Word and image

WORD AND IMAGE

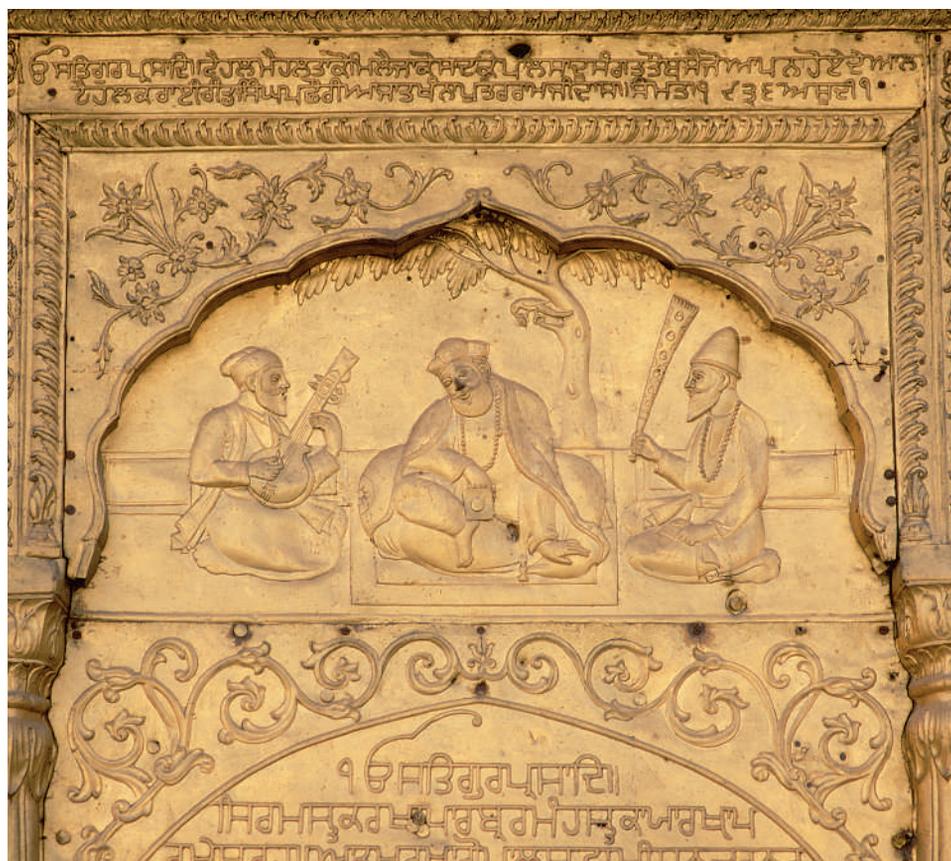

In both oral and literate societies, the tendency to intermingle word and image is irresistible. Spoken words, whether song, chant, or prose, contain the life-force or spirit of the speaker and are commonly joined to images by incantation and by rituals designed to charge images with power. Written words are themselves signifiers that can be pictorialized in many different ways in order to compound the potency of images. Word and image are imbricated or patterned one on top of the other for the purpose of enhancing memory, expanding the capacity of visual narrative, or avoiding the injunctions against visual representation that some religions enforce. By visualizing spoken or written language in the form of symbolic devices, image makers are able to create a hybrid form of discourse—pictographs, hieroglyphs, ideograms, or characters. Finally, naming is a universal practice in human culture. Visualizing names in graphic symbols or pictorial tableaux is often

a way of remembering or evoking the deceased or tapping the power of the spirit by accessing its essence contained within the name.

Many religions find ways of integrating the written word and the image to create composite forms of representation. In the case of Sikhism, Judaism, and Islam, such composites are motivated by the desire to avoid committing idolatry, reducing the divine to a human invention. Influenced by Islam, Sikhism, for instance, eschews cult imagery, but engages in intense forms of devotion to its *gurūs*, the ten historical teachers who led Sikhs through times of tribulation and martyrdom. The hymns of several *gurūs* compose the eleventh and final *gurū*, the collection of holy writings, known as the *Gurū Granth Sāhib* (Great Reverend Teacher). Copies of this book are kept in every *gurdwara* or Sikh temple, where they are ritually displayed on throne-like altars (a) during Sikh worship and even

(a) *Gurū Granth Sāhib* on display during worship in a Sikh *gurdwara* in Merrillville, Indiana, in 2003. [Photograph by David Morgan]

attended by a fly whisk as if the book were the body of one of the *gurūs*. This reverence for the book displaces the role of images in worship. But Sikhism finds a place for images, as shown by a gilded plaque at the Golden Temple in Punjab (b), portraying the revered Gurū Nānak with attendants. Another (unpictured) example is a deft intermingling of sacred text with an image of Nānak. The resulting “imagetext” strikes a higher unity that avoids confusing image with deity. The image consists of the opening scripture of the Sikh holy book, composed by Nānak himself. To see his image congealing in his words makes the *gurū*’s wisdom appear palpable.

Micrographs are a common Jewish counterpart to the Sikh image described above and may have inspired it. One example shows the prophet Jeremiah lamenting the ruins

(b) Top. An early-seventeenth-century gilded plaque depicting Gurū Nānak (center) with two attendants. Golden Temple, Amritsar, Punjab, India. [©Michael Freeman/Corbis] (c) Left. *Jeremiah Mourning the Destruction of the Temple in Jerusalem*, a mid-nineteenth-century lithograph by Beryl Reiss. [Courtesy of The Library of the Jewish Theological Seminary]

of the Jewish temple (c). Ironically, every aspect of the image consists of Hebrew text from the book of Jeremiah. If the second commandment (*Dt.* 5:8–9) proscribes the worship of images, or even the creation of images, the micrograph eludes the proscription by only writing sacred text. A similar evasion of the injunction against imagery informs the paper amulet reproduced here (d), a Jewish print of symbols and objects portrayed by textual inscriptions, used for protection during childbirth. Muslims could produce comparable imagetexts, though attitudes varied greatly among Muslims in Persia, Turkey, India, and Africa, on the one hand, and Arabic Muslims, on the other. Among the most familiar examples of the Muslim imagetext is the sumptuous calligraphy and decoration of the Qur'anic page (e). A *qiblah*-compass from Istanbul

(d) TOP. A late-nineteenth-century paper amulet from Jerusalem, used by Jewish women for protection during childbirth. [*Erich Lessing/Art Resource, N.Y.*] (e) RIGHT. *In the Name of the Almighty*, seventh-century CE calligraphy in the form of a hoopoe, ink on paper, Iran. [*Bildarchiv Preussischer Kulturbesitz/Art Resource, N.Y.*]

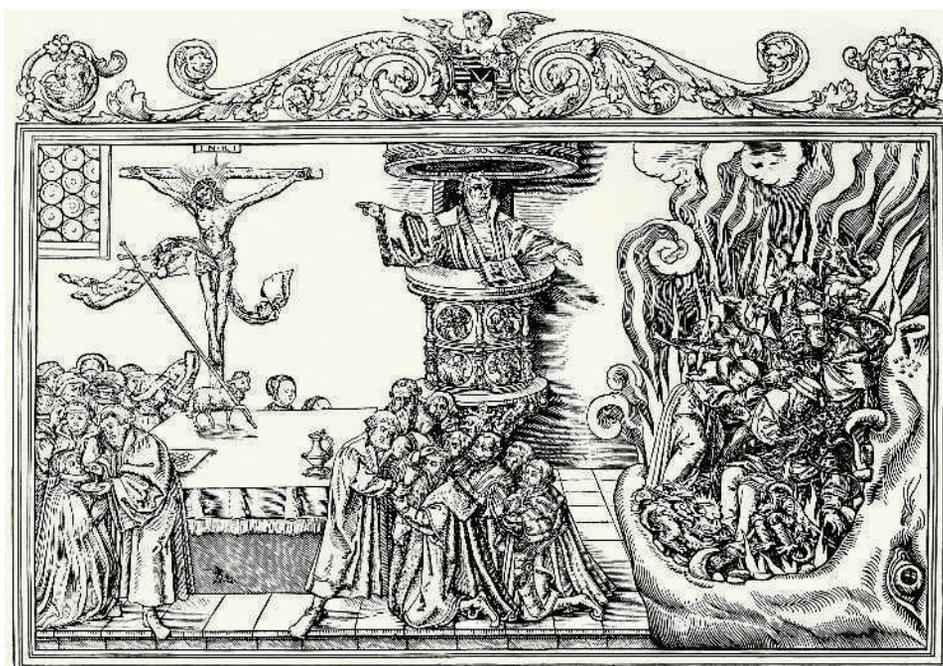

(f) Top. Cardboard *qiblah*-compass in a brass case, 1808–1809, from Istanbul, Turkey. [©The Nour Foundation: Nasser D. Khalili Collection of Islamic Art. Accession number: sc1275] (g) ABOVE. Alphabet page from the 1782 edition of the *New England Primer*, first published in Boston in about 1690. [Courtesy American Antiquarian Society]

(f) shows how word and image could be combined in order to provide an important form of information for Muslim piety. This compass was able to find the direction of Mecca anywhere in the world when adjusted to the coordinates indicated on its face.

In another form of image dedicated to generating a kind of useful information, American Protestants relied on the alphabet page of the *New England Primer* (g) to teach their children to read. The page aligns the alphabet on the left with a central column of imagery, which corresponds, in turn, to rhymed phrases on the right. By embedding imagery in the semantic field of text, American Puritans and their theological descendants did not mistake image for divine referent, but applied the image as a form of graphic information to promote literacy, and to instill in children greater knowledge of the Bible and morality while doing so. The lesson also affirmed the important ideology of print: that words correspond clearly to images, and that both combine to create a uniform, reliable system of representing the physical and moral world. Cultural literacy was neatly enfolded in textual literacy.

The continuity of word and image in Protestant the-

ology began with Martin Luther, who is shown preaching in Wittenberg in a print by Lucas Cranach the Younger (h). Luther preaches a dramatic sermon of propagandistic rage against the papal party, which is glimpsed in the smoking maw of a hellish monster, while the Lutheran party appears below the pulpit and to the left, receiving the elements of the Eucharist (wine and bread). The image was intended to register the fine points of doctrinal controversy between Catholics and Lutherans. The crucified Jesus flutters above the altar in order to underscore the Lutheran doctrine of consubstantiation (that the elements of the sacrament were joined with the substance of Christ's body and blood). The laity receives both wine and bread in contrast to the Catholic practice of distributing only the bread. The balance of word and image is tipped in favor of the word in the work of the twentieth-century Baptist preacher and artist Howard Finster, who, though he includes a standing figure of Jesus behind the cross, foregrounds a cross composed of text and recast as a graphic lesson on moral choice (i). Recalling many popular prints before it, the subject of Finster's work is not the cross or figure of Christ, but, as the title signals, *The Way of Jesus* and the viewer's need to choose to follow

(h) **TOP.** Woodcut print (c. 1540) by Lucas Cranach the Younger depicting Martin Luther preaching to the true church and the false church. [©Bettmann/Corbis] (i) **RIGHT.** Howard Finster, *The Way of Jesus*, enamel and glitter on plywood, 1982. [Lehigh University Art Galleries Museum Operation]

it. The top of the cross, the direction toward God, as one arrow indicates, consists of densely inscribed text, while the bottom of the cross fades into a dark field of imagery. Encased in this single work is the radical Protestant antagonism toward the image. Though Jesus is present, he is relegated to the rear of the cross, which Finster has visualized as an obdurate block of words.

The capacity of written text to stand for objects was exploited by Japanese painters of the *Lotus Sūtra*, an important Buddhist scripture that encouraged the identification of the Buddha's body with the stupa and its relics

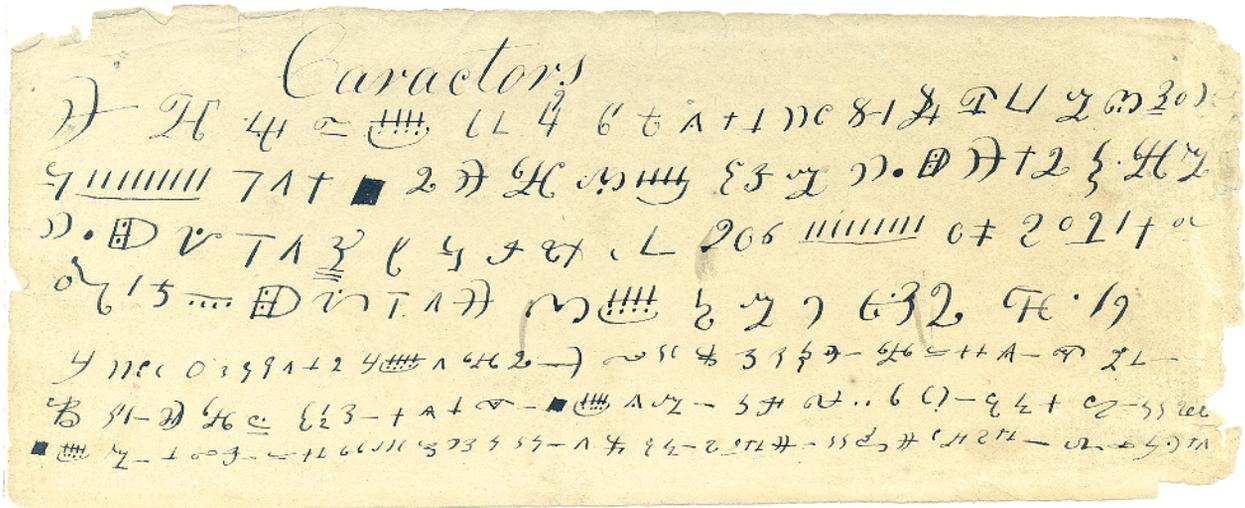

and the very text of his teachings laid down in the written sūtras. In many scroll paintings of the sūtra, artists composed images of stupas from the Japanese characters of the Buddhist text, creating a visual unity of word, image, and the object that housed a relic of the Buddha's body. To see the sūtra was to see the stupa that contained the remains of the teacher. Pilgrims to the Vietnam Veterans Memorial (j) in Washington, D.C., gaze upon the names of the dead and see behind the inscribed names the reflections of themselves looking at the names in this moving, mausoleum-like memorial. The reflections encourage the idea that there is a space behind the wall, that the wall of names is a screen through which survivors may sense the proximity of their lost loved ones. Image and text intermingle to suggest a presence that makes remembering a poignantly embodied rite.

Symbolic imagery can possess a suggestive power by virtue of its appearance as a code. Tarot cards, for example, are clusters of emblematic devices and allegorical figures whose meanings are general and indeterminate until the cards are progressively configured in a serial reading that gradually tailors the cards to the personal reflections of the tarot reader's client (k). The secrecy and mystery of the cards is revealed as a divination of the client's past, present, and future. Another kind of secrecy applies to the script of the golden plates found at Hill Cumorah by Joseph Smith, which he transcribed in 1828 in order for the text to be inspected by a Columbia University professor of ancient languages. Written in what the text itself called "Reformed Egyptian," the script could be translated only when Smith made use of mysterious

interpretive devices that he called “Urim and Thummim.” The putative golden plates, their allegedly ancient script, and the translation of the now-lost text shroud the *Book of Mormon* in a mystery that only enhances its authority as divine revelation for believers. The tantalizing trace of the transcript shown here (I) imbues the actual absence of proof with an antiquarian aura. The ancient ciphers evoke a past in which myth and history are virtually indistinguishable. Religion without suggestion is very little religion.

TRANSCENDENTAL MEDITATION. Beginning as a method discovered by Maharishi Mahesh Yogi (b. 1911), Transcendental Meditation (TM) became an international movement in 1958, when it was presented as a scientific response and practical remedy to the various problems of modern life. This thrust was stressed even more when its founder and teachers denied that the movement was a religion, or that it had been founded as such. Instead, they argued that it was an easy technique that could be mastered by anyone. By using this method, a person could overcome ordinary problems such as mental and emotional stress and high blood pressure while obtaining greater relaxation, gaining greater physical energy and mental clarity, and achieving more advanced stages of consciousness. In spite of its many modern benefits, this new method of yoga claimed to be part of an ancient Hindu spiritual lineage.

Maharishi Mahesh Yogi, who was born Mahesh Prasad Varma on October 18, 1911 in Uttar Kashi, India, traced his spiritual heritage to the great Advaita Vedānta thinker Sankara (c. 788–820), and beyond him to ancient Vedic literature. Maharishi studied for fourteen years with Swami Brahmananda Saraswati (1869–1953) at the Jyotimath, a monastic community located high in the Himalayan mountain range of India, although he was never appointed successor to his own teacher. Before his student apprenticeship, Maharishi earned a college-level degree in physics and mathematics at Allahabad University in India. His educational background partially explains his tendency to wrap his message in scientific jargon and to stress the scientific advantages of his method. The Science of Creative Intelligence (SCI) is, for instance, the official name of his belief system, which is conceived as dynamic due to its ever expanding and increasing nature.

The use of scientific language to convey a religious message accomplishes at least two objectives: (1) it gives the belief system legitimacy, and (2) it forms a cognitive connection to the contemporary Western worldview that is dominated by science. TM operates from the basic presupposition that there is a compatibility between Advaita Vedānta, the Vedas, and Western science. Since 1988 TM has, for instance, worked intensively to demonstrate the parallels between quantum physics and its method.

MISSION TO THE WEST. Before making his mission to the West, Maharishi began his spiritual mission beyond India in April 1958 with a trip to Rangoon, Burma. He then traveled to Bangkok, Thailand; the island of Penang; Kuala Lumpur, Malaysia; Singapore; Hong Kong; Hawai'i; and finally the U.S. mainland. On a subsequent journey in 1960 to Germany he opened nine yoga centers, and later that year he traveled to the Scandinavian countries, beginning with Norway, before going to Italy, Greece, and Nairobi, Kenya. Later trips were made to South America, which made his movement a truly global enterprise.

Maharishi's introduction of his spiritual discovery to the West was preceded by the efforts of Swami Vivekananda (1863–1902) and Yogananda (1893–1952). Vivekananda traveled to America to attend the World Parliament of Religions in 1893 and launched the Vedanta Societies, whereas Yogananda traveled to America to attend the International Congress of Religious Liberals, organized by the Unitarian Church in Boston in 1920, and established the Self-Realization Fellowship with more than 150 centers throughout the world. Following in their footsteps, Maharishi arrived in America in 1959 and lectured on yoga in San Francisco, with additional trips to Los Angeles, New York, London, and Germany. His movement was initially called the Spiritual Regeneration Movement, which later became the name of the adult branch of the movement. The other wing of the movement was named the Students International Meditation Society (SIMS), established in 1964 in Germany. An early emphasis of the movement was its mission to college campuses, which was given a huge impetus in the mid-1960s when the British rock group the Beatles studied with the Maharishi in India. This event generated worldwide publicity for his movement. After his estrangement from the Beatles, the Maharishi initiated, instructed, and toured with the Beach Boys. Maharishi used his celebrity status with icons of popular culture to endear himself with the youth culture. By the 1970s, student centers could be found at over one thousand campuses. By the beginning of the 1980s the movement estimated that 1.5 million people had practiced Transcendental Meditation with a teacher. The college-campus focus of the movement culminated with the establishment of Maharishi International University in Fairfield, Iowa, in 1974 on the campus of the bankrupted Parsons College.

Pushing the margins of science, Maharishi established the Maharishi European Research University in 1975 at two lakeside hotels on Lake Lucerne in Switzerland. The purpose of the university was to research the effects of Transcendental Meditation and to determine the existence of higher states of consciousness. During the following year Maharishi envisioned his own world government with the ancient Indian Vedas as the basis of its constitution. He appointed ministers to various positions with titles like the Development of Consciousness, Prosperity, and Fulfillment and Health and Immortality. During the 1980s Maharishi began a program

called TM-Sidhi with the purpose of teaching students to achieve yogic powers, such as the ability to fly or levitate. There was a public demonstration before 120 journalists in Washington, D.C., on July 9, 1986 that did not correspond with the media hype for the event and resulted in media ridicule of the movement. The members of the media were amused at the sham performance of students jumping on mats imitating acts of levitation.

MEDITATIVE TECHNIQUE AND MESSAGE. The meditative technique of Maharishi is grounded in a Neo-Vedānta metaphysical philosophy in which an unchanging reality is opposed to an ever-changing phenomenal world. Maharishi's book *Science of Being and Art of Living: Transcendental Meditation* (1963) expresses his basic philosophical position. The unchanging reality is equated with Being, which represents a state of pure existence that is omnipresent, unmanifested, and transcendental. Not only is Being beyond time, space, causation, and ever-changing phenomena, it remains unrecognized by human beings because their minds do not realize their essential identity with Being, since minds are captive to the outward-projecting senses. The essential nature of Being is further identified with absolute blissful consciousness, which radiates from Being. Maharishi compares Being to the ocean, upon which there are many waves. These waves are like the field of continually changing phenomena. What is really important for Maharishi is for human beings to realize Being, because without this realization a person's life is without foundation, meaningless, and fruitless. This realization is within the capabilities of everyone by means of TM.

This form of meditation is intimately connected to a person's breath (Prāṇa), which is an expression of Being in the sense that it represents a tendency of the unmanifested to reveal itself. The breath represents the latent power of Being within a person. As the nature of Being, breath plays a role as the motivating force of creation and evolution. The breath can be harnessed and used to help the mind of a person realize Being directly. This is accomplished by Transcendental Meditation, which enables a person to extricate oneself from a state of relative experience, transcend ordinary thinking, and gain the permanent state of Being. This means that a particular mind loses its individuality. It becomes instead a cosmic mind that is omnipresent, pure, and eternal.

Before achieving this cosmic state of mind, the human mind is like a seed that produces a tree. What this analogy attempts to show is the interdependent nature of the mind and karma (action). It is impossible for action to occur without a mind. In turn, it is karma that produces the mind, which in turn creates more karma. This suggests that karma owes its existence to the mind, and in turn creates the mind. By means of karma, the original, pure consciousness of Being is transformed into conscious mind. If karma represents what is temporary and perishable, Being is its exact opposite because it represents eternal unity. Karma creates diversity within the unity of Being.

Within the context of this metaphysical edifice, the technique of Transcendental Meditation involves saturating the mind with Being by harnessing one's breath and making it harmonious with the rhythm of nature and cosmic life. Maharishi emphasizes the naturalness of his technique. Moreover, the technique is a simple, easy, and direct way to development one's mental capabilities and latent potentialities. In contrast to ancient ascetic traditions of India, in TM it is not necessary to renounce the world or withdraw from one's family. That is an ascetic practice which can be performed within the context of the ordinary activities of the world.

Instruction in the technique of meditation stresses that it is an easy and natural process. Students are instructed to devote twenty minutes each day to practice, ideally in the morning and early evening. At the beginning stage, a student does not have to be convinced that the method will work. What is important is the correct practice. If a student performs the technique properly, positive results will follow automatically. The proper technique involves seven steps. The initial step involves attending a introductory lecture that is intended to prepare a person for what is to follow. In the second step, the theory of Transcendental Meditation is presented through a preparatory talk. The third step involves an interview with the teacher, at which time a student is given a sacred mantra (repetitive formula) that is personally fitted to a person, who is not to reveal it to others. By focusing on the mantra, persons are able to concentrate their attention on it. The final steps involve periodic verification and validation of a person's experiences by returning to and checking with a teacher.

Maharishi identifies seven levels of consciousness, with the final one culminating in a state of unity. The fifth state represents a cosmic consciousness that represents an awareness of Being even after the cessation of meditation, whereas the fourth stage stands for the transcendental state, which is a state of pure consciousness described as beyond the previous state of waking, dream, and deep-sleep consciousness. The fifth stage is an expansion of the pure consciousness achieved on the fourth level from an individual to a wider cosmic dimension. The sixth state is called God consciousness. Traditional yogic postures are unnecessary—in TM a person can simply sit upright and comfortably on a chair with eyes closed. The movement tends to stress that anyone can learn this simple, effortless, and easy mental technique.

From the perspective of Maharishi, this yogic technique and Neo-Vedānta metaphysical edifice are not a form of Hinduism. In fact, Transcendental Meditation is not a religion at all. By de-emphasizing its Hindu roots, stressing its nonreligious nature, and focusing on the scientifically demonstrable value of the technique, TM created a successful message that was embraced by many spiritual seekers and a scientifically minded audience. The movement used scientific means to demonstrate how the technique calmed the mind, increased awareness, relaxed the body, and lowered metabolism.

MILLENNIAL EXPECTATIONS. When Maharishi initially arrived in the United States, he stated at a press conference his rationale for coming to America. He confessed that he had learned a secret, swift, deep form of meditation that he was now motivated to share with the world for the spiritual regeneration of its inhabitants. A few years later, he established the Spiritual Regeneration Movement of Great Britain, located in northern London. In 1975 Maharishi announced the Dawn of the Age of Enlightenment. His bold and optimistic pronouncement suggested the commencement of a period during which humans can reach their fullest potential and that will be characterized by boundless happiness, harmony, peace, and personal fulfillment. This new dawn will also represent a period when science will verify and validate the teachings of the Maharishi. Moreover, even those who did not meditate would enjoy the benefits of this new age. The Maharishi took this message on tour to various countries. The impetus for such millennial hope continued in December 1983–January 1984, when he created the Taste of Utopia Assembly, which was staged at Maharishi International University. The purpose of this gathering was to unite Vedic wisdom and the practice of the TM-Sidhi program. Their fusion would usher into existence a utopian age of peace and prosperity. This vision represented a fuller expression of a utopian hope embodied within the movement from its earliest moments.

As Transcendental Meditation grew in the awareness of ordinary citizens, many tended to associate it with New Age religion. During the 1960s and 1970s, people were experimenting with drugs like LSD to induce altered states of consciousness and bliss. Within the context of the drug culture and New Age religion, TM appeared to ordinary people to be offering similar results. Thus, numerous practitioners of various forms of New Age religion and former drug experimenters were attracted to the TM movement because of its apparent kinship with these other forms of spiritual experimentation. Besides such perceived forms of kinship among TM, drug culture, and New Age spirituality, Transcendental Meditation shared with New Age spirituality a holistic view of life. This was a form of thinking and living that attempted to extricate itself from all forms of dualism, such as the dichotomy between body and mind. The Transcendental Meditation movement also intersected with New Age spiritualities with respect to organic and vegetarian dietary practices and alternative forms of medicine. In 1985, for instance, Maharishi launched the World Plan for Perfect Health along with a medical institution, the World Center for Ayurveda, in India.

The Transcendental Meditation movement promised a transformation of both the individual and society by means of an expansion of consciousness to unimagined states. In short, TM aimed to create a perfect society inhabited by perfect individuals. The movement offered a realized eschatology for a transformed mode of living in the present moment that promised a horizon of economic well-being, psychological and somatic healing, peace, and mental comfort.

The Transcendental Meditation movement has attracted disenfranchised, disaffected, and disenchanting seekers looking for spiritual experience, healing, community, a general sense of well-being, and happiness because of the decline of community, the rise of impersonal organizations, alienation, fragmentation of life, secularism, competing multicultural messages, and religious pluralism. With the promise of a perfect society, TM offered a personal and private form of spirituality for many disenchanting seekers.

TRANSCULTURATION AND RELIGION: AN OVERVIEW

The term *transculturation* was first used by the Cuban sociologist Fernando Ortiz to describe the formation of Cuban

culture from the coming together of indigenous, Spanish, and African populations. (Ortiz gave prominence to the term in two chapters of his book *Tobacco and Sugar*, 1947: chapter two is entitled "The Social Phenomenon of Transculturation and Its Importance," and chapter seven has the title, "The Transculturation of Tobacco.") In his studies, Ortiz shows how these groups interrelated, adopted, and adapted themselves in modes of language, music, art, and agricultural production. The contemporary usage of the term owes its academic parlance to the work of Mary Louise Pratt, who, in her book *Imperial Eyes: Travel Writing and Transculturation* (1992), following Ortiz, tells us that processes of this kind occur within "contact zones," "zones where cultures meet, clash, and grapple." These zones, according to Pratt, express the improvisational dimensions of colonial encounters in the modern period. The contact zones show that the encounters between colonizers and colonized, while characterized by the domination of the colonizers, did not simply define separateness but many complex interlocking relations. Within this overall context of domination, Pratt foregrounds the copresence, interaction, and improvisational dimensions of the contact zones (p. 7).

Pratt and others who make use of the term use it primarily to describe the contact of Western culture with other cultures over the last five hundred years. These contacts have taken on several overlapping forms—conquest, domination, reciprocity, adaptation, amalgamation, and so on. The phenomenon of the contact of cultures is not peculiar to the modern period, however. Given the human capacity for locomotion, different and diverse groups of people have been "in contact" since human beings have been on earth; cultural contacts have taken place throughout the history of humankind. Prior to the Neolithic period, when humans domesticated animals and began to practice agriculture, small transhumance bands of humans were in constant movement over designated parts of their regions. With the beginnings of early citted existence in China, Mesopotamia, and then in regions all over the world, the sedentary and centered human mode of being gained prestige. Though cities represented the human mode as sedentary and centered, movement, travel, and meetings and encounters with human groups outside the city centers increased rather than diminished.

Mary Helms's *Ulysses' Sail* (1988) examines the meaning of geographical distance and foreign places in premodern periods in several cultures of the world. Just as the vertical distance between the heavens and the earth expressed the spaces and loci for cosmological and theological speculation, the horizontal traversal of space revealed structures of power and knowledge. Long-distance spaces were traversed by long-distance travelers who were either themselves elite or represented the elite orders of society. Helms does not deny that trade went on through this travel but her emphasis is upon the creation of the symbolic spaces made through geographical travel.

Various kinds of knowledge, including literacy, navigation, the forging of metals, and astronomy, attended those

who made these journeys, thus enhancing their power and prestige. The symbolic power also accrued from the knowledge of “outside phenomena.” Thus, in Helms’s study, boundaries are equal or even more important than zones. Long-distance travel involved going outside boundaries and thus the knowledge gained was understood to have the power of transformation. Helms’s study “rest[s] upon the assumption that the significance of interchanges of people and material goods across geographical distances can better be understood if we know something of the qualities attributed to space and distance in various situations” (p. 10).

PILGRIMAGES. One aspect of the kind of long-distance travel discussed by Mary Helms has taken the form of pilgrimages in various cultures throughout the world. While Helms has pointed to long-distance travelers as people who went beyond, even transgressed, boundaries in their search for knowledge and power, the pilgrimage, though still emphasizing travel, specifies a definite destination and purpose for the traveler. It is this form of long-distance travel that is the precursor of the long-distance travels of Western peoples beginning in the fifteenth century of the Common Era.

The contact of Western cultures from the fifteenth century with the cultures of the world should be seen against the practice, rhetoric, and literature of pilgrimage. Pilgrimage has a long tradition in European cultures. By the fourteenth century one can discern two major meanings arising out of the pilgrimage: pilgrimage as a soteriological act or pilgrimage as an act of grace. The archetypal pilgrimage was the Christian pilgrimage to Jerusalem. Jerusalem for the Christian defined the symbolic and geographical center of the world; this space was saturated with the life and meaning of the Christian savior and thus was the most powerful and prestigious place in all Christendom. The pilgrimage to Jerusalem defined a penitential journey, where believers undertook a kind of asceticism en route that prepared them for the receptive beneficence of being in the Holy Land.

Following Helms, the pilgrimage to Jerusalem, and in like manner all other Christian pilgrimages, was based upon the vertical meaning of space, with the heaven above, the human as sinner in the middle, and the earth below. In the pilgrimage to Jerusalem, the penitent was congruent with the fundamental orders of divine power. At this center, the penitent could experience the most potent meanings of grace and redemption. The pilgrim nevertheless had to travel through space to arrive at Jerusalem, and in so doing, the old specter described by Helms in the horizontal traversal of the earth came back into play. The change of places and spaces through the journey of the pilgrimage piqued the curiosity of the traveler. Christian Zacher in *Curiosity and Pilgrimage* (1976) describes the tension between the soteriological and liturgical meaning of pilgrimage and the meaning of the pilgrimage as a journey of curiosity. The growing emphasis with curiosity as a major aspect of pilgrimage came to constitute another and often separate motivation for undertaking a pilgrimage.

Obviously, theological formulations were given for the liturgical meaning of pilgrimage; equal theological attention was paid to curiosity. It was pointed out that curiosity—wanting to know on one’s own—was the original source of human sin. It was human curiosity in the Garden of Eden that led to the first disobedience to God. Curiosity represented the human will to know apart from God’s command, and thus in this independent mode of knowing, humans transgressed the meaning and roles of proper knowledge. These summary statements by Zacher show the marked difference between the two modes: “the temptation to *curiositas* referred to any morally excessive and suspect interest in observing the world, seeking novel experience, or acquiring knowledge for its own sake” (p. 4). Regarding the liturgical meaning of pilgrimage, Zacher states the contrast: “As a form of religious worship, pilgrimage allowed men to journey through this present world visiting sacral landscapes as long as they kept their gaze permanently fixed on the invisible world beyond” (p. 4). Pilgrimage as a movement through space expressed an inner and outer process of spiritual meanings.

Two major changes took place that began to transform the pilgrimage from a liturgical ritual of travel into a more purposeful and pragmatic endeavor. The first occurred when Pope Urban II in 1095 called for a pilgrimage from the armed knights of Christendom to free the Holy Land from the Muslims and by so doing reconstitute the meaning of the sacred center of Christendom. This action allowed armed knights to undertake a ritual act while still part of a military order (Elsner and Rubiés, 1999, p. 24). The other change took place when monks and priests from the eleventh century on began to undertake missionary movements to other lands to convert nonbelievers to the true faith of Christianity. Missions took on a more rationalistic ideological bent that led to rationalistic narratives. Missions and crusades were allied during the late medieval period and this pattern was adopted by explorers of Africa and the Atlantic in the fifteenth century.

Though liturgical ritual pilgrimages were undertaken for soteriological purposes, it is clear that a great deal of curiosity was always expressed through them. This curiosity had to do with the empirical observations of other lands and habits. Victor Turner in his anthropological analysis of pilgrimage suggests that a kind of tacit curiosity is part of the very structure of pilgrimage itself.

The language and style of the pilgrimage structure pervaded the travel narratives and discourses of Europeans commencing with the voyages of Columbus in the fifteenth century. The pilgrimage model from this time on entered into the travel stylistics and rhetoric of all long-distance travels of Europeans. Thus, from the earliest pilgrimage traditions of the church to the pilgrimage voyages of the Reformation Puritans to the New World, the pilgrimage model served as both umbrella and reservoir for the meanings of travel, discovery, conquest, and even scientific curiosity.

Henri Baudet has noted that the languages of travel and discovery embodied a duality that found expression in two relations of Europeans to the non-Europeans they “discovered.”

One is in the realm of political life—in the concrete relations with concrete non-European countries, peoples and worlds. . . . The other relationship is an expression of the domain of the imagination, of all sorts of images of non-western people not derived from observation, experience or perceptible reality, but from a psychological urge—an urge that creates its own reality which may be different from the realities of the first category. (Baudet, 1988, p. 6)

Long-distance travel, the salvation of souls, and military missions coalesced into an amalgam of ideology and practice that became the basic structure of Western explorations, discoveries, and conquests over the last five hundred years. This ideological orientation led Daniel Defert to make the following remark concerning Western expansion:

The early Europeans were pilgrims, *prudencia peregrandi*. They were taught languages as *linguae peregrinae*, that is not languages of a given territory but language necessary for the activity of traveling. . . . This vast universe, known only to a few people, absent from the sacred texts and of which Antiquity knew nothing could have provided a field of endless invention and exaggeration. But the writer’s obligation to the truth was the result of a hierarchal network of competition and confrontation. No doubt the voyage of discovery should be situated historically between medieval crusades which it miniaturizes and the organization of a laboratory. (1982, p. 12)

NORMATIVE MODES OF WESTERN TIME. From the time of Constantine through the medieval period the West was dominated by a Christian conception of the temporal process. Following the missionary commandment from the Gospels to preach and baptize all humanity, notions of time and space were made to conform to this injunction. Geographical space and the temporal process were believed to aid and abet this dictum. While other temporal modes among other peoples and cultures were acknowledged, they were understood as stages of preparation for the reception of the true time of Christian faith and practice. It was this conception and understanding of time based on a biblical paradigm that accompanied both the Roman Catholic missionary orders and Protestants in their explorations, discoveries, and conquests in various parts of the globe at least until the sixteenth century.

Following certain developments stemming from the Protestant Reformation and various technologies in the West, new notions regarding the temporal process emerged from the Western Enlightenment. Both had to do with the secularization of time. One conception offered a critique and alternative to the biblical structure of time from creation, to the passion and resurrection of Christ, to the last days; the other, while accepting the basic Christian ordering of time

as formative and necessary for the West, nevertheless exorcised all the mystical and theological meanings from this temporal process, thus equating and identifying the time of Western culture with the meaning, structure, and order for a normative understanding of all human time.

It is a generally accepted notion in the Western social sciences that the history of humankind can be divided into four stages of development: the hunting-gathering, the pastoral, the agricultural, and the commercial. These stages did not arise from empirical observation but as a result of a kind of conjectural history. Ronald L. Meek in *Social Science and the Ignoble Savage* (1976) traces this conjectural history as it emerges from several thinkers during the eighteenth century. One prominent element in the development of the theory grew from various theories put forth to account for America, the lands across the Atlantic. America was seen as the first stage of some kind of development of human culture. Meek tells us that the decisive influence in the general adoption of the four-stage theory of cultural evolution and development was the Scottish moral philosophers, the most influential being Adam Smith. In his lectures on jurisprudence in 1762 and 1763, Smith used the four-stage theory as the underpinning for explaining the nature and meaning of property within several types of societies. With the growing acceptance of the theory, several scholars and literary authors undertook research and wrote texts that presupposed these stages as the “natural” evolution of human cultures. For the popular cultures of Europe, the four-stage theory could be turned into the binary of primitive/civilized. This theory and its shorthand became a convenient taxonomy for the classification of the cultures that Europeans encountered in various parts of the world.

While several events, technologies, and ideas contributed to the notion of a purely secular temporal process, the sustained treatment of this conception can be found in eighteenth- and nineteenth-century German philosophy, most especially in G. W. F. Hegel and those influenced by him. Karl Löwith’s *From Hegel to Nietzsche: The Revolution in Nineteenth-Century Thought* (1964) traces the way in which these thinkers undertook a critical analysis of the meaning of time within Western culture. Their philosophies were not a simple rejection of a religious or Christian notion of time. While Christian notions of time and history were subjected to critique, they also attempted to show that for a certain period of Western history, Christianity was the bearer of what was objectively real in human time. This objective reality of history has in the modern period moved from the framework of the Christian faith and is now embodied within the secular structures of Western culture. While Hegel was the progenitor of these notions, Löwith points to Johann Friedrich Overbeck as the seminal thinker in the Hegelian school who summarized the theory of the ultimate reality of modern historical temporality.

When Europeans made contact with non-European cultures in various parts of the world, they were armed with

ideological cultural notions not simply regarding what was normative for them but, in addition, their norms were understood to be normative for all humankind. While they were more often than not bearers of superior military, navigational, and other forms of technology, it was their normative understandings of time and space that they desired to enforce upon those whom they met. The encounter with others must perform create a “contact zone,” a zone of time/space that must be adjudicated regardless of the dominating power. Conquerors had to learn from the conquered if they were to maintain their authority and the conquered had to adjust, adapt, and respond to those who came from afar. It is clear that since the fifteenth century, the entire globe has become the site of hundreds of contact zones. These zones were the loci of new forms of language and knowledge, new understandings of the nature of human relations, and the creation and production of new forms of human community. These meanings have for the most part been ignored due to the manner in which the West, in an uncritical manner, absolutized its meaning of itself as the norm for all humankind.

EXCHANGES: LANGUAGES, RATIONALITIES, AND MATERIALITIES. The model of pilgrimage was always caught within a tension between curiosity, on the one hand, and the liturgical ritual meaning of a soteriology, on the other. It is equally the case that much travel was motivated by desire for the form of knowledge that came from visits to distant places. The narratives, discourses, and practices hardly revealed the kind of contingency and descriptions that would open these journeys to a full portrayal of the wide variety of exchange relations that were attendant to these travels.

Kathleen Biddick in *The Typological Imaginary* (2003) traces the origins of the stylization of the kind of “absoluteness” that became the favored narrative structure. In her research she shows that this stylization of the absoluteness of time and space can be traced back to what she calls the “Christian typological imagination.” This form of historical thinking grows out of the way in which Christianity worked out its relationship to the history of Judaism and the Jews. The history of the Jews was subsumed into the Christian canon through their creation of the Christian Old Testament. From this perspective, the history of the Jews ended or should have ended with the coming of Jesus Christ. Though the history of Judaism continued and continues to this day, because of the canonization of the Christian Bible and the ensuing cultural power of Christianity, the Jews and Judaism were destined to always be seen as a people and tradition who were relegated to a temporal past, Christian time becoming the normative meaning of temporality as history. As Biddick put it, “They believed that the Christian new time—as ‘this is now’—*superseded* a ‘that was then’ of Israel” (p. 1). She makes it clear that Western secular time took over this meaning of supersession from the Christians. Now given the fact that Western historical time in either its mundane or philosophical modes carries this sense, modes of time in transcultural contact zones are often seen as “unhistorical.”

Biddick refers to this kind of time as temporalities—ones not about divisions between then and now, but about passages, gaps, intervals, in betweenness. “These unhistorical temporalities that do not use time as a utilitarian resource to ground identity are temporalities that can never be one” (p. 2).

Temporalities within contact zones are very complex. The time of the pre-Western contact is no longer normative, though dimensions of it may inhere within the language; inhabitants are forced to accept the official historical time of their conquerors, and those oppressed within these spaces must express a temporality of their own “lived time,” which is neither the precontact time of their traditional cultures nor the official time of the conquest.

From the fifteenth century to the present several different Western empires have dominated various cultural areas of the world. While dominance and conquest were common traits, all empires did not undertake these modes of control in the same manner. Neither did all the cultures within the dominated areas respond or adapt in the same manner. The processes and dynamics of these interactions define the varying meanings from within the contact zones.

