dao de jing*. The *Xiang’er*, a commentary on the *Dao de jing* attributed to Zhang Lu, was used as a kind of catechism in the instruction of the faithful. Morals and law were combined: diseases were believed to be caused by evil deeds, and hence the sick were healed by rites of expiation, ceremonials, confessions, and punishment. The misdeeds of the faithful, such as theft and drinking, also fell under the jurisdiction of the sect. Road repair or imprisonment was the usual punishment.

The year was marked by a religious calendar. At the equinoxes, offerings were made to the god of the earth and the god of the soil, and healing talismans were distributed to the sect's followers. At the solstices, sacrifices were made for the salvation of the souls of the dead. Communal feasts (*chu*) were offered during the first, seventh, and tenth months, and also on religious occasions such as an initiation or the consecration of an oratory. At each new moon a communal sexual ritual was celebrated, the Union of the Breaths (*heqi*), which Buddhist sources describe as a licentious orgy, but which some texts still extant show to be a ceremony of highly stylized erotic choreography of religious and cosmic significance.

The sect of the Celestial Masters is still in existence, and its leaders claim direct descent from Zhang Daoling and Zhang Lu. Many of the present rituals, sacrifices, and festivals derive from rituals of the Celestial Masters of the third century.

ISABELLE ROBINET (1987)

ZHANG XUECHENG (1738–1801), Chinese historian and philosopher. A native of Shaoxing (Kuaiji district), Zhejiang Province, and son of a district magistrate, Zhang went to Beijing as a student in 1762, and in the next ten years became acquainted with many of the leading writers of the day. Among his associates and mentors were, notably, Zhu Yun (1729–81), whom he acknowledged as his master, and the philosopher and philologist Dai Zhen (1724–77), whom Zhang admired for his philosophical essays but criticized strongly for his opposition to the ideas of the Song dynasty Confucian moralist Zhu Xi (1130–1200). As a youth Zhang developed a keen interest in the art and theory of historical writing, admiring the Tang dynasty historiographer Liu Zhiji (661–721). As early as 1770 he had begun to formulate a theory of the development of civilization based on the Han court librarian Liu Xin's theories of the history of types of writing. In 1778 he passed the examinations for the highest civil service degree (*jinshi*), but he never took office, and supported himself usually through teaching ap-

pointments in local academies, commissions to compile local and family histories, and research and writing sponsored by patrons (notably Bi Yuan, 1730–97).

Zhang articulated his vision of the human past in his local history of Hezhou (1775; only fragments are extant), his *Jiaochou tongyi* (Philosophy of Bibliography, 1779), and especially in his monograph-length essay *Yuandao* (The Analysis of the Way, 1789). He saw all moral conventions, institutions, traditions of learning, and genres of writing as taking form in an early state of the human condition in which there was no distinction between public (official) and private aspects of life, when all kinds of writing were naturally beautiful or useful according to their function, anonymous and unmarred by personal vanity. This ideal state of affairs ended some centuries before Confucius. Thereafter, "officials were no longer teachers," and there was no longer a "unity of government (*zhi*) and doctrine (*jiao*)"—Zhang's idiom (following the Song polymath Ouyang Xiu, 1007–1072) for saying that the primal unity of the human spirit was sundered forever, in an alienation of intellect from action. Intellectual history since that time has been a dialectical process of always incomplete vision of the truth, ages of philosophy, of scholarship, and of literary art succeeding each other endlessly, each age blind to the values it fails to realize. Zhang crystalizes his vision in the famous one-line evaluation of the Confucian Classics, opening his collected essays, *Wenshi tongyi* (General Principles of Literary and Historical Criticism): "The Six Classics are all history." By this he means that they are not authored books that formulate the *dao* of human society, but are exemplifications of this *dao*, being documents, residues of the functioning of the ancient society and state, an age when "the *dao* and its embodiments were one" (*dao qi heyi*). This *dao* cannot be reduced to "empty words" (*kong yan*) and formulas; it must be grasped intuitively through the study of institutions and human acts, which the historian must present just as they were, without bias.

In this aspect of his thought Zhang is close to the Ming dynasty Confucian moralist Wang Shouren (Wang Yangming, 1472–1529); but unlike Wang he never himself had a religious drive toward self-cultivation. Zhang had several Buddhist friends, whom he teased good-naturedly, but he was open-mindedly willing to own that Buddhism might be saying something true and valuable in its own way. He could hardly be called a Daoist, but his vision of intellectual history owes not a little to Zhuangzi. He had strong conservative prejudices about the status of women, expressed in several vigorous essays attacking the poet Yuan Mei (1716–1798). Zhang was impatient with the philological scholarship fashionable in his time, his thinking being more akin to the so-called Tongcheng circle of literary men. He much admired the early Qing historian Huang Zongxi (1610–1695) and other Zhejiang authors, and is sometimes classed as a "member" of an "Eastern Zhejiang school" of historical learning.

Revised Bibliography

ZHANG ZAI (1021–1077), also known as Zhang Hengqu, the second major Neo-Confucian thinker in the traditional lineage of Neo-Confucian teachers. Zhang Zai was a native of Chang'an in modern Shaanxi. His study of what became central Neo-Confucian texts began at the age of twenty-one when he corresponded with and then met Fan Zhongyan (989–1052), a prominent Confucian official. Fan suggested that Zhang Zai begin his study with the *Zhongyong* (Doctrine of the mean). This advice led Zhang Zai to study Confucianism, but like many Neo-Confucians he also studied Buddhism and Daoism, particularly their religious practices such as meditation. Eventually, however, he rejected their philosophies and returned to Confucian classics. Zhang Zai was appointed to office in 1057 and became widely recognized as one of the major interpreters of Confucian teachings. He eventually resigned from office over disagreement with the reform measures of Wang Anshi (1021–1086), a figure of major political influence during the Song dynasty. Zhang was appointed once again, only to retire and die on the trip home from the capital in 1077.

For Zhang Zai, the focus of his return to Confucian teachings was his interest in two of the classics, the *Yi Jing* (Book of changes) and the *Zhongyong*, works that served as the foundation of his philosophical and religious thought. Zhang Zai's prominent position in the lineage of Neo-Confucian teachers, a position in part the result of the lineage drawn up by the great synthesizer of Neo-Confucianism, Zhu Xi (1130–1200), derives from the interpretive stance he developed toward these works and from his position as teacher to both Zheng Hao (1032–1085) and Zheng Yi (1033–1077), two of the most prominent figures in the development of Neo-Confucian thought.

Like Zhou Dunyi (1017–1073), the first major Neo-Confucian teacher, Zhang Zai based much of his philosophy upon the *Yijing*. For Zhang Zai, the *taiji*, or Great Ultimate, refers to the source of all existence, which he takes to be *qi*, the material or vital force of existence itself. Thus *taiji* is identified with *qi* and yin and yang, the symbols of polar opposites in Chinese thought, as well as with the Five Elements (*wuxing*), the basis of an early cosmological theory of the nature of change. Although later modified by other thinkers, this *qi*-based monism continued to play an important role in Neo-Confucian metaphysics.

Zhang Zai's thought had far-reaching religious implications as well. While Neo-Confucianism has often been thought to be primarily a rationalistic system whose major influence was intellectual, a more recent reassessment of the tradition suggests that Neo-Confucianism also contains a profound religious dimension. The focus of this religious perspective is the central role assigned to the figure of the sage (*sheng*) and to the goal of sagehood. To become a sage became increasingly important as the goal of Neo-Confucian learning and self-cultivation.

When Neo-Confucianism is considered in this context, Zhang Zai's philosophical system is fully religious. In Zhang Zai's most celebrated work, the *Ximing* (Western inscription), the monistic metaphysical structure of *qi* is enlarged to include a poetic vision of the unity and interdependence of the universe and its multifaceted phenomena:

Heaven is my father and Earth is my mother, and even
such a small creature as I finds an intimate place in their
midst.

Therefore that which extends throughout the universe I
regard as my body and that which directs the universe I
consider as my nature.

All people are my brothers and sisters, and all things are
my companions. (de Bary and Bloom, 1999, p. 683)

Some have called this passage the foundation of Neo-Confucian ethics. Others have expanded its meaning to include not only ethics but a religious dimension that ultimately comprehends the religious goal of sagehood.

Later Neo-Confucians primarily valued Zhang Zai's doctrine of the sage "forming one body with the universe." This doctrine represents both the Neo-Confucian contiguity with its classical Confucian heritage and an enlargement of the Neo-Confucian system. At the center of Zhang Zai's teaching is the idea of *ren*, humaneness or human-heartedness, in many ways the salient teaching of the classical Confucian tradition. This basic quality, which was for Confucius and Mencius the bond between human society and the ways of Heaven (*tian*) and hence fundamental to the underlying moral structure of the universe, was expanded by Zhang Zai to encompass the universe itself, since for the sage to form "one body with the universe" suggests the complementarity and fundamental identity of microcosm and macrocosm. The doctrine illustrates as well Zhang Zai's belief in

the fundamental goodness and purpose of the universe and in the potential of the individual to realize the ideal of the sage.

In the teaching of “forming one body with the universe,” Zhang Zai also claimed to distinguish Confucianism clearly from Buddhism and Daoism. For him the universe and its processes have a real existence. In turn, human life is looked upon as intrinsically valuable and ultimately the very foundation for the realization of sagehood. For Zhang Zai, such a view is clearly distinguishable from Daoism and Buddhism, both of which require a radical departure from the universe as it is given in order to fulfill the soteriological quest. In Zhang Zai’s terms, Daoism and Buddhism both emphasize escape from the world, while Confucianism finds fulfillment and ultimate identity precisely within the changes found in this world, a world of *qi* rather than of emptiness. The sage accepts the ultimate reality of *qi* and its inherent goodness, he acknowledges the infusion of *ren* throughout the very structure of the universe itself, and thus he can fulfill the ideal of the sage, “forming one body with the universe.”

Berthrong, *Transformations of the Confucian Way* (Boulder, Colo., 1998), pp. 6–114. and Rodney L. Taylor, *The Illustrated Encyclopaedia of Confucianism*, 2 vols (New York, 2003), pp. 107–108.

RODNEY L. TAYLOR (1987 AND 2005)

ZHENREN. The term *zhenren* (“real person”) is first encountered in parts of the *Zhuangzi* that are thought to date from the third century BCE. *Zhenren* may also be translated

“perfect person” or “true person” (most Sinologists now translate it “Perfected”). Zhuangzi’s “real person” is one who does not oppose the human and the natural, who knows how to accept both defeat and victory, joy and sorrow, life and death without being affected by them. Ordinary people, according to Zhuangzi, “wallow in their passions because they are out of touch with the workings of Heaven. The ‘real person’ of ancient times knew neither to love life nor to hate death. . . He took pleasure in what he received; he forgot what he gave back. This is what it means not to throw away the Dao with the heart, not to use what is human to help out what is heavenly. This is what is called a ‘real person’” (chap. 6). The “real person” is thus one who possesses what is for Zhuangzi the highest form of knowledge, the knowledge that enables him to “make all things equal” and so renders him invulnerable to the vicissitudes of human life.

Zhuangzi uses a range of terms to refer to this ideal person, among them “divine person” (*shenren*), “accomplished person” (*zhijien*), and “saintly person” (*shengren*). The last term in particular, being the standard term in the *Laozi*, appears much more frequently than “real person.” But the term *saintly person* had the disadvantage, at a time when the battle between the different schools of philosophy had reached its pitch, of referring also to the Confucian ideal person. In the *Laozi* itself, in fact, it refers indifferently to the ruler of men and the person who, even if he does not rule, is worthy of ruling. By Zhuangzi’s time the feudal system of the Zhou dynasty (c. 1150 to 256 BCE) was in its final agony, and interstate relationships were characterized by ruse and violence. This political context forced philosophers to choose between “man” and “nature,” between politics and integrity, and the term *saintly person* came increasingly to serve only as the designation of the Confucian (that is, political) ideal. In its place the Daoists put the “real person.” This person does not yet, by definition, refuse all contact with human society and politics, but if he should happen to “get involved,” he will not allow himself to “feel involved.”

In chapter 21 of the *Zhuangzi* we thus read of Sun Shu Ao, who had “thrice been named prime minister without considering it glorious and thrice been dismissed without looking distressed.” Someone asks Sun Shu Ao whether he has some special way of “using his heart.” “Why should I be any better than anyone else?” he responds. “When [the nomination] came, I could not refuse it; when it left, I could not keep it. Neither getting it nor losing it had anything to do with me.” Such a man, comments Zhuangzi through the mouth of none other than Confucius, is “a real person of old.”

This phrase, “a real person of old,” shows that the concept of the “real person” is associated from the very first with the notion of a golden age in times past, a paradise lost. On the individual level, it is linked with the preservation of one’s original purity and integrity; “The way of whiteness and purity consists exclusively in keeping one’s spirit. If you keep your spirit and do not lose it, you will become one with your spirit” (*Zhuangzi*, chap. 15).

Zhuangzi makes no explicit reference to the techniques that enable one to maintain one's purity and "keep" one's spirit, but they are implicit in the vocabulary used to describe the "real persons of old." The reference to these techniques is even clearer in another third-century BCE text, the *Lushi chungiu* (Annals of Mr. Lu): "One who daily renews his seminal energy and gets rid entirely of perverse energies, and [so] lives out his heaven [-appointed] years, is called a 'real person.'" The reference is all the more interesting in that the next line reads: "The saint-kings of the past perfected their persons, and the empire then perfected itself. They regulated their bodies, and the empire was regulated." To solve the crisis of the body politic, says this author, we must find individuals who, like the saints of old, concentrate on the vital energies of their own bodies.

A long dissertation on the Daoist ideal in chapter 7 of the *Huainanzi* by Liu An (c. 180–122 BCE) adds little of substance to Zhuangzi's conception of the "real person." Liu An's language, however, is more explicitly physiological and cosmological: the essence of the "saintly person" or "real person"—the terms remain interchangeable—is "one with the root of Great Purity, and he wanders in the realm of no-form. . . He makes ghosts and gods to do his bidding." In chapter 14 we learn that the "real person" has such cosmic powers because he has "never become distinct from the Great One." By "closing up his four gates"—the eyes, ears, mouth, and heart—and keeping his vital forces from being wasted on the outside, he "regulates what is within and knows nothing of what is without" (chap. 7).

The *Huainanzi* is no more specific about how to become a "real person" than the *Zhuangzi*. But Liu An's "real person" is obviously far less concerned with the world of politics and society than the "real person" of Zhuangzi, and he is correspondingly more concerned with his interior world of spirits, souls, and oneness. Within the scope of that world, moreover, he has attained what can only be called superhuman powers. These powers are precisely those later ascribed to exorcists and Daoist priests.

A wide range of techniques leading not just to supernatural powers but to immortality are described in the *Lixian zhuan* (Biographies of the immortals, second century CE). The "way of the immortals" might involve a diet of pine seeds or sap, of mushrooms, or simply of clouds; it might mean the ingestion of a variety of elixirs or mineral drugs, the "circulation of energy and the transmutation of the body," the elimination of the five cereals from one's diet, or "nourishing one's energy." "Nourishing one's energy" usually refers to an art of intercourse in which the semen, rather than being allowed to flow out of the body, is "returned" by way of the spinal column to "repair the brain." In the *Lixian zhuan* this technique is specifically attributed to Laozi, who is one of only three immortals in this text to be called a "real person."

The second, Master Fujū, makes a living as a wandering mirror-polisher in the region of Wu (southeastern China).

He also regularly heals sick clients with "purple pills and red drugs," and the local people first recognize in him a "real person" when he saves thousands from an epidemic with his medicine. Later, before leaving for one of the "isles of the immortals" in the Eastern Sea, he creates a stream with miraculous healing powers for the local people, who, after his departure, set up dozens of sanctuaries for his worship. The third "real person," Zhuhuang, is himself first cured of an ailment by a "Daoist" (*daoshi*) living on a mountain and is then given a book called *Laojun huangting jing* (The Yellow court classic of Lord Lao). When he finally returns home eighty years later, "his white hair had all turned black."

In his *Lunheng* (Critical disquisitions), Wang Chong (27–97 CE) refers to the belief that Laozi became a "real person" by "nourishing his spermatic essence and being chary of his energy" (chap. 7). A commentary from the second century CE on the *Laozi*, the *Heshang gong*, confirms that the "real person" is one who "cultivates the Dao within his body by being chary of his energy and by nourishing his spirits" (chap. 54). The first glimpse of what all this means comes from the oldest extant version of *The Yellow Court Classic*, which alludes to the "Real-Person Infant Elixir" inside the body.

The *Laojun zhong jing* (Classic on the center of the person, second century CE) identifies the "Real-Person Infant Elixir" as the "father and mother of the Dao, [those who] give birth to the infant" (1.6b). He (or she) is also called the "master of the real self, who is constantly instructing me in the techniques of eternal life, the way of gods and immortals" (1.7b). This internal "real person" also appears in the *Tai-shang lingbao wu-fu xu* (Preface to the five symbols of the numinous treasure of the Most High), a work of the fourth century. The main technique for obtaining immortality described in this text involves absorption of the energies of the heavens of the five directions. The energies of the center are used to nourish the "real person" whose name is Infant Elixir, and who dwells in the Yellow Court.

Every adept thus contains within his or her body a "real person" in embryo. It is the adept's "real self," and if it is properly fed and instructed, it will grow up to replace entirely the "old self." For this nourishment and instruction it relies on what Zhuangzi called "real persons of the past": in the text of *The Five Symbols*, for example, it is the Real Person of Bell Mountain who reveals to the legendary Emperor Yu the "oral instructions for the way to eternal life" (1.6a). When a hermit later explores a cave in which Yu had buried a set of the five symbols called "real writs," he discovers it to be a "residence full of real persons" (1.9a). The most important of the myriads of "real persons" who come thus to inhabit Daoist caves and heavens is Laozi himself, who is in fact already the real self the adept will become.

In general, the religious content of the term *real person*, implicit already in the *Zhuangzi*, becomes entirely explicit by the fourth and fifth centuries: he or she is the revealer of sacred texts. The revelations on Mount Mao (Maoshan), for

example, which date to the years 364 to 370 and which form the scriptural basis for the Maoshan tradition, are almost all attributed to *zhenren*, many of whom are female. The Lingbao canon of the late fourth/early fifth century also contains texts ascribed to real persons. But an even more important development is their appearance on the ritual arena, where “flags of the real persons” are hung up to mark the Gate of All Real Persons. According to a text attributed to Lu Xiujing (406–477), this gate represents the divinized spirits of the sacred mountains and rivers of China. The gods of the Five Sacred Peaks, in particular, are referred to as real persons, a usage that was continued in the Tang dynasty (618–907 CE), when Sima Chengzhen convinced Emperor Xuanzong (r. 713–756) to replace the worship of the blood-eating gods of these mountains with the vegetarian real persons of Daoist worship. The same emperor in fact considered himself a *zhenren* and had his statue set up next to that of his divine ancestor, Laozi, to illustrate his semi-divine status. He also conferred the title real person on four Daoist philosophers, among them Zhuangzi.

By the Song dynasty (960–1279), living Daoists were also being called “real persons.” The title of the massive Yuan collection of Daoist hagiographies, the *Lishi zhenxian tidaotongjian* (Comprehensive mirror of the real persons and immortals who have embodied the Dao through the ages), shows that *real person* and *immortal* had become synonymous terms that could be combined to refer to any Daoist of some renown. Among the most famous were the seven disciples of the founder of the Quanzhen movement, known collectively as the Seven Real Persons.

ZHENYAN Buddhism is a form of Vajrayāna Buddhism that flourished in China from the seventh to the twelfth century. The term *zhenyan* is a translation of the Sanskrit word *mantra* and literally means “real word.” The school is also called Mijiao (esoteric teaching) to distinguish it both from all other forms of Buddhism, which are regarded as exoteric, and from Indo-Tibetan Vajrayāna. The Chinese translation of *mantra* by the word *zhenyan* underscores the importance of a realized ontology. *Zhen* designates the real, apprehended through words, meditation, and action: it is reality realized.

Although the term *zhenyan* is conventionally used to designate sectarian lineages during the Tang (618–907) and Song (960–1278) dynasties, it may also indicate Tantric precursors of the organized lineages and the continued presence of Zhenyan elements in other sects and in popular cults.

HISTORY. Buddhism spread across Asia on two levels: clerics with a theological bent missionized the literate elite while healers and wonder-workers ministered to the peasants. Early proto-Tantric materials in China appear at both levels, although their application is largely associated with wonder-workers. Zhu Lüyan translated the first text containing *dhāraṇīs*, the *Modengqie jing* (T.D. no. 1300), in 230 CE, yet there is little evidence that it aroused interest at the Wu court in the South. Fotudeng (d. 348) worked among the people and served the rough latter Zhao emperors Shi Luo (r. 330–333) and Shi Hu (r. 333–348) with a repertoire of mantras and *dhāraṇīs*. Like later Zhenyan masters, he used ritual to bring rain, to make military prognostications, to heal, and to influence politics.

During the Six Dynasties period (221–584), the magical use of mantra and *dhāraṇīs* found greater acceptance in North China while other Buddhist traditions dominated the literary culture of the South. The unification of China under the Sui (584–618) and Tang dynasties wedded the interests, culture, and family lines of the barbarian North with those of the Han South. Meanwhile in India, Tantric ritual, spurned earlier as heterodox by the Buddhist establishment, was being codified and blended with Mahāyāna theology, re-

sulting in the formation of the Vajrayāna. During the first century of Tang rule other Buddhist schools held sway, and Daoists were patronized by emperors who made much of the fact that they bore the surname (Li) of the sage Laozi.

Tantric teachings remained eclipsed until the arrival of Śubhākarasiṃha (Shanwuwei) in 716 and his translation of the *Mahāvairocana Sūtra* (T.D. no. 848). Vajrabodhi (Jin'gangzhi) and his disciple Amoghavajra (Bukong) arrived in 720 and produced two selective translations of the *Sarvatathāgatātattvasaṃgraha* (T.D. no. 866, 865). For the next fifty years the wonder-working abilities of these *ācāryas* (teachers) and the prestige of their newly imported teachings bolstered the school until, under Amoghavajra and Emperor Daizong (r. 762–779), Zhenyan replaced Daoism as the dominant religious force among the elite.

During the Tang there were two closely related Zhenyan lineages. Śubhākarasiṃha and his disciple Yixing concentrated on the *Mahāvairocana Sūtra* and its *Commentary* (T.D. no. 1796) and on the *Susiddhikāra Sūtra* (T.D. no. 893). Vajrabodhi, Amoghavajra, and Amoghavajra's disciples Hanguang, Huigu, and others concentrated on the *Sarvatathāgatātattvasaṃgraha* and also incorporated teachings associated with the *Mahāvairocana Sūtra*. Thus, each lineage had a characteristic textual emphasis. Only the best disciples were initiated into both. Amoghavajra's synthesis was the most influential, although the lineage and teachings of Śubhākarasiṃha continued to be transmitted. Both lineages had links to non-Esoteric sects; that of Śubhākarasiṃha has great influence in Tiantai, while that of Vajrabodhi developed links to Huayan. A similar situation developed in Japan as the Shingon and Tendai Esoteric lineages (Tōmitsu and Taimitsu, respectively) interacted with each other and with other sects. Following Amoghavajra's death in 774 his disciples continued to perform rituals in the Imperial Chapel, at the Green Dragon and Da Xingshan temples in Chang'an, and at the Golden Pavilion on Mount Wutai. At the beginning of the ninth century Japanese clerics such as Saichō (767–822), the founder of Tendai, and Kūkai (774–835), founder of Shingon and disciple of Huigu, studied the teachings in China. Zhenyan continued to be popular at the court and spread among the upper classes in the provinces. It suffered during the Huichang persecution of 845 but was not completely extinguished.

Zhenyan showed renewed vitality during the Song dynasty owing to a final wave of missionaries from India. Shihu, Fatian, and Faxian presided over an Esoteric revival, translating new scriptures and producing complete translations of earlier works, such as Shihu's 1002 CE version of the *Sarvatathāgatātattvasaṃgraha* (T.D. no. 882). Zhenyan ritual elements continued to penetrate other Buddhist sects and when its lineages died these elements continued in the other sects and in popular traditions. Esoteric Buddhism had two further revivals. The first was under the impact of Lamaism during the Yuan (1206–1368), the second during the nineteenth century with the reintroduction of the school from Japan.

TEXTS. Zhenyan teachings are drawn from two major texts, the *Mahāvairocana Sūtra* and the *Sarvatathāgatātattvasaṃgraha*. The *Mahāvairocana Sūtra* was probably written in North India during the seventh century. The text begins with a theological prolegomenon describing Mahāvairocana Buddha's palace at the summit of the cosmos (Akaniṣṭha Heaven). The palace and the cosmos are manifestations of Mahāvairocana's wondrous transformation power (*adhiṣṭhāna*), which is based on the realization of ultimate unconditioned reality (*śūnyatā*; emptiness). The unconditioned and the cosmos manifested through transformative power are presented as a *maṇḍala*, first as an exterior *maṇḍala*, then as the *maṇḍala* realized ritually in the heart of the practitioner. The massive *Commentary* (T.D. no. 1796), giving Śubhākarasiṃha's oral explanations as recorded by Yixing, is indispensable. Another arrangement of the *Commentary* by Zhiyan and Wengu was influential in Tiantai circles.

There are three versions of the *Sarvatathāgatātattvasaṃgraha*, those of Vajrabodhi (T.D. no. 866), of Amoghavajra (T.D. no. 865), and the complete version of Shihu (T.D. no. 882), which dates from the Song. Those of Vajrabodhi and Amoghavajra are highly abridged selections from the text. The *Sarvatathāgatātattvasaṃgraha*, apparently written in South India, also begins in the Akaniṣṭha Heaven and presents a series of *maṇḍalas* based on a fivefold visionary structure through which the *bodhisattva* Sarvāthasiddha realizes his identity with Mahāvairocana as the unconditioned *dharmakāya*. Thus, he also realizes his identity with all of the Buddha's wondrous transformations, which form the conditioned world. Amoghavajra's *Shibahui zhibui* (T.D. no. 869) is important in understanding the *Tattvasaṃgraha*.

A third text important to the Zhenyan school is the *Susiddhikāra Sūtra* (T.D. no. 893), a ritual compendium translated by Śubhākarasiṃha and closely associated with the *Mahāvairocana Sūtra*. During the ninth century some lineages regarded the *Susiddhikāra Sūtra* as the synthetic conjunction of the *Mahāvairocana Sūtra* and the *Sarvatathāgatātattvasaṃgraha*, calling Zhenyan the "Triple Great Dharma." Some of Amoghavajra's disciples referred to the total Zhenyan teaching as "the Manuals of *Siddhi*, the Eighteen Assemblies [of the *Sarvatathāgatātattvasaṃgraha*], and the Mahākaraṇḍāgarbha Maṇḍala [of the *Mahāvairocana Sūtra*]" (T.D. 50.294b).

TEACHINGS. The basic teachings of Zhenyan are common to both textual traditions. Zhenyan teaches the ritual realization of the paradoxical identity of *nirvāṇa* and *samsāra*, of the unconditioned and the world, of Buddha and humans. This conjunction is a primary organizing motif in the major texts and in Chinese commentary and ritual adaptations.

The Three Mysteries. Zhenyan proclaims the goal of enlightenment in this world, in this body, not in some distant land aeons hence. According to the *Mahāvairocana Sūtra*, "the complete Zhenyan altar is first established in your own body. . . . [Mahāvairocana] is in this body" (T.D.

18.36c). This immanent realization and a closely guarded initiatory structure distinguish Zhenyan from exoteric Buddhism. Enlightenment is actualized in ritual through the three mysteries (Chin., *sanmi*; Skt., *triguhyā*) of body, speech, and mind. The practitioner realizes that his body, speech, and consciousness in meditation are identical with those of Mahāvairocana. The Three Mysteries therefore allow the practitioner to realize that *bodhi*, the thought of enlightenment, exists within us. Enlightenment is accomplished through a ritual realization of the enlightened state guided by iconographic, mantric, and meditational conventions.

A key to realizing the Three Mysteries is meditation on the Sanskrit seed syllable *A*. The *Mahāvairocana Sūtra* says, “What is the Zhenyan Dharma? It is [the teaching of] the letter *A*” (T.D. 18.10a). *A*, the first letter in the Sanskrit alphabet, is also a negative prefix. Thus, it represents the conjunction of the conditioned and the unconditioned, of *samsāra* and *nirvāṇa*, and is the symbol of Mahāvairocana and of *bodhi*. Through ritual and meditation this seed is nurtured in the heart, and the meditator becomes Mahāvairocana.

Bodhisattva path. In Mahāyāna Buddhism the path toward Buddhahood is the arduous one of the *bodhisattva*. It begins with the arousal of the thought of enlightenment (*bodhicitta*) and passes through ten stages over a period of three great *kalpas* (aeons). Zhenyan collapses the path into a ritual process; the three *kalpas* are interpreted not as units of time but as defilements to be eliminated. “If one transcends the three *kalpas* in one’s lifetime, then in one life one attains Buddhahood. Why should time be discussed?” (T.D. 39.600c). From the Esoteric perspective, the last stage of the path is contained in the first. Thus, there are two interpretations of the statement in the *Mahāvairocana Sūtra* that “*bodhi* is the cause, compassion (*karuṇā*) the root, skill in means (*upāya*) the outcome” (T.D. 18.1b–1c). The exoteric view indicates the development of the *bodhisattva* through time. From the Esoteric viewpoint, all three—*bodhi*, compassion, and skill in means, the beginning, middle, and end of the path—are accomplished ritually as a piece. They are a whole, as are roots, trunk, and branches of a tree. Zhenyan collapses the beginning and end of the path: the disciple and the Buddha are really identical.

The goal: siddhi. Success in Zhenyan ritual is called *siddhi* (accomplishment; Chin., *chengjiu*). There are two major typologies of *siddhi*. The first is found in the *Mahāvairocana Sūtra* and is associated with the lineage of Amoghavajra; the second is propounded in the *Susiddhikāra Sūtra* and in Śubhākarasimha’s *Commentary*. According to the *Mahāvairocana Sūtra*, mundane, or outer *siddhi* (*laukika-siddhi*) is overtly aimed at the application of wondrous transformative powers (skill in means) to aid in the salvation of beings. Supermundane, or inner, *siddhi* (*lokottarasiddhi*) is aimed at the achievement of enlightenment. All Zhenyan ritual has both components. Burnt offerings (*homa*), for example, involve placing things in a fire and might be performed

to expel invading armies. The same rite has an inner meaning: one’s defilements are incinerated and enlightenment attained. Ritual activity in the world, which is performed for the salvation of beings, is paradoxically an exercise in one’s own enlightenment. The second typology of *siddhi*, which may reflect Tiantai or even Daoist influence, posits three levels of *siddhi*: superior, middling, and inferior. Superior *siddhi* is said to lead to transcendence and emptiness. Middling *siddhi* leads to the various heavenly realms, while inferior *siddhi* leads to command of illusion. We are further told that inferior *siddhi* may yield superior attainment and vice versa (T.D. 18.614a–614c).

BUDDHOLOGY. Zhenyan teaching on the nature and function of the Buddha is similar to that of other Vajrayāna traditions. Zhenyan posits two theories concerning the Buddha’s bodies. The first is the triple-body theory. The *dharmakāya*, or body of *dharma*, represents the unconditioned thought of enlightenment in itself; *sambhogakāya*, or body of bliss, represents the wondrous powers achieved through compassionate deeds; *nirmāṇakāya* is the form taken by a Buddha to apply those powers in aid of suffering beings. The three bodies thus parallel the triade *bodhi*, compassion, and skill in means. In Zhenyan ritual, the three bodies are realized simultaneously. Enlightenment and salvific activity form a conjunction in compassion. The consecration ritual (*abhiṣeka*) is therefore the paradigm of all ritual, for in it the disciple is consecrated as *sambhogakāya*. *Bodhi* (*dharmakāya*) and skill and means (*nirmāṇakāya*) are joined in compassion (*sambhogakāya*). The second theory distinguishes three wheel bodies (*san lunshen*, *tricakrakāya*). The first wheel, *svabhāvavacarakāya*, is Buddhahood in itself. It manifests itself in beneficent or horrific forms. Beneficent manifestations such as Avalokiteśvara (Guanyin) practice compassion and, according to Amoghavajra, are equivalent to the *sambhogakāya*. Horrific manifestations such as the *vidyārājas* Trilokyavijaya and Acala, utilize skill in means to chastise and discipline beings. The Three Wheels are ultimately one. Much of Zhenyan ritual is devoted to the third wheel.

The two maṇḍalas. Unlike most Vajrayāna traditions, Zhenyan focuses on a pair of *maṇḍalas*, the Womb Maṇḍala, drawn primarily from the *Mahāvairocana Sūtra*, and the Diamond Maṇḍala, drawn from the *Sarvatathāgatattva-saṃgraha*. The Womb Maṇḍala of Great Compassion (Mahākaraṇā-garbhodbhāva Maṇḍala) is a graphic representation of the cosmos as the wondrous transformations, born of compassion and based on *bodhi*, of Mahāvairocana. The term *garbha* has two meanings. It is *bodhi*, the embryo of enlightenment present in all beings, as well as the womb of compassion and skill in means in which the embryo grows. The *maṇḍala* has three courts. The first is an eight-petaled lotus on which Mahāvairocana is enthroned amid four buddhas and four *bodhisattvas*. This court represents the seed of *bodhi*, of enlightened wisdom present in the cosmos. An intermediate court is dominated by beneficent manifestations that embody compassion, such as Avalokiteśvara, Mañjuśrī, and Kṣitigarbha. The Court of the Outer *Vajras* represents

Māhāvairocana's skill in means as manifested through the *vidyārājas* and the Hindu gods in the traditional Buddhist six destinies (*gati*). Thus the *maṇḍala* embodies the triade *bodhi*, compassion, and skill in means.

The Diamond Maṇḍala is actually a selection of nine *maṇḍalas* from the many presented in the *Sarvatathāgatattvasaṃgraha*. The central *maṇḍala*, the Vajradhātu Mahāmaṇḍala, is the most important since the others are derived from it. The Vajradhātu Mahāmaṇḍala represents the fivefold wisdom that is the basis of enlightenment. The *maṇḍala* has three courts. The first is the Akaniṣṭha Palace of Mahāvairocana, who is enthroned on a lunar disk and surrounded by four Buddhas representative of aspects of his wisdom. Surrounding the palace are the Buddhas of the past, present, and future (the *bhadrakalpa*), whose compassion causes the enlightenment of beings. The outer perimeter of the *maṇḍala* is populated by twenty Hindu divinities who act as protectors of the Dharma. Each of the other *maṇḍalas* described in the *Sarvatathāgatattvasaṃgraha* focuses on a particular aspect of the whole.

Both the Womb Maṇḍala and the Diamond Maṇḍala are external projections of a reality that must be realized internally through the Three Mysteries. Each *maṇḍala* and each of the two texts has a separate initiatory tradition through which the disciple ritually realizes the reality of Mahāvairocana in the center of the cosmos.

ZHENYAN AS CHINESE VAJRAYĀNA. The Zhenyan *ācāryas* lived in a great cosmopolitan city, Chang'an, a milieu in which Confucian, Buddhist, and Daoist, and even Muslim and Nestorian ideas were freely exchanged. Many of Zhenyan's distinctive teachings were articulated for this audience. Zhenyan's preoccupation with two *maṇḍalas* is a distinctively Chinese adaptation of Vajrayāna teachings. Since the two textual lineages came to be regarded as a pair, the *maṇḍalas* drawn from them also constitute a pair. Just as each *maṇḍala* expresses the conjunction of conditioned and unconditioned reality, so too, during the late eighth century, did the pair become a graphic shorthand for that conjunction. Through a reinterpretation of Chinese philosophical categories the Womb Maṇḍala was said to represent Mahāvairocana's numinous reality (*li*), *bodhi* as universally present in the Buddha's compassionate activities. The Diamond Maṇḍala represented the enlightened mind in itself, wisdom (*zhi*). There is evidence that this synthesis was taught by Amoghavajra's disciple Huiguo, and it may even have been initiated by Amoghavajra.

Another distinctive innovation is the selection of nine *maṇḍalas* from the *Sarvatathāgatattvasaṃgraha* and their arrangement in a three by three square. The configuration is clearly based on the *Luoshu*, one of a pair of ancient Chinese cosmograms representing the earthly realm. This cosmogram was the basis of an imperially sponsored Daoist cult of Taiyi (surpassing unity), in which the sovereign of the universe circulated through a court of nine thrones. Moreover, Amoghavajra changed the *maṇḍala*'s traditional Indian attri-

butions. Mahāvairocana, formerly associated with the color blue and the element ether, was now associated with yellow and earth, the traditional attributes of the Chinese sovereign and those chosen by the Tang rulers. It is even possible that the paired cosmograms, the *Hetu* and the *Luoshu*, influenced Zhenyan's pair of *maṇḍalas*.

Another Chinese development was Amoghavajra's promotion of Vajrayāna as the best method both for the attainment of enlightenment and for the protection of the state. Such a teaching appealed to the mid-Tang emperors, for it joined lofty theological pursuits with practical application, and after the An Lushan rebellion the emperor needed all the aid he could get. A series of rites was developed for the protection of the state, for the prolongation of the emperor's life, for the salvation of the imperial ancestors, and for the propagation of rain. The emperor was hailed as a *cakravartin*, the universal worldly ruler and counterpart of the Buddha. The state was portrayed as a Buddha land.