These contact zones had an effect upon the literary productions of Europeans, indicating how the Europeans were responding and the impact of these non-European cultures upon European sensibilities. Peter Hulme in his *Colonial Encounters: Europe and the Native Caribbean, 1492–1797* (1986) shows how Europeans styled the encounters in literary form. For example, the encounters of Columbus and other Europeans in the New World are expressed in the dramas of Prospero and Caliban, John Smith and Pocahontas, Robinson Crusoe and Friday, and Inkle and Yarico; these dramas are attempts to express these encounters in ways that would fit within the orders of European cultures (p. xiii). Hulme makes it clear that there is much more going on than simply literary production. These literary forms, he says, should be seen as colonial discourses. By this he means,

an ensemble of linguistically based practices unified by their common deployment in the management of colonial relationship, an ensemble that could combine the most formulaic and bureaucratic of official documents. . . underlying colonial discourse, in other words, is the presumption that large parts of the non-European world were *produced* for Europe through a discourse that imbricated sets of questions and assumptions, methods, of procedure and analysis, and kinds of writing and imagery. (1986, p. 2)

These literary productions taken on face value enabled Europeans to create stereotypical images of the non-Europeans encountered in colonial and imperial projects. These images enhanced the images of the exotic, the oriental, and the noble savage as products of the distances from the center of European metropolises. They fed into the stadial theories of the historical development of humankind, congealing this difference into cultural categories of the West.

The conjectural theory of history that formed the base upon which the stadial theory was erected was correlated

with a cultural theory of human intelligence. Thus, various stages were expressions of forms of intelligence. This led to notions of “how natives think,” or “prelogical mentality,” and the like. Such theoretical postulations were based upon the normative structure and meanings of Western thought. Seldom were these issues of thought asked from within the contact zones, where oppressive administrative colonial structures, Europeans, and non-Europeans carried on their lives.

Thus, cultural, literary, philosophical, and scientific languages and discourses employing this supercessionary and absolute language of temporality normalized a Western understanding of the nature of the encounters with non-Western peoples. Interwoven and concealed within these linguistic productions were the actual and authentic relationships that were taking place in the contact zones. Two instances of the meaning of contact as it relates to the exchange of material products can be seen in the events and discourses surrounding the meaning of *fetish* and *fetishism* and the phenomena referred to as *cargo cults*.

The fetish and fetishism became popular in European discourses of the eighteenth century as a definition of the earliest form of religion. This definition and its usage was part and parcel of a stadial evolutionary variation of supercessionary history. The etymological origin of the word *fetish* is the Portuguese *feitico*, which means “manufactured” or “fabricated.” William Pietz, who has recently undertaken the most extensive research into the history of this term and its various usages in modern times, traces its beginning with the Portuguese to its usage by the Dutchmen Pieter de Marees and Bosman through a succession of other European writers, finally appearing in the work of the first historian of religions, Friedrich Max Müller. It later becomes an important term in the writings on political economy of Karl Marx and in the theories of sexuality of Sigmund Freud. Given such a wide range of significations and connotations, Pietz notes that,

fetish has never been a component in a discursive formation. Fetish rather describes not societies, institutions, or cultures but cross-cultural spaces. From this standpoint, the fetish must be viewed as proper to no historical field other than that of the history of the word itself, and to no discrete society or culture, but to a cross-cultural situation formed by the on-going encounter of value codes of radically different social orders. (1985, p. 11)

At one level the fetish is about a new conception of matter and materiality as these notions undergo transformations within the Atlantic world of exchanges and discourses. While the religious world of Christianity was predicated upon the creation of all matter by God, a form of matter was necessary in the Atlantic that carried only an exchange and not an inherent value. The notion of the fetish, as originating in the Atlantic encounters with radically different cultural notions of the value of matter, developed into the language of the fetish, which performed the dual roles of hiding the true and

authentic exchanges that took place in the Atlantic encounters, and creating a form of matter that would not bear the weight of any human meaning of tradition or origination. The fetish in Pietz’s description fits perfectly the kind of significations that arise from transcultural contact zones.

Another phenomenon of such spaces is the cargo cult. The term *cargo cult* was coined in 1923 in *The Vailala Madness and the Destruction of Native Ceremonies in the Gulf Division*, a report by government anthropologist F. E. Williams, to describe what he considered to be strange ritual phenomena among the population in Papua New Guinea. These rituals involved an interpretation of matter from within the contact zone. Although Westerners brought a wide variety of material products to Melanesia during the colonial period, their notion of matter was under the sign of inanimate products whose value lay only in their potential for exchange. The natives of Papua New Guinea understood matter and exchange in very different ways. In addition, Westerners were accompanied by Christian missionaries, who preached a gospel of the inherent value of each human soul as the basis for salvation. The natives of this area quickly perceived that though Christians preached a message of the salvation of human souls, they acted in terms of a soteriology based upon the accumulation and distribution of material goods. From this perspective they were able to understand the strange and almost magical characteristics between money as a mode of exchange, the inanimate nature of material products, and the hidden relationship obtaining between these items. Their response to this conundrum was in the form of rituals involving Western made products, the cargo, and millenarian hopes.

All forms of human expression, including language, took on different forms within the contact zones. There were several languages: the language of the official colonizing culture, the original or indigenous languages, and languages that were mixtures of the official and indigenous languages. These mixed, creole, or pidgin languages were not simply derivatives from the mixture but equally a system of communication that was uniquely suited to render adequately the experiences of those who lived outside and underneath the official legitimated orders of officialdom.

Exchanges were not limited to languages, products, and services; there were exchanges of sexualities as well. Exchanges of sexualities produced offspring of the mixtures in the contact zones. Every situation of contact included classes of persons resulting from the union of Westerners and non-Westerners. These “illegitimate” offspring became in turn complex aspects of the communication systems of the other exchanges between dimensions of work, products, and sexualities. For example, Magali Carrera (2003) has demonstrated how the complex mixtures of Spaniards, Indians, and Africans in Mexico led to taxonomies of cultural valuation that were expressed and normalized in a genre of *casta* paintings. Exchanges were not limited to human expressions; in the United States human beings as enslaved persons were legally

defined as chattel and exchanged as property. This mode of exchange created almost imponderable issues regarding definitions and meanings of human freedom in a democratic society. One can see how various forms of fetishism enter into and serve to hide the true situation, often making it impossible for the official linguistic traditions to deal with the meanings and expressions that lie hidden within their legal and civil pronouncements.

Karen Fields's *Revival and Rebellion in Colonial Central Africa* (1985) shows in a precise manner "how natives think." The "natives" were very capable of not only "living in," but also "thinking about" and reflecting upon their situation. As over against an anthropological wisdom that Africans had no objective knowledge of the forces determining their behavior, she shows that they not only possessed such knowledge but were capable of making creative, critical, and intelligent use of it. Her book also enables us to see that within the contact zone the cultural categories of the West are taken up and reinterpreted in ways that give them a freshness and novelty. In the search and desire for another source of power that is no longer derivative of traditional resources, nor simply acquiescent to colonial authorities, the native in question, Shadrack, saw the God of the Watch Tower Society as the foundation for a critical and revolutionary meaning within the contact zone.

Another example of reason and intelligence from the contact zone can be seen in Margaret J. Wiener's *Visible and Invisible Realms: Power, Magic, and Colonial Conquest in Bali* (1995), which demonstrates the persistence of the meaning of the "other" and the invisible world of value and orientation in the midst of contemporary life. She also makes clear that Klungkung, the Balinese kingdom, did not anticipate the entrance into Western civilization as a heralded event.

John D. Kelly (1991) studied the meaning of virtue as a value within the structures of imported indentured workers from India on the island of Fiji in the early part of the twentieth century. His discussion raises issues regarding the nature of virtue when one wishes to be modern and at the same time appreciates the authentic limits placed upon one by tradition. These issues bear upon the nature of work, sexuality, kinship systems, and anti-colonialist organization and agitation. This study from within a contact zone adds much to the range of the meaning of virtue. Michael Taussig's *The Devil and Commodity Fetishism in South America* (1980), following a neo-Marxist methodology, is able to show a new valorization of the meaning of the devil from within the contexts of several contact zones in South America. Fernando Cervantes's *The Devil in the New World: The Impact of Diabolism in New Spain* (1994) shows how this same figure of the devil brought by the Spanish missionaries developed in opposition, on the one hand, and in parallel, on the other hand, to the understandings of the Aztecs. Cervantes's thorough study lays the grounds for a mature notion of evil emerging from the realities of the contact zone.

One might identify transculturation and contact zones as corollaries of a creole or a creolization process. The term *creole*, from the Spanish *criollo*, was initially used to identify persons born in the Americas but who claimed white European ancestry. From this point of view, all of the "Founding Fathers" of the United States could be called creoles. The term took on other connotations from within the situations of transculturation and the many "contact zones" throughout the world. More often than not, it now refers to the processes and dynamics of the fluid improvisational meanings of cultures that express the survival, critique, and creativity of those who occupy these situations and sites.

The Martinican intellectual Edouard Glissant has proposed the term *creolization* to describe a more general philosophical stance of transculturation and contact zones. Such a stance undertakes a critique of the official histories and the implicit notions of time and space embedded within them. Glissant calls for a "creolization process" of relationship and relativity. In the introduction to Glissant's *Caribbean Discourses*, J. Michael Dash characterizes one of his positions: "But the world can no longer be shaped into a system. Too many Others and Elsewheres disturb the placid surface. . . . Glissant is a natural deconstructionist who celebrates latency, opacity, infinite metamorphosis" (Glissant, 1989, p. xii).

These works and several others of this genre are the result of serious questions asked from within contact zones rather than from the ideologically normative positions of Western categories. While the term *globalization* is used to refer to the various aspects of a worldwide capitalistic market-consumer system, the term might equally specify the myriad contact zones throughout the world where Western cultures and non-Western cultures have encountered each other. In these in-between spaces inhabited by both, exchanges, violent and reciprocal, have taken place. From places such as these a more authentic sense of humankind's place in the world might be forged.

BIBLIOGRAPHY

In *On the Social Phenomenon of "Transculturation" and its Importance in Cuba*, Fernando Ortiz opened the door to the significance of cultural contact through his studies of the formation of the Afro-Cuban dimensions of Cuban culture. His publication, *Tobacco and Sugar*, translated from the Spanish by Harriet de Onis (New York, 1947) marks the first scholarly usage of the term "transculturation." The contemporary study of cultural contact within an orientation of transculturation as both a description and critique of colonialism and imperialism was initiated by Mary Louise Pratt's *Imperial Eyes: Travel Writing and Transculturation* (London, 1992). Pratt's work served as a catalyst for other works published before and subsequent to her work, including Fredi Chiappelli, ed., *First Images of America: The Impact of the New World on the Old*, 2 vols. (Berkeley, 1976). Henri Baudet's *Paradise on Earth: Some Thoughts on European Images of Non-European Man*, translated by Elizabeth Wentholt (New Haven, 1965; reprints, Westport, Conn., 1976, and Middletown, Conn.,

1988), shows how travel leads to images of non-European peoples, even though these images are not based upon observation or perceptions. See also Nicholas Thomas's *Entangled Objects: Exchange, Material Culture, and Colonialism in the Pacific* (Cambridge, Mass., 1991). Charles H. Long devoted a section of his *Significations: Signs, Symbols, and Images in the Interpretation of Religion*, 2d ed. (Aurora, Colo., 1995), to an understanding of cultural contact and religion. Arjun Appadurai, ed., *The Social Life of Things: Commodities in Cultural Perspective* (Cambridge, U.K., 1986), extends the meaning of *transculturation* to the nature and meaning of objects. The display and meaning that objects take in this process were enhanced by the "world fairs" that became international exhibits for exotic and esoteric objects. Two important works discuss this aspect, Paul Greenhalgh's *Ephemeral Vistas: The Expositions Universelles, Great Exhibitions, and World Fairs, 1851–1939* (Manchester, U.K., 1988), and John Burris's *Exhibiting Religion: Colonialism and Spectacle at International Expositions, 1851–1893* (Charlottesville, Va., 2001). The impact of studies of cultural contact on the discipline of anthropology can be seen in Johannes Fabian's *Time and the Other: How Anthropology Makes Its Object* (New York, 1983) and Nicholas B. Dirks, ed., *Colonialism and Culture* (Ann Arbor, Mich., 1992).

The literature on travel as pilgrimage is extensive. Mary Helms's study of travel in *Ulysses' Sail: An Ethnographic Odyssey of Power, Knowledge, and Geographical Distance* (Princeton, 1988) adds a new dimension to the meaning of travel and the nature and quality of knowledge. Victor Turner's analysis of Christian pilgrimage in *Image and Pilgrimage in Christian Culture: Anthropological Perspectives* (New York, 1978) specifies the ritual elements and processes within the structure of Christian pilgrimages. For discussion of medieval European pilgrimages see, Christian Zacher, *Curiosity and Pilgrimage: The Literature of Discovery in Fourteenth-Century England* (Baltimore and London, 1976); Lionel Rothkrug's several studies include "Popular Religion and Holy Shrines: Their Influence on the Origins of the German Reformation and Their Role in German Cultural Development," in *Religion and the People, 800–1700*, edited by Jim Obelkevich (Chapel Hill, 1979); and *Religious Practices and Collective Perceptions: Hidden Homologies in the Renaissance and Reformation* (Waterloo, Ont., 1980).

Two edited works on pilgrimage contain excellent articles with extensive bibliographies: *Implicit Understandings: Observing, Reporting, and Reflecting on the Encounters Between Europeans and Other Peoples in the Early Modern Era* (Cambridge, U.K., 1994), edited by Stuart B. Schwartz; and *Voyages and Visions: Towards a Cultural History of Travel*, edited by Jaś Elsner and Joan-Pau Rubiés (London, 1999)—see in particular Elsner and Rubiés's introduction: "Travel and the Problem of Modernity." Daniel Defert's "The Collection of the World: Accounts of Voyages from the Sixteenth to the Eighteenth Centuries," *Dialectical Anthropology* 7 (1982): 11–20, presages the world fairs mentioned above in the works of Greenhalgh and Burris. For a discussion of the tension in liturgical time that ensued in medieval societies under the impact of technology and trade, see Harald Kleinschmidt, *Understanding the Middle Ages: The Transformations of Ideas and Attitudes in the Medieval World* (Woodbridge, U.K., 2000). Norbert Elias's *Time: An Essay*, translated by Edmund Jephcott (Ox-

ford, 1967), is a good discussion of social time; it should be read along with Fabian's work, cited above. Kathleen Biddick's *The Typological Imaginary: Circumcision, Technology, History* (Philadelphia, 2003) demonstrates how medieval Christian time, later inherited by secular time, was based upon the placement of Jews and Judaism in time and space; this work should be seen as a counter to the kind of conjectural history that produced a stadial theory of cultural development as discussed in Ronald L. Meek's *Social Science and the Ignoble Savage* (Cambridge, U.K., 1976). The relationship of time, travel, and literary images is explored in Peter Hulme's *Colonial Encounters: Europe and the Native Caribbean, 1492–1797* (London and New York, 1986; reprint, 1992). The philosophical justification and amalgam of Christian time with secular time is the task of Karl Löwith's *From Hegel to Nietzsche: The Revolution in Nineteenth Century Thought*, translated by David E. Green (New York, 1964; reprint, 1991).

One of the earliest reports of a contact site in a transcultural situation is F. E. William's classic statement in *The Vailala Madness and the Destruction of Native Ceremonies in the Gulf Division* (Port Moresby, Papua New Guinea, 1923). This report, which led to the notion of "cargo cults," was followed by several works, the most notable being Peter Lawrence's *Road Belong Cargo: A Study of the Cargo Movement in the Southern Madang District, New Guinea* (Manchester, U.K., 1964) and the following works by Kenelm O. Burridge: *Mambu: A Melanesian Millennium* (London, 1960; reprint, Princeton, 1995) and *Tangu Traditions: A Study of the Way of Life, Mythology, and Developing Experience of a New Guinea People* (Oxford, 1969). A comprehensive study of this area is found in G. W. Trompf, *Payback: The Logic of Retribution in Melanesian Religions* (Cambridge, U.K., 1994).

Examples of historical empirical studies of contact zones include: for Africa, Karen E. Fields, *Revival and Rebellion in Colonial Central Africa* (Princeton, 1985); for Fiji, John D. Kelly, *A Politics of Virtue: Hinduism, Sexuality, and Countercolonial Discourse in Fiji* (Chicago and London, 1991); and for Bali, Margaret J. Wiener, *Visible and Invisible Realms: Power, Magic, and Colonial Conquest in Bali* (Chicago and London, 1995), which shows in stark relief how religious powers and resources of an "invisible world" emerge and come to play decisive roles in the Dutch conquest of Bali. Magali Carrera's *Imagining Identity in New Spain: Race, Lineage, and the Colonial Body in Portraiture and Casta Paintings* (Austin, Tex., 2003) demonstrates not only how the complex issue of race, class, and gender were managed but equally how they were normalized in domestic portraiture in the Mexican colonial family. John Cowley's *Carnival, Canboulay, and Calypso: Traditions in the Making* (Cambridge, U.K., 1996) describes how the carnival tradition becomes the container, expression, and critique of an ongoing tradition in the Caribbean. Finally, Fernando Cervantes's *The Devil in the New World: The Impact of Diabolism in New Spain* (New Haven, 1994) and Michael Taussig's, *The Devil and Commodity Fetishism in South America* (Chapel Hill, N.C., 1980) present, on the one hand, theological ramifications of this Christian symbol in a contact zone, and, on the other, the popular manifestations of this meaning as related to work and the economic system.

No discussion of transculturation or contacts zones can proceed very far without dealing with the issue of the fetish or what

is implied in the modern discourse about fetishism. The most profound researches on the fetish are those of William Pietz, whose essays have been published in several issues of the journal *RES: Anthropology and Aesthetics*. These include: "The Problem of the Fetish I," *RES* 9 (1985): 5–18; "The Problem of the Fetish II: The Origin of the Fetish," *RES* 13 (1987): 23–41; and "The Problem of the Fetish, IIIa: Bosman's Guinea and the Enlightenment Theory of Fetishism," *RES* 16 (1988): 105–124. The importance of Pietz's research is shown by the fact that it is made use of by Biddick (cited above) and constitutes a significant part of the discussion of another important text dealing with issues related to contact zones, Anne McClintock's *Imperial Leather: Race, Gender, and Sexuality in the Colonial Context* (New York and London, 1995).

Almost all of the above works state explicitly or imply theoretical or methodological positions. However, a few texts directly set forth theoretical and methodological positions based upon transculturation and the contact zones. These include Ashis Nandy's *The Intimate Enemy: Loss and Recovery of Self Under Colonialism* (Delhi, 1983). Another text containing a unique interpretation and extension of thought is Vinay Lal's *Dissenting Knowledges, Open Futures: The Multiple Selves and Strange Destinations of Ashis Nandy* (New Delhi, 2000). Édouard Glissant's *Caribbean Discourse: Selected Essays*, translated by J. Michael Dash (Charlottesville, Va., 1989), comes from a completely different experience of the contact zone, and expresses many of the same meanings and styles as does Nandy.

CHARLES H. LONG (2005)

TRANSCULTURATION AND RELIGION: RELIGION IN THE FORMATION OF MODERN CANADA

The history of modern Canada has been characterized by a concurrence of dichotomies typified by the ongoing discord between French and English Canadians. This dichotomy, however, has been only one of a number of defining antitheses involving ethnicity, religion, and regionalism. Historians have long recognized the preeminent role of religion in the formation of the nation, and the relationship of religion—particularly the churches—to the growth of the specific dichotomies that define the Canadian Confederation. The churches, and religion more broadly, have been thoroughly bound to the political, social, and cultural development of this nation whose designation of "dominion," and motto, "from sea to sea," are both taken from the seventy-second Psalm.

THE CHURCHES. The relationship between churches and state in Canada was inaugurated in 1534, when Jacques Cartier erected a cross at the Gaspé Peninsula around which he and his companions knelt to pray. Cartier had sailed from Saint Malo, a French seaport connected with the transatlantic fishery that had emerged in the wake of the discovery of cod stocks off the coast of Newfoundland by Giovanni Caboto (John Cabot) and his son Sebastian, who had been

commissioned by Henry VII in the late fifteenth century to seek out spices. By the end of the sixteenth century French fishers and aboriginal peoples had established a lucrative trade in furs, laying the foundation for a staple trade that would continue to bring the French to the northern part of the continent. The first permanent French settlements were established in Acadia in 1604 and Quebec in 1608. At the time of their founding, France was undergoing a period of religious revitalization. The counter-reformation had engendered a firm association between an increasingly missionary Catholic Church and the state, and all colonial ventures were consequently required to carry Catholicism with them and to missionize among native peoples. Aside from a few itinerant priests among the Mi'kmaq of Acadia from 1604 to 1613, active evangelization in North America was undertaken by religious orders, beginning with the Récollets who arrived at Quebec in 1615, and then the Society of Jesus (Jesuits) in 1625. French/aboriginal relations were relatively amicable during this period, due to the fact that French settlements were tied primarily to the trade in furs, an enterprise that did not give rise to large-scale colonization and required a level of cordiality among interested parties. Additionally, the French fostered alliances through the extension of trading privileges to baptized aboriginals.

In 1627, the French crown transferred control of the colony to the Company of New France, whose charter required the importation of four thousand French settlers with the services of priests, who would also evangelize among the native population. Baptized aboriginals were to be afforded the same rights as French citizens. Over the next quarter century the Jesuits established missions among the Algonquin, Montagnais, Abenaki, and to a lesser degree, Mohawk. The order assumed a prominent role in New France, due primarily to the fact that it was the principle purveyor of education, health care, and social assistance. Over time, much of this work would be undertaken by French and Canadian religious orders of women, such as the Ursulines, who arrived at Quebec in 1639 and established a boarding school for French and native girls.

By 1700, France controlled most of North America, aside from some parts of Newfoundland and the thirteen colonies. New France, however, was not isolated from the English colonies; indeed, conflict between them began in 1613, when Samuel Argall sailed from Virginia and destroyed the French trading post on Mount Desert Island (in present-day Maine). In 1627, the Kirk brothers took Quebec, and maintained control of the colony until 1633; and in 1690, William Phips unsuccessfully attacked Quebec. French control began to wane with the conquest of Acadia by seven hundred New England soldiers in 1710. By the Treaty of Utrecht (ending the War of the Spanish Succession in 1713), France surrendered Hudson Bay, Newfoundland, and Acadia (Nova Scotia); while maintaining control of the Saint Lawrence colonies, Ile Saint-Jean (Prince Edward Island), and Ile Royale (Cape Breton). The Treaty established two separate legal

structures for the French Acadians and the Mi'kmaq population in the region, and guaranteed freedom of religion to the Acadians in return for oaths of allegiance, which they refused to take. The legal separation of ethnic groups was unstable, given that trade, intermarriage, and missionization had created an Acadian community that lacked such distinctions. The situation was epitomized by the request by the Acadians for a ruling on whether a 1744 order placing bounties on Mi'kmaq scalps applied to mixed-blood peoples. Frustrated with resistance from an allied Acadian and Mi'kmaq population, the English began forcibly deporting the Acadians in 1755.

The Seven Years' War (1756–1763) marked the end of French control in North America, but colonial animosities had reached a pitch before the end of the war. On September 13, 1759, the Canadians surrendered Quebec, following a confrontation with the New Englanders on the Plains of Abraham. A year later, Montreal followed suit. Until the end of the Seven Years' War, the two cities were occupied by the British. The treaty ending the war was signed in 1763; within a year, the colony was renamed the Province of Quebec and the Royal Proclamation of 1763 established the administration of the country. England had no clear policy toward the colony in the decade following the fall of Quebec. The Proclamation was vague, apparently presuming that English immigration would define the colony's political, economic, and religious temperament; but a consistent policy was not articulated during the 1760s due to the fact that England was politically unstable, with six administrations in the span of a decade. This haphazard mode of control was ended by the need to counter revolutionary rumblings in the thirteen colonies, and the result was the Quebec Act of 1774, the first constitution created by a parliamentary statute for a British colony. The Act inaugurated England's "second empire," a period during which parliament became chiefly responsible for imperial affairs. The Quebec Act guaranteed freedom of religion to French Catholics in return for an oath of allegiance that was modified to exclude potentially offensive references to religion. The *Coutume de Paris* remained the civil law of Quebec, while English law applied in criminal cases. There was no habeas corpus. The Act made no provision for an elected legislature, and left the Canadians comparatively free of taxation. Many in the thirteen colonies regarded the Act as an assault, objecting to the creation of nonrepresentative government, the "establishment" of Roman Catholicism in the colony, and the prerogative assumed by the British Parliament in its enactment. It is consequently cited as one of the causes of the American Revolution. More critically for Canada, it was the first British statute that conceded the presence of multiple ethnic groups in a colony.

At the time of the conquest of Quebec, French Catholics represented 95 percent of the province's non-aboriginal population. Although a few thousand European immigrants arrived after 1750, the influx of American loyalists instigated by the Revolutionary War dramatically altered the popula-

tion balance. Between 1750 and 1800, English immigrants attempted to establish the Church of England, an effort that failed in Quebec, but succeeded to varying degrees in Nova Scotia, Prince Edward Island, Newfoundland, and what would become Ontario. In 1758, for instance, the Nova Scotia legislature instituted the Church of England, allowed freedom to Protestant dissenters, and prohibited Catholic priests from ministering in the province. In 1769, Prince Edward Island limited the rights of Roman Catholics, and by the turn of the century established the Church of England.

Following the American Revolution, seven thousand loyalists claimed land in Quebec, where there were ninety thousand French Catholics. Loyalist demand for constitutional amendments resulted in the Constitutional Act of 1791, which divided Quebec into two provinces: Upper and Lower Canada. The Act implemented elected assemblies, set aside one-seventh of the land as clergy reserves for the support of the Anglican Church, and stipulated that only Anglican ministers could perform marriages. Ultimately, however, it effectively gave power in each of the Canadas to a leadership that could override legislation passed by their assemblies. Upper Canada's political elite, the Family Compact, was firmly allied with the Anglican Church, despite the fact that Anglicans constituted a minority of Protestants in the province (by 1800 there were, among others, Presbyterians, Methodists, Quakers, Congregationalists, Lutherans, and Mennonites); and the Compact's counterpart in Lower Canada, the Chateau Clique, was controlled by the English and their French supporters. Popular rebellions were crushed in both provinces in 1837 and 1838, and Lord Durham was dispatched from England to report on the causes of the unrest. His recommendations, which included the granting of responsible government, the union of the two provinces, and the systematic assimilation of the French, resulted in the Act of Union of 1841. The Union created an inevitable tension between French Catholics demanding protection for their national distinctiveness, and English Protestants who began to lobby for denominational equality in a definitively Protestant society (the secularization of clergy reserves in 1854, for instance, was an offshoot of these efforts). Evangelicalism within both groups became prominent after 1840, as each sought to influence the fabric of Canadian institutions and laws. Catholic energies were focused on French Canada, while Protestants concentrated on the nation as a whole.

By the British North America Act of 1867, Ontario, Quebec, New Brunswick, and Nova Scotia were united into a Confederation: the Dominion of Canada. Newfoundland, Prince Edward Island, and British Columbia were identified as "colonies or provinces" that could join the Confederation by means of a joint action of their legislatures and the federal parliament. A year later, the Imperial Parliament enacted the Rupert's Land Act, providing for the surrender of Hudson's Bay Company land to England (Charles II had granted the entire territory surrounding Hudson Bay to his cousin Prince Rupert and seventeen associates in 1670), and the subse-

quent transfer of the territory to the Canadian government. No provision was made for the territory's admittance into the Confederation; it was regarded as a colony of a colony, a foundation that would perpetually cause western resentment toward central Canada.

In one respect, the Dominion was the project of politicians and advocates for a transcontinental railroad; and in this sense, the nation had a secular foundation. Still, Confederation provided for substantial provincial autonomy in matters of religion, language, and education, provisions that acknowledged the failure of the attempt, by means of the Union of 1840, to submerge French Catholic nationalism within a dominant English political structure. The British North America Act addressed more fully the constitutional rights of religious minorities, than those of ethnic groups; yet, although the Act confirmed the rights of French Canadians, the Confederation itself did not mitigate their fear of cultural eclipse within a prevailing English national culture. As early as 1871, for instance, the New Brunswick legislature prohibited the teaching of religion and the use of the French language in state-supported schools. During the same period, rival Protestant factions were creating coalitions that expressed a desire for the newly formed nation to assume an Anglo-Protestant character. The move toward Protestant unification was widespread in Anglo-Saxon nations during the nineteenth century; but Canadian churches generally accomplished the move earlier than others. Nineteenth-century intradenominational unions established a model that was expanded following Confederation, and that ultimately resulted in the creation of the United Church of Canada in 1925 (bringing together Methodists, Congregationalists, and many Presbyterians).

The acquisition of the west aroused in many evangelical Protestant churches a millennial desire to extend "His" dominion from one ocean to another, by assimilating immigrants into a dominant Protestant national culture. Competition among denominations quickly became economically unfeasible, and the need for a united response to the task lent urgency to the movement for union. Interest in a national church was fueled also, in part, by the desire to influence legislation, and by Anglo concern over increasing Roman Catholic influence in politics, especially in Quebec. By 1902, a number of anti-Catholic associations were already in existence whose aim it was to curb the expansion of Catholic influence. Unionists believed that a single Protestant church would foster an Anglo-Protestant form of national unity, a sentiment that was expressed in the preamble to the United Church's 1908 Basis of Union, which described "a national church with a national mission."

Although no formal agreement was reached until 1925, local Protestant churches in Ontario, the Maritime Provinces, and the west began to initiate their own unions in 1908. The unions coincided with a general wave of social action in Canada within which churches were deeply implicated. Among Protestants generally, the Social Gospel had be-

come prominent by the late nineteenth century, a movement motivated by the belief that social reforms would establish God's kingdom, and that capitalism must be tempered by cooperation between business, workers, and consumers. The United Church of Canada institutionalized the vision of the Social Gospellers, and is acknowledged as having contributed significantly to the development of the Canadian welfare state.

While Protestants generally pressed for the development of an English-Protestant nation, the Catholic Church was engendering its own forms of social action. Catholic social action emerged in Nova Scotia in the 1930s in cooperative organizations like the Antigonish Movement that involved fishers and farmers. In the late 1920s, Action Catholique became prominent in Quebec, contributing to a general growth of social and political awareness in the province. Many of its young members eventually assumed prominent roles in academia and the media in Quebec during what was called the Quiet Revolution. Quebec underwent a dramatic transformation during the 1960s, whereby a social order that had functioned relatively uninterrupted since the Union of 1841 was overturned. The Quiet Revolution profoundly altered the province's social structure, where an Anglophone elite had for over a century controlled the economy, and the Catholic Church had assumed responsibility for protecting Francophone culture through education and social welfare. In 1960, the Quebec government began nationalizing major industries, providing for the rise of trade unions, and assuming control of health, social welfare, and education. As the Catholic Church lost control of these institutions, church attendance plummeted.

Declining church attendance ultimately affected not only the Catholic Church in Quebec. Prior to 1950, two-thirds of Canadians attended a church on a regular basis; by 1980, only one-third did so. Scholars have noted that evangelical Protestantism and Catholicism, which had been assertive forces for more than a century, had ceased to inspire Canadians. In addition to the Quiet Revolution, an obvious reason for this decline was the fact that Canada's ethnic composition no longer lent itself to the traditional cultural duality of English/French: by the early 1960s, over one third of the nation's population did not identify with either group. For Protestants in particular, any aspiration for a monolithic Protestant nation was simply anachronistic. Additionally, a transformation of higher education during the period may have contributed to the decline. Until the 1960s, most Canadian universities and colleges were owned and managed by churches, but increased costs forced the churches to turn to government for subsidization, and provincial legislatures refused to support church-controlled institutions. Some closed, while others secularized. The trend toward secularization has continued, with the result that churches no longer exercise direct influence over the public sphere. Many believe, consequently, that religion has become a private phenomenon for Canadians, involving such things as belief in

the supernatural, the questioning of life's meaning, and institutional memory that draws them back to the churches for selective events (Bibby, 2002). The public role of religion, as typified by the churches, has been all but eliminated.

BETWEEN THE DICHOTOMIES. The churches have indelibly marked the development of modern Canada. In this respect, religion has played a key role in the creation of the nation but, since the 1960s, has ceased to pervasively define the public sphere, nor to influence Canadians' collective sense of national identity. This aspect of religion in Canada has essentially revolved around a series of dichotomies: English/French, Catholic/Protestant, native/white, east/west (metropolis/hinterland). Within this framework of dichotomies, another modality of religion has expressed itself from the margins of the dominant culture and its various national visions. The impact of this religious mode upon the formation of modern Canada is not immediately discernable in traditional narratives of the nation's religious history, but it has been, in many instances, profound. Although examples of this form of religion are numerous (Grant, 1980), one of the most significant instances is the religiously inspired leadership of Louis Riel in the North-West Rebellion of 1885. Riel provides a vantage point from which to explore another relationship between religion and the formation of Canada, one that may well continue to have an effect on the nation during its so-called secular period.

This relationship is imbedded in an abiding historical pattern foreshadowed by events in Acadia at the turn of the seventeenth century. In 1610 a secular priest in Acadia, Jessé Fléché, baptized the Mi'kmaq chief Membertou and twenty members of his family. Given that Fléché could speak no Mi'kmaq (and Membertou appears to have been under the impression that he was entering into a trading alliance), the legitimacy of these baptisms was called into question by the Church and by Jesuits who arrived in Acadia a year later. To redress the problem, the Jesuit Enemond Massé availed himself of the hospitality of the Mi'kmaq, choosing to live within the community and learn their language, a move made possible by a half century of previous goodwill between aboriginals and French fishers in Acadia, and that would define the nature of Jesuit/native relations in North America. His residence among the Mi'kmaq was short-lived. In 1613, the New Englander, Samuel Argall captured Acadia. During the battle for control of the region, Gilbert Du Thet was shot fatally, making him the first Jesuit to die in New France. Du Thet was killed while manning a canon. The events of 1610 to 1613 to a great degree established a pattern within which much of Canada's subsequent history can be situated. The pattern involves at least three distinct aspects: (1) a French/aboriginal foundation based on trade and Catholicism; (2) a violent English overlay that results in a French/English dichotomy that takes precedence over the aboriginal foundation; and (3) the implication of religion in this dichotomy.

This Acadian configuration is an especially apt model in respect to Louis Riel and the North-West Rebellion of

1885. Riel was born at Red River (in what would become the province of Manitoba) in 1844. He was Métis—a member of a community created by the Canadian fur trade, the descendants predominantly of French Catholic men and aboriginal women. The Métis, and in particular, the Métis buffalo hunt, were integral components of the society of the nineteenth century north-West until the transfer of the territory from the Hudson's Bay Company to the Dominion. The transfer was badly managed, with the Canadian government initiating land surveys before the territory had been formally transferred to the Dominion. Residents of the area around Red River (a large number of whom were Métis) were led to believe that existing land titles would not be acknowledged, and under the leadership of Riel formed a provisional government to oppose the transfer without legitimate attention to their grievances. Central to the negotiations between Canada and Riel's provisional government was the assurance of representative government and recognition of land claims. The result was the Manitoba Act, which created the province of Manitoba in 1870. Among other assurances, the Act guaranteed that land grants would be made to all mixed-blood residents of the territory. In the immediate wake of the creation of the province, Riel, the Métis, and the region's aboriginal population found themselves very much enmeshed in the Acadian pattern outlined above. Riel had expected to be a central figure in the transition of the territory to a province, but instead, a warrant for his arrest was issued (pertaining to an execution that had occurred in the course of the Métis resistance), and the Ontario legislature subsequently placed a \$5000 bounty on him. He was a fugitive until 1875, when the federal government imposed a five year banishment. The Métis and aboriginals fared little better. The Métis land base did not materialize, and they were forced to migrate north and west as immigrants from central Canada inundated the province. Meanwhile, Canadian and American hunters were decimating the buffalo, which had been the foundation of both Métis and aboriginal life. The disappearance of the buffalo, in addition to epidemic disease, and insufficient assistance to native peoples who had signed treaties extinguishing land rights in return for reserves, led to starvation. Cree leaders petitioned the Canadian government and Prime Minister John A. Macdonald, but received no replies.

During his exile Riel began receiving visions, beginning at Washington Cathedral in Washington, D.C., in 1875, where the Holy Spirit anointed him "Prophet of the New World." His visions would ultimately map out a different kind of Canada. From his position between the dichotomy of ethnicity, Riel perceived a creative space within which a new orientation emerged with the potential for a different kind of unified national body. This nation was defined between the various Canadian dichotomies of ethnicity (English/French, native/white), religion (Catholic/Protestant), and metropolis/hinterland. In respect to ethnicity, he envisioned massive immigration of Italians, Poles, Belgians, Scandinavians, converted Jews, and Germans who together

with the aboriginal population, the French, the Métis, and the “great Anglo-Saxon race” would each inhabit equal shares of the nation’s territory, creating hybrid ethnicities. The Germans would, for instance, “make a new German-Indian world” (Morton, 1974, pp. 355, 366). Religion, too, was to undergo a radical transformation through which the dichotomy of Catholic/Protestant would be subsumed by a new universal Catholicism. “I wish to leave Rome aside,” he said,

Inasmuch as it is the cause of division between Catholics and Protestants. . . . If I have any influence in the new world it is to help in that way and even if it takes 200 years to become practical. . . .then my children’s children will shake hands with the Protestants of the new world in a friendly manner. I do not wish these evils that exist in Europe to be. . .repeated in America. (Morton, 1974, p. 319)

Finally, the dichotomy of metropolis/hinterland was recast with Canada as the center of a new world. It was obvious to Riel that the territories, the hinterland of central Canada, would be the fulcrum of this new order: “although the Province of Ontario is great it is not as great as the North-West” (Morton, 1974, p. 321). The north-West was also to be the seat of a new Roman Catholic church, with Saint Boniface (present-day Winnipeg) as the new Rome, the Métis as the new “sacerdotal people,” and A. A. Taché, archbishop of Saint Boniface, the new pontiff. The removal of the papacy from Rome was warranted by the simple fact that “Rome did not pay attention to us” (Morton, 1974, p. 322). Ultimately it was clear to Riel that with all these transformations, Canada was to “become one of the most prosperous centres of the world, thanks to God” (Flanagan, 1974, p. 26).

Driven by this vision of a new Canada in which existing dichotomies would be rendered meaningless, Riel led a second Métis rebellion against the Dominion in present-day Saskatchewan in 1885. It coincided with similar uprisings from the region’s aboriginal population, and both resistances were crushed by Dominion forces. Riel was tried and found guilty of high treason, and was hanged on November 16, 1885. Riel’s religiously inspired resistance to central Canada seemed to have little effect on the formation of the nation, beyond apparently intensifying an existing historical pattern of an English Protestant/French Catholic dichotomy and an increasingly marginalized aboriginal and Métis community. The hanging of Riel fueled the French press and leadership, who found common cause with Riel’s French ancestry, and accused the English of ethnic prejudice and religious fanaticism. Reaction among English Canadians quickly turned to an anti-Quebec sentiment, and amplified calls for national unity based on Anglo-Protestant patriotism. The execution has been linked to subsequent attacks on French Catholic education, resistance to the creation of French divisions in the world wars, and opposition to the institution of official bilingualism after 1960.

In 1885 aboriginal grievances were not the same as those of the Métis, and although at least two native actions may

have been prompted by news of successful Métis action, this resistance was in no way executed under the leadership of Riel. Nonetheless, contemporary authorities melded the resistances, going so far as to accuse Riel at his trial of “arousing the Indians” and letting “loose the flood-gates of rapine and bloodshed” (Morton, 1974, p. 371). In the year following the events of 1885, aboriginal peoples were increasingly marginalized from mainstream society. The Department of Indian Affairs began to assume greater control over their lives, a trend that continued for almost a century, and resulted in wide-ranging regulation from education to the writing of wills. An aboriginal pass system was introduced, effectively restricting native peoples to their reserves. This was justified by the contention that participation in the rebellion constituted a violation of treaty agreements. Later “pass laws” adopted by the South African apartheid regime were patterned on this Canadian model.

As for the Métis generally (who were not afforded status by the Canadian government until 1982), the community became virtually invisible to the dominant culture. Many changed their names, others immigrated to the United States, some moved onto native reserves, while others moved northward. It seems that Riel’s religiously-inspired rebellion did not immediately inform the creation of modern Canada, except insofar as it solidified a basic Canadian pattern that would inform the nation’s next century.

THE TWENTY-FIRST CENTURY. Turning to Canada a century after the hanging of Riel, a number of dramatic alterations in this pattern have occurred. First, as church historians have noted, the nation has become secularized, and increasingly Canadians no longer associate themselves with the churches that informed so much of the nation’s development. Additionally, the delicate antagonism between English and French entered into a new phase in the final decades of the century, through which their ongoing dichotomous relationship could well be dissolved. On October 16, 1970, the federal government declared the War Measures Act (a presumption of virtually unlimited power) in response to the kidnapping of British senior trade commissioner, James Cross, and Pierre Laporte, a Quebec cabinet minister. The kidnappings and subsequent murder of Laporte were attributed to the Front de Liberation du Québec. Although the events of October 1970 did not initiate further efforts to secure an independent Quebec through violence, the question of separation remained a serious political issue, culminating in the election in Quebec of the separatist Parti Québécois in 1976, and two narrowly rejected referendums on sovereignty in 1980 and 1995. Additionally, constitutional changes have created a context for the assertion of aboriginal and Métis land claims, which are only beginning to be felt. The Constitutional Act of 1982 (through which Canada gained its own constitution) vaguely recognized “existing” aboriginal and treaty rights, and recognized the Métis as aboriginal peoples. Land claims recognition has been slow but profound. In the mid-1990s, for instance, Donald Marshall was found guilty in the Nova Scotia Court of Appeal of fish-

ing eels illegally. A team of lawyers (four of whom were Mi'kmaq) took the case to the Supreme Court of Canada, and in 1999 the Court upheld Marshall's right to catch and sell fish in accordance with treaties ratified in 1760 and 1761. The same year that the constitution was patriated, the Constitutional Alliance of the Northwest Territories was formed to press for the division of the Northwest Territories into two distinct territories. The subject had been discussed for a number of decades, and on April 1, 1999, the central and eastern part of the territories (a region constituting nearly one-fifth of Canada's land mass) was established as the territory of Nunavut, marking the largest aboriginal land claim settlement in Canadian history. The creation of Nunavut effectively gave the population (85% Inuit) control over education, health and social services, and the management of natural resources. In September 2003, the Supreme Court overturned an earlier conviction of Métis Steve Powley for hunting illegally. In the landmark ruling, the court declared that Powley could exercise the right to hunt without a license on the basis of the definition of the Métis as "aboriginal" in the Constitution of 1982 (council for Powley included lawyer Jean Teillet, great-great-grandniece of Louis Riel).

As Canada entered the twenty-first century many aspects of the national pattern of English overlay on an aboriginal/French foundation were disintegrating, while longstanding dichotomies were reshaping the national landscape. What might now be said of Louis Riel, who was religiously inspired to conceive of the nation in a radically different way, but whose life seemed to have accomplished little beyond the reification of the established order? This man was situated in the space between the dichotomies of ethnicity, was called by God to break with Rome and refashion a new universal Catholicism, envisioned the geographical center of Canada as the defining center of the nation, and was tried and executed as a Canadian traitor. Yet, a statue of Riel now graces the grounds of the Manitoba Legislature, and an accompanying plaque reads: "In 1992, the Parliament of Canada and the Legislative Assembly of Manitoba formally recognized Riel's contribution to the development of the Canadian Confederation and his role, and that of the Métis, as founders of Manitoba." Riel is the hero of over twenty plays, an opera, radio and television dramas, novels, poetry, music, cartoons, and a comic book. He is the only Canadian public figure whose writings have been published in their entirety (Riel, 1985), a project undertaken jointly by the federal government and a number of universities to mark the one hundredth anniversary of Riel's execution; in recent years, he has emerged as a national hero, especially, among English-speaking writers. Riel has been called a mythic figure, a mad messiah, a prophet, a savior, a mystic, a visionary, a Canadian Joan of Arc, a saint, and a martyr. Such frankly religious language is not accidental. As scholars announced the triumph of secularization and the privatization of religion in Canada at the end of the twentieth century, Riel was simultaneously emerging as a religious figure implicated in the meaning of a changing nation. As such, he may well constitute a resource

for the continued role of religion in the formation of a twenty-first century Confederation.

JENNIFER I. M. REID (2005)

TRANSCULTURATION AND RELIGION: RELIGION IN THE FORMATION OF THE MODERN CARIBBEAN

Ciboney, Arawak-speaking Taíno, and Carib Amerindians crisscrossed the islands of the Caribbean archipelago for a

millennium prior to the arrival of Europeans. Columbus learned from the Lucaya, a subgroup of the Taíno, that the island in the Bahamas where he first alighted was named Guanahani. He nevertheless christened (and Christianized) it as San Salvador before taking six Lucaya back to Spain as *exotica* to present at court in 1492—the first transculturation between Europe and the Caribbean. In 1493 the second voyage carried sugar cane from Europe to Hispaniola (Isla Española), and the Taíno gave Europe tobacco in return—a further and consequential moment of transculturation. By 1501 Nicolás de Ovando, governor of Hispaniola, ordered the delivery of the first Africans (Spanish-speaking Ladinós already enslaved in Iberia) to the New World. The Africans replaced dying Amerindians in the gold mines in a third moment of transculturation, in which the powers guiding all future exchange became transparent.

Thus began the recurrent economic and social pattern that created the Caribbean, built from its florid exploitation and from the regular resistance to it. Already in 1511 the Taíno had rebelled against the new order on Puerto Rico, and Africans on Hispaniola revolted not long after in 1521.

Three centuries later, following the abolition of slavery in the British holdings of Jamaica and Trinidad in 1834, East Indians and Chinese were imported en masse as indentured workers to labor next to or as overseers of Africans. Here was yet another moment of transculturation, bringing new rites and new gods: Kālī, Hanumān, Lakṣmī, and Rāma. Indian deities were now ritualized in the same zones as African *orishas*, and the signs and symbols of European Masonic secret societies shared the same space as those of Afro-Cuban *cabildos*.

During the intervening centuries, a solid social template emerged from between the same grinding continental plates that had thrust up Caribbean volcanoes. Europeans ruled over slaves whose labor produced sugar, the source of wealth that built the palaces of Antwerp and Versailles and fomented the Industrial Revolution of England. Yet if the lands of the Caribbean took on a shared economic form in the first global economy, they also developed unique religious patterns in accord with the particular objects, ideas, migrants, and languages that arrived at each place. Even when those objects, ideas, and peoples were similar, they were adopted by different means and with varying effects as they were received and made to signify in relation to specific landscapes, needs, histories, and contexts of implementation.

This essay proceeds by first examining the term *transculturation* as itself a product of the Caribbean. It then considers four cases of religious transculturation: Cuba, Jamaica, Saint Vincent, and Brazil. For each case, a different issue of transculturation is interpreted: in Cuba, the material and temporal niches in which old religions were received, remade, or lost; in Jamaica (and Rastafarians), the problem of indigenizing English, the colonial idiom, to make it able to “speak” religiously; in Saint Vincent, the phenomenon of physical emigration and the shifts in Garífuna religion that occur

through the modern exodus to globalized cities such as New York; and in Brazil, the forging of a new religion in the contact zone out of the cross-fertilization of religious ideas from Africa and Europe. All four cases address the issue of reception and change—how ideas, objects, and people produced in one place take on new meaning when displaced, circulated, and rerooted in new soil in new ground.

The entry does not give an exhaustive account of the religion but rather illuminates key processes through select examples. As the inclusion of Brazil indicates, this essay is on the “big Caribbean,” defined not only by territorial contiguity but also by shared social history.

TRANSCULTURATION AS A CARIBBEAN PRODUCT. The term *transculturation* is itself an intellectual product of the Caribbean, appearing in Fernando Ortiz’s *Contrapunteo cubano del tabaco y el azúcar* (Cuban counterpoint: Tobacco and sugar), first published in 1940. Ortiz proposed that the new word was superior to *acculturation* (a term especially associated with Melville Herskovits) because it did not imply a unilinear process of adopting a new culture—the idea that the former slate is completely erased before the new one is written. Rather, it suggested the nuances of culture loss or *deracination*; as such, losses and the responses to them continue to inform the experience of the new situation. It also connoted the only partial and fragmentary assimilation of a new culture as well as the completely novel creations that were bound to arise in what Ortiz called “neo-culturation.”

More important than this semantic dexterity was the way Ortiz wrote about culture in the history of Cuba, as the process of human interaction with and thinking through the material resources at hand. Tobacco and sugar in Ortiz’s hands became nothing less than a total semiotic system of contrasts through which the world was humanly experienced. For example, whereas tobacco recalls magic and is immutably dark, sugar connotes the commodification of a product born brown, then standardized to become white. In Ortiz’s view, the material products of the island provided the lens through which issues of race and religion were perceived, contemplated, worked, and transformed.

If tobacco and sugar could be detached from their status as mere agricultural products to be recirculated as a symbolic system of meanings applied to every domain of experience, no less are the deracinated people of the Caribbean transcultured through their interactions with each other and with the products through which they know and make themselves.

CUBA: MATERIAL NICHES OF REMEMBRANCE IN THE CONTACT ZONE. Most prominent among distinctively Cuban religions is Santería. The name of Santería, implying the devotion to saints by *santeros*, was an innovation of the 1930s initiated by the Afro-Cuban scholar Romulo Lachatañeré. The new moniker was intended to counter state witch hunts levied against what was popularly called witchcraft (*brujería*) by granting the religion a more legitimate, Catholic resonance. Hence the very naming of the religion, which has real

effects on religious practice, stands as testimony to the interaction between religion and political power.

Whether called Santería or La Regla de Ocha (The Rule of the *Orisha*), the religion derived from the quest of African slaves to reconstruct a shared religion out of disparate African traditions, which had been lumped together in the new territory. The great majority of African slaves disembarked in Cuba were set to work on giant sugar plantations, especially after the Haitian revolutions that began in 1791 and left Cuba the dominant world supplier of sugar. In the cities, however, especially Havana and Matanzas, a thriving free black society grew up in the niches of the slave economy. Out of these came black Catholic *cabildos* and *cofradías*, the councils and brotherhoods that, under the mantle of their devotion of Catholic saints, offered sites of mutual aid. By 1800 there were *cabildos* of fourteen different African “nations,” each with its own king and queen, flag, and house. These were veritable rebuilt African monarchies, albeit with few temporal powers, in which the devotion to African gods could be remembered and recreated. Preeminent among the nations were the Yoruba, who were brought in great numbers after 1790 and carried with them a mythically rich, colorful, compelling pantheon of gods called *orisha* (Yoruba *ori-se*, literally “head-source”). Also prominent were the Kongo peoples, who comprised by far the largest group of slaves brought during the trade’s first three centuries. These created another distinct Afro-Cuban religious lineage, Palo Monte. Palo invoked spirits of central West Africa, called *minkisi*, and contracted them to the living ritualizer through “binding” and “enclosing” their symbols in cauldrons, bottles, or bundles.

In every case, the religion had to be reconstructed out of the available materials and within the limited available spatial and temporal niches presented by colonial Cuba. West African religious were based above all in ritual practices choreographed out of a vast and complex set of iconic, culinary, musical, sartorial, and spatial cues. The gods were present only insofar as they could be rendered present through ritual work correctly executed to produce spirit possession. This meant that the gods that did not fit the niches presented were eventually lost, forgotten, or rendered superfluous. For example, the African gods related to agriculture remained important in Haiti because the religion of vodou emerged in a peasant farming society of small landholders after the revolution. Yet the analogous deities became largely inconsequential in Cuba and Brazil, because Santería and Candomblé took shape in and around cities where agriculture was not a pressing concern of everyday experience.

A progressive condensation and canonization of a relatively fixed set of *orishas* took shape. The Afro-Cuban Catholic *cofradías* celebrated these *orishas* in the temporal and material niches available under slave law. For example, Changó, the *orisha* of kingship, lightning, and male seductive power was (and is) celebrated on December 4, the day of the Catholic calendar devoted to Santa Barbara. Her red and white

banners and chromolithographs depicting a lightning strike (in Catholic hagiography Barbara’s father was struck by lightning) provided a semiotic set into which Changó, a deity of lightning whose colors are red and white, could visually be integrated. Therefore devotees of Changó were able to ceremonialize and cognitively retain his memory. Many of the gods found no such fit, no material or calendrical niches of remembrance, and these gods died with those who last carried and incorporated them.

Condensation was one process, and aesthetic innovation was another. The aesthetics of African royal power had to be transferred to the idiom of European finery adopted from the Spanish colonial court. Santería initiates undergoing the day of enthronement and public display were (and are) dressed in long gowns of fine silk brocades and lace that emulated Spanish royalty but also served as memory bridges to recall African royalism. Likewise, the containers (*sopera*) of sacred stones that served as indexes of the sacred union between initiated persons and the *orisha*, were in many cases of fine porcelain, another European import applied to ritually sustaining the memory of Africa.

The importance of such transcultured ritual objects is revealed by the periodic persecutions that were suffered by practitioners of Santería, in which invasions of cult houses focused on the confiscation of objects such as drums, clothing, scepters, and the vases and porcelain bowls that held the iconic seats of the saints. Similarly transcultured material niches were also created in the Kongo legacy of Palo Monte. The *palos* (sticks) assembled in a cauldron signify a contract of power between a practitioner and an ancestral spirit, but they also contain a specific Cuban history within them. They recall the palisades (defenses built of sharpened sticks) run-away slave communities erected for their protection from slave hunters. Those palisades have now been transcultured to serve the purpose of protecting their users in contemporary urban centers.

JAMAICA: TRANSCULTURING SPEECH IN THE CONTACT ZONE. Named from the Arawak word *Xayaca* (Land of Wood and Water), Jamaica has loaned its soil to manifold ethnic groups. Arawak and then Carib Amerindian societies were followed by Spaniards, Africans, the British, and then Asians. Africans were brought and set to labor by 1513, and during the late 1600s Jamaica’s sugar production was the most advanced in the Caribbean. Following emancipation in 1834, Great Britain tapped another of its colonies for thirty thousand East Indians who were imported as laborers. Hence diverse religious expressions converged and combined: Myal and Obeah (the latter derived from the West African Ashanti word *obeye*, meaning sorcerer); central African-derived Pukumina; the indigenized Christianity of Zion Revivalism; and during the twentieth century, Rastafarianism.

In its simplest form, Rastafarianism viewed the crowning of the new Ethiopian emperor, Haile Selassie (1892–1975), as the arrival of a new messiah, a Black Christ who would lead black Jamaicans back to Africa. Indeed, this

projected return was to be the salvation of the people. Rastafarianism presented a fusion of diverse factors: revival millenarianism; Marcus Garvey's (1887–1940) back-to-Africa movement; Jamaican urbanization, industrialization, and the creation of an urban underclass; an Ethiopianism inspired by Garvey applied to a selective reading of the Hebrew Bible; the timely ascent of Haile Selassie—or Ras (Prince) Tafari—as emperor of Ethiopia in 1930; and the inversion of key markers like dreadlocks and ganja (marijuana) use from outcast symbols to expressions of defiant power.

Any of these elements moreover can be further divided into more complex transculturations. Garvey's message was a product not only of his Jamaican birth but also of his trajectory passing through Central America, Europe, Africa, and most important, the Pan-African centers of Harlem and Paris. The adoption of dreadlocks in the late 1940s may have imitated one or all of several influences: Kenya's anticolonial Mau Mau revolt against the British in the 1950s, the emulation of the styles of East Indian ascetics, or the Youth Black Faith movement of the 1940s that was indigenous to Jamaica. Similarly, ganja arrived with East Indian laborers before being adopted by revival millenarianism and later Rastafarianism as a key component of its "reasoning" rituals, in which it was used to inspire impassioned exchanges of religiopolitical speech.

It is such idiosyncratic speech that is the key transcultured marker of Rastafarianism. Because standard English is regarded as a colonial and compromised tongue and yet is the sole language of most Jamaicans, Rastafarian practitioners developed a means of at once distancing themselves from that language even as they worked through it by communicating in the dialect of "dread-talk." This occurs through multiple linguistic innovations. In the first, terms of standard English are varied or endowed with new meanings (e.g., *reason*, for ritually inspired discourses; *chalice*, for the pipe used to inhale the smoke of the herb; and *bald-tail*, for shorn, unenlightened non-Rastas). A second innovation is playing with standard words, which are altered in relation to phonological implications, such as *politricks* (politics), *live-icate* (as opposed to dedicate), or *jollification* (enjoyment). The most important revision of standard English occurs in the creation of *I*-words: *Ital* (natural), *Irie* (truth), *I-ration* (creation), *I-thiopia* (Ethiopia), plus the reference to oneself and others as "I and I." Explanations for the invocation of "I and I" in dread-talk include: (1) the refusal to make a subject of another person, hence the use of only first person address; (2) the verbal expression of the idea that one is never utterly separate from God (Jah) or from other persons, hence always "I and I"; and (3) the rejection of the term *me*, which connotes slave speech and subservience compared with *I*, a term of agency and choice.

Whereas English was the language given to members of the urban underclass in Kingston, the Rastafarian community transcultured it to signify distinction from rather than inclusion in the British linguistic legacy. Yet the fact that

Rastafarianism is practiced in a variant of English is precisely that which aided and abetted its global dissemination as a Pan-African symbol. This was accomplished above all through reggae, disseminated during the 1970s by Bob Marley, Peter Tosh, Jimmy Cliff, and others as well as through the aesthetic codes rendered fashionable through the popularity of that music. At the beginning of the twenty-first century African identity is commonly expressed in Bahia, Brazil, Bronx, New York, and Port of Spain, Trinidad, through the colors, flags, clothes, music, and hairstyles of Rastafarianism. In this sense, the English language as a transcultured linguistic object cuts in two ways: dissented from, it also allows for that dissent to travel and be heard.

THE GARIFUNA: TRANSMIGRATION AND THE MULTIPLYING OF CONTACT ZONES. The Garifuna stand as the finest exemplars of the simplest cause of transculturation: human migration. An ethnic group born on the island of Saint Vincent in the seventeenth and eighteenth centuries through the exchange between African and Carib groups, they were initially known as the Black Carib. They were deported en masse by the British in 1797 to the coast of Central America. In addition to their own Arawak-derived language, many also spoke French and English, a repertoire to which they rapidly added Spanish. Garifuna religion reflected these transmigrations, including elements of African, Amerindian, and Roman Catholic Christian belief and practice. During the nineteenth century, the Garifuna emigrated up and down the Central American coast of the Caribbean by canoe as dedicated traders and travelers and in the process settled in some forty villages from Nicaragua to Belize.

That relative territorial stability changed dramatically in the twentieth century, during which time a third of Garifuna emigrated abroad, especially to the United States. The phenomenon of frequent migration and returns, related to contemporary labor patterns, had two dramatic effects on the religious life of the Garifuna and by extension of the Caribbean region in general. One effect is the burgeoning Protestant neo-Pentecostal affiliations. Employing high-tech sound systems, formal dress codes, and dramatic preaching styles, these neo-Pentecostal groups emulate—and are often funded by—U.S. denominational patrons. The second effect is the revivalist acceleration of discourses and practices of traditional ritual events, whose meanings are transformed in the process of being revived. For the Garifuna, traditional ancestor rituals that were once simply considered indigenous to themselves are increasingly understood as African in origin. As Garifuna migrants to U.S. cities have been exposed to the religions of their neighbors, such as Cuban Santería, Haitian vodou, Trinidadian *orisha*, and Puerto Rican Santerismo, they begun to view their religion in relation to that set and to perceive themselves as members of the religious African diaspora.

The two new directions of Garifuna religious change—toward Pentecostal modernity and reformed tradition—are not socially bifurcated but rather work in tandem, because

they signify over and against and in rivalry with each other. Both proffer membership in global networks rather than local, village-based ones, and both are reliant on modern technologies of semiotic reproduction (e.g., videos, compact discs, books, and magazines) as they compete for adherents in the marketplace of identities and for recognition from state and international authorities. The Garífuna, like practitioners of other religions in the Caribbean region, are in the process of mastering and transculturing new objects of modernity to make them their own: communication systems, recording devices, legal documents, and other devices of “making history” in rationalized forms that can be used for pedagogy and legal defense. For the Garífuna, as elsewhere in the Caribbean, there exists a growing sense that local religion must be given global range—witnessed to, recorded, publicized, discursively defended, and disseminated—to acquire exchange value in the marketplace of religions. Otherwise, they risk losing their place.

Through migrations of the last generation, some Caribbean religions of the region like Santería have already become sophisticated transnational religions with a solid footing in legal and academic settings. Others, like practitioners of the ancestor religion of the Garífuna, remain ambivalent in relation to such processes of deliberate transculturation and what hidden risks they may hold.

BRAZIL: MAKING NEW RELIGIONS IN THE CONTACT ZONE.

Like Cuban Santería, the Afro-Brazilian religion of Candomblé traces its origins to one of the city-states of the Yoruba, Dahomean, or Kongolese peoples of West and West Central Africa. It was forcibly brought to Brazil during the Portuguese slave trade over four centuries. As in Santería, Candomblé reconstructs a link to Africa through the reverence of deities (*orixás*) to generate power, or *axé*, for human use in its most worldly forms—luck, fertility, wealth, prestige, and health.

Axé can imply transformative capacity, charisma, fecundity, success, or physical force like electricity. As a quality of a house or a drum, however, it connotes tradition, lineage, and legitimate foundations. Producing *axé* entails a series of material practices that contain, enclose, and bind the elusive *axé* into loci (e.g., altars, vases, heads) from which its force can be received and redistributed. The techniques and tools of condensing and containing *axé* are known as the foundational secrets (*fundamentos*) of the religion. One gains access to this secret knowledge or, more properly, to the places and practice of secrecy by performing progressive initiations into increasingly important functions in the house (*terreiro*). The import of religious secrecy was augmented, however, by the new terrain from which Candomblé grew during the 1800s. Secrecy was transcultured and began to signify doubly: first in relation to West African ideals of contained, “cool” power and second as resistance to the police forces of the national context in which the rituals were practiced. Yoruba ideals of religious secrecy were overlapped with the Afro-Brazilian notion of *fundamentos*, deep knowledge based in practices hidden from the gaze of potential noninitiate encroachers.

In the contact zone, religious identities take on force through boundary work, that is, the marking and parsing of differences and similarities between a given religion and its neighbors. So Candomblé also began to be defined by its relation to, resistance against, and adaptation from other popular Brazilian religious expressions, such as French-descended spiritism.

Spiritism arrived in Brazil in the late nineteenth century via the teachings of Allan Kardec, also known as Hippolyte Léon Denizard Rivail. Its popularity derived from its healing techniques, enacted through mediums in ways as emotionally compelling as they seemed scientific. For spiritists, mediums became effective healers when possessed by more ancient, enlightened souls. In the twenty-first century the mediums dress in white or blue medical clothing to offer *passes* (passes) over the bodies of their subjects, moving their hands over the skin to attract negative vibrations to their own hands and cast them into the air. The healing spirits come from members of civilizations considered to be evolved—doctors or healers from Europe, ancient Egypt, or the Aztec Empire. Sickness is regarded as obsession, and the ritual intervention is a disobsession wherein one medium incorporates the obsessing spirit, while other mediums use their evolved entities to advocate for their client’s release. Meetings reflect a high degree of rational bureaucratic organization.

The Afro-Brazilian religion of Candomblé and French-derived Spiritism transcultured each other. Spiritist groups were inspired by the African deities of Candomblé, and Candomblé groups were rationalized in similar ways to spiritism. Adopting elements of both, Umbanda is the result of the convergence of these two groups into a new, national religion. Umbanda was born in the industrializing south of Brazil in the 1920s. It shared aspects with Candomblé (such as possession, specific drumming patterns that call the spirits and *orixás* as heads of spirit divisions) and with spiritism (such as the manifestation of spirits of the dead for the purpose of consultation and healing and a rigid hierarchy of more and less evolved spirits).

Umbanda spirits are organized hierarchically in a complex system of seven lineages, called phalanxes, each headed by an *orixá* or saint. One kind of spirit of light is the *caboclo*, the spirit of the indigenous Brazilian Indian. Another is the *preto-velho*, the spirit of the old African slave, who manifests humility, kindness, comfort, and sympathy. The *erês* or *crianças* are spirits of children who are playful and innocent. Finally, the *exús*, derived from the Yoruba trickster-messenger Eshu, are considered evil and must be rigorously controlled.

Although these are the most characteristic, traditional spirit roles in Umbanda, there is enormous flexibility for new spiritual entities to emerge, such as manifestations of homeless street children or the folkloric, hard-drinking bandits (*cangaçeiros*) of the arid northeast. Embedded in the spirits of Umbanda and the material processes through which they are incorporated is the ongoing transculturation of Brazilian

history as it continually reworks the national mythology of the “three races”—Amerindian, African, white European—for a new time.

PAUL CHRISTOPHER JOHNSON (2005)

TRANSCULTURATION AND RELIGION: RELIGION IN THE FORMATION OF MODERN JAPAN

Japan began forming a modern culture when it came into contact with the West. Then the Portuguese brought matchlocks to Japan, and Francis Xavier brought Christianity. In the nineteenth century, Japan underwent crucial development as a result of exchanges with the West, and this development has continued to the present with ongoing cultural contacts.

This was not the first time that Japan borrowed from other cultures. Yet Japanese borrowing in the modern period was much different from Japanese contacts with Chinese and Korean civilizations between the fifth and thirteenth centuries. In the case of these earlier contacts, because seafaring voyages were full of danger, the oceans surrounding the Japanese archipelago provided a buffer zone. Moreover, the cultures and civilizations of China and Korea, imbued with Confucian, Taoist, and Buddhist philosophies, were not as aggressive as modern Western powers, armed with steam ships, modern military forces, modern capitalism, and imperialist tendencies. As a result, Japanese assimilation of Chinese and Korean civilization was more gradual, gentler, and more deeply penetrating.

GUNS AND CHRISTIANITY. As mentioned, Japan's contact with the West began around the time when Portuguese merchants drifted ashore a southern island of the Japanese archipelago in 1543. The matchlocks they brought with them were mastered quickly, reproduced in large quantities by native craftsmen, and spread quickly and widely throughout the country. These guns not only changed military tactics but also transformed the structure of castles and other fortifications. Eventually, Oda Nobunaga (1534–1582), Toyotomi Hideyoshi (1538–1598), and Tokugawa Ieyasu (1542–1616), successive unifiers of the country, used such guns quite successfully in battles to unify the country.

The Catholic Church began missionary activities in Japan when Francis Xavier and other Jesuit priests arrived in 1549 on Kagoshima to evangelize in western Japan. In the beginning, Christianity was well received by warlords and later the Tokugawa shogunate. Portuguese merchants began international trade with Japan, followed by the Spanish in 1580, the Dutch in 1609, and the British in 1613. Japanese mercantile ships, which had trading abroad since the middle of fourteenth century, continued trade with China, Korea, Formosa, the Philippines, Java, Vietnam, Malaysia, and Thailand. Japanese leaders were interested in new information about Europe and the outside world, and in new scientific and technical knowledge, including knowledge about imported European firearms. Since Catholic missionary activities and the merchant trade were intimately connected, many warlords interested in the profits of trade readily converted to Christianity.

In 1587 Hideyoshi banished the missionaries and prohibited the Christian faith among the warlords. But only a few missionaries left Japan, and those who remained successfully propagated Christianity among the masses, gaining as many as 700,000 devotees by the early seventeenth century, more than two times the population of the capital city of Kyoto at that time. Later the Tokugawa shogunate, perceiving the colonialist interests of foreign powers and fearing uprisings among the masses, started to ban the Christian faith by issuing successive ordinances in 1614, 1616, and 1623. During this time the government destroyed churches, deported missionaries, and tortured and executed defiant Christians. All the Christian warlords but a few famous converts renounced their faith.

Some Christians went underground and maintained their faith for generations until the reopening of the country in the nineteenth century. Underground Christianity, separated from the Catholic orders, became indigenized and syncretized with folk Buddhism for outward appearances. The virgin Mary was amalgamated with Kannon (Avalokiteśvara), Buddhist goddess of mercy, and called "Maria Kannon."

After the Shimabara uprising of Christians, in which forty thousand people fought on the Christian side, the Tokugawa government, in 1639, took the extreme measure of closing Japan to all foreign trade. The only exception was

trade with the Dutch, who did not engage in any missionary activity, at the port of Nagasaki, from then on the only port officially open for international trade and exchanges. The Tokugawa feudal regime thus started the policy of seclusion, which was to last for 260 years.

PROSPERITY AMIDST SECLUSION. Several external factors made possible the long, peaceful seclusion of Japan. Vast oceans lay between Europe and Japan. At the time the center of political and economic power in Europe was shifting from Spain and Portugal to England and Holland, and this affected the ability of these countries to develop colonial empires. Also, the industrial revolution had not yet taken hold in Europe. Later, in the eighteenth and nineteenth centuries, when steam ships and the accelerating industrial revolution enabled Western countries to project power all over the world, Japan was revisited, this time by the fleets of various Western nations to force open its doors. The vast oceans were no longer a barrier to Western civilization. The oceanic space was becoming domesticated more and more by the power of capitalism, colonialism and imperialism as well as the science and technology of the West.

Domestically, the Tokugawa regime carried out an apt set of policies to order society and stabilize the country. It established a rigid social hierarchy consisting of four main social classes—warriors, farmers, artisans, and merchants—and prohibited upward mobility. In another important policy it confiscated weapons, allowing only hunters to use firearms and only warriors to use swords. And it rigidly regulated Buddhist temples and Shintō shrines. On Buddhist temples it imposed the temple parish system (*jidan seido*). This policy required individuals to be certified by their local Buddhist temples not to be a member of the "evil religion" Christianity.

Neo-Confucian philosophy provided the Tokugawa regime with a powerful political ideology, with distinctions of rank and status, for ruling feudal society. As a result, Confucian studies prospered under the patronage of the shogunate and many daimyo. The regime used neo-Confucian philosophy to regulate all Buddhist temples and Shintō shrines and suppress underground Christians. The Bureau of Buddhist Temples and Shintō Shrines organized Buddhist temples, in sectarian divisions, into a hierarchy of a central temple on top and more local temples further down. Temples thus functioned as a bureaucracy to control the spiritual life of the people. The government also banned new doctrines and interpretations in Buddhist and Shintō communities. Though the Tokugawa government recognized Buddhist sects as official religions, Buddhist priests thus lost their religious freedom and spontaneity. Young novices trained as priests at head temples, upon completing their training, went back to local temples to teach children Confucian ethics and the *Analect*s. The official schools of the clans (*bankō*) and the many private temple schools (*terakoya*) greatly contributed to the prevalence of literacy among the populace in Tokugawa period (1603–1867). With its power to proscribe sects, the regime controlled the scope of activities of the temples.

The Tokugawa government, by establishing the peace and making life secure, encouraged the growth of industry and commerce, as well as the development of a transportation system centered around the waterways of sea, rivers, and canals. Within the feudal social-class system there developed a mercantile economy with currency and credit, and this encouraged the production of various agricultural and industrial commodities within the country. People were already consuming such commercial products as cotton, sugar, silk, and tea, all of which had a foreign origin. These commodities became important trade goods when Japan resumed trading with Western nations: Japanese imported cotton products and sugar and exported silk and tea.

JAPANESE THOUGHT. The neo-Confucian school not only synthesized the concept of *li* (reason, principle) with the Great Ultimate, material forces (*qi*), human nature, and the mind; in Japan it also later equated *li* with the Way of the Gods (the literal meaning of “Shintō”). Joseph Kitagawa points out that since warrior-administrators translated philosophical ideas into practical measures for governing the country, the Tokugawa regime tended to be free from Chinese models. Since neo-Confucianism provided the ideological foundation of the regime, this school produced many famous scholars.

Equally important was the Wang Yangming school, which interpreted *li* as identical with the mind and viewed each individual mind as the manifestation of the Universal Mind. Though the regime did not support the Wang Yangming school, the idea of moral cultivation based on the Universal Mind appealed to many Japanese and gave rise to many important social reformers. Mind Learning (Shingaku), a popular version of Confucianism with Shintō and Buddhist elements, taught commoners the importance of disciplining the mind with simple, easy-to-understand language.

Besides these three schools of Confucianism, a variety of other schools of learning thrived during the Tokugawa period. Ancient Learning (Kogaku) advocated directly studying the texts of Confucius and Mencius. This gesture of returning to origins by reading the classical texts was a radical criticism of the neo-Confucian and Wang Yangming schools as later departures from the original Way.

National Learning (Kokugaku) was born as the antithesis of Chinese Learning, specifically the school of Ancient Learning, which advocated returning to classical Chinese texts. The school of National Learning created a tradition of textual criticism for the interpretation of Japanese classical texts that did away with all Chinese influences on the interpretation of Japanese texts. The most outstanding scholar of National Learning was Motoori Norinaga (1730–1801), who studied the *Kojiki* (Records of ancient matters), which is written in *manyōgana* (Chinese characters used phonetically). As is often pointed out, he tried to return to the world of meaning revealed by the ancient text itself, to grasp the meaning of the text by directly participating in it without any

intervening Chinese influences and by living it as the Way of the Gods. Motoori deciphered and interpreted the *Kojiki* as sacred. Motoori’s scholarship came to be accepted by Shintō theologians as the foundation of Shintō theology and, together with the scholarship of Hirata Atsutane, one of Motoori’s posthumous disciples, laid the foundation for later nationalist Shintō movements during the Meiji period (1868–1912).

Dutch Learning (Rangaku) was primarily the learning of Dutch medicine. Dutch Learning produced such positivistic spirits as Yamawaki Tōyō, who studied the internal organs of the dissected body, and Maeno Ryōtaku and Sugita Genpaku, who not only examined the anatomized body but also translated a Dutch book on anatomy as *Kaitai shinsho* (New anatomy).

A positivist attitude can also be observed in the social reformer Andō Shōeki (d. 1762), who criticized traditional Confucian and Buddhist thinking as artificial and asserted the importance of learning directly from nature. For Andō, everyone must return to the Way of Nature (or the Life of Nature) by partaking in production, that is, agriculture. Nature is not an object of observation or contemplation, but what life partakes in. “By human participation, the True Way of Life reveals itself as the Truly Wondrous Way of Life.” “Farmers cultivate land, weave cloths, eat simple food, wear simple cloths, selflessly and self-containedly. They are the direct children of Nature” (*Shizen Shin-ei-do*, vol. 4, pp. 57–69). Andō repudiated the feudalistic social hierarchy of Tokugawa society as artificial and to be avoided.

These schools of learning sought to return to the old, that is, to go back to origins in classical texts or back to original paradigms, and realize them here and now, or they sought to prove texts in a positivist spirit. These traditions later became the basis for responses to Western civilization, whether the response be to introduce a new approach, to appropriate critically, or to oppose.

The Tokugawa period also witnessed the development of popular arts, such as painting, woodblock prints, poetry, Kabuki theater, and puppet theater (Ningyō Jōruri). Each of these genres responded to the imaginary needs of the people in highly creative ways. These arts were sustained by wealthy merchants living in urban centers and later spread to local villages.

THE RISE OF RELIGIOUS MOVEMENTS. The Tokugawa regime rigidly controlled and manipulated the Buddhist sects and Shintō shrines as official religions. Institutional forms of religion, when they emerged, were suppressed and went underground during the Tokugawa period. Having lost freedom and mobility within the feudal parish system, Buddhism and Shintō, as institutions, lost their religiosity and degenerated into funeral services and administrators of ancestor veneration, respectively.

But various important folk religious movements emerged spontaneously from the lower strata of society. One

such movement was large scale pilgrimages, which often undercut feudal space boundaries. There were mass pilgrimages to the Grand Shrine of Ise, repeated every sixty years, which developed into the Anything-Goes Dance (Eejanaika Odori), in which the masses, dancing and singing, went toward Ise. Other pilgrimages were the Pilgrimage to the Eighty-Eight Sacred Places of Shikoku (Shikoku Henro) and the Pilgrimage to the Thirty-Three Sacred Places of Kannon in Western Japan (Saigoku Junrei). All of these pilgrimages expressed a yearning for a worldly paradise apart from the realities of the contemporary world.

Three religions—Kurozumikyō, Tenrikyō, and Konkōkyō—emerged from the villages toward the end of the Tokugawa period. These popular religions became the prototypes of new religions in modern Japan. Each of these religions was based upon the religious experience of its founder and sustained people with simple but universal teachings.

RESPONSES TO FOREIGN CIVILIZATIONS. In Japanese contacts with the Chinese and Korean civilizations in the fifth to ninth centuries, Kitagawa finds a threefold response: a welcome introduction, integration and assimilation, and rejection or transformation. This threefold process greatly enriched indigenous culture and tradition through the assimilation and integration of Buddhism, Confucianism, and Daoism. These contacts even stimulated the native religious tradition to develop Shintō and gave birth to many new religions, including indigenous forms of Buddhism. By this contact, Japanese culture and society was greatly enriched.

Prior to direct contact with modern Western powers, various aspects of Tokugawa feudal society were becoming modern. But the need to modernize took on a whole new meaning and urgency after Japanese contact with the West. When Portuguese traders and Jesuit Catholicism arrived in Japan, in the initial phases they were welcome. Later on in the historical process, however, Western culture could not be assimilated or integrated well because the Catholic Church demanded wholehearted allegiance and the Western powers had aggressive colonial interests. Thus, in a natural response, the Tokugawa regime rejected Western culture and Christianity except for Dutch trade, although many fragmental influences from Western culture remained.

The second cycle of contact with Western civilizations began in the late eighteenth century. Since 1792 Russians repeatedly sent diplomatic missions and battleships to Japan asking for the opening of trade. In 1808 England sent a battleship to Nagasaki to take over the Dutch trading base there. And when a team of administrators representing various clans visited Shanghai at the time of the Opium War (1840–1842) to investigate, they observed China succumbing to British military power and discovered that most of the East Asian coastal regions except Manchuria, Korea, and Japan had been colonized. Fearing Western colonialism, they felt the need to build up power to protect Japan. Many Dutch schools of medicine and schools of the feudal clans were soon transformed into naval strategy research institutes and naval

academies. Then, in 1853, the four “black ships” led by Commodore Matthew Perry, with their powerful cannons, appeared off the shore of Japan and asked for the opening of Japanese ports.

The regime was forced to make treaties with the United States, Holland, England, France, and Russia on unequal terms, granting extraterritorial rights and giving up the right to levy tariffs. To avoid colonization and attain equilibrium with the Western powers, leaders felt the need to plan for enriching the nation and building up defenses. The whole country was divided into two factions: one for the shogunate and the other for the emperor, one for opening the country to foreigners and the other for excluding foreigners. The peaceful country, suddenly surrounded by the powerful military powers of the West, was thrown into an unprecedented crisis. Thus began a new cycle of contact with the West. It was the beginning of the perpetual fast changes in life and society that have continued into the twenty-first century.

Out of the crisis, people searched for a new unity and new order for the nation and ultimately chose to reinvent the country by reverting to the ancient ideal of an emperor-centered religious, political, and national polity. The design of the Meiji imperial regime was to construct a modern nation-state by negating the recent past (the feudal Tokugawa tradition) and restoring the monarchical rule of the eighth century, centered on the traditional Japanese notion of a sacred emperor at the top of all hierarchies. This was another phase of traditional Japanese “immanent theocracy,” to use Kitagawa’s term. Meiji leaders followed the ancient model of unity of religion and state (*saisei itchi*). In this new regime, the former social hierarchy of warrior, farmer, artisan, and merchant was eliminated, and all the people were now treated equally as the subjects of the semidivine emperor.

WESTERNIZATION. The modernization of Japan was not imposed on the Japanese people from the outside by colonialism. Rather, it was what the Japanese were determined to accomplish to overcome the disequilibrium of Western and Japanese power. A basic strategy of the regime was to use the Japanese spirit and Western knowledge (*wakon-yōsai*). Learning the knowledge of the West was the secret to equalization and rectification of the power imbalance.

Recognizing that the Western powers would not revise the unequal treaties, Japanese leaders adopted various elements of European jurisprudence in the French, German, and English codes. This produced contradictions, since French codes were progressive and the German codes were conservative. Etō Shinpei (1834–1874), one of the chief designers of the modern state in the early stage of its formation, highly appreciated the French civil code, especially on the rights of the people, and incorporated aspects of the French code into the Meiji civil code. The Meiji code also had to embrace incoherences due to differences of culture and society.

Japan started modernizing not only in jurisprudence but also in many other areas of culture and society. Japan adopt-

ed many Western institutions, such as government offices, a solar calendar, police, an army, a navy, railways, gaslight, a postal system, electricity, compulsory education, banks, a parliament, and a constitution.

These measures for Westernizing Japan were accompanied by a policy of enlightenment and civilization (*bunmei kaika*), which promoted Western culture and civilization in all aspects of life and society, from modern Western sciences and rationalism to people's hairstyles and Western-style clothes. Japanese intellectuals translated many works of Western philosophers and scientists, starting with Darwin, Mill, Huxley, and Spencer and following with Voltaire, Rousseau, Descartes, Kant, Shopenhauer, Hegel, Spinoza, Locke, Hume, Nietzsche, W. James, Dewey, Bergson, Sartre, and Heidegger. They also translated many novelists and poets, such as Shakespeare, Goethe, Maupassant, Tolstoy, Ibsen, Dostoevskii, Hemmingway, Kafka, Zola, Heine, and Baudelaire. Many of these works were accepted as new paradigms in their genres.

As for policies toward religion, the Meiji government, like the Tokugawa regime, required religious registration. However, in place of Buddhist temples, the Meiji government required every Japanese subject to register at the local Shintō shrine. The architects of the Meiji government took the Western model of Christianity as the unifying force of the nation-state and modified it so that the Shintō pantheon of spirits (*kami*) served as the religious foundation of Japan, and they attempted to make Shintō the state religion in Japan. After encountering criticism and resistance from various sectors, other religious groups in Japan, and international societies, the government relaxed this religious policy.

During the formation of modern Japan, Japanese intellectuals absorbed Western ideals, rationalism, technology, and economic systems. Many young students and bureaucrats were dispatched to Western countries to study Western laws, institutions, sciences, and technologies. The Japanese government invited and employed many foreign advisors, professors, technocrats, and specialists to establish and develop a modern nation-state with industrial capacity and military strength.

CULTURAL VALUES AND CRITICISM. To say the least, Western notions of science, which were based on the diversification of knowledge into various branches, had a strong impact on the minds of Japanese scholars, who had been accustomed to a holistic approach to learning. Within the Western sciences, for instance, religion was separated from all other branches of knowledge, such as politics, economy, culture, society, philosophy, mathematics, and physics. In the holistic orientation of the Japanese tradition, in contrast, Chinese Learning, National Learning, and Dutch Learning did not have clear divisions of knowledge. Therefore, for Japanese, being educated in the new tradition of Western sciences often meant exposure to an entirely new cultural and epistemological orientation based on a different set of values. This orientation required Japanese to evaluate Japanese and West-

ern values against each other before accepting Western orientations and integrating them into Japanese culture. Japanese culture had to adjust itself to these new concepts and ideas. How to adapt Japanese culture was always open to criticism.

One such critic was Okakura Tenshin (1862–1913), an art critic and leader in modern Japanese art circles. Before the Russo-Japanese War, Okakura criticized Western colonialism and imperialism, saying that Asia is one. In the year after the war (1906), he also criticized “moderns” who judged the Japanese victory in bloody battles over Russia as “civilized” and who regarded such peaceful pastimes as the tea ceremony and other aesthetic activities as “barbarian.” Okakura's critiques were published in English in London; the former was written in India, and the latter in Boston. He knew the problems of the East and the West, of Japanese culture and Western culture, because he lived in and knew both worlds.