The promotion of the state cult focused on deities who were compassionately active in the world. The *vidyārājas*, or protectors, were important, as were Avalokiteśvara and Kṣitigarbha, both of whom figured prominently in rites for dead imperial ancestors. Mañjuśrī and Samantabhadra, representing wisdom and the fulfillment of vows, were frequently paired, as for instance, at the Golden Pavilion on Mount Wutai and in Taiyuan, the imperial clan seat.

THE LEGACY OF ZHENYAN. Although sectarian Zhenyan disappeared after the Song dynasty, it had widespread influence on Chinese Buddhism. The use of mantra and *dhāraṇī* permeated other Buddhist groups, including some Pure Land and Chan sects. Tales of wonder-working *ācāryas* added to popular lore. Zhenyan and Daoism influenced each other. During the Six Dynasties, Tantric rituals such as consecration (*abhiṣeka*) and pseudo-Sanskrit mantras were already in use in Daoist circles. Zhenyan ritual structures, used in rites for imperial ancestors, and even some of the divinities, such as Dizang (Kṣitigarbha), were emulated in Daoist Esoteric rites dating from the Song. These ancestor rites have remained an economic mainstay for both the Daoists and the Buddhists. The tremendous increase in the popularity of Guanyin during the Tang and Song is also attributable in part to Zhenyan. Guanyin, in one form or another, is invoked in many of Zhenyan's public rites. Thus, even after its demise as a recognizable sect, Zhenyan continued to shape Chinese tradition. Finally, it transformed Japanese Buddhism through the teachings of such clerics as Saichō and Kūkai, who formally introduced the sect to Japan.

Works in Western Languages

The only work available in a Western language that is devoted exclusively to Zhenyan is Chou I-liang's monograph-length article "Tantrism in China," *Harvard Journal of Asiatic Studies* 8 (March 1945): 241–332, an annotated translation of the standard biographies of Śubhākarasimha, Vajrabodhi, and Amoghavajra. Amoghavajra's role in the court with particular reference to the Golden Pavilion on Mount Wutai and the cult of Mañjuśrī is discussed in Raoul Birnbaum's *Studies on the Mysteries of Mañjuśrī* (Boulder, Colo., 1983). The Japanese monk Ennin gives us an eyewitness account of Zhenyan just before the persecution of 845 in his diary, translated by Edwin O. Reischauer as *Ennin's Diary: The Record of a Pilgrimage to China in Search of the Law* (New York, 1955). Fotudeng's exploits are recounted by Arthur F. Wright in "Fo-t'u-têng: A Biography," *Harvard Journal of Asiatic Studies* 11 (1948): 321–371. There are several studies of Shingon, the Japanese offspring of Zhenyan, that cover material in Zhenyan history and texts. These studies present valuable material but must be used with caution, as they advance Shingon interpretations of Zhenyan; these interpretations are not always faithful to those of the Zhenyan masters. In English, see Yoshito S. Hakeda's *Kūkai: Major Works* (New York, 1972) and Minoru Kiyota's *Shingon Buddhism* (Los Angeles, 1978).

On the *maṇḍalas*, Beatrice Lane Suzuki's article on the Womb Maṇḍala, "Shingon School of Mahāyāna Buddhism: II, The Mandara," *Eastern Buddhist* 7 (May 1936): 1–38, is helpful. Anesaki Masaharu's "Buddhist Cosmotheism and the Symbolism of Its Art," in his *Buddhist Art in Relation to Buddhist Ideals* (1915; reprint, New York, 1978), is brief but insightful. More difficult to find are two works in French by the Shingon priest Tajima Ryūjun: *Les deux grands maṇḍalas et la doctrine de l'ésotérisme Shingon* (Paris, 1959) and *Étude sur le Mahāvairocana-sūtra* (Paris, 1936). The best full-color illustrations appear in Pierre Rambach's *The Sacred Message of Tantric Buddhism*, translated by Barbara Bray (New York, 1979).

Works in Asian Languages

There is as little secondary material on the Zhenyan school in Chinese as there is an overabundance of it in Japanese. Chinese scholarship on Buddhism has suffered through a period of relative decline in interest during the nineteenth and early twentieth century and then through a period of outright suppression during the second half of the twentieth century. Scholarship on Buddhism, Daoism, and other religious traditions is beginning to revive, but for the moment one must make do with a few works that present a decidedly Marxist reading of Zhenyan in particular and of Chinese Buddhism in general. The most extensive and informative work is Guo Ming's treatment of Esoteric Buddhism in his *Sui-Tang fo-jiao* (Ji'nan, 1980), pp. 573–610. More heavy-handed Marxist interpretations are Gao Guanru's entry on Esoteric Buddhism in *Zhongguo fojiao*, vol. 1 (Beijing, 1980), pp. 312–318, and Fan Wenlan's *Tangdai fojiao* (Beijing, 1979), pp. 36–46.

There is a wide range of secondary works in Japanese, but nearly all treat Zhenyan from the perspective of Shingon. The best of these, however, are distinguished by careful scholarship

and sophisticated historical and doctrinal reasoning. Matsunaga Yūkei's *Mikkyō no rekishi* (Kyoto, 1969) is comprehensive, readable, and views Esoteric Buddhism in the context of the Tantric systems of India and Tibet. Although old, somewhat hard to find, conservative, and written in Classical Chinese, Omura Seigai's *Mikkyō hattatsushi*, 5 vols. (1918; reprint, Tokyo, 1972) is by far the best textual history of Zhenyan. Finally, I would still recommend two old works by Toganoo Shoun. His *Himitsu bukyōshi* (Kyoto, 1933), which was reprinted as vol. 9 of *Gendai bukyō meicho zenshū*, edited by Nakamura Hajime, Masutani Fumio, and Joseph M. Kitagawa (Tokyo, 1964), provides excellent historical coverage, and his *Mandara no kenkyū* (Kyoto, 1936), which chronicles the development and use of *maṇḍalas* in Esoteric Buddhism beginning in India, has yet to be surpassed. Most Japanese works still hold that Tantra emerged in Buddhism at the time of its first textual appearance, that is in the seventh century. Alex Wayman has recently put forward persuasive arguments for dating some Buddhist Tantric texts some three to four centuries earlier in "The Early History of the Buddhist Tantras, Especially the Guhyasamāja Tantra," in his *The Buddhist Tantras: Light on Indo-Tibetan Esoterism* (New York, 1973).

Revised Bibliography

ZHIYAN (602–668), second patriarch of the Huayan school of Buddhism in China. Born in the town of Tianshui near Chang'an, the capital of the Tang dynasty, Zhiyan was the son of an official in Shenzhou province. When Zhiyan was twelve years old his family was visited by the first patriarch of the Huayan school, Dushun, who claimed that Zhiyan was his son and should be returned to him. This declaration was taken by Zhiyan's parents to mean that Zhiyan was to become a Buddhist monk, and they thus entrusted him to Dushun.

Ordained in 615, Zhiyan studied Buddhism, mainly the thought of the *She dasheng lun* (*Mahāyānasamgraha*) and, later, the thought of the *Huayan jing* (*Mahāvaiṣṭvāyāna-buddhagandavyūha Sūtra*), under many famous Buddhists. During this period he also mastered Sanskrit. His reading of the *Huayan jing shu* (Commentary on the *Huayan jing*) by Huiguang, the founder of the Nandao branch of the Dilun school, greatly contributed to his religious development. Shortly after this he met a monk who taught him to consider the meaning [of] the Huayan teaching of *liuxiang* (“six aspects” of reality). At the age of twenty-seven, having followed this monk’s teaching, he is said to have realized the truth of the “One Vehicle.” Thereafter, he wrote his commentary on the *Huayan jing*, the *Souxuan ji*. By pursuing this religious path Zhiyan became the leader of the Huayan school at the Zhixiang Si on Mount Zhongnan. Although Zhiyan did not seek social influence, honor, and wealth, he did engage in social activity when, late in his life, he became a private teacher of Xian, the king of Pei. This occurred while he was staying at the Yunhua Si in Chang’an.

Zhiyan’s greatest influence was in the development and systematization of Huayan doctrine. His work was to pave the way for Fazang’s subsequent completion of Huayan thought. Zhiyan created the method of classifying the Buddhist teachings into five grades, arranged according to the subtlety of the doctrines, and founded the teaching of *fajie yuanqi* (“dependent origination of the True Realm”). These doctrines were given their final form by Fazang, one of his disciples. However, Zhiyan had his own character, one different from both those of his teachers and of his disciples. For example, he placed high emphasis on Tanqian’s *Wangshifei lun*, a work that praised what it termed *wuxin* (“the mind beyond functions”), a mental state based upon the thought of Zhuangzi, and esteemed Xinxing’s Sect of the Three Stages, which was generally treated as heretical. Zhiyan’s extant works are as follows:

1. *Souxuan ji* (T.D. no. 1732)
2. *Yisheng shixuan men* (T.D. no. 1868)
3. *Wushiyao wenda* (T.D. no. 1869)
4. *Huayan jing kongmu zhang* (T.D. no. 1870)
5. *Jin’gang jing lüeshu* (T.D. no. 1704)

Zhiyan had two disciples of special importance for the tradition. The first, Fazang (643–712), went on to become the great systematizer and so-called third “patriarch” of Huayan Buddhism in China. Through his efforts, Huayan became one of the prestigious and lavishly patronized traditions of the Tang dynasty (618–907). The other, Uisang (625–702), returned to his native Korean state of Silla and was instrumental in establishing Huayan as one of the most important Buddhist traditions there.

KIMURA KIYOTAKA (1987)

ZHIYI (538–597), third patriarch of the influential Tiantai school of Chinese Buddhism. This man is often regarded as having united Chinese Buddhism into a coherent whole by resolving doctrinal and practical strains that had plagued Buddhism virtually from the time of its introduction into China. His literary output was prodigious: about one thousand pages of the *Taishō* edition of the Chinese Buddhist canon are devoted to his extant works, a sum that would correspond to about nine thousand pages in unannotated English translation.

More important, however, than the sheer volume of his works is their synthesizing nature. Zhiyi was born at a time when Chinese Buddhism was beginning to move from unquestioning fidelity to Indian Mahāyāna doctrines and practices toward a more mature synthesis of Indic and Chinese religious values. Zhiyi was not the only man of his era to contribute to this synthesis: it is well known, for instance, that he borrowed heavily from the “three southern and seven northern” teachers in constructing his own system of doctrinal classification (*panjiao*). However, Zhiyi’s scheme of doctrinal classification proved to be more comprehensive and influential than those of his predecessors and contemporaries, in part because of his success at incorporating religious practice as well as doctrine into his great synthesis. In short, he is credited with having united practice with doctrine and doctrine with practice, whereas his predecessors had attempted only to arrange the various doctrines in the sūtras into an understandable and consistent whole. His role in uniting these two tendencies in Chinese Buddhism has often been compared to the political achievement of his patron Sui Wendi, the first emperor of the Sui dynasty, who succeeded in uniting the north and south of China for the first time in some three and a half centuries. The analogy is apt in that Buddhist historiography commonly views the north of China before the Sui as having been oriented toward the practical side of Buddhism, just as its leaders were men of action, often non-Chinese in ancestry, while the South then tended toward the theoretical or doctrinal side, its leaders and upper classes being aristocrats and Chinese scholar-officials. Thus in uniting doctrine and practice, Zhiyi united southern and northern religious cultures in a way comparable to the feat of his imperial patron. In his own words, these two aspects of Buddhism must be considered analogous to the “two wings of a bird” or the “two wheels of a cart,” each valueless without the other. Zhiyi, therefore, was a kind of

nodal point in the development of Chinese Buddhism, embracing in his synthesis virtually all that went before, and influencing virtually all that came after.

In terms of formal lineage Zhiyi stands third in the line of Tiantai patriarchs, following the semilegendary Huiwen and the historically attested Huisi. However, Zhiyi is generally regarded as the de facto founder of the Tiantai school, named for the mountain where Zhiyi built his most important monastery. Because it was associated so closely with the rulers of the Sui, Tiantai suffered an eclipse with the rise of the Tang dynasty (618–907 CE), whose rulers were eager to dissociate themselves from the ideological underpinnings of Sui rule. The school was revived a century and a half later by the monk Zhanran (711–782), one of whose disciples transmitted the Tiantai teachings to the Japanese monk Saichō (767–822). Saichō in turn introduced the lineage to Japan, where it soon became the dominant tradition. Its center, Mount Hiei near Kyoto, became the training ground for most of the key figures in the development of Kamakura Buddhism. The Tiantai lineage continues to the present day, with active branches in Taiwan and especially Japan, although nothing is known about the situation in China proper.

Among Zhiyi's works the two most prominent are the *Fahua xuanyi* (Profound meaning of the *Lotus Sūtra*) and the *Mohe zhiguan* (The great calming and contemplation, or The practice of meditation according to the Mahāyāna). The former is his principal work on doctrine, the latter his principal work on practice, but Zhiyi was careful to relate each aspect to the other in both works. He applied a tripartite analysis to both doctrine and practice, which he classified as sudden, gradual, or variable. The "sudden" doctrine (or teaching) refers to the *Avatamsaka Sūtra*, understood by Zhiyi and some of his predecessors as the text expounded by the Buddha to a mostly uncomprehending audience immediately after his enlightenment. It is referred to as "sudden" because it purports to reveal the Buddha's direct experience of enlightenment just as it is, without making any concessions to the need of its audience for a more "gradual" exposition of the nature of the experience. "Gradual" doctrines (or teachings) refer to the succeeding four stages of the Buddha's teaching, during which he was said to have gradually trained his listeners, in sūtra after sūtra of deepening truth, for the final revelation of the *Lotus* and *Nirvāṇa Sūtras*, commonly believed to be the last discourses of the Buddha. "Sudden meditation" is the kind of meditation expounded in the *Mohe zhiguan*, in which preliminary practices are dispensed with and "ultimate reality is taken as the object of meditation from the very beginning." Gradual meditation, like the gradual teaching, moves step by step toward the goal. Finally, by "variable" Zhiyi meant certain texts and practices that could function as either sudden or gradual, depending upon the level of religious attainment of the practitioner.

The strength of Zhiyi's system lies in its comprehensive-ness. By showing how a variety of disparate texts and prac-

tices, each of which had its own adherents, could be the product of a historically continuous revelation, beginning with the Buddha's preaching of the *Avatamsaka Sūtra* and culminating in the message of the *Lotus* and *Nirvāṇa Sūtras*, Zhiyi was able successfully to integrate them all into a single, coherent system. His great synthesis made it possible for the many branches of Chinese Buddhism to be regarded by their adherents as aspects of a loosely integrated, self-consistent whole.

A related and highly influential teaching of Zhiyi is the doctrine of the Three Truths: Empty, Provisional, and—Zhiyi's addition—Middle. This may be regarded as a Chinese emendation, or even improvement, on the pivotal Indian Mahāyāna concept of the Two Truths, first expounded by Nāgārjuna. While the Indians discerned two levels of meaning in the sūtras (i.e., in the Buddha's pronouncements) and regarded the Empty (*śūnya*) as superior to the Provisional, Zhiyi and the Chinese Buddhist tradition after him were uncomfortable with this Indian equation of ultimate truth and emptiness. To them, such a formulation seemed too nihilistic. Zhiyi was able to find passages in Nāgārjuna's works that justified the addition of a third Truth, namely the Middle, which he also styled the Perfect Teaching. This third level of truth became characteristic of the fundamental orientation of Chinese Buddhism, affirming as it does that ultimate reality (or truth) is not to be found apart from mundane reality (or truth), that the world as it is is already identical to the Absolute. The corollary of this doctrine is the assertion that all beings have the buddha nature, that is, that without exception all beings have the capacity for buddhahood. Scarcely any school or teacher in East Asian Buddhism has deviated from these two related teachings, and their influence upon Chan and Zen was particularly significant. While Zhiyi cannot be said to have originated them—he was always careful to provide scriptural citations for his doctrines, and other Chinese monks were exploring similar notions before him—he argued them with greater eloquence and made them an essential part of his incalculably influential summation of Buddhist doctrine and practice.

Revised Bibliography

ZHOU DUNYI (1017–1073), also known as Zhou Lianxi, was the first major neo-Confucian thinker generally credited with formulating a Confucian cosmology and metaphysics. Zhou Dunyi was a native of Daozhou in modern Hunan province in China. Zhou held a series of modest official positions throughout his career but because he refused to participate in the official civil service examinations, he was limited in the positions he could occupy and never achieved high level appointments with their accompanying status and recognition. He briefly served as tutor to both Cheng Hao (1032–1085) and Cheng Yi (1033–1107), the brothers who were to become major exponents of what later became known as the two principal schools of neo-Confucianism. Apart from his interactions with the Cheng brothers, he was generally not a well known figure until Zhu Xi (1130–1200) later raised his status to one of the founding figures of the neo-Confucian movement. It seems to have been primarily for his role in the development of a neo-Confucian cosmology and metaphysics that Zhou Dunyi was considered by Zhu Xi to be the first teacher in the traditional lineage of neo-Confucians. Zhou Dunyi's major exposition of this cosmology and metaphysics, an interest new to the Confucian school, is found in his two major works, the *Taijitu shuo* (An explanation of the diagram of the Great Ultimate) and the *Tongshu* (Penetrating the book of changes).

At the center of Zhou Dunyi's system of thought lies what is called the Diagram of the Great Ultimate, which may have been transmitted to him by a Daoist priest. For Zhou, the Great Ultimate (*taiji*) is seen as the source of all things in the universe, that which lies both within and behind all things. In its capacity for tranquillity it gives rise to *yin*, the symbol of the mysterious and the female in Chinese thought. In its capacity for activity it gives rise to *yang*, the symbol of the rational and the male. It is the source of the basic patterns or phases of change known as the Five Elements (*wuxing*)

and forms the foundation of the two major symbols of the *Yi jing* (Book of changes): *qian*, the heavenly principle, and *kun*, the earthly principle, themselves again symbols of male and female. Humankind in Zhou Dunyi's system receives the highest, most rarefied form of the Five Elements, and thus is seen as capable of playing a critical role in the life of the universe. On this point the system finds its characteristically Confucian focus, for in humankind lies the foundation for understanding the universe as a whole. Particularly in the ideal form as a sage, the human being is the central figure in the universe. In this way, a metaphysical framework is established that incorporates the Confucian emphasis upon the unique relation of humankind and heaven (*tian*) that forms the basic moral structure of the universe.

One of the most frequently debated points of Zhou Dunyi's thought is the first sentence of his *Explanation of the Diagram of the Great Ultimate*. The sentence reads "The Ultimate of Non-being and also the Great Ultimate!" (Chan, 1963, p. 463). The *wuji*, or Ultimate of Non-being, is often cited as evidence of Daoist influence, for it first occurs in the *Dao de jing*. To simply identify its source does not, however, explain what particular meaning it has for Zhou Dunyi. From Zhou's point of view the entire universe, all being itself, is ultimately derived from the Great Ultimate. By suggesting that the Great Ultimate is also the Ultimate of Non-being, Zhou affirms the all-inclusive nature of the source of things. The measure of its all-inclusiveness is that even its own opposite is included: there is nothing that is excluded from the Great Ultimate. This interpretation of the Great Ultimate also has a very practical side to it, for by suggesting that the Great Ultimate includes the Ultimate of Non-being, Zhou Dunyi emphasizes the degree to which Confucianism already includes Buddhist and Daoist symbols. Thus, what the Buddhists refer to as emptiness (*kong*) or the Daoists as voidness (*xu*) is, according to Zhou, already subsumed in the Great Ultimate. This is not to be understood as some kind of syncretism, but instead as a reaffirmation of the Confucian claim for the ontological priority of the Great Ultimate and thus of the Confucian affirmation of life itself as the ultimate ground for the achievement of sagehood.

There are other areas of Daoist influence in Zhou's thought beyond that evinced in his interpretation of the Great Ultimate. At the center of his practices and teachings are the ideas of quietude or tranquillity (*jing*) and desirelessness (*wuyu*). The sage is defined by Zhou Dunyi as one who is able to achieve a state of profound quietude and who is without desires. Zhu Xi felt that such ideas if carried to excess could lead dangerously close to the ways of the Buddhists and the Daoists. It may be because of this reservation that Zhu Xi chose to emphasize the metaphysical structure of Zhou Dunyi's thought and qualified Zhou's views by insisting upon the need for serious study rather than the cultivation of states of quietude and desirelessness.

The religious significance of Zhou Dunyi's thought for the development of neo-Confucianism is found in part in the

degree to which he isolates the Great Ultimate as a symbol of ultimate meaning. The significance of this symbol persists throughout the course of the neo-Confucian tradition and reaffirms the central Confucian idea of the ultimate importance of life. But Zhou Dunyi's own life serves as a neo-Confucian religious model as well. In Zhou Dunyi we have someone who told his disciples that the whole purpose of learning is to achieve the goal of sagehood, and someone who in his own life displayed a seriousness and a humility that speak directly to the authenticity of the neo-Confucian religious perspective. When asked at one point why he refrained from cutting the grass outside his window, Zhou said that the grass's feeling and his own were the same. This has suggested to most readers Zhou Dunyi's extraordinary respect for and love of all forms of life, not to the detriment of the unique role of humankind, but rather as the extension and enlargement of humankind's own focus. It also suggests Zhou Dunyi's own religious sense of the continuity of all life and its common root in the Great Ultimate.

BIBLIOGRAPHY

Introductory essays on Zhou Dunyi with a partial translation of his major writings are found in the two major sourcebooks on Chinese thought: *A Source Book in Chinese Philosophy*, translated by Wing-tsit Chan (Princeton, 1963), pp. 460–480, and *Sources of Chinese Tradition, From Earliest Times to 1600*, 2d ed., edited by Wm. Theodore de Bary and Irene Bloom (New York, 1999), vol. 1, pp. 669–678. Both contain selections from *An Explanation of the Diagram of the Great Ultimate* and *Penetrating the Book of Changes*. Zhou Dunyi's writings are included in part in a thirteenth-century anthology of neo-Confucianism compiled by Zhu Hsi and Lü Zuqian, translated into English by Wing-tsit Chan as *Reflections on Things at Hand* (New York, 1967). Discussions of specific aspects of Zhou Dunyi's thought may be found in Fung Yu-lan's *A History of Chinese Philosophy*, 2d ed., translated by Derk Bodde (Princeton, 1953), vol. 2, pp. 434–451; and Carsun Chang's *The Development of Neo-Confucian Thought*, 2 vols. (New York, 1957–1962), vol. 1, pp. 137–158. General studies including material on Zhou Dunyi are Xinghong Yao, *An Introduction to Confucianism* (Cambridge, UK, 2000), pp. 98–104; John H. Berthrong, *Transformations of the Confucian Way* (Boulder, Colo., 1998), pp. 86–114.

RODNEY L. TAYLOR (1987 AND 2005)

ZHUANGZI. Zhuangzi is both the name of the second foundational text of the Daoist philosophical and religious tradition and the name of the putative author of this text after whom the book was titled, who, according to early historical sources, flourished between about 369 and 286 BCE. While what we know of the philosophy of Zhuangzi comes primarily from this work, it is important to realize that the *Zhuangzi* text is not the work of a single author. At the very least there are five authorial voices: the historical Zhuangzi;

his disciples; a “Primitivistic” Daoist author with ideas akin to those of the *Dao de jing*, who responded to the challenge of the followers' individualist thinker Yang Zhu; and the “Syncretic” Daoist authors who likely compiled the original recension of the text. The received version in thirty-three chapters was established by the commentator Guo Xiang (d. 312 CE), who revised a fifty-two chapter original recension first listed in imperial bibliographies circa 110 CE by removing material he thought was superstitious and generally not of philosophical interest. This received Guo version is traditionally divided into three sections: “Inner Chapters” (1–7), “Outer Chapters” (8–22), and “Miscellaneous Chapters” (23–33). This division is longstanding and is likely to have been part of the original recension.

The *Zhuangzi* has become renowned for a series of original insights into human nature and the nature of the cosmos, and many of these are found in the “Inner Chapters.” These insights are communicated in a variety of literary styles: didactic narratives, poetry, and very short prose essays. Like its famous companion, the *Dao de jing*, the *Zhuangzi* is grounded in the complementary ideas of Dao and De. Dao, the “Way,” is an ineffable monistic principle that infuses and guides the spontaneous processes of all phenomena; De, “Inner Power,” is the manifestation of this Way within all phenomena. Despite sharing these foundational ideas, these two Daoist works discuss them very differently. The *Dao de jing* often presents the characteristics and features of the Way in a discursive style (e.g., DDJ 1: “The Way that can be told of is not the Constant Way”). On the other hand, the *Zhuangzi* often approaches the Way indirectly through narratives and poetry. Witness the following rumination on epistemological relativity that ends with a vivid pointing to the Way:

What is It is also Other, what is Other is also It. There they say, “this is true and that is false” from one point of view; here we say, “this is true and that is false” from another point of view. Are there really It and Other? Or really no It and Other? Where neither It nor Other finds its opposite is called the axis of the Way. When the axis is found at the center of the circle there is no limit to responding with either, on the one hand no limit to what is it, on the other no limit to what is not. . . . (chapter 2)

This questioning of the certainty of knowledge from any normal human viewpoint is another hallmark of the “Inner Chapters,” as is the considerable degree of humor and irony with which the most profound insights into the cosmos are presented. This is true as well for Zhuangzi's presentation of Inner Power, which is done through narratives in which the paragons of its cultivation are skilled tradesmen and the outcasts of society. This flaunting of societal prejudices is another way in which Zhuangzi challenges entrenched beliefs and demonstrates the breathtaking freedom from fixed conventions that has delighted readers for two millennia.

The *Zhuangzi* of the “Inner Chapters” is also known for a thorough questioning of the canons, methods, and value

of discursive logic as practiced by contemporary thinkers in the traditions of the Mohists, Confucians, and Terminologists (*ming jia*). He skewers the presumed objectivity of their categories, arguing that names are purely arbitrary and reveal no inherent truths about the things that are named. Furthermore, no matter how sophisticated the logic involved, no argument can establish objective truths because all knowing remains confined to the standpoint of the knower:

how do I know that what I call knowing is not ignorance? How do I know that what I call ignorance is not knowing? . . . Gibbons are sought by baboons as mates, elaphures like the company of deer, loaches play with fish. Maoqiang and Lady Li were beautiful in the eyes of men but when the fish saw them they plunged into the deep, and when the birds saw them they flew away. Which of these four knows what is truly beautiful in the world? (chapter 2)

Inspired by such ideas, comparative philosophers have engaged in spirited debate about whether Zhuangzi is a skeptic, a relativist, or a perspectivist. Scholars of religion further maintain that Zhuangzi's philosophical relativism does not apply to the higher level of cognition he calls "great knowledge," which is attained through the "inner cultivation" practices that lead to mystical gnosis. These practices involve sitting quietly and systematically circulating the breath until mind and body become tranquil and the contents of consciousness gradually empty. Taken to its ultimate levels, this practice leads to a direct experience of the Way. In the "Inner Chapters" Zhuangzi epitomizes this meditative practice as "the fasting of the mind" and as "sitting and forgetting": "I let organs and members drop away, dismiss hearing and eyesight, part from the body and expel knowledge, and merge with the Great Pervader. This is what I mean by 'just sit and forget'" (chapter 6).

Yet for Zhuangzi this experience of "merging with the Great Pervader" (the Way), although profound, is relatively easy compared to the challenges of bringing this gnosis into the everyday world: "to stop making footprints is easy but it is difficult to walk without touching the ground" (chapter 4). This type of ungrounded "walking" has a significant epistemological dimension: a distinctive mode of cognition that Zhuangzi refers to as "flowing" (*yin-shi*: literally "to affirm by following along") in contrast to the "fixed" mode of cognition (*wei-shi*: literally "to affirm by forcing") that is bound to one individual perspective (chapter 2).

Zhuangzi further makes clear that abandonment of fixed cognition is concomitant with abandonment of attachment to the self and with the embracing of a new perspective grounded in the Way. From this perspective, just as the Way is able to "pervade and unify" all things, to see them just as they are, without bias and without preference, so too are sages able to see "all things as equal." It is just this kind of mystical seeing that is the essential defining characteristic of the "great knowledge" or "illumination" of the flowing cognition that is developed through inner cultivation practice.

Zhuangzi's questioning of logic and his skepticism and relativism are based upon this shift from fixed cognition to flowing cognition, from self-centered perspective to "Way-centered" perspective. His epistemological critique is thus applied to knowledge derived from fixed cognition. Flowing cognition is exempted from this critique because it is this continually changing "Way-centered" perspective from which the critique is made.

These complementary mystical experiences (merging with the Great Pervader and pervading and unifying all things through flowing cognition) are critical for understanding other important philosophical themes for which the *Zhuangzi* is renowned. Political involvements are useless entanglements that only inhibit the opportunity to realize these experiences. Naturalness and spontaneity arise directly from the flowing cognition that is free of attachment to any one limited perspective. When sages act from this cognitive mode they can spontaneously respond without self-consciousness to whatever situation in which they find themselves. This freedom from attachment to any individual perspective also leads to the freedom from fear of death and acceptance of it as part of the natural processes of life that is another of the hallmarks of this work.

THE DISCIPLES OF ZHUANGZI. With writings as profound and vibrant as these, the historical Zhuangzi must have had quite a devoted group of followers. It is to them that we owe both the transmission of his ideas beyond his lifetime and at least six chapters of new material, much of it consisting of narratives written in the style of the "Inner Chapters" but generally not demonstrating the same creativity and rhetorical skill. Zhuangzi is a figure in about one quarter of these narratives, which were probably based on stories told by his immediate disciples and written down after his death. The chapters in this section, 17–22, are almost completely devoid of the philosophical essays, jottings, or even the diatribes we find in the first third of the book, yet they contain some of its most famous narratives.

Unlike the "Inner Chapters," which contain no references to Laozi the man and to the text of the *Dao de jing*, many of these disciple chapters use ideas and quotations from the *Dao de jing*. Thus they were most likely written after this work began circulating widely in China circa 260 BCE. To the extent that they recast material from the "Inner Chapters" in new narrative frameworks and frequently see it in light of ideas from the *Dao de jing*, these chapters represent a unique blending of the two intellectually foundational sources of early Daoism. Chapters 23 through 27 and 32 are much more heterogeneous in their content and contain fragmentary writings of the followers of Zhuangzi mixed with passages from the other authorial voices in the text.

THE PRIMITIVIST CHAPTERS. Four chapters (8–10, 16) and half of a fifth (11) espouse a philosophical position similar to that found in the *Dao de jing*, differing principally in that it is not addressed to the ruler. Because of their advocacy of a return to a government and social organization similar to

that found in primitive tribal utopias, they have been labeled “Primitivist.” They shared a utopian vision and critique of the Confucians with the Yangists and, under their influence, developed the first Daoist theory of human nature that derived from “inner cultivation” and was cast in terms of the Way and Inner Power. Rather than totally eschewing political life, they advocated a government by non-action (*wuwei*) similar to that found in the *Dao de jing*.

The Primitivists argue that it is the inherent nature of all people to be “simple and unhewn.” The “simple” (*so*) and the “unhewn” (*pu*) are important ideas in the *Dao de jing* wherein to be simple means to be unselfish (DDJ 19) and to be “unhewn” means to be without desires (DDJ 19, 38). These ideas suggest a state of mind totally devoid of self-consciousness, a state of mind in which people act spontaneously and without self-reflection. It is a state of mind that is reminiscent of the flowing cognition of the “Inner Chapters.” For the Primitivists, it is human nature to attain this state of mind when people are left on their own, when the institutions of culture do not interfere with spontaneous human tendencies. To attain this state is to realize one’s Inner Power.

Throughout their writings the Primitivists harken back to an earlier utopian age when people lived in selfless harmony with one another and with all things in the world and when the Way and Inner Power were fully realized. The Confucian sage-rulers, who established cultural norms and thereby forced people to think about how to attain them, destroyed this harmony and made it much more difficult for people to attain the simple and unhewn state of mind. However by doing away with the sages and their cultural norms we can return to a primitive utopia. Then society can be governed by a ruler who learns how to practice non-action.

Chapters 28–31 of the received recension of the *Zhuangzi* are similar in thought to five essays from the first two chapters of the compendium *Lüshi chunqiu* (240 BCE), which constitute the only surviving works of the lost Yangist tradition. While some regard these *Zhuangzi* chapters themselves as Yangist, close examination reveals that they are a heterogeneous collection of writings likely compiled and created by the Primitivists to respond to the intellectual challenges of the Yangists in the debates at the Qin court of Lü Buwei, where the *Lüshi chunqiu* was written.

THE SYNCRETIST CHAPTERS. The final stratum of the *Zhuangzi* contains a distinctive and largely consistent viewpoint that connects with the rest of the text and with a larger philosophical context. It is contained in three complete essays: (1) the first two-thirds of chapter 13, “The Way of Heaven”; (2) chapter 15 “Inveterate Ideas”; and (3) the final chapter, 33, “Below in the Empire,” as well as in narratives that play key roles in chapters 12 and 14. This material shares a common cosmology of the Way and interest in inner cultivation that we have seen in most of the rest of the text but veers in a different direction in its political thought, advocating a hierarchical social and political structure that incorporates the

best ideas of other earlier intellectual lineages within a Daoist cosmological framework. Nonetheless, it agrees with the Primitivist idea that government should be led by a sage enlightened through inner cultivation techniques. In its general intellectual viewpoint it exemplifies many of the characteristics of the Daoist tradition that were first enunciated by the Han dynasty historian, Sima Tan (d. 110 BCE), the man who coined the very term “Daoism” (*daoia*). According to him, Daoists assert that:

1. Humans can cultivate themselves to attain harmony of body and mind and to realize their essential connection to the Way and to the entire cosmos.
2. When rulers become adept at such “inner cultivation” they can govern dispassionately and humanely according to the greater patterns of heaven and earth, upon which they model their social and political institutions.
3. While remaining faithful to this general Daoist orientation rulers should make use of the best ideas of other early intellectual lineages.
4. With these institutions and practices established, rulers can govern by taking no action while leaving nothing undone.

All these ideas are found in the Syncretist *Zhuangzi*. Inner cultivation practice is advocated to attain a deep and tranquil state of mind to enable both sages and rulers to act efficaciously in the world. They then make use of this experience to act spontaneously and harmoniously while being guided by the greater patterns of the cosmos. This is the Syncretists’ version of attaining the flowing mode of cognition advocated in the other parts of the text. The Syncretist author of chapter 13 argues that this flowing mode can be applied to a variety of life circumstances: ruler and minister, politician and hermit, sage and commoner can all utilize flowing cognition; but when it is applied to rulership, it attains its greatest flourishing. Government by enlightened sages who attain flowing cognition is the pinnacle of Daoist political thought for the Syncretist: it is symbolized by the phrase “in stillness a sage, in motion a king,” which is elsewhere referred to as being inwardly a sage and outwardly a king. It is with this cultivated mind that the sage ruler establishes human society in parallel to the greater patterns of the cosmos. This coordination of human society with cosmic patterns is a characteristic tenet of the early Daoist syncretic lineage that historians first called the “Way of the Yellow Emperor and Laozi” (*Huang-Lao zhi dao*), and some scholars have argued that these Syncretist chapters are the products of this intellectual lineage.

The final chapter of the *Zhuangzi*, “Below in the Empire,” exemplifies this kind of syncretism in its analysis of earlier intellectual traditions. After establishing its own position, the comprehensive “Way of Heaven and Earth,” it analyzes how each of these earlier traditions understood one part of this comprehensive Way but ultimately failed to grasp the whole. *Zhuangzi* himself is included in this analysis. The Syncretist author praises *Zhuangzi* for his depth of mystical

cultivation but chides him for failing to realize that there are practical affairs in the world that must be attended to. It is an interesting yet telling comment. The Syncretist criticizes the very impracticability for which Zhuangzi later became renowned.

Thus the text called the *Zhuangzi* is a multilayered work that transmits the ideas of an important early Daoist philosophical and religious lineage founded by the historical figure of Zhuangzi towards the end of the fourth century BCE. His writings were conveyed to later generations by his disciples who added to the work over the better part of a century, during which the developing text passed through the Qin court of Lü Buwei, circa 240 BCE, and was completed at the court of Liu An (c. 180–122 BCE), second king of Huai-nan, circa 150 BCE. While the lineage of Zhuangzi elaborated upon the master's original thought by developing Primitivist and Syncretist political dimensions, each in its own way remained true to his advocacy of cultivating the spontaneous flowing mode of cognition.

SEE ALSO Daoism, overview article.

BIBLIOGRAPHY

There are three scholarly modern translations of the *Zhuangzi* currently in circulation that are worthy of consultation. All others are outdated, derivative, or not grounded in Sinological scholarship. There are the complete translations of Burton Watson, *The Complete Works of Chuang Tzu* (New York, 1968), and Victor Mair, *Wandering on the Way: Early Taoist Tales and Parables of Chuang Tzu* (Honolulu, 1998). Both are more literary than philosophical, and while each is appealing for its rendering of the humorous flair of the original, the Mair translation is preferable because of its well-founded semantic subdivisions within each chapter and Mair's tendency to translate the meaning of proper names, which skillfully helps to communicate the irony of these names in the original narratives.

The philosophically most interesting and the most linguistically precise translation is Angus Charles Graham, *Chuang Tzu: The Inner Chapters* (London, 1981; Reprint, Boston, 2000). Despite its title, it contains about eighty percent of the original text organized by each of the five philosophical positions Graham has identified in the work: (1) the historical Zhuangzi; (2) his disciples; (3) The Primitivist; (4) The Yangists; and (5) The Syncretists, with additional passages translated under narrative categories such as "stories about Zhuangzi," etc. This is at once a strength and a weakness of the Graham translation: it clearly distinguishes philosophical voices that most translations do not. However, organizing the translation along these lines makes it maddening to attempt to compare different translations or to check Graham's translation with the original Chinese text.