Another critic was Minakata Kumakusu (1867–1941), a folklorist and natural historian. Minakata protested against the government's policy of consolidating Shintō shrines throughout the country to clear virgin forests belonging to the shrines. The government undertook this measure to create land for increased farm production and further industrialization. This measure, begun in 1906, met vehement criticism from Minakata, who had returned to Japan after a long sojourn of research in the United States and England. The policy was abandoned in 1915.

Though individuals raised severe criticisms of the direction of modernization at critical junctures in modern Japanese history, Japanese commoners often meekly accepted policies for Westernizing the nation. The Japanese tended to embrace recklessly the ideals of modern Western civilizations—rationalism, industrialization, capitalism, progress, and development—even when such ideals were incompatible with traditional Japanese values.

THE IMPACT OF MODERNIZATION ON RELIGION. During the past 150 years, Japanese society has undergone many radical cultural and social changes involving all aspects of life. Included here are such great transformations as the overthrow of the feudal Tokugawa regime; the establishment of the modern Meiji imperial state; the rapid introduction of policies to modernize in the fields of government, law, education, technology, and culture; the development of capitalism; colonialist and militaristic involvement in Asia; the Sino-Japanese War (1894–1895); the Russo-Japanese War (1904–1905); the further development of industry and capitalism; greater economic and military involvement in Asia; the Second World War (which ended in Japan's defeat); the U.S. occupation; postwar modernization and democratization; and phenomenal economic growth. These rapid changes in society brought forth serious existential crises, including the disintegration of traditional communities and values, along with new types of human alienation and identity crises.

Modern Western concepts and views of religion were introduced in the early Meiji period into Japanese universities, which in themselves were modeled after Western universities. The Japanese word *shūkyō* was coined to translate the Western notion of religion, and when the word was applied to Japanese religionlike institutions, it often created problems. Buddhists, for instance, were uncomfortable with the theistic connotations of the word. Followers of other Japanese religions found their own problems. Because of its amorphous conception of the sacred, the Japanese indigenous religion Shintō does not fit well into the category of religion. Moreover, many studies of Japanese religion completely ignore the whole folk-religious tradition, a strong undercurrent of Japanese religious culture, because none of these folk religions had coherent, systematically articulated doctrines comparable to the Western ideal, Protestant Christianity.

Japanese religions responded to the changed intellectual climate. Shintō was now a state religion and took on all the trappings of state ideology. The elite Buddhist sects busily readjusted themselves to Western influences and the new political and social situations surrounding them. The True Pure-Land Sect was foremost in these attempts. It sent young students to study at Oxford University (where Max Müller was) and at other European institutions even before the Meiji Restoration in 1868. This sect drafted a constitution and experimented with a parliament even before the governmental did. It appropriated ideas of Western philosophy to develop its doctrines. The Zen Sect also actively developed its scholarship. In the process, elite Buddhist sects rediscovered the importance of the doctrines of their founders in the Kamakura period (1185–1333). Yet these sects were still bound to the powerful remnants of their hereditary parishes, inherited from the Tokugawa period. Thus these established religions, Shintō and Buddhism, developed doctrinally but remained aloof from the religious needs of the people. Christian sects, which were treated as an “evil religion” during the Tokugawa period, became tolerated and resumed their activities, but never became as potent a force as before.

NEW RELIGIONS. Western civilization thrust itself upon Japan in an age of imperialism. To survive, Japan absorbed Western ideals, rationality, technology, and economic systems. Thus did the Japanese elite seek to emulate and overcome the West. And yet they also sought to distinguish Japan from the West. This is important to note, because Japan, despite all the evidence to the contrary, is still presented as a homogeneous culture with little or no individuality. This notion of a homogeneous culture owes much to sudden contact with the West and to the Meiji effort to create a modern state to rival Western powers by forming a new political center consisting of a people united under an emperor.

The political myths created by the Japanese elite notwithstanding, Japanese commoners displayed their individuality in new religions. While the established religions and their leaders were busily trying to adjust to ongoing changes

and remained aloof from the religious needs of the common people, new religious movements emerged spontaneously from the lower strata of society. The established religions tended to accept government policies, but there were signs of resistance among many of the new religions. But as soon as these new religions were more or less established within society, other new religions would emerge from lower strata of society or from the fringes of established new religions. The emergence of new religions has followed this general historical pattern up until the explosion of new religions in the 1990s, including Aum Shinrikyō, which in 1995 released Sarin gas in Tokyo subways during the morning rush hour.

Under the religious policy of the Meiji government, Shintō shrines were elevated to the status of the official state religion. After Buddhist, Christian, and liberal scholars resisted and criticized this move, the government eventually designated Shintō as a national cult rather than as a religion. By this move, all Shintō shrines were transformed from places of veneration to nonreligious places of national rituals. Buddhism lost its status as the state religion, which it had enjoyed during the Tokugawa period, but it remained an established religion supported by hereditary parishioners. During the Meiji period, three newly formed religions and some syncretic folk-religious associations were officially recognized as Shintō sects. Within the framework of Meiji imperial Shintō, all religious groups were officially recognized and tolerated.

By the policy of enlightenment, various age-old folk-religious practices, including yin-yang divination calendars, magico-religious practices, and symbolism, were suppressed as superstition, evil religion, and even licentious worship. All religions—Buddhism, Christianity, and the new religions—compromised with the ideology of a sacred emperor to survive in the framework of Meiji policy toward religion.

One of the most far-reaching influences of the enlightenment policy of the Meiji was that religion disappeared from the public domain. Religion became a private matter within a secular, modern state, although a sacred and inviolable emperor ruled over it. Politicians did not confess their faith, and schools and universities did not teach religion as a core subject.

Many students and scholars went abroad to study Western sciences and philosophy. After returning to Japan, many became leading intellectuals, civil servants, and political leaders. As Uchimura Kanzō states, the Japanese accepted Christian civilization but not Christianity itself (*Questions and Answers on Christianity*). Soon intellectuals found themselves in an intellectual climate in which they could not be persuasive unless they could skillfully manipulate modern Western scientific concepts. Even Buddhist scholars (figures such as Kiyosawa Manshi, Kimura Taiken, and Nishida Kitarō) had to use Western philosophical and scientific concepts to articulate their doctrines and ideas. For this reason, various sciences, including folklore and the study of religion, have had to follow modern Western models devoutly until into the

twenty-first century. Despite this tendency, some thinkers also developed profound and articulate critiques of the West, as can be seen in the work of Okakura Tenshin, D. T. Suzuki, Nishida Kitarō, Nishitani Keiji, and Yanagita Kunio. Except for Nishida, all of these men were directly exposed to modern Western civilization, and all were aware of the need to straddle the two worlds.

The intellectual climate for novelists was similar to that for philosophers. Both Natsume Sōseki (1867–1916) and Mori Ōgai (1862–1922) were well versed not only in Chinese and Japanese literature, but also in Western languages and literatures. Sōseki expressed concern about the impossible task of synthesizing the enlightenment spirit of the externally imposed (the Western) and the spontaneous spirit of the indigenous. For him, “An enlightenment that was triggered from the outside was unknown until recent times. We must catch up with the West. But by incorporating the external, we become anxious and fret over it.” Mori wrote, “The new Japan is in the midst of a whirlpool in which Eastern culture and Western culture are coming together. There are some scholars who stand in the Eastern, and others who stand in the Western; both stand on a single leg. This age calls for scholars who stand firmly on two legs.”

THE TAISHŌ INTELLECTUAL CLIMATE. The internal conflicts and agonies observed in novelists and philosophers of the Meiji period became weaker among intellectuals in the post-Meiji period, that is, after the Russo-Japanese War. In that war Japan struggled to defend itself against Russia’s powerful military expansion with colonial intent. Japanese victory meant that it succeeded at building a strong nation by Westernizing, and that Japan was now a player in the power game among the world powers over East Asia. Although Japan had succeeded in its struggle for treaties ending extraterritoriality and allowing it to impose tariffs, it now had to contest with the world powers in a struggle for survival. After the Russian revolution in 1917, the First World War ended.

Intellectually, instead of agonies over how to maintain Japanese identity in the face of the Western onslaught, Japanese now faced the influences of Marxism, nihilism, and vitalist philosophy. This new intellectual climate, stemming from the thought of Karl Marx, Friedrich Nietzsche, and Henri Bergson, reflected contemporary Western social and political crises. Also swirling about in the atmosphere of the Taishō period (1912–1926) were liberalism and democratic thought, which helped give rise to movements for people’s rights and socialism.

Soon, social, political, and economic crises visited Japan, and the newspapers frequently carried news about socialist movements. The novels of Akutagawa Ryūnosuke, who committed suicide by taking poison, represented a contemporary Japanese world reflecting the apocalyptic vision of the Western world. Nishitani Keiji, a leading philosopher of religion in twentieth-century Japan, stated that when Japanese intellectuals became aware of the crises of the West

from Western philosophers and novelists, they attempted to go back to their own tradition, but when they tried to rediscover it, they also became aware that their own tradition had already partially broken down. To overcome this crisis, Nishitani thinks, “the Japanese have to overcome a double nihilism, for one aspect of the problem is a Western crisis, and the other aspect is a Japanese crisis.”

THE POSTWAR PERIOD. Japan’s defeat in the Second World War and the atomic bombing of Hiroshima and Nagasaki terminated Japan’s colonialist and imperialist ambitions. During its occupation of Japan, the United States imposed on Japan a new constitution instituting democratic reforms, disarming the nation, separating church and state, radically revising the civil codes, giving the emperor the status of symbol of the nation.

Thus began another phase of the radical transformation of Japan due to contact with the West. Japan started to rebuild its country as a modern democratic, secular state by further Westernizing and rationalizing its institutions, but since the new structure of the state was imposed by an external force, many problems arose. In postwar Japan, many new religions again spontaneously emerged. Almost all of these new religions emphasized the veneration of ancestors by focusing on the form of the family altar, the proper way to hold services, the meaning of ancestor spirits, and so on. The United States sponsored a reform of the civil code along liberal Western lines that ensured the rights of every individual in the family at the risk of the continuity of the family. In reaction to this drastic change in the structure of the family, these new religions attempted to ensure the continuity of the family and family ties.

MISHIMA YUKIO. An outstanding postwar critique of Japan’s Westernization is found in the life and work of the novelist Mishima Yukio (1925–1970). Mishima wrote many creative novels in the literary style of twentieth-century Western literature. He also wrote many important essays before he committed suicide in the traditional samurai style of slitting his bowels. He wrote, “A characteristic of contemporary culture is probably that many different illusions—including ideals, norms, and ideologies—that had inspired people toward life have broken down. The idea of the absolute was lost, and people are forced to face naked life as materialistic and naturalistic, deprived of all designs. This is the cause of the irredeemable nihilism of today.” When any community is eroded by other culture, its rules and customs break down, and the community gradually falls apart morally and spiritually. In such circumstances, life destroys itself, whatever efforts may be tried to fulfill life.

Mishima was desperately warning against the tendency of life to destroy itself in Japan’s headlong effort to Westernize and modernize. When he criticized the Japanese emperor for proclaiming that he was a human being, not a living *kami*, he also pointed out the contradiction of modern constitutional emperors. For Mishima, it is impossible to

Westernize the sacred; the sacred cannot be embodied within the framework of a Western secular nation-state.

TRANSCULTURATION AND RELIGION: RELIGION IN THE FORMATION OF MODERN INDIA

To put into historical perspective the multifaceted pattern of Hindu socioreligious modernism, scholars have chronicled the origins of British Orientalism and the Bengal Renaissance. Similar to the European Renaissance, which occurred prior to the Reformation, nineteenth-century India also underwent a period of cultural renaissance followed by an era of religious reformation.

BRITISH ORIENTALISM AND THE BENGAL RENAISSANCE. The Bengal Renaissance occurred in eastern Gangetic India—specifically, in the colonial metropolis of Calcutta—from the year 1773, when Warren Hastings designated the city as the future capital of British India, until 1828, when Governor-General Lord Bentinck challenged Orientalist cultural policy. During this period, Calcutta operated schools using European textbooks and teaching methods. In addition, the newly created Hindu middle class had founded Hindu College, the only Western-style institution of higher learning in South Asia. The government supported newspa-

pers, journals, and books printed in English and the vernacular languages of India. Calcutta boasted a modern public library. Perhaps most significantly, the metropolis contained native intelligentsia, whose members were familiar with happenings in contemporary Europe, fully cognizant of their country's own historical legacy, and, as a renaissance elite, hopeful about its future as a culture in the modern world.

The agents of Western colonial rule who sympathetically supported these endeavors were "acculturated" civil, military, and judicial officials of the British East India Company (as well as some missionaries) referred to as Orientalists, largely because of the cultural policy that was followed by the government. Most of these so-called Orientalists did not harbor nationalistic or imperialistic ambitions, nor did they support the increasingly bureaucratic mentality that developed after 1870. On the contrary, the Orientalists had been shaped by the eighteenth-century world of the Enlightenment, with its open-minded curiosity about other civilizations. Orientalists were encouraged by official policy to master at least one Indian language and to use that language fruitfully for scholarly research. It was no accident that the Asiatic Society of Bengal, established in Calcutta in 1784 as the first modern organization of its type to study Asian civilizations in all their aspects, was a direct result of a British East India Company cultural policy. Orientalists such as William Jones, William Carey, James Prinsep, H. T. Colebrooke, and H. H. Wilson made important discoveries in such fields as pre-Muslim Indian history, religion, and archaeology. Research into the kinship of Indo-European languages and the rediscoveries of the historic Buddha, Aśoka, and the Mauryan Empire were some of the lasting achievements of this coterie of devoted civil servants. There is no evidence that they ensconced themselves in clubs, as did the later bureaucrats, nor did they construct a barrier of racial privilege between themselves and their "subject races." Instead, the Orientalists reached out to the Bengali intelligentsia, forming relationships with them, serving as sources of knowledge about contemporary Britain and, above all, working together on projects designed to promote social and cultural change in Calcutta.

The Bengal Renaissance arose from interaction between the Bengali intelligentsia and the British Orientalists. Between 1800 and 1830, in Calcutta, the Bengali intelligentsia consisted of uncertain but hopeful people who were adopting alien values and ideas to reform indigenous traditions. They established relationships with the British, both for material gain and to use them as windows to the West. Fortunately for them, the distance between London and Calcutta was vast, and the Orientalists with whom they associated had already become sufficiently "Indianized." The Bengali's favorable view of the West during this sympathetic Orientalist period helped to maintain good rapport and goodwill between the representatives of the two civilizations.

RAMMOHUN ROY, FATHER OF MODERN INDIA. Of all the Bengalis in the Orientalist period, none was more influential

in creating a legacy of Hindu socioreligious reform than Rammohun Roy (1772–1833). Long before Vivekananda laid the foundation of his Ramakrishna Mission, before Nehru wrote his monumental *Discovery of India* in a British prison, and before Gandhi built his nationalist ideology on the bedrock of Hindu and Buddhist morality, Rammohun had already utilized the Orientalist rediscovery of the ancient tradition, which the progressive intelligentsia readily accepted in their quest for a new identity in the modern world.

Rammohun had studied Asian religions from primary sources and met countless Europeans in Calcutta who imparted to him their thoughts on Western civilization in the nineteenth century. Missionaries at the Danish enclave of Serampore had tried unsuccessfully to convert Rammohun to their Baptist form of Protestant Christianity. Some other members of the intelligentsia who were xenophiles did become Christians, deciding that their salvation lay in copying the West or in accepting that modernization equated to Westernization. But Rammohun, supported by the scholarly evidence of Orientalist research into Hindu antiquity, contrasted the age he lived in—with its *kulin* polygamy, sati practices, caste rigidity, idolatry, and the abuse of women—to the classical age, which was free of dark-age excrescences. For Rammohun, he and his fellow Indians did not need to surrender themselves to an alien way of life in order to accept modernistic values. Ancient Hindus were mathematical and scientific sophisticates; Brahma of the Upaniṣads was as superior a notion of the godhead as anything produced in the Middle East; ancient India overflowed with philosophic diversity; and ancient art, literature, and medicine flourished among Indians in classical times. Moreover, evidence existed that women were considered equal to men.

From 1815, when Rammohun settled in Calcutta, until 1833, when he traveled to England to meet with Unitarians (he died there later that same year), he labored intensely, keeping up with Orientalist scholarship, translating ancient scriptures, organizing meetings of the Calcutta Unitarian Society and Brāhmo Sabhā (society of God), and becoming involved in journalistic ventures and debates. As he sought to recreate the Vedantic tradition, he was often attacked by missionaries and other Christians, who ridiculed his efforts. In 1823, for example, he defended the Vedānta as containing a rational exposition on the unity of God without the superstitious verbiage that he claimed was so common in many Christian sources. Unlike the Bible, Rammohun argued, the Vedānta did not attempt to categorize the attributes of the Almighty, a gesture he found anthropomorphic and futile. He also contended that, whereas Christianity required a blood sacrifice to expiate the sins of humanity, the Vedānta taught that the only means necessary to overcome sin is sincere repentance and solemn meditation. He asked whether popular Christianity was any better than popular Hinduism. How could the crucifixes, the saints, miracles, trinity, and holy water be justified?

Ultimately, Rammohun chose to reform Hinduism against the backdrop of a liberal faith emanating from former

Christians in America and Britain who were highly dissatisfied with the same dubious beliefs and practices that troubled Rammohun and many of his cohorts in Calcutta. It is no coincidence that Rammohun established a Calcutta Unitarian Society in Calcutta in 1823, or that he died while visiting the home of the Reverend Lant Carpenter, a prominent Unitarian in Bristol, and that, had he lived, Rammohun would have traveled across the ocean to Boston and met with William Ellery Channing, the leading spokesman of liberal Unitarianism in the United States. Though Unitarianism was never a mass movement, like-minded sentiments regarding religion and society brought East and West together, with important consequences for socioreligious reform in India. Three simple but highly controversial ideas for the time (1815–1835) provided the link between the renaissance intelligentsia in Calcutta and the enlightened, liberal-minded elite in England and the United States.

First, a national faith would replace the predominant religions of the world, believed to be restricting the freedom of human beings by enslaving them to performing mechanical rites and rituals, listening to irresponsible anecdotes that served no moral purpose, and holding meaningless superstitions and otherworldly beliefs that served no useful purpose in improving the lot of the human race. Second, social reform would emancipate the exploited classes such as workers, peasants, and women through education and the extension of civil rights, allowing all to benefit equally from modern civilization. Finally, universal theistic progress would occur; human perfectibility could not be confined to a particular race or ethnicity but could happen worldwide.

Mindful of these three objectives, Rammohun Roy helped establish the Brāhmo Sabhā, precursor of the Brahma Samaj, on January 23, 1830. He then left for Europe to meet with persons who shared his beliefs. Though he never returned to India, he did leave behind the outline of a program for Hindu reformation.

THE BRĀHMO SAMĀJ AND THE HINDU REFORMATION. The work of developing the Brāhmo Samāj after Rammohun's death was taken up by Debendranath Tagore (1817–1903), son of Rammohun's close friend, Dwarkanath Tagore. Like Rammohun, Debendranath identified true Hinduism with the Vedantic tradition; he also fought Christian missionaries' attempts at converting members of the new educated Bengali elite. In this endeavor, Debendranath received assistance, often against his better judgment, from an American Unitarian missionary, Charles Dall, who came to Calcutta in 1855 hoping (but failing) to find Rammohun's philosophical convictions in Debendranath's leadership. Unlike his father and Rammohun, who both voluntarily traveled to England, Debendranath remained suspicious of Westerners most of his life. Dall had to wait until 1866, when a more radical Brahmo named Keshub Chandra Sen rebelled against Tagore's conservatism and founded his own Brāhmo Samāj. Dall considered Keshub to be Rammohun's true successor.

Debendranath's significant contribution to the Hindu Reformation was his intellectual preoccupation with formulating the principles of a new middle-class ethic for Brahmos and their counterparts throughout India. Debendranath had begun a process that was similar to Christian reformers of earlier centuries, transforming the religion to become more puritanical so as to serve the needs of the new European Protestant middle class. Brāhmo missionaries translated his book, published in 1855 as *Brahmo Dharma* (Brāhmo ethic), into the languages of other Indian peoples as they traveled throughout South Asia spreading the gospel of Hindu reform. Debendranath redefined *dharmā*, which in ancient times had meant caste duty, as a modernized set of precepts for the true Hindu. Debendranath offered the emancipated Hindu guidance and edification in everything from family responsibilities to behavior in the workplace to being a devotee of the one true God.

Debendranath never claimed to be creating something new, however. He began by stressing the duties that each member of the household owed to one another. He emphasized the social good from which a family can profit if its members practice sincerity, devotion, purity, forgiveness, and gentleness. In the workplace, Debendranath advocated the good Hindu to rely on one's self, persevere always, and work hard continually. He believed that poverty could be overcome by laboring in the path of righteousness. He advised doing one's own work rather than being dependent on others, and against choosing to beg.

In 1866 one of Debendranath's followers, Keshub Chandra Sen (1839–1884), led the militant wing of the movement to form a separate Brāhmo organization, dedicated to what they believed to be Rammohun Roy's ideological path. Keshub accused Debendranath of doing nothing as a social reformer, especially with regard to female emancipation. Furthermore, the activists saw Debendranath as a hypocrite because he attacked caste privilege but continued to wear the sacred thread as a Brahman. They also criticized Debendranath's suspicion of foreigners, such as Charles Dall, whom Keshub and his militant supporters viewed as a spokesman for liberal religion throughout the Western world. Keshub also felt that the Brāhmo mission to reach out to like-minded Hindus in Maharashtra, Gujarat, the Punjab, Tamilnadu, and elsewhere needed a more radical approach to a wide variety of issues, many of which Debendranath avoided.

Keshub's greatest influence on the course of Hindu reformation, outside of promoting female education, was probably his remarkable eclecticism. In this sense, he was very much like Rammohun, who had studied all the world's major religions, including Islam. But Keshub went much further than his predecessor, both in his quest for knowledge of comparative religion and in his attempts to understand the patterns of change and continuity in the history of South Asian religions.

In 1880 Keshub started conducting his pilgrimages to the saints. These were elaborate devotional seminars designed to trace the history of human crises and the role of ethical and religious reformers as saviors seeking to arrest the chaos. One of the saints was Socrates, who offered a practical morality and an exemplary life, in contrast to the corruption of his age. Before staging the seminar on Buddha, Keshub went to Bodh Gaya and meditated under the bodhi tree. His seminar on Jesus taught Keshub that Christ equated the love of man with the will of God. And as for Muḥammad, Keshub learned that the way to achieve the brotherhood of man was through practicing a rigid monotheistic faith.

Keshub's eclecticism—especially when studying Indian reformers throughout history—gave him a very different perspective on Hindu classical and postclassical developments. Unlike Rammohun and most other Brahmos up to his time, Keshub did not identify with one classical tradition, such as the Vedantic. Rather, Keshub viewed the Hindu faith as a pluralistic phenomenon in which various traditions emerged in their authentically pristine forms at different times to meet a pressing spiritual need, but they became distorted later through internal institutional decay or by the effects of disruptive foreign influences.

One illustration was Keshub's positive influence on Swami Dayananda Saraswati (1824–1883), who proved to be the earliest modern reformer of the Vedic tradition. Most nineteenth-century Hindu reformers were ambivalent about the Vedic tradition because they associated it with caste rigidity, the subjection of women, idolatry, and worse. Dayananda repudiated these charges and spent his mature life denouncing what he called the evils of post-Vedic Hinduism. Because he argued that the true Vedas rejected idol worship, untouchability, child marriage, and the rest of the evils attributed to them, Dayananda's followers called him the "Luther of India."

Keshub also encouraged other Brahmos to research the roots of Indian sectarian faiths. Bijoy Krishna Goswami (b. 1841), a radical modernist, translated early Vaisnava songs which declared equal rights for men and women and the repudiation of caste privilege. Aghore Nath Gupta (d. 1881) conducted Keshub's seminar on the Buddha, in which he declared that the great reformer was not an atheist but a compassionate humanist who taught us how to live in a world that was false and full of illusion. Keshub also influenced Dharmapala, a neo-Buddhist from Sri Lanka, to start the Maha Bodhi Society.

Narendra Nath Dutt, better known as Vivekananda (1863–1902), joined Keshub's coterie in 1880. Scholars have difficulty assessing Vivekananda's contribution to the Hindu Reformation because, though he owed much to Keshub's teaching, and though his view of the Vedantic tradition came largely from Brahmo sources, he chose as the name of his own organization or mission that of a Kamakrishna, a contemporary mystic saint from Calcutta. Vivekananda was the earliest non-Brahmo to be accepted by religious liberals in

the West. In fact, his talk at the Parliament of Religion in 1893, which was organized by American Unitarians, was considered to be among the best of the conference.

Vivekananda has erroneously been considered a Hindu nationalist because scholars believe he defended such things as caste and icons. However, a close study of his ideological development reveals that he neither defended the negative aspects of caste nor promotes the external worship of images. For Vivekananda, there was nothing wrong with hierarchical structures, since every society on earth had one. What was wrong—as happened in India—was the corruption of the system, which then would become oppressive. Rather than abolish caste, he wanted to democratize it. As Vivekananda would argue, if you teach the fisherman the Vedanta, he will say “I am as good a man as you are.” As for images in the service of religion, Vivekananda refused to assume a rigidly iconoclastic position, such as those of Islam or Protestantism. He did not understand why worshipping a God without form was necessarily more spiritually uplifting than creating an image by which to convey the same message.

THE HINDU RENAISSANCE AND REFORMATION CHALLENGED. In the final decades of British Indian rule, the renaissance and reformation movements were very much challenged by forces in every direction. Orientalism, with its profound interest in all facets of civilization in India, had long since disappeared by the turn of the twentieth century. It had ceased to be the cultural policy of the British East India Company in 1835, when it was replaced by the liberal Anglicized cultural policy advocated by Thomas Babington Macaulay during the famous Anglicist-Orientalist controversy. Macaulay, who never learned an Indian language while he served in Calcutta, challenged the Orientalist belief that modernism among South Asians could be achieved by cultivating their languages and by identifying with a classical tradition. Macaulay argued that if Indians wanted a progressive future for themselves, they ought to anglicize their lives, becoming proficient in the English language and choosing Western careers and professional ethics. But the successful expansion of the British Empire after 1870 led to another shift in cultural policy. Both liberal-minded Orientalism and Anglicism gave way to cultural imperialism, or the excesses of ethnocentric self-glorification. This policy held that, except for military prowess, East was East and West was West, and never the two shall meet. The grandeur of the British Empire seemed to testify to the superiority of the British race, while the subjected state of India at that time appeared to confirm the inferiority of the Indian race.

On the Indian side, renaissance and reformation were challenged by a more radical generation of freedom fighters, who surrendered their moderate politics for an extremist form of nationalist agitation. When the British imperialists denied human equality between citizens of India and the West, a xenophobia swept over the English-educated Indian intelligentsia, which led to increased cultural apologetics about everything Indian, including popular religion. Bal

Gangadhar Tilak (1856–1920), the Maharashtran ultranationalist, totally rejected what he called the Pax Britannica. He believed that the establishment of English schools and British administrative and legal institutions were an imperialist deception secretly designed to exploit the country. Though Tilak did not urge violent methods to win freedom, others did, and several British officials were assassinated as a result. Some scholars assert that had Mahatma Gandhi (1869–1948) not assumed the leadership of the Congress Party after World War I, with his message of nonviolence, the Indian nationalist struggle would have become a movement drenched in blood. Gandhi admired Vivekananda’s approach to Hindu reform.

The Orientalist legacy of the Bengal Renaissance and the Brāhmo legacy of Hindu Reformation were kept vividly alive throughout the first half of the twentieth century by India’s greatest writer, Rabindranath Tagore (1861–1941), who in 1914 became the first Asian to win the Nobel Prize in Literature. As the grandson of Dwarkanath Tagore, who had started the Calcutta Unitarian Committee and Brahmo Sabha with Rammohun Roy in the 1820s, and as the son of Debendranath Tagore, who revitalized the Brahmo Samaj in the 1840s following Rammohun’s death, Rabindranath struggled for decades to protect renaissance and reformation against the inroads of imperialism and nationalism.

In a manuscript compiled during World War I entitled *Nationalism*, Rabindranath saw the conflict as a crucial stage in the breakdown of all that was hopeful and positive in the progress of civilization. To him, the war’s genocide in the trenches represented the butchery of nations feeding upon other nations. The Russian ideologue Karl Marx is reputed to have said that religion was the opiate of the people; for Tagore, nationalism had become the opiate of the people.

His opposition to nationalism did not mean that Tagore supported British imperialism. On the contrary, he attacked it vigorously, perhaps with more candor and understanding than any other thinker before him. Tagore dramatically surrendered his knighthood following the Jallianwala Bagh massacre on May 30, 1919.

In July 1921, Rabindranath inaugurated Visva Bharati University in Santiniketan, hoping the institution would embody the ideals of Brahmo universalism. Three years earlier, on December 22, 1918, he had declared that Visva Bharati would carry on the efforts of scholars such as Keshub Chandra Sen, who had sought to understand the religions of India and the world by studying primary sources.

TRANSCULTURATION AND RELIGION: RELIGION IN THE FORMATION OF MODERN OCEANIA

In 1601, after a Spanish historian published a map showing the islands of the Carolines and the Marianas, north New Guinea, and most of the Solomon Islands, Pacific Island peoples became part of the general history of humankind. Even before geographers accepted French *savant* Dumont d'Urville's 1832 classification of Polynesia, Melanesia, and Micronesia, the islands entered the European imagination. Polynesia, largely through voyagers' experiences at Tahiti, evoked a new kind of paradise, one including sexual freedom as well as escape from social restrictions in the Old World; to a large extent, the region remains a "legend that sells" for pleasure-seeking holiday-makers. Melanesia, in contrast, has always presented ambiguity—home of untold treasures ac-

companied by frightful, perhaps monstrous dangers. For example, the world's largest gold and copper mine at Freeport, on the south coast of Irian Jaya, coexists with tourists' common anxiety about law-and-order issues, especially in nearby Papua New Guinea and the Solomons. Significantly, the European explorers who discovered Micronesian and Polynesian (sometimes referred to as "Austronesian") peoples viewed their lighter skins, more "welcoming" approach, and "recognizable" social structures (even kingship) as corresponding to the Enlightenment's (1780s–1840s) popular notions of "the noble savage." Conversely, the Europeans placed the "black islanders" of the southwest Pacific near the bottom of the evolutionary scale and often saw them as ignoble, miserable, and treacherous. These biased images affected transcultural outcomes.

For their part, the indigenous islanders had to make sense of these highly mysterious newcomers, whose dress and accouterments were utterly alien and whose vessels were significantly larger than and different from their own. Each island culture had its own postures of response and interaction, and in this vast region, which contains twenty-five percent of the known discrete languages and religions, this complexity is daunting. In general, however, each society had periods of initial contact, longer periods of adjustment to serious intrusions into its local ways of life, and the increasingly more common, yet nonetheless creative, absorption of modernity.

In terms of religious change, the Pacific Islands are noted for a massive shift towards Christianity (with over 90% nominal adherence for the whole region). This general change has entailed varying consequences for the myriad of isolated, small-scale, and survivalist cultures, some of which have been so accommodating to the new faith that their traditions have become highly muted, and others which have been highly resistant to conversion. Typically, Christianity has provided a window of opportunity for very localized peoples to participate in modernity, with all its accompanying bewilderments that in turn have occasionally subverted the religious life.

Pacific "contact scenarios" with outsiders can be plotted from the sixteenth century to the early twenty-first, since some mountain cultures in easternmost Irian Jaya have yet to interact with the outside world. When their content can be (re)constructed, most indigenous responses to external contacts appear "religious," in that newcomers are taken to be deities, strange and powerful spirits, or returning ancestors. On Hawai'i Island, in 1779, the "natives" thought Captain James Cook was the long-awaited, returning fertility god Lono, and he was feted by Chief Koah at much cost to the locals. After Cook's departure, however, when a storm forced him to return to the island, the natives killed him because of what they saw as his deception. Over half a century earlier, Rapanui, or Easter Islanders, apparently reacted to the enigma of passing vessels (before Jacob Roggeveen's landfall of 1722) by feverishly erecting many of their great statues to

face the sea at Rano Raruku—a most untraditional act, considering that the effigies of chiefs were meant to gaze over their ancestral lands. In Polynesia, with its more vertically oriented cosmologies (sky/earth/underworld), the newcomers were often thought to have arrived from above: the Samoan term *papala[n]gi* (sky people), for instance, is used to describe the white visitors. Later on, as in Papua New Guinea, where a horizontal view of the cosmos prevailed, the first appearances of outsiders mostly suggested the return of the dead. In 1877, for example, the Papuan Koitabu thought Ruatoka, a Rarotongan co-worker of missionary James Chalmers, was an ancestral spirit because of his ghostly white suit; in 1946, isolated Ke'efu highlanders who stumbled upon thirteen dead white people in a strange shelter—a crashed plane—buried their bodies and offered sacrifices to them as “new beings” who could die like themselves.

Once interaction with outsiders continued, however sporadic, islanders had to decide whether to resist them or trade with them. Epidemic diseases caused by contact often stalled the progress of possible relationships, but the islanders also found the newcomers themselves to be vulnerable to trouble, sickness, and death. Once their weaknesses were known, the outsiders were classified as strangers, and thus became worth attacking. Spirit power would be needed to hold back the intruder; for example, patrol officer Jack Hides remembers a day in 1935 on the Papuan Plateau when a swaying Etoro medium, playing a drum while perched on another's shoulders, sang a repelling clan into action.

Although the islanders killed various newcomers, many of whom were unarmed missionaries, the superior weapons of whites and their parties eventually subdued any reprisals. In any case, trade offered a popular and profitable way of dealing with the new uncertainty. Seafarers usually bore attractive items for exchange, and they were soon considered as possible prizes of (group) possession. Sometimes exchange activity was not satisfying, however; Tongans, as a result, would pirate visiting vessels, such as the *Port-au-Prince* in 1806. The more hierarchical (mostly Polynesian) societies, though, were in the best position to negotiate a high-level, stable *rapprochement* with European officialdom. Tonga, after all, had held together a far-flung island empire, from as far west as the Isle of Pines (in southern New Caledonia) to Samoa. Other, smaller societies had to capitalize on their limited opportunities. Theft often occurred, explaining how so many steel axes filtered into the Papuan Highlands years before European miners did. Sometimes individuals got lucky without having to resort to stealing. The earliest Catholic missionaries to the New Guinea highland Chimbu, for instance, gave tools to the local people to help them establish an outpost in 1936. When the fortunate recipients arrived back in their hamlets, however, news of their prizes had preceded them; the missionaries then found queues of people, with gifts to trade in order to acquire the new instruments.

Outsiders often selected relatively safe locations to begin trading or mission work, and as a consequence, some groups

earned privilege over others. Since inter-tribal hostilities had long been endemic to the region, recipients of new weapons could use them to create havoc among their enemies. For example, Maori tribes procured muskets from the 1810s, convincing even missionaries to trade them for hunting purposes. In Fiji, the European Charles Savage, remaining out of the range of traditional weaponry, was “employed” by Naulivou, chief of Mbau, to shoot down his foes at the forefront of inter-tribal battles (1808–1809).

Even during peacetime, however, the new religion could be manipulated to secure special advantages and keep up old enmities. Christianity came in more than one guise, and if one tribe was benefiting from the presence of a mission station, another might be tempted to invite in the representative of a different denomination. Before the 1950s, Catholic/Protestant missionary competition made possible the local politics of playing one against the other. Sectarian Protestant elements also competed for loyalties. In Papua after 1908, for example, dissident families or clans often achieved social separation as a means of satisfying their local grievances by becoming Seventh-day Adventists. In Polynesia, Mormonism grew rapidly at the expense of more mainstream churches, partly because of the material benefits it offered such as superior housing and medical services. In fact, the Mormons had established their small “kingdom” in the Tuamotos as early as 1844—even before the founding of Salt Lake City.

With the establishment of towns, missions, trading posts, and plantations, there arose the possibility of access to increased power and new goods. Traditionally, wealth was not only a mark of social status (of nobility in Polynesia, and often of successful management in Melanesia), but it was also a sign of blessing from the spirit order. In smaller societies, moreover, prosperity was cherished by the group; the common people looked to their chiefs for magnanimity, and a Melanesian big-man achieved his leadership through generous relinquishment—giving gifts so that many were put in his debt. Now, however, since the longest-staying possessors of the new goods were missionaries, the indigenous people deduced that special material blessings would flow through practicing the new religion. Ships' cargo was already mysterious in origin, and the connection of the strange goods with the availability of new spiritual power heightened expectations of collective well-being. This notion, called “cargoism,” led people to try worshiping in the churches. Especially in Melanesia, though, where traditional rituals focused on the tangible fecundity of plants and animals, group agitations occurred, sparked by local prophesiers filled with hope that “cargo” (European-style trade goods invested with a religious aura) would arrive in abundance. The bearers of cargo were often thought to be returning ancestors, but also possibly the “Jesus” spoken of by the evangelists. Makeshift wharves, even airstrips, were erected to receive the marvels. What had been almost exclusively directed to the expatriate strangers would now come to the local peoples. Such “cargo cults,” as they have been dubbed, expressed frustration that indigenes had

only limited access to these wonderful items, an inequity that seemed to contradict values of reciprocity and sharing.

Acculturative activity surrounding the introduced, internationally marketed commodities has a complex history of its own. It has often involved mimicry, yet with suggestions of ritual. Closer to contact, for instance, isolated villagers began setting their own imitation tables with wooden copies of knives and forks. In later colonial times, with new jobs available and liquor restrictions removed, islander office workers could put on the airs of sophisticated white drinkers in hotels, uncharacteristically sitting with crossed legs and drooping cigarettes. Experimentalism abounded. Setting up a store to become wealthy enticed many, yet businesses commonly failed because the owners expected magical results, and their relatives quickly absorbed the earnings. Islanders often combined the new technology with traditional causal beliefs. For instance, Melpa highlanders have been known to sacrifice chickens when their trucks break down, and some bureaucrats have become convinced they have been bewitched through their computers.

The remarkable effect of Christian missions in Oceania influenced the transculturative processes involved in the massive shift to a universal religion. A number of transformations deserve special recognition. One is epistemic—traditionalist islanders and incoming Christians shared a general worldview in terms of retributive (or “payback”) logic, but each supposed their grasp of its operations was correct. *Indigenes* supposed, for example, that trespassing into spirits’ sacred groves and lairs would mean certain death; when missionaries, without this fear, did trespass without dire consequence, they were taken to possess a superior understanding of how the world worked, even while they had their own assumptions about sacrilege. Again, islanders explained most sicknesses and deaths in terms of spiritual causes and damaged relationships with deities that provoked ancestral punishments. Results of the missions’ modern health services, however, often defied such expectations, even while Christians taught that bodily blessings derived from relying on “the true God.” Consequently, knowledge passed on at initiations could not compete with a mission education.

In some earlier civilizations in Polynesia with kings as rulers, the long-term establishment of Christianity followed the *dénouements* of major wars. In Tahiti in 1815, Pomare II, who had lost power because of the emergent cult of the war god Oro, regained it in a holy war with the backing of the London Missionary Society (LMS) from the Leeward Islands. In Tonga, the powerful, pro-Christian secular chief Taufa’ahau, who dominated the Ha’apai, subdued his enemies by 1837. He unified the conquered peoples by first assuming the role of the supreme sacral kingship of Tu’i Tonga (1852), and then by attempting to place the Wesleyan Mission under his divine rule (although he had only partially succeeded by 1875).

Conversion to the new religion mandated by high-level, local decision-makers also occurred in other places: in

Hawai’i under Kaahumanu in 1822, for example, and in Fiji under Cakabao in 1854). Legitimatization of local rule by missionaries prior to colonization was often marked by the acceptance of royal insignia (e.g., whales’ teeth on Fiji), signs of authority which became very important when royal courts and councils of chiefs had to negotiate European annexations. Although missionaries disdained beliefs and rites that appeared to contradict their faith, they sometimes worked to save the culture by solidifying a weakened traditional government, as did Benjamin and Lydia Snow in the Marshall Islands in the 1860s.

More generally, religious change occurred through evangelically charged, politically disengaged individuals. Many pioneer “European” missionaries have stolen the historical limelight, but an immense unknown number of islanders also chose to participate in the evangelizing process. Important centers sprang up for the training of islander evangelists; with the eastern Pacific being evangelized first, the emissaries have generally moved westward. Thus, Takamoa and Malua Theological Colleges, established by the LMS on Rarotonga (Cook Islands) in 1839 and Apia (Western Samoa) in 1844, respectively, have produced both preachers and teachers that exposed Melanesia to the new faith. Many of these evangelists—103 out of 203 of the pioneer Polynesian LMS personnel—died in dangerous and malaria-ridden places, unfortunate deaths that were taken as signs of spiritual vulnerability in Melanesian cultures. Methodist Fijians were prominent among the earliest Melanesians to work among their fellow black islanders to the west (notably in New Britain and Bougainville).

These islander missionaries on Melanesia created a three-tiered chain of “pastoral power,” which was comparable to colonial military structures. The religious hierarchy, however, set an example for ways that people other than the “white masters” could lead congregations. In western Melanesia, Indonesians filled these mediating roles; the Dutch Reformed missionaries typically deployed Ambonese, and the Catholics sent Flores Islanders. Melanesia did experience a time lag, however, before the highly populous and volatile highlands received missionaries in 1920; various coastal Melanesians were entrusted with this “frontier” activity. Devout Lutheran converts from the Huon Peninsula became the first native evangelists to the eastern highlands of Papua New Guinea, and rather aggressive Gogodala preachers were sent by the Unevangelized Fields Mission into the southern highlands. Throughout Catholic mission history in Melanesia, many catechists were trained to perform non-clerical religious duties in dispersed villages that were visited infrequently by expatriate missionaries. As celibacy was required of its religious, though, the Catholic Church always dawdled in the creation of indigenous clergy—in a world of island societies that expected everyone to marry. Nevertheless, new orders have been created in the region, such as the 1935 founding of a sisterhood called The Handmaids of our Lord in Papua. And in 1925, the Anglicans founded the Melanesian Brotherhood in the eastern Solomon Islands.

Overall, the European and American overseas missions have established mainstream Christian denominations throughout the Pacific Islands. Historical circumstances usually caused different church traditions to predominate in different areas. Once a given mission gained a foothold in a particular region, not even colonial shifts could readily change it. France, for example, which generally favored Catholic mission activity, did not deter LMS-originated Protestantism in Tahiti (with its famous “Temple,” famous for choral competitions, in Papeete) or in the Loyalty Islands (part of France’s Oceanic province of New Caledonia). Germany’s takeover of New Guinea in 1885 resulted in strong Lutheran and Catholic missions, especially on the mainland, but did not prevent the growth of Methodism (after the pioneering work of Australian George Brown) on the islands of New Britain and New Ireland. How these missions established themselves sometimes depended on formal agreements. At a time of comity between missions in the British Empire, for example, the Governor of British New Guinea (or Papua) Sir William McGregor negotiated spheres of influence for missions within his jurisdiction in 1890. As a result, the LMS work expanded along the southern coast where Catholic missions were not already established, while the Anglicans consolidated in the northeast and the Methodists further east again, in the Trobriand Islands. Not being party to this agreement, and with a lot of non-British personnel, the Catholics managed to evade this arrangement to their advantage, however, as did the Adventists.

Each mission’s presence in a given region generated group loyalties, which are often reflected in the provincial organizations of the newly independent Pacific nations; the groundwork of new social strata was laid through mission schooling and indigenous ministries; and distinctive expressions of Christianity arose that often reflected the primacy of the first cultures affected in a given region. In the Papua, for instance, annual ceremonies of LMS-originated churches along the coast are largely modeled on the Motu traditional exchange ceremony—called *bobo*—because the Motu were the first converts. In Catholic areas, the short, less schooled, and more aggressive Papuan Highlanders, called “bush kanakas,” have often suffered in comparison to the tall, educated, coastal Mekeo, who have had a longer experience with the outside world and who dominate the betel-nut market in the capital city of Port Moresby.

All throughout the Pacific, distinctive regional expressions of mainstream Christianity abound. What would a Samoan or Tongan Christian funeral be without the proverbial exchange of woven mats? How would agreements between secular and ecclesiastical leadership be achieved in central Polynesia and much of eastern Melanesia without sharing the common cup of pressed *kava* root? Dramatic reenactments of tensions upon the arrival of the first missionaries—of Methodist minister Dr. Bromilow on Dobu Island in east Papua in 1891, or of Anglican bishop George Selwyn on Santa Ysabel in the central Solomons in 1862—become annual celebrations in particular places.

Moreover, local rituals have become complicated due to varying limitations placed on the interaction between gospel and culture. In the central New Guinea Highlands, for instance, at the Wahgi people’s great pig-killing festivals, in which a host tribe gives with astounding generosity to non-hostile tribes around it, a wooden cross will often be planted on the dance ground and a Catholic priest will open proceedings with a blessing. Members of the Swiss Brethren’s mission, on the other hand, would prohibit their adherents from attending these ceremonies. Across the Pacific Islands, pork and crab have been familiar dietary components, yet the Seventh-day Adventist Church, which has proportionately its largest following in the Pacific, proscribes such food in accordance with the Levitical code. Consequently, the first outward sign of any Adventist village is the presence of foreign livestock—especially goats and cattle.

As the churches grew, the model of the Christian village usually prevailed. Both the government and the mission discouraged dispersed hamlets and encouraged larger communities, often nestling around well-kept places of worship. This proximity did not prevent various frictions, however. Sorcerers, especially in Melanesia, had once been accepted as useful agents to retaliate against enemies in other tribes; now, however, the new peace was disturbed by the unnerving possibility that the remaining sorcerers could be paid to perpetuate evil acts for jealous and disgruntled families within the same village. Similarly, denominational or sectarian differences and tensions often disrupted rural peace, occasionally dividing villages. Group reactions also arose from dissatisfaction with the outcomes of introduced religion. In Polynesia and Micronesia, where both hierarchical social structures and cosmologies pertained, unsatisfied groups often responded to dissident prophets who accentuated the lack of spirit power in ordinary church life. Thus, in these regions, missionaries could gain new followers on the pretext that a prophet has an extraordinary access to heaven’s blessings. For example, between 1930 and 1932 on Onotoa (now part of Kiribati), the prophet Ten Naewa tried to outwit the LMS missionaries by announcing that God would descend in person, and he himself “fathered” the Father’s arrival, as he led his waiting “Sheep.” In Melanesia, however, where cargo cults were more prevalent, the common complaint was the churches did not bear material results (pidgin: *kaikai*, or food). In the Solomons before World War II, local prophets such as Sanop, on Bougainville, announced the arrival of rifles, motor cars, and aircraft that were delivered by ancestors, thus rendering the colonial authorities unnecessary.

Eventually, independent churches emerged—many with indigenous leaders who rejected the mainline forms of Christianity as foreign. In Melanesia, where over twenty such churches have emerged, a third of them originated in cargo movements. Others stress concrete experiences of faith, such as dreams, visions, or collective ecstasies; the latter are notable among members of the Christian Fellowship Church, in New Georgia, the Solomons. This church was once led by

the white-robed “Holy Mama.” In Polynesia, independent church leaders are commonly believed to have direct access to heaven or to have come down from the heavens. The Maori church, founded by Ratana in 1928, accepted him as God’s “mouthpiece”; prominent in this church’s iconography is a ladder linking an airplane (representing heaven) with a car (representing Earth). In 1985, the LMS Cook Islands Christian Church began to attempt to heal a long-standing internal rift, caused by a remarkable female healer named Apii Piho and her followers, who believed her claim that she was Jesus.

The resilience of traditions in certain pockets of the Pacific has sometimes kept Christian influences at bay. Virtually all the strong neo-traditionalist movements are in Melanesia, and some of these are cargo cults. Latter-day followers of the large movement in Madang (north-coastal New Guinea) during the 1950s and 1960s maintained that the indigenes should be left to develop their own salvation stories, in which the ancestors and cult founder Yali are the heroes, rather than the Biblical prophets and Jesus. In the Solomons, on the western and southern parts of Guadalcanal, one Moro sect has created a movement—complete with its own schools—that is deliberately designed to preserve tribal culture and keep out Western influences. Not far to the north, the mountainous center of Malaita is home to the Kwaio, who reject any “Christian interference.”

All these expressions of independence, as well as the many different varieties of indigenously generated new religious movements in the Pacific, have shown that islanders believe in expressing religiosity in their own cultural terms. Tensions and altercations at the village level have inevitably served to instruct churches in the Oceanic region, preparing them for their own self-determination. In intercultural relations, the balance of forces until the end of the twentieth century favored preserving sound beliefs and practices borne by the West. Religious leaders wanted to ensure that the different peoples receiving the Christian message were properly acculturated and did not lapse into the curious misunderstandings that had produced “cargo cults.” They made some concessions, however, in terms of sculpture (of crucifixes, for instance) and architecture (Port Moresby’s handsome Catholic cathedral, designed in the shape of a Sepik *haus tambaran* [spirit house] in 1967). A few missionaries, such as Maurice Leenhardt—Protestant pastor to the Houailou on eastern New Caledonian mainland in the 1930s—asked themselves whether they had learned more from “the natives” than they taught them. Others, such as Percy Chatterton, submitted to the spirit of independence arising from local congregations; he quietly facilitated the post-LMS *Papua Ekalesia* (Church of Papua), the first independent church of mainstream background in Melanesia formed between 1963 and 1968. The local people’s confidence in their own leadership eventually caused a decisive shift away from church communities operating under mission control toward regionally autonomous ecclesiastical structures, or separate Catholic epis-

copies, under islander supervision. By the early twenty-first century, the prevailing missiological discourse stressed inculturation, or the advisability of imbedding the gospel into the local culture, both honoring the latter’s pre-existing values while also transforming and redeeming its weaknesses from within.

The general movement towards national ecclesial emancipation—or, rarely, transnational status, as with the United Church in Papua New Guinea and the Solomon Islands after 1968—proceeded with the emergence of new political independencies in the region. Excluding New Zealand (1947), the newly decolonized nations—Western Samoa (1962), Nauru (1968), Fiji (1970), Papua New Guinea (1975), Solomons, (1978), Kiribati (1979), and Vanuatu (1980)—have been governed by indigenous leaders. Even where independence has not been achieved (with France and the United States as the two notable powers prolonging their possession of Pacific islands), national churches have been created, such as the *l’Église évangélique* in France’s New Caledonia or the United Church in the Marshall Island in American Micronesia. Whether politically autonomous or not, the whole region has increasingly become affected by monetarization, foreign investment, and transnational companies’ pursuit of opportunities in the metal, oil, gas, and timber industries. For example, one of the world’s richest copper deposits is on Bougainville; natural gas is now piped out of the Lake Kutubu area in Papua New Guinea’s Southern Highlands; while New Caledonia has become well known for its extensive nickel deposits.

Pacific islanders have embraced modernity in highly varying ways. Money has become the medium of exchange in towns and cities, but is still used in tandem with traditional valuable items (such as mats, shells, feathers) in villages and in rites (especially marriages and funerals). In rural areas, money can therefore be incorporated into ritual life and suggest new ritual forms. Old coins seem to circulate forever within single villages through ritualized gambling games. Money can now be pinned on a branch by New Guinea highlanders and paraded as a “money tree” to apologize for a killing or a road accident in a specific tribal area—quite an innovation, since compensation payments in kind were traditionally exchanged between allies, not adversaries. Some late-twentieth-century cargo cults were actually money cults; the followers were persuaded that the money that was already in the red boxes held by the leaders would multiply through weekly rituals. Overall, the islanders’ quest to make money has been strong, however. Sepik craftsmen have sold traditional effigies of the dead for money and have carved spirit figures for the tourist market. *Hula* dancing to entertain tourists in Hawai’i exemplifies adaptation of local dance forms in order to earn money from visitors. Even in rural areas, today’s leading dance performers in traditional ceremonies would compete for prizes at town shows or the privilege to represent their nation at Pacific arts festivals.

Success in business and in the modern economy, although reserved for the few, has had religious consequences.

Protestant Tongans employed in Honolulu or Sydney, for example, or Cook Islanders in Auckland, have started important diaspora congregations, importing their pastors from their home regions. In Melanesia, capitalist success may sometimes cause a business leader to develop political aspirations, yet those ambitions inevitably lead him or her to the traditional cultivation of dependents through the practice of generous gift-giving as a neo-traditional “big-man.” Wealthy people may build large new houses in their home villages, only to find themselves the objects of jealousy and thus of paid sorcery attacks. In this context, the persistence of sorcery can be defended ideologically as a social equalizer to counter the inequities that threaten old reciprocities and village values.

Religious factors also influence modern Pacific politics. National constitutions typically invoke the supreme God, sometimes along with a worthy customary inheritance. Clergy have also achieved political prominence, such as Anglican Fr. Walter Lini, first Prime Minister of Vanuatu, or Catholic Fr. John Momis, the foundation Minister for Decentralization in Papua, New Guinea. Furthermore, internal military conflicts have sought religious inspiration. The Papuan Liberation Army (OPM) partly legitimates itself as a defense of Christianity against what is perceived as Indonesia’s neo-colonial promotion of Islam, and its members look to the collective martyrdom of followers of the prophetess Anganita under the Japanese in 1943 as an inspiring precedent for their actions. In the Solomon Islands, civil strife in the late twentieth century, as well as religious differences between largely Anglican Malaitans and mostly Catholic Guadalcanalese, exacerbated the clash. In such post-colonial conflicts, political slogans have carried neo-traditional religious import. From 1990 to 2003, ideologues for the Bougainville Liberation Army, for example, fought for the independence of Bougainville as *Mekamui* (the Sacred Island). More generally, throughout what is a predominantly peaceful region, thinly disguised appeals to Christian principles often lurk behind the apparently secular political agendas of new national parliaments promoting better health, education, and social security.

Despite frustrating realities sometimes experienced by many outsider investigators, especially anthropologists, the Pacific Islands are remarkable for their strengthening indigenous Christianity. As a result, traditional cultures are being transformed, and, rather than being devastated, showing their resilience in change. Contrary to some historians, outsiders did not destroy Pacific cultures. While terrible epidemics did make many island communities very vulnerable, by and large, the missionaries did not impose religious change by force, and the islanders can no longer be preconceived as credulous, lacking any ability to make sensible decisions of their own. In fact, cultural relinquishments sometimes occurred spontaneously. LMS personnel, for instance, encouraged the preservation of the Motu people’s harvest festival, during which worshipers wore extraordinary fifteen-

foot high masks. When the Japanese unexpectedly bombed Port Moresby in 1942, however, the Motu never celebrated the festival again—not because they were forced to give it up, but because it had somehow lost relevance in a changing world.

Oceania’s religious scene in the early twenty-first century should be assessed for what it has become. Anthropologists can now begin evaluating specific congregations; observing sociological differences in the region, such as the sedate, hierarchical Polynesian churches compared to the dynamic congregations of Melanesia, with their spiritistic and charismatic worship; and studying indigenous theological endeavors and liturgical innovations, appreciating them as important new developments within the wider world of religious affairs.

GARRY W. TROMPF (2005)

TRANSMIGRATION denotes the process by which, after death, either a spiritual or an ethereal, subtle, and thinly material part of the personality, leaves the body that it previously inhabited; it then “migrates” to enter (i.e., is reborn in) another body, either human or animal, or another form of being, such as a plant or even an inanimate object. Other terms often used in this context are rebirth, especially in connection with Indian religions, *palingenesis* (from Greek *palin*, “again,” and *genesis*, “birth,”), metempsychosis (from Greek *meta*, “again,” and *psychê*, “soul”) and, increasingly in modern popular parlance, reincarnation (from Latin *re* “back” and *caro*, “flesh”). Manichean texts in Syriac use the expression *tašpikha* or *tašpikha denafshata*, corresponding to Greek *metangismos* (from Greek *metangizesthai*, “pour from one vessel into another one, decant”; similarly, Latin *transfundi*) and conveying the underlying notion of a transfusion or change of vessel whereby the soul is “poured” from one body into another. The Latin church father Augustine of Hippo (354–430) in his anti-Manichean writings also uses the

noun *revolutiones* and the verb *revolvi*, which happen to be identical with the later qabbalistic technical term *gilgul*: the soul “revolves” (i.e. rotates) through successive bodies. Earlier qabbalistic terms were *sod-ha-’ibbur* (“the mystery of transition”) and *ha’ taqah* (“displacing, changing place”), the latter equivalent to the Arabic *tanasukh*.

It is obvious that the notion of a non-physical entity (soul) existing separately from the physical body is assumed by most beliefs that posit an afterlife. The detailed elaboration of other cultures’ views of afterlife and transmigration depends on the psychology and anthropology of those cultures, explicitly or implicitly. Thus the word soul may mean the whole human minus the body or a special substance or collection of substances non-physical in nature. In the former case, it is the whole albeit disincarnate person that survives (and goes on, for example, to the underworld, the land of the dead); in the latter case it is a specific soul-substance that persists and returns to its ancestral or heavenly home or haunts the living or is reborn. Many belief systems, especially among non-literate societies, know of multiple souls, but the idea is also not uncommon in literate societies: examples include the *ba* and *ka* of the ancient Egyptians, the oldest Greek *psychê* and *thymos*, and the fivefold division among contemporary Jewish qabbalists (*nefesh*, *ruah*, *neshamah*, *hayyah*, *yehidah*).

Unfortunately, contemporary knowledge of most small-scale indigenous cultures is often based on the information of single informants and passing travelers, but rarely on the sustained investigation of an anthropologist remaining in a culture for many years. The once-predominant idea among anthropologists that a single informant could be sufficient to “decode” a culture has proved to be a profound mistake, and it should be noted while using such sources that much of the information is incomplete. Even the material from older literate civilizations is not always that easy to analyze. The fragmentary character of the texts and the modern, often Christian and philosophically influenced ideas about the soul and the body tend to color interpretations and should preclude facile conclusions. Last but not least, scholarly approaches often tend to present a uniform picture (the Christians believe, the Buddhists believe, etc.), whereas especially in eschatological matters people often have their own private ideas. One final point is the appropriateness of the terminology of reincarnation or rebirth. Although it is used here in order not to complicate an understanding, it must be stressed that the terms regularly, especially in Africa, do not presuppose that the ancestors now leave the area of the dead, or how the afterlife is imagined. On the contrary: ancestors may reincarnate but they often do stay present in the world of the dead as well. In other words, among many communities there is a belief that the ancestors have a multiple presence, in this world and the world hereafter.

ORIGIN OF CONCEPT. Edward Tylor (1832–1917), one of the fathers of social anthropology, was perhaps the first modern scholar of transmigration, but he still interpreted his ma-

terial in an evolutionary key, starting with the birth of the concept of the soul. Yet that stage in human history is unrecoverable and speculations in that direction are rarely fruitful. A modern approach should look at the geographical spread, the nature, and the functions of transmigration in society. This survey will examine first non-literate societies and progress to the major literate cultures and modern Western society.

CROSS-CULTURAL OVERVIEW OF NON-LITERATE SOCIETIES. The acceptance of the belief in some form of transmigration or return of the dead person to terrestrial life is a widely occurring concept that is evident in many cultures. Whereas older studies often claim that there is little evidence of belief in transmigration in most non-literate societies to the extent that they have been reliably and systematically studied by ethnologists, contemporary studies have uncovered a wealth of evidence to the contrary. This new research has been especially successful in America, where evidence suggests that such beliefs once were present among all North American Indian tribes. The first notices go back to the earliest stages of contact with European arrivals to the continent. For example, it was recorded in 1636 that the Hurons believed a human soul can return into the body of a child, as evidenced by the child’s strong resemblance to a deceased person. The prevalence of this belief among the Northwest Coast Indians and the Inuit strongly suggests that here was the development of an ancient cultural complex, which may have been introduced by the first American immigrants who came via the Bering Strait. There is less evidence of this in Middle and Latin America, and the evidence becomes even scarcer in investigations into the cultures of the southernmost region of Latin America.

About Africa, there are mentions of reincarnation ranging from quite extensive reports to mere scattered observations. Not surprisingly they seem to be limited to the south of North Africa where the adoption of Christianity and Islam likely prevented the survival of older beliefs in this direction. It seems that in West Africa, especially, the belief in reincarnation was prevalent. The beliefs can assume various forms. In many instances, there is the belief that a recently and honorably deceased ancestor—a warrior, for example—is reborn in a baby, although the connection with the ancestor becomes weaker as the child grows. There also seems to be a gender aspect to the belief, for some tribes, like the Konkomba, stress that women reincarnate, too. The Nigerian Yoruba believe that every living person is a reincarnation. Apparently, the encroachment by Europeans even incited some Akan to formulate a belief in a return as white people, as the Dutch traveller Willem Bosman (b. c. 1672) noted.

The existence of a belief in reincarnation among the Australian Aranda (Arunta) was the subject of a vigorous debate in the early 1900s between Baldwin Spencer and Frank Gillen, on one side, and German missionary Carl Strehlow, on the other, who disputed the findings of the former. Yet the outcome seems to be that here, too, reincarnation exist-

ed, even though rather by mythical ancestors than by “real” people. The fact that several neighboring tribes mention a reincarnation of ancestors supports the interpretations of Spencer and Gillen.

In the area of Melanesia, Micronesia and Polynesia, many tribes tell about reincarnation, but the best information comes from the Trobriand Islands, where Bronislaw Malinowski (1884–1942) carried out detailed investigations in the framework of his interest in the islanders’ sexual lives. As he noted, the inhabitants explained pregnancies as the reincarnation of ancestors.

There is more information regarding Siberia, the Arctic and the subarctic circle, where the belief in reincarnation was virtually ubiquitous. Here shamanistic “theology” even stressed that shamans could remember their former lives and some were able to show scars of their former lives. Among the Jakuts it was rather exceptionally believed that one could be reborn even outside one’s own tribe. In general, it is the ancestors who were believed to return.

From this survey, it follows that the belief in reincarnation is evidently very old. It is less easy to understand, though, why it was originally absent from Egypt and the ancient Near East, from ancient Japan and China as well as from the Indo-European peoples. Unfortunately, contemporary knowledge of the roads by which beliefs have traveled in prehistory are so obscure that explanations of this geographical spread can only be speculative.

There is more certainty about the nature and function of this belief in reincarnation, however. Firstly, there is a distinction between the transmigration of a deceased person into an animal and the reincarnation into a person. The former is much less current than the latter, but it is well attested. Among some Alaskan Inuits, for example, it was believed that the souls of the dead migrated into their dogs. On the other hand, the most frequent belief is that the birth of a new child signifies the rebirth of an ancestor. From the ancestors, it is nearly universal that it is usually a deceased grandparent who is the favorite incarnated person, as is also indicated by the identity of the name; in West Africa the identity between ancestor and reincarnated child seems particularly marked. Through the reincarnation the young child becomes incorporated, so to say, in the ancestral line, which reinforces or creates new kinship relationships; reincarnation is very much a social process. This identity between ancestor and young child often is so strongly linked in some cultures that corporal punishment of children was prohibited out of respect for the ancestors. At the same time, the ancestor functions as a kind of guardian spirit for the youngster.

In addition to being evidence of an older ancestor, a newly born baby is sometimes perceived as the reincarnation of a previously deceased young child. It is plausible that this belief has originated in an attempt to comfort parents regarding the loss of an earlier child.

INDIA. The notion of transmigration and reincarnation is a pivotal aspect of the general socio-religious belief system in

India. In the Hindu religious tradition, the concept of transmigration is a vital aspect of the cultural milieu and has played a dominant role in shaping the actions, ethics, and ideologies of the people. Thus, the Indian subcontinent and the cultures influenced by it are dominated by the notion of *samsāra*, “what turns around forever,” the wheel of birth and death. Whereas in the West the idea of reincarnation was always felt to be something exotic, strange, and at any rate required special justification, in India it came to be an accepted presupposition of life.

The history and development of this notion are not yet quite clear. However, there is consensus that the weary round of *samsāra* is not yet part of Vedic religion. The *locus classicus* of Indian reincarnation can be found in two parallel passages of the oldest Upaniṣads (*Brhad Aranyaka Upaniṣad* 6.2 and *Chandogya Upaniṣad* 5.3–10), which mention reincarnation and salvation. The fact that the notion was taken for granted—and indeed even made the basis of their respective doctrines of salvation—by Jainism and Buddhism suggests that by the sixth century BCE it was already widespread in India. Among the presuppositions of this doctrine is the notion that space and time are endless. The identity of the self depends on (moral) karmic determinants. Life is an unending, eternal, weary round of suffering, governed by an automatic causality of reward and punishment (*kamma*) that takes the soul from one existence to another through all six spheres of being, from that of the gods to that of “hungry spirits” and demons.

In Indian religious sensibility the emphasis is not so much on the duality of life/death as on birth/dying. The problem about rebirth is that of necessity it also implies “re-dying,” that is, death recurring ad infinitum, unless a person succeeds in escaping from the vicious circle of *samsāra* (also depicted iconically as the monstrous wheel of unending existences, the *bhavacakra*, and described graphically in the Buddhist Avadana and Nidana literature) into ultimate liberation (Hindu *mokṣa*, Buddhist *nirvāṇa*). It should be emphasized that the ultimate goal (*artha*) is release and escape; the heavens (*svarga*) are still part of the samsaric world. Doctrinal differences of opinion relate to the method of liberation (yoga, mortifications, the “middle path”) as well as to the precise definition of the liberated state.

The descriptions in the *Brhad Aranyaka Upaniṣad* 6.12.15f. (cf. also *Kausitaki Upaniṣad* and *Mundaka Upaniṣad*) still exhibit a somewhat mythological character. Those who have achieved perfection and have realized their true self go, after death, the “way of the sun,” namely, the path of the gods (*devayana*): they enter the abode of *brahman* (*brahmaloka*) never to return again. Those who have not achieved ultimate self-realization but have lived a life of sinless piety and devotion, through sacrifices, penance, and charity, go along the path of the ancestors (*pitryana*) to the world of the moon, where they become rain and subsequently food: “Gods feed on them, and when that passes away from them, they start on their return journey to the reborn

as human beings. . . Thus do they rotate.” Evildoers are reborn as insects and vermin. According to the *Chandogya Upaniṣad* 5.10.7, they are reborn as dogs and pigs. As has been noted above, heaven too is part of the samsaric cycle, and hence gods too are reborn, even as human beings can be reborn as *devas*, to be subsequently reborn once again.

What or who exactly is it that is reborn? Unorthodox sramanic teachings as well as Upanisadic speculation provide a varied technical vocabulary (*atman*, *jiva*, *purusa*) to deal with the questions of empirical ego, real self, and so forth. Some systems of thought conceive also of spiritual entities in terms of a subtle, ethereal matter; one such example in Western history would be the Stoics.

Jainism. In the Jain system, the living entity is called *jiva* (the eternal “soul” or “life”), and it is doomed to unending rebirths as long as it is covered and encumbered (as if by a thinner or thicker film) by *kamma*, which is conceived as a kind of fine matter. The generation of new *kamma* must be stopped, and the accumulated *kamma* already present must be removed if liberation is to be achieved. That such liberation can be achieved is demonstrated by the line of *jinas* (lit., “conquerors”).

Buddhism. The Buddha left no writings himself. Because Buddhist teachings were written down much later, the oldest stage of Buddhist teaching about transmigration is unknown. The fascinating problem of Buddhist doctrine concerning karmic rebirth arises from the fact that Buddhism denies the existence of an *atman*—that is, self, or ego-substance beyond the empirical ego, which is a transitory combination of “heaps” of “elements” (*skandhas*). Regardless of whether the anti-Brahmanic doctrine of *anatman* (“no-self”) was already explicitly taught by the Buddha himself or was developed later, it is a central concept of historical Buddhism. It is clear, though, that reincarnation did not yet occupy a position of prime importance in the teachings of the Buddha himself, but was elaborated in minute detail only by his later pupils, as in the *Abhidharma Pitaka* of the Pali-canon.

Tibet. The application of the doctrine of rebirth in Tibet, a culture decisively shaped by one particular form of Buddhism, deserves special mention because of its relevance to the social system and its political institutions. Buddhism was established late in Tibet, not before the seventh century CE. However, it would last to the fifteenth century before the characteristic connection between the worldly and spiritual powers started to receive its well-known contemporary form. Whereas initially it was only the leader of one of the many monk communities whose rule was determined by reincarnation, in the seventeenth century Mongolian support stabilized the rule of the Dalai Lama, which endured until the Chinese conquered Tibet in 1951 and eliminated the theocracy. The influence of the exile of the renowned fourteenth Dalai Lama on the Tibetan ideas of reincarnation still remains to be properly assessed.

GREEK RELIGION. Reincarnation in ancient Greece was “invented” by Pythagoras, an aristocrat from Samos, who came as an exile to Croton in southern Italy around 530 BCE. Here he developed his teachings about reincarnation that are only vaguely known, due to the fact that no writings of Pythagoras himself have been preserved and his community was almost completely massacred in the middle of the fifth century BCE. Yet his contemporary Xenophanes of Colophon (sixth century BCE) (fragment B 7, ed. Diels/Kranz) already told the following, uncomplimentary anecdote: “And once, they say, when he passed by a dog which was being maltreated, he pitied the animal and said these words: ‘Stop! Don’t beat him! For he is the soul of a friend whom I recognized straightaway when I heard his voice.’” Regrettably, it is not known how often Pythagoras thought of a reincarnation, but both Pindar (fragment 133, ed. Maehler) and Plato (*Phaedrus* 249a) speak of three times, of which the first reincarnation has been occasioned by a mistake in the underworld. Aristotle (384–322 BCE) notes: “as though it were possible, as in the tales of the Pythagoreans, for just any soul to clothe itself in just any body.” Apparently, Aristotle thought that Pythagorean reincarnation went from body to body, but the mid-fifth-century philosopher Empedocles clearly taught differently, as he wrote: “already I have been a boy and a maiden, a bush and a bird and a fish jumping up from the sea” (fragment B 117, ed. Diels/Kranz). This process could last an extremely long time, as Empedocles speaks elsewhere of wandering “thrice ten thousand seasons” (fragment B 115, ed. Diels/Kranz). The origins of Pythagoras’s views are unknown. Earlier generations of scholars liked to connect him with Buddhist views as he was nearly a contemporary of Buddha, but the down dating of the Buddha (above) has made this improbable. It seems possible, however, to isolate a few factors that may have played a role to a smaller or larger degree.

First, reincarnation could only come about when the Greek concept of *psychê* had developed into humankind’s immortal self. It seems indeed that Pythagoras was also the first Greek to develop this particular idea of the soul. Second, the aristocratic Greeks were historically more interested in group survival than in personal survival. Yet at the end of the archaic period, there seem to be signs of an increasing interest in a more personal form of survival. Reincarnation can be seen as a more radical answer to this general development. Pythagoras’s loss of political power around 500 BCE may have been an extra stimulus for developing the doctrine of reincarnation, since the survival of the soul singled out those reincarnated from those who were not. In other words, the doctrine may have been a kind of comfort to those of his pupils and friends that followed him into his exile. It might echo in the thesis of Max Weber (1864–1920), which posits that the rise of religions of salvation, such as Christianity, was also the consequence of the depoliticization of the educated classes.

It was probably only a short while after Pythagoras that somebody in southern Italy developed a new set of doctrines

and practices which were promulgated not under their own name but that of the most famous singer of the Archaic Age, Orpheus. The so-called Orphics introduced vegetarianism, and modified existing Bacchic mysteries. At the same time they also produced new teachings (1) on the coming into being of the cosmos, gods and humankind; (2) on eschatology; and (3) reincarnation. Pindar (fragment 133 Maehler) already declares that the best roles in future incarnations will be for those “from whom Persephone accepts compensation for ancient grief (viz. because the Titans had killed her son Dionysos)” and this “ancient grief” is also alluded to on recently found Orphic Gold Leaves. On an Orphic bone tablet that was found in Crimean Olbia c. 400 BCE, the terms “life-death-life: truth; Dio(nysos)-Orphik(?oi)” are legible, and in his *Meno* (81a) Plato (c. 428–348 or 347 BCE) attributes the doctrine of reincarnation to “priests and priestesses who try to give an account for the functions of their activities,” that is, to wandering Orphics. It is part of this doctrine that the body is looked at rather negatively and considered to be the “prison of the soul.”

As with Pythagoras, there are few particulars about Orphic reincarnation, but it is certain that Plato used Pythagoras and the Orphics. His views on reincarnation have to be deduced from his dialogues, whose temporal order still is debated. It seems that in his oldest dialogues Plato still is not completely convinced of the reality of reincarnation, but in the middle ones (*Phaedo*, *Phaedrus* and the *Republic*) the doctrine has become an important part of his eschatological views, even though the content varies depending on the dialogue. It is important to note that Plato’s *Phaedo* gives evidence of the important process of ethicization, to use the term employed by Gananath Obeyesekere (2002), in which the bad receive a bad reincarnation (into animals) and the philosophers go to the gods.

Plato’s ideas were rejected by some of his pupils and Aristotle, but the Pythagoreans carried them into later antiquity. The doctrine is found with philosophers like Plutarch (before 50–after 120 CE), the *Corpus Hermeticum*, and the so-called Chaldaean Oracles, but it became far more influential among the Neoplatonists like Plotinus (205–270 CE) and Porphyry. Unlike Plato, the former even considers a reincarnation into plants a possibility. Moreover, Plotinus clearly had precise thoughts about the different stages of reincarnation. Whereas the first rebirth is seen as an entry, the subsequent ones he calls *metensōmatōsis*, or “re-embodiment”; people can remember their previous lives, and there is no liberation from the cycle of rebirths. Later philosophers had much difficulty with the thought of a transmigration into animals and it is striking that in the second half of the sixth century, Olympiodorus, one of the last Neoplatonists, rejected the doctrine of reincarnation.

CELTS. According to Caesar in his *Gallia Wars* (6.14) the Druids believed that souls did not perish but wander after death; for this reason Clement of Alexandria (*Stromateis* 1.15) already compared them with the Brahmins. As reincar-

nation was clearly not part of Indo-European traditions and there is little reliable evidence about such views in medieval Celtic literature, the Druids may well have taken over Greek views, perhaps via Massilia (Marseilles). Unfortunately, there are no further detailed sources, and this intriguing possibility remains an unsubstantiated one.

EARLY CHRISTIANITY. The early Christians firmly believed in the resurrection of the body and therefore opposed the doctrine of reincarnation. Although there were a few exceptions that were prepared to consider its validity, such as Origen, even he came to a negative conclusion. In the second and third centuries CE, especially, church leaders tried to refute the belief, but around 400 CE reincarnation no longer played a role in the internal and external Christian debates. Apparently, this decline in polemics went hand in hand with the loss of pagan interest in reincarnation.

It was different with the Gnostics. They opposed the idea of resurrection, and thus it is hardly surprising that some of them—in particular the Carpocratians—were more sympathetic to reincarnation, even though they limited its numbers. It seems possible that the Gnostics had reinterpreted the older Greek beliefs in a more optimistic way, but the fact that the Gnostics are viewed in this respect only through the prism of Christian theology makes every interpretation a somewhat dubious affair.

MANICHAISM. Manichaeism is the only world religion that has disappeared. It was founded by Mani, who was probably born on April 24, 216. He was may have been descended from Persian aristocracy but certainly grew up in a Jewish-Christian group, the Elcasaites, and died in 277 in a Persian prison. His followers carried his beliefs to the West, where they found in Augustine a temporary convert, and to the East, where they were more successful. Via the Silk Road, Manichaean faith traveled to China, where the last Manichaeans probably died in the sixteenth century. Mani worked in a geographical area that was influenced by Zoroastrian, Jewish, Christian and Buddhist views and this plurality makes it difficult to isolate the precise origin of many of his ideas. The difficulty is compounded by the need to reconstruct the Manichaean doctrines from a whole series of languages, ranging over many centuries from Latin and Coptic until Sogdian and Chinese.

The Elcasaites community in which Mani grew up practiced vegetarianism, which in antiquity often went concomitant with a belief in reincarnation. Indeed, a Christian source reports that one of the Elcasaites, Alcibiades, taught that Christ had experienced already many a rebirth before being born from the Virgin Mary. This information points to a Greek origin rather than an Indian one, as later Arab historians suspected.

The Manichaeans taught that the soul could be reborn in humans, plants and animals. The aim was to be reborn in an elite Manichaean, a so-called *electus*, and in this way to become liberated from the cycle of rebirths. It is clear that

the Manichaeans dreaded their rebirths, as they could become birds, mice, or even grass.

ISLAM. From the eighth century CE onward, Islam received a clear impetus regarding the doctrine of reincarnation from the Manichaeans and Neoplatonists. Yet whereas conventional Islam strictly rejected reincarnation, “heretical” currents embraced the doctrine, in particular the Syrian Alawites, the Lebanese Druze, and the Anatolian Alevites. Their heretical position explains why they kept their teachings highly secret. It was only in the nineteenth century that apostate Alawites started to publish some of their texts. These show that reincarnation is meant to enable the light souls to ascend to heaven through their reincarnations. The believers can reach this goal in seven times, but the non-believers have to die and be born again a thousand times. Particularly bad is the transmigration into an animal or plant. It seems that the doctrine also helps to explain human misfortune as a penalty for misdemeanors in previous lives.

JUDAISM. Like normative Christianity and Islam, normative Judaism also rejected reincarnation, and it is not mentioned in the texts of biblical and rabbinical Judaism. The first exposition of reincarnation in a primary Jewish source occurs around 1200 CE in the book *Bahir*, which was probably written in southern France. It is a typically Jewish touch that the cycle of rebirths ends with the Messiah, who himself stands outside the cycle. Allusions to and discussions of reincarnation can be found before *Bahir* and go back at least to the eighth century CE. This suggests a possible influence from Islam, but a Neoplatonist and/or Manichaean background cannot be excluded either, given that some Manichaeans were still present in Mesopotamia around that time.

Since the thirteenth century the notion of *gilgul* has been a central qabbalistic tenet, which also found a place in the most influential qabbalistic text of that era, the *Zohar* by Moses de Léon (d. 1305). After the expulsion of the Jews from Spain, the doctrine of reincarnation went with them to other areas where Jews were living. This meant that via Galilee Safed in sixteenth-century Galilee it eventually reached eastern Europe, where Hasidic leaders regularly tried to legitimize their position by claiming to be a reincarnation of previous great rabbis and scholars. This tradition largely ended after the upheavals of World War II and the Holocaust.

WESTERN CHRISTIANITY. Around the same time as *Bahir*, if not already a few decades earlier, reincarnation can be found among the Cathars of southern France. The best information comes from the protocol of interrogations in the Pyrenees by Bishop Jacques Fournier (1285–1342). Cathar belief was strongly dualistic: people had a good soul in a bad body. Souls traveled from body to body until they finally, if they had become a Cathar, could return to heaven. It is in this final body also that the resurrection will take place. The Cathars clearly admitted to a transmigration into animals and, as a rule, seemed to have limited the number of reincarnations to about seven. Although all kinds of solu-

tions have been offered to the question from where the Cathars derived their doctrine—from Jewish, Islamic or “heretical” Christian traditions—it is only fair to say that none has been demonstrated in a satisfactory manner.

The Romans had not been overly interested in reincarnation, but it was Publius Ovidius Naso (43–17) who, through Book XV of his *Metamorphoses*, kept the memory of Pythagoras and his teachings alive through the Middle Ages. This meant that the doctrine was regularly discussed and always rejected. Even during the Renaissance and the immediate successive centuries, followers of the doctrine are extremely hard to find. Giordano Bruno (1548–1600) was a rare exception to this. Yet it is only in the later seventeenth and eighteenth centuries that evidence arrives of a renewed interest in the doctrine, undoubtedly favored by the growing questioning of normative Christianity by leading intellectuals amongst whom Gotthold Ephraim Lessing (1729–1781) played a leading role.

THEOSOPHY, ANTHROPOSOPHY, NEW AGE. Despite a growing interest in reincarnation among European intellectuals in the nineteenth century, the continuing rejection by normative Christianity meant that it was only in alternative circles that the doctrine of reincarnation could gain a permanent position. The source of all modern views is the Theosophical Society, which was founded by Helena Petrovna Blavatsky (1831–1891) in 1875. This imaginative dilettante found traces of reincarnation even in Egyptian sources and the Bible, where previous scholars had not. It was her encounter with India that led her to develop her views on reincarnation—which, however, were filled with typically European ideas, in particular the evolutionary development of the personality. Blavatsky was still trying to come to terms with the combination of Asian and European concepts, but Rudolf Steiner (1861–1925) attempted especially in the last years of his life, to make reincarnation one of the central tenets of his anthroposophy. Steiner was much impressed by the scientific progress of the nineteenth century and tried to make his views on reincarnation acceptable to a public that admired the latest insights of science. His views, however, must be gleaned from his voluminous writings, because he never succeeded in delivering a systematic exposition. The reincarnation, according to Steiner, starts in prehistory where the soul arises from a kind of sea “of the spiritual (German: *des Geistigen*)” and where it also ends. In the time between the reincarnations, which may last on average between 1,000 to 1,300 years, the souls wait on one of the planets. During this period the soul keeps its memory and before re-entering a body it looks for an appropriate pair of parents. Steiner himself usually concentrated on male reincarnations and was not averse to speculations about his own historical “ancestors.”

Over the course of the twentieth century, the idea of reincarnation gained increasing popularity, in particular among adherents of what is loosely called New Age religion, and is even accepted by some Christian theologians. It is also

not unusual to find acceptance of the belief that people choose their own incarnation. Yet contemporary believers are less interested in the physical rebirth than in the progressive spiritual evolution through successive “realities.” They often no longer think of a surviving mortal “I” but rather prefer to believe in a True Individuality or Higher Self, which constitutes the link between this life and the previous or coming ones. Some New Age sources even claim that reincarnation transcends space and time and that past and future lives coexist with the present lives. But such views occur especially in authors who tend to theoretical speculations and often have a science-fiction background.

Recovery of the past lives can now also be used for therapeutic purposes. In a twist that is not altogether surprising, a belief that once was typically religious is used to achieve psychological improvement.

TREASURE TRADITION. The Treasure (*gter ma*) tradition has some precedents in Indian Buddhism. One striking example is a prophecy by the Buddha in the

Pratyutpannasamādhi Sūtra that predicts the sūtra would come to be hidden in the ground for future times when it could be propagated again. The Treasures also draw widely on a range of notions about revelation and visionary inspiration from both Indian and Chinese religions. However, as a well-defined movement with far-reaching political and cultural significance, Treasure is a distinctively Tibetan phenomenon.

Treasure-like claims can be found in the colophons of some of the early Tibetan Snying thig (Nyingthig, “Heart Sphere”) scriptures, but the Treasure tradition in its full form only emerges gradually. It is common both to certain branches of Tibetan Buddhism and to the adherents of Bon, another religious tradition that has ancient roots in Tibet but that comes together as a school at around the same time as the appearance of Buddhist Treasure adherents. An early Bonpo “treasure discoverer” (*gter ston*) is said to be Gshen chen Klu dga’ (Shenchen Luga) of the eleventh century. A formative moment for the Buddhist Treasure tradition is to be identified in the work of Nyang ral Nyi ma ’Od zer (Nyangral Nyima Ozer, 1136–c. 1204), a visionary and scholar of the Rnying ma (Nyingma) school of Tibetan Buddhism. This Treasure discoverer codified a full-length hagiography of Padmasambhava, the Indian Tantric master who is said to have been invited to the royal court in the eighth century to teach Buddhism to the Tibetans. This story included seminal passages about Padmasambhava’s concealment of Treasure as part of his mission in Tibet.

Nyang ral Nyi ma ’Od zer and his hagiography of Padmasambhava are concerned primarily with the triumph of Buddhism over Tibet’s older religions, especially the traditions called Bon, but the Bon tradition produced many Treasures of its own and flourished throughout the same time period that the Buddhist treasure tradition did. These Bon Treasure scriptures contain much of the same range of types of meditative and ritual practices as the Buddhist Treasures, but their narratives of the period of the royal court are told from a different perspective, focusing upon Bonpo struggles with the Buddhist faction and the persecution of Bon by the Buddhist kings. They trace the ultimate origins of Treasure teachings to the founder of the Bon religion, Gshen rab Mi bo (Shenrab Miwo), and to early Bon masters in Tibet.