There are a number of excellent essay collections that deal with various aspects of the philosophy and the textual history of the *Zhuangzi*: Roger T. Ames, ed., *Wandering at Ease in the Zhuangzi* (Albany, N.Y., 1998); Scott Cook, ed., *Hiding the World in the World: Uneven Discourses on the Zhuangzi* (Albany, N.Y., 2003); Paul Kjellberg and Philip J. Ivanhoe, eds., *Essays on Skepticism, Relativism, and Ethics in the Zhuangzi*

(Albany, 1996); and Victor Mair, ed., *Experimental Essays on the Chuang Tzu* (Honolulu, 1983). Each collects essays by at least a dozen specialists in either Chinese thought or in comparative philosophy, and each has its stronger and weaker contributions, with none standing out from the rest.

There is a thoughtful collection of essays on various aspects of the philosophy of *Zhuangzi* by Jean Francois Billeter titled *Études sur Tchouang-Tseu* (Paris, 2004). It assembles five of his essays published in academic journals and adds a number of new ones. Harold D. Roth's *A Companion to Angus C. Graham's Chuang Tzu: The Inner Chapters* (Honolulu, 2003) is a useful collection of Angus Graham's essays on *Zhuangzi* that also includes Graham's rare textual notes to his translation of *Zhuangzi* and an assessment of his text-analytical scholarship by Roth. In addition there are several other works on the textual history of the *Zhuangzi*: Angus C. Graham, "How Much of *Chuang Tzu* did Chuang Tzu write?" reprinted in Roth, *A Companion*, presents his ideas of the stratification of the text; Liu Xiaogan, *Classifying the Zhuangzi Chapters* (Ann Arbor, Mich., 1994) is a thorough book-length study of this same topic that reaches similar conclusions on the strata but sometimes different conclusions about the authorship of these strata; Harold D. Roth's "Chuang Tzu" in *Early Chinese Texts: A Bibliographical Guide*, compiled and edited by Michael Loewe (Berkeley, Calif., 1993), succinctly summarizes Western and East Asian scholarship on the textual history and textual analysis of the *Zhuangzi*. Finally, Harold D. Roth's "Who Compiled the *Chuang Tzu*?" in *Chinese Texts and Philosophical Contexts*, ed. Henry Rosemont, Jr. (LaSalle, Ill., 1991) argues that the Syncretist compilers of the *Zhuangzi* were members of the early Daoist Huang-Lao lineage who were part of the intellectual circle of Liu An, second king of Huai-nan in about 150 BCE.

HAROLD D. ROTH (2005)

ZHUHONG (1535–1615), also known as Master Yunqi; an important Buddhist leader in the late Ming dynasty (1368–1644). A reformer of monastic Buddhism, a synthesizer of various Buddhist traditions, and a successful promoter of lay Buddhism, Zhuhong was also regarded posthumously as the eighth Pure Land patriarch. However, his influence has never been confined within any sectarian boundary. He has, in fact, been credited with the renewal of Buddhism in Ming China.

Zhuhong was a native of Hangzhou. He became a student in the local school at the age of sixteen and quickly achieved a reputation for his knowledge of Confucianism and Daoism. He sat for the higher civil examinations several times but was without success. His interest in Pure Land Buddhism dates from the time when he daily witnessed an old woman calling the name of the Buddha Amitābha (Chin., Emitufo). Thereafter, he kept a vegetarian diet, studied Buddhist scriptures, and practiced *nianfo* (recitation of Amitābha's name). When Zhuhong was twenty-seven his father died. Shortly afterward his wife and only son also passed away. He then remarried a pious Buddhist laywoman

and resolved that if he failed to pass the provincial examinations by the age of thirty and the metropolitan examinations by the age of forty, he would become a monk. Three years later his mother died. When success in the examinations still eluded him he bade farewell to his wife (who later became a nun) and in 1566 entered the monastic order.

After he became a monk, Zhuhong followed the mendicant tradition, spending the next six years traveling throughout the country seeking instruction from prominent teachers. He achieved his first enlightenment on his way to Dongzhang in Shandong. He also took part in five sessions of Chan meditation held in different monasteries in the Zhejiang area. In 1571 he returned to Mount Yunqi in his native Hangzhou. It is said that through the performance of Tantric rituals and the invocation of the Buddha's name, Zhuhong cleared the region of tigers that had been harming men and beasts, and brought rain during a severe drought. In gratitude, villagers rebuilt an abandoned old temple, which he named Yunqi Monastery upon its completion in 1577. Zhuhong stayed there until his death in 1615, making it a model of monastic discipline and a center for the joint practice of Pure Land and Chan, a syncretic tradition that was initiated by the Chan master Yanshou (904–975) and that reached its culmination with Zhuhong.

The joint practice of Chan and Pure Land rested on the assertion that the two paths were essentially the same insofar as both led to the same goal: the stopping of wrong thoughts and the end of the cycle of *saṃsāra* (Chin., *shengsi*). Zhuhong wrote a four-volume commentary on the smaller *Sukhāvāṣṭyūha Sūtra* (Chin., *Emitufo jing*) in which he provided a creative interpretation of “one mind” (*yixin*). Using the Huayan categories of particularity (*shi*) and universality (*li*), Zhuhong divided the attainment of *nianfo* into the “one mind of particularity” and the “one mind of universality.” The former is achieved through concentration, which suppresses ignorance, while the latter is achieved through insight, which destroys ignorance. By the “uninterrupted experience and embodiment” of the Buddha's name, he believed, one could attain insight into the true nature of things, the object of Chan meditation. The link between Chan meditation and *nianfo* practice was precisely this one mind. Zhuhong firmly believed that this one mind was nothing other than that to which Bodhidharma was “directly pointing.”

Zhuhong was an energetic evangelist of vegetarianism and kindness to animals. Under his advocacy, the practice of “release of life” (*fangsheng*), that is, buying fish and other creatures from marketplaces and setting them free, became very popular among lay Buddhists. He wrote the *Zizhi lu* (Record of Self-knowledge), which was modeled on the ledgers of merit and demerit long favored by Daoists, to inculcate Buddhist values among the general populace.

Zhuhong was interested in harmonizing Buddhism with Confucianism. He was less impressed by Daoism and clearly hostile toward Catholicism, as can be seen from the four re-

buttals supposedly addressed to Matteo Ricci and contained in Zhuhong's collected works, *Yunqi fabui*.

CHUN-FANG YÜ (1987)

ZHU XI (1130–1200), philosopher, scholar, and formulator of what would for centuries be regarded as mainstream neo-Confucianism. The son of an official, Zhu Xi passed the highest civil service examination when he was only eighteen. In 1151 he was appointed a district registrar in Fujian province, where he served until 1158. He did not accept another official post until 1172, when he became prefect of Nankang in Jiangxi. Except for a month and a half in 1194, when Zhu Xi served at court, his government service was entirely at the local or regional level.

As a local official he built a strong record of conscientious service looking after the economic as well as moral welfare of the people. One notable accomplishment was the establishment of communal granaries as a measure to combat famine. Less successful was his attempt to conduct a land survey. Most influential in the long run were his activities on behalf of education, especially the rehabilitation of private academies such as the White Deer Grotto Academy in Nankang. Such academies played a prime role in propagating neo-Confucianism.

In office or out, Zhu Xi was ever mindful of the plight of the Song dynasty, which had lost China's northern heartland to the non-Chinese Jin only three years before his own birth. In memorials and personal audiences he urged moral reform of the government beginning with the emperor himself. Both his ideas about moral government and his discussions on specific policy issues, however, had little influence on government. Zhu's brief period at court came to an end when a hostile faction came to power. Not content with purging their opponents from government, the men who ousted Zhu Xi went on to denounce him and fifty-eight other philosophers as guilty of “spurious” or “false” learning (*weixue*). Zhu Xi was still in political disgrace at the time of his death.

In his prolific writings and recorded conversations with disciples Zhu Xi ranged over many areas of inquiry encompassing a host of topics and issues. His greatest achievement lay in shaping the varied and diffuse ideas of his eleventh-

century predecessors into a coherent, organic philosophy. In the process he not only defined neo-Confucianism but established the Confucian core curriculum. It was Zhu Xi who joined the *Daxue* (Great learning) and the *Zhongyong* (Doctrine of the mean), originally two chapters in the *Li ji* (Book of rites), with the *Lunyu* (Analects) of Confucius and the *Mengzi* to comprise the so-called Four Books, a collection that formed the basis for the education of the Chinese elite until 1905.

Zhu Xi's thought was deeply religious in several senses. On a personal level, his was a creed to guide people's conduct as well as thinking, a quest for wisdom as well as truth, focused on an ideal of self-perfection (sagehood) to be pursued with the most earnest dedication. Part and parcel of this attitude was his reverence for Confucius and other past sages as well as his passionate concern with proper behavior and ritual. Furthermore, his view of the world and man was grounded in a sense of a transcendent reality and a vision of the unity of the cosmos and humanity.

Like Cheng Yi before him, Zhu Xi considered both the physical world of nature and the moral world of human relations as structured by *li* ("principle"), but he went beyond Cheng Yi to identify principle with the "supreme polarity" (supreme ultimate; *taiji*) discussed by Zhou Dunyi (1017–1073) in his *Taijitu shuo* (Explanation of the diagram of the Supreme Polarity). Above and prior to form, the Supreme Polarity is itself without form. It contains all principles even as it is their source. It generates tranquillity and activity, the cosmic forces of yin and yang; indeed, its activity and tranquillity are yin and yang. It is transcendent but also immanent, for Zhu Xi stressed the unity of the one and the many. To illustrate this, he used the metaphor of the single moon that shines on and is reflected in rivers and lakes everywhere. Everything has the Supreme Polarity within it, yet the Supreme Polarity remains one whole.

Zhu's contemporary, Lu Jiuyuan (Lu Xiangshan, 1139–1193), objected to Zhou Dunyi's formulation, "the Non-Polarity [*wuji*, or Ultimate of Non-being] and yet the Supreme Polarity," as constituting the Daoist emphasis on non-being. But Zhu Xi insisted on retaining this formula because it makes clear that there is nothing beyond or prior to the *Taiji* and that *Taiji* cannot be limited or qualified in any way. As indicated in the diagram, the Non-Polarity and the Supreme Polarity are not two entities. According to Zhu Xi, in some contexts the *Taiji* need not itself be thought of as an entity at all.

Zhu Xi compared the relationship between *Taiji*, which he identified with principle or pattern (*li*), and the flux of activity and tranquillity, which he identified with material force (*qi*), to that of a man riding a horse, going wherever the horse goes in an inseparable union. In a crucial disagreement with Buddhists, Zhu Xi emphasized that principle is not something empty and detached, insisting instead that principle and concrete things never exist in isolation from one another. Without the material force (*qi*), principle (*li*)

would have nothing to attach itself to. Accordingly, *qi* plays an important role in Zhu Xi's thought, so much so that an extensive literature has debated whether his thought may be more properly characterized as monism or dualism. Perhaps one may say that he was capable of adopting both perspectives, but that in ultimate metaphysical terms he saw reality as one.

Human beings are, of course, very much part of this reality. Like all Neo-Confucians, Zhu Xi accepted Mengzi's teaching that human nature is fundamentally good and that it contains within it the "beginnings" of the virtues. He equates this nature with principle: it belongs to the individual but is also shared with the world. While nature is good in its original quiescent state, once aroused to activity, goodness consists in following it, while evil results from going against it. What makes evil possible is that in man, as in the cosmos, principle needs to attach itself to material force in order to become actualized. Just as water may be clear or turbid, the physical nature people receive at birth may be pure or gross in varying degree. The more turbid the physical nature, the more seriously will principle be obstructed, but human beings, unlike animals, are able to penetrate their turbidity to recover the underlying principles.

Essential to Zhu Xi's view of man and the process of self-perfection is the activity of the "mind-and-heart" (*xin*, hereafter "mind"). Drawing on Zhang Zai, Zhu Xi held that the mind unites and controls the nature and the feelings. Thus, unlike Lu Jiuyuan and the "school of Mind" (Xinxue), Zhu Xi does not identify the mind with principle. For him, principles are contained in the mind, which, however, is constituted of highly rarefied *qi*. While the nature, identified with substance (*ti*), is good, the feelings, identified as function (*yong*), need to be maintained in proper balance. Some, such as the feeling of commiseration, are good, but there is always the danger posed by selfish desires. As a result, the human mind (*ren-xin*) is in a precarious state, ever subject to errors that prevent it from returning to the original "mind of the Way" (*dao-xin*, moral mind). The nature, as principle in general, is inert. Consequently, Zhu Xi places special emphasis on the mind as the active master whose role it is to engage in the strenuous effort to discriminate between moral error and the correct way and then to maintain constant correctness. Self-cultivation requires utmost exertion and commitment.

In his methodology of self-development Zhu Xi emphasized intellectual learning, but, in keeping with the general inclusive and synthetic cast of his mind, he by no means rejected meditation, or "quiet sitting" (*qingzuo*), as the neo-Confucians called it. He once even advised a student to spend half his day in quiet sitting and the other half in reading. As a young man Zhu Xi was greatly influenced by the concept of quietism, but changed his views under the influence of his friend Zhang Shi (1133–1180) and the ideas of the philosopher Hu Hong (1106–1162). It was not until 1169 that he worked out a doctrine of self-cultivation that

involved watchfulness over one's emotions and feelings both before and after they have been aroused. Central to this doctrine was the cultivation and practice of "seriousness" (*jing*, also rendered as "reverence, mindfulness"). The *locus classicus* for the concept of seriousness, so prominent in the thought of Cheng Yi as well as Zhu Xi, is a passage in the *Yi jing* (Book of changes) that couples "seriousness to straighten the internal life" with "righteousness to square the external life."

Zhu Xi is especially noted for stressing "the investigation of things" (*gewu*, a term from *Daxue*), by which he meant the investigation of the principles of all things and events. It was on this issue that he had his famous debate with Lu Jiuyuan in 1175 at the Goose Lake Temple in Jiangxi. In contrast to Lu, whose philosophy of inwardness de-emphasized external learning or book knowledge, Zhu Xi maintained that principle was to be investigated in the external world as well as within one's self. According to Zhu, the extension of knowledge (*zhi-zhi*, another term from *Daxue*) is a gradual process of investigating the principles of one thing after another until a great breakthrough takes place and the perfection of knowledge is attained. Like other Confucians, he taught that such knowledge must necessarily be manifested in action, but unlike the Ming dynasty philosopher Wang Yangming (1472–1529), Zhu Xi taught that knowledge must precede action.

The prime virtue, the source of all other virtues and thus the object of all endeavor is "humaneness" (*ren*, also rendered as "humanity, benevolence"). In keeping with the centrality of this concept in Confucian thought, Zhu Xi gave much attention to working out his own theory of humaneness. Rejecting an interpretation given by one of Cheng Yi's disciples, who defined it as consciousness, as well as that of another disciple, who equated it to unity with all things, Zhu Xi characterized *ren* as the principle of love and the very character of the mind. Vital and creative, *ren* is the spirit of life found in the mind of Heaven and earth. Thus, through humaneness people partake of the creative process of the universe.

This creative process is natural and unending. Because the universe constantly rotates, the heaviest material force concentrates at the center to form the earth while the most rarefied *qi* is farthest out, forming the sky, sun, moon, and celestial bodies. When Zhu Xi discussed the "mind of heaven and earth," the word translated as "heaven" is *tian*, which, depending on the context, can also be rendered as "sky" or "nature." Asked about its meaning in the classics, Zhu Xi replied that in some cases it meant "the lord" and in some "principle." The question of whether Zhu Xi was a deist was much debated among Jesuit and other Western scholars of Chinese philosophy and forms an important chapter in the history of Western sinology rather than in that of neo-Confucianism in China or East Asia.

In both his official capacity and in his personal life Zhu Xi participated wholeheartedly in religious ceremonies, including, for instance, prayers for rain in times of drought, sacrifices to former sages, and ancestor worship. As a man of

his time, he believed in the existence of ghosts but sought to explain natural phenomena in terms of *li*. He strongly rejected the Buddhist idea of reincarnation, Daoist beliefs in longevity, and shamanism. Living in disgrace in his old age, he wrote a memorial condemning the men in power, much to the alarm of his disciples, who were concerned for his safety. Finally, they persuaded him to let divination decide whether to risk sending the memorial. Zhu Xi accepted the negative verdict of the milfoil. It was a dramatic and poignant expression of his conviction of the unity of the universe and man.

A brief summary of as subtle and prolific a thinker as Zhu Xi inevitably runs into the danger of oversimplification. It also tends to disguise the extent to which the modern scholar is engaged in a task of interpretation and reconstruction, for Zhu Xi, like other Chinese thinkers, did not set forth his ideas in a systematic magnum opus. Although there are some essays on specific subjects, for the most part he developed his ideas in commentaries on the classics, letters to friends, prefaces and the like, as well as in conversations recorded by disciples. His works are a rich source for modern students of many aspects of twelfth-century China and continue to provide scholars within the tradition with numerous issues for cogitation and debate. Recent years have seen major advances in the study of Zhu Xi, but the work continues.

BIBLIOGRAPHY

Wing-tsit Chan's "The Study of Chu Hsi in the West," *Journal of Asian Studies* 35 (August 1976): 555–577, is a comprehensive survey and a most useful guide. Professor Chan has included translations from Zhu Xi in his *A Source Book in Chinese Philosophy* (Princeton, 1963) and translated Zhu Xi and Lü Ziqian's anthology of Northern Song neo-Confucianism, the *Jinsi lu*, under the title *Reflections on Things at Hand* (New York, 1967). Studies published since the appearance of Professor Chan's article include *Journal of Chinese Philosophy* 5.2 (June 1978), a special issue on Zhu Xi; Hoyt C. Tillman's *Utilitarian Confucianism: Chen Liang's Challenge to Zhu Xi* (Cambridge, Mass., 1982); Daniel K. Gardner's meticulous translations and insightful studies: *Zhu Xi and the Da-xue* (Cambridge, Mass., 1986); *Learning to Be a Sage: Selections from the Conversations of Master Chu* (Berkeley, 1990); and *Zhu Xi's Reading of the Analects: Canon, Commentary, and the Classical Tradition* (New York, 2003). Also see Kim Yuk-sik, *Natural Philosophy of Chu Hsi* (Philadelphia, 2000) and *Zhu Xi and Neo-Confucianism*, edited by Wing-tsit Chan (Honolulu, 1986).

Mu's *Zhuzi xin xuean* (Taipei, 1971) remains authoritative. Wing-tsit Chan's *Zhu xue lunji* (Taipei, 1982) includes an essay on Zhu Xi's religious practice. An excellent study published in the Peoples' Republic is Zhang Liwen's *Zhu Xi sixiang yanjiu* (Beijing, 1981). Japanese scholars have made major contributions to the study of Zhu Xi. An extensive modern transla-

tion of Zhu Xi and others associated with him is the fifteen-volume *Shushigaku taikai* (Tokyo, 1974–1983).

CONRAD SCHIROKAUER (1987 AND 2005)

ZIMMER, HEINRICH ROBERT (1890–1943), German Indologist and comparative mythologist. Son of the Sanskritist and Celticist Heinrich Friedrich Zimmer (1850–1910), Heinrich (Henry) Robert Zimmer was born in Greifswald, in present-day Germany, on December 6, 1890. Beginning his studies in Berlin in Hebrew literature, Germanics, and art history, he received his doctorate in 1913 with a thesis on India's traditional system of *gotras*. After service in World War I, he qualified as professor at Greifswald and then moved to Heidelberg in 1922. Zimmer's marriage to Christiane von Hofmannsthal, daughter of the Jewish poet Hugo von Hofmannsthal, and his consistent outspokenness as an anti-Nazi were causes for his eventual dismissal from the university in 1938. After lecturing at Oxford and Johns Hopkins universities, Zimmer was appointed visiting lecturer at Columbia University in 1941. He died of pneumonia two years later, on March 20, 1943.

Although the son of one of Germany's pioneering Indologists, whose *Altindische Leben: Die Kultur der vedischen Arier* is a landmark in Vedic studies, Heinrich Zimmer is most often linked rather to two other persons: Joseph Campbell and, particularly, C. G. Jung. Jung apparently first learned of Zimmer through the latter's *Kunstsform und Yoga im indischen Kultbild* (1926), a work that introduced Tantric studies to Jung and to much of educated Europe. Zimmer and Jung first met in 1932, and their deep friendship, based on shared strong interests, had important consequences for both; not least important was their joint founding of the Psychology Seminar of Zurich. As editor of Zimmer's posthumous English publications, upon which Zimmer's reputation principally rests, Joseph Campbell's role also has been extremely important.

Zimmer's passionate interest in Indian thought and spirituality as witnesses to the universal aspirations of the human spirit marked something of a departure from contemporary and immediately preceding continental approaches to the study of India's religions, and is reminiscent rather of the attitudes of such late eighteenth- and early nineteenth-century German Romantics as Wilhelm and Friedrich Schlegel. With Sir John Woodroffe (also known as Arthur Avalon), who seems strongly to have influenced his own thought, Zimmer was among the first in the twentieth century to urge that understanding the adventure of Indian religious and philosophical thought would help one better understand one's own situation in the world. This enthusiastic, personal element represents an early flowering of a new, "second-generation" attitude in the European study of non-European religious thought and culture. Rather than holding the "alien" cultural material at arm's length, Zimmer embraced it (though he was never able to fulfill his wish to visit

India). While his enthusiasm led to certain excesses and disputable interpretations of India's religions, Zimmer's own example eloquently suggests the importance of such enthusiasm for true understanding. In Jung's words, Zimmer's was "a spirit that overcame the limitations of the specialist and, turning towards humanity, bestowed upon it the joyous gift of eternal fruit" (Jung, *Collected Works*, vol. 11, 1963, p. 577).

BIBLIOGRAPHY

Had Zimmer written nothing else, his *The Art of Indian Asia*, 2 vols., completed and edited by Joseph Campbell (New York, 1950), would have assured his reputation and importance. Four others of his works are available in English. His important *Kunstsform und Yoga im indischen Kultbild* (Berlin, 1926) is now translated into English by Gerald Chapple and James B. Lawson as *Artistic Form and Yoga in the Sacred Images of India* (Princeton, N.J., 1984). Joseph Campbell also completed and edited three further works. Possibly the most engaging of these is Zimmer's *Myths and Symbols in Indian Art and Civilization* (New York, 1946), which remains among the more useful introductions to traditional Indian thought and culture. The essays constituting *The King and the Corpse* (New York, 1948) well illustrate Zimmer's broad interests in comparative mythology and folklore. No doubt the liveliest introduction to the sweep of classical Hindu, Buddhist, and Jain philosophy is his *Philosophies of India* (New York, 1951), though some of his interpretations must be treated with caution.

A charming autobiographical sketch written by Zimmer only three months before his death is included as an appendix in Chapple and Lawson's translation of *Kunstsform und Yoga* along with a select bibliography (pp. 243–267). *Heinrich Zimmer: Coming into His Own*, edited by Margaret H. Case (Princeton, N.J., 1994) is a volume of illuminating essays stemming from a 1990 Columbia University conference celebrating Zimmer's birth centenary. Among these essays are two personal reminiscences (one by Zimmer's daughter), Zimmer's own estimate of Jung's significance for his work, and helpful assessments of Joseph Campbell's role in preserving and transmitting Zimmer's scholarship by Wendy Doniger and Gerald Chapple. Inter alia, Chapple notes the substantial amount of Zimmer's scholarly and popular writing in German that remains untranslated.

G. R. WELBON (1987 AND 2005)

ZINZENDORF, NIKOLAUS (1700–1760), German nobleman, theologian, leader of the Moravian church; born Count Nikolaus Ludwig von Zinzendorf on May 26, 1700, in Dresden, Saxony. At his baptism his parents invited the electress of Saxony to be his godmother and the Pietist leader Philipp Jakob Spener to be his godfather. These choices represented the influences of noble lineage and pietistic devotion that were to be so decisive in Zinzendorf's later life.

Even as a child Zinzendorf displayed an extraordinary interest in religious matters. At the age of ten, following pri-

vate tutoring, he was sent to the Halle boarding school run by the Pietist leader August Hermann Francke. In 1716 he transferred to the orthodox Lutheran University of Wittenberg to prepare for a career as a lawyer, but he continued to read theological literature in his free time. His perennially irenic approach to theological disputes showed up in his ultimately unsuccessful attempts to arrange colloquiums for the exchange of views between the Pietists of Halle and the orthodox of Wittenberg.

With his formal training completed, Zinzendorf studied briefly at various universities and developed friendships with leading personalities, including the Jansenist cardinal archbishop of Paris, Louis de Noailles. Although Zinzendorf would have probably preferred ordination as a Lutheran pastor or to work with Francke at Halle, his family did not consider such possibilities appropriate for a nobleman, and he became a legal counselor. In September 1721 he married Countess Erdmuth Dorothea Reuss, also a committed Pietist, with whom he fathered twelve children.

In 1722 Zinzendorf purchased the Berthelsdorf estate from his grandmother and soon found himself with an unexpected opportunity to exercise his religious leadership when a group of religious refugees from neighboring Bohemia settled on his estate. They were heirs of the traditions of the Unity of Brethren, a group that had thrived a century earlier during the Hussite reformation. Persecution had forced them to continue their religious practices underground and sometimes to leave their homeland as refugees. The leadership of these people consumed Zinzendorf's considerable energies for the rest of his life. The newly established town of Herrnhut, with its unique communal organization and economic self-sufficiency, became the center for the developing Moravian church, as it became known in the late 1740s.

In 1735, after examination by the theological faculties of the Universities of Stralsund and Tübingen, Zinzendorf's desire to receive Lutheran ordination was finally realized. With the revival of the Brethren's clerical orders, he was consecrated a Moravian bishop in 1737. These events signaled the emergence of a new denomination and created legal difficulties for Zinzendorf, resulting in banishment from Saxony from 1736 to 1747. During this period he visited Moravian settlements and missions in Europe, England, the West Indies, and America. From the mid-1740s to 1750, Zinzendorf and some of his followers displayed a marked tendency to carry certain of his ideas to emotional excess. This approach was finally rejected and years later came to be regarded as the "sifting time." The Moravians were granted religious freedom in Saxony in 1749, and six years later the count returned to spend his last days in Herrnhut. When the countess died in 1756, Zinzendorf entered into a morganatic marriage with Anna Nitschmann, a leader of the Single Sisters Choir, one of the church's residential groups.

Zinzendorf's extensive involvement in the practical life of the church and his belief that it was not possible to produce a system of theology kept him from producing a com-

prehensive presentation of his often-original ideas. Throughout his life he worked at new translations of the Bible, incorporating the use of popular language, rearrangements of the books in order of historical origin, harmonization of the Passion accounts, and an abridged Old Testament. He also produced attempts at Lutheran and Reformed catechisms, prepared numerous sermons, and wrote religious poetry and hymns.

In his theology Zinzendorf sought an alternative to the rationalism of the Enlightenment and the sterility of Lutheran orthodoxy. His answer was "heart religion." His christocentricity derived from his belief that God is a person, not a system, and can be known only through the Son, who reveals the Father. To experience Christ in the inner senses is the true essence of religion. From this central idea flows Zinzendorf's interest in experiential language, including reference to the Holy Spirit as "Mother." Likewise, "heart religion" knows no creedal or institutional boundaries; hence Zinzendorf's radical ecumenicity. The relationship with Christ produces joy in the believer; Zinzendorf's thought departed from traditional Pietism's emphasis upon struggle and conversion to focus on the results of this relationship. A startlingly creative thinker in his day, Zinzendorf's influences are apparent in the later theology of Friedrich Schleiermacher with his attention to religious feeling and in the Christocentric emphasis of Karl Barth.

BIBLIOGRAPHY

Erich Beyreuther and Gerhard Meyer have edited Zinzendorf's *Hauptschriften*, 6 vols. (Hildesheim, 1962–1963), along with *Ergänzungsbände zu den Hauptschriften*, 12 vols. (Hildesheim, 1964–1972), photographically reproduced original editions. An excellent introduction to Zinzendorf's role within Pietism and a summary of his theology is provided by F. Ernest Stoeffler in his *German Pietism during the Eighteenth Century* (Leiden, 1973). See also Arthur J. Freeman *An Ecumenical Theology of the Heart: the Theology of Count Nicholas Ludwig von Zinzendorf* (Bethlehem, Pennsylvania, 1998) and Gary S. Kinkel *Our Dear Mother the Spirit: an Investigation of Count Zinzendorf's Theology and Praxis* (Lanham, Md., 1990). George W. Forell has translated Zinzendorf's sermons in *Nicholaus Ludwig Count von Zinzendorf: Nine Public Lectures on Important Subjects in Religion* (Iowa City, Iowa, 1973). *A Collection of Sermons from Zinzendorf's Pennsylvania Journey* has been published (Bethlehem, Pa., 2001) by Julie Tomberlin-Weber, translator, and Craig Atwood, editor. Stoeffler and Forell both provide helpful bibliographies. The best modern biography is *Count Zinzendorf* by John R. Weinlich (Nashville, Tenn., 1956).

DAVID A. SCHATTSCHNEIDER (1987 AND 2005)

ZIONISM. The origin of the word *Zion* is unclear. It most likely derives from a word meaning "rock" or "stronghold" or perhaps "a dry place." The first occurrence of the

name is in *2 Samuel* 5:7, where David captures the Jebusite city of Jerusalem. The “fortress of Zion” appears to have been the Jebusite name for the place that was henceforth to be called “the citadel of David.” But although Jebusite in origin, the name Zion (Hebrew, *Tsiyyon*) was assimilated into the Israelite vocabulary and became associated with the Davidic monarchy and its capital in Jerusalem. In writings of such prophets as “First Isaiah” and Jeremiah and in *Psalms*, the name Zion is used as a synonym first for the Temple in Jerusalem, then for the kingdom of Judah, and finally, in postexilic literature, for the Land of Israel. In the Babylonian exile the psalmist wrote: “By the waters of Babylon / There we sat down, yea, we wept / When we remembered Zion” (*Ps.* 137:1). Thus what was first a specific place-name came to represent symbolically the whole Land of Israel, whose people had been exiled. The particular associations between Zion and the Davidic monarchy gave the word a special resonance in later messianic literature that expressed longing not only for the return of the people to their land but also for the reestablishment of the kingdom of David.

A particular tension has informed the Jewish relationship to Zion since biblical times. On the one hand, the Land of Israel is regarded as a land specially promised to the ancient Israelites and their descendants (the term *Holy Land*, however, only appears once in the Hebrew Bible). According to this position, the Israelite God can be worshiped only on this sanctified territory. Thus when David flees from Saul to the land of the Philistines, he laments that “[men] have driven me out this day that I should have no share in the heritage of the Lord, saying ‘Go and serve other gods’” (*I Sm.* 26:19). In Psalm 137, verse 4 the writer wonders, “How shall we sing the song of YHVH in a foreign land?” In both biblical and rabbinic law, much of the agricultural, ritual, and even civil law applied only to the Land of Israel.

On the other hand, a strong universalist tendency already developed in biblical times held that God rules over all the world and can be worshipped anywhere. This tendency became particularly prominent as a result of the Babylonian exile and found expression in such exilic writers as “Second Isaiah” (*Is.* 40ff.). In some of this literature there is even a hint of criticism against those who wished to limit worship of God to Zion: “Thus says YHVH: with heaven my throne and earth my footstool, what house could you build me, what place could you make for my rest?” (*Is.* 66:1).

The realities of Jewish life during and after the Second Temple period (538 BCE–70 CE) made a combination of these positions necessary. From the time of the Babylonian exile, a large Jewish community developed outside the Land of Israel and became particularly prominent during the Hellenistic and Roman Empires. Even before the destruction of the Second Temple in 70 CE and the Bar Kokhba Revolt (132–135 CE), the Jews of the Diaspora probably constituted a majority of the Jewish people. Nevertheless these Jews maintained a strong connection with the Land of Israel and its religious institutions. They made regular pilgrimages to

the Temple and contributed money to it for sacrifices. After the Temple was destroyed, the Palestinian community remained important until the late third century, when it began to decline, and following the Muslim conquest in the seventh century, it ceased to play a significant role in Jewish life. Even after the Temple was destroyed, the Land of Israel continued to function as a religious center for Diaspora communities, owing in part to the continuing authority of the Palestinian rabbis. But at the same time the emerging rabbinic center in Babylonia challenged its Palestinian counterparts and insisted on the equal—or sometimes even the greater—importance of its own community. From a legal point of view, these rabbis did not legislate that one must live in the land in order to fulfill all those commandments that could only be realized there. But they did make the decision of a man to “go up” to the land binding on his wife.

The rabbis developed rituals that could be practiced anywhere and yet were designed to preserve the memory of the Temple (*zekher le-hurban*). Such ceremonies included leaving a small area of wall unfinished in one’s house. It was during this period that prayers were added to the daily service that pleaded with God:

Sound the great shofar for our freedom; raise the standard for the gathering of our exiles, and assemble us from the four corners of the earth. . . . Restore our judges as of old. . . . And to Jerusalem thy city return in mercy and dwell therein as thou has spoken, rebuild it soon in our days as an everlasting building, and speedily set up therein the throne of David. (The Daily Prayer Book)

MEDIEVAL PERIOD. The spiritual connection to Zion was kept alive during the Middle Ages primarily through literature. To be sure through the centuries there were individual Jews who made pilgrimages or actually settled in the Land of Israel, but no theology of pilgrimage developed, nor was it seen as religious obligation. The theme of Zion played an important role in the medieval liturgical poems (*piyyutim*) and especially in the lamentation poem (*qinot*) recited on the Ninth of Av (the day, according to tradition, on which the First and Second Temples were destroyed).

The best examples of secular poetry devoted to longing for Zion are found during the “classical age” of the Spanish Jews (900–1200 CE). Two themes intermingle in this poetry: descriptions of the beauty of Zion and lamentations for its ruin. Some of the Spanish Jewish writers achieved high positions in Spanish society, but their work reflects persistent attachment to the land of their forefathers. Shemu’el ha-Nagid (933–1055/6 CE) was the vizier of Granada and the commander of its army. One of his poems, “My Heart Waxes Hot within Me,” celebrates victory over his enemies, but the first part is a lament over the destruction of Zion. Thus Shemu’el’s pride over his military accomplishments was tempered by the feeling that they were incomplete as long as the Jews lived in exile.

Perhaps the most outstanding representative of this school of poets was Yehudah ha-Levi (c. 1075–1141), whose

Shirei Tsiyyon (Songs of Zion) inspired many imitations later in the Middle Ages. One of his poems, (“Zion, Will You Not Seek the Welfare of Your Prisoners?”) was included in the liturgy of the Ninth of Av. In another, titled, “My Heart is in the East,” he wrote:

My heart is in the East and I am at the edge of the West
How then can I taste what I eat, how can I enjoy it?
How can I fulfill my vows and pledges, while Zion is
in the domain of Edom [i.e., the Christian Crusaders]
and I am in the bonds of Arabia [i.e., Muslim Spain]?
It would be easy for me to leave behind the good things
of Spain, just as It would be glorious to see the dust of
the ruined Shrine. (*The Penguin Book of Hebrew Verse*)

Ha-Levi emigrated to the Land of Israel toward the end of his life, although whether he moved out of ideological or pragmatic reasons remains disputed.

Moses Nahmanides (1194–1270), the twelfth-century Spanish commentator, philosopher, and mystic, who died in the land in 1270, advanced the most radical position on settlement in the land. Not only did he view it as a religious obligation, but he held that it was perhaps the cardinal obligation. Where other thinkers had noted the fact that perhaps a third of the laws of biblical and rabbinic Judaism pertained to the land—and especially to its agriculture—Nahmanides suggested that all of the commandments required performance in the land if they were to achieve their full mystical effect on the divine.

This proto-Zionist sentiment cannot be dissociated from medieval Jewish messianism. All messianic thinkers in the Middle Ages considered the return to Zion to be among the primary tasks of the Messiah. Even as messianic expectations were embroidered with supernatural fantasies, such as the belief in the resurrection of the dead, the core of Jewish messianism remained political and nationalistic: the Messiah would return the Jews to Zion, reestablish the kingdom of David, and rebuild the Temple in Jerusalem. The movements mentioned here were all attempts to spark the messianic process by encouraging human beings to take the first steps of resettling the Land of Israel. In the seventeenth century the Shabbatean movement caused Jews throughout the world to prepare themselves for the imminent return to Zion, a hope largely dashed when the putative Messiah, Shabbetai Tsevi (1626–1676), converted to Islam in 1667.

On the other hand, another group of medieval thinkers deemphasized the importance of immigration to Zion. Some, such as Ḥayyim Kohen (twelfth century), saw no obligation to live in the Land of Israel since the commandments pertaining to the land could not be observed until the coming of the Messiah. Meir ben Baruch of Rothenburg (c. 1220–1293) argued that it is permissible to leave the Land of Israel to study the Torah. Similarly Moses Maimonides (Mosheh ben Maimon, 1135/8–1204), the most renowned of medieval Jewish philosophers and legal scholars, gave greater emphasis to the study of the Torah than to awaiting or hastening the coming of the Messiah. In his code of Jewish

law (*Mishneh Torah*, c. 1180), Maimonides did not include settling in the land as one of the 613 commandments. For Maimonides the central event in Jewish history was at Mount Sinai, and the return to Zion in messianic times would be a means toward uninterrupted study of the law revealed at Sinai. Although Maimonides clearly believed in the coming of the Messiah (which he understood as a realistic and not solely supernatural process), he subordinated Zion to Sinai.