In the Buddhist version of the Treasure story, the rationale for hiding Treasures is said to have been formulated when Padmasambhava discerned the future, a time when Tibetans would need special teachings to get them through certain difficult periods. He therefore designed special Buddhist practices and scriptures just for those times and proceeded to set up the circumstances for those special teachings to be revealed at just the right moment. This involved designating some of his own disciples to reveal those teachings in a future lifetime. Padmasambhava then uttered an empowering prophecy about that future revelation and proceeded to hide the teachings in a way that they would not be available until the proper prophesied moment in the future.

As the Treasure tradition develops, the manner in which Padmasambhava and other treasure concealers—both Buddhist and Bon—hide these teachings comes to be distinguished into several types. The basic form of the story is that the Treasures are buried in the physical world—in, for example, the ground or a stone or a pillar. But another mode soon appears by which the concealer buries a Treasure in the memory of the future discoverer. This alternate means relying on mental processes and visionary experiences and is often said to be set into motion when the concealer transmits ritually to the future discoverer an especially impressive communication. This makes it memorable enough to be held in mind over the course of several lifetimes. In either case—of the “earth Treasures” or the “mental Treasures”—the buried teaching is usually encoded in some way, often said to be a special abbreviated language or script distinctive to the *ḍākinīs*, a class of female enlightened spirits. Padmasambhava’s consort and disciple Ye shes mtsho rgyal (Yeshe Tsogyal), a former Tibetan queen, is herself cast as a *ḍākinī* and served as Padmasambhava’s principal helper in the effort to conceal treasure. Ye shes mtsho rgyal often is said to have been both the scribe for the Buddhist treasure teachings and their encoder.

Concealing the Treasure in code helps protect it against discovery by the wrong person at the wrong time. The other element that ensures that the Treasure reaches its correct destination in the future is the prophecy uttered at the time of the treasure’s concealment. In the case of the Buddhist Treasures, these prophecies are uttered by Padmasambhava and serve to name the future discoverer and some of his (and sometimes her) circumstances, also often in coded or abbreviated form. When a discoverer in later times comes to present a teaching that is claimed to have been originally hidden as Treasure, one of the things that adds to the credibility of that claim is if the Treasure does indeed contain this prophetic utterance, with specific reference to the discoverer’s name and other characteristics.

Most Treasure texts do include such prophecies as part of the narrative sections that advance the legitimacy of the Treasure itself. When one considers what Treasures are from the perspective of the discoverer, one can understand why legitimacy is such a key issue. Treasure teachings usually come in the form of texts although they can also come in the form of objects, such as ritual instruments or symbolic images. To claim that such things, be they textual or otherwise, were indeed concealed in the past for a particular purpose to be fulfilled in the present and additionally that the discoverer is a reincarnation of a person in the past specifically appointed to uncover that Treasure now requires support and evidence in order to be believed.

In fact the Treasures were regularly subject to criticism by skeptical members of most schools of Tibetan Buddhism. Partially such skepticism had to do with institutional and sectarian competition. In large part the Treasure tradition served as a vehicle for religious figures to distinguish them-

selves outside of the conventional monastic and academic avenues for self-advancement. But that was precisely what made them subject to doubt. This doubt is also represented in psychological and personal terms in accounts of the experiences of the discoverers themselves. In fact it is for this reason that the Treasure tradition spawned prodigious autobiographical writing throughout its history, often focused on narratives, sometimes idiosyncratic and poetic, of dreams, visions, and meditative experiences. In these experiences the visionary would make contact with the teachers of the past who had originally concealed the Treasure, such as Padmasambhava or an exalted Bon po master. The discoverers were often preoccupied with “reading the signs” of their lives, their bodies (which often included special marks and patterns on the skin), and their surroundings in order to pick up signals and evidence that would connect them with their prophecy texts and elements of a past life as a disciple of the original concealer. Once the discoverers did access the actual Treasure itself—which often came in abbreviated form either in a dream, in a vision, or in “reality” in the form of a small scroll of paper with just a few cryptic linguistic indications—they would struggle with “decoding” the initial Treasure signs, a struggle that itself would have to draw on a whole range of esoteric yogic practices and skills. In short, a key part of what made the Treasures credible was just such genuine doubts and heroic struggles on the part of the visionary introducing them.

The successful effort to access Treasure material and then decode and unpack it to serve as a teaching tradition served to bolster the reputation of the discoverer himself or herself, and indeed the success of a Treasure often rode on the discoverer’s charisma and personal power. But other kinds of evidence were also marshaled. In many ways it was frequently the virtues of the teachings themselves—their ritual or soteriological efficacy, their aesthetic qualities, and their compelling narratives—that made them believable and worthy of veneration as representations of truth and reality, that is, as teachings of an enlightened figure like Gshen rab Mi bo or Padmasambhava who served as an intermediary for primordial enlightenment itself.

In the Buddhist case, the Treasure promoters argued that their teachings should actually be considered to be originally and most basically the actual words of a buddha, on a par with other canonical Buddhist scriptures translated from Indic languages into Tibetan. Evidence of the success of these Treasure scriptures may be seen in the careers of the discoverers and the kinds of following they attracted and the communities and institutions they built. It can also be assessed in the longer term legacy: how often a given Treasure cycle was published, how often it was ritually performed. In fact there have been hundreds of Treasure discoverers introducing treasure texts and objects from the twelfth century CE to the twenty-first century. Many achieved great fame, and their works had lasting influence upon Tibetan literature, religious practices, and especially narratives about Tibet’s royal

past and its present religious identity. Some of the discoverers, like Klong chen pa (Longchenpa), were also scholars of the highest order. Others, such as 'Jigs med gling pa (Jigme Lingpa), introduced Treasure ritual cycles that had far-reaching popularity and influence.

It should also be noted that Treasure activity was sometimes the site of collaboration between Buddhists and Bonpos. In the nineteenth century the principal Buddhist Treasure cycles were collected by the polymath Kong sprul blo gros mtha' yas (Kongtrul Lodro Taye), himself originally a practitioner of Bon. Kong sprul worked in association with the visionary 'Jam dbyangs mkhyen brtse' i dbang po (Jamyang Khyentse Wangpo) and other colleagues and codified a corpus of Buddhist Treasures in a single collection, the *Rin chen gter mdzod*, of over one hundred volumes. A product of the nonsectarian Ris med (Rime) movement, this collection is organized by literary genre and ritual purpose. It contains a wealth of meditation techniques, ritual actions, and descriptions of deities. It also includes key narratives about Tibet's royal dynasties, the glories of its kings, the defeat of (in this version) anti-Buddhist demons and ministers, and the process by which the Buddhism that Padmasambhava taught to the court was taken in to become Tibet's national religion. The Bon po Treasure literature was also collected, codified, and divided into two main sections that are similar to those of the more mainstream Tibetan Buddhist canon, the Kanjur and Tanjur. But unlike the Buddhist Kanjur and Tanjur, this massive Bon po collection of several hundred volumes consists almost entirely of Treasure texts. Its date of compilation is not entirely clear, but it almost certainly predated the Buddhist *Rin chen gter mdzod* (Repository of the precious Treasures), possibly by a few hundred years.

For both the Bonpos and Buddhists, Treasure text production constituted a way to formulate new teachings suited to particular situations and audiences while giving them an aura of authenticity, antique pedigree, and religious power. Their specifically Tibetan character is evident in both Treasure traditions. The Bon po Treasures are replete with detailed rituals and deity lore that have no analogue in India and are clearly of ancient Tibetan origin. In the Buddhist Treasures Tibetanness becomes salient in debates about canonicity, authorship, and origins. Tibetan Buddhist orthodoxy had it that all genuinely original and canon-worthy Buddhist teachings had to come from India. By tracing a Treasure's origins back to a primordial Indic buddha or buddha principle, the treasure theorists managed to have it both ways: to give the Treasure an aura of authenticity even while allowing historical Tibetan teachers to formulate new materials under the Treasure tradition's aegis. In both cases it is thus no accident that the Treasure narratives display so much concern with Tibetan history, its leaders, its invasions, its glories, and its disputes. Treasure became a venue for Tibetan religious production qua Tibetan. It eventually became a popular means to acquire spiritual charisma not just by the unconventional yogis of the Bon po and Rnying ma schools

who predominated in treasure production but also among some of the more monastic communities and other schools of Tibetan Buddhism. One particularly notable example is that the powerful fifth Dalai Lama had Treasure discoveries, and other Dalai Lamas had important connections with Treasure figures.

It is not coincidental that Treasure discovery continues to be a popular means for lamas to produce teachings and gain followers inside Tibetan areas in China in the early twenty-first century. The potentially nationalist implications of the tradition have not been lost on the governmental authorities, who for the most part have enforced a ban on Treasure discovery and have imposed tight restrictions on flourishing communities that continue to grow up around such visionaries.

JANET GYATSO (2005)

TREES are a form of nature that represent life and the sacred continuity of the spiritual, cosmic, and physical worlds. A tree is often used to symbolize a deity or other sacred being, or it may stand for what is sacred in general. The reli-

gious beliefs that surround a tree may include as sacred any one or all of the physical parts of the tree: its trunk, branches, leaves, blossoms, sap, or roots. Sacred objects constructed from the wood of special trees are also used for religious purposes.

The physical properties of trees are combined with supernatural or sacred ideas, the beliefs that surround a tree's connection with what constitutes religion in different cultures. Trees are not only sacred in the major religions of the East and West, but also in other traditions where belief in the sacred is combined with beliefs in the power of ancestors, in the creation of life in birth, about death and the afterworld, and about health and illness. Trees that represent certain deities or ancestors, serve as mediators or links to the religious realm, and are associated with cultural beliefs in heaven or the afterlife. Trees may be valued as spiritual and physical contributors of life because they furnish liquids valued as sacred beverages used in ritual or as medicines for curing a variety of illnesses.

Through association with a particular religious or historical event, an individual tree or species of tree acquires the symbolic significance of the event as part of its meaning. The oak, date palm, and willow were used in the building of Solomon's temple and in constructing booths at Sukkot (*Lv.* 23:40). Deodar wood is used in the construction of Hindu temples. The oak is commonly taken to be the tree under which Joshua set up a pillar at Shechem to commemorate the nation's covenant with God (*Jos.* 24:26). The Jewish captives in Babylon in 597 BCE hung harps on weeping willows along the banks of the Euphrates (*Ps.* 137). The religious significance of this act established the willow as a symbol of mourning, death, and rebirth. The branches of the palm tree stand for Christ's triumphal entry into Jerusalem on Palm Sunday as well as for his rebirth. These associations are still prevalent in Christian tradition.

A society's religious beliefs about what kinds of trees are sacred generally depends on the nature and number of trees found in its territory. If trees are plentiful, the forest as a whole will also be an important part of the religion's spiritual beliefs and rituals. The Kwakiutl Indians of Pacific North America, like many other societies living in a tree-filled environment, believe that their heavily forested inland region is the home of supernatural beings.

THE INNATE POWER OF TREES. Religious or spiritual power may be inherent in a tree or in the elements that make up the tree. For example, in Taoist thought, trees and all forms of nature contain *yin* and *yang* energies, that is, the opposing forces of the universe. Each tree has spiritual power as it contains and balances these inequalities: the light and dark colors of the leaves and bark, and the opposition between light and shadow. In southwest China *fengshui* stands for the interaction of *yin* and *yang* and represents a power that affects the world and everything in it. *Fengshui* may be found especially in strange and awe-inspiring trees and stones. The contemplation of these powers or the active cultivation of trees to

enhance their spiritual force, as in the Japanese art of *bonsai*, builds gentleness of character, religious spirit, and respect for humankind.

The Andaman Islanders use the intrinsic qualities of hibiscus trees to aid them in their struggles to catch large turtles and fish. It is through the spiritual qualities of these trees that the Islanders are able to succeed in overcoming their prey and to protect themselves from harm. The particular qualities of the tree represent essential elements of physical and spiritual life and ward off dangers associated with turtles and the sea.

The Haida Indians of North America used a power inherent in hemlock branches to scrub themselves in ritual baths. The tree had the power to purify and protect the Indians and to enable them to attain the degree of cleanliness required during their rituals and thus remain on good terms with their supernatural beings.

Power to avert illness and evil. Trees offer protection from both physical and spiritual illness through their associations with the divine. For the Ainu of Japan, *ramat* (literally "heart," translated as "spirit" or "soul") is a power that resides in all things in varying degrees. Wood is especially rich in *ramat*, which is provided by the spirit of Shiramba Kamuy, the upholder of the world and male god of vegetation. The Ainu believe that nothing is more effective for protection against evil and spiritual problems than *inaw* (carved wood offerings). The wood of over fifteen kinds of trees including oak, willow, lilac, dogwood, and magnolia may be used in the carving of *inaw*, which are then offered to good *kamuy* (spirits). Similarly three trees—the thorn, elder, and alder—are predominantly used to carve *inaw* for bad *kamuy*. *Inaw* are also hung in houses to provide general protection for the home and its occupants.

In the Konkan district of western India it is believed that barrenness can be cured by planting a tree for the uneasy spirits that wander about and inhabit women, preventing conception. Under favorable circumstances the evil spirit will leave a woman suffering from barrenness to take up residence in the newly planted tree, allowing the woman to conceive. The Indian mimosa tree is believed to provide spiritual protection against wicked spells and the evil eye. The illness caused by *Sītalā-Māyā*, the Indian goddess of smallpox, may be averted by setting up a branch of the neem tree just as Buddhists invoke certain sacred trees for health.

Trees may represent a spiritual healing for and protection from evil. The oil of the olive was traditionally used to soothe pain and so the olive tree or a sprig of the tree has become a symbol of the grace of Jesus Christ through which the sorrowful sinner finds eternal peace.

The cosmic tree. In many religions the universe is portrayed as multilayered, the layers kept distinct and in place by a world tree running through the exact center of the cosmos. Salish Indians of North America hold that their deity made three worlds, one above the other: the sky world, the earth, and the underworld. All are connected by a single tree

that passes through the middle of each. The Babylonians believed that their cosmic tree, Kiskanu, was the home of the god of fertility and Ea's mother, Bau, the goddess of plenty. Heaven, or the home of Bai Ülgen, is believed by the Altai people to be on the top of a giant fir tree that grows at the earth's navel. The Vasyugan Ostiak (Khanty) believed that the cosmic tree's branches touched the sky and its roots extended to the underworld. A copy of the celestial tree of the Siberian Tatars stands before the palace of Erlik Khan, the lord of the dead.

Similarly, in Scandinavian mythology the cosmos is connected by a sacred ash, Yggdrasil. Its roots reach to Niflheimr, the lowest region of Hel; its trunk, enwrapped by the snake of the ocean, is in Midgarðr, the realm of humans; and its branches reach to Ásgarðr, the home of the gods. Other versions of the myth depict the great ash with three roots: Niflheimr or Hel under one, Utgarðr, the realm of giants and demons, under the second, and Midgarðr under the third. On top of Yggdrasil sits the eagle of Óðinn (Odin), chief of the gods; nearby is the Spring of Urðr ("fate"), where the gods dispense justice and determine the fate of the world. At Ragnarok, the doomsday of the gods, Yggdrasil will shake its roots, freeing the monsters of the lower regions.

Indian tradition offers many variations of the cosmic tree. In the Upanisads the tree is inverted with its roots in the sky while its branches cover the earth. The eternal *asvattha* ("fig tree"; *Ficus religiosa*) is a manifestation of Brahmā in the universe. This forest tree is also described as rising from the navel of Varuṇa or of Nārāyaṇa as he floats in the waters of the universe.

The ancient Egyptians believed that the sky was a huge tree that overarched the earth. The stars were fruits or leaves on the tree and the gods perched on its boughs. This tree separated the ocean from the sky, the upper from the lower worlds. Osiris, lord of the dead, was identified with this celestial tree. The sun was born from the tree every day while the celestial tree disappeared each morning, thus marking the periods of night and day. The year was also symbolized by 365 trees representing the days of their calendar year.

Cosmic space is also defined horizontally by trees. In addition to the center of the earth and the sacred tree, with its roots deep in the underworld and its trunks and branches defining the world of humans and the gods, many American Indian religions add sacred trees, and their associated colors, birds or other animals, and gods, to each of the four cardinal directions. The Maya, the Aztec, and the Indian cultures that later took part in their cultural heritage believed that five sacred trees (the four corners of the world and the center) were responsible for the organization of the universe; they allotted particular times of the year, or entire years in some cases, to serve under the dominion of each direction.

The tree of life. Many religions believe that the cosmic tree stands for the sacrality of the world, its creation, continuation, and fertility. Thus in many cases the world tree is also

a tree of life and immortality as well. The patronesses of the cosmic tree for the Warao of South America are the Grandmothers, deities who are also associated with seasonal change and the winter solstice. The trees of the cardinal points and the Warao deities take on an especially interesting form. The southeast represents the soul of the Mother of the Forest, a deity of the world of light, while the southwest is the body of the Mother of the Forest. For the Warao, deities of the northeast and northwest represent the Tree of Life, the moriche palm, and so symbolize sustenance and fertility. Hebraic teaching and Islamic tradition describe the Tree of Life with its roots in heaven and its branches overarching the earth. Zoroastrianism teaches that the Tree of All Seeds, or the Tree of All Healing, which grows in the cosmic sea, Vourukasha, is responsible for life on earth.

In ancient Egypt, the celestial tree was also a tree of life. Its fruit kept the gods and the souls of the dead in eternal youth and wisdom. Out of this tree of life emerge divine arms some of which bear gifts while others pour out the water of life from an urn. In the Vedas, Varuna lifted up the celestial tree of life and by squeezing its fruit between two stones obtained *soma*, or *amṛta*, the drink of immortality. Ancient Egyptian religion also associated this tree with fate. Sekhait, the goddess of writings or fate, sits at the foot of the cosmic tree where she records on the tree itself, or in its leaves, all future events as well as the important events of the present for the benefit of future generations.

The tree of knowledge. For Buddhists, the bodhi tree, or bo tree, is both the source of life for all beings and the tree of enlightenment. Śākyamuni Buddha made a special resolution at the foot of this tree of wisdom to remain under its branches until he attained supreme enlightenment. It was under this tree that he attained enlightenment after he was tempted and threatened by Māra and his three daughters Tanhā, Rati, and Rāga, who were like swaying branches of a young leafy tree singing songs of the season of spring.

The Babylonians believed that two trees guarded the eastern entry to heaven: the tree of truth and the tree of life. Similarly, in the Garden of Eden described in *Genesis* stood the Tree of Life and the Tree of the Knowledge of Good and Evil. After Adam ate of the fruit of the Tree of Knowledge of Good and Evil offered by Eve, God said, "Behold, the man is become as one of us, to know good and evil: and now, lest he put forth his hand, and take also of the tree of life, and eat, and live forever" (*Gn.* 3:22). Adam and Eve were driven from the garden, marking the beginning of humankind's troubles on earth.

Trees as food. In many religions trees are believed to be responsible for spiritual nurturance and sacred food. The Polynesians of Futuna believe that in Polotu, the abode of the gods, grows a sacred tree, the Puka-tala. The leaves of this tree will change into a wide variety of foods when they are cooked and so may supply all needs. For the tribes of South America's Gran Chaco, the god Cota created a wondrous tree that would provide food and drink for hungry people.

The bark of the alder tree is credited by the Karok Indians on the Klamath River in northwestern North America with providing salmon, an important food source. The creator of the world, Kareya, built a dam at the entrance of the Klamath River that prevented salmon from coming upstream to the Karok. The bark of the alder tree looks like salmon when it is broken off the tree and wetted. A Karok myth relates how this bark was used by Coyote to trick the women who guarded the dam into allowing the salmon to come up from the ocean, forever supplying food for the Karok. Salmon play both a life-sustaining and a religious role among these Indians, as does the wood of the alder tree.

Creation of humankind. In many religions the myth of a people's origin relates how a cosmic tree played an important role in either the actual creation of people or the emergence of humankind in this world from some other world. These beliefs are intimately tied to what is believed to be sacred. For example, among the Ainu the human backbone is regarded as the seat of life, and was originally made from a willow branch. But more frequently the cosmic tree or tree of life is responsible for the creation of the people of a society. Kiowa religion features a girl child, Pekeahaidei, carried by a growing tree into the sky where she marries and has a boy child. Carrying her child with her, she falls through a hole in her world. The child survives the fall to this world and is raised by Spider Old Woman, a very sacred being. Later the child creates Kiowa culture.

The Uyurucars of Bolivia believe that their god Tiri split a tree and from the opening came all the people of the earth. The Zuni, in their story of creation, are brought up from the lowest world level, where all is darkness, with the aid of the two sons of the sun. Branches from the pine tree to the north, the spruce to the west, the silver spruce to the south, and the aspen tree to the east had to be gathered before they could leave the Darkness World. The Zuni climbed the long prayer stick made from the pine of the north to the third world; scaled the crook from the spruce of the west to the second world; used the prayer stick from the spruce of the south to rise to the world below this one, and finally emerged into the Daylight World (this world) by climbing the prayer stick made from the aspen tree. This emergence story blends the cosmic tree, the trees of the four corners, and the tree of life as sacred elements that bring the Zuni to their present world and that serve as important parts of their religious beliefs.

The Seneca Indians of northeastern North America also give an account of the discovery of the world originating with the sacred people of the sky. In the middle of their village stood a tree covered with white blossoms, which gave light to the people when the tree was in bloom. When the blossoms fell, there was darkness. A woman of the Seneca dreamed three times that the tree must be pulled up by the roots. After the third dream, her people uprooted the tree. Upon discovering their actions, the chief became angry and ordered the woman who had had the dream to be pushed

into the hole where the tree had been. The falling woman then discovered this world, an event that marks the beginning of the Seneca culture.

Trees as ancestors. A common extension of the notion of the cosmic tree as the source of all life is the belief in a tree as an ancestor and creator. This belief can take many forms. The Warramunga of northern Australia, for example, believe that the new life present in the womb of a mother receives its spirit or soul from certain trees, entering the womb through the navel. The Lakota on the upper Missouri River say that the first man and woman were two trees and that a snake chewed their roots off in order to allow the couple to walk away.

The Sauras of India honor the banyan tree, for they believe that "it is our mother." The banyan tree succored two fatherless children whose mother had abandoned them under its branches. The children would have perished but for the milk of the banyan that dripped into their mouths and fed them.

For the Ndembu, the "milk tree" (*mudyi*) is a dominant symbol of their culture and religious beliefs. The white latex sap of the tree is believed to represent breast milk and semen, suggesting the creation and nurturance of life. This tree stands for what is good in Ndembu society and is used in rituals to counter evil forces. The tree also stands for the spirits of the ancestors of the matriline, the important lineage of descent, and so represents social custom and structure.

In another vein, trees can be associated with a shrine dedicated to a deceased relative, who, in time, becomes an ancestor. Among the Nuer a *colwic* is the spirit of those people struck by lightning. These people are believed to have been chosen to enter into close kinship with the god Kwoth. A person killed by lightning is said to become a Child of Kwoth, a spirit of the air. The blood relatives of the deceased, his patriline, erect a *riek* or shrine over his funeral mound and plant a sapling of the nyuot tree at its side. The nyuot tree is associated with the *colwic* spirit and with the rain and the sky to which the soul of the dead person has been taken. When this sapling is planted during the rains (when most lightning occurs), the tree takes root. If it were to die another would be planted in its place. This tree becomes a shrine for the deceased's lineage. It is through this shrine that the deceased's spirit may become active in the everyday affairs of his relatives.

This idea of a sacred tree representing the lineage or clan is an old one. For many cultures, the ancestors are the deities and are responsible for life, death, and spiritual happiness. The wooden totem pole used particularly by cultures of the Pacific Northwest coast of North America is not merely a name or emblem of different family groupings. The totem is a collective label, but it also has a religious character: the totem's origins related to the special relationship to the ancestors and the sacred world. The *inaw* of the Ainu, mentioned above, were originally the receptacles of ancestral

ramat, later, the winged *inaw* (*shutu inaw*) came to represent ancestors. Some of these winged *inaw* became minor *kamuy* owing to their concentrated *ramat*, and were effective in warding off injurious magic.

TREES AND DIVINE POWERS. Trees may be viewed as having souls or spirits themselves or they may be a part of some divine being. Thus trees may symbolize a deity either by serving as the visible embodiment of a sacred presence or by marking a sacred spot that a deity frequents. Sacred trees may be the abode of deities or may be the divine beings themselves. For instance, the sacred heath worshiped in the time of Plutarch grew around the sarcophagus of Osiris and was known as the “soul of Osiris.”

Trees with souls or spirits. Many religions include beliefs that trees have souls or are sentient sacred beings. The Australian Aborigines believe that the spirit of humanity resides in the land and that a tree, a bush, or a rock is the present incarnation of this spirit and has great religious value. A group of relatives thus includes humans and the spirits of these natural features of the landscape. If an Aboriginal leaves the area, he would leave a vital part of himself behind.

The pre-Islamic *jinn* are associated with certain kinds of trees. These trees are conceived as animate and rational, for a supernatural life and power resides in the trees. In Greece the dryads were oak nymphs, and the *tengu* of Japan are forest spirits.

The Trobriand Islanders of the western Pacific depend both spiritually and physically on the spirit of their canoe and the tree from which it is made. Once a tree is selected, the owner, builder, and helpers must perform a short ceremony before the tree can be cut down. A small cut is made in the trunk, and a bit of food is placed in the incision. This is an offering to the tree's *tokway*, or wood sprite, to induce the spirit to leave the tree so that the workers may begin the process of converting the tree into a canoe.

The Japanese have a story about the spirit of a very large and old willow tree that grows near a temple. The village decides to build a bridge and use the willow's wood for part of its construction. A young man, who like his ancestors before him loves and respects the old tree, saves it by offering to substitute wood from his own land in place of the willow tree. The village accepts and the tree is saved. Returning from work one day the young man meets a beautiful young woman under the willow. They marry with the understanding that the young man never ask his wife where she came from or who her parents were. He agrees. The emperor declares that a temple is to be built nearby. The village is eager to have the willow included in the building materials for the good fortune it will bring. One morning when the willow is being cut down the wife wakes up and tells her husband that she is the spirit of the willow, that she married him to make him happy in return for saving her (and the willow) so many years ago, but that now she must return to the willow to die with it because she is a part of it.

The spirit of a Buddhist nun of the eighth century CE is believed to be embodied in a giant ginkgo tree in Japan. This tree is called the Nurse Goddess Tree of Miyagi Field because of hanging formations that resemble human breasts, from which moisture drips in wet weather. This tree's “moisture” is believed to have the power of restoring milk to a woman who is unable to nurse. The tree itself is worshiped as a sacred mortal who has become a god and is filled with divine power.

Deities as trees. Trees may give birth to deities, or sacred beings may be made from trees. Among the Ainu of Japan, A-e-oina Kamuy, a sky god, is born to the elm tree spirit as is Kamuy Fuchi, supreme ancestress and ruler of all departed spirits. She was born from the elm tree impregnated by Kando-loro Kamuy, the possessor of the heavens. Her spirit is manifested in the sacred fire of the hearth and in vegetation.

In Asia Minor the almond tree and the river Sangarius were believed to have given birth to the god Attis, and consequently maturing almond trees became his symbol. The Tupari of the Mato Grosso region of Brazil believe that two of their male gods were born from a large rock. Since they had no wives, they cut down two trees, and each carved himself a woman and so populated the world.

Trees may also represent the essence of the deity. For example, the Buddha's fig tree, *asvattha*, is the chosen symbol of his essence, synonymous with all existence and all life. Among the Mandan Indians along the Missouri River in North Dakota, the world had two creators: First Creator and Lone Man. Lone Man leaves the cedar with the Mandan as a protection from all harm. The cedar is the body of Lone Man and contains his essence. Among the Arikara the cedar trees grown in front of their lodges are the body and spirit of Mother Corn, an important deity.

Deities symbolized by trees. Wreaths and crowns of foliage, usually laurel, olive, myrtle, ivy, or oak were sacred to Apollo and so symbolized some particular personification of him. The myrtle was also a symbol of both Venus and Neptune, the male and female deities of the productive and fertile powers of the waters. Several species of oak were symbols of Zeus.

Frequently a tree is held to be sacred because a deity resides in its branches. The *asvattha* is said by some to be the abode of Brahma as well as embodying his essence and serving as the tree of wisdom and life. Other sources say that in this sacred tree abide Brahmā, Viṣṇu, and Śiva, as well as Viṣṇu in his incarnation as Kṛṣṇa. Among the ancient Semites, the goddess Al-Ozza had her abode in a sacred acacia at Nakhla.

Some trees are taken as symbols of a sacred person because of particular religious qualities the tree possesses. The myrtle is believed to be the symbol of pure maidenhood in Christianity and so is ascribed to the Virgin because of her pure life and sacred character. The palm, cypress, and olive

are also symbols of the Virgin during her annunciation. They denote peace, heaven, and hope.

Greek beliefs frequently describe the actions of the gods in transforming human or divine beings into trees. The virgin Daphne, fleeing Apollo's embrace, is turned into a laurel tree by her mother, Gaia, the earth. Apollo breaks off a branch and crowns himself with it. In another myth, Aphrodite takes pity on Smyrna, mother of the slain Adonis, and transforms her into a myrrh tree.

TREES AS VEHICLES OF COMMUNICATION WITH DEITIES.

Trees serve as a means of communicating with the divine in three ways: through their use in shrines, the meeting place on earth of a sacred being and humankind; through the relationship between sacred trees and shamans, the religious mediators of the divine; and through the use of sacred drinks or drugs made from trees that allow a mystical contact with the sacred.

Trees and religious shrines. Sacred trees may be found along with bushes, shrubs, rocks, or even with a temple to make a shrine. In ancient Egypt, by order of Pepi II, a new center of worship was officially recognized by planting a Syrian fir in the town. Among the Pare of Africa, religious shrines were sacred groves of trees and depended in size upon the size of the community who would worship in them. Many Shintō shrines are built under the branches of an ancient tree as an alternate abode for the deity of the tree. The usual sacred tree of Shintō is the evergreen sakaki. It is usually on the grounds of the shrine, protected by sacred ropes. One of the most powerful shrines in Java lies in the center of Modjokerto, where at the foot of a huge banyan tree lies a small stone statue of Gaṇeśa, the Hindu elephant god of wisdom, surrounded by a white fence.

A shrine in the town of Kagami in Japan is dedicated to Musubi no Kami, the god of love, and built in honor of a cherry tree, Kanzakura. A myth tells of the spirit of a sacred cherry tree. A young girl falls in love with a handsome young man and will not accept the marriage arranged for her by her father. When the girl discovers she has fallen in love with the spirit of the cherry tree, she chooses to become a caretaker of the shrine devoted to the tree. There she stayed for the remainder of her life, representing religious perfection and dedication.

Sacred trees pass on communications from deities by speaking directly to humans, or indirectly through their whispering leaves whose sounds must then be interpreted by priests. At Dodona in Epirus, the talking Oak of Zeus delivered divine messages to humans through priests. Wood from this oak was also used to build the *Argo* and spoke to the heroes with a human voice. At Delphi, the laurel tree served as the voice of Apollo. The famous sacred tree near Shechem called the "tree of the revealer" in *Genesis* 12:6, was originally a Canaanite tree oracle.

Trees and shamans. Shamans or priests are frequently associated with sacred trees as oracles or interpreters of divine

will. The shaman may be spiritually connected to the cosmic tree. Most frequently the shaman uses the cosmic tree as a vehicle to ascend to the sky or to the deities of the universe to gain sacred information.

In addition to the ability to transverse the universe and communicate with the deities by means of the sacred tree, shamans can communicate with the spiritual realm through divination, frequently using parts of sacred trees for ritual communication. According to the religion of the Sisal, an ethnic group in the Tumu district of northern Ghana, the first diviner or shaman descended from God shortly after humans descended to earth using the baobab tree. Shamans also frequently have spirit helpers to aid them in their ceremonies. Among the Coast Salish of North America, one of the most powerful spirit helpers is known as Biggest Tree and aids the shaman in acquiring gifts made from cedar. These gifts are "alive" for those who possess the power to perceive and use them.

Religious objects made of wood may also act as messengers. The wooden *inaw* of the Ainu are messengers (*shongokoro guru*) or intermediaries between the Ainu and the *kamuy* or between the *kamuy* themselves.

Trees and divine intoxicants. Many religions include the use of a divine potion, made from sacred plants, as necessary vehicles to the divine. Shamans frequently incorporate the use of such potions into their practices. Varuṇa obtains *soma*, or *amṛta*, the fruit of immortality, by squeezing the fruit of the celestial tree of life between two stones. The palmyra palm is a symbol of Śiva, yielding an intoxicating and powerful juice. In Chan Kom, descendants of the Maya use a favorite Mayan intoxicant and purge that has strong religious associations. They make a ceremonial mead of fermented honey and add the bark of the balche tree during the process for its narcotic effect. This drink, *balche*, enables communication with the deities and is necessary for all religious rituals, especially those for fertility, abundance of crops, rain, health, and family.

THE RITUAL USE OF TREES. Sacred trees have a ritual significance. The trees and their meanings may be incorporated into rituals of curing, initiation, marriage, and death. Trees used in any of these contexts stand for the divine and represent the sacred beliefs being honored through the ritual.

Trees appear in rituals in various forms as symbols for the divine. Sacred beverages are made from tree bark. Incense made from the sap and bark of sacred trees calls deities down to this world and then "feeds" them while they are here. *Copal*, an incense made from a tree sap and used by many cultures in Latin America, not only aids communication with the deities but protects the ritual participants from harm by driving away evil and purifying the area. Most frequently, wood is used to construct powerful religious paraphernalia, such as the sacred poles erected to symbolize the presence of the ancestral spirits or the cosmic tree during the ritual. The symbol of the cross is used in different religions to symbolize specific divine beings or the sacred in general.

The Zinacantecos, descendants of the Maya in Chiapas, erect cross shrines for every kind of ceremony. Three small pine trees are fastened to crosses and pine needles are strewn on the ground around the crosses to set off the area as sacred and ritually pure. There must be three crosses for a ceremony, and one is generally a permanent wooden construction, supplemented by two crosses made entirely from fresh pine boughs. The triadic symbol displays the Catholic religious use of three crosses as well as the traditional Native American beliefs. Crosses are “doorways” to the houses of the ancestral deities. They mark the boundaries between the sacred and the profane realms.

In Christian belief, the cross may be referred to as a symbol of the Tree of Life that stands in the Garden of Eden. The wood from the True Cross was believed to have the power to restore the dead to life. A variety of different trees are credited with being the wood chosen for Christ's cross: cedar of Lebanon, dogwood, mesquite, ash, and oak.

Trees in rituals of initiation and marriage. Many African cultures mark the transition from youth to adulthood through rituals of initiation, and some of the most powerful symbolism of this change is represented through the use of trees. Among the Ndembu, the milk tree, the *mudyi*, a symbol of life and the ancestors, is used in both male and female initiation ceremonies to transform boys and girls into fertile, productive adults. Traditionally, a girl's initiation ceremony and the use of the milk tree served as her marriage ceremony as well.

Every young girl among the Newari of Nepal is married to a small tree (*bel*) from early childhood. In India, the “marriage of trees” may be performed when a woman has been married for many years and has not yet borne children. One tree representing her husband and one tree symbolizing her fertility are planted side by side so that their combined growth may symbolically and spiritually increase her fertility and the growth of life within her womb.

The “marriage tree” is common in South India as a representation of a male or female ancestor. This tree is necessary for all weddings and is adorned as a part of the ceremony. In Java large “plants,” are assembled from banana stems and scalloped tree leaves of various types, and wrapped with green coconut branches. These “flowers” made from trees are essential ritual elements for the wedding ceremony, representing the virginity of the bride and the groom.

Trees associated with death and rebirth. A variety of trees are specifically associated with religious beliefs about the fate of the dead and the rebirth or passage of their souls to the afterlife. Christian death symbolism involves the use of willows and cedar trees. These trees symbolically stand for the death of the body as well as heralding a rebirth of the soul. These trees are almost always present in cemeteries in America and may be accompanied by conifers or other kinds of evergreens: a promise of everlasting life. Wood is the most common material from which coffins are made for burial in

Christian practice in the United States. The leaves of the baine palm used by the Coorgs of South India are associated with death and are used in funeral rituals.

Many religions practice tree burial as the appropriate spiritual resting place for the deceased. The Khasiyas of eastern India leave the deceased in the hollow trunk of a tree. Many North American Indian groups placed their dead in trees or on wooden structures grouped together to form a sacred burial ground. The Nootka and Southern Kwakiutl used another form of tree burial. They folded the body up and put it in a large box, which was then placed high in a tree. A wooden mortuary column was erected to display the family crest of the deceased.

In many religions, without proper religious burial the soul of the departed would be in danger and could harm the deceased's living friends and relatives. For the funeral pyre, the Coorgs of South India cut down a mango or pavili tree that grows in the burial ground. The entire tree must be used for cremating the corpse; improper use of the tree's parts may result in another death in the community in the near future.

BIBLIOGRAPHY

- Mircea Eliade provides a thorough discussion of the many different beliefs and practices that involve sacred trees in *Patterns in Comparative Religion* (New York, 1958). Eliade places religious belief associated with trees into seven categories. Clifford Geertz's *The Religion of Java* (New York, 1960) describes the syncretism of Hindu, Muslim, and folk beliefs that constitutes Javanese religion. Geertz's book is noteworthy for its discussion of ritual objects made from trees. Victor Turner's seminal treatment of the African milk tree in *The Forest of Symbols: Aspects of Ndembu Ritual* (Ithaca, N.Y., 1967) is an insightful and extensive consideration of a dominant symbol in Ndembu culture, the *mudyi*, or sacred tree. Turner explores the ritual use of trees in life-cycle rites of passage.
- M. N. Srinivas has provided an important contribution to the understanding of Hindu beliefs about sacred trees, especially their role in rituals of the life cycle, in *Religion and Society among the Coorgs of South India* (London, 1952). A. R. Radcliffe-Brown provides an account of the religious beliefs in the powers of trees and the rituals associated with them as found among the people who live on a chain of islands extending from Burma to Sumatra in *The Andaman Islanders* (1922; 3d ed., Glencoe, Ill., 1948). In *Argonauts of the Western Pacific* (1922; New York, 1953) Bronislaw Malinowski provides a fascinating account of the beliefs and rituals that surround the use of trees among the Trobriand Islanders.
- The use of trees as discussed in Buddhist scriptures is presented by Ananda K. Coomaraswamy in *Elements of Buddhist Iconography* (1935; New Delhi, 1972). The mixture of Roman Catholic and Mayan beliefs is explored in Evon Z. Vogt's *Zinacantan: A Maya Community in the Highlands of Chiapas* (Cambridge, Mass., 1969). This is an extensive study of the Tzotzil-speaking Indians of Guatemala and includes a full ac-

count of their religious beliefs and the importance of sacred trees. Douglas Sharon's *Wizard of the Four Winds: A Shaman's Story* (New York, 1978) contains some encapsulations of North American and Mesoamerican cosmologies, including beliefs about sacred trees. Sharon's treatment of Mesoamerican shamans' use of trees as a source of power is noteworthy. Mircea Eliade's *Shamanism: Archaic Techniques of Ecstasy*, rev. & enl. ed. (New York, 1964), also provides an insightful discussion on the relationships between shamans and the cosmic tree.

One of the best discussions of the interrelationship between spirit, soul, God, and elements of nature is found in E. E. Evans-Pritchard's *Nuer Religion* (New York, 1977). Neil G. Munro's *Ainu Creed and Cult* (London, 1962) neatly describes the Ainu belief in ramat (spirit or soul), which inhabits trees, and the sacred and magical qualities ramat passed on to the ritual objects made from trees.

TRENT, COUNCIL OF. Also known as the nineteenth general council of the Roman Catholic Church, this council opened on December 13, 1545, and closed on December 4, 1563, after twenty-five formal sessions. The road to Trent, long and tortuous, passed through Constance, Basel, and Pisa. The cry for a sweeping reform of the church from top to bottom—"reformatio capitis et membrorum"—had been raised one hundred years before Luther posted his theses. It continued to ring out through the fifteenth century, accompanied more often than not by the insistence that serious reform could be achieved only within the framework of a general council. Basic to this coupling of reform and council was the widespread conviction that the papacy was incapable of or unwilling to put right the tangle of abuses that threatened to smother the ecclesiastical life of Christendom. Indeed, it was argued by many that the popes' chronic

misuse of their dispensing powers, particularly with regard to the appointment to benefices, was the root cause of those abuses.

The demand for a council became the standard rhetoric not only of churchmen but also of princes and statesmen. Conciliar preeminence assumed doctrinal status in many of the best universities in Europe and found its way into a thousand pamphlets, treatises, and broadsides. Preachers thundered the message from their pulpits, and echoes were heard in busy chancelleries no less than in silent Carthusian charterhouses. No pope could be elected until he had assured the cardinals in conclave that he would summon a council within a year or two of his coronation.

Such were the shock waves loosed at the Council of Constance (1414–1418). The questions addressed there were at once constitutional, procedural, and moral. With whom or what lies ultimate authority within the church? The monarchical concept of the papal primacy had taken its classical form in the days of Gregory VII (d. 1085), had pressed its brief even further under the great lawyer popes of the thirteenth century (e.g., Innocent III, d. 1216, and Clement IV, d. 1268) and, scarcely checked by the extravagances of Boniface VIII (d. 1303), had reached a kind of practical hegemony, at least in fiscal affairs, at Avignon (1305–1376). But the protracted scandal of the Western Schism (1378–1417), when two and then three rival "popes" competed for the allegiance of Christendom, brought the notion of papal monarchy into severe disrepute, just as the solution of the crisis by a general council convened at Constance under the aegis of the German emperor enhanced the idea of conciliar superiority. The council's deposition of the three squabbling claimants, its election of a successor (Martin V, 1417–1431), and its solemn decree, *Sacrosancta*, all combined to stake out a constitutional position: a general council, representative of the emperor and other Christian princes, the learned elite of the universities, the experts in canon law, and the college of bishops, acted for the whole church, of which the pope was a functionary, albeit an exalted functionary.