This trend of thought became even more pronounced in eighteenth-century Hasidism, which, as Gershom Scholem (1897–1981) has argued, frequently played down expectations of the imminent coming of the Messiah. Dov Ber, the *maggid* of Mezhrich (1704–1772), believed that the qabbalistic task of “raising the sparks” might be more effectively accomplished in the lands of the exile. Naḥman of Bratslav (1772–1810), who was perhaps the most messianic of the Hasidic masters, stretched the holiness of the Land of Israel to encompass all the lands in which the Jews lived, thus spiritualizing what had hitherto been a concrete concept.

THE NINETEENTH CENTURY. In the nineteenth century the forces of modern nationalism, released by the French Revolution, awakened nationalist hopes among the Jews throughout Europe. Although emancipation and assimilation caused many Jews, particularly in western and central Europe, to identify with the national aspirations of the countries in which they lived, increases in anti-Semitism and the failure of emancipation to fulfill its promises refocused attention on Zion. The nineteenth century thus witnessed a fusing of traditional messianism with modern nationalism that culminated in the emergence of modern Zionism at the end of the century.

Two important intellectual developments in the nineteenth century, among both modernizing and traditional Jews, prepared the ground for Zionism. The first was the movement of Jewish Enlightenment (*Haskalah*), which began in Germany in the late eighteenth century and spread to eastern Europe in the nineteenth. The *Haskalah* developed in two directions with respect to Zion. On the one hand, there was a general tendency to promote the emancipation of the Jews in Europe by glorifying the European nations. The Reform movement in Germany, which was one product of enlightenment, deleted references to Zion in the prayer book and emphasized the patriotic attachment of Jews to their native countries. Some *Haskalah* writers used messianic language to describe European rulers, such as Joseph II of Austria (1741–1790) and Alexander II of Russia (1818–1881), who were perceived as particularly sympathetic to the Jews.

On the other hand, much of the new Hebrew literature written by *Haskalah* authors, especially in eastern Europe, harkened back to the land of the Bible. Avraham Mapu (1808–1867), the first Hebrew novelist, placed the plots of two of his novels, *Ahavat Tsiyyon* (Love of Zion, 1853) and *Ashmat Shomron* (Guilt of Shomron, 1865–1866), in roman-

tic biblical settings. Hebrew newspapers such as *Ha-shahar* and *Ha-maggid*, published in Russia, also fostered interest in the Land of Israel and countered assimilationist tendencies by arguing for a Jewish national consciousness. In addition the activities of western European Jewish philanthropists, such as Edmund de Rothschild (1845–1934), Adolphe Crémieux (1796–1880), and Moses Montefiore (1784–1885), in settling Jews in Palestine fostered the beginnings of the modern settlement in the country. Thus both in literature and philanthropy modern “enlightened” Jews created the basis for a Zionist movement.

One secular Jewish thinker of particular importance was Moses Hess (1812–1875). Hess was one of the early leaders of European socialism. Following the 1848 revolutions, he withdrew from political activity and became interested in the history of national groups. He rediscovered his Jewish origins and became a fervent advocate of Jewish nationalism. In his *Rome and Jerusalem* (1862), he advanced a proposal for the renewal of the Jewish state, arguing that the continuation of the Jewish people could be justified only on national, rather than religious, grounds.

The second important nineteenth-century development was among traditional Jews. Tsevi Hirsch Kalischer (1795–1874) appealed to the Rothschild family to buy the Land of Israel from Muḥammad ‘Alī (1769–1849), the ruler of Egypt. Kalischer developed a plan to reinstitute the ancient sacrifices on the Temple mount as a way of hastening the coming of the Messiah. He based his messianic doctrine, which called for human initiative, on Moses Maimonides, who had argued that certain human actions might precede the actual coming of the Messiah. Later, following the Damascus blood libel affair of 1840 and the attempt by Western philanthropists to rescue the Damascus Jews, Kalischer advocated agricultural settlement in the Land of Israel. However, even in his later writings, which put forward this kind of practical suggestion, Kalischer never abandoned his messianic expectations, nor did he give up his hope that the sacrifices might be reinstated by the new settlers.

A similar kind of religious “Zionism” can be found in the writings of Yehudah ben Shelomoh Alkalai (1798–1878), who until the Damascus Affair was an obscure preacher in the Balkans. Like Kalischer, Alkalai argued in numerous pamphlets for Jewish settlement in the Holy Land as a means toward bringing the Messiah.

The writings of Kalischer and Alkalai had little immediate effect, although there was an increase in immigration to Palestine by Orthodox Jews throughout the nineteenth century. New communities of religious Jews were established outside the walls of Jerusalem, in some cases with the help of philanthropists like Montefiore. In 1878 a group of Orthodox Jews established the first agricultural colony, Petach Tikva. Despite their traditionalist orientation, these religious Jews made important contributions in laying the groundwork for the later Zionist settlement.

MODERN SECULAR ZIONISM. The rise of anti-Semitism in France, Germany, and Russia in the last quarter of the nineteenth century raised serious questions about the prospects of Jewish integration into European society. Under the influence of modern nationalist ideas, a number of secular or partially secular Jews in several countries began to conceive of a Jewish homeland as the only answer to the Jewish situation. In addition to the political problem of anti-Semitism, many of these thinkers felt that the growing problem of Jewish assimilation could be addressed only by the creation of a Jewish society with its own national culture.

The new Zionist thinkers attempted to combine the ideas of secular nationalism with the messianic aspirations still cultivated by the large population of traditional Jews. Indeed it might be argued that Zionism emerged when it did as a result of the influence of modern nationalism, but that it emerged at all was a result of the persistence of the age-old religious longing for Zion. Yet the tensions between these seemingly similar national ideals were evident from the inception of modern Zionism, and they continue to characterize the conflict between the secular and the religious in modern Israel.

Following the pogroms in Russia in 1881, a group of eastern European intellectuals formed the *Ḥibbat Tsiyyon* (Love of Zion). The members of this movement came from both of the groups previously mentioned: followers of the Haskalah and religious figures. *Ḥibbat Tsiyyon* was primarily a practical movement that sought to foster settlement and agricultural development in Palestine. It borrowed its ideology of “productivization” of the Jews from the earlier Haskalah. The *Ḥibbat Tsiyyon* was a response to the mass emigration of Jews from Russia that began in the wake of the pogroms, and it tried to direct the immigration to Palestine instead of to western Europe and America. Although the *Ḥibbat Tsiyyon* sponsored a number of colonies in Palestine, it never became a mass movement, and its impact was largely on Russian Jewish intellectuals.

Modern Zionism really began with Theodor Herzl (1860–1904). The term Zionism was coined in 1890 by Nathan Birnbaum (1864–1937) in his journal *Selbstemanzipation* and was adopted by Herzl and his followers at the First Zionist Congress in 1897. Although some rabbis supported Herzl, most members of the movement, including Herzl himself, were secular and Westernized. Nevertheless Herzl was greeted by many eastern European Jews as a messianic figure. The first substantial Zionist emigration from eastern Europe to Palestine started after the pogroms of 1903 and 1905 to 1906 and was largely made up of young secular Russian Jews, many of whom were influenced by the Russian radicalism of the period.

The attitude toward religion among the early secular Zionist thinkers was frequently quite hostile. Traditional Judaism was viewed as the religion of the exile, and the Zionists saw themselves as a movement to “negate the exile” (*shelilat ha-golah*). This position received its sharpest expression in

the writings of M. Y. Berdichevsky (1865–1921), J. H. Brenner (1881–1921), and Jacob Klatzkin (1882–1948). Berdichevsky, for example, saw the whole religious Jewish tradition, going back to Mount Sinai, as being opposed to a proud national life, and he wished to create a “new Hebrew man” based on a “Nietzschean” countertradition of strength and naturalism. Berdichevsky traced this countertradition back to the biblical period, when, he believed, the ancient Hebrews followed a revelation from Mount Gerizim, mentioned in *Deuteronomy* 27:11–26, that was opposed to the “ethical” Torah of Mount Sinai. The prophets, and later the rabbis, suppressed this Torah of nature, but it persisted in heretical movements and splinter sects, such as the first-century Zealots and the eighteenth-century Ḥasidim. This idea, that the Jews had been misled by the rabbis and had followed a tradition alien to their roots, had an important influence on the more radical secular Zionist attitudes toward the Jewish religion.

Nevertheless there were other secular Zionists who tried to base the new Zionist culture on elements from the religious tradition. Aḥad ha-‘Am (the pen name of Asher Ginsberg, 1856–1927) tried to develop a secular Judaism based on certain principles from the Jewish heritage. He believed that the Jewish religion was one expression of a wider Jewish national culture. The elements that a secular Judaism might borrow from the tradition varied in Aḥad ha-‘Am’s writings (sometimes “absolute monotheism” was stressed, other times “liberal ethics”), but he held that the development of this culture was possible only in a Jewish national home. This national cultural center would in turn revitalize the Jewish Diaspora, which had been spiritually weakened by assimilation and the decline of the Jewish religion.

A number of the leaders of the secular Zionist labor movement also tried, with varying degrees of success, to incorporate a more positive attitude toward the Jewish religion into their secular ideologies. Aharon David Gordon (1856–1922), who was one of the pioneers of the early agricultural settlements, developed a religion of labor based on a mystical bond between the Jew and the Land of Israel. Physical labor on the national soil is a way of renewing the self and bringing it into harmony with the cosmos. Although Gordon was not a practicing Orthodox Jew, his philosophy relied heavily on Jewish mysticism and Hasidism as well as on Tolstoyan ideals.

Another labor leader, Berl Katzenelson (1887–1944), argued for the adaptation of traditional Jewish holidays and rituals to the new national home. Katzenelson, who was enormously influential as a cultural and ideological writer, laid the groundwork for a secular national culture that had its roots in Jewish tradition. Similarly the first prime minister of Israel, David Ben Gurion (1886–1973), sought to base the new national culture on a return to the Bible, a theme that had precedent among the Haskalah writers of the nineteenth century.

The ambivalence toward the Jewish tradition that one finds in many of these early secular Zionists had much to do with their biographies. In most cases they came from traditional homes and were educated in the *yeshivot* (rabbinic academies) of eastern Europe. Zionism was a radical revolution for them against the world of their childhood, but they never fully broke with their memories of this religious culture. Even if their way of life was secular, they wished to recreate an authentic Jewish culture on a new, national basis.

If the labor Zionists were ambivalent at best toward the Jewish religion, their counterparts in the Revisionist Zionist Party (organized in 1925) were militant. The Revisionists were led by Vladimir Jabotinsky (1880–1940), the Russian-Jewish journalist and poet, and they acquired the reputation of a right-wing, nationalist movement. Although Jabotinsky had a few religious followers, his movement was generally adamantly secular and opposed to religion. In the 1940s a splinter group under the poet Yonatan Ratosh (1908–1981) broke off from the Revisionists and formed the Young Hebrew, or “Canaanite,” movement (the latter term was originally used by their opponents). The Canaanites saw the Jews as a religious group whose history was in the exile, whereas the new Hebrew community in Palestine was to break from the religious past and develop its own indigenous culture. The Canaanites were inspired by the myths of the ancient Canaanites that were uncovered in the Ras Shamra excavations of the 1930s. Although the Canaanites were an extreme nativist movement, their thought points to an important trend in Israeli culture away from traditional Jewish religion and toward a new national culture that might incorporate ancient Near Eastern myths.

RELIGIOUS ZIONISM. Although the majority of the Orthodox Jewish world was either indifferent or opposed to Herzl’s Zionist movement, there was a significant group that responded favorably to the idea of a Jewish state. Among the first rabbis to join Herzl were Yitshaq Ya‘aqov Reines (1839–1915) and Shemu‘el Mohilever (1824–1898), who was perhaps the most prominent rabbi in the Ḥibbat Tsiyyon movement. In 1902 Reines formed Mizraḥi, a religious faction within the World Zionist Organization (the name is a composite of some of the Hebrew letters from the words *merkaz ruhani*, “spiritual center”). Mizraḥi consisted of two groups, one that opposed the introduction of any “cultural” issues into the Zionist movement, for fear that the secularists would set the tone in such endeavors, and another that saw that Zionism could not avoid confronting cultural questions and demanded that Mizraḥi try to influence the Zionist movement in a religious direction. Although the “political” faction was initially predominant, the Mizraḥi movement ultimately saw as its *raison d’être* the fostering of religious education and public religious practice in the Zionist settlement in Palestine and later the state of Israel.

Mizraḥi played a major role in mustering support for Zionism among Orthodox Jews in Europe and the United States. It created a network of schools in which Zionism was

taught together with traditional religious subjects. At the same time Mizrahi established schools in Palestine that formed the backbone of the religious educational system that is an important part of the general educational system in the contemporary state of Israel. The Mizrahi youth movements, Young Mizrahi and Benei Akiva, began establishing agricultural settlements in Palestine in the 1920s.

The Mizrahi joined three other religious parties to create a religious faction in the first Israeli governing coalition. In 1956 they formed the National Religious Party (NRP) and Po'el Mizrahi (Mizrahi workers). The NRP has sat in every Israeli government (with the exception of one year) to date and regularly receives approximately 10 percent of the vote. However, this percentage began to drop in the 1980s with the defection of more nationalist elements to other, nonreligious parties and the emergence of the ultraorthodox Shas Party, which appealed to Jews of Middle Eastern and North African origin. Despite its relatively small share of the national vote, the NRP has constituted an important "swing" element in Israeli governments since neither the Labor Alignment nor the Likud Party has been able to win a clear majority. Thus the NRP has exerted disproportionate influence on Israeli politics and on the role of religion in Israeli society.

Since its inception the Mizrahi sought to avoid the problem of the relationship of Zionism to Jewish messianism. Much opposition to Zionism in the religious world stemmed from the belief that human beings should not "force the end" (i.e., initiate messianic times by secular means). Instead of answering this position with a new messianic theory, the adherents of Mizrahi took a cautious stance, claiming that the Zionist movement constituted a "beginning of redemption." They saw their role as guaranteeing that the future redemption would not be ruined by the heretical actions of the secular Zionists.

There were, however, certain elements among the religious Zionists who took a bolder approach to the question of messianism. Primary among these was Avraham Yitshaq Kook (1865–1935), who became chief rabbi of Jaffa in 1904 and then chief Ashkenazic rabbi of Palestine from 1921 until his death in 1935. Kook held that redemption had begun with the Zionist movement, and in anticipation of imminent messianic times, he fostered study of the sacrificial laws in his *yeshivah*. Unlike other religious Zionists and religious anti-Zionists, Kook believed the secular pioneers were a necessary force to prepare the material foundation for messianic times. He argued dialectically that the profane was necessary for subsequent emergence of the sacred. Kook met frequently with leaders of the labor Zionist movement and developed close ties with them. As chief rabbi of Jaffa he played a central role in 1909 in the attempt to solve the problem of the *shemittah*, the agricultural sabbatical during which land owned by Jews in the Land of Israel is supposed to lie fallow. Kook arranged for sale of such land to a non-Jew, which allowed it to be worked by Jews and permitted the continua-

tion of the agricultural settlements. Kook's unusually positive attitude toward the secular Zionist movement was based on his belief that, when Zionism succeeded, messianic times would come and the Zionist movement would itself return to its unconscious religious roots.

Kook's messianic philosophy had little direct impact on the religious Zionist parties, but it did influence a new generation of religious Israelis, particularly through the Merkaz ha-Rav Yeshivah in Jerusalem, established by Kook and headed by his son Tsevi Yehudah Kook (1891–1982) until the latter's death. This new generation did not accept the compromise position of the older leaders of Mizrahi, who believed that the religious parties should primarily guard the religious status quo in the state of Israel. The young religious Zionists, who grew up after the creation of the state in 1948, believed strongly in Zionism as the fulfillment of traditional Jewish messianism. This belief took political expression after the Six-Day War of 1967. Young religious Israelis reestablished the settlements in the Etsion bloc south of Jerusalem and created a Jewish outpost in Hebron in 1968. (This illegal settlement was later recognized by the government and developed into the town of Qiryat Arba outside of Hebron.) In 1974, following the Yom Kippur War, these religious activists founded the Gush Emunim (bloc of the faithful) movement, which advocated the incorporation of Judea and Samaria (the West Bank of the Jordan River) into Israel. The Gush Emunim led a settlement drive in these areas, sometimes with the support of the Israeli government and sometimes illegally. They constituted a significant messianic force in Israeli politics and formed alliances with secular nationalist forces.

RELIGIOUS INSTITUTIONS IN THE STATE OF ISRAEL. Under both the Ottoman Empire and the British Mandate, Jewish religious courts enjoyed official jurisdiction over matrimonial and inheritance law. The office of the *bakham basi* in the Ottoman Empire was succeeded by the Ashkenazic and Sefardic chief rabbis under the British Mandate. These functions were carried over to the rabbinic courts and the chief rabbinate of the state of Israel, which were given jurisdiction over matters of personal law by a Knesset enactment of 1953. Rabbinical judges were given the same status as district court judges, and their decisions were enforced by the civil authorities. Thus in matters of marriage, divorce, and child custody, rabbinic courts—ruling according to Jewish law (*halak-hah*)—have state sanction. Civil marriage and divorce do not exist, although civil marriages are recognized if contracted abroad. The Ministry of Religious Affairs deals with the needs of the various religious communities in Israel and funds the construction and maintenance of synagogues, *yeshivot*, and other religious facilities.

Although both the Conservative and Reform movements have small followings in Israel, their rabbis are not authorized by the rabbinate to perform marriages, and they do not benefit from the budgets available through the Ministry of Religious Affairs. Conversion to Judaism is supervised by

the rabbinate, and thus Conservative and Reform conversions are not recognized as valid unless contracted abroad.

Although the majority of the Jewish citizens of Israel are secular or quasi-traditional, a religious status quo is maintained. The Sabbath is the national day of rest, and Jewish holidays are national holidays. Sabbath rules apply in public places at the discretion of local municipalities, but the various political parties have undertaken to maintain the practices that have existed since the creation of the state. In the 1977 and 1982 coalition agreements, the Agudat Yisra'el Party, which represents some of the most orthodox elements, demanded certain changes in the status quo, such as cancellation of Sabbath flights by the national airline, El Al.

The problem of religion in the state of Israel is connected more generally to the question of a Jewish state. According to the Orthodox interpretation, a Jewish state would have to be a "theocratic" state governed by Jewish law (*halakhah*). At the opposite extreme, the secular nationalist argument holds that Israel should be a secular state in which synagogue and state are strictly separated and whose Jewish character is determined purely by the sociological makeup of its population. For the Orthodox the identity of the Jews can only be determined by the *halakhah*: one is a Jew only if born of a Jewish mother or converted by a *halakhic* procedure. For the secular Zionists anyone who declares himself or herself a Jew should be considered as such. Moreover some secular nationalists argue that a new Israeli identity should take the place of Jewish identity, which they regard as a religious relic of the years of exile. In a case in the 1960s the Israeli Supreme Court ruled that Jewish identity is not determined by the *halakhah*. The case concerned a Carmelite monk, Brother Daniel, who was born a Jew and had fought against the Nazis as a partisan. He requested Israeli citizenship under the Law of Return, arguing that, according to the *halakhah*, he remained a Jew even though he professed another religion. The court ruled against him with the argument that the conventional understanding of who is a Jew contradicted the *halakhah* in such a case and, since Israel is not a *halakhic* state, that the common definition should prevail. Similarly in 1970 the court ruled that a child born of a Jewish father and a non-Jewish mother might be registered as of "Israeli" rather than "Jewish" national identity. This decision would have set aside the concept of a corporate Jewish state in favor of a new secular Israeli identity. As a result of pressure from the religious Zionist parties and of discomfort on the part of many secular Zionists, the Knesset passed a law providing that only persons recognized as Jews by the *halakhah* might be registered as Jews by nationality. In 1980 the Knesset passed a law stipulating that, in matters in which there is no specific law or precedent, judges should be guided by "Hebrew jurisprudence" (*mishpat ivri*). Judges were directed to follow traditional Jewish law, but by avoiding the term *halakhah*, the Knesset was able to satisfy the secular refusal to accept a theocratic state. Thus the judicial system has generally attempted a secular definition of Jewish identity,

whereas the legislative system, responding to religious sentiments, has avoided such a break with tradition.

The immigration of nearly a million Russian Jews following the breakup of the Soviet Union posed new challenges to Israel's identity. Many of these Russian Jews were of mixed parentage, and a large percentage (perhaps as many as a third) was not Jewish at all. The courts faced problems of whether fallen soldiers of Israel's army could be buried in Jewish cemeteries. The state faced another problem in 1994 with the immigration of Ethiopian Jews, whose religious traditions did not include rabbinic law. The rabbinate ruled that they were to be considered Jews, even though the weight of historical evidence seemed to preclude such ethnic descent on religious grounds.

ANTI-ZIONISM. There are a number of expressions of anti-Zionism based on religious motivations. In both Europe and America nineteenth-century Reform Judaism was unalterably opposed to a national definition of Judaism. The Pittsburgh Platform of 1885 specifically rejected any expectation of a return of the Jews to Zion. By 1937, however, the Reform movement had moved to a more neutral position and adopted the Columbus Platform, in which the "group loyalty" of the Jews is recognized and the Jewish community of Palestine is supported "not only [as] a haven of refuge for the oppressed but also [as] a center of Jewish culture and spiritual life" (Plaut, 1963–1965). Nevertheless a wing of the Reform movement, which formed the American Council for Judaism, actively opposed the creation of Israel in the 1940s. Following the Six-Day War, the Reform movement became explicitly Zionist and joined the World Zionist Organization. Reform Jews established several *kibbutsim* and congregations in Israel.

Among the Orthodox, Zionism was initially greeted with skepticism or hostility. The initial plan to hold the First Zionist Congress in Munich was canceled as a result of opposition by the German rabbis. In 1912 Agudat Yisra'el was formed by rabbis from Germany, Hungary, and Poland as an organization to advance orthodoxy in Jewish life. The Agudah opposed secular Zionism but maintained an ambivalent attitude toward settlement in the Land of Israel. Following the establishment of the state, the Agudah became a political party advocating a state based on the *halakhah*. The ideology of the movement opposes participation in Zionist governments, although its representatives have nevertheless from time to time held cabinet seats and although they provided coalition support for the government after 1977. The Agudah has used its political influence to strengthen its educational and religious institutions and has sought religious concessions from the Knesset, such as exemptions for religious girls from national service and stricter adherence to Sabbath rules. As opposed to the National Religious Party, the Agudah considers itself non-Zionist and does not identify with the national goals of the state.

In the 1980s the Shas Party was formed under the spiritual leadership of Rabbi 'Ovadyah Yosef (b. 1920), an Iraqi-

born sage who served as chief Sefardic rabbi of Israel. The Shas Party appealed primarily to Jews of Middle Eastern and North African origin and defined itself as non-Zionist, by which it meant that, like the Agudat Yisra'el, it favored a theocratic state in place of the secular state of Israel. But Shas was characterized more by pragmatism, seeking state subsidies for its extensive network of schools and social services for its constituents.

A more extreme anti-Zionist group is the Neturei Karta (guardians of the city), which broke off from Agudat Yisra'el in 1935. The Neturei Karta are largely followers of the Satmar Hasidic sect. Neturei Karta opposed the creation of the state of Israel and regarded Zionism as a heinous sin that prevents the coming of the Messiah. They believe the Nazi Holocaust was punishment for secular Zionism, and they declared their willingness to participate in an Arab government in Palestine. They clashed violently from time to time with the Israeli police in demonstrations against what they regard as violations of Jewish law in the state. The members of Neturei Karta live for the most part in Jerusalem, where they govern themselves, taking no services from the state and paying no taxes. They also have significant support from certain ultraorthodox Jews in the United States.

CONCLUSION. Modern Israel is the product of both secular and religious tendencies with origins in modern nationalism and in the traditional messianic connection to Zion. With the exception of the small anti-Zionist group, most Jews in the world, representing virtually the whole religious spectrum, support the basic aspirations of Zionism. Thus the character of the Jewish state—religious, secular, or some combination of both—remains an issue of political conflict among Zionists, but this conflict is also emblematic of the larger question of the relationship of religion to nationalism in the modern world.

BIBLIOGRAPHY

Two books devoted to the subject of Zion throughout the history of Jewish thought are Abraham S. Halkin, ed., *Zion in Jewish Literature* (New York, 1961), which contains essays on the biblical and rabbinic periods, medieval secular and religious poetry, and nineteenth-century Hebrew poetry and prose; and the more synthetic Jean-Christophe Attias and Esther Benbassa, *Israel, the Impossible Land* (Stanford, Calif., 2003). An additional source of Zionist poetry is *The Penguin Book of Hebrew Verse*, edited by T. Carmi (New York, 1981), which includes poetry by Yehudah ha-Levi. For additional articles on the biblical period, see Shemaryahu Talmon's "The Biblical Concept of Jerusalem," *Journal of Ecumenical Studies* 8 (1971): 300–316; and Ben Zion Dinaburg's "Zion and Jerusalem: Their Role in the Historic Consciousness of Israel" (in Hebrew), *Zion* 16 (1951): 1–17. Other valuable discussions of medieval writings are Yitzhak F. Baer's "Erez Yisrael and the Diaspora in the View of the Middle Ages" (in Hebrew), *Zion Yearbook* 6 (1946): 149–171; and H. H. Ben-Sasson's "Exile and Redemption through the Eyes of the

Spanish Exiles" (in Hebrew) in *Yitzhak F. Baer Jubilee Volume*, edited by S.W. Baron, B. Dinur, S. Ettinger, and I. Halperin (Jerusalem, 1960). A nationalist argument about the relationship between the Jews and Zion in Jewish history and especially the modern period is in Ben Zion Dinur's *Israel and the Diaspora* (Philadelphia, Pa., 1969). For the relationship of the Jewish Enlightenment to Zion, see Isaac F. Barzilay's "National and Anti-National Trends in the Berlin Haskalah," *Jewish Social Studies* 21 (1959): 165–192; and Jacob S. Raisin's *The Haskalah Movement in Russia* (Maple Shade, N.J., 2001), an old but still useful work. The attitude of nineteenth-century Reform is treated in W. Gunther Plaut's *The Rise of Reform Judaism* (New York, 1963–1965).

On the origins and history of the Zionist movement, see David Vital's *The Origins of Zionism* (Oxford, U.K., 1975) and *Zionism: The Formative Years* (Oxford, U.K., 1982). A good general history of Zionism is Walter Laqueur's *A History of Zionism* (New York, 1972). The history of Zionist thought has been treated by Shlomo Avineri in *The Making of Modern Zionism: The Intellectual Origins of the Jewish State* (New York, 1981) and by Ben Halpern in *The Idea of the Jewish State* (Cambridge, Mass., 1961). A good anthology of Zionist thought with a superb introductory essay is Arthur Hertzberg, ed., *The Zionist Idea* (Philadelphia, 1997). The specific issue of religion in the Zionist movement is treated by Ehud Luz, *Parallels Meet: Religion and Nationalism in the Early Zionist Movement (1882–1904)* (Philadelphia, 1988) and, in the state of Israel, by Ervin Birnbaum, *The Politics of Compromise: State and Religion in Israel* (Rutherford, N.J., 1970), Charles S. Liebman and Eliezer Don-Yehiya, *Religion and Politics in Israel* (Bloomington, Ind., 1984), and S. Zalmon Abramov, *Perpetual Dilemma: Jewish Religion in the Jewish State* (Rutherford, N.J., 1976). A good treatment of the relationship between Zionism and Jewish messianism is Aviezer Ravitzky, *Messianism, Zionism, and Jewish Religious Radicalism* (Chicago, 1996). An anthology of anti-Zionist thought is in Michael Selzer, ed., *Zionism Reconsidered* (New York, 1970). A semischolarly treatment of religion in Israel from the viewpoint of Neturei Karta is Emile Marmorstein's *Heaven at Bay: The Jewish Kulturkampf in the Holy Land* (London, 1969).

DAVID BIALE (1987 AND 2005)

ZODIAC SEE ASTROLOGY

ZOHAR. *Sefer ha-zohar* (The book of splendor) is the central book in the literature of Jewish mysticism (Qabbalah). It is attributed to Shim'on bar Yoh'ai, a second century tanna, but modern scholarship has concluded that it is a compilation dating from thirteenth-century Spain. Quotations from the *Zohar* first appear in qabbalistic writings after 1280, and analysis of the book's terminology and prose style shows that its real author is Mosheh de León (1240–1305), a Castilian qabbalist.

Written mostly in Aramaic, the *Zohar* presents an elaborate and comprehensive, though not always coherent, mysti-

cal system that employs audacious anthropomorphic and sexual imagery to express a mythical and symbolic perception of divine reality without precedent in medieval Qabbalah. The *Zohar* was accepted by qabbalists as an authoritative ancient work, and its influence on the later evolution of Jewish mysticism was felt principally through the impact of its mythical conceptions on qabbalistic theosophy.

The *Zohar* encompasses a series of qabbalistic works that can be divided into three main layers:

- (1) *Midrash ha-ne'elam* (The hidden Midrash) is considered to be the earliest stratum. Written partly in Hebrew, partly in Aramaic, it has overt affinities with Mosheh de León's early Hebrew works and an obvious tendency toward allegorical exegesis of biblical verses.
- (2) The bulk of the *Zohar* consists mainly of a homiletical interpretation of the Pentateuch, written in Aramaic and using symbolic exegesis. To this layer belong several shorter compositions, of which the most important are *Sifra' de-tseni'uta'* (The occult book), *Idra' rabba'* and *Idra' zutta'*.
- (3) The latest stratum is formed by two large compositions: *Tiqunei zohar*, which is composed of seventy interpretations of the word *bereshit* (the opening word of *Genesis*), and *Ra'ya' meheimna'* (The faithful shepherd), a qabbalistic interpretation of the rationale for the commandments.

Immediately after their appearance, the earlier strata of the *Zohar* were the subjects of commentaries by qabbalists. Yosef Angelino (early fourteenth century) compiled a commentary entitled *Livnat ha-sappir* on the portions of the *Zohar* that explain *Genesis* and *Leviticus*. In the late thirteenth century David ben Yehudah he-Ḥasid wrote *Sefer ha-gevul*, a commentary on *Idra' rabba'*. In the second half of the sixteenth century several important commentaries were composed including, Shim'on Lavi's *Ketem paz*, Mosheh Cordovero's *Or yaqar*, and works by Mosheh Isserles, Eliyahu Loans of Worms, Avraham Axulai, Avraham Galante, and Ḥayyim Vital. All subsequent commentaries extant were written under the influence of the reinterpretation of qabbalistic ideas by Isaac Luria, a fact that diminishes their contribution to understanding the text. The most important of these are by Shalom Buzaglo (seventeenth century) Eliyahu ben Shelomoh Zalman (known as the Gaon of Vilna [Vilnius]) in the eighteenth century, and Yitshaq Eizik Safrin of Komarno in the nineteenth century.

There are several Hebrew translations of the *Zohar*; the earliest, dating from the late thirteenth or early fourteenth century, is that of David ben Yehudah he-Ḥasid, who incorporated parts of it in his own qabbalistic works. Parts of the *Zohar* have been translated into Latin by Guillaume Postel and Knorr von Rosenroth. Larger translations exist in English (by Harry Sperling and Maurice Simon, 1931–1934; by Daniel Chanan Matt, 1983); in French (by Jean de Pauly, 1906–1911; by Charles Mopsik and B. Maruani, 1981); in

German (by Ernst Müller, 1932 and 1984); and in Italian (by L. Balducci, 1978).

MOSHE IDEL (1987)

ZOLLA, ELÉMIRE. Elémire Zolla (1926–2002), an Anglo-Italian polymath, writer, historian of ideas, metaphysical thinker, and spiritual seeker, has a unique place in twentieth-century religious, comparative, and cultural studies. His rigorous and passionate explorations of shamanism, Gnosticism, alchemy, and esoteric doctrines, and his original views on archetypes as the unifying patterns underlying historical processes, on the mystic state conceived as the crux and marrow of human experience, and on syncretism as the equalization of philosophies and religions on a trans-historical plan, make Zolla an unusual thinker, and a candidate for a nonparochial reconsideration of his spiritual anthropology. Zolla's work is imbued with the passion for truth that Abraham Joshua Heschel immediately recognized at the time of their first encounter in Rome in the late 1960s. In fact, Zolla was the dedicatee of the Italian edition of Heschel's *Passion for Truth* (1974).

A prominent and controversial figure on the Italian cultural scene from the late 1950s, Zolla became director of the Institute of Foreign Languages and Literatures at the University of Genoa, where he was also chair of Anglo-American literature and Germanic philology (1970–1974). In those same years, before transferring to the University of Rome to serve as professor of American literature, he directed the Ticinese Institute for Advanced Studies at Lugano, Switzerland, where he organized summer courses dealing with the metaphysical assumptions of Latin, Greek, Hindu, Chinese, Iranian, Hebrew, Islamic, and African civilizations. Zolla was also the founder and editor of an Italian-language journal in

cultural and religious studies, *Conoscenza religiosa* (1969–1983), and he was a regular contributor to numerous other journals, many in English. He served on the board of editors of *Cahiers de l'hermetisme*, *Connaissance des religions*, *Incognita*, and *Quaderni di Italianistica*, and was a member of the advisory board of the African Institute for the Studies of Humanistic Values at the University of Cincinnati, as well as for the Centre for the Study of Eurasian Shamanism at the University of Rome Tor Vergata, and the scientific council of the Centre d'anthropologie et de civilization Européenne at the University of Strasbourg. Zolla became professor emeritus in American literature at the University of Rome after he retired in 1991.

ESSENTIAL BIOGRAPHICAL AND ACADEMIC DATA. Zolla was born in Turin on July 9, 1926. His father, Venanzio, was a well known Anglo-Italian painter; his mother, Blanche Smith, was a musician from Kent. Zolla was brought up speaking English, Italian, French, Spanish, and German. Later he would master several other languages, including Russian (he translated Pavel Florenskii's *Ikonostas* as *Le porte regali*, Milan, 1977). He graduated in law from the University of Turin, and also attended courses in psychiatry held at the town asylum. A severe lung disease contracted at the age of twenty-two gave him recurrent reminders throughout his life of the need to cherish every drop of vital energy. From a religious point of view, he was agnostic, but a fervent believer, as he used to say, in the boundless power of belief. In the prime of his life he wrote stories, including "An Angelic Visit on Via dei Martiri," and two novels, *Minuetto all'inferno* (Minuet in hell; 1956) and *Cecilia o la disattenzione* (Cecilia or inattention; 1961).

As a literary critic he freelanced for the main periodicals of the time, contributing essays on Franz Kafka, André Gide, Thomas Mann, Marcel Proust, and James Joyce. Zolla developed a keen interest in American matters from literary, historical, juridical, and ethnological angles. On the suggestion of Mario Praz, the leading Anglicist at the University of Rome, who had been highly impressed by Zolla's earlier investigations on Herman Melville's *Clarel*, on Emily Dickinson's poetry, and on Nathaniel Hawthorne's *Septimius Felton*, Zolla was offered the post of associate professor of American literature at the University of Rome in 1959. A full professorship followed in 1967.

Eloquence, bold knowledge, and a special gift for teaching made Zolla revered and popular among his assistants and students at the universities of Genoa and Rome. New branches of study, such as Native North-American studies and ethnopoetics, along with fecund intersections with comparative and Oriental studies, developed as a result of Zolla's work. He launched research projects involving teams of junior scholars on the superman theme in modern literature and on exoticism in American literature. He also edited and introduced *Novecento Americano* (American literature in the twentieth century; 1980–1983), a three-volume textbook providing monographs on fifty major American modern

writers. The studies *in mortem* produced by some of Zolla's former disciples are noteworthy when considering the legacy of Zolla's work in this area.

KEY FIGURES IN ZOLLA'S THOUGHT. In a long interview with a journalist shortly before his death, Zolla teasingly predicted: "It won't be easy to retrace the lives I have lived and the directions of my thought" (Fasoli, 1995, p. 29). On another occasion, when asked who had been a key figure in his own quest, he replied by quoting two metaphors, both of them aquatic. The first is from Zolla's collection of essays *Che cos'è la tradizione?* (What is tradition?, 1971), a work that Bernard Wall described as a manifesto of a fearless program of reaction against the spiritual atrophy of modern civilization: "Humans are like carp," wrote Zolla, "who flourish and grow when there is a rock in the center of their pond that they can swim around in harmonious circles" (p. 9). The second metaphor, from Zolla's *Verità segrete esposte in evidenza* (Neglected truths exposed, 1990), is contained in a broader reflection, abbreviated here: "Every life," wrote Zolla, "comprises an invisible interiority that is substantial to it. The only way to grasp this is to sidestep tangible appearances, to take a leap against the current like the salmon, who is the living symbol of knowledge in the Old Norse Scriptures" (p. 154). The carp circling the rock and the salmon swimming upstream towards the source—no images could better express the two leading traits in Zolla's intellectual biography and at the same time the character of his peculiar philosophical vision.

Syncretism, which Zolla vigorously defended in his essay "Il sincretismo" (1986), and metaphysical experience, which in the first lines of "Archetypes" (1981) he described as "the gathering in of the aloof mind" when it "becomes absorbed in its self-existent identity and sameness," were as much leitmotifs in Zolla's pursuit of a unitive knowledge as was his incoercible drive toward the systematic exploration of otherness, a notion that he shaped into an extraordinarily vast array of implications, much beyond its strict ethnological meaning. In a memorable lecture given at the Interreligious Colloquium at the Rothko Chapel in Houston in 1974 (see Ibish and Marculescu, 1978), Zolla described otherness as an antipodal category of the human spirit, the paradigm of an inverted world where ordinary life might flow peacefully between action and contemplation, and the esoteric life as a joyous apprenticeship in metaphysical experience. This broader notion of otherness offers a key to an unbiased investigation of Zolla's accumulated research into alchemy, including Western, Indian, and Daoist notions of immortality; esotericism, with a special bent for ecstatic Qabbalah, Sufism, Zoroastrian, and Tantric traditions; mysticism, which he explored in a monumental anthology of pagan and Christian contemplatives (*I mistici dell'Occidente*, 1963); shamanism, particularly in the Native North American and Korean contexts; and tradition and metaphysics, fields par excellence of Zolla's lifelong spiritual quest. His encounters with survivals of the past among the North American Indians, in Africa (Nubia and Cairo), and especially in

the East (Israel, Iran, India, Bali, Taiwan, Korea, and Japan), were analyzed in his quarterly journal *Conoscenza religiosa*. An international group of leading specialists contributed to its sixty-eight issues.

The most perceptive interpreter of the multifaceted identity of Zolla's spiritual anthropology was probably the Romanian historian of religions, Ioan P. Culianu (1950–1991). In his view Zolla was “perhaps the most original, versatile, and untimely of Italy's foremost intellectuals, displaying supreme indifference towards the fashion of the day and therefore—needless to say—controversial” (Culianu, 1990, pp. 222–224). In his reconstruction of the image of the Indian in American literature, which Zolla made in his celebrated book, *The Writer and the Shaman* (1968), he approached the categories from the point of view of the Native American. Moreover, Culianu emphasizes that this process of lucid identification with the indigenous point of view, or with the shaman who effects his ascent to heaven in trance, or with the mystic enraptured in a circle of contemplative bliss, was possible thanks to the new position that emerged as part of Zolla's method. It is the position of the “intelligence out of love” (a fairly faithful translation of Dante's “intelletto d'amore”). To kindle a certain quality of love in the process of comprehending the inner nature of otherness was the esoteric part of Zolla's intellectual achievement. He was well aware that such an achievement could not be pursued except by swimming upstream against the current of his time. No vision could be as antipodal to the spirit of the age which was dominant on the eve of the 1968 student revolts as the one Zolla depicted in *Le potenze dell'anima* (The powers of the soul, 1968), a crucial investigation of the spiritual morphology in the history of culture.

BIBLIOGRAPHY

Eighty percent of Zolla's writings are in Italian; approximately ten percent are in English, with the remaining works in Spanish, French, and German. Essays and papers provided to international conferences are scattered in several journals and volumes of proceedings. His articles in *Il corriere della sera*, *La nación*, and the Sunday supplement of *Il sole 24ore* (published between 2000 and 2002) have ranged from travel accounts to social, literary, and art criticism. An annotated bibliography in Italian, updated to 1991, is available in *La religione della terra: Vie sciamaniche, universi immaginali, iperspazi virtuali nell'esperienza sacrale della vita*, edited by Grazia Marchianò (Como, Italy, 1991), pp. 35–41. This title, translated as *Earth Religion: Shamanic Paths, Imaginal Worlds, Virtual Hyperspaces in the Sacred Experience of Life*, is a collection of interdisciplinary essays offered to Zolla on the occasion of his sixty-fifth birthday by Francisco Garcia Bazán, Ioan Petru Culianu, Terence DuQuesne, Moshé Idel, Toshihiko and Toyo Izutsu, Wolfgang J. Jilek, Louise Jilek-Aall, Luce López-Baralt, Adam McLean, Viviana Pâques, and Lawrence E. Sullivan.

For evidence of the mark Zolla left on a new generation of Italian specialists in Anglo-American studies, see Angelica Palumbo's “Elémire Zolla: An Initiation to Research” (in Italian). *Studi Europei: Annals of the Department of History of Europe-*

an Thought 10 (Genoa, 2002): 129–144, and Fedora Giordano's “Zolla and the Native Americans” (in Italian), in *Gli Indiani d'America e l'Italia*, edited by F. Giordano and Alberto Guaraldi, Alessandria, 2002.

Bibliographies updated to the year of Zolla's death (2002) are available in *Viator* 6 (2002): 24–34; and *Idea viva: Gaceta de cultura* 14 (2002): 52–54, where, in addition, the relevance of Zolla's esoteric thought is examined by F. G. Bazán in “E. Zolla y el esoterismo,” pp. 10, 12, and 48; and *Sheshat: Cross-Cultural Perspectives in Poetry and Philosophy* 6 (2003), a special issue in memory of Zolla, edited by Terence DuQuesne and Mark Angelo de Brito. See also *Religion, Fiction, and History: Essays in Memory of Ioan Petru Culianu*, 2 vols., edited by Sorin Antohi (Bucharest, 2001), a collection to which Zolla contributed his “Culianu” (pp. 176–205), which includes an essential bibliographical survey on page 589.

Ten new works by Zolla appeared between 1991 and 2002, the last being *Discesa all'ade e resurrezione* (Milan, 2002), a philosophical meditation on the hermetic motif of the journey of the human soul once the flesh has been discarded. Zolla's *Il dio dell'ebbrezza: Antologia dei moderni dionisiaci* (Turin, 1998) is an exegesis of the Dionysian traces in modern literature, and *Uscite dal mondo* (Milan, 1992) is a collection of essays focusing on the goal of life in light of the amazing new perspectives offered by virtual reality technology. Among Zolla's works in English, *The Eclipse of the Intellectual* (1959), translated by Raymond Rosenthal (New York, 1968), Zolla's first controversial book in social criticism, contains a fierce attack on modern mass civilization. Zolla's influence is acknowledged in Marshall McLuhan's *From Cliché to Archetype* (New York, 1970). Stefano Cochetti notices the strong influence of Theodor W. Adorno's and Max Horkheimer's negative dialectics on it. Zolla's *The Writer and the Shaman: A Morphology of the American Indian*, translated by Raymond Rosenthal (New York, 1973), is an impressive study of the images of the Indian in American literature from the beginning of colonization to 1969.

Zolla's *Language and Cosmogony* (Ipswich, U.K., 1976) is a philosophically-based analysis of Indo-European roots leading to a reconstruction of the Vedic cosmogonical process. His *The Uses of Imagination and the Decline of the West* (Ipswich, U.K., 1978) is a concise discussion on the decay of creative imagination as distinct from and opposite to fancy in the modern West, with a learned, comparative approach to the theory of imagination in Iranian metaphysics and Indian Vedānta. Zolla's *Archetypes: The Persistence of Unifying Patterns* (New York, 1982) begins with a description of metaphysical experience in terms akin to *samādhi* in the Vedānta philosophy, then moves on to a consideration of the archetypal patterns and their modes of operation as mirrored in mathematics, poetry, history, and politics. Reviews include those by Paul D. Huss in *Library Journal* 5, no. 1 (1982): 897; Pamela van Schaik, *English Studies of the University of South Africa* 1 (1982); Philip Sherrard, *Temenos* 3 (1982): 186–190; and Victor H. Jones, *The Journal of Mind and Behavior* 3, no. 2 (1982): 175–177. *The Androgyne: Fusion of the Sexes* (London, 1981), published in the United States as *The Androgyne: Reconciliation of Male and Female* (New York, 1982), is a scholarly and beautifully illustrated pageant of the man-woman image throughout history and myth. Encyclopedic entries by Zolla include “Les religions des

Amériques: Tribus Indiennes du Canada et des Etats-Unis," in *Encyclopédie des religions*, edited by Frédéric Lenoir and Ysé T. Masquelier, vol. 1, pp. 1235–1250 (Paris, 1997); and "Chamanisme: Amérique du Nord: Cheyenne"; "Amérique du Nord: Inuit"; and "Amérique du Nord: Sioux"; in *Dictionnaire critique de l'esoterisme*, edited by Jean Servier, pp. 280–282 (Paris, 1998).

Zolla's essay, "Traditional Modes of Contemplation and Action" can be found in *Contemplation and Action in World Religions: Selected Papers from the Rothko Chapel Colloquium "Traditional Modes of Contemplation and Action,"* edited by Yusuf Ibish and Ileana Marculescu (Houston, Tex., and Seattle, Wash., 1978). See also Ioan P. Culianu, "Elémire Zolla: Neglected Truths Exposed," *Incognita* 1, no. 2 (1990): 222–224; and Doriano Fasoli, ed. *Un destino itinerante: Conversazioni tra occidente e oriente* (Venice, 1995).

Reviews on Zolla include Bernard Wall, "Against the Delirium of Negation," *Times Literary Supplement* (October 29, 1971). Excerpts from major reviews are quoted in the entry on Zolla in *Book Review Digest* (1974): 1351. See also Vine Deloria Jr., "Images of the Indian," *Boston Sunday Herald Advertiser* (March 2, 1974); Guy Davenport, *The Geography of Imagination* (1981): 353–358; Peter Nabokov, "Return to the Native," *New York Review of Books* 31 (September 27, 1984); and Ioan P. Culianu, "The Construction of the Other," *History of Religions* 30, no. 3 (1991): 308–311. In Cesare Médail's *Le piccole porte*, translated as *Small Doors* (Milan, 2004), Zolla's spiritual quest is closely examined in comparison with the ones of Mircea Eliade, Tenzin Gyatso, XIVth Dalai Lama, Thich Nhat Hanh, and Raimon Panikkar.

GRAZIA MARCHIANÒ (2005)

ZONGMI (780–841), more fully, Guifeng Zongmi; Chinese Buddhist Chan and Huayan scholar, traditionally reckoned as the fifth "patriarch" both in the Heze line of Southern Chan and in the Huayan tradition. Zongmi was born in Xichong County, Guo prefecture, in Szechwan province. His family, the Ho, was one of local prominence, and as a youth he received a traditional education in the Confucian classics. He became interested in Buddhism as an adolescent, but he continued his Confucian studies at a local academy in preparation for the imperial examinations that would open the door to an official career. In 804, however, he met the Chan priest Daoyuan and was so impressed that he abandoned his worldly ambitions and became his disciple. Later, while still a novice monk, he experienced his first awakening after reading only two or three pages of the *Yuanjue jing* (The scripture of perfect enlightenment) at the home of a lay patron. Zongmi continued his Chan study under Daoyuan, receiving full ordination from him in 808. Two years later he was introduced to the commentary and subcommentary to the *Avatamsaka Sūtra* written by the famous Huayan scholar Chengguan (738–839). This work so impressed him that in 812 he became a disciple of Chengguan and studied intensely with him for two years. In 816 he withdrew to Mount

Zhongnan outside the eastern capital of Luoyang to read the Buddhist canon. He now began a productive career as a scholar, writing numerous commentaries on a wide range of Buddhist texts. His greatest exegetical energies, however, were devoted to the *Yuanjue jing*, which he regarded as better suited to the age than the *Avatamsaka*. His scholarly activity came to an abrupt stop in 835, when he became implicated in an abortive attempt to oust the eunuchs from power at court. Afterward he withdrew from public life, and nothing further is known about him until his death in 841.

Zongmi's Chan training played a key role in the new thrust that he gave to Huayan metaphysics. His emphasis on the ultimate ground from which phenomena arise over their unimpeded interpenetration—an idea characteristic of the classical Huayan thought of Fazang (643–712)—reveals his interest in clarifying the ontological basis for religious practice. He also found in Huayan hermeneutics a framework in which to harmonize the conflicting tendencies evident in the Buddhist world of his day. His *Chanyuan zhuquanji duxu* (Preface to the collected writings on the source of Chan), for instance, in addition to affording valuable historical insight into the Chan of the late eighth and early ninth centuries, seeks to reconcile the split that had developed between Chan practitioners and textual scholars, as well as between the various Chan lineages. His efforts to articulate a comprehensive framework in which apparently opposing positions could be sublated also extended to non-Buddhist traditions, as can best be seen in his *Yuanren lun* (Inquiry into the origin of man). Zongmi's writings represent an important stage in the complex unfolding of the dialogue among the "Three Religions" (Buddhism, Daoism, and Confucianism) in Chinese history.

SEE ALSO Huayan.

BIBLIOGRAPHY

The most thorough study of Zongmi's life and thought is Kamata Shigeo's *Shūmitsu kyōgaku no shisōshiteki kenkyū* (Tokyo, 1975), which includes a summary in English. Although not entirely reliable in details, the best introduction to Zongmi in English is still Jan Yunhua's "Zongmi: His Analysis of Chan Buddhism," *T'oung pao* 58 (1972): 1–53. Two of Zongmi's most important works are also available in English translation. For a study and translation of his, see Jeffrey L. Broughton's "Guifeng Zongmi: The Convergence of Chan and the Teachings" (Ph.D. diss., Columbia University, 1975). For a study and translation of his *Yuanren lun*, see my own work, "Zongmi's *Inquiry into the Origin of Man: A Study of Chinese Buddhist Hermeneutics*" (Ph.D. diss., Harvard University, 1981).

Revised Bibliography

ZOROASTRIANISM. Zoroastrianism, known to its followers as the *Zarathushti din* (Zoroastrian religion), developed from the words, ideas, beliefs, and rituals attributed to a devotional poet named Zarathushtra (later Middle Persian or Pahlavi: Zardukhsht, Zardusht; New Persian or Farsi: Zardosht). Zarathushtra eventually came to be regarded as the founder and prophet of the devotionally monotheistic, doctrinally dualistic faith named after him. So, followers of the religion are termed Zoroastrians (New Persian: Zartosthis, Zardoshtis; Gujarati: Jarthushtis). Zoroastrians also traditionally refer to their faith as *Mazdayasna daēnā* (Middle Persian: *dēn ī Māzdēsn*) (religion of Mazdā) and to themselves as *Mazdayasna* (Middle Persian: *Māzdēsn*) (worshippers of Mazdā), thus acknowledging worship of Ahura Mazdā (Wise Lord) as God and creator. The *Fravaranē* (Profession of faith) begins with the Avestan words: "I profess myself a worshiper of Mazdā, a follower of Zarathushtra, opposing the demons, accepting the doctrine of the Ahura."

Zoroastrianism developed into the major religion—*theologically, demographically, and politically*—of Iran and Central Asia between the sixth century BCE and the tenth century CE, enjoying royal patronage from various dynasties. During those centuries it influenced Hellenistic, Jewish, Christian, and Muslim beliefs through contact between members of those communities and Zoroastrians. Zoroastrians assimilated aspects of monotheism and hagiography from the Judeo-Christian and Islamic traditions. After the Arab conquest of Iran and Central Asia in the seventh century CE, Zoroastrianism gradually lost adherents through conversion to Islam. During the tenth century, some adherents migrated to India, forming the minority Parsi (Persian) community that flourishes there into the twenty-first century but became endogamic within Hindu society. By the thirteenth century, Irani Zoroastrians also had become a confessional minority. During the nineteenth and twentieth centuries, Zoroastrians relocated from Iran and India to other countries. Based on recent demographic assessments, the faith has a following of approximately 300,000 persons worldwide.

THE FOUNDER, HIS IDEAS, AND HIS REPRESENTATIONS. The issue of Zarathushtra's image is central to Zoroastrianism and Zoroastrians. Therefore, Zarathushtra requires discussion within any overview of the religion.

Zarathushtra's dates and place. Devotees do not doubt the basic reality of Zarathushtra's existence. Yet one line of modern scholarship has been to view Zarathushtra as a legendary character. This position has resulted in suggestions that a historical Zarathushtra was not the composer of the *Gāthās* (Songs) central to Zoroastrian belief. Rather,

some scholars attributed the *Gāthās* to one or more anonymous poet-worshippers who allegedly presented an epic character named Zarathushtra as the prototypical poet-sacrificer. These conclusions are based on comparing aspects of the Gathic texts with certain Vedic poems and archaic Greek epics. However, analyses of compositional style and structure indicate that the *Gāthās* were the product of a single devotional poet named Zarathushtra (Possessor of Old Camels) who ensured that memory of him was perpetuated through self-references within his compositions.

When and where Zarathushtra lived is another problematic issue. The traditional place and date for Zarathushtra's life found in a variety of Iranian (including Zoroastrian), Mesopotamian, Greek, and later Arab sources is in Iran two hundred and fifty-eight years before Alexander the Great's conquest of Iran and the death of the last Achaemenian king, Dārayavaush or Darius III (in 330 BCE)—that is, 588 BCE. However, the traditional date for Zarathushtra's life seems to have been either of Greek or more probably of Babylonian origin. Moreover, it is unlikely that the Old or Gathic Avestan dialect was still spoken at that time, as evidenced by the rapid decline in use of its west Iranian cognate, Old Persian, during the Achaemenian period. So composition of the *Gāthās* must have predated the seventh century BCE.

Another set of dates for Zarathushtra's life arose among classical writers. Diogenes Laertius (fl. third century CE), based on Xanthus of Lydia (fl. fifth century BCE) and Hermodorus (fl. fourth century BCE), gave two dates for Zarathushtra's life—six thousand years before the Achaemenian king Xerxes' forces invaded Greece (in 480 BCE) and from five to six thousand years before the Trojan War (early second millennium BCE). Pliny the Elder (23–79 CE) cited Eudoxus (fl. fourth century BCE) in claiming that Zarathushtra had lived six thousand years before the death of Plato (in 348 or 347 BCE), or five thousand years before the Trojan War. All those dates fall within the seventh millennium BCE. Moreover, classical Greek and Roman authors regarded Zarathushtra as having been an Iranian magus. One major problem with accepting seventh millennium BCE dates for Zarathushtra's life is that his words and ideas should then be present not only in the *Gāthās* but also within early Vedic texts of Hinduism and be part of Indo-European devotional literature generally. Because the material data indicates that Proto-Indians separated from Proto-Iranians during the late third or early second millennium BCE, Zarathushtra's life cannot date to before that division.

The third possible place and date for Zarathushtra are the result of enhanced knowledge of both comparative Indo-Iranian linguistics and the archaeology of Central Asia. The linguistic data suggests that the *Gāthās* must have been composed after the Proto-Iranians were distinct from the Proto-Indians (that is, by the eighteenth century BCE) but before the *Gāthās* became part of the Zoroastrian religious canon (that is, between the tenth and sixth centuries BCE), following

which Old Avestan fell into disuse. Descriptive reconstruction from the Avestan texts of the society in which Zarathushtra lived correlates with the archaeological remains of the Late Bronze Age in Central Asia. That Bronze Age culture extended from the Caspian Sea through Transoxiana to Afghanistan in 2000–1750 BCE, followed by a period of societal dispersion in 1750–1500 BCE. So, Zarathushtra probably lived and preached in Central Asia between the eighteenth and fifteenth centuries BCE.

Zarathushtra's teachings. Zarathushtra's *Gāthās* provided the Bronze Age people of Central Asia with a vivid and engaging system whereby religious belief and ritual activity were utilized to differentiate between *asha* (order) and *drug* (confusion) (*Gāthās* 33.4, 34.6). Zarathushtra established *mazdā* (wisdom) and Ahura Mazda (later Old Persian: Auramazdā, Middle Persian: Ohrmazd, New Persian: Hormazd) as means of distinguishing right from wrong (*Gāthās* 33.13, 45.6). The primordial entity Ahura Mazda was ascribed a creative hypostasis called Spenta Mainyu (originally Spanta Manyu, Middle Persian: Spenāg Mēnōg) (Holy Spirit). Opposing order and Ahura Mazda, Zarathushtra suggested, were confusion and the primordial entity Angra Mainyu (later Middle Persian: Ahreman, New Persian: Ahriman) (the Angry Spirit). By medieval times Zoroastrian theologians would ascribe a destructive hypostasis called Ganāg Mēnōg (Harmful Spirit) to Angra Mainyu. According to Zarathushtra, the two primordial entities were “in thought, word, and deed, the better and the worse” respectively (*Gāthās* 30.3). Ahura Mazda came to be venerated as the “father of order” and the “creator of all these [beneficial] things” (*Gāthās* 44.3, 7).

The *Gāthās* also suggested that the corporeal (Avestan: *gaēthya*) world be regarded as an extension of the spiritual (Avestan: *mainyava*) one, explaining the differential experiences of humans in terms of struggles between order and confusion. In so doing, Zarathushtra endowed human existence with meaning during life and hope for an afterlife. Zarathushtra even articulated the notion of pious souls journeying to a paradisiacal existence in the Abode of Song.

Zarathushtra's images. As the Zoroastrians of ancient and medieval Iran interacted with other religious communities such as Jews, Christians, and eventually Muslims, a pious biography or hagiography developed around Zarathushtra. Zoroastrian writers in antiquity and the Middle Ages drew upon glimpses of his life, the names of family members and followers like Jāmāspa, and the accounts of his opponents, such as the tribal leader Bēndva in the *Gāthās*, combining those with biblical notions of piety, devotional quest, revelation, opposition, ministry, and violent demise. This organized hagiography began to develop after the Achaemenian conquest of Babylonia (in 538 BCE) under influence of Israelite accounts of the Patriarchs, was augmented during the second through seventh centuries CE by the Christian image of Jesus' life as recounted in the Gospels, and was supplemented by images from the life of the prophet Muḥammad after Arab Muslims began ruling Iran in the seventh century.

According to that later hagiographic tradition, Zarathushtra's mother, Dughdōvā, was forced to flee her hometown for another village. There, she met a pious man named Pourushaspa, with whom she conceived Zarathushtra. A light supposedly shone from Dughdōvā's womb when she was pregnant, resulting in attempts by evildoers to harm mother and fetus. Upon birth, Zarathushtra's first breath apparently sounded like a laugh rather than a cry. Surviving several attacks upon his life, Zarathushtra eventually left home at the age of twenty. After a decade of wandering and contemplation, he received revelation via Vohu Manah (Middle Persian: Wahman, New Persian: Bahman) (Good Mind) and returned to preach the religion of Ahura Mazda. Zarathushtra was opposed by the clergy of the older cults in his homeland and had to seek refuge at the court of a neighboring ruler named Vishtāspa, who accepted the religion. Here, Zarathushtra preached and gained many followers until he was assassinated by a priest of another sect at the age of seventy-seven, or so it was written. Through these stories, Zarathushtra's image was firmly established as that of a Near Eastern prophet and eventually recorded in the *Zardukhsht nāmag* or *Zardosht nāme* (Book of Zarathushtra) and other medieval texts like as the *Dēnkard* (Acts of the religion), written in the Middle Persian and New Persian languages. This hagiography has become increasingly popular among Zoroastrians. It is often reproduced in an assortment of pious literature from novels for adults to comics for children in which Zarathushtra is regarded as one of the earliest prophets.

There are no surviving descriptions or renditions of Zarathushtra's actual likeness. Images, however, were produced by devotees and others. Raphael Santi (1483–1520), the Italian Renaissance artist, depicted Zarathushtra—back turned to viewers, wearing a golden robe, holding a globe of the Earth, facing a depiction of Ptolemy, and standing next to an image of the artist himself—on the lower right corner of the *School of Artists* fresco at the Vatican in Rome, Italy. Modern Zoroastrians have generated their own images of Zarathushtra, the most popular of which is modeled on a rock relief of Mithra commissioned by the Sasanian king Ardashir II (r. 379–383) at Taq-e Bostan in Iran. Various versions of that image adorn fire temples and homes of contemporary Zoroastrians showing Zarathushtra with rays of light emerging from a halo and, sometimes, pointing his right forefinger upward to heaven, much like the Greek philosopher Plato in Raphael's fresco.

PRIESTS, SECTS, AND LAY LEADERS. A Zoroastrian clergyman is termed a magus (Old Persian: *magush*, Middle Persian: *mowbed*, *mowmard*, New Persian and Gujarati: *mobed*) and is a member of a hereditary priestly subgroup among the Zoroastrians. Over time, subgroups developed among the magi based on theological divergences. Likewise, sects arose within the Zoroastrian community itself based on differences in beliefs and praxes. At various times, certain lay members of the Zoroastrian community have also gained followers for particular tenets and traditions.

The Magi in history Herodotos (c. 484–between 430 and 420 BCE), the Greek author, mentioned that no devotional rituals would be conducted by Iranians unless a magus was present. He also listed practices and beliefs specific to the magi such as consanguineous marriage, exposure of human corpses to wild creatures and the environment for desiccation, nondesecration of nature, and dislike of creatures regarded as noxious or harmful, such as wild animals, reptiles, and insects (*History* 1.101, 132, 140). Herodotos confirms that the magi (Greek: *magoi*) began as the priestly tribe among a tribal confederation known as the Medes. It appears that they appropriated the ideas of Zarathushtra after those concepts had begun to spread among the Proto-Iranians and that they were the sole clerics of the early Zoroastrians by the time the Medes had settled permanently in Iran (ninth century BCE). The magi claimed, erroneously, that Zarathushtra had been a member of their group and had lived among them in northwestern Iran as noted by Plato (c. 428–348 or 347 BCE) *Alcibiades* 1.121). The magi modified Zarathushtra's message to accommodate their own practices within the framework of dualism between order and confusion. They brought with them the notion of a hereditary priesthood that followed their established praxis of never including women in the ecclesiastic membership, claiming that menstruation and childbirth resulted in the discharge of blood that, once outside the body, could pollute priests, ritual actions, and holy places.

Greek and Roman authors learned of Zarathushtra through contact with the magi. Hellenistic scholars such as Pythagoras (c. 570–500 BCE) came to regard Zarathushtra as a mystical figure and as the original leader of magicians—a term deriving from the Old Persian word *magush* borrowed into Greek as *mágos* and Latin as *magus*. The name Zoroaster, by which the devotional poet is commonly identified in Western literature, derives from classical Greek *Zōroástrēs*, meaning “golden star” and symbolizing his association with spirituality. The magi were introduced into Christian belief as the wise men from the east who supposedly journeyed to Bethlehem; thus, the sages of Zoroastrianism were used to legitimize the founder of another Near Eastern faith.

Ranks within the early Zoroastrian magi seem to have included that of *āthravan* (fire priest) and *zaotar* (invoker, libation offerer). During the Achaemenian Empire, magi served as seers, counselors, and tutors to Iranian noble families. Magi staffed fire temples at urban centers such as Kangavar and Istakhr. The chief priest at each temple probably was titled *magupati* (head magus, master magus.) Seminaries developed for training magi, as did pious foundations for meeting the expenses of temples and seminaries. The color white was reserved for magian clothing to symbolize purity. Their dress, as evidenced from artistic representations, consisted of loose pants, a long-sleeve tunic bound by a belt, and a hooded cap with side flaps for covering the mouth to prevent breath and saliva from polluting ritual items. Because they lost royal favor and state support, the magi reacted adversely

to Alexander's conquest of Iran. They denounced the Macedonian conqueror by claiming that his troops slaughtered many magi and burned copies of Zoroastrian scripture—a legend that became part of Iranian official history. Under the Achaemenians and, subsequently, with the Seleucids (fourth century–first century BCE), some magi moved to Ionia and Cappadocia (now in Turkey) where they staffed fire temples into the first century BCE (as noted by Strabo, (c. 63 BCE–24 CE), *Geography* 15.3.14–15).

By the Arsacid or Parthian period (238 BCE–224 CE), magi served in ranks bearing titles such as *hērpāt* (later *hērbed*) (theologian), *magpat* (ritual priest), and *bagnapat* (shrine master.) They were present in large provincial temples such as those for the holiest fires in Iran—Ādur Farrōbay, Ādur Gushnasp, and Ādur Burzēnmihr—and in village *chahār tāq* (four-arch) fire precincts. They began working with clerics of other religious groups within Iran, such as the Jewish patriarchate, to regulate religious activity across confessional lines. They also served in the imperial judiciary. Leading magi were mentioned in Sassanid royal inscriptions and other official documents. Kirdīr, who functioned as royal *hērbed* under the second Sassanid ruler Shāpūr I (r. 240–272) and his immediate successors, commissioned Middle Persian inscriptions in which his religious duties, visions of the afterlife, and image were recorded. Kirdīr claimed to have zealously attacked religious sects regarded as heresies. By the fourth century, magi were led by an official titled the *mowbedān mowbed* (chief magus of the magi), or high priest—such as Ādurbād ī Māraspandān, who served during the reign of Shāpūr II (r. 309–379)—whose position was part of the royal court at Ctesiphon (near modern Baghdad). The title *dastwar* (high priest), denoting a cleric certified in both scripture and exegesis, was used as well.

When Zoroastrians lost political control of Iran and Zoroastrianism began to lose adherents to Islam, medieval magi compiled the faith's traditions and practices into the Pahlavi books. For example, Mardānfarokh ī Ohrmazddādān (fl. ninth century) wrote the *Shkand Gumānīg Wizār* (Doubt dispelling exposition) to critique Judaism, Christianity, Manichaeism, and Islam while defending Zoroastrian tenets. Later, between the fifteenth and eighteenth centuries, magi in Iran sent the *Persian Revāyats* (Treatises) to their coreligionists—the Parsis—in India to advise the latter on religious observances. As the number of Zoroastrians in Iran declined through conversion to Islam, fire temples and seminaries (Middle Persian: *hērbedestān*) fell into disuse. After the Parsi Zoroastrians had settled in western India, their magi divided into five *panths* (ecclesiastic groups). Learned among the Indian magi was Neryōsangh Dhaval (fl. late eleventh century or early twelfth century), who translated portions of the Avesta into the Sanskrit language. According to Iranian tradition, the *dastur dasturān* (high priest of high priests) moved to the central Iranian village of Torkabad north of Yazd in the twelfth century and then to Yazd itself during the eighteenth century.

Contemporary magi. The present-day priesthood, whose members are still called *mobeds*, traces its lineage to the medieval magi of Iran. They form a class (New Persian and Gujarati: *āthornān*) (members of the priestly group) distinct from the laity (New Persian and Gujarati: *behdinān*) (members of the good religion). Within the modern magi, ranks persist, including that of *ostā* (teacher, an uninitiated priest), *ērvad* (teacher priest, a priest who has undergone the first level of induction), and *dastur* (high priest, usually, but not always, associated with a temple for a holy fire of the *ātesh bebrām* [fire of Verethraghna], or highest ritual level). Two categories of lay individuals traditionally have assisted magi in Iran: the *ātashband* (keeper of the flames) who tends ritual fires and the *dahmobed* (junior priest) who serves as temple warden. In the twentieth and twenty-first centuries, another category of priestly assistants has been created by the Mobed Councils in Iran and North America, namely the *mobedyār* (lay priest), to counter the growing shortage in the number of clerics by performing basic rituals for the laity.

Magi in both Iran and India continue to wear white robes and a white turban. They don a white mouth and nose mask (Middle Persian and New Persian: *padām*, Gujarati: *padān*) to avoid polluting implements (New Persian and Gujarati: *ālāt*) and offerings (Avestan: *myazda*, Middle Persian: *mēzd*, New Persian and Gujarati: *myazd*) during rituals. For high or inner rituals, they are required to be in a major state of ritual purity, which is obtained via the *Barashnūm ī nō shab* (Purification of the nine [days and] nights ceremony). During rites, an appropriately inducted and purified magus can serve in ranks including *zōt* (invoker, officiating priest), *rāspī* (assistant), and *bōywalla* (incense offerer). Passed from father to son, priesthood involves studying liturgies and rituals from childhood. Training usually occurs at a seminary (now known in New Persian and Gujarati as *madrasah*). Presently, there are only two functioning seminaries for the magi—the Athornan Boarding Madressa at Dadar in Bombay (Mumbai) and the M. F. Cama Athornan Institute at Andheri West in Bombay. Despite such training, because scripture is memorized, many magi comprehend only the gist of prayers. Clerical training may be followed by formal induction as a priest via the *Nāwar* and *Martab* (*Maratib*) ceremonies among the Parsis and the *Navezut* ceremony among Iranis. Most magi also obtain secular education and, after undergoing only the *Nāwar* or basic *Navezut* induction, serve as part-time priests or else leave the priesthood completely for secular employment that provides greater remuneration. The resulting shortage of magi has led to abbreviation of certain rites such as purificatory ones and to a focus on daily devotions. On a regular basis, magi serve lay Zoroastrians at fire temples in countries as diverse as Iran, India, Australia, Britain, and the United States, where they are employed by local congregations.

Leaders and groups. A large array of beliefs and practices seem to have been prevalent among the ancient and medieval magi. Only as the religion declined under Muslim rule

in late medieval times were certain priests able to establish the more monolithic form of Zoroastrianism that is evidenced by the Middle Persian literature of the ninth through thirteenth centuries. As a result those texts, written for the most part by a handful of related clergymen, convey a false sense of uniformity in doctrine and ritual. One of the most widespread doctrinal variations was that called Zurvanism, which regarded Zurvan (Time) as a monist reconciliation of the dualism represented by Ahura Mazda and Angra Mainyu and as a means of explaining the evil spirit's anger. Probably arising from theological speculation during the fifth century BCE, it was still subscribed to by magi such as Zādspram in the late ninth century CE. Another sect, that following Gayōmartiya and engaging in astrological and cosmological speculation, regarded Ahura Mazda as eternal but Angra Mainyu as produced by divine doubt (in this respect perhaps drawing upon Zurvanite ideas) before waning in the ninth century.

Premodern and modern Parsis have experienced their own sectarian schisms. Disagreement relating to the calendar caused a division of the Parsi Zoroastrian community in 1746 into Kadmīs, who readopted the *qadīmī* (ancient) Iranian calendar, and Shenshaīs (also called Rasimīs) (traditionalists), who maintained the traditional Parsi calendar. Another group, called the Fasalīs or Faslīs, formed in 1906 to rely on a *fasl* (seasonal) calendar for rituals. Observance of rituals and festivals on different days because of these calendrical differences persists to the present, even among Parsis now residing in Western countries.

As priests' erudition on scripture and exegesis declined during the twentieth century, so did the Zoroastrian community's esteem for the magi, reliance on clerical learning, and acceptance of ecclesiastical authority. Contemporary *dasturs* still issue socioreligious injunctions on matters such as conversion to Zoroastrianism, marriage with members of other faiths, appropriate roles for women, and disposal of corpses, but by and large such rulings have only moral value for receptive laity and other magi. As a result, some magi have begun following sects established by lay Zoroastrians. One such sect arose when a Parsi named Behramshah Shroff (1858–1927) claimed to have been trained by spiritual sages on Mount Damavand in Iran and preached *Ilm-e Khshnum* (Knowledge of joy). *Ilm-e Khshnum* provides esoteric teachings that combine ideas of mysticism, astrology, reincarnation, and auras with the practice of vegetarianism and the compilation of new exegeses on the Avesta while granting religious authority to laypersons. One Khshnumist subgroup—whose members are identifiable by their red prayer caps and formulaic phrases of greeting such as *kshmaothra aburahe mazda* (satisfaction unto Ahura Mazda)—now follows the teachings of Minochehr Pundole and so are termed the Pundolites. Among twenty-first-century Irani Zoroastrians living in the United States, a Muslim convert to Zoroastrianism named Ali Jafarey is popular. He founded the Zarathushtrian Assembly based in Anaheim, California, in

1990. Its members advocate Zoroastrianism as a universalistic faith—a viewpoint rejected by mainstream Zoroastrians who do not favor unregulated proselytism.

SCRIPTURE, EXEGESES, COMMENTARIES, AND CATECHISMS. Holy texts, interpretations of scripture, and discourses have developed and changed over the centuries. They have also been translated into a variety of languages to meet the confessional needs of linguistically diverse Zoroastrian communities.

The Avesta. Zoroastrian scripture, or Avesta (Middle Persian: *Abestāg*, probably from Old Iranian: **Upa-stāvaka*, “praise”), is a collection of texts regarded as holy and central to beliefs and practices. The canon may be divided into two groups based on linguistic differences: (1) the Old or Gathic Avestan materials, which were composed orally between the eighteenth and twentieth century BCE, transmitted and augmented for several centuries, then established as the main portion of the oral scriptural canon between the tenth and sixth centuries BCE, and (2) the Young or Standard Avestan materials, which were composed orally, in some cases from existing verses, between the ninth and fifth centuries BCE, transmitted, augmented, then established in the oral scriptural canon by the third century BCE. The written text of the Avesta originated in the fourth century CE—probably from deliberations by magi under the royal patronage of Shāpūr II. All existing Avestan manuscripts derive from a base text dating to the ninth or tenth century.

Only about one-third of the Sassanid Avesta has survived. It consists of:

1. The *Yasna* (Middle Persian and New Persian: *Yasn*, Gujarati: *Ijeshne*) (Sacrifice, worship), comprising seventy-two chapters. *Yasna* 28–34, 43–50, 51, and 53 preserve the seventeen *Gāthās* of Zarathushtra. Chapters 35–41 comprise the *Yasna Haptanghāiti* (Yasna of seven chapters), composed in Old Avestan prose probably by devotional poets among the early Zoroastrian community. Four *maθhras* (holy words), also composed in Old Avestan perhaps by Zarathushtra himself, are preserved in the *Yasna*—namely, *Yathā Ahū Vairyō* (*Ahuna Vairya*, *Abunawar*) (As is the Lord’s will), *Ashem Vohū* (Order is good), *Yenghē Hātām* (All the entities), and *Ā Airyēmā Ishyō* (May the invigorating Airyaman.) The other chapters of the *Yasna* were composed in the Young Avestan dialect. Because this scripture serves as the recitation for the central ritual of worship, *Yasna* chapter 1 invites Ahura Mazda and other holy spiritual entities to the ritual that will be performed. *Yasna* chapters 70–72 bring the accompanying ritual to an end with worship of those spirits.
2. The *Vīsperad* (Avestan: *Vīspe Ratavō*) ([Prayers to] all the [spiritual] chiefs), comprising twenty-four short sections. It is a collection of supplementary materials, compiled in the Young Avestan dialect, to the *Yasna*. It is dedicated to Ahura Mazda as the chief and master of all creation, and serves to extend the *Yasna*.