The decree *Frequens*, which called for such a council to be held every ten years, concerned itself with the procedural problem. *Frequens* presumed the doctrine of *Sacrosancta*. Since final and decisive authority belonged to the council, the pope's position was that of chief executive or prime minister responsible to the council, which therefore had to meet frequently. The conciliar movement of the fifteenth century based itself on these grounds. Due partly to the temper of the time, that movement did not succeed. The secular counterparts of the aristocratic ecclesiastical assemblage the conciliarists had in mind were in retreat everywhere in Europe and, in most places, on the eve of dissolution. Ambitious dynasts were in the process of bringing the powers to tax, to maintain military establishments, and to appoint government personnel under their own bureaucratic control, and thus reducing and even eliminating the prerogatives of the great medieval parliaments. It was unlikely that the church,

the first great Western institution to adopt this centralizing model, would have reversed direction in favor of a polity that was demonstrably anachronistic.

But there were other, more proximate causes for the collapse of the movement, not least the tendency of the conciliarists to quarrel among themselves. The popes, for their part, ignored the doctrine of *Sacrosancta* and evaded the provisions of *Frequens*. A council was indeed convoked at Basel in 1431, but it soon fell out with the pope, who withdrew from it and convened a more tame assembly under his own presidency at Florence. The rump council continued to meet at Basel until 1449, when it broke up into bitterly contending factions. After that, conciliar rhetoric sounded increasingly hollow, especially when engaged in by secular rulers who routinely invoked the threat of a council as a device to influence papal policy in Italy. So the conciliar movement died a lingering death, its last gasp coming at Pisa in 1511, when the king of France, in league with a dissident minority of the college of cardinals, summoned a council whose declared purpose was to strip the pope, the king's bitterest political enemy, of his office. This *conciliabulum* did not survive the French military reverses of the following year.

The effective end of the movement, however, did not put a quietus to the theory. The teaching of *Sacrosancta* continued to flourish in university circles, notably at the Sorbonne. Nor did those who rejected *Sacrosancta* necessarily repudiate *Frequens* as well. The two decrees had doubtlessly been wedded in the minds of the fathers of Constance, but as the century wore on a distinction between them was often drawn by those who, while not prepared to admit the constitutional superiority of the council, nevertheless believed that only a council could bring about meaningful reform.

The moral issue raised at Constance went unresolved for a hundred years. There had occurred a kind of spontaneous reform of the members in some places—the *Devotio Moderna* in the Netherlands, a florescence of mysticism in England and Germany, an evangelical revival in northern Italy, a dedication among the educated classes everywhere to the scholarly endeavors of Christian humanism. But these were hardly more than specks upon a dark sea of clerical illiteracy, popular superstition, jobbery, and pastoral neglect. The belief was almost universal that such abuses perdured because the Curia Romana, the pope's own administration, permitted and even encouraged them. Curial fees, taxes, and charges proliferated, most of them designed to allow what traditional law and common sense declared to be perilous to the life of the church. The members would never be properly reformed, it was said, unless the head were reformed too.

The Renaissance popes, whose lifestyles and political ambitions were hardly calculated to inspire confidence, stubbornly refused to put their houses in order or to permit any other organ of the church to do so. They tried to keep to the high ground of constitutional theory. The papal primacy, they argued, was a datum of divine revelation that they were pledged to defend as they had received it. They also declined

to have any outside agency oversee and most likely interfere with the workings of their own court, the central bureaucracy of the church. Reform of the Curia, they proclaimed, was the business solely of the supreme pontiff.

Whatever the theoretical value of this argument, the trouble with it was that the supreme pontiffs, themselves products of the curial system, were clearly not prepared to go beyond platitudes and gestures in correcting the colossal financial chicanery that corrupted the various papal departments and that reached a stunning climax in the election and pontificate of Alexander VI (r. 1492–1503). Since Constance, the conviction that everything was for sale in Rome—offices, judgments, indulgences, dispensations from the law—had grown, not lessened, and the poison of simony seeped down through the whole body of the church. Julius II did indeed summon a council in 1512, largely as a counter to the French-sponsored gathering at Pisa, but the meanderings of the Fifth Lateran Council (1512–1517) produced reform decrees that were no better than scraps of paper and that served merely to confirm the cynical mistrust of the papacy's moral resolution.

The popes' highest card in this game of stalemate was the reluctance of even fervent conciliarists—aside from a handful of academics—to challenge the doctrine of the Petrine office. But the year that saw the conclusion of the futile Fifth Lateran Council was also the year of the ninety-five theses. By 1520, Luther declared himself ready to jettison the papacy if that institution obstructed the full flowering of the gospel as he understood it. And Luther soon proved he was no effete intellectual but the leader of a potentially vast popular movement. Over the next decade the character of the debate about a council was drastically altered. As early as 1523, the German estates, gathered in the Diet of Nuremberg, called for “a free Christian council in German lands.” Here was conciliarism with a new twist. Now, besides the old clamor for a council to reform ecclesiastical abuses, there came the demand from a growing constituency in northern Europe for a reform of dogma as well.

THE COUNCIL OF PAUL III. The pope who had to contend with this new situation, Clement VII (r. 1523–1534), avoided it as best he could, and though he paid lip service to the conciliar idea, he was as obstructive as his predecessors had been. His successor was cut from a different cloth. Alessandro Farnese, who upon his election assumed the name Paul III (r. 1534–1549), had long been a champion within the Curia of a reform council, and he had carefully distanced himself from Clement VII's duplicitous policy in this regard. Not that Farnese had the credentials of a reformer. His youthful career—Alexander VI had made him a cardinal when he was twenty-six—had revealed many of the more seamy features of the Renaissance papal court. In his middle years he had undergone something of a religious conversion, which, though it did not eradicate all the bad habits of his past, led him at least to a greater earnestness and gravity of purpose. Never a moral zealot himself, he signaled his good

intentions by promoting men of genuine probity and even holiness to high ranks and, most of all, by immediately moving to fulfill his pledge to summon a general council.

From the beginning of Paul III's initiative, everything seemed to work at cross-purposes. For a council to succeed, both great Catholic sovereigns—the German emperor and the king of France—had to support it, but they were bitterly at odds with each other. The emperor, Charles V, pressed for a council of reconciliation to bring peace to Germany, which meant a council to correct abuses, to satisfy the *gravamina* of the German estates against the Curia, with as little attention as possible paid to divisive doctrinal issues. Francis I wanted no council at all, because religious unrest in Germany, which discomfited his Habsburg rival, was much to his liking. Had Paul III had his way, he would have preferred a council over which he could keep careful watch, a kind of “Sixth Lateran,” which would emphasize doctrine and, with a preponderance of bishops from the Papal States in attendance, protect the prerogatives of the Curia. But he knew he had no chance for that, and so he proposed what appeared to be the next best scenario. Mantua was a petty Italian city-state whose duke was vassal to the emperor; on June 2, 1536, the pope, ignoring the unanimous advice of his cardinals, summoned a general council to convene at Mantua the following May and ordered all the bishops, abbots, and other prelates of the whole world to appear there.

Immediately obstacles sprang up all around him. The duke of Mantua demanded a large papal army to garrison the town. The Protestants promptly declined to attend because of the presence of this hostile force, and then, when security arrangements were altered to meet their objections, they refused anyway. The king of France also refused to participate or to allow any French prelates to do so. The emperor, pointing out how Francis I had connived with the Lutheran princes and even with the Turks, urged Paul III to join him in an assault upon the French and thus guarantee a successful council. The war duly broke out in 1536, but without the pope, who shrank from a step that might have provoked Francis into following the schismatic example of Henry VIII and that at the same time might have contributed to eliminating the only check upon Habsburg power, which he feared as much as the French king did. Instead, the pope postponed the Mantuan council twice, then translated it to Vicenza, postponed it again, and finally, in 1539, suspended it altogether.

The failure was more than a disappointment. It tended to sustain the view—not only among Protestants—that this pope was no more serious about reform than his predecessors had been. Paul III did not help his cause much by the simultaneous campaign he was carrying on—in the best Renaissance style of his first mentor, Alexander VI—to make a ruling dynasty of his children and grandchildren. The Farnese did indeed become dukes of Parma, but only at the cost of diminishing further the pope's limited fund of goodwill. Even so, whatever Paul III's flaws of character, lack of persis-

tence was not one of them. The intricate diplomacy involved in the conciliar enterprise never really ceased, even when the distrustful emperor turned to another tack and urged a conference of leading theologians, Protestant and Catholic, who could discuss all the religious discontents and find solutions to them. The pope cooperated in this venture, but the distinguished participants in the Colloquy of Ratisbon, which occupied most of the summer of 1541, failed to reach a meeting of minds. Any hope of religious reunion was fast slipping away.

The pope responded by returning to his conciliar project. With the assent of the somewhat chastened emperor, he formally announced the opening of a general council for November 1, 1542. The site this time was Trent, a small Italianized town northwest of Venice that was nevertheless an imperial free city and thus juridically “in German lands.” But the earlier pattern of delay, postponement, and obstructiveness by Francis I and outright rejection by the Protestants, quarrels between pope and emperor, and intermittent warfare between France and the empire was bitterly repeated. Not until December 13, 1545, did Paul III's council finally begin in the Cathedral of Saint Vigilius in Trent. The process had consumed eleven years and had produced only thirty-four voting participants. It was no wonder the mood was somber throughout the Mass of the Holy Ghost and the formal reading of the bull of convocation, which reminded the fathers that their solemn task was to heal the confessional split, to reform those abuses that sullied Christ's body, and to promote amity among Christian princes.

Those princes, though their influence over the council was enormous, did not participate directly in its decision making, nor did anyone else outside the higher clergy. In its procedure Trent was more akin to the papal councils of the high Middle Ages than to Constance or Basel. Franchise belonged only to the “fathers” of the council, that is, to the bishops present—not their proctors—and to the generals of the mendicant orders. The presiding officers were the legates appointed by the pope. They were empowered to set the agenda, although each bishop was free to request inclusion of any proposal he pleased. This arrangement met with few serious difficulties once the basic compromise between the pope's and the emperor's positions was accepted: that matters of dogma and matters of reform would be treated simultaneously.

The work schedule followed a consistent pattern. It began with a “particular congregation,” at which theologians and canonists would discuss the draft of a particular decree. The fathers formed the audience for these technical expositions. Then, meeting alone in a “general congregation,” they debated the matter themselves until they reached agreement upon a final text. A “session” was a public meeting at which that text was read out, formally voted upon, and promulgated at the council's decree. Since it was thought to have a liturgical as well as a juridical significance, a session was always convened in the cathedral or some other church. Between

1545 and 1563 the Council of Trent held twenty-five sessions, of which seventeen were substantive in the sense that they were occasions for the proclamation of doctrinal definitions and reform legislation, while the rest were ceremonial affairs.

The first particular congregation met on February 20, 1546, to examine Luther's assertion of *sola scriptura*. On April 8, at the fourth session, the council declared that apostolic traditions, "which have come from the mouth of Christ or by the direction of the Holy Spirit and have been passed down to our own times," deserve to be accepted by believers "with as much reverence [*pari pietatis ac reverentia*]" as scripture itself. The fifth session, on June 17, renewed earlier conciliar legislation setting up structures for the theological training of the parochial clergy and placed upon bishops and pastors a stern obligation to preach to their flocks every Sunday and holy day. On the dogmatic side this session issued six "canons," terse condemnatory statements on the Pelagian as well as the Lutheran view of original sin.

Then began the most protracted debate of the council, devoted to the central Lutheran doctrine of justification. The first draft of a decree on this controversial subject was submitted to the fathers on July 28 and promptly rejected. For the next seven months the arguments raged through forty-four particular and sixty-one general congregations, until finally an acceptable text was hammered out and promulgated at the sixth session, on January 13, 1547. There was nearly unanimous assent to the sixteen chapters of the decree and the thirty-three canons, which repudiated Luther's view of justification by faith alone. But there was no such unanimity when the next great issue of reform was introduced. The fathers and their theologians wrangled through the succeeding months over the requirement that bishops reside in their dioceses. When the proposed decree was presented the first time, only twenty-eight fathers out of a total grown by early 1547 to sixty indicated their agreement by voting *placet*. The divisions over the matter were so deep that it had to be set aside for later consideration. The seventh session, on March 3, 1547, therefore contented itself with asserting a bishop's right to supervise parishes in his diocese administered by members of religious orders. The dogmatic decrees of the same session defined the nature of the sacraments, fixed their number at seven, and asserted their effective spiritual power (*ex opere operato*). The doctrine of baptism and confirmation was also treated in detail.

Meanwhile, in the midst of all this intellectual labor, various discontents revealed themselves. Trent was a small town with limited accommodations. Its location made it a difficult place to supply with provisions, and its climate was harsher than the southerners in attendance were accustomed to. Many of the fathers complained of the discomfort in which they were forced to live. During the summer of 1546, fighting between the emperor and the Smalcald League surged close enough to the city that dissolution of the council was seriously contemplated. This danger passed away, only

to be replaced by a typhus epidemic that broke out in the vicinity early in 1547 and that caused the council to translate its deliberations to Bologna (eighth session, March 11, 1547). The emperor was furious at what he considered the pope's maneuver to bring the council under his direct control by removing it to a city in the Papal States. Fourteen imperialist bishops remained in Trent, but the majority of the fathers went dutifully off to Bologna, where they labored through intense debate in both particular and general congregations on the rest of the sacraments, the sacrificial character of the Mass, purgatory, veneration of the saints, and monastic vows—all doctrinal issues raised by the Protestant reformers. But Paul III allowed no formal sessions or decrees, lest he push the angry emperor too far. The significance of the Bologna phase of the council, until its suspension on February 16, 1548, proved to be the use to which its work was put when the council assembled again at Trent three years later.

THE COUNCIL OF JULIUS III. Giovanni Maria del Monte, who had been senior legate during the first phase of the council, was elected pope in February 1550 and took the name Julius III. Immediately he came under pressure from the emperor to reconvene the council and, specifically, to get on with the business of reform. The new pope faced many of the same political problems as his predecessor, and it was in the teeth of strong resistance from the German Protestant princes and the new king of France, Henry II, that the council reopened at Trent on May 1, 1551. The fifty or so fathers did little serious work before the end of the summer, but thanks to the deliberations at Bologna they were ready at the thirteenth session, on October 11, to issue a decree on the Eucharist that in eight expository chapters and eleven canons reasserted the traditional dogma of the real presence as well as the mechanism of transubstantiation. Six weeks later, at the fourteenth session, the sacraments of penance and extreme unction received doctrinal definition. The landmark character of these dogmatic decisions, however, was not matched by the reform legislation passed in the thirteenth and fourteenth sessions. Directives about rights and duties of bishops with regard to their clergy, and regulations governing procedures in ecclesiastical courts, did not, as the council's critics were quick to point out, strike at the roots of the accumulated abuses.

At the beginning of 1552 a faint flicker of hope for reunion flared up and then quickly died out. On January 15, ambassadors and theologians from several Protestant states, having come to Trent under a safe-conduct, appeared at the council's fifteenth session. But their brief presence only served to demonstrate that the confessional divisions could no longer be healed or that at any rate a council managed by the pope and already committed to *traditio* no less than to *scriptura* as a font of revelation could never be an instrument of reconciliation.

So the fathers returned wearily to their own debates, now treating of the sacrament of orders and the sacrifice of

the Mass. The congregations dragged on inconclusively into the spring, as the emperor went to war yet again with the German princes allied with France. This time he was badly defeated, and when he fled to nearby Innsbruck the fathers at Trent decided it was too risky to remain there. They used the sixteenth session, April 28, 1552, to adjourn the council *sine die*. Julius III, at heart an indolent and self-indulgent man, made no effort through the rest of his pontificate to revive it. His successor, Paul IV (1555–1559), was fiercely determined to effect reform, but he had no patience for conciliar ways and preferred instead to impose doctrinal and moral purity by liberal use of the inquisition, of which he had once been head. This policy was an utter failure, as indeed was Paul IV's whole reign, and when the cardinals entered the conclave of 1559 the scandal of an unfinished council cast a long shadow over it.

THE COUNCIL OF PIUS IV. The conclave of 1559 lasted more than three months, and the pope who emerged from it, Pius IV (Giovanni Angelo de' Medici), was committed to bringing the Council of Trent to a satisfactory conclusion. The obstacles he encountered in persuading the Catholic powers to take up the conciliar enterprise once again were different but hardly less daunting than those Paul III and Julius III had had to face. The Peace of Augsburg (1555) and the Treaty of Cateau-Cambresis (1559) had indeed removed for the time being the threat of war that had so plagued the earlier stages of the council. But the Catholic monarchs—three of them, now that Charles V had departed the scene and had divided the Habsburg territories between his brother, Ferdinand I, and his son, Philip II of Spain—were deeply at odds over the crucial problem of whether the council Pius IV formally convoked (November 29, 1560) was to be a continuation of the former one or an entirely new undertaking. France, now troubled as Germany had been for a generation by a growing and aggressive Protestant faction, joined the imperialists in demanding a new council unencumbered by any decisions arrived at earlier. The king of Spain conversely insisted that the work begun before be allowed to run its course. The pope agreed with this view, though he dared not say so publicly. Instead he adopted a policy of studied ambiguity, confident that once an assembly had been lured back to its original site the problem would solve itself. After months of the most convoluted diplomacy, this tactic succeeded. On January 18, 1562, some 113 fathers gathered at Trent—their number would ultimately swell to 277—and implicitly accepted continuation by deciding to resume deliberations at the point at which they had been suspended ten years before.

By March the council had returned to the discussion of episcopal residence and found itself mired once again in argument. Everyone agreed that bishops should reside in their dioceses and that their widespread failure to do so was a fundamental cause of corruption in the church. But was the requirement one of divine law or ecclesiastical law? This seemingly abstract question had vast implications, because if residence were an obligation *jure divino*, it could mean that

bishops exercised their office independently of the pope. A vote on April 20, revealed that the fathers were divided almost evenly on the subject. Tempers ran so high that the legates managed to calm the situation only by postponing discussion of the question until a later date. Dogmatic deliberations meanwhile continued, and at the twenty-first session (July 16, 1562) the council defined the sacrificial character of the Mass and the whole presence of Christ in each of the eucharistic species of bread and wine. The disciplinary decision as to whether the laity should be allowed to share the chalice—something taken seriously by the emperor and by Germans generally—was referred to the pope for implementation after the council.

Next on the agenda came discussion of the sacrament of orders, which involved once more the thorny issue of episcopal residence. By autumn the council had reached an impasse. No formulation, however ingenious, could budge the determination of either side. The winter of 1563 arrived, and then the spring, and still no resolution was in sight. The conciliar machinery ground to a halt, and after ten months of wrangling, the breakup of the council appeared imminent. Then, in early March, the senior legate suddenly died, and Pius IV replaced him with Giovanni Cardinal Morone. This proved to be the decisive intervention.

Morone, the ablest papal diplomat of the century, recognized that behind the arguments advanced by the proponents of *jus divinum* lurked the conviction that the papacy intended no real reform. He moved swiftly to defuse this radical mistrust, especially in the minds of the emperor and the king of Spain, by guaranteeing that a sweeping reform schema, blessed in advance by the pope, would be proposed to the council in short order. Employing a variety of formal and informal commissions, and playing skillfully upon the vanity of the heretofore unpredictable French delegation, Morone put the council back to work again. When the emperor expressed misgivings, Morone went off to Innsbruck to reassure him; when the pope hesitated to support his program, Morone threatened to resign. At the twenty-third session, on July 15, 1563, the council approved his first package of reform legislation. Perhaps its most important provision was the directive to establish a system of seminaries to provide intellectual and moral training for the parochial clergy. As for the conciliar crisis at hand, Morone evaded the insoluble problem by ignoring it. "It is a divine precept that the pastor know his flock," the decree began, but, though strictly obliging bishops to reside, it did not try to define the basis of that obligation. Moreover, cardinals were explicitly included in the requirement, and thus was struck down one of the worst and most resented of the abuses, the accumulation of benefices by officers of the Curia.

The logjam broken, there followed a hectic summer and autumn of congregations dealing with a flood of reform ideas. The whole clerical estate was refashioned during these months. Morone moved easily through all the factions, the pope's man indeed but the council's man too, always urging

accommodation, compromise, the practical attainment of the goal of restoring spiritual primacy to the workings of the church. Special emphasis was placed upon eliminating the chaos in ecclesiastical administration which had opened the door to so many abuses. Morone spared little time for theoretical discussion; the question of indulgences, for example, which had occasioned the Lutheran reformation, was settled not in a dogmatic decree but in a reform decree. This also was the case with the veneration of the saints and relics. The council indeed defined the sacramentality and the indissolubility of matrimony, but it was even more intent on suppression of clandestine marriages. Statistically the achievement was prodigious: three times as much reform legislation was passed by the council during Morone's brief legateship than in all the sessions before him combined.

By the twenty-fourth session, on November 11, 1563, the end was finally in sight. The last session, at which all the conciliar decrees since 1545 were to be formally promulgated, was scheduled for December 9. However, news from Rome that Pius IV was severely ill led Morone to move the date forward. Therefore, the twenty-fifth session was held on December 3 and 4, 1563, when each of the 229 fathers gave his *placet* to all the work the council had done over its eighteen years of life. A *Te Deum* was sung, and tearful fathers embraced one another, in many cases embracing those with whom they had often violently disagreed.

BIBLIOGRAPHY

The official collection of Tridentine decrees is *Canones et decreta, Concilii Tridentini* (Rome, 1564), many times reprinted, now to be found most conveniently in the volume edited by Giuseppe Alberigo and others, *Conciliorum oecumenicorum decreta* (Bologna, 1972). Relevant documents can be found in *Concilium Tridentinum: Diariorum, actorum, epistularum, tractatum; Nova collectio*, 13 vols. (Freiburg, 1901–1967), an immense deposit and an indispensable tool of research.

The two classic studies are Paolo Sarpi's *L'istoria del Concilio Tridentino* (1619), 3 vols., edited by Giovanni Gambarin (Bari, 1935); and Sforza Pallavicino's *Storia del Concilio de Trento* (1656–1657), 3 vols., edited by Mario Scotti (Turin, 1968). The polemical camps trace themselves back to either Pallavicino, a defender of the council, or to Sarpi, an attacker of it.

The definitive history of the council has now been written: Hubert Jedin's *Geschichte des Konzils von Trient*, 4 vols. in 5 (Freiburg, 1949–1975), the first two volumes of which have been translated into English by Ernest Graf as *A History of the Council of Trent* (London, 1957–1960). Jedin also published many monographs on Trent, including *Girolamo Seripando*, 2 vols. (Würzburg, 1937), translated into English (but without the full scholarly apparatus) as *Papal Legate at the Council of Trent, Cardinal Seripando* (Saint Louis, 1947); and *Krisis und Abschluss des Trienter Konzils, 1562–63* (Freiburg, 1964), badly translated as *Crisis and Closure of the Council of Trent: A Retrospective View from the Second Vatican Council* (London, 1967).

A useful survey of ecclesiastical history during the time the council was sitting is Leon Cristiani's *L'église à l'époque du Concile de Trente*, "Histoire de l'église," no. 17 (Paris, 1948). Special studies of note include *Il Concilio di Trento e la Riforma Tridentina*, 2 vols. (Rome, 1965), a collection of distinguished essays by a panel of international scholars; Dermot Fenlon's *Heresy and Obedience in Tridentine Italy* (Cambridge, U.K., 1972), on Italian humanism and its import upon reform; James A. O'Donohoe's *Tridentine Seminary Legislation: Its Sources and Its Formation* (Louvain, 1957); and Wolfgang P. Fischer's *Frankreich und die Wiedereröffnung des Konzils von Trient, 1559–1562* (Münster, 1973), on the resumption of the council after the death of Paul IV. On the diplomacy during those crucial few years, H. Outram Evennett's *The Cardinal of Lorraine and the Council of Trent* (Cambridge, U.K., 1930) is still useful, as is Gustave Constant's *La légation du Cardinal Morone près l'empereur et le concile de Trente, avril-décembre, 1563* (Paris, 1922), a collection of documents and commentary. The best analysis of the council of Pius IV is Robert Trisco's "Reforming the Roman Curia: Emperor Ferdinand I and the Council of Trent," in *Reform and Authority in the Medieval and Reformation Church*, edited by Guy F. Lytle (Washington, D.C., 1981).

MARVIN R. O'CONNELL (1987)

TRIADS, groups or sets of three persons, things, or attributes, are found in many concepts of the divine. Because triads involve an uneven number they have been considered to be perfect expressions of unity and proportion, corresponding to a threefold division in nature or to images of the nuclear family.

In Indian mythology, the *Rgveda* suggests a threefold classification of its many divinities into gods of heaven, air, and earth. In its prayers three chief gods represent the powers of these natural elements: "May Sūrya [sun] protect us from the sky, Vāta [wind] from the air, Agni [fire] from the earthly regions" (10.158.1). Agni, god of fire and messenger to the gods during fire sacrifice, took three forms, as the sun in the sky, lightning in the aerial waters, and fire on earth. Commentators on the Vedas considered that the number of gods could be reduced to three, Agni, Vāyu, and Sūrya being considered as sons of the lord of creatures, Prajāpati.

A famous dialogue in the Brāhmaṇas and Upaniṣads asks how many gods there are. In reply, a traditional invocatory formula in a hymn to all the gods is quoted as indicating three hundred and three and three thousand and three. Further questioning reduces these figures to thirty-three, six, three, two, one and a half, and finally one, and that one is *brahman* (*Bṛhadāraṇyaka Upaniṣad* 3.9).

In the same Upaniṣad, Prajāpati is said to have had three kinds of offspring—gods, humans, and demons—who lived with their father as students of sacred knowledge. Each class of beings asked for a divine word, and to all Prajāpati gave the same reply: *dā*. This word was like the rolling thunder, *dā, dā, dā*. Each interpreted the word according to its own

needs, and three definitions resulted: self restraint, giving, and compassion (*Bṛhadāranyaka Upaniṣad* 5.2). This concept was used by T. S. Eliot in the closing lines of *The Waste Land*: “then spoke the thunder. . . .” Eliot ended with another threefold borrowing from the Upaniṣads: “Shantih Shantih Shantih” (“Peace, peace, peace”).

The Upaniṣads refer to three *guṇas*, strands or qualities that characterize all existing beings. These qualities are goodness or purity (*sattva*), passion or force (*rajas*), and darkness or dullness (*tamas*). The *Maitri Upaniṣad* affirms that in the beginning the three qualities were differentiated within the supreme self: “That One become threefold.” This supreme self (*brahman*) is indicated by the sacred syllable *om*, with which every recitation of the Veda begins. The sacred syllable divides itself threefold, for *om* consists of three units: /a/, /u/, and /m/. *Aum* is the sound form of this being, and “one should worship it with *aum* continually” (*Maitri Upaniṣad* 6.3–4). A later description of *Brahman* was *saccit-ānanda*, or *saccidānanda*: being, intelligence or consciousness, and bliss.

In the *Bhagavadgītā*, goodness, passion, and darkness are declared to be the strands or qualities that spring from nature, binding the embodied self although it is changeless. But the world was deluded by these three strands and did not recognize that they come from God alone, that they are in him but he is not in them. God is higher and eternal. Because nature is the uncanny power of God, all elements must ultimately derive from him (*Bhagavadgītā* 7.12–13).

TRIMŪRTI. In Hindu mythology and popular theology many gods appeared, though Viṣṇu and Śiva (Rudra) became dominant. Early in the common era a *trimūrti* (“having three forms”) was proposed that created a triad of these two and a creator, Brahmā. These three were regarded as forms of the neuter absolute *brahman*, or corresponding to the three *guṇas* of the Absolute. The epic *Mahābhārata* tells of these gods separately and not as a unity, and when the Trimūrti concept appeared its exposition varied according to the preferences of the writers for one or another deity.

A story in the *Bhāgavata Purāṇa* says that there was once a dispute among the gods as to which member of the triad was greatest. The sage Bṛḥgu went to each of them in turn to decide the matter by tests. First he saw Brahmā but omitted to bow to him, whereupon the god blazed out in anger. Next he visited Śiva and did not return the god’s salutation, so that Śiva raised his trident (*triśūla*) to destroy him; the sage was spared only by the intercession of Śiva’s wife. Lastly Bṛḥgu called on Viṣṇu, found him asleep, and woke him with a kick on the chest. Instead of becoming angry, Viṣṇu begged the sage’s pardon for not having greeted him and said that he was highly honored by the kick, which had left an indelible mark on his breast, and that he hoped the sage’s foot had not been hurt. Bṛḥgu decided that Viṣṇu was the mightiest god because he overcame his enemies with weapons of gentleness and generosity. This Vaiṣṇava story indicates the diversity and rivalry of different sects and the problems of a triad.

It was debated whether the three gods were equal or had interchangeable functions. Each in turn might be the Supreme Lord, Parameśvara, and take the place of the others. The poet Kālidāsa, in his *Kumārāsambhava* (2.4ff.), expressed his adoration for the Trimūrti unified before creation but afterward divided in three qualities, proclaiming its threefold glory as “knower and known, priest and oblation, worshiper and prayer.” These verses inspired Emerson’s poem *Brahma* and its line “I am the doubter and the doubt, I am the song the Brahmin sings.” But rather than teaching the equality of three persons in one God, Kālidāsa seems to have been addressing the personal Brahmā as the supreme god, despite his use of the term *Trimūrti*.

For the Vaiṣṇava believer Brahmā was an emanation of Viṣṇu, a demiurge or secondary creator; he is described in the vision of the *Bhagavadgītā* (11.15) as sitting on a lotus throne emerging from the body of Viṣṇu, the god of gods, a scene illustrated in many paintings. Whatever his former status, Brahmā has long since declined in popular esteem. His temple at Pushkar in Rajasthan is said to be one of only two in India, though this is difficult to verify in such a vast land with innumerable shrines. At Pushkar the temple of Brahmā has four black faces, supposedly directed at the four cardinal points though three of them face the worshiper. A *lingam* of Śiva nearby also has four human faces carved on it, no doubt to show affinity with Brahmā. But in popular religion in most of India today Brahmā has virtually disappeared, while Viṣṇu and Śiva have vast followings. (The two groups are considered almost as distinct religions.) The third most popular cult today follows the great goddess Mahādevī, the all-pervading power *śakti*, known under many names and notably today as Kālī.

A famous sculpture of the Trimūrti dating from the fifth to eighth centuries CE is in the Great Cave on Elephanta Island near Bombay. It is a massive stone bust nineteen feet high, with three faces each four or five feet long. This figure represents Śiva, who is the dominant deity among the sculptures in these caves. The eastern face is Rudra the destroyer, the front is Brahmā the creator, and the western face is Viṣṇu the preserver. All three are regarded as aspects of the character of Śiva, and all show the impressive serenity that marks representations of divine activity.

Early students of Hinduism in the West often considered that parallels exist between the Trimūrti and the Christian doctrine of the Trinity, and attempts were made to apportion common functions to the three persons in one God. There are still writers who call Brahmā, Viṣṇu, and Śiva “the Trinity,” but the parallel with Christianity is not close, and the Trimūrti concept never became popular or embodied an orthodox and catholic creed. Hindu writers and artists tended to favor one god of the three, and Viṣṇu and Śiva came to dominate in their own schools.

TRIKĀYA. In Indian Buddhism there were triadic concepts from an early date, and some that developed in Mahāyāna Buddhism and outside India showed parallels to Chinese tri-

ads. The Three Refuges (*trīśaraṇa*), or Three Jewels (*triratna*), appeared in Buddhism at an early date. In the Tripiṭaka, or “Three Baskets” of scripture, the invocation of these refuges is attributed to the first lay believer in the Buddha. Recited every day in Theravāda Buddhism by the laity as well as by monks, the Triple Refuge is a simple affirmation of trust in the central objects of religion: the Buddha, the Dhamma or doctrine, and the Sangha or monastic order. The formula reads thus: “I go to the Buddha for refuge, I go to the Dhamma for refuge, I go to the Sangha for refuge.” The Buddha is credited with saying that whoever trusts firmly in the virtues of the Three Jewels has “entered the stream,” has set out on the way to enlightenment.

In the development of Buddhism the term *yāna* (“vehicle, means of progress”) was used to indicate a way of attaining enlightenment. The Mahāyāna claimed to be the “one vehicle” (*ekayāna*), and its followers called their opponents Hīnayāna, followers of a “lesser vehicle.” But, occasionally, more tolerant texts spoke of the major ways as *triyāna*, “threefold means.”

Mahāyāna Buddhist philosophy wrestled with the problems of the absolute and the relative and of one or many Buddhas. A solution was found for philosophy in the doctrine of the *trikāya* (“three bodies”). This was expressed in essence in the *Laṅkāvatāra Sūtra* and developed by the Yogācāra school. According to this theory the body of the Buddha is threefold. The *dharmakāya* (“doctrine body or essential body”) is self-existent and absolute, the same for all Buddhas. It supports the other two bodies, for ultimately only it exists. The *sambhogakāya* (“bliss body or communal body”) is the channel through which the Buddhas communicate with *bodhisattvas* in the heavens. This notion was used to interpret texts that describe many Buddhas preaching to assemblies of *bodhisattvas* and gods in all the universes, while at the same time they had passed away to *nirvāṇa*. The *nirmāṇakāya* (“transformation body”) is that by which the Buddha works for the good of all creatures, including the historical Buddha, who appeared on earth, and in other existences, and then passed away into *nirvāṇa*.

The *trikāya* doctrine sought to reconcile different expressions of the nature of the Buddha. In early texts the *dharmakāya* was simply the body of doctrine; once the Buddha had died, he existed thereafter in the doctrine. In popular beliefs the Buddhas were many, and they continued to exist in a state of bliss to hear the prayers of worshipers. Buddhist art from Gandhara to Japan often grouped three Buddhas or *bodhisattvas* together, the individual personages differing according to the environment. Parallels that have been drawn between the *trikāya* doctrine and the Christian teaching of the Trinity are strained and unproved. The Chinese triads appear to have been separate developments, although in popular religion triads of gods may be confused with several Buddhas.

THREE PURE ONES. Chinese speculations on a divine Triad and its representation in worship may have developed from

Daoist philosophical notions of an original unity that produced diversity. In the Dao de jing 42 (fourth to third century BCE?) it is declared that “Dao produced the one, the one produced the two, the two produced the three, and the three produced the ten thousand things.” This is not unlike an idea in the *Chāndogya Upaniṣad* (6.2) of one neuter being that entered into three divinities to produce the many. However, Arthur Waley in his translation of this verse rendered it thus: “Dao gave birth to the One, the One gave birth successively to two things, three things, up to ten thousand” (Waley, 1934, p. 195).

The concept of an inseparable triad of Heaven, earth, and man became popular in Chinese thought. Philosophers aimed at formulating systems that would deal with all questions concerning the divine, natural, and human worlds, so that all human activity might be in harmony with divine and natural orders. Such a system of knowledge and behavior was set out in the *Lüshi Chunqiu* (Spring and Autumn Annals of Mr. Lü), a work by various hands early in the common era. The book is in three sections, representing the triad of Heaven, earth, and humanity. The first section is in twelve chapters, the number associated with Heaven. The second is in eight chapters, the number associated with earth. The third is in six chapters, the number associated with man. Each chapter indicates actions appropriate for each season, stating that if humans fail to perform them properly they will cause disturbances in nature and bring calamity from Heaven.

Perhaps early in the common era, popular Daoist religion developed the worship of a triad, the Three Ones, Sanyi. It has been suggested that the concept of three celestial persons derived from Christian influence, although it is rather early for that to have happened unless some Christian ideas had filtered through via gnostic speculations. It is more likely that the idea of a religious triad developed from philosophical notions of diversity arising from unity, or that philosophical and religious concepts developed independently and were merged by priests who claimed authority for three deities worshiped as one.

An ancient Daoist divinity was Daiyi, the Grand Unity, introduced into official worship during the Han dynasty as the greatest of all gods, above the five legendary emperors. The Grand Unity became the personification of the Dao, as the Dao emanated itself into creation, a triad developed that controlled the whole universe. To the Grand Unity were added Dianyī, the Heavenly Unity, and Diyi, the Earthly Unity. It is strange that Diyi, the original all-embracing unity, was regarded as one of three. It seems more natural for Diyi to have been conceived as three in one, but there was great complexity in the multiplication of Daoist deities. From the second century of the common era Daoist liturgies spoke of the Great Mysterious Three in One, Taixuan Sanyi comprised the Sagely Father, the Lord and Master of the Human Spirit, and the Pivot of All Transformations. The Daoist imagination peopled the universe with a great variety

of gods, natural forces, and deified heroes, forming a heavenly hierarchy, under the presiding supreme triad that controlled the universe like a state bureaucracy.

In the Daoist triad the three gods were said severally to control time past, present, and to come. By the Sung dynasty the triad of Three Pure Ones had become associated with chronological functions. The Precious Heavenly Lord, the First Original Heavenly Venerable One, controlled time past; some have compared him to the Father in the Christian Trinity. The Precious Spiritual Lord, the Great Jade Imperial Heavenly Venerable One, controlled time present; scholars have compared him to the Son. The Precious Divine Lord, the Pure Dawn Heavenly Venerable One appearing from the Golden Palace, controlled time to come; scholars have compared him to the Holy Spirit. Joseph Needham wrote that “there can be little doubt that the Taoists [Daoists] had intimate contact with Nestorian Christians at the capital during the T’ang dynasty. The really interesting question is where their trinity came from eight centuries previously” (*Science and Civilization in China*, Cambridge, 1956, vol. 2, pp. 158–160).

Whether there was a Christian influence or not (Nestorian missions did not arrive in China until the seventh century at the earliest), there was abundant contact between Daoism and Buddhism, which from the first century established itself as one of the three great ways of Chinese religion. Buddhist triadic concepts could be found in the *trikāya* doctrine, or in the concept of the Dhyāni Buddhas, which were regarded as personifications of creative aspects or manifestations of a primordial Ādi-Buddha. In popular Buddhist religion there were triads of Buddhas, such as Śākyamuni (Gautama), Amitābha of the Pure Land, and Maitreya, the Buddha to come. Another triad comprised the mythical Avalokiteśvara, Mañjuśrī, and Samantabhadra, who have been worshiped in temples and pagodas in China and neighboring lands down to modern times, often alongside Daoist gods.

Laozi, the great saint of Daoism and the supposed author of the *Dao de jing*, was often assimilated to the Three Pure Ones. Influenced by Buddhist teachings on multiple Buddhas and *bodhisattvas* and the various incarnations of the Buddha, the Daoists came to espouse similar beliefs. Laozi was said to have been born before heaven and earth appeared and to have experienced numerous later births. Like the Buddha, he became an object of worship.

In Japanese Shintō the first verse of the *Kojiki* names three gods who all came into existence at the time of the beginning of heaven and earth. Later gods of storm, sea, and fire were grouped in threes, notably the storm god Susano-o no Mikoto, who was considered under three aspects (“three-treasure-rough-god”). The supreme sun goddess, Amaterasu, when asked for permission to erect a great Buddhist statue at Nara, is said to have identified herself with Vairocana, a member of a Buddhist triad, the personification of truth and purity.

The Shintō *kami* were regarded either as *avatāras* of the Buddhas (from the Buddhist point of view) or as their originals (from the Shintō point of view). Chinese triadic influences appeared in Japanese symbolism, as in paintings with three parallel curves and three or more flamelike signs, which were taken as symbols of the soul. A characteristic Shintō symbol is the *tomoe*, which is chiefly found in groups of three in the crest of many shrines. The *tomoe*, three pear-shaped sections of a circle, is often associated with the Chinese *yin* and *yang*, the two pear-shaped halves of a circle indicating complementary opposites, such as heaven and earth, male and female. The threefold *tomoe* is found even in the great Shintō shrine center at Ise, though this site is said to have been kept free from foreign influences.

HYPOSTASES AND FAMILIES. Triadic concepts can be traced in the ancient Mediterranean world, though not as clearly, with the exception of Egypt, as in India and China. Plato in the *Republic* (book 4) distinguished two elements in human nature, the rational and the irrational or lustful, not unlike the Indian *sattva* and *tamas*. But he found himself obliged to distinguish a third element, the spirited or passionate, similar to the Indian *rajas*. When there is a division between rational and irrational, the spirited should array itself on the side of the rational. The three elements in man, according to Plato, correspond to the social classes of guardians, auxiliaries, and producers. These were not unlike Indian classes or priests, warriors, and merchant farmers, although Plato’s classes served different functions. Individuals and societies are wise when the rational element prevails, as when *sattva* prevails in Indian thought. They are courageous because of the spirited element, and they are temperate when the rational element governs with the consent of the other two, producing balance and harmony.

The Greeks wrestled with the problems of the divine nature and action in ways different from those of the Indians or Egyptians. In the *Timaeus* Plato proposed an account of the universe. The world came into being as a living creature endowed with soul and intelligence by the providence of God; the world is an image of what is eternal and true, a reflection of the changeless; the ultimate truth is God the creator. This was a unitary view, though Christian theologians later found a foreshadowing of the Trinity in the *Timaeus*, even from its first verse, which simply said, “One, two, three, but where is the fourth of my guests?”

There was more triadism in Neoplatonic teachings of three primal hypostases, a favorite theme of Christian theologians. Plotinus claimed that earlier Greek philosophers had established three degrees of reality, the primary realities or hypostases. These were represented triadically as the Good or the One, the Intelligence or the One-many, and the World Soul. These three are in the very nature of things, and they are also in human nature, so that our individual soul is something divine, possessing intelligence, and perfect.

In popular Greek religion various gods were grouped together, as, for example, Demeter, Kore, and Dionysos. De-

meter, the corn goddess (Lat., Ceres), had an early double, Kore, who in time was regarded as her daughter, Kore or Persephone (Lat., Proserpina). Demeter's search for Persephone in the underworld was a vegetation myth represented in the Eleusinian mysteries under the symbol of the growing seed that assures a happy future life. Dionysos was also a fertility god; his mystery flourished in the Hellenistic age when Christianity was expanding.