3. The *Khwardag Abestāg* (New Persian and Gujarati: *Khorde Avesta*) (Concise or shorter Avesta), beginning with five prayers: *Ashem Vohū*; *Yathā Ahū Vairyō*; *Nirang-e Kusti Bastan* (Incantation for tying the cord), also known as *Ohrmazd Khwadāy* (Ahura Mazda is the Lord); *Srōsh Bāj* (Recitation to Sraosha); and *Hōshbām* (Middle Persian: *Ōshbām*) (Dawn). Next come five *Niyāyishns* (New Persian and Gujarati: *Niyāyesh*) (Invocations of praise) to the sun, Mithra, the moon, water, and fire, in that order. Then follow prayers to the five *Gāhs* (periods, watches [of each day]). *Siroza* (Thirty days) 1 and 2 contain short invocations to thirty-three divine spirits individually. The words of four *Āfrīnagāns* (Blessings) are also given in the *Khorde Avesta*.

There are twenty-one surviving *Yashts* (Devotional poems) dedicated to various beneficent spirits in the *Khorde Avesta*. Those devotional poems are *Ohrmazd* (New Persian and Gujarati: *Hormazd*) *Yasht* to Ahura Mazda; *Haft Amahraspand* (New Persian and Gujarati: *Haft Ameshaspand*, *Haftān*) *Yasht* to the seven Amesha Spentas (Holy Immortals); *Ardwahasht* (New Persian and Gujarati: *Ardibehesht*, *Ordibehesht*) *Yasht* to the male Amesha Spenta Asha Vahishta (Best Order, Prayer); *Hordād* (New Persian: *Khordād*, Gujarati: *Awerdād*) *Yasht* to the female Amesha Spenta Haurvatāt (Integrity, Wholeness, Perfection); *Ardwīsūr* (New Persian: *Ābān*, Gujarati: *Āwān*, *Āvā*) *Yasht* to the female water yazata (worship-worthy spirit) Aredvī Sūrā Anāhitā; *Khwarshēd* (New Persian and Gujarati: *Khorshed*) *Yasht* to Hvare Khshaēta, the yazata of the Sun; *Māh* (*Māh Bakhtār*, New Persian: *Māh Bokhtār*, Gujarati: *Mohor*) *Yasht* to Māh, the yazata of the Moon; *Tishtar* (New Persian and Gujarati: *Teshtar*) *Yasht* to Tishtrya the star Sirius, religiously often confused with the divine spirit Tīr (beneficent stars); *Druwāsp* (New Persian and Gujarati: *Drvāsp*) *Yasht* to the female yazata Drvāspā, associated with horses and cattle; *Mibr* (New Persian and Gujarati: *Meber*) *Yasht* to Mithra; *Srōsh* (New Persian and Gujarati: *Sarosh*) *Yasht Hādōkht* (that is, *Yasht* 11) or extract to Sraosha, together with *Srōsh Yasht Wadī* (*Yasna* 57) or the longer (greater) *yasht* to Sraosha, and *Srōsh Yasht ī Keh* (*Yasna* 56) or the shorter (lesser) *yasht* to Sraosha (this designation is found in *Yasna* manuscripts); *Rashn* (Gujarati: *Rashna*) *Yasht* to Rashnu, the male yazata of justice and spiritual judgment; *Frawardīn* (New Persian and Gujarati: *Farvardīn*) *Yasht* to the fravashis (immortal human spirits); *Wahrām* (New Persian and Gujarati: *Behrām*) *Yasht* to Verethraghna, the male yazata of victory; *Rām Yasht* to Vayu (Middle Persian: Way, New Persian: Bād, Gujarati: Govād), the male yazata of the good celestial wind; *Dēn* (New Persian and Gujarati: *Dīn*) *Yasht* to the Cistā (Cisti), the female yazata of insight or religious knowledge; *Ard* (*Ahrishwang*, *Ahlishwang*, New Persian and Gujarati: *Ashishvang*) *Yasht* to Ashi, the female yazata of recompense; *Ashtād* (*Āshād*) *Yasht* to Arshtāt, the female yazata of rectitude and order; *Zamyād* (*Zam*) *Yasht* to Khvarenah (glory); *Hōm Yasht* (*Yasna* 8.9–10.21) to Haoma (Parsis designate this as the *Mōtī* [larger, longer] *Hōm Yasht*) plus an

extract from *Yasna* 9 (Parsis designate this as the *Nānī* or [smaller, shorter] *Hōm Yasht*); and the *Wanand Yasht* to Vega, the brightest star in the constellation Lyra.

4. The *Vidēvdād* (Middle Persian: *Wendīdād*, New Persian and Gujarati: *Vendidād*), consisting of twenty-two prose chapters in Young Avestan. The text is largely socioreligious in content, focusing on ritual purity with rules and rites for protecting the earth, cleansing after pollution by corpses and carrion, rites for exorcizing spiritual pollution, and fines for absolution from sin. Most of the ritual stipulations in the *Vidēvdād* can be attributed to practices specific to magi of the Proto-Iranian, Median, Achaemenian, and Parthian periods. Like the *Yasna*, the *Vidēvdād* is scripture that functions as the basis of a high ritual. Therefore, its manuscripts contain not only doctrine and exegesis but also performative directions for the magi to follow.
5. Additional texts for daily use that are included in premodern manuscripts and modern printed versions of the *Khorde Avesta*. *Nirangs* (Avestan: *nīrāngāni*, Middle Persian: *nērang*) (incantations, spells) are present, often as extracts from Avestan or Middle Persian passages. Pious believers regard them as highly efficacious in dispelling evil, producing good health, and fulfilling boons. The *Duā Nām Setāyeshne* (*Nām Stāyishn*; Invocation of praise to the names [of Ahura Mazda]) and a list, *One hundred and One Names of Ahura Mazda* (*Sād-ō Yek Nām-e Khodā*), were incorporated so that devotees could directly display respect for their creator. The text of the *Tandorosti* (Health of the body) is given so that it can be recited for both maintenance and return to well-being. The *Petīt* [or *Patēt*] *Pashēmānī* (Penance and repentance) also become part of many *Khorde Avestas* because it is believed that spiritual ailments which led to physical manifestations of illness could be expunged through regular confessionals. Eventually, *monājāts* (litanies) in New Persian and Gujarati (now even in English translations) were incorporated so that devotees can understand the gist of the prayers that are in languages which most individuals have not learned.
6. Several surviving Avestan texts and textual fragments, containing materials that probably were once part of scripture. A few should be mentioned. The Young Avestan *Hērbedestān* (Priestly code or book of religious education) and *Nērangestān* (Ritual code or book of ritual directions) were redacted between the sixth and ninth centuries CE. The *Pursishnīhā* (Questions [and answers]) on pious and sinful behaviors was redacted in the fifteenth century. The *Aogemadaēcā* (I profess) is a dirge that was redacted by the twelfth century. It has a Pāzand version as well. The *Hādōkht Nask* (Selection of scripture) provides an important synopsis of Zoroastrian notions of the afterlife.

Zand. Sassanid magi and learned laymen, writing in Middle Persian, produced a series of supplementary texts

often drawing upon Avestan sources that no longer exist. Their endeavors were continued by other clergymen when Zoroastrians fell under Muslim overlordship in the seventh century. The major accomplishment of those priests was *Zand* (Avestan: *zantish*) (exegesis) on the Avesta. The purpose of each translation with commentary—often written interlinear with the Avestan text—into Middle Persian was to transmit the meaning of texts to members of the Zoroastrian community who no longer comprehended the Avestan language. Because of problems in determining equivalent lexical value, reconstituting the sentences, and explaining phrases, the translations often were not exact but served more as expository commentaries. Middle Persian *Zand* has survived to the present for the *Gāthās*; the *Yasna*; the *Khwurdag Abestāg*, including the *Ohrmazd*, *Ardwabisht*, *Srōsh*, *Wabrām*, *Hōm*, and *Wanand Yasht*; the *Videvdād*; the *Hērbedestān*; the *Nērangestān*; and a few other scriptures.

The Pahlavi books. Most of the Middle Persian or Pahlavi books were compiled and redacted by Zoroastrians in Iran between the ninth and thirteenth centuries. Such compilations aimed to preserve Zoroastrian doctrine, ritual, theology, mythology, history, and mores under circumstances in which the faith was becoming a minority. An encyclopedic collection, the *Dēnkard* preserves selections from the collective wisdom of the medieval magi as edited by two *hudēnān pēshōbāy* (leaders of the members of the good religion) in Fars—namely, Ādurfarrōbay ī Farrokhzādān (fl. early ninth century) and Ādurbād ī Ēmēdān (fl. early tenth century). Cosmogonical and eschatological texts include the *Bundahishn* ([Book of] primal creation; major redaction in 1078) and the *Wizīdagīhā* (Selections), by Zādspram (fl. late ninth century), which cover Zoroastrian mythical, legendary, and factual history from creation to the end of time. The *Ardā Wirāz Nāmag* (Book of righteous Wirāz, based on Sassanid-era materials but redacted in the ninth or tenth century) preserves the description of a spiritual voyage through heaven, limbo, and hell. The *Ardā Wirāz Nāmag* proved very popular as a didactic text, and so was translated into Pāzand and Old Gujarati and illustrated for the edification of premodern Parsis. A book on apocalypticism—also found in Pāzand—is the *Zand ī Wahman Yasn* (Exegesis on the devotional poem to Vohu Manah), an anonymous ninth-century compilation.

Among Middle Persian catechisms are the *Mēnōg ī Khrad* ([Book of the] spirit of wisdom, sixth century), which was composed in the form of an imaginary dialogue between the Spirit of Wisdom and a sage. A later Pāzand version of it is extant as well. The *Chīdag Handarz ī Pōryōtkēshān* (Select counsels of the ancient sages, ninth century), also known as the *Pand Nāmag* (Book of advice), provides a more basic synopsis of religious values, beliefs, and practices. Among the books providing religious guidance are *Nāmagīhā* (Epistles) of Manushchihr ī Juwānjamān (fl. ninth century); the *Rivāyat* (Treatise) of Ēmēd ī Ashawahishtān (fl. mid-tenth century); and the *Pahlavi Rivāyats of Ādurfarrōbay and Farrōbaysrōsh*, which contain replies by two Irani magi to

questions posed by laypersons in the years 800 and 1008, respectively. Broader in theme is the *Dādestān ī Dēnīg* (Book of religious judgments), answers by Manushchīhr ī Juwānjamān to ninety-two questions from laypersons on matters of doctrine, ethics, legal issues, and social problems experienced by Zoroastrians in ninth-century Iran. Religious stipulations and ritual requirements are discussed in the *Shāyest nē Shāyest* (The proper and the improper) and its *Supplementary Texts*; both compilations, although written in the ninth century, contain Sassanid period (224–651 CE) rulings and mores.

Pāzand and Sanskrit versions. Magi living in Iran under Muslim rule produced *Pāzand* ([Text] with commentary) literature. Pāzand prayers include the *Paywand nāme*, or *Ashirwād*, which serves as the benediction for marriage ceremonies. This Pāzand tradition was continued by the Parsi priest Neryōsangh Dhaval. He transcribed select Pahlavi books into the Avestan script to make them accessible to twelfth-century magi who could not read Middle Persian. In addition to the Pāzand texts mentioned previously (in discussions of the Avesta and the Pahlavi books), there are among others the *Petīs*, the *Dibāches* (Prefatory recitations) to *Āfrīnagāns*, and *Nirangs*.

Neryōsangh Dhaval also translated portions of Avestan scripture into Sanskrit, including incomplete versions of the *Yasna*, the *Khorde Avesta*, the *Mēnōg ī Khrad*, and the *Shkand Gumānīg Wizār*. Fragments of Sanskrit translations of the *Vidēvdād*, perhaps also going back to Neryōsangh's efforts, have survived. His intension was to make Zoroastrian scripture and exegesis accessible to Parsis who knew the Indian language but not Avestan and Middle Persian. There are sixteen Sanskrit *ślokas* by Aka Adhyaru, verses dating to before the seventeenth century, dealing with miscellaneous socio-religious matters from prayer times to dress codes to purity. The *Ashirwād* was translated from Pāzand into Sanskrit by Dinidās Bahman (fl. early fifteenth century) prior to the year 1415.

New Persian and Gujarati texts. Many Zoroastrian religious documents were written in New Persian. Most famous is the Parsi community's founding legend, known as the *Qessa-e Sanjān* (Story of Sanjan) composed in 1600 CE by Bahman Kaikōbād Sanjāna, a Zoroastrian priest. Expository translations from Middle Persian texts include the late medieval *Saddar Bondahesh* ([Book of] primal creation [written] in one hundred chapters) and *Saddar Nasr* (One hundred chapters of assistance.) More original works of advice, yet drawing upon established traditions, form the *Persian Revāyats*, which date to between the late fifteen and late eighteenth centuries. Those treatises contain responses by learned Zoroastrians living in Yazd and Kermān to ecclesiastical questions posed by their Indian coreligionists. The *Farziyāt nāme* (Book of obligatory duties), by *dastur* Darab Pahlān (1668–1734), written in couplets at Navsari, India, lays out the religious duties of each individual—male and female, children and adults—through life and on every day of the

month; it displayed Indian influence by advocating vegetarianism. It was translated and published in Gujarati for general readers about one century later. The Muslim scholar Ebrahim Pur-e Davoud (1885–1968) produced New Persian translations of the *Gāthās* and *Yashts* that became popular among Iranis and, upon reprint in Bombay, met with enthusiasm from educated Parsis.

In addition to translation into Gujarati of the *Khorde Avesta*, Zoroastrians in India wrote original tracts in the Gujarati language, which had replaced New Persian as their medium of communication. The *Rehbar-e Din-e Jarthushti* (Guide to the Zoroastrian religion) is a premodern catechism written by the high priest Erachji Meherjirana (1826–1900). That text was eventually translated into English with a commentary by the contemporary Parsi *dastur* Firoze Kotwal of Bombay.

English renditions. As English has become a major medium of communication among Zoroastrians—through British colonialism, Western-style secular education, globalization, and migration to the West—translations of scripture have been produced in that language. Among the most commonly utilized prayer books during the late twentieth and early twenty-first centuries—especially for teaching scripture to children before their initiation into the faith—with transcription of the Avestan and Middle Persian texts into the Roman (i.e., English) script and translation of those texts into English are *Daily Prayers of the Zoroastrians* by the Sri Lankan lay Parsi scholar Framroz Rustomjee (1896–1978) and *Khorde Avesta* by the Irani *mobed* Fariborz Shahzadi, who now lives in the United States. Major discourses on Zoroastrianism, written in English, have been published by *dastur* Khurshed Dabu (1889–1979) at Bombay. *Ervad* Godrej Sidhwa at Karachi and *mobed* Behram Shahzadi at Westminster, California, among many others, have also written Zoroastrian theological works in English during the twentieth century. Basically catechisms, those books serve to disseminate knowledge of Zoroastrianism—from a variety of perspectives—to clerical and secular Zoroastrians and to non-Zoroastrians who may not know any of their religion's traditional languages.

DOCTRINES AND MYTHOLOGY. Zoroastrian beliefs and myths were interconnected by ancient and medieval magi to provide believers with a unified explanation for the joys and sufferings of life while endowing existence with purpose. It is clear that Zarathushtra's own ideas were conjoined with the Indo-European and Indo-Iranian tenets that Zoroastrians inherited. Near Eastern millenary chronologies—beliefs in which a new millennium was regarded as a new age, following a violent end to the old one—then reshaped Zoroastrian beliefs as did historical events.

Dualism, pantheon, and demons. As the devotional tradition was amplified slowly after Zarathushtra's lifetime, it came to be believed that Ahura Mazdā, through Spenta Mainyu, had created six Amesha Spentas to generate and protect aspects of material creation: Vohu Manah, who over-

sees animals; Asha Vahishta, who symbolizes fire; Khshathra Vairya (Middle Persian: Shahrewar) (Desirable dominion, power), who manifests metals; Spenta Ārmaiti (Middle Persian: Spendarmad) (Holy disposition, later understood as Holy devotion), who represents the Earth as its mother; Haurvatāt, who characterizes water; and Ameretāt (Middle Persian: Amurdād, New Persian and Gujarati: Amardād) (Immortality, rejuvenation), who exemplifies plants. After incorporation of the *Yashts*, which originally served as devotional poems for Indo-Iranian divinities, into the liturgy of the descendants of Zarathushtra's early followers, it was assumed that Ahura Mazda originally had created more beneficent spirits. These included the male and female yazatas like Mithra, Sraosha, Verethraghna, Daēnā, Ashi, and Aredvī Sūrā Anāhitā to assist in protecting the material creations. Zoroastrian doctrine records that, in response, Angra Mainyu supposedly produced numerous daēvas (Middle Persian: dēws, New Persian and Gujarati: divs). The daēvas (shinning ones) had been part of Indo-Iranian belief but were demonized by Zarathushtra (*Gāthās* 30.6). Such malevolent daēvas include female ones like Āzi (Middle Persian: Āz), who generates concupiscence and other desires; Jahikā (Middle Persian: Jēh) the “Whore,” who supposedly misleads women to lust and prostitution; and Drukhsh Nasush (Middle Persian: Druz ī Nasush), who ferments carrion and pollution. There are also male ones, like Aēshma (Middle Persian: Khēshm), who instills wrath; Aka Manah (Middle Persian: Akōman), who instigates bad thoughts; and Būti (Middle Persian: But), who spreads idolatry. Essentially, spiritual entities venerated by the earliest Iranians were assimilated into the developing Zoroastrian faith and then assigned differential valence as either agents of order or confusion during antiquity and the Middle Ages.

During the modern period, the beliefs of Zoroastrians have gradually changed under the influences of Protestant Christianity—especially due to the activities of the Reverend Dr. John Wilson (who began preaching in Bombay in 1829, eventually converting some Parsis to Anglicanism) and other British missionaries—and colonial western ideas, moving from a dualism to an absolute monotheism in which Ahura Mazda is regarded as the sole God. The Amesha Spentas and yazatas are now accorded a variety of positions, usually equivalent to archangels and angels, respectively. Angra Mainyu has come to be regarded as the Devil with his independent nature tempered by partial subservience to God. The daēvas have lost much of their demonic force, becoming minor bad spirits and ghouls. Yet most Zoroastrians living in the twenty-first century continue to believe that humans serve a vital function in the struggle between God and the Devil, representing order or good versus confusion or evil, respectively. Moreover, from the 1980s onward there has been a trend among orthodox Zoroastrians back to dualistic tenets while maintaining Ahura Mazda's divine supremacy.

Cosmogony and sacred history. Human history is regarded as a divinely ordained, twelve-thousand-year period

of finite time (Middle Persian: *zamān ī kanārāgōmand*) bounded at its commencement and conclusion by eternity or infinite time (Middle Persian: *zamān ī akanārag*). Before finite time began, Ahura Mazda and Angra Mainyu supposedly were separated from each other by the void or wind of Vayu and dwelt within heaven in “infinite light” (Middle Persian: *anagr rōshnīh*) and within hell in “infinite darkness” (Middle Persian: *anagr tārigīh*), respectively.

When finite time began, creation (Middle Persian: *dahishn*) lasted six thousand years. The first three thousand years of creation were marked by the initial encounter between Ahura Mazda and Angra Mainyu and an offer of peaceful coexistence in purity and righteousness that was rejected by the evil spirit. After Angra Mainyu had spurned Ahura Mazda's overture of peace, the Angry Spirit was temporarily defeated by the Wise Lord, who chanted the *Ashem Vohū* prayer. On hearing these holy words, the Angry Spirit is said to have collapsed, stupefied, back into the darkness (*Wizīdagīhā* 1.1–4). The second three thousand years passed while Angra Mainyu lay in a stupor and Ahura Mazda prepared spiritual creations—including the Amesha Spentas, yazatas, and the spiritual prototypes of all living creatures. Angra Mainyu revived and generated harmful spirits. When Angra Mainyu attacked again, Ahura Mazda repelled the adversary for another three thousand years with the *Yathā Ahū Vairyō* prayer (*Bundahishn* 1.29–30). According to religious lore, Ahura Mazda then transformed spiritual creations into the material universe by fashioning the Earth inside the sphere of the sky. That sphere, supposedly made of rock crystal, was thought to enclose the oceans, seven continents, and firmament with the Sun, Moon, planets, and stars. On the central continent called Khvaniratha (Middle Persian: Khwanirah), Ahura Mazda apparently placed the first human—an androgyne named Gayō Maretan (Middle Persian: Gayōmard, New Persian: Gayumars, Keyumars) (Mortal life)—the primordial bovine, and the first plant (*Bundahishn* 1A.1–3.24). Angra Mainyu eventually was aroused from his second stupor by the demoness Jahikā.

Corporeal existence and humanity's purpose. The second six thousand years of finite time is said to be the current age of mixture (Middle Persian: *gumēzishn*) between good and evil. Angra Mainyu invaded the world, polluted it, and then slew Gayō Maretan, the primordial bovine, and the first plant with the demoness Āz's assistance, according to Zoroastrian cosmogonical accounts. Owing to Ahura Mazda's intervention, humanity supposedly arose from the semen of the androgyne, animals and cereals from the body of the first bull, and other plants from the seed of the initial plant (*Wizīdagīhā* 2.1–22). The first human couple, Mashya (man) and Mashyāna (woman), who were born from Gayō Maretan's semen, are believed to have succumbed to lying and worshiping daēvas, resulting in their damnation (*Bundahishn* 14.11–30). Human history passed, in this scheme of religious chronology, with the rise and fall of legendary dynasties until Zarathushtra was born in the year 8,970.

Thirty years later, Zarathushtra received revelation from Ahura Mazda and preached the Wise Lord's faith—thus beginning the final three-thousand-year sequence. According to sacral history, the era of Zarathushtra and the Kayanians was followed by the Achaemenian, Seleucid, Arsacid, and Sassanid dynasties. Thereafter, the Arabs conquered Iran establishing the Umayyad (661–750) and Abbasid (750–1258) caliphates, succeeded by semi-independent and independent Iranian Muslim states and then by Turkish invaders (tenth to fourteenth centuries). Those conquests, triggering the reduction of Zoroastrianism to a minor faith and Zoroastrians to the status of a religious minority through conversion to Islam between the eighth and thirteenth centuries CE, were incorporated into the faith's mythohistory and explained in terms of a steady increase in evil (*Zand ī Wahman Yasn* 1.6–11, 3.20–29, 6.6–10). Thereafter, it is claimed, finite time will progress onward and Zoroastrianism will not be practiced widely—a situation that allegedly heralds the advent of the final days.

For devotees, the material world came to be viewed as not merely the arena in which humans combat evil. Zoroastrians regard it as the trap into which the evil spirit was lured. Once trapped in matter, Angra Mainyu ostensibly is vanquished gradually via good thoughts, good words, and good deeds by divine spirits and devotees acting in unison. This became the faith's and each practitioner's *raison d'être*. Zoroastrians, then, trust that humans were created by Ahura Mazda as allies in God's cosmic struggle against Angra Mainyu and that humans consented to assume physical form to further this battle. The reward of heaven after death is offered to the souls of believers, albeit on gender-differential bases, who have upheld righteousness and combated evil during their lifetimes.

Afterlife. Zoroastrians have faith that when an individual dies, the life force leaves the corporeal body, which then becomes a corpse that demonic forces attack and cause to decay so that pollution occurs. His or her mortal soul (Avestan: *urvan*, Middle Persian: *ruwān*, New Persian: *ravān*) also leaves the body, remaining beside the head of the corpse for three days and nights (*Mēnōg ī Khrad* 2.111–114). The mortal soul of a righteous person is said to chant happily *Yasna* 43, "According to my wish," whereas the mortal soul of a sinful person wails *Yasna* 46, "To what land shall I flee?" (*Hādōkht Nask* 2.2–6, 3.2–6). On the dawn of the fourth day, the soul is led to the Bridge of the Compiler (Avestan: *Cinvat peretav*, Middle Persian: *Chinwad publ*). Beneath this metaphysical transit point, which connects the earthly realm to the heavenly one, is said to lie hell. Individual tribunals are convened at the bridge's earthly base to determine each mortal soul's holiness. The yazatas Mithra (who presides to appraise whether the soul has kept its covenant to do good while in the corporeal world), Rashnu, and Sraosha—in some later traditions, Mithra and Sraosha are occasionally replaced by Arštāt and Zamyād—comprise the spiritual court. Rashnu is described as weighing each soul's good and

bad deeds in the pans of a scale (*Mēnōg ī Khrad* 2.118–122, 163).

If the soul's righteous acts outweigh its evil ones, the soul is greeted by its Daēnā or conscience in the form of a "a beautiful girl" (*Hādōkht Nask* 2.9) who personifies those pious actions. This good Daēnā, together with the yazatas, then escort the saved mortal soul across the bridge to heaven, where the soul will dwell until the end of time in union with its immortal spirit (Avestan: *fravashi*, Middle Persian: *frawahr*, New Persian: *farvarshi*, Gujarati: *farohar*) (*Mēnōg ī Khrad* 2.123). If a mortal soul's unrighteous acts outweigh its good ones, that soul is greeted by its Daēnā "in the form of an ugly naked whore" (*Hādōkht Nask* 3.9) who personifies the soul's evil actions. This bad Daēnā, together with other daēvas, toss the condemned mortal soul off the bridge into hell, where it will dwell and experience punishment as recompense until the end of time. In cases where a mortal soul's good and evil deeds are equal, it is consigned to limbo until the end of time.

Heaven or paradise, known as *Garō-nmāna* (also *Garō-demāna*, Middle Persian: *Garōdmān*) (Abode of song) and therefore termed *Wahisht* (the best [place]), is depicted as a physical location—a realm of joy, peace, happiness that is full of light, warmth, and all virtuous pleasures (*Hādōkht Nask* 2.15–18). Hell, known as *Drūjō-nmāna* (also *Drūjō-demāna*, Middle Persian: *Druzdmān*) (Abode of Confusion) and therefore described as *Dushokh* (the Worst [place]), is also depicted as a physical location—a realm of grief, conflict, despair that is filled with darkness, cold, stench, plus harmful insects and animals like scorpions and serpents (*Hādōkht Nask* 3.15–36). Here demonic creatures, lead by Angra Mainyu, are said to gloat as they torment the impious soul together with his or her predeceased bad relatives and friends in a gloomy space. Limbo, known as *Nana* (different [place]), *Misvana Gātav* (Place of the Mixed), or *Hamēstagān* (Place of the Equally-Weighing Ones), is thought to be located between the Earth and heaven. It is described as a place where mortal souls are suspended, each in isolation, experiencing nothing at all.

Apocalypse and eschatology. Social strife, personal calamity, and pollution of body and soul are all viewed as originating from Angra Mainyu, whose presence in the material world is believed to increase as time passes. The present period will, in Zoroastrian belief, be followed by a time when three saviors—Ukhshyatereta (Middle Persian: *Ushēdar*) (He who makes order flourish); Ukhshyatnemah (Middle Persian: *Ushēdarmah*) (He who makes reverence flourish); and Astvatereta (He who embodies order), also called Saoshyant (Middle Persian: *Sōshāns*) (Savior)—will be born, one every thousand years, to gradually purify the world and its inhabitants (*Zand ī Wahman Yasn* 9.1–23). Eventually, during the religious year 11973, the eschaton supposedly will commence with Saoshyant resurrecting all the dead. The resurrection, performed by Saoshyant at Ahura Mazda's command, results in each human's mortal soul and immortal

spirit returning to earth from heaven, hell, or limbo and gaining a final body (Middle Persian: *tan ī pasēn*). Zoroastrians claim that Ahura Mazda then will descend to Earth with the Amesha Spentas and yazatas. Saoshyant will separate righteous individuals from evil ones at a final, universal judgment of all humans. At that assembly, called the gathering of Isatvāstra (Middle Persian: Isadwāstar) after the prophet Zarathushtra's eldest son, each person will recognize his or her relatives and friends, and the pious shall rejoice in their goodness while the sinful lament their evil deeds. It is believed that the stars will fall from space onto the Earth, leveling the mountains into molten metal. Each sinner, having already suffered in hell after death, will be purified once more of his or her transgressions and impurities by means of an ordeal involving passage through the molten metal. A mythical bovine named Hadhayash (Middle Persian: Hadhayans) will be ritually sacrificed, and its fat mixed with a legendary white haoma to produce an elixir granting immortality of body and soul to all who consume it (*Bundahishn* 34.10–26).

Thereafter, Ahura Mazda, the Amesha Spentas, and the yazatas will annihilate most of the daēvas and all the harmful corporeal creatures. The devil Angra Mainyu himself will be rendered innocuous and forced to scuttle out of creation back to hell. Finally, hell will supposedly be sealed shut with molten metal, safeguarding the spiritual and material worlds from evil, impurity, and pollution forever. According to Zoroastrian eschatology, once the separation (Middle Persian: *wizārishn*) of confusion or evil from order or good has been accomplished, Ahura Mazda will renovate or “make excellent” (Avestan: *frasho-kereti*, Middle Persian: *frashagird*) the universe in the year 12000: “The renovation will take place in the world, [and the beings in] the material world will become immortal forever” (*Bundahishn* 34.32). Human history allegedly will then end, and eternity will recommence in absolute purity and perfection, with humanity dwelling in happiness upon a refurbished, flat earth.

RITUALS. Worship (Middle Persian: *yazishn*) and purification (Middle Persian: *yōjdahrgarīh*) are central to all aspects of Zoroastrian piety. Worship may occur at home or even outdoors, but is most regularly performed inside fire temples (New Persian: *āteshkade*), where holy fires of the *ātesh behrām*, *ātesh ādarān* (fire of fires), and *ādurōg ī dādghāh* (hearth fire) ranks burn upon altars in fire precincts (New Persian: *āteshgāhs*). Medieval injunctions urged devotees to “go each day to the fire temple and perform worship” (*Chīdag Handarz ī Pōryōtkēshān* 45). Yet in order for worship to be efficacious, the devotee must have ritual purity.

Purity and pollution. Elaborate rules were established by the magi to prevent pollution of the material world on the basis that Angra Mainyu had produced various types of defilement, particularly through Drukhsh Nasush, whose ill effects could spread from humans and animals to fire, water, and earth. A series of purificatory ceremonies were developed to ensure socioreligious purity for high ceremonies and rites of passage. Most of those rituals have fallen into disuse in the

twentieth and twenty-first centuries, because beliefs regarding pollution have undergone modification as a consequence of modern science and have come to be regarded by many Zoroastrians as superstitious demonology.

The simplest ritual cleansing, known as the *Pādyāb* (Protection [preceding] water), takes only a few minutes to perform. It is undergone facing a source of light such as the Sun, Moon, stars, or lamp. After covering the head as a sign of deference, the performer dedicates his or her action to Ahura Mazda. He or she washes the hands and forearms, the face, and the feet (if unshod), then wipes them dry. Original praxis in ancient and medieval times required that the ablution be performed first with *gōmēz* (urine from a bovine), or else with dust, before washing with water. Moreover, *gōmēz* (or else dust) and water had to be applied thrice. In modern practice, however, water is regarded as adequate for ensuring daily purity and so is applied only once due to simplification of the ritual. According to orthopractic codes, this cleansing is essential upon awakening each morning, prior to prayer and eating, after urination and excretion, and at the beginning of each period of each day. Most Zoroastrians now perform a perfunctory *pādyāb* only before entering a fire temple or after attending a funeral. After undergoing a *pādyāb*, the devotee must perform the ritual of untying and retying the *kustī* (see below).

More elaborate is the *Sade Nāhn* (Simple ritual bath). Conducted at home, fire temple, or funerary ground, it is administered during the daylight hours so that light can aid in dispelling evil. The ceremony lasts approximately half an hour. In orthodox practice, a priest who has attained the rank of purifier (Avestan: *yaozhdāthrya*, Middle Persian: *yōjdāhrgar*, New Persian: *yozhdāsragar*) must officiate. After performing a *Pādyāb* and untying the *kustī*, the candidate for purification recites the *Bāj* ([Consecratory] recitation) used for grace before meals, then chews a pomegranate leaf as a sign of wishing for immortality, drinks three sips of *nirangdin* or consecrated urine from a bovine for symbolic spiritual cleansing, and recites the *Pētī* for absolution from sin. He or she undresses, applies *gōmēz* over the body, washes with water, dries the body, dons a *sudre* or white undershirt, dresses in clean clothes, and reties the *kustī*. In modern performance, ablution with *gōmēz* is often omitted and all actions have been reduced from thrice to once. Moreover this *Nāhn* is undergone by most male and female Zoroastrians only prior to initiation and marriage. Until the mid-1900s, it was undergone by mothers forty days after childbirth (serving as a simplification of an even more detailed cleansing of thirty washings) and by pious devotees on holy days.

The most complex of Zoroastrian purification rituals is the *Barashnūm ī nō shab*. It generally was reserved for cleansing after direct contact with human carrion or to ensure that a priest was in the highest state of ritual purity. Purification was obtained via consuming *nirangdin*, followed by multiple cleansings with *gōmēz*, dust, and water while either standing within pits (in antiquity), crouching upon stones (during the

Middle Ages), or squatting on bricks (in modern times), followed by seclusion and additional ablutions for nine days and nights. The *Barashnūm ī nō shab* is still undergone, but with diminishing frequency, only by magi who conduct the most central Zoroastrian consecratory services.

Worship. Zoroastrian liturgical ceremonies can be divided into two categories: inner or high services that must be performed within a holy *gāh* (space, precinct), usually located within fire temples, and outer or regular services that can be performed at any clean location. Inner rituals include the *Yasna*, *Vīspērad*, *Vendidād*, *Nīrangdīn* (Consecration of liquids), and *Bāj*. Magi who conduct inner rituals have to be in high states of purity and grace. Outer rituals include the *Āfrīnagān*, *Staomi* (*Stūm*; Praise), *Farrokhsī* ([Recitation] for the Fravashis), and *Jashan* (Thanksgiving).

The *Yasna* ritual, the most fundamental of Zoroastrian devotional ceremonies, brings together fire, water, plants, animals, humans, and holy words. The *Yasna* liturgy has already been discussed. Originating among the Indo-Iranians, it was assimilated into Zoroastrianism and modified to remove immolation of sacrificial animals in the libation produced from the haoma (Vedic: soma) plant. In a variant form it is still present in Hinduism as the *yajña* ceremony. Conducted each dawn by two magi who are in the highest state of ritual purity, most of the ritual occurs within a precinct that had been made holy by demarcating and consecrating a small space from the rest of the area via furrows while reciting holy words. In ancient and medieval times, an animal regarded as beneficial, such as an ox, sheep, or goat, would be sacrificed as an offering. Since the early twentieth century, fruits, flat unleavened breads (*drōn*), and cooked foods have been substituted. Twigs from the *haoma* plant (now identified by Zoroastrians as ephedra) are purified and pounded to extract sap, which is strained and mixed with milk and water to form a libation called *parāhōm*. Aromas from the consecrated food and drink are believed to satisfy Ahura Mazda, the Amesha Spentas, and yazatas to whom the worship is directed. Thereafter, the two priests and sponsoring laypersons consume the food offerings and infuse the liquid offering into a source of water, such as the temple's well.

The *Vīspērad* ritual's liturgy consists of the *Yasna* plus twenty-four additional passages from the Avesta. Dedicated to Ahura Mazda, its performance comprises the *Yasna* ritual with the extended recitation. This inner ritual is performed whenever the *Vendidād* is conducted. It is performed at the *Gāhānbārs* (also pronounced *Gāhāmbārs*) (Communal feasts) too.

The *Vendidād* ritual is often conducted by an officiating priest and an assisting priest at midnight to dispel evil. Celebration of the ritual involves recitation of the *Vidēvdād* text from the Avesta with interpolation of chapters from the *Yasna* and *Vīspērad*, producing a total of forty-nine selections. The ritual is conducted in the presence of a *dādgāh* fire and lasts approximately seven hours.

Nīrangdīn rituals are conducted to obtain consecrated liquid used to purify symbolically the souls of devotees. Having purified themselves via the *Barashnūm ī nō shab* and obtained religious fortitude via a *Khūb* (Good [ritual power]), two priests obtain bull's urine. As part of the *Nīrangdīn* ceremony, the prefatory rite for the *Yasna* and other high rituals—known as the *Paragūā* (Preceding the Yasna)—and the *Vendidād* are performed, consecrating the urine.

Bāj services involve consecration of *drōn*, *gōshudā* (animal products)—now usually butter—and fruits with dedication of those offerings to yazatas and fravashis. *Bājs* often are commissioned on death anniversaries by relatives of deceased Zoroastrians.

The *Āfrīnagān*, *Farrokhsī*, and *Staomi* outer rituals serve to honor the mortal souls and immortal spirits of both living and deceased Zoroastrians. For example, the *Staomi* (*Stūm*) ritual is a soliloquy of remembrance that links the present to the past and the future, uniting the living with the dead. That ritual may be conducted in any clean area where outer ceremonies are performed, such as at a Zoroastrian's house or inside a fire temple, upon a carpet or table or within a ritual precinct. At the turn of the twenty-first century, the *Staomi* consists of five stages: a *shnūman* (dedicatory formula), *Yasna 26* or the rite proper, a *dībāca*, a series of propitiatory recitations, and a *Bāj* that serves as a closing recitation. Because of offerings and the fragrances of those offerings that are made holy during the ritual, it is believed that asymbolic gathering together of all fravashis occurs. At such gatherings, therefore, the immortal spirits can be propitiated by the living, and in turn those spirits presumably bless the living. Most frequently performed is the *Jashan* ritual, which also involves consecration of food by the officiating magus or magi who recite an *Āfrīnagān* and *Bāj*. Then the food is shared by the sponsors of the ritual, often at a communal gathering.

Festivals and popular rites. Prayer services like *Jashans* are performed in fire temples and homes on days such as *Nav Ruz*, the New Year's festival (at the vernal equinox); *Mihragān* (also called *Jash-e Mehr Izēd*), the feast honoring Mithra (at the autumnal equinox), and the *Gāhānbārs*. The six *Gāhānbārs* are still celebrated by many Zoroastrians, especially those in Iran. On those occasions fruits, flowers, and cooked foods made from plants—and now less frequently from animals—are consecrated to the divinities and then consumed by the community. Originally, animals were sacrificed by Zoroastrians in both Iran and India on religious and communal festivals. But Hindu vegetarian influences on the Parsis led to the gradual phasing out of animal sacrifice, and Parsi abstention spread to Iranis in the twentieth century.

The spreading upon *Sofres* (clothes) of food offerings to beneficent spirits, often in conjunction with the *Gāhānbārs* and during pilgrimages to shrines, has become a frequent devotional practice among women, although not sanctioned by the magi. *Sofres* are widely performed by Zoroastrian women of all social classes in Iran. The rite serves as a locus of femi-

nine spirituality, organized and attended mainly by women and their children.

Pilgrimages form part of the religious lives of devout Zoroastrians who are seeking favors from God or are fulfilling vows. Major shrines are located in the Iranian province of Yazd and each shrine has a founding legend associated with Zoroastrian attempts to withstand conversion to Islam. The six major *pirs* (shrines) are Pir-e Sabz, Pir-e Nawraki (Nāreke), Pir-e Narestan, Set-e (Se-tā) Pir, Pir-e Herisht (Hrisht), and Pir-e Bānu Pārs. Those shrines are administered by local *anjomans* (associations), often drawing upon funds from charitable foundations. Parsis consider the Irān Shāh *ātesh bebrām* at the city of Udwarda to be their most venerable holy fire, and so travel to worship Ahura Mazda in its presence. In the late twentieth century, Parsis began making pilgrimages to Iran, where they visit the important functional fire temples and shrines at Yazd and Sharifabad, then view the ruins of ancient and early medieval archaeological monuments associated with the Zoroastrian dynasties of that country.

rites of passage. Zoroastrians past and present perform ceremonies to mark major points in their lives, much like members of other faiths. Birth, initiation into the religion, marriage, and death are important times during which religious beliefs are reaffirmed and membership in the confessional community is consolidated. Those rites of passage involve not only the Zoroastrian who is undergoing the life-altering event, but his or her family and friends as well.

Birth. Children are regarded as essential for “continuation of the corporeal lineage” to combat confusion in the material world (*Chīdag Handarz ī Pōryōtkēshān* 5). Therefore, abortion is discouraged (*Vidēvdād* 15.9–12). Birth rites still follow many guidelines found in medieval and premodern Zoroastrian writings, even though most births now occur in hospitals.

Once a woman conceives, an oil lamp or light is lit in her house to ward off evil. Also, the expectant mother should avoid contact with polluted items that may render her ritually unclean (*Saddar Nasr* 16.1, 17.2). Traditionalist Parsis mark the first days of the fifth and seventh months as auspicious, exchanging gifts between husband and wife and between each spouse’s families. Upon the birth of a child, a lamp is kept lighted for between three to forty days, depending on the degree of orthopraxy in the family, so that mother and child will be protected from *daēvas* (*Farziyāt nāme* 2c–d). Because *haoma* is regarded as “death dispelling” (*Hōm Yasht* or *Yasna* 9.7), a few drops of its libation or *parāhōm* followed by a few grains of sugar would be placed upon the child’s tongue by the parents, grandparents, or family priest while reciting the *Yathā Abū Vairyō* prayer so that the child might experience a life free of sickness and full of joy. This practice was common into the eighteenth century (*Farziyāt nāme* 2a). Now, after prayers of thanks to God, breast milk or milk formulas are fed to the infant. Naming of the child occurs shortly thereafter (as noted even in the Achaemenian

period by Herodotos, *History*, 1.139). Many families still consult astrologers who determine, based on the day and time of birth, the syllable with which the child’s given name should commence.

Despite the positive aspects of childbirth among Zoroastrians, the accompanying discharge of tissue and blood came to be regarded as polluting. A period of isolation was prescribed for the mother—initially twelve days during antiquity (*Vidēvdād* 5.45–62, 7.60–72), extended to forty days by the Middle Ages (*Shāyest nē Shāyest* 3.15). This praxis continued into premodern times, to be followed by a ritual purification via the *Sade Nāhn* before the mother was reintroduced to the community (*Persian Revāyats* 223). Isolation and purification gradually ceased to be enforced during the early twentieth century. In the twenty-first century, most Zoroastrian women simply bathe to cleanse themselves after childbirth.

Initiation. Teaching of prayers to children by a magus or family elder usually begins at the age of seven years. Once the boy or girl has memorized at least the *Ashem Vohū*, *Yathā Abū Vairyō*, *Kēm Nā Mazda*, *Nirang-e Kustī Bastan* or *Ohrmazd Khwadāy*, *Jasa Mē Avanghe Mazda* (Come to my aid, O [Ahura] Mazda), and *Srōsh Bāj* prayers, he or she is initiated into the faith before puberty (*Farziyāt nāme* 2h–i). Failure to be initiated is thought to expose the child to demonic forces (*Vidēvdād* 18.31, 54). During the ceremony that symbolizes advent to adulthood, acceptance of religio-legal responsibilities, and spiritual rebirth, each child is vested with a cord (Avestan: *aiwiyānghana*, Middle Persian: *kustīg*, New Persian: *koshti*, Gujarati: *kustī*) around the waist and a white undershirt (Middle Persian *shabīg*, New Persian: *sedra*, Gujarati: *sudre*). Origin of initiation into the sectarian community may date from the Central Asian Bronze Age, for a similar cord is tied around the shoulder of each Brahman boy during the *Upanayana* ceremony in Hinduism. Failing to wear these holy items was regarded as a sin and equated to “scrambling around naked” (*Shāyest nē Shāyest* 4.10). The *sudre* is sown from white cloth such as cotton and serves as religious armor against evil. Its neckline has a small pocket or *girebbān* (*girdo*) where the wearer’s good deeds symbolically accumulate. The *kustī* is woven by priests’ wives from wool and its seventy-two strands are said to represent the chapters of the *Yasna* (*Nērangestān* 3.1.11–21). An entire medieval text, the *Chīm ī Kustīg* (Meaning of the cord) discusses the *kustī*’s theological significance.

In the twenty-first century, most Zoroastrian boys and girls undergo religious initiation between the ages of seven and fifteen. The ceremony is termed *Navjote* (new birth) or *Sedra-Pushi* (donning the white undershirt) and is conducted by one or more magi. Just before initiation, the boy or girl undergoes the *Sade Nāhn* to ensure that entrance into the devotional community occurs in a state of ritual purity. A *dādghāh* fire burns in a small altar during the ceremony; candles and oil lamps may also be lighted so that illumination drives away evil. Fruits and flowers are placed nearby as offer-

ings to Ahura Mazdā, the yazatas, and the fravashis. Several Zoroastrians may be initiated together, irrespective of gender. Standing up, the priest(s) lead the initiate(s) in prayers while the undershirt is donned and the cord is looped around the waist thrice and tied at front and back with square knots. Family and friends gather to witness the initiation, share a festive meal, and bestow gifts upon the initiate. The initiation ceremony is still performed routinely by Zoroastrians all over the world early in the twenty-first century. Auspicious days, such as the days of each month dedicated to Ahura Mazdā and Verethraghna, often are chosen for the ceremony.

The *kustī*, which most Zoroastrians continue to wear, should be untied and retied after the *Pādyāb* purification and with the recitation of prayers at five canonical prayer times—sunrise, noon, afternoon, evening, and before sunrise—and prior to performing worship at fire temples (*Farziyāt nāme* 3). The majority of modern-day Zoroastrians wear the *sudre* and *kustī* under their clothes, but the rites of untying and retying the cord are usually performed facing the sun or another source of light by laity only upon awakening each morning, prior to sleeping at night, and for bathing. If a Zoroastrian apostate wishes to return to the community, he or she has to undergo another initiation ceremony. Admission to Zoroastrianism became patrilineal after its followers became a minority faith during the late Middle Ages. Orthodox contemporary Parsi magi initiate only children whose parents are both Zoroastrians. More liberal magi among the Parsis and Iranis initiate children whose fathers are of Zoroastrian descent. Rarely are persons whose parents were not non-Zoroastrians initiated—and such initiates still are denied entrance to Zoroastrian religious sites on the Indian subcontinent.

Marriage. The family unit has long been central to Zoroastrian communal structure, and so marriage is encouraged as a religious duty and divorce is discouraged, especially after children have been born (*Chīdag Handarz ī Pōryōtkēshān* 5). Royal records from ancient Iran, medieval religious manuals, and premodern marriage records indicate that Zoroastrian social praxis found polygyny fully acceptable. Wives were accorded differential status within the family based on their social class prior to marriage, whether they bore children, and the stipulations of their marriage contract. Only during the twentieth century was polygyny phased out under European influence, first among the Parsis and subsequently among Iranis.

Spring, reflecting fertility and growth, is regarded as an auspicious time for weddings. So are nights of the full and new moons. *Nav Ruz*, the “New Year’s” festival day, is favored too. In India the monsoon seasons are avoided. Traditionally, weddings occur in the evening. Parsis conduct the service after nightfall owing to a legendary agreement with the first Hindu king whom their ancestors encountered in Gujarat. Iranis would conduct both the betrothal and wedding services at midnight, a practice now modified to early evening so that celebrations can be held with family and

friends at a dinner reception. A white jacket (Gujarati: *duglī*) and trousers plus an ornate hat (Gujarati: *fethā, paghī*) are worn by Parsi grooms. White saris, with the trail draped over the head, are worn by Parsi brides. White jacket and trousers, with a simple green prayer cap, are worn by Irani grooms, although recently Western-style suits have become popular. White or green robes and shawl are worn by Irani brides, although in the twentieth and twenty first centuries Western-style wedding gowns have become popular. Symbolic items at an Irani wedding include a candelabra with candles to cast light upon the service, a tray with sweets (known as *lurk*) made of seven types of fruits and nuts representing Ahura Mazdā and the Amesha Spentas, a pomegranate and an egg symbolizing fertility, decorated sugar cones representing the sweetness of married life, a mirror for self reflection, a prayer book to provide guidance, and a needle with thread and scissors indicating domesticity. Symbolic items present at Parsi weddings include trays with coconuts and rice grains representing fertility and a censer or fire brazier. Parsi brides and grooms wear flower garlands and hold flower bouquets as well. The religious service for a wedding is conducted by one or more priests. Irani and Parsi wedding ceremonies display variations that reflect cultural differences between the two communities of Zoroastrians.

Among Iranis, the wedding service begins when Ahura Mazdā is invoked by the officiating magus. Recitations include *andarz* (advice) relating to the *gava giri* (marriage contract). Bride and groom are asked if they accept each other as partners. A wedding sermon by the priest on the benevolence of the Amesha Spentas follows. Selections from the *Srōsh Bāj* and *Yasna* 52 (which recounts a wedding homily by Zarathushtra) are chanted by the magus. Finally, the *Tandarosti* is recited. Then the couple is sprinkled with flower petals and rice symbolically to bring them good luck. Among Parsis, the *Āchu Michu* rite of Indian origin—in which eggs, leaves, nuts, sugar, coconut, rose petals and other flowers, water, and coins are utilized to symbolize aspects of creation and reproduction coupled with hopes of joy and wealth—is performed upon groom and bride by the bride’s mother and the groom’s mother. The officiating priest inquires from the bride and groom whether they consent to marrying each other. The bride and groom sit facing each other and the *Hathēvāro* (hand fastening) rite is performed: a white cotton sheet separates the seated bride and groom, while their right hands are bound together by the magus using white thread to indicate their holy union. The thread is then wrapped around them seven times in a clockwise manner while seven *Yathā Ahū Vairyō* prayers are recited. The sheet is then removed, the bride and groom toss rice at each other, the thread is removed as well, and the fire brazier brought close to the couple so that they may worship God in its presence. Next, with the couple seated side by side facing east, the Pāzand and Sanskrit versions of the *Ashirwād* are narrated by the officiating magus in the name of Ahura Mazdā, and the couple’s oral consents are obtained for the marriage. Finally, *Tandarosti* is intoned to bless the newlyweds. A celebratory

meal usually follows, hosted by the couple's parents, for their families and friends.

Death and funerary practices. If a Zoroastrian is known to be in the final hours of his or her life, the dying individual is supposed to recite the *Pētīt Pashēmānīh* (also called *Patēt-e Vidardegān* [Penance for the deceased] by Iranis and *Patēt Ravān-nī* [Penance for the soul] by Parsis) in repentance for prior evil deeds, followed by several *Ashem Vohū* prayers. After the deceased's eyes are closed, the corpse is given a ritual cleaning (termed *sachkār* by the Parsis) either by professional corpse bearers (New Persian and Gujarati: *nasā sālārs*) and corpse cleaners (New Persian and Gujarati: *pākshus*) or by relatives or friends of the same sex, all of whom should be Zoroastrians. The chest is draped in a *sudre* and a *kustī* is tied around its waist. Thereafter, the deceased's body is dressed in white clothes, his or her hands are crossed over the chest, the legs are crossed by Iranian Zoroastrians but not by Parsi Zoroastrians, and the entire body is covered with a white shroud. The face remains exposed. If possible, handling of corpses is left to professional Zoroastrian corpse cleaners and bearers. Until the funeral service commences, a prayer vigil is maintained to safeguard the deceased's body and soul from demonic forces thought to be lurking in the vicinity. At the commencement of each period of the day, a rite known as *sagdīd* ([ritually] seen by the dog) is performed. The actual funeral service, termed *Gēh Sārnā* (Chanting of the Gāthās) by Parsis, occurs within twenty-four hours, during the three daylight periods, or morning, afternoon, and evening but not after sunset or after midnight. The body is placed upon a metal (which like stone is believed to withstand pollution) bier. The funeral service is followed by *sezdo* (*sijdā*) (last respects). Then the deceased's face is covered with the shroud. The bier may be carried to the funerary site with mourners following, after having recited the *Srōsh Bāj* and formed gender-specific pairs. Mourners must be led by a pair of priests or one priest plus a dog to ward off evil and pollution. Most often in the late twentieth and early twenty-first centuries the corpse is placed in a hearse, which is followed to the funerary site by relatives and friends in a motorcade.

In the early history of Zoroastrianism, human corpses were buried under the floors of disused buildings, following a practice prevalent among the Late Bronze Age people of Central Asia. Later, interment took place in village cemeteries. Achaemenian monarchs and their families were interred in rock sepulchers in the belief that the stone prevented the spread of pollution created by corpses' decay. Yet as praxis changed between the sixth and third centuries BCE, the original Avestan term *dakhma* for a grave or tomb came to designate a place for exposure of corpses. As initially remote locales came to be inhabited because of demographic growth, *dakhmas* developed into walled enclosures or funerary towers that came to be called "Towers of Silence" in popular parlance. The practice of exposure prior to gathering and disposal of the bones appears to have been introduced by the an-

cient magi in order to prevent pollution of the earth, fire, and water.

Further variations in Zoroastrian funerary practices occurred during the nineteenth and twentieth centuries. Exposure of corpses was gradually phased out in Sri Lanka (then Ceylon) during the late 1800s and in Iran during the 1970s. Iranis now bury their dead in graves walled with cement slabs to prevent the corpse from polluting earth and water. Parsis in India and Pakistan continue the tradition of exposing bodies to vultures in funerary towers, particularly at Bombay and Karachi, laying the bodies in specific areas or rows according to gender and age. However, in the United States, Canada, England, Australia, Sri Lanka, and even some locales in India and Pakistan, Zoroastrians—like their coreligionists in Iran—bury the dead irrespective of gender and age in rows of graves within graveyards known as *aramgāhs* (places of rest, cemeteries). In Western countries, deceased non-Zoroastrian spouses may also be buried in those graveyards.

HISTORICAL ASPECTS. Zoroastrianism was brought onto the Iranian plateau by tribes migrating southward from Central Asia around 1500 BCE. It became established as the dominant faith among the Medes, Persians, Scythians, and other Iranian groups who took up residence in various locations on that plateau. Through the Persians, Zoroastrianism spread to the indigenous Elamites of southwestern Iran as evidenced by renditions of the names of Ahura Mazdā and various yazatas preserved in Elamite ritual documents.

Ancient Iran. Median practice of Zoroastrianism is known from archaeological remains. At the citadel of Tepe Nush-e Jan (c. mid-eighth century to sixth century BCE), south of the northwest Iranian city of Hamadan, two rooms with ritual fire precincts have been excavated. Likewise, the capital city of Hagmatāna (Ecbatana, now Hamadan) had at least one small, open-sided building with four corner columns supporting a domed ceiling that seems to be a precursor of the *chahār tāq*-style of fire precinct. A relief carved above the entrance to a late Median or early Achaemenian rock tomb located at Qyzqapan in Iraqi Kurdistan depicts a priest on the left and a warrior on the right, both in Median garb appropriate to their occupations, flanking a fire altar with a stylized, semicircular flame.

Some modern scholars have questioned whether the Achaemenian rulers followed Zoroastrianism. Kūrush or Cyrus II (r. 550–530 BCE), who founded the dynasty, had magi at his royal court, according to classical writers. An open-air ritual precinct with stone fire plinths has been excavated at Parsarga (Pasargadae), the royal capital. The plinths' function is indicated by reliefs carved above the rock cliff tombs of seven subsequent Achaemenian rulers, including that of Darius I at Naqsh-e Rostam and that of Artakshshaçā or Artaxerxes III (r. 359–338 BCE) at Persepolis. The king or a magus climbed to the top of the southern plinth, faced the northern plinth, which bore a fire altar with flame, and performed devotions before Zoroastrianism's main icon. Implements such

as mortars and pestles, whose dedicatory inscriptions confirm their ritual usage for pounding of *haoma* during the *Yasna* ritual, have been excavated at Persepolis. While Zarathushtra was not mentioned in imperial inscriptions, Ahura Mazda was routinely praised in those writings. For instance, Darius I noted: “Ahura Mazda is the great God who created this earth, who created that sky, who created humans, who created happiness for humanity, who made Darius king” (*Naqsh-e Rostam inscription A 1–5*). Following Egyptian depictions of Ra and Assyrian ones of Ashshur, Ahura Mazda seems to have been depicted on Achaemenian royal reliefs standing within a disk which had a bird’s wings, tail, and talons, although some scholars consider the symbol to represent Khvarenah (glory) and modern Parsis regard it as a farohar. Artaxerxes II (r. 404–359 BCE) and Artaxerxes III honored Mithra and Anāhitā in conjunction with Ahura Mazda—a practice that parallels Zoroastrian liturgies—as evidenced by their official Old Persian inscriptions (*Susa inscriptions A 4–5, D 3–4; Hamadan inscriptions A 5–6, B; and Persepolis inscription A 25*). No form of Mazda worship other than Zoroastrianism has ever been identified. It is safe, therefore, to regard the Achaemenian rulers and many of their Iranian subjects as Zoroastrians, even though a range of other religions—such as Judaism and Babylonian cults—were practiced within the empire and Cyrus II honored other divinities like Yahweh and Marduk when he was among their followers.

Religiosity during the Seleucid period was characterized by an amalgamation of Greek, Mesopotamian, and Iranian divinities. On the Iranian plateau and in Armenia, Anāhitā—whose name was Hellenized as Anaitis and whose attributes were augmented by those of other feminine divinities, such as Artemis and Inanna-Ishtar—became the focus of an extensive temple cult with statuary and votive offerings. Among the residents of Commagene in southeastern Anatolia, Ahura Mazda was fused with Zeus as Zeus Oromasdes. Mithra was fused with Apollo Helios Hermes, and Verethraghna (called Artagnes by the people of Anatolia) was conjoined with Hercules Ares. Colossal images of all those composite divinities were placed on a platform in an open air Zoroastrian temple at the site of Nimrud Dagh in southeastern Anatolia during the reign of Antiochus I (c. 69–34 BCE), a king of the regional Orontid dynasty (c. 163 BCE–CE 72) who had descended from Achaemenian satraps. Antiochus also had images carved of him clasping the hands of divinities (Greek: *dekhiosis*).

Such syncretism continued during the Parthian period. Women, for example, served as professional mourners at funerals. Augmentation of the ritual role of fire occurred between middle Achaemenian and early Parthian times with the construction of monumental temples. Holy fires of the highest ritual grade, called the fires of Verethraghna, (Parthian: *ādar warahrān*, Middle Persian: *ātakhsh wahrām*, New Persian and Parsi Gujarati: *ātesh behrām*) the yazata of victory, were placed in fire temples. The most famous *ādar*

warahrān of antiquity were founded during that time: Ādur Farrōbay, considered the *ādar warahrān* of clergy and nobility, at the site of Kariyan; Ādur Gushnasp, linked to rulers as the *ādar warahrān* of warriors, at the site of Takht-e Sulayman southeast of Lake Urmia (now in Iranian Azerbaijan); and Ādur Burzēnmīhr, regarded as the holy fire of farmers and pastoralists, on Revand mountain northwest of Nishapur in Parthia (now Khorasan).

Advent of the Sassanid dynasty witnessed Zoroastrianism becoming the official religion of Iran. In addition to supporting the faith financially, Sassanid monarchs are credited by the magi as having commanded codification of the Avesta. Sacral kingship based on Zoroastrianism became normative. So Sassanid rulers like Ardashīr I (r. 224–240), Shāpūr I (r. 240–272), and Khusrō II (r. 591–628) had themselves depicted on monumental rock reliefs at Naqsh-e Rostam, Naqsh-e Rajab, and Taq-e Bostan receiving diadems of kingship from anthropomorphized images of Ahura Mazda and Anāhitā. Every Sassanid monarch referred to himself or herself as *māzdēsñ bay* (Mazda-worshipping Lord) on their coins. That coinage routinely depicted monarchs—for example, Hormizd II (r. 302–309)—performing worship in front of fire altars. Magian ranks were regularized. Fire temples and seminaries were funded by the state and by private foundations. Committing apostasy was forbidden. As a result, under the Sassanian dynasty, Zoroastrianism became the politically and demographically dominant faith on the Iranian plateau and in western Central Asia.

Conversion to Christianity and Islam. Yet as Christian missionaries began proselytizing among Zoroastrians, and individuals from the latter groups began to adopt Christianity, Zoroastrian fire temples were transformed into churches at locales like Ejmiacin and Dvin in Armenia after the year 300. In Sassanid Iran itself, converts to Nestorianism deliberately extinguished holy fires on occasion while refusing to return to Zoroastrianism—resulting in their martyrdom at the hands of magi as documented in the Syriac martyrologies.

Confessional realignment gained momentum with the Arab Muslim conquest of the Sassanid Empire during the seventh century. The Arab conquest came to be associated with prophetic and apocalyptic expectations. It gave rise to literature that presented claims of propitious birth, flourishing of a new religion and its followers, and disintegration of older dynasties and faiths. Islamic prophecy alluded to triumph, Zoroastrian apocalypticism to doom. The prophet Muḥammad and the Muslim caliphs were presented as successors to Zarathushtra and the Sassanid monarchs. These stories were construed to cast a veil of mystery over ordinary events involving the fall of one empire with its state religion and the rise of another empire with its new faith. Since people believed these statements, they acted on those beliefs. Many despondent Zoroastrians, concluding that a true deity would not have forsaken their religion or them, eventually chose to accept the new Islamic faith, which they felt had

demonstrated its ascendance through political victory. Urban Irani Zoroastrians adopted Islam from the eighth through tenth centuries, and that faith spread among rural folk from the tenth through thirteenth centuries. Most Zoroastrian ecclesiastical institutions were either transformed into Islamic mosques and Sunni *madrasahs* or else destroyed or abandoned by the fourteenth century. The *chahār tāq* style of fire precinct with its domed roof was assimilated into Muslim religious architecture as domed mosques. Moreover, as residents' confessional alliance shifted to Islam, there was gradual diminishment in contributions to pious foundations that supported the magi.

Zoroastrian leaders turned to canon law in a futile attempt to circumscribe contact of their followers with Muslims, for they rightly perceived interaction as a conveyor of religious and social changes that threatened their traditional way of life. The magi outlawed marriage, sexual intercourse, and procreation with Muslims, encouraging all Zoroastrians to ostracize those who violated these bans. Muslim elites were, however, often in positions to stifle such endeavors and encourage conversion to Islam by the people whom they referred to generically as the *māgūs* (so named by Muslims after the priesthood).

Medieval migrations. The Arab Muslim occupation of Iran triggered migrations by Zoroastrians. Zoroastrianism had already reached China during the early sixth century, where the religion came to be known as Hsien. During and after the seventh century, there were many small, poorly documented migrations away from Iran over both land and sea. Some Zoroastrians, especially Sassanid nobles and military personnel, immigrated eastward through Central Asia to northern China. Other groups of Zoroastrians probably sailed from Iran to join expatriate communities already present in southern Chinese port cities like Canton. From China, small groups even relocated to Japan. From fifteen to eighteen fire temples functioned in China until Zoroastrianism, together with other foreign faiths, was proscribed there in 845. However, Zoroastrians survived in China as late as the mid-fourteenth century, after which they were completely assimilated into the local population. The situation proved different for other groups of immigrants, specifically those who went to India and formed the *Parsi* (Persian) community that flourishes into the twenty-first century. Those Zoroastrians who remained in Iran sought refuge from Muslim lifestyles by moving to out-of-the-way locales within Fars, Yazd, and Kermān provinces.

Medieval and premodern minorities in Iran. Between the fourteenth and seventeenth centuries, the lives of Zoroastrians as a *dhimmī* (minority) community were governed by religious tenets and a sectarian society dominated by Muslim men. All followers of Zoroastrianism had to pay the *jizya* (poll tax) to the Sunni Muslim authorities, and the Zoroastrians' standing under Islamic law was secondary to members of the new confessional majority. Invasion and rule of Iran by the Mongols (1219–1256), Ilkhanids (1256–1335), and

Timurids (1370–1507) resulted in violence against Zoroastrians producing even further conversion to Islam.

Institutionalization of Shiism under the Safavids (1501–1722) did little to strengthen relations between the Muslim and Zoroastrian communities, for the latter increasingly feared the specter of forced conversion to Islam under the religious zealotry of specific Shi'ī clerics or *mollās*. Zoroastrians living in the Yazd and Kermān areas bore the brunt of religious persecution, resulting in adoption of Shiism by some villagers, the transformation of associated fire temples into mosques, and desecration or even demolition of nearby funerary towers. A New Persian designation, *gabr* (hollow, empty), hence “one lacking faith, infidel,” came to be used by Muslims to scorn Zoroastrians as nonbelievers in God despite the claim of the latter that the Avesta was a holy book just like the *Qur'ān*. Likewise, the term *ātashparast* (fire worshipper) became a slur directed against Zoroastrians by Shi'ī Iranians, despite the former's protestations that they worshipped God and not fire. Forcible relocation of Zoroastrians occurred during the reign of Shāh 'Abbās I (r. 1587–1629) from Yazd and Kermān to the capital city, Isfahan, as laborers. In other cities of Safavid Iran, they also served as manual workers and textile weavers. Outside the cities, they toiled on farmland owned by Muslims.

European eyewitness accounts suggest that the Zoroastrian community of Iran was at its nadir during the Qajar period (1779–1921). Since Zoroastrians were considered *najēs* (unclean) by the Shi'ah, they experienced hostility from the Muslim majority populace. Conversion to Islam was enforced periodically with transformation of fire temples to mosques. In the middle of the nineteenth century, Zoroastrians feared that their homes would be raided and religious texts burned. Religious rites were performed indoors, out of view of Muslims, so as not to attract the latter's attention. Only after intercession by Parsi Zoroastrians from British India was religious freedom enhanced and the *jizya* abolished by Qajar royal decree in 1882. Zoroastrian *anjomans* (associations) were established thereafter, as were women's societies and orphanages. More than three dozen schools for Zoroastrian boys and girls were founded with Parsi and Irani money. The curricula at such institutions combined Western secular knowledge and traditional religious instruction, stressing English as a language for societal advancement. Irani magi began traveling to and residing in India for clerical training—a trend that lasted until the latter part of the twentieth century, when the priesthood within Iran was able to strengthen its organizational and didactic bases. Zoroastrians, hoping for more equitable treatment under a secular national government, participated actively in the Constitutional Reform movement. Eventually, the community was allocated its own seat in the *majles* (national consultative assembly, parliament). Although the 1906 Constitution claimed “all citizens are equal before the law,” the legal standing of Zoroastrians vis-à-vis Muslims remained unequal as evidenced by Article 8 of that Constitution, where Zoroastri-

ans were assigned a legal status no different from that which they held previously as a *dhimmī* community. Therefore, during the nineteenth and early twentieth centuries, more Zoroastrians relocated from Iran to British India to live amidst the Parsis. Carving out a distinctive economic niche in India, they became restaurateurs and liquor merchants.

Modern Iran. A brief period of respite for Zoroastrians in Iran from socioeconomic hardship and pressure to adopt Islam was experienced under the Pahlavi dynasty (1925–1979). Attempts to secularize and westernize Iranian society resulted in citizens generally being regarded as equal under the law. The *‘Ayn nāme* (Uniform Legal Code) for Zoroastrians was put into practice during the mid-1930s, establishing a nationally approved framework for their rights in personal matters such as marriage, divorce, and inheritance. The Family Protection Law of 1967 and its revisions of 1975 were another central part of the restructuring of the community’s legal relationship with the nation. Glorification of Iran’s pre-Islamic past for sociopolitical reasons by the state, including introduction into the official calendar in 1925 of Zoroastrian names for the months, also raised the status of Zoroastrians in the eyes of many Muslim Iranians. The Pahlavi era was marked by rapid urbanization and reform for the Zoroastrian community as educational, employment, and business opportunities burgeoned. Westernization, urbanization, and secular education led to religious change, spread in part through elementary, middle, and high schools founded by Irani Zoroastrians for edification of their children during the Pahlavi period plus those schools that had been established earlier. Irani Zoroastrian communal leaders championed their religion as an early form of monotheism, brought about calendrical reform, and simplified or replaced rites deemed antiquated in favor of ones regarded as more suitable for a community with newfound societal and economic aspirations. Even conversion to Zoroastrianism by Muslims was tacitly permitted. Reform gradually spread from the community in Tehran to other urban settings such as the cities of Kermān and Yazd. Due to state pressure on behalf of its secularization program, access to most fire temples in Iran was opened in the 1960s to members of all faiths—although they were requested (but not required) to cover their heads and remove footwear as signs of respect for the holy fires. Together with open access, yet another change occurred wherein the *Pād̄yāb* purificatory ritual and *koshti* (cord rite) came to be ever-less-frequently performed prior to entering the presence of a holy fire. Thus, an attenuation in notions of purity and pollution took place. By the mid-1970s, the community was finally confident that its lot had genuinely changed for the better in a secularizing Iranian state. Hence, leading members of the community at Tehran, Yazd, and Kermān still recount that Iran’s reversal in 1979 to a political system in which Islam predominated once more deeply shook the foundational psyche of the Zoroastrian community and brought back a collective, multigenerational memory of harsh times from centuries past.

The advent of the Islamic Republic of Iran witnessed a return to strict socioreligious minority status for Zoroastrians. Technically protected under Article 13 of the 1979 Constitution, the community is allocated one elected representative position among the two hundred and seventy members or national representatives of the legislative branch of government, the *majles*. Despite being officially recognized as a minority and represented in public settings, Zoroastrians in Iran often are offered only limited protection on a daily basis from their Muslim neighbors. As a result, they sporadically have been targets for persecution. Community records list cases of Zoroastrian women being compelled to marry Muslim men in the presence of Shī‘ī clerics or *mollās* and to publicly adopt Islam. On a daily basis, more important are the legal distinctions between Muslims and Zoroastrians, which echo, in large part, ordinances that Zoroastrians have experienced under many Islamic regimes since the middle of the seventh century. Thus, for instance, a Zoroastrian who converts to Islam is regarded by Iranian law as the sole inheritor of his or her family’s assets. Likewise, a Zoroastrian who even accidentally causes the demise of a Muslim faces the possibility of capital punishment, but not vice versa. The concept that Zoroastrians are *najes* has been revived, affecting their socioeconomic lives in daily interactions with Muslims, since items the former touch, especially food, may be regarded as unclean by the latter. The insults *gabr* and *ātashparast* have once again been used against them. Chronic unemployment has become prevalent among members of both genders. One major cause appears to be discrimination by the government in access to state jobs. While employment opportunities are withheld, Zoroastrians feel they have been targeted for especially hazardous assignments when performing the military service required of all young men in Iran. Therefore, yet again Zoroastrians have begun leaving Iran.

Globalization of the faith. The initial modern exodus from Iran was during the 1980s by elite families who had been associated with the Pahlavi state and therefore feared retribution. Relocations since then have been by young men and women who are growing increasingly pessimistic about the possibility of a viable socioeconomic future for their families and themselves in Iran. Some of the migrants, fleeing Iran overland to Turkey, Pakistan, and India, then spending many months or a few years in refugee camps or under the protective welfare of Parsi communities, eventually settle in North America and in Europe. Globalization of the Zoroastrian community has also occurred through emigration of Parsis from the Indian subcontinent. During the British Raj, Parsi trading families settled in Burma (now Myanmar); Singapore; Malaysia; Hong Kong (now united with the People’s Republic of China) and mainland China; Taiwan; the Seychelles; and African countries such as Zaire, Tanzania (on the island of Zanzibar), and South Africa. Some Parsis relocated to England, Scotland, and Wales during the nineteenth and twentieth centuries, seeking better educational and economic opportunities. Beginning in the 1960s, yet other Parsis left to unite with relatives in Australia, New Zealand, Europe,

and North America as a consequence of nationalism and religious fundamentalism in India, Pakistan, and Sri Lanka. Since the 1970s, Parsi immigrants have settled in the United States and Canada after gaining education and employment there.

Many among the first generation of recent Irani immigrants have settled in ethnic clusters—forming large communities in cities like Los Angeles, Toronto, and London—where they continue many of their native customs and speak New Persian. However, their children, the second generation, being born in Western countries, have tended to become better acculturated as native speakers of the English language. For them, Iran is a cultural legacy of their parents. While the first generation of Parsi immigrants remains bilingual in the Gujarati and English languages, maintaining customs from the Indian subcontinent, their children have limited facility in Gujarati and have integrated fully with local Western populations. Differences of language and custom still present challenges to the cultural and religious unity of the first generations of Parsi and Irani Zoroastrians in the West. Despite such divergences, they have worked together raising funds to establish community centers, fire temples, and cemeteries in most major cities in the United States, Canada, England, and Australia.

As Zoroastrians have spread globally, many issues have come to the fore. They include intermarriage between them and followers of other faiths and the religious identity of children from such unions; conversion to Zoroastrianism of persons who wish to adopt the religion; access to fire temples by non-Zoroastrians, including those who are the spouses and children of Zoroastrians; and ways in which the bodies of deceased Zoroastrians may be disposed, including inhumation and cremation. By and large the Parsis of India tend to be the most conservative and orthopractic. Theocratic positions taken by Zoroastrians in India are not uniformly accepted by lay and clerical Zoroastrians elsewhere, however. Occasionally, individuals who wish to join Zoroastrianism are initiated by magi outside the Indian subcontinent, but magi in the Indian subcontinent do not accept converts. Likewise, the frequency of marriage across confessional boundaries is on the rise; this is the case even among the Parsis of India. Outside the Indian subcontinent, Zoroastrians routinely permit non-Zoroastrian spouses to attend rituals at fire temples and cemeteries. Zoroastrian women, while still not part of the priesthood, now participate fully in community activities and governance.

In the late twentieth century, Zoroastrian organizations in countries around the globe began establishing and maintaining regular contact with one another. Recent demographic studies, national censuses, and community association membership rosters yield the following approximate population figures for Zoroastrians—Iranis, Parsis, and recent converts—worldwide in the early twenty-first century: 28,000 in Iran; 69,600 in India; 20,100 in the United States; 10,000 in Canada; 7,500 in England, Scotland, Wales, and

Ireland; 4,500 in the other countries of the European Union; 2,800 in Pakistan; 2,100 in Australia; 1,200 in the United Arab Emirates; 250 in New Zealand; 190 in Hong Kong; 150 in Singapore; 130 in Bahrain; 110 in Zaire; 75 in South Africa; 70 in Sri Lanka; 50 in Myanmar; 30 in Japan; 30 in Malaysia; 30 in the Seychelles; 20 in Bermuda; 10 in Venezuela; 10 in the Peoples Republic of China; and even smaller numbers in Armenia, Azerbaijan, Belarus, Yemen, Tanzania (on the island of Zanzibar), Zambia, Mozambique, Mexico, and Brazil.

JAMSHEED K. CHOKSY (2005)

ZULU RELIGION. After nearly 150 years of missionary activity the majority of the some 5.5 million Zulu-speaking South Africans are Christians. For many, however, the *amadlozi* (ancestors or shades of dead kin) who once dominated Zulu religion are still a force to be reckoned with and propitiated. The acceptance of the power of the *amadlozi* to intervene in the lives of their descendants and to help them is manifested in the beliefs and rituals of most of the African independent churches to which, indeed, over a quarter of all Zulu Christians belong. The basic concerns of traditional Zulu religion—the pursuit of health, fertility, and a balance between man and man and between man and nature—are as relevant today as ever. Since these are the very areas in which the ancestors are thought to be most powerful, offerings to the *amadlozi* occur in many contexts both traditional and Christian. These offerings take place both in the far-flung areas of rural KwaZulu (the geographical area situated on the east coast of South Africa between 28° and 31° south latitude from which most Zulu originated even if they have no ties there today) as well as in cosmopolitan urban centers where Zulu mingle with other South Africans as residents and work-seekers.

Attention is focused here upon the major enduring features of Zulu religion as first reported in the writings of early travelers and missionaries, and later in contemporary anthropological work in KwaZulu, notably that of Harriet Ngunwane, whose study of the Nyuswa-Zulu provides a picture of how Zulu religion is practiced today and highlights the previously neglected role of women in belief and ritual.

In Zulu thought the ancestors are only one part of a more extensive system of beliefs. Within this system, the nat-

ural order is thought to impinge closely upon man for human beings are thought to be related both physically and psychically to their environment and to be vulnerable to harmful forces in nature. Such forces either operate automatically or are manipulated by sorcerers (*abathakathi*) who cause ill health, misfortune, and the general state of vulnerability known as *isifo*. The ancestors also harm the living but only as a warning when they are angry; in fact, the *amadlozi*, many of whom were once known to the living, are the major protectors against sorcery. Appropriate ancestral offerings are cattle or goats that are sacrificed, the meat being left overnight for the ancestors to “lick” (*khotha*) and to share with the living. Diviners called *izangoma* (sg., *isangoma*) are consulted whenever illness, misfortune, or unusual events occur, for it is they alone who can ascertain the cause. They also recommend paths of reparation in the case of ancestral anger and, in the event of sorcery, may point out the sorcerer or suggest countermeasures. Diviners are called to their profession by their own ancestors, who possess and guide them, and they undergo a lengthy training in their art. Herbalists (*izinyanga*) also treat disease and provide protective medicines but, because they are not possessed by the spirits, they lack powers of divination.

ZULU COSMOLOGY AND THE NATURAL ORDER. The Zulu say that in the beginning there was uMvelinqangi, literally the first “comer-out,” who broke off from a reed bed followed by human beings, animals, and nature as a whole. He sent a chameleon to humanity with the message that they would live forever. Later, growing impatient with the chameleon’s slowness, he sent a lizard with the message that all humans would die, and because it was the faster animal, the lizard arrived first. In some tales uMvelinqangi is portrayed as the source of the known social order, for he gave human beings their ancestors and decided how the ancestors should be approached and placated. There is, however, little evidence that uMvelinqangi was worshiped directly. Ideas about him probably served largely as explanatory constructs for the natural order (and some features of the social order), and in traditional times such ideas would have played a minor role in everyday religious practice. Another name for uMvelinqangi was uNkulunkulu (“the old, old one”), a term that missionaries used for “God,” thus causing some confusion by conflating Zulu ideas of a pure creator with Christian notions of a creator and supreme being to whom regular worship must be directed. Distinct from uMvelinqangi is iNkosi yeZulu, the lord of the sky and personification of heaven. He is associated with thunder and lightning, which are greatly feared and against which specially trained herbalists offer protection.

Linked also with the sky or the “above” (*ezulwini*—a critical concept that contrasts with *phansi*, the “below,” where the dead go before becoming ancestors) is iNkosazana yeZulu, or merely iNkosazana, the princess of heaven (uNkomkhubulwana). The latter term is derived from *khubula* (“to sow again after rain or sun has destroyed crops”), and this female deity is closely associated with abundance and

sufficient (but not too much) rain. She bestows fertility on crops, cattle, and human beings and is often actively placated in times of drought and searing heat. The patron of women and particularly of young girls, iNkosazana is said to appear in the fructifying mists of spring and to stand on the threshold of summer like a girl whose puberty ceremonies mark her entry to marriage and procreation. The same songs are sung both at girls' puberty ceremonies and at ceremonies held in honor of iNkosazana; in both cases the songs are thought to promote fertility and good rains. Before hoeing begins, women sometimes plant a small field for iNkosazana near a river, and a libation of beer is poured on the ground to the accompaniment of a prayer for a fruitful harvest. Other ceremonies connected with the goddess are aimed at warding off pests that affect crops, cattle diseases, and maladies common in spring and summer such as malaria and gastroenteritis. The word *ukushweleza* ("to make an apology"), which is used in connection with these rituals, suggests the placation of iNkosazana's anger and the setting of things in order so that the season will proceed without mishap. Because of its conceptual links with fertility and girls' puberty ceremonials, the cult of iNkosazana must be seen against the background of the widespread emphasis upon fertility in African cosmological systems. Her cult has a counterpart in the *uyali-vuhwera* fertility cult and the *gomana* drum cult of the northeastern Transvaal Lowveld, but the Zulu are unique among Bantu-speaking peoples in southern Africa in their conception of a female deity associated with fertility who is worshiped even today.

The natural order impinges on life in other ways which affect health and well-being. In contrast to illnesses caused by sorcery or ancestral anger, there is an extremely wide range of diseases stretching from the common cold to more serious epidemics like smallpox or measles, which are said to "just happen." These maladies may be due to natural causes such as the changing of the seasons or the inevitable processes of aging and maturation. Many are treated with medicines which are potent in themselves and do not necessarily require ritual or religious accompaniment, although protection against certain seasonal illnesses may be sought from iNkosazana. Another important class of natural illnesses are thought to result inevitably from imbalances in nature. All living things are believed to leave behind something of themselves and absorb something of the atmosphere through which they move. Such influences, called *imikhondo* ("tracks"), may be detrimental to the individual. Treatment, while bringing relief to one person, may release the dangerous element to affect others. To keep the immediate environment pure, people seek to discard *imikhondo* in public places such as highways and crossroads, where they are thought to mix with other noxious substances placed there by sorcerers; these areas are thus extremely dangerous to travelers. Moving into a new environment may in itself be dangerous, as one is not yet attuned to its influences. Several categories of people are particularly at risk from environmental influences including newcomers to an area, infants who have only recently entered

the world, and all those who are temporarily in a weakened state, known as *umnyama*. This last category includes the bereaved, newly delivered mothers, homicides, and menstruating women. Although all people should be strengthened from time to time against alien environmental influences, these people must be given specific treatments, often both medicinal and ritual, aimed not only at strengthening them but also at achieving or restoring order or symmetry between them and their environment. The word commonly used to describe such treatment is *ukuzilungisa* (from *lunga*, "to be as should be," and *isa*, "to come to be"), which implies the restitution of balance not only between man and nature but sometimes between man and man or between man and his ancestors.

Certain natural processes are thought to weaken the individual. The most important and general is *umnyama*, to which reference was made above, and which may be literally translated as "darkness," "blackness," or "heaviness." This state results from contact with death or birth, which renders the individual open to sorcery, other malign influences, bad luck, and misfortune, and also makes him or her a danger to others. Women are extremely vulnerable to *umnyama* because of their biological association with procreation and because the chief mourners at funerals are always women. Indeed, Ngubane argues that because of this dual association with the beginning and end of life, women occupy a "marginal" position in Zulu cosmology and serve as a symbolic bridge between "this world" (the world of the living) and the "otherworld" (that of the spirits). Women, however, not only link this world and the otherworld, but in their roles as daughter in one kinship group and mother in another they form a bridge between two distinct patrilineages. Zulu society is strongly patrilineal, and marriage may occur only outside the clan. A bride is thus an outsider in her affinal home, yet it is only through her that her husband's group can reproduce itself. This social marginality is indicated by certain linguistic avoidances or restrictions (*blonipha*) placed upon a bride and also by the fear that married women are potential sorcerers in their husband's homestead. Since the bearer of children is thus paradoxically also a threat to continuity of the patriline, Zulu social structure places married women in an ambiguous position which complements the marginality they derive from their biological and cultural association with birth and death. Diviners are also seen to be marginal in that they intercede between the living and the dead, between this world and the otherworld, and it is significant that most diviners are women and that men who are called to this position are transvestites.

ANCESTORS AND SOCIAL LIFE. As Eileen Jensen Krige has pointed out, "the real vital religion of the Zulus is their ancestor worship" (Krige, 1936). Indeed, when things are going well, the Zulu say that their ancestors are "with them," but when misfortune strikes, they say that the ancestors are "facing away." Revelations are made in dreams and visions as well as through misfortune, and what angers the ancestors most is neglect and failure to fulfill kinship obligations. Dif-

ferent aspects of the overall conception of the ancestors are indicated in the various Zulu words used for the dead. *Amadlozi* is derived from *dloza*, meaning “to care for, keep an eye on,” but because the spirit world is thought to be situated “below” (*phansi*), the ancestors are often referred to simply as *abaphansi*, “those of the below.” Another word frequently used is *amathongo*, from *ubuthongo*, “deep sleep,” a reference to one of the ways in which the ancestors contact the living. Diviners address their ancestors as *makhosi*, from *inkhosi*, “chief,” and *ubukhosi*, “authority, power, glory,” thus emphasizing the major nuances of the unique relationship between them and the spirits which possess them. The word *isithunzi*, from *umthunzi*, “shadow,” refers to the force or personality that leaves the body at death and wanders aimlessly until it is “brought home” (*buyisa*) by a special ceremony designed to integrate it (as an *idlozi*, or ancestor proper) into the body of powerful ancestors who have control over the living. Since the spirits are dependent upon their descendants to perform this and other ancestral rituals, the relationship between the living and the dead is one of mutuality which excludes non-kin and reflects the major emphases of Zulu kinship and particularly patrilineal organization.

A man’s most important ancestors are his father, mother, father’s father, and father’s mother, as well as the father’s brothers who act with and share sacrifices offered to deceased parents and grandparents. Among the Nyuswa-Zulu, about whom we have recent knowledge from the work of Ngubane, *amadlozi* more than three generations removed from a homestead head are not thought to be dangerous. They are said, however, to come to sacrifices along with closer ancestors, and may even possess a diviner as a supporting spirit. The living kin who gather for ancestral rituals largely include the patrilineal descendants of a grandfather, and the women who have married these men. At sacrifices, it is the genealogically senior male (*umnumzane*) who officiates. Among the Nyuswa-Zulu the married men of this cluster or segment (*umndeni*) of two or three generations often live close to each other and, under the headship of the *umnumzane*, act as a corporate group in the control and management of common resources (such as land) and in the settlement of internal disputes. The authority of the *umnumzane* is bolstered by his ritual position and the fact that younger agnates can approach the ancestors only through him. The rituals of the ancestor cult therefore both demonstrate and, in the Durkhemian sense, promote the corporate character and social continuity of the *umndeni*. On the political level, the ancestors of the king guard and protect the whole society and are sacrificed to at national festivals. Prior to the defeat of the Zulu nation and the disbanding of the army by the British, the king’s ancestors were always called upon before warriors went into battle.

The ancestor cult reflects a number of other important aspects of Zulu social life. The role of the chief wife who bears the heir is emphasized, for it is on the *umsamo* of her hut (the rear part of the dwelling associated with the spirits)

that sacrificial meat is placed for the ancestors to share. Individual social identities are often fixed unambiguously by calling on the ancestors. Thus a baby is placed formally under the control of the ancestors to whose line it belongs by the sacrifice of a goat known as *imbeleko*, the skin of which is used to secure the baby on its mother’s back. This ceremony is usually performed by the child’s father or father’s father, but in the case of an unmarried woman, the responsibility lies with her father and his *umndeni* to which the child belongs.

In former times abandoned children were adopted by an *imbeleko* sacrifice, thus demonstrating that it is social rather than biological paternity which is important. By the same token, one of the objectives of wedding ceremonies is to introduce the bride, who comes from another descent group, to her husband’s ancestors and to put her under their care. Neglect of this formality may result in failure on the part of her affinal ancestors to recognize and protect her and her children. Barrenness is sometimes, however, attributed to a married woman’s own ancestors who may, for instance, be angry that the correct puberty ceremonies were not performed for her. They may also make her ill if they want her to become a diviner. In both cases it is her father’s responsibility to set matters in order. The fact that a married woman can be affected by her own ancestors as well as those of her husband serves both to underline the separate identity of affinal groups linked by marriage and to indicate the married woman’s role as a bridge between the two patrilineages. With time and the birth of children she is effectively transferred from the one descent group to the other. After menopause she may eat those parts of ancestral sacrifices reserved for members of her affinal kin group, and she may even call on the ancestors if no suitable male is present. At death she is fully incorporated into her affinal group when she is brought back by her son as one of his patrilineal ancestors. She has then completed the “long journey” (*udwendwe*) that she began as a bride, and in so doing she had mediated between the conflicting interests of patriliney and exogamy in Zulu society.

SPIRIT POSSESSION. Spirit possession is an important and dynamic aspect of Zulu life. The call to be a diviner takes the form of recognized mental and physical affliction, the cure for which are initiation and professional training. The traditional *isangoma* (and her counterpart in many Christian sects) is a pivotal force for order and rapprochement between man and the spirit world. There are, however, new forms of spirit possession that were first reported at the turn of the century, which have intensified since the 1930s. These are destructive and anarchic; Ngubane relates them to the disruptive effects of social and industrial change. *Indiki* and *ufufunyane* (or *iziwe*) are the most prevalent types, resulting from possession by the deceased spirits of foreigners, which have not been integrated into the body of the ancestors. *Indiki* are possessed by male spirits who enter the individual’s chest by chance and manifest themselves in a deep bellowing voice which speaks in a foreign tongue. Treatment often in-

volves replacing the alien spirit with an ancestral spirit, and the *indiki* may become a diviner. *Ufufunyane* is diagnosed as due to sorcery and is a particularly intractable form, for the alien spirit becomes violent when challenged. The possessed individuals become hysterical and may attempt suicide in a frenzy. Treatment involves dispelling the alien spirit—often hordes of spirits of different race groups—and replacing them by spirits controlled by the doctor and referred to as a regiment (*amabutho*). The image is one of war against the sorcerer's evil medicine; no attempt is made to call an ancestral spirit, and no cult membership or professionalization results.

TRADITIONAL BELIEF AND ZULU CHRISTIANITY. Zulu cosmological ideas have been incorporated into Zulu Christian thought in a number of subtle ways. The word for "breath" (*umoya*) is translated as "Holy Spirit," and people said to be filled with the Holy Spirit become leaders in African independent churches that have split off from orthodox congregations. In these churches Christian beliefs coexist with aspects of traditional Zulu belief, and leadership reveals striking similarities to traditional divination in that the prophet, with the help of the Holy Spirit, explains misfortune and prescribes remedies. These may include ancestral offerings as well as orthodox Christian prayer. Protection against sorcery and misfortune is given by prayer and also medicine, and the blend of the two religious systems is basic to the vibrancy of African Christianity as it has developed, not only in the independent churches, but recently in orthodox congregations as well. Healing, purification, and the search for fertility are major issues in African Christianity, and many of the sects and churches that have proliferated in town and country serve not only the spiritual needs of their members but perform important social and welfare functions in the context of the chronic poverty and political subordination that has characterized the lives of many Zulu in the twentieth century.

BIBLIOGRAPHY

The most important of the early works on Zulu religion is the Reverend Henry Callaway's *The Religious System of the Amazulu* (1870; reprint, Cape Town, 1970), which presents original texts by Zulu informants together with translations and notes. A. T. Bryant's article "The Zulu Cult of the Dead," *Man* 17 (September 1917): 140–145, and his book *The Zulu People* (1948; New York, 1970), which gives details on Nomkhubulwane beliefs and ceremonies, provide a useful summary of what may be considered the main elements of the traditional belief system as described to early travelers and missionaries. An anthropological analysis, built up largely from these sources, but placing both belief and practice in their wider social context, is to be found in Eileen Jensen Krige's *The Social System of the Zulus* (Pietermaritzburg, 1936), pp. 280–296.

Two studies that deal with the present situation, both based on detailed anthropological research, are the Reverend Axel-Ivar Berglund's *Zulu Thought-Patterns and Symbolism* (London, 1976), and Harriet Ngubane's *Body and Mind in Zulu Medi-*

cine (London, 1977). The first work offers an exhaustive compilation of detail, which provides some important insights, and also discusses a number of problematic conceptual issues. However, for scholars and laymen alike, Ngubane's book is the best starting point; an ethnographic study of one community, it is written lucidly and with the insight of a Zulu anthropologist. For doctors and those involved in the medical field, it is a *sine qua non* as it examines religious beliefs as part of Zulu ideas about the causation and treatment of disease.

Researchers seeking to become conversant with the details of Zulu thought patterns should consult Otto F. Raum's *The Social Functions of Avoidances and Taboos among the Zulu* (Berlin and New York, 1973), as it presents fascinating but very detailed data on a wide range of beliefs and their associated avoidances. The writings of Katesa Schlosser will also be of interest, especially *Zauberei im Zululand: Manuskripte des Blitz-Zauberers Laduma Madela* (Kiel, 1972), a study of Zulu mythology as told by a lightning doctor. Although the latter work shows how one Zulu philosopher has rethought and to some extent reinterpreted and expanded traditional Zulu cosmological notions, none of the above works concentrate specifically on change. Those interested in this aspect should consult Bengt Sundkler's *Bantu Prophets in South Africa*, 2d ed. (Oxford, 1961), and his more recent *Zulu Zion and Some Swazi Zionists* (Lund and Oxford, 1976). The sociological and welfare concomitants of many African independent churches are discussed in the work of James P. Kiernan; see in particular "Pure and Puritan: An Attempt to View Zionism as a Collective Response to Urban Poverty," *African Studies* 36 (1977): 31–41. The continuing influence of the conception of the ancestors in literature and worldview is demonstrated by a recent collection of poems by the Zulu poet Mazisi Kunene, *The Ancestors and the Sacred Mountain* (Exeter, N. H., 1982).

Revised Bibliography

ZURVANISM. It is difficult to determine whether veneration of a deity of time and fate, literally a father "time" figure, named Zurvan (Avestan, Zrvan; Pahlavi, Zurwān—variant form, Zamān) developed chronologically or spatially into a distinct religious movement in ancient and medieval Iran that competed with Zoroastrianism or Mazdaism. Nevertheless, Zurvanism is attested in Iranian belief generally, and Zoroastrianism specifically, from at least mid-

Achaemenian times (late fifth century BCE). By the Sasanian period (224–651 CE), Zurvanite theology and mythology seems to have gained substantial followers among the magi or Zoroastrian priests along with Iranian nobles and scholars, possibly exerting influence on doctrines at times when fatalism seemed appropriate. As a monist sect, it possibly was one form of early medieval orthodoxy in southwestern Iran, among other locales. Yet there are no Iranian temples that can be associated specifically with worship of Zurvan. Neither are there images that can be identified clearly as representing Zurvan, not even the leontocephalic, or lion-headed, spirit (later known to be associated with western Mithraism). Nor can any particular rituals be attributed to the rations of Zurvan. The entire performative dimension of religiosity appears to have been absent in the case of Zurvan.

SOURCES AND PRINCIPLES. The *Persepolis Fortification Tablets* (fifth century BCE) preserve the theophoric name Izrudukma (*Zru[va]taukhma, “of Zurvan’s seed” [2084.4]) as an early reference to the importance of time in ancient Iranian society. Other ancient-to-medieval Iranian and Armenian names like Zrovandukht (daughter of Zurvan), Zarwandād (created or given by Zurvan), and Zrvandasht (preserved by Zurvan) also reflect devotees’ association with this deity.

The Zoroastrian scripture, or *Abestāg* (Avesta; Praise), places only limited emphasis on Zurvan, mentioning him infrequently. One passage in the Young Avesta (composed between 900–400 BCE, with canonization lasting into the third century BCE) notes that after death the souls of the “confused ones and the orderly ones all journey along the road created by Zurvan to the bridge of the compiler created by [Ahura] Mazdā” (*Vidēvdād*, “Code to Ward Off Evil Spirits,” 19.29). Another passage claims that Spenta Mainyu (holy spirit; the hypostasis of Ahura Mazdā), created Manthra Spenta (holy word) in Zurvan—that is, during time (*Vidēvdād* 19.9). Other Young Avestan references to Zurvan distinguish between Zrvan akarana (infinite or unlimited time) and Zrvan dareghō-khva-dhāta (time of the long dominion) (*Vidēvdād* 19.13, 19.16; *Yasna*, “Worship, Sacrifice” 72.10; *Sīrōza*, “[Invocations for] the Thirty Days of the Month,” 1.21, 2.21; *Niyāyishn*, “Litany,” 1.8). In these scriptural passages, Zurvan is associated with a range of divine spirits such as the Amesha Spentas (holy immortals), Daēna (religion, conscience), Rāman (peace), Vayu (wind or air), Thwasha (space), and Tishtrya (Sirius.) However, Zurvan is not presented as a preexisting deity, independent of Ahura Mazdā.

Clearer attestation of Zurvan’s independent status comes from the reign of Artaxerxes or Artakhshaçā II (r. 404–359/8 BCE), through the writing of Theopompos (fl. fourth century BCE) as cited by Plutarch (c. 46—after 119 CE, where a millenary scheme of time—when Ohrmazd and Ahreman do battle—is the result of actions by a god who having “brought this to pass is quiet and at rest for a time” (*Isis and Osiris* 47). A few other classical sources, preserved in later redactions, also cite Zurvan. Antiochus I (c. 69–34 BCE) of Commagene referred to Kronos apeiros (unlimited

time) on his Greek inscription at Nimrud Dagh in Anatolia—a document containing allusions to Iranian beliefs syncretized with Hellenistic ones. The broad dates for those documents have led to scholarly suggestions that chronological speculation may have culminated in a time-based cosmogony within the multinational, multireligious empire of the Achaemenians. Doctrinal augmentation could have occurred through confluence of Near Eastern, Greek, Iranian, and Indian notions of cosmic progenitors—such as Ra, Kronos, Zrvan, and Kāla, respectively—with the mythological Indo-European primal twins represented in the Old Avestan devotional poems as Spenta Mainyu and Angra Mainyu (*Gathas* 30.3, 45.2).

Zurvanism and medieval Zoroastrianism. Medieval Zoroastrian theology drew upon the Avesta to describe Zurvan in two forms: as Zurwān ī akanārag (infinite time) and as Zurwān ī dērang khwadāy (time of the long dominion)—an epithet shared with Vayu or Way—alternately termed Zurwān ī kanāragōmand or Zurwān ī brīnōmand (finite time). Such was the case in the *Greater Bundahishn* ([Book of] primal creation) (especially 3.14—on which see figure 1, Codex TD1 folio 14 verso, the oldest extant manuscript copy dating to 1531 CE, lines 2–3—and 3.6, 26.31), a text whose redactions spanned the Sasanian Empire and the Umayyad (661–750 CE) and Abbasid (750–1258 CE) caliphates.

In those forms, Zurvanite ideas are present in the *Mēnōg ī Khrad* (Spirit of wisdom), a Pahlavi or Middle Persian exegetical text from the sixth century CE, where Ahura Mazdā is said to have created the universe with the “blessing of infinite time,” who is “infinite, ageless, undying, painless, unfeeling, incorruptible, and unassailable” (8.8, 8.9). Moreover, Zurvan was equated to Vayu as a weapon of Ahura Mazdā against falsehood (*Greater Bundahishn* 26.34).

In the ninth century CE, Zurvan was associated by Zoroastrians with the divine spirits Rām (peace), Spīhr (sky), Māh (moon), and Gōsh (cow) in assisting the Amesha Spenta named Vohu Manah (Wahman; “good mind”; *Greater Bundahishn* 3.14). Likewise, the *Wizīdagihā* (Selections) of Zādspram, a ninth-century CE *hērbed* (theologian) living at Sirkan, presented Ahura Mazdā’s creative power as linked to Zurvan, who determines the course of the cosmic conflict between order and confusion (1.27–28, 2.19, 34.35). So, ultimately, these medieval sources do not clarify the degree of Zurvan’s independence, in theology and ritual, from a Zoroastrian pantheon headed by Ahura Mazdā. However, even when not adopting an extreme monism of Zurvan with its ascription of the origin of all other entities to the actions of time, medieval Zoroastrianism in most sectarian forms employed a millenary system of two, eternal, dualistic spirits in conflict during time (compare the standard account of cosmogony in the *Greater Bundahishn* 1.1–1a.14).

Christian and Muslim sources. Perhaps because of tensions within Zoroastrianism of reconciling Ahura Mazdā and Zurvan as progenitor spirits, the major extant textual

sources for Zurvanism are those by Christian and Muslim writers. Armenian Christian authors who mentioned the Zurvanite creation myth include Eznik of Kolb (fl. fifth century CE) and Elishē Vardapet (d. 480 CE). There are Syriac accounts, such as those by the Arab Christian bishop Theodore Abū Qurra (c. 740–820 CE), Theodore bar Kōnai (fl. ninth century CE), and the Nestorian monk Yohannān bar Penkayē (fl. c. seventh to ninth century CE). The Syriac documents mention divinities named Ashōqar, Frashōqar, and Zarōqar—whose names derive from Iranian words—as existing alongside Zurvan. All of the above-named writers may have utilized a common source, a work by the Cappadocian bishop Theodore of Mopsuestia (c. 350–428/9 CE), in addition to drawing upon each others' writings when possible. Syriac martyrologies of Nestorians, such as that of a woman named Anāhīd (d. c. 446 CE), mention portions of Zurvanite theology as well.

According to extant versions of the Zurvanite creation myth, as preserved by these authors, Ohrmazd (Ahura Mazda, variously rendered as Ohrmizd, Ormizd, Hormizd, and Hormuz in the documents of Zurvanism) was conceived as the result of a rite that Zurvan had performed for a millennium to be granted a son who could create the universe. Ahreman (often written in those same sources as Ahriman, Ahrimen, Ahrman, Arhmn) was conceived unexpectedly, though not surprisingly within the ritual context, because Zurvan had doubted the efficacy of his devotive actions. Realizing that his wife would give birth to twins, Zurvan supposedly decided that the firstborn would rule the universe. Ahreman, upon learning of Zurvan's decision from a rather naïve Ohrmazd, ripped his way out of the womb and demanded his birthright. Zurvan, repulsed by this son's vile-ness, sought to restrict the evil twin's power by establishing a finite period of nine thousand years during which Ahreman would be in charge. Zurvan deemed that thereafter, his other son, Ohrmazd, would gain absolute power and appropriately determine the trajectory of events. Having set into motion the cosmic cycle and predetermined its outcome, Zurvan's relevance largely ended. No mention was made specifically of the origins of time or its female spouse, nor of the recipient of ritual, perhaps because it was assumed both that time in all its facets was eternal and that ritual could occur either for its own sake without a recipient or be directed at the performer.

Interestingly, a ninth-century CE Zoroastrian denunciation of this story is found in the *Dēnkard* (Acts of the religion; 9.30.4–5), where it is attributed to “the ranting of the demon Arashka” (Arashk or Areshk, “envy”). More important, Mardānfarrokh, the son of Ohrmazddād (fl. ninth century CE), author of the *Shkand Gumānīg Wizār* (Doubt dispelling exposition), condemned persons who subscribed to doctrines of time, referring to them as *Daharī* (6.2–3). This classification probably reflects a confluence of Islamic and Zoroastrian thought, because the *Dahriyya* (from the Arabic *dahr*, “time”) were regarded as a heterodox sect by Sunni

Muslims as well. The text of the critique itself preserves a variant of Zurvanite cosmogony. Even later, Iranian heresiographer Abū 'l-Faḥḥ Muḥammad al-Shahrastānī (d. 1153 CE) would categorize the *Zurwāniyya* as a specific sect.

Function of the Zurvanite myth. Mardānfarrokh's and Shahrastānī's comments reveal the central function of Zurvan for certain ancient and medieval Zoroastrians. It appears Zurvanism's teachings sought to reconcile the origins and functions of the dualism between Zoroastrianism's chief divinity Ahura Mazda and chief demon Angra Mainyu through an entity whose actions created both. Zurvanism thus seems to have served as a theological and philosophical means of speculating about the origins, functions, and effects of the passage of time, the role of fate, the nature of duality, and the dilemmas of human existence within religiously constructed chronological frameworks. In other words, the Zurvanite myth provided those persons who accepted it with an explanation of how and why cosmogony occurred, stressing the roles of time as both medium and framework for creation. It proffered a theological explanation for the origins, purposes, interrelatedness, and interdependence of good and evil (Ohrmazd and Ahreman) and of their functions within human and cosmic frameworks of time. It also focused attention on the importance of performing rituals properly, for the case of Zurvan implied that if any aspect of a rite—thought, word, or deed—deviated, pandemonium could occur. Ultimately, the creation story would have been an attempt to overcome—through common origins, interrelated functions, and shared destinies that were linked and mediated by time—dilemmas posed by the creativeness and destructiveness ascribed in Zoroastrianism to spiritual forces and by the effects of those on human lives.

Manichaeism and Mandaicism. Other Iranian faiths also experienced the effect of time as a doctrinal force. Manichaeism drew upon Iranian beliefs in Zurvan, postulating a high god variously named Zurwān, Pidar Rōshn (Father of Light), and Pidar ī Wuzurgīh (Father of Greatness), who was “righteous” and dwelled “among the lights” (M 10R 11). Manichaeans believed that Zurvan was forced into conflict by an attacking Ahrimen and had created Ohrmizd to battle against the evil spirit but that the counteroffensive failed to stop evil at the beginning of time. As a result, life and death occur, Manichaeans had to strive toward purification of their spirits, and purity would set the stage for the final days of humanity. Manichaeism taught that eventually, and having enjoyed the assistance of devotees over the centuries, Zurvan would defeat Ahriman and purify all aspects of spirit or light from matter or darkness at the end of time (M 473, M 475, M 477, M 482, M 472, M 470). Likewise, Mandaean belief regarding the origins of both the good spirit and the evil spirit from a singular source, Pīrā Rabbā, may bear an echo of Zurvanism. Both Manichaeism and Mandaicism may have assimilated aspects of Zurvanism through intercommunal contacts within southern and western Iran and in Iraq during the early Middle Ages.

DECLINE. Zurvanism's waning in Zoroastrianism is evidenced by very gradual omission of Zurvanite ideas in the writings of magi after the thirteenth century, perhaps because social turmoil created by the Mongol conquests facilitated the slow spread among the Zoroastrian minority of starker dualist ideas. The Muslim population of Iran, by then an absolute demographic majority, had little theological need for a figure such as Zurvan, because all aspects of life could be reconciled with the attributes of its monotheistic deity Allah. So entrenched was the notion of time as a creator spirit that doctrinal change appears to have been slow. Even texts contained in the *Revāyats* (Treatises)—compiled by Iranian magi for their counterparts in India from 1478 to 1773—while referring to time in the more generic sense of *zamān*, which had preceded corporeal creation and in which the material universe exists ('*Ulamā-e Islām*, 2, pp. 72–80), also preserves the idea that "Zamān is the creator. . . . It created fire and water; once these combined, Ohrmazd came into existence" and goes on to echo the Zurvanite creation story ('*Ulamā-e Islām*, 2, pp. 80–81). When the Gujarati *Rehbar-e Din-e Jarthushhti* (Guide to the Zoroastrian religion) was composed by dastur Erachji Sohrabji Meherjirana in 1869 at Bombay (later Mumbai) in India, time had faded in importance. As veneration of time lapsed, Ahura Mazda began to emerge in Zoroastrian belief—especially under colonial, Christian, influences in the nineteenth and twentieth centuries—as a monotheistic god par excellence, the creator of all other spiritual entities, whether evil ones like Angra Mainyu or aloof ones like Zurvan.

JAMSHEED K. CHOKSY (2005)

ZWINGLI, HULDRYCH (1484–1531), Swiss Protestant theologian. Born in Wildhaus, Switzerland, Zwingli was educated in Vienna (1500–1502) and later in Basel (1502–1506), where he studied under Thomas Wyttenbach. He read Erasmus during his first pastorate in Glarus (1506–1516). During his second pastorate in Einsiedeln (1516–1518), he began to preach against indulgences. In 1518 Zwingli became preacher in the Zurich Cathedral, a post he retained until his death in 1531. He married Anna Reinhart in 1524.

From the beginning of his work in Zurich, Zwingli declared scripture to be the sole ultimate authority for the life and teaching of the church, thereby repudiating hierarchical authority. He preached against indulgences, stating that Christ's sacrifice is sufficient to remit all penalties for sin. He also preached against ascetic religious orders, fasting, the invocation of the saints, and the doctrine of purgatory. As a fervent Swiss patriot, Zwingli opposed Pope Leo X's recruitment of Swiss mercenaries.

In 1522 the civil authority of the canton of Zurich declared that a disputation should take place between those who advocated and those who opposed the Reformation principle that scripture alone should be the ultimate norm of church life and teaching. In preparation for this disputation, Zwingli, the leader of the Reformation group, wrote his lengthy *Sixty-Seven Conclusions*, in which he repudiated the authority of the pope, the transubstantiation of bread and wine, the veneration of the saints, the existence of purgatory, and the necessity of fasting. The disputation was held on 29 January 1523; the council of Zurich decided in favor of the Reformation, and Zurich became a canton of the Reformation.

Zwingli's attention then turned toward a radical Reformation group, the Anabaptists, which had begun to flourish

in Zurich during the early 1520s. The Anabaptists opposed the baptism of infants and denied the validity of such baptisms. They opposed any jurisdiction of the civil authorities in church life. They placed ultimate church authority in the local congregation rather than in larger church or civil councils. They aspired to establish "sinless congregations." In 1526 the government of Zurich, with Zwingli's support, suppressed the Anabaptists. The government also suppressed Catholicism in the canton. In retaliation the papal forces made war on Zurich. In a battle at Kappel on 11 October 1531, Zwingli fell and was executed on the battlefield.

While Zwingli, Luther, and Calvin had in common such great Reformation themes as the justification of the sinner by faith rather than by works and the acknowledgment that the church in all of its teaching is subject to the greater authority of scripture, there were also disagreements among them, principally in their understandings of the church, the Lord's Supper, and the relationship between church and civil authority. Zwingli's influence on subsequent Protestant teaching is apparent chiefly in these areas.

DOCTRINE OF THE CHURCH. Luther and Calvin identify the church with the preaching of the word and the administration of the sacraments. Zwingli agrees but offers a more developed understanding of the church as community. He does so by identifying three meanings of the word *church* and then interrelating those meanings. He defines the church as (1) the communion of saints, the heavenly church called and gathered by Christ, (2) the historical church, made up of those who throughout the world confess Christ as Lord, and (3) the local congregation. It is Christ who chooses the members of his church and gathers them into a fellowship with him. This is the heavenly church that must exist here and now as the historical church, the means by which Christ makes himself visible in the world.

There is no historical church, however, except as it comprises the many local congregations. The unity of the historical church exists not by the mere assertion that all these local congregations belong to it but rather by the fact, known through faith, that all local congregations have been chosen and gathered by the same Lord. Moreover, this unity is emphasized by the fact that every congregation has the same pattern of life to emulate. The earthly Jesus chose and gathered a local congregation, the apostles. Now the risen Lord, by the power of the Holy Spirit, continues to call and gather local congregations and commands them to emulate the pattern of the first congregation, as it is described in the New Testament. Zwingli, through his interrelation of these three meanings of *church*, represents Christ's choosing and gathering of his saints as the basic meaning of the church. He then explains preaching and the sacraments as means by which Christ calls and gathers his people into fellowship with him. These same means are to be used by his people to gather themselves around their invisible Lord, thereby making him visible. The invisible "being gathered" and the visible "gathering" constitute Zwingli's church.

LORD'S SUPPER. For Zwingli, the Lord's Supper could not be understood in isolation but only as a moment in Christ's calling and gathering of his saints. The Lord's Supper is a pledge of loyalty by God's people made to their Lord, who commands this of them. It is one moment, but a central moment, of Christ's calling and gathering activity; it is not a moment in which Christ becomes suddenly present. Rather, Christ is understood to be present in the whole of that calling and gathering activity, which is the church. Zwingli does not deny that transubstantiation takes place in the Lord's Supper. He declares, however, that it is not the elements of bread and wine but rather the people who are changed; they are changed into saints by the calling and gathering activity of Christ. Luther and Calvin differed with Zwingli; both, in different ways, continued the tradition of the church that focuses attention upon the elements of bread and wine. Zwingli and Luther quarreled about this focus at the Marburg Colloquy of 1529.

CHURCH AND CIVIL GOVERNMENT. According to Zwingli, Christ not only gathers a church, he also ordains the existence of the civil community, a body of free citizens. The authority of the civil community, while ultimately Christ's, rests derivatively in the consent of the citizenry. The church and civil society each has responsibilities toward the other. The civil rulers are to keep the peace and rule according to a concept of justice derived from scripture. Preachers are, therefore, to proclaim not only the gospel but also the demands of human justice that are derived from the gospel announced in scripture. The members of the civil community are guided away from self-interest by such preaching. The civil rulers, then, have the power and responsibility to protect the church's preaching of justice and the responsibility to be guided by it. The church and its preachers have no direct power to rule in civil affairs, but they have the responsibility of preaching human justice to citizens and civil rulers.

Zwingli's emphasis on the preaching of God's justice as the basis of the human justice of the civil community and on the importance of the consent of the governed distinguishes his teaching from Luther's. Luther taught that the function of civil rulers is, primarily, to restrain disorder. Zwingli's emphasis on the preacher as the people's tribune before the civil rulers and his willingness to accept some civil jurisdiction over church life distinguish his teaching from Calvin's. Calvin advocated a stronger separation between the ecclesiastical and the civil authorities.