The Etruscans had a triad of gods—Tinia, Uni, and Menerva—who presided over the destinies of towns and were identified by the Romans with their Capitoline triad of Jupiter, Juno, and Minerva. In Rome the flamens (priests or sacrificers) were led by three major and twelve minor priests. The three major priests were the *flamen Dialis* (of Jupiter), the *flamen Martialis* (of Mars), and the *flamen Quirinalis* (of Quirinus). These gods of the triad were invoked in formulas of devotion recited before battle, on receiving spoils, and when sanctifying treaties. Jupiter represented the sky-universe, like the celestial gods of Greece and India, and his priest was preeminent. Mars was the god of war, and months and festivals were named after him. Quirinus was a god of Sabine origin, but little is known of him except that his functions resembled those of Mars and his flamen formed the third of the threesome with those of Jupiter and Mars. The triad of Jupiter, Mars, and Quirinus was later overshadowed by the triad of Jupiter, Juno, and Minerva. A great new temple was dedicated to the latter three on the Capitoline hill in Rome in 509 BCE, the first year of the republic; inside was a statue of Jupiter.

Among the many gods of the ancient Western world, the clear examples of triads are found in Egypt and Mesopotamia. One reason for the concept of triads in Egypt, and no doubt in other lands, was the fusion of the cults of different places. When a victorious ruler brought several towns under his dominion, they would be subject to both political and religious control. New gods encountered local deities whose worship could hardly be suppressed. A simple solution for the conqueror and his priests was to admit the gods of the vanquished into general worship, without giving them too much independence. Neighboring gods joined the principal deity, the patron of the city. Thus at Heliopolis the local god Atum was joined with the lion pair Shu and Tefnut from the nearby town of Leontopolis. At Memphis there was a triad of Ptah, Sekhmet, and Nefertum. At Elephantine was a triad of Khnum, Sati, and Anukis.

However different the gods might have been originally, the ancients regarded them as members of a divine family, taking the roles of father, mother, and son. But the coincidence of different family relationships in the mythologies of the merging cults could cause confusion, as when the father became the son of his wife, or the mother the wife of her son.

The most famous triadic divine family of ancient Egypt was that of Osiris, Isis, and their son Horus. Osiris was a very popular god, whose cult flourished throughout Egypt from prehistoric times. In the texts Osiris was said to have been

killed by his brother Seth, though according to one tradition he was drowned. The body of Osiris was divided into several parts and was sought and embalmed by his wife Isis, who became pregnant by the dead god. Isis gave birth to Horus, who avenged his father by killing Seth and reigning as successor to Osiris. This complicated mythology was recorded most clearly by Plutarch in the beginning century of the common era. Fundamental to the myths of this divine triad were the death and resurrection of Osiris, his place as a nature god, and his role as a model for earthly rulers. These myths provided links with both gnostic and Christian teachings.

Egyptian priests refined their ideas of the divine triads from early anthropomorphic myths to more abstract conceptions. Thus the god Ptah had two of his faculties, heart and tongue (spirit and word), personified under the visible forms of the gods Horus and Thoth. Or the family associations became the union of three spiritual aspects of the same god: his supreme intelligence, active spirit, and creative word. Or God was conceived of as three persons animated by the same will, like the founders of the towns of Thebes, Heliopolis, and Memphis. Re was the thinking head of this triad, Ptah its body, and Amun its invisible intelligence. This was not far from the Neoplatonic doctrines of a God who comprised intelligence, mind, and reason.

In Mesopotamia there were triads of deities organized according to the elements of heaven and earth. The high god Anu ruled in the sky, Enlil inspired the wind or storm and was god of the land, and Enki or Ea ruled the waters or abyss on which the world rested. The positioning of the deities varied over time. For instance, Enlil was once regarded as the first of the triad, though from the beginning of the second millennium BCE he was regarded as second. Another triad of Babylonian deities was composed of the moon god Sin, the sun god Shamash, and the storm god Adad. The popular goddess Ishtar was associated with both this and the previous triads, ousting colorless figures with whom they had earlier been associated. She was connected also with the ancient Sumerian god Tammuz, a vegetation deity like Osiris who descended into the underworld where Ishtar went to seek him. The return of Osiris and Ishtar in the spring brought joy and fertility.

Of the surviving religions of Semitic origin, Judaism and Islam rejected triadic notions of the godhead, while Christianity developed them. The Hebrew Bible was strongly monotheistic, although traces of female elements in the deity can be discovered, as when Jeremiah revealed that incense had been offered to the queen of heaven in Jerusalem and the cities of Judah (*Jer.* 44:17). Scholars have noted that there was goddess worship among Hebrew emigrants at Elephantine in Egypt. In a more abstract way *Proverbs* 8 and 9 referred to wisdom personified as the female companion of God before and during creation, a notion akin to the Logos doctrine of the Fourth Gospel. In the Qabbalah sexual imagery was used to describe the love of God for the Shekhinah,

a sacred union of king and queen. But in general, Jewish teaching was alien to dualities or triads.

Islam was even more adamant, attacking the Christian doctrine of the Trinity, or what it considered that to be. Thus the Qur'an exhorts, "Do not say, Three. Refrain, it will be better for you. God is only one God" (4:169). And again, "Surely they have disbelieved who say: 'God is one of three.' There is no god but one God" (5:77). Orthodox Christian doctrine did not say God was one of three, though no doubt the doctrine could be perverted in that way in popular use. Any suggestion of a divine family, of God begetting or procreating, or having a partner associated with him, was repugnant to Islam. Thus in the Qur'an Jesus was credited with denying that he said, "Take me and my mother as two gods apart from God" (5:116). This was quite proper, and belief in the unity and absoluteness of God was fundamental to Islam. Some writers have pointed out that Islamic theology alludes to diversity in the divine nature through "the most beautiful names of God" (*al-asmā' al-ḥusnā*); these many attributes and titles are recited on prayer beads in popular devotion. And theologians have discussed the eternity of the Qur'an, which was held to be uncreated, almost like a divine hypostasis. In Islamic art the name of God, *Allāh*, may be seen written three times in the prayer niche in mosques, but the main current of Islam has been against both triad and trinity.

Christian doctrine developed, against an Old Testament background, from devotion to Christ, but as it developed it came into contact with triadic concepts of the divine from Egypt and the Near East. Belief in a divine family emerged, for the concepts of Father and Son were in Christianity from the beginning. The Holy Spirit was regarded as the third hypostasis in the Trinity, but it was often a vague or neglected notion. With the growth of the cult of the Virgin and Mother the female side of a triad seemed guaranteed. If Mary had been called God the Mother, like Isis, she would have completed a divine family. In popular religion that might have happened, but trinitarian theology was anchored in the Bible, and Christian teachings developed from those scriptures that gave a threefold baptismal formula and a triadic blessing. As with other religions, the threefold doctrine is best understood in its historical context, however attractive seeming cultural parallels may be.

BIBLIOGRAPHY

Useful general introductions to Indian and Chinese thought, with selections from texts, are available in *Sources of Indian Tradition* (New York, 1958) and *Sources of Chinese Tradition* (New York, 1960), compiled by Wm. Theodore de Bary and others. A. L. Basham's *The Wonder That Was India*, rev. ed. (New York, 1963), ranges over Indian history and society but devotes its longest chapter to religion, and Robert C. Zaehner's *Concordant Discord* (Oxford, 1970) speculates about Chinese triads and other doctrines of the divine nature. Joseph Needham's great series on China has been use-

fully abridged in *The Shorter Science and Civilisation in China* (Cambridge, 1978) with chapters on Daoism and Confucianism. Of the many books by Edward Conze on Buddhism perhaps the best introduction is *Buddhism: Its Essence and Development* (Oxford, 1951), although *Indian Buddhism*, by Anthony K. Warder (Delhi, 1970), has fuller accounts of both Theravada and Mahayana primary sources. Arthur Waley's *The Way and Its Power* (London, 1934) is a classic that has been reprinted many times, although other translations need to be compared with it, and Holmes Welch's *The Parting of the Way: Laozi and the Daoist Movement* (London, 1957) gives more information on Daoism in general. Short, useful introductions to the major religions of ancient Greece, Rome, Egypt, Mesopotamia, and indeed of Asia as well, are provided in my *Man and His Gods* (London, 1971), reprinted with slight changes as *An Illustrated History of the World's Religions* (London, 1983).

TRICKSTERS: AN OVERVIEW

Trickster is the name given to a type of mythic figure distinguished by his skill at trickery and deceit as well as by his prodigious biological drives and exaggerated bodily parts. The myths of many cultures portray such a comic and amoral character, who is sometimes human but is more often animal in shape, typically an animal noted for agility and cunning: the wily coyote, the sly fox, the elusive rabbit, or the crafty spider. Sometimes the trickster is the agent who introduces fire, agriculture, tools, or even death to the human world. As such, he plays the part of another mythic archetype, the transformer, or culture hero, who in a mythic age at the beginning of the world helps shape human culture into its familiar form. However, the trickster's distinction lies not so much in his particular feats as in the peculiar quality of his exploits—a combination of guile and stupidity—and in the ludicrous dimensions of his bodily parts and biological drives. In those cultures where he stands independent of other mythic figures, his adventures are recounted in a separate cycle of myths and lore.

The trickster represents a complicated combination of three modes of sacrality: the divine, the animal, and the human. Myth relates that the trickster existed in the early times when the world was still taking shape and was inhabited by supernatural beings. As one of these important supernaturals, the trickster possesses extraordinary powers more divine than human. He frequently thwarts the supreme being's creative intentions. In one North American Indian

myth, for example, the Winnebago trickster Wakdjunkaga scatters all living creatures across the face of the earth with an enormous fart, which leaves them laughing, yelling, and barking. This is an ungracious parallel to the Winnebago's solemn account wherein Earthmaker creates a quiet and static world order in which each species remains in a separate lodge. The trickster may assume an even more active role on the mythic stage in the absence or weakness of a supreme being. However, there is no need to pair the trickster in a dualism with the supreme being in order to understand his unique character.

The trickster is remarkable for the carnality that he shares with humans and animals. In his case, however, bodily functions and features are extreme: voracious appetite, insatiable lust, stupendous excretions, cosmic flatulence. He reorders (or has reordered for him) his bodily parts: His head may be fastened to his bottom, or his penis to his back. The trickster is usually male, but he often assumes female form in order to conceive and give birth. His (or her) most conspicuous bodily parts are passages (mouth, nostrils, anus, ears, vagina) and members that bridge or penetrate those passages (e.g., head, penis, or, in the case of the spider figure, the filament with which he spins his web). The trickster's appetites cannot be exhaustively explained in terms of the biology of sex or the physiology of hunger. He craves modes of being other than his own: animal, plant, and so on.

On a grand scale, the trickster mimics human needs, drives, and foibles, especially the imperfections of an ambitious but flawed intelligence. He often fumbles his tricks, and his mishaps lead to a comic apotheosis of wit into wisdom. The nature of his deception is especially complicated: a pretended ignorance and a pretended cunning. The irony of his maladroit trickery is so pervasive that one cannot decide whether the trickster is really ignorant or whether he is so clever that he successfully exculpates himself by pretending to be stupid. Reflections on his nature call into question the deeper nature of reality in an imperfect and changing world of the senses. By his duplicity, the trickster would have one believe that he intends his elaborate schemes to fail so that benefits might arise from catastrophe.

Ironically, it is just in his animal-like biological constraints and imperfections of intelligence—the human frame of meaning—that the trickster affirms a sacrality different from that of divine immortals. This sensate sacrality of foibles stumbles into other sacred realms with penetrating burlesque. For these reasons, trickster stories have been called a mythology of incarnation, and he a symbol of the human condition. The religious dimension of comic figures in folk literatures and dramas is often illumined by comparison with the strictly mythic personality of the trickster found in sacred texts relating the beginnings of the world.

The trickster parodies all pretensions to perfection. He mocks the gods, institutional religious figures, the techniques of humans, and himself. By poking fun at anything that parades as permanent, important, or impermeable, he exposes

a penetrable (i.e., accessible, comprehensible) reality. In the process of penetrating it, he reveals the sacrality both of passage and of mundane flaw. He images the process of the religious imagination itself, which sees to it that human beings experiment with the sacred and which sometimes leads not to the serenity of faith in a static, eternal paradise but to an exciting, unpredictable turmoil of the senses in sacred music, dance, and sexuality. The trickster represents not a mystical contemplation of the singular but a sensuous appreciation of multiplicities and contraries.

As the trickster flounders toward a sacred life rooted more in carnate being than in divine being, ambiguity, irony, change, and humor fill the emptiness caused by the *kenōsis* of immortality. The trickster unites things by passing them through the senses and the imperfect reflections of his intelligence. His bodily parts and “all too human” intelligence admit no firm distinction between corporeal and spiritual existence. His exorbitant and active penis offers him access to realms of reality in which he ought properly to have no business. His (or her) bodily passages become the loci where worlds meet, come together, and even pass through and interpenetrate one another. Wherever he appears, the trickster enacts the human comedy as a sacred drama, displaying the ironic condition of a limited mind served by limited senses but with an unlimited desire to relate to the realms of meaning around it.

BIBLIOGRAPHY

The best overview of general interpretations of the trickster is chapter 1 of Robert D. Pelton's *The Trickster in West Africa: A Study of Mythic Irony and Sacred Delight* (Berkeley, Calif., 1980). For psychological interpretations that now appear overdependent on developmental models without consideration of religious depth, see three essays in Paul Radin's *The Trickster: A Study in American Indian Mythology* (1956; reprint, New York, 1969): C. G. Jung's “On the Psychology of the Trickster Figure,” Karl Kerényi's “The Trickster in Relation to Greek Mythology,” and Radin's title piece. For an overview that makes healthier use of the social context of the trickster in interpreting its meaning, see Laura akarius's “Le mythe du ‘Trickster,’” *Revue de l'histoire des religions* 175 (1969): 17–46. For an attempt to place the figure within the history of ideas, see Ugo Bianchi's “Pour l'histoire du dualisme: Un Coyote africain, le renard pâle,” in *Liber Amicorum: Studies in Honor of Professor Dr. C. J. Bleeker* (Leiden, 1969), pp. 27–43. Angelo Brelich has done admirably by examining the uniqueness of the trickster vis-à-vis other mythical figures in “Il Trickster,” *Studi e materiali di storia delle religioni* 29 (1958): 129–137. I have pointed to the kind of close reading of trickster texts necessary to disclose their full religious value in “Multiple Levels of Religious Meaning in Culture: A New Look at Winnebago Sacred Texts,” *Canadian Journal of Native Studies* 2 (December 1982): 221–247. I have also drawn out the comic aspects of incarnate saviors and loutish literary figures in “The Irony of Incarnation: The Comedy of Kenosis,” *Journal of Religion* 62 (October 1982): 412–417.

Revised Bibliography

TRICKSTERS: AFRICAN TRICKSTERS

African tricksters speak and embody a vivid, subtle language of sacred transformation. Through it they strike up absurd conversations between laundresses and goddesses, sex and death, flatulence and spiritual power, breaking the univocal by the anomalous and so opening human life—bodily, daily, defined—to its sacramental immensity. Like their counterparts in Amerindian myth and folklore, African tricksters inject bawdiness, rebellion, and wild lying (one might aptly call it polymorphous perversity) into the mythic history and the common experience of divine-human relations wherever they appear. Unlike many tricksters elsewhere, however, these multiform world-shatters and pathfinders in Africa are woven not only into the fabric of myth but also into the stuff of everyday life, playing a part in economics, rites of passage, and ordinary conversation. This observation may tell more about the history of Western colonialism and ethnography than it does about the tricksters of non-Westerners, but it does suggest that anyone who wants to know the trickster in Africa must study the particular ways and speech of many different African peoples.

Such study is only now passing into its second phase. Travelers, ethnographers, and, more recently, Africans themselves have studied hundreds of African societies. Trickster-like myths and stories have emerged from many of their reports, but only a few collections of trickster tales have been gathered and examined within the context of their social and religious settings. Rarely do we have the tales in their original languages, or in more than a single version, together with the indigenous commentary that would make deep translation and comparison more reliable. Nevertheless, these bare beginnings have already demonstrated that the transforming power of the trickster—what the Yoruba refer to when they say that "Eṣu turns feces into treasure"—works in the present as well as in the primordial past.

In the first place, Africans have delighted in using animal tricksters to shape their children's "moral imagination," as T. O. Beidelman (1980) has put it. He has analyzed the complex ways that the Kaguru use Hare, Hyena, and other

animals as metaphors, partly for the surface rules and patterns of their life, but much more for the deeper intuitions and meanings that make them, the Kaguru, who they are. The Kaguru, like the Ashanti in their *anansesem* ("spider stories") and the Azande in their tales of Tore, the spider, understand that the intricate lies and outrages of their tricksters reveal the social order as sacred in its supple particularity. Too bawdy to be taken as cautionary fables, too confident of the unity between specific and ultimate aims to be reduced to sets of binary opposition, too attuned to animals' lives to use them univocally, these stories provide an education in wit. They insist that the core of human existence, a meeting place of every sort of force, is displayed by—not prior to, withdrawn from, or obliterated by—the twists of disease, the denial of hospitality, the crazed lens of sexual rivalry. Ananse is "wonderful" because he makes all multiplicity a symbol of the Ashanti oneness that exists here and now. Telling the trickster's stories, then, is an anamnesis. In displaying his power to dismember everything, a people celebrates its capacity for remembering its own way of being.

African trickster figures are images of an ironic imagination that yokes together bodiliness and transcendence, society and individuality. Ananse of the Ashanti, Mantis of the San, Ogo-Yurugu of the Dogon, and others contend with animals and gods, spirits and humans; they exploit every liminal space to claim all speech for human language. Thus the differences among these figures are as significant as their similarities. Indeed, the trickster in Africa shows by his witty juggling with meaning and absurdity that he is more accurately understood as a spectrum of commentaries on mythic commentary than as a "category." This epistemological playfulness seems to represent a sophisticated African form of religious thought. It is perhaps a commonplace to insist that in every system the order of the center and the wildness of the periphery are linked. It is a bold piece of spiritual logic to make this insistence a joke—or even more, a joking relationship.

Legba, the trickster god of the Fon, personifies such logic clearly. The youngest of the seven children of the female-male high god, Mawu-Lisa, Legba is her linguist. All who approach her, even the other gods, must first address him. His trickery provoked Mawu into distancing herself from the newly formed earth, and his unpredictable mediation reminds both gods and humans that autonomy requires the perils of relationship. Legba's phallic image stands before all Fon dwellings as a symbol that every passage reshapes the world; like Ananse, he reveals that each transaction releases a sort of anti-entropic energy that turns muteness into conversation, randomness into meaning.

Legba is the master of the Fon dialectic. Fon mythology has kept alive the memory of their historical adaptiveness, which enabled them to borrow liberally from the institutions of their neighbors (especially from the Yoruba, whose Eṣu-Èṣẹgba inspired Legba). By grasping their history in mythic terms as well as in secular terms, the Fon have insisted

that their assimilation of others' creations is both revelation and ingenuity, and their traditional order has delighted in elaborating the movement from dark, female inside to bright, male outside—and back again. The patterns of kingship and clan, the stages of inner growth, the interweavings of gods and nature, and even the structures of juridical process became images of the dual being of the high god, the bipolar principle of all life. In the intercourse between visible and invisible universes, Legba is the living copula. The Fon say that Legba, or Aflakete (a name meaning "I have tricked you"), "dances everywhere like a man copulating." He infuses cosmic dialectic into social order as the laughter he provokes becomes the sacramental sign that the male-female processes of Fon life are both human and transcendent.

The link between divination and the trickster represents a still deeper level of meaning that West Africans especially have found in him. The Yoruba, like the Fon (who have adopted much of the Yoruba system of divination, known as Ifa) and the Dogon, see their trickster god as the chief possessor of divination's language. Eṣu is a disruptive mediator, "the anger of the gods," who stirs up trouble to increase sacrifice, yet his quickness of eye and hand symbolizes a metaphysical slipperiness that makes him both sociotherapist and iconographer. At moments of conflict the meetings that create a world become collisions. Lines of connection break down, intersections turn into dead ends, and, as the myths say, all becomes as fluid as water, as destructive as fire. Divination seeks to transform these dead ends into thresholds of larger meaning; Yoruba divination particularly knows that to give answers to knotted social and spiritual questions is, finally, to redraw an *imago mundi*, to restore the shattered icon of the Yoruba cosmos. Eṣu is not the source of most divinatory responses, but he enables divination to run its course. Some depiction of him is carved into every divining tray, and that portion of the tray is always turned to the east, from which both light and darkness come. Eṣu brings confusion so that order may encompass the unencompassable. In their art and cities the Yoruba image the world that the relationship between sky and earth, Oḷorun and Onile, with all their attendants and rituals, has brought into being. Lord of exchange in the market beginning and ending each Yoruba week, Eṣu reveals that the meeting of these beings creates human business, truly Yoruba ground. At every kind of crossroads Eṣu's mastery of interchange ensures that the design of this ground includes all movement—even explosion and decay.

The central figure of the vast spiral of correspondences that is Dogon life and myth is the tricksterlike Ogo-Yurugu. Created by Amma, the high god, to become one of the androgynous semidivine founders and overseers of life on earth, Ogo rebelled against his "father's" plan because he feared he would be deprived of his female twin. He seized part of his primordial matrix and sought to shape the world with its help. After a long struggle, Amma rendered him mute and put him to wander alone on the fringes of human society as

Yuru-gu, the "pale fox," but his concupiscent itch, his desire to possess the source of fecundity, led his obedient male twin (Nommo) to offer himself to Amma as a sacrifice that brought the world as it is into being. The Dogon believe that Yurugu still speaks a revelatory, if twisted, word in divination and that his story is embedded in the human personality, especially in males. The navel bears witness to his premature separation from the divine womb; children resemble him in their play; the joking relationship between an adolescent boy and his maternal uncle's wife repeats the pattern of Ogo's quest for twinning; and funeral dances bear the traces of his mistaken celebration of victory over Amma. Ogo-Yurugu is a paradigm of Dogon irony, for his "going and coming" discloses that wholeness is an "achieved gift," one both won and bestowed: as man thrusts outward, he discovers the inner unity of personal individuation, social integration, and cosmic intelligibility.

The Dogon find Ogo-Yurugu within the soul and on the peripheries of life, in the present and in the farthest past, in solitary rebellion and in every relationship. Like Ananse, whose lies defeat Kyiriakyinyee ("hate to be contradicted") and bring contradiction into Ashanti life, Ogo symbolizes the human imagination reaching everywhere to create worlds as filled with both order and meaning as language itself. The African trickster, then, teaches both dexterity and insight. His dance does not signify abandonment of either worship or intelligence; it signifies delight that the unsayable is quite precisely said in the never-final failures of this world's words. If, then, the realm of the sacred is shaped by human play as well as by divine work, so that the least fragment of life can become an icon of boundlessness, what could be more practical than learning how to imagine? And how could one better celebrate the meeting of transcendence and human wit than with sacred laughter?

BIBLIOGRAPHY

- T. O. Beidelman has made an intensive study of trickster figures and their social meanings in the oral literature of the Kaguru. His important interpretive essay, which argues for a moral rather than an epistemological interpretation of the trickster, is "The Moral Imagination of the Kaguru: Some Thoughts on Tricksters, Translation and Comparative Analysis," *American Ethnologist* 7 (1980): 27–42. It includes a bibliography of his more than twenty-five articles on the Kaguru: collections and translations of tales, analyses of their significance, and other commentaries on Kaguru society. See also Beidelman's "Ambiguous Animals: Two Theriomorphic Metaphors in Kaguru Folklore," *Africa* 45 (1975): 183–200.
- Other major collections of trickster stories are E. E. Evans-Pritchard's *The Zande Trickster* (Oxford, 1967), R. S. Rattray's *Akan-Ashanti Folk-Tales* (Oxford, 1930), Charles van Dyck's "An Analytic Study of the Folktales of Selected Peoples of West Africa" (Ph.D. diss., University of Oxford, 1967), and Melville J. Herskovits and Frances S. Herskovits's *Dahomean Narrative: A Cross-Cultural Analysis* (Evanston, 1958). Tales, divination verses, and analyses of Eṣu-Èlegba

can be found in 'Wande Abimbola's *Ifa Divination Poetry* (New York, 1977); William Bascom's *Ifa Divination: Communication between Gods and Men in West Africa* (Bloomington, Ind., 1969); John Pemberton's "Eshu-Elegba: The Yoruba Trickster God," *African Arts* 9 (1975): 20–27, 66–70, 90–91, and "A Cluster of Sacred Symbols: Orisa Worship among the Igbomina Yoruba of Ila-Orangun," *History of Religions* 17 (1977): 1–28; and Joan Wescott's "The Sculpture and Myths of Eshu-Elegba, the Yoruba Trickster," *Africa* 32 (1962): 336–354. The major work on Dogon myth and life is that of Marcel Griaule and Germaine Dieterlen: *Le renard pâle*, vol. 1, *Le mythe cosmogonique*, pt. 1, "La création du monde" (Paris, 1965).

For a study of four West African trickster figures in their social and mythic settings, see my book *The Trickster in West Africa: A Study of Mythic Irony and Sacred Delight* (Berkeley, 1980), which concludes with a discussion of the theory of the trickster. For a comparative study of African and North American tricksters and an analysis of the trickster's role among the Azande, see Brian V. Street's "The Trickster Theme: Winnebago and Azande," in *Zande Themes*, edited by Andre Singer and Brian V. Street (Oxford, 1972), pp. 82–104. In addition to Beidelman's bibliography and the one in my book, see also that of Martha Warren Beckwith in her *Jamaica Anansi Stories* (1924; reprint, New York, 1969).

Revised Bibliography

TRICKSTERS: NORTH AMERICAN TRICKSTERS [FIRST EDITION]

The most prominent and popular personage, generally speaking, in the varied oral traditions of the numerous Amerindian peoples living north of the Rio Grande is the figure known as the trickster. Although the trickster may be spoken of in the singular as a type, there are in fact many tricksters, of whom a great variety of stories is told across the North American continent. Some are purely tricksters, but the most significant and central mythic figure in many tribes is a trickster who is also the tribe's culture hero and the creator (usually by transformation) of the present world order. Sometimes he is the maker of the earth and its beings, or alternately the co-creator, often antagonistic to the principal creator.

With rare exceptions, North American tricksters are beings of the mythic age only; they are not believed to be living

gods or spirits, and they have no cult (other than the semiritualistic narration of their stories). Their relationship to shamanism, the definitive religious form in most of the region, is debated. Tricksters' activities in myths often resemble shamans' journeys to the spirit world, but tricksters ordinarily employ no "helpers," and shamans do not seek help from "trickster spirits." Although a history of oral traditions can be only a matter of speculation, it appears that the trickster figure belongs to a very ancient stratum of Indian mythology, since certain universally disseminated motifs, such as the theft of fire and the origin of death, are regularly attributed to him.

The concept of the trickster as a type is based upon his most essential trait: his trickiness. Tricksters everywhere are deceitful, cunning, amoral, sexually hyperactive, taboo-breaking, voracious, thieving, adventurous, vainglorious—yet not truly evil or malicious—and always amusing and undaunted. Even though his activities are usually motivated by ungoverned desire, the trickster is capable of performing deeds that benefit others: releasing imprisoned game, the sun, the tides, and such; vanquishing and/or transforming evil monsters; and, like the shaman, journeying to the land of the spirits or the dead to rescue a lost loved one. The significant element in all these deeds is trickery. But the trickster's tricks are not considered evil: as a weak "animal-person" or mere human in a world of strange animals and spirit beings, the trickster must use strategy to survive. Moreover, as a being of insatiable appetites (for food and sex), he cannot afford the luxury of scruples. Thus he breaks incest taboos (rapes or marries in disguise his daughter or mother-in-law) and hoodwinks small animals into dancing with eyes closed so he can kill them. His overweening pride prevents him from asking for help, or from acknowledging it when he receives it, and leads him into countless misadventures. Often behaving like a fool and coming to grief, he reacts invariably with buoyant good humor, refusing to accept defeat. Nothing is sacred in his eyes: all holy institutions may be mocked or mimicked with impunity by the trickster. Shamanism, especially, seems parodied in such continent-wide stories as those of a trickster's flight with geese or on the back of a buzzard, ending in his crashing to earth, often being fragmented, and his laughing it all off as a big joke.

In addition to humorous trickster folk tales, which are remarkably similar all over North America, each region has its own set of traditions about the mythic age, and in a majority of instances the leading personage of that time was a trickster.

Raven is the dominant mythic figure all along the Alaskan and Canadian Pacific coast. Some tribes attribute to him the creation of the land (e.g., by dropping pebbles on the water), probably following a world flood. The central myth of the Raven cycle is about his theft of the sun, which was being kept in a box by a "powerful chief." Making himself a tiny particle in the drinking water of the chief's daughter, Raven contrives to be reborn as a baby in the chief's house.

He cries for the box and is given it, whereupon he resumes his raven form and flies away, bringing light to the world. (Theft of the sun is a mythic theme found over much of North America, attributed almost always to the principal trickster or to a group of animals headed by him.)

In the Plateau region of the northwestern United States, Coyote is usually regarded as the maker or procreator of the people, sometimes using the body of a river monster he kills, sometimes by cohabitation with trees after a flood. His principal cycle concerns his release of the salmon and his subsequent journey up the Columbia River, leading the salmon. He demands a "wife" at each village, and if his request is granted, he makes that place a good fishing spot. The cycle is prefaced with a tale of jealousy, lust, and deceit. Coyote, desiring his son's two wives, treacherously and magically causes his son to be taken into the sky world. Coyote pretends to be his son while the son in the sky is gaining supernatural powers, unbeknownst to Coyote. Later the son returns, reclaims his wives, and takes revenge by causing his father to fall into the river and be carried away. Thus Coyote arrives at the mouth of the river where the salmon are kept; by turning himself into a baby, he tricks the women who keep them and releases them to swim upstream.

In California and the Great Basin region, Coyote usually is involved in a dualistic relationship with a wise, benevolent creator (Eagle, Fox, Wolf, or an anthropomorphic figure). Set against the backdrop of a world flood (or fire), the earth is remade and repopulated by the two, with Coyote ordaining the "bad" things such as mountains, storms, and fruit growing out of reach. Coyote decrees death—and then his son is the first to die. So Coyote establishes mourning rites for people to "enjoy." He also decrees conception by sex and painful childbirth. Here and in the Plateau, where "spirit helpers" were commonplace in everyday life, Coyote too has his "helpers": two chunks of excrement that he voids when in need of advice, but to which he always replies, "Just what I was going to do anyway!"

The Paiute and Shoshoni of the Great Basin consider Coyote the progenitor of the people (through intercourse with a mysterious woman following the flood). But among the Pueblo, whose mythology centers on an emergence from the underground, Coyote plays a rather minor role in most tribes. The Navajo assign him a larger part than the others: he causes the flood that necessitates the emergence; then he scatters the stars in the sky haphazardly, ordains death, and establishes sex. On the Great Plains, Coyote is known primarily as a trickster only. Some northern tribes credit him with the recreation of the earth after the deluge, and the Kiowa consider themselves the people of Sendah, a Coyote-like figure, who led them out of a hollow log in the beginning. Inktomi ("spider") of the Lakota is very similar to Coyote, except in the unique esoteric traditions reported from the Oglala Lakota. Here he is a veritable "fallen angel," who caused the first human family to be banished from their subterranean paradise and who subsequently induced the whole

human race to emerge onto the earth by making them think life here would be better. The Oglala are one of the few groups in North America who consider the trickster genuinely evil, and almost the only tribe that believes the trickster to be a living spirit.

Hare, the chief trickster in the poorly preserved traditions of the Indians of the Southeast, seems not to be implicated in the emergence-origin traditions of these tribes. Rather, he is a culture hero (stealing the sun, fire, and such; transforming monsters), and he is the bungling rival of the youthful "blood-clot boy," a pure hero type. Siouan-speaking peoples seem to have brought a tradition of Rabbit stories to the Great Plains when they migrated there from the Southeast. Their Rabbit or Hare is a precocious boy, living with his grandmother, who by his foolish and/or heroic deeds makes the world habitable, as it is today. He is not, however, credited with any demiurgic activities.

The Algonquins, inhabiting a large part of eastern and midwestern Canada, New England, and the area around the three western Great Lakes, have mythologies centered on anthropomorphic culture heroes who were also tricksters, though seldom foolish, plus several minor theriomorphic tricksters. The leading figures are Gluskabe in Maine, Teikapis in northern Quebec, and Manabush and Wisakejak (various spellings) in the most westerly tribes. The few Teikapis tales recorded show him a monster-killing dwarf, whose greatest exploit was the snaring of the sun. Gluskabe, Manabush, and Wisakejak have much in common: they live with their grandmother and younger brother, Wolf—who is abducted and killed by water monsters and must be rescued and revived by the hero. (A remarkably similar tale is told of Coyote and Wolf far to the west, in the Great Basin.) The myth has been elaborated in the esoteric traditions of the Midewiwin, a secret curing society of the western Algonquins. Some investigators report a vague belief that the hero of this myth lives now somewhere in the north. The neighboring Iroquois make no place for their trickster, S'hodieonskon, in their dualistic creation myth.

In some tribes humorous trickster tales are relegated to a category apart from the more serious "myths," but because all these narratives are set in "myth times," they are never confused with quasi-historical legends or accounts of shamanic experiences. Thus, to some degree, a quality of sacredness adheres to the person of the trickster everywhere, despite the seemingly profane nature of many of the narratives.

The oral traditions of North America present a variety of combinations of trickster traits with others (culture hero, demiurge, etc.); but all are reducible to the idea of a being who lives by his wits and his wit, who represents a mythical perception of man making his cosmos and finding a place within it.

SEE ALSO North American Indian Religions, article on Mythic Themes.

BIBLIOGRAPHY

The term *trickster* was coined by Daniel G. Brinton in his *Myths of the New World* (Philadelphia, 1868). The only serious study of the American trickster to have been published in book form remains Paul Radin's *The Trickster* (1956; reprint, New York, 1969), which contains important essays by C. G. Jung and Karl Kerényi. It is not, however, a general study of tricksters in North America, but is mainly about those of the Winnebago tribe. My article "The North American Indian Trickster," *History of Religions* 5 (Winter, 1966): 327–350, is based on an earlier work, "The Structure and Religious Significance of the Trickster-Transformer-Culture Hero in the Mythology of the North American Indians" (Ph. D. diss., University of Chicago, 1965), which is a study of the entire continent north of the Rio Grande. Edward H. Piper sees the trickster as basically a child figure in his psychological analysis, "A Dialogical Study of the North American Trickster Figure and the Phenomenon of Play" (Ph. D. diss., University of Chicago, 1975). Laura Makarius has written several articles on tricksters from various parts of the world, viewing the trickster as a taboo-breaking magician; on the North American trickster, see her study "The Crime of Manabozo," *American Anthropologist* 75 (1973): 663–675. Barbara Babcock-Abrahams has published an interesting anthropological study, "'A Tolerated Margin of Mess': The Trickster and His Tales Reconsidered," *Journal of the American Folklore Institute* 2 (1975): 147–186. A recent popular collection of trickster stories, without significant interpretation, is by Barry Holstun Lopez: *Giving Birth to Thunder, Sleeping with His Daughter: Coyote Builds North America* (Kansas City, 1977). See also the February 1979 issue of *Parabola* (4, no. 1), which is devoted to the trickster. For the texts of the stories, one must resort to the hundreds of volumes of reports of pioneer American anthropologists published by the Bureau of American Ethnology, the American Folklore Society, and other organizations.

MAC LINSKOTT RICKETTS (1987)

TRICKSTERS: NORTH AMERICAN TRICKSTERS [FURTHER CONSIDERATIONS]

These are exciting times for the trickster. As suggested above, the term *trickster* is used to describe a character that has "trickiness" as his main attribute and is adept at surviving by his "wits." Yet, absent from this description is any critical appraisal of the trickster concept. The comparative analyses of trickster types in varied American Indian cultural traditions often ignore the bias of the analysts. Indeed, some critics suggest that the trickster that we encounter when reading cross-cultural accounts is not the indigenous trickster, but the trickster through the eyes of the analyst. But even as scholarly accounts of tricksters were being debated, the trickster became, in the 1980s and 1990s, a paradigm for overturning accepted practices in the academic world. During the height of the postmodern movement in the humanities and sciences critics of the status quo invoked the name of Trickster to undermine and question accepted practices. Marginalized groups fighting to have their voices heard over the dominant

discourse also adopted the trickster as a model. Ironically, contemporary American Indians witnessed the cooptation of their tricksters by everyone else and so began to employ trickster tactics themselves. True to the trickster's nature, the practice of trickster tactics of destabilization, irony, foolishness, and deceit became a contest of one-upmanship. The happy result is evident in current American Indian manifestations of the trickster, a figure that cannot be analyzed as a phenomenon rooted in a mythic past anymore. Trickster stories are still told with the same awe and laughter, but the trickster has become a model for action as well.

The kinds of actions engaged in by contemporary tricksters can in many ways be analyzed like the actions of the mythic trickster. On the one hand, there are actions that are foolish and lead to embarrassing consequences. On the other hand, there are actions that are creative and heroic and lead to community leadership and personal accomplishment. Examples of the foolishness of tricksters most often impart lessons relevant to day-to-day life situations. The conflict between personal wants and needs and the order and limitations of an impersonal social order leads to constant evaluations of what actions to take in relation to the costs the actions will exact. Will the trickster engaged in quotidian situations prompt foolish acts? Will the embarrassment of failure (or success) be acceptable or will it prevent action? Do the trickster stories compel one to act or prevent one from acting? It is in these debates over trickster actions and responses to the everyday that the importance of trickster stories for self-identity can be explored. By recognizing that contemporary peoples do not just enjoy trickster stories as a humorous tale set in the mythic past, but see in them a parable of actions and consequences that affect daily decisions, we begin to see that tricksters continue to have a high degree of salience for contemporary American Indians.

Can the trickster figure be said to have any religious or spiritual significance or efficacy in today's world? As stated above, tricksters' roles in religion and spiritually are continually debated. However, in acknowledging the creative influence that trickster figures have had in forming the landscape to make it suitable for human habitation we come closer to the spiritual nature of tricksters. Many examples in the earlier part of this article illustrate how tricksters of many cultural traditions have been responsible for preparing the world for humans. Tricksters have done so both consciously and unconsciously. In the end (of mythic time), the landscape has become the physical manifestation of all of trickster's activities. Be it the freeing of game, the leveling of mountains, the creation of waterfalls, the destruction of monsters, or the changing of proportions and countenances of animals, all these actions are embedded in the landscape and the cultural traditions of the native North Americans. For many American Indians the Native landscape is a sacred landscape, full of stories that reinforce their connections to this world as well as to the mythic world that existed before humans. These worlds are not separate, just as the trickster of the mythic time and world is not separate from today's world.

Trickster is not an object for analysis held at an objective distance, but rather serves as a model for survival. Many American Indian artists, writers, leaders, and community members use trickster tactics—and thereby embody the trickster—to negotiate social injustices, preservation of traditional values, and repatriation of self-identity and self-determination. Trickster, then, is alive and well in Native North America.

BIBLIOGRAPHY

The analysis of the trickster from non-Native perspectives and to serve non-Native purposes has been a part of the translation processes since trickster tales were recorded. Paul Radin's classic *The Trickster; a Study in American Indian Mythology. With Commentaries by Karl Kerényi and C. G. Jung* (New York, c1956; reprint, 1972) is an example from the perspective of psychoanalysis. Lewis Hyde would later follow with his cross-cultural perspective in *Trickster Makes This World: Mischief, Myth, and Art* (New York, 1998). The postmodern incarnation of tricksters as a mode of critique is clearly articulated in Donna Haraway's "Situated Knowledges: The Science Question in Feminism and the Privilege of Partial Perspective" in her *Simians, Cyborgs, and Women: The Reinvention of Nature*, (New York, 1991). A trickster mode of analysis for semiotics is also explicitly stated in C. W. Spinks's *Semiosis, Marginal Signs and Trickster: A Dagger of the Mind* (Houndmills, Basingstoke, U.K., 1991), and most recently in his edited volume *Trickster and Ambivalence: The Dance of Differentiation* (Madison, Wis., 2001). For discussions on trickster and marginal literature see Jeanne Campbell Reesman's *Trickster Lives: Culture and Myth in American Fiction* (Athens, Ga., 2001) and Jeanne Rosier Smith's *Writing Tricksters: Mythic Gambols in American Ethnic Literature* (Berkeley, 1997). In this same period, Native American writers and artists began to re-appropriate trickster discourses in their creative works. Gerald Vizenor's *Dead Voices: Natural Agonies in the New World* (Norman, Okla., 1992) is a novel that grapples with the trickster role in contemporary Native American oral traditions and his *Narrative Chance: Postmodern Discourse on Native American Indian Literatures* (Albuquerque, N. Mex., 1989) uses the postmodern appropriations of trickster discourse to re-present a native analysis of Native American literature. Native American artists were also exploring the possibilities of a revitalized trickster discourse in their creative works as discussed and presented in Allan J. Ryan's *The Trickster Shift: Humour and Irony in Contemporary Native Art* (Vancouver, 1999). More locally inspired trickster projects are embedded in larger cultural reinscription projects such as the Tlinkit project *Will the Time Ever Come?: A Tlingit Source Book*, edited by Andrew Hope III and Thomas F. Thornton (Fairbanks, 2000) and the Western Apache project described by Keith Basso in his *Wisdom Sits in Places: Landscape and Language Among the Western Apache* (Albuquerque, 1996).

BERNARD C. PERLEY (2005)

TRICKSTERS: MESOAMERICAN AND SOUTH AMERICAN TRICKSTERS

The peoples of Mesoamerica and South America maintain lively traditions concerning a cunning and deceitful mythic figure, the trickster. Although tricksters are ludicrous rather than solemn beings, they cannot be discounted as trivial because their activities and transformations touch on religious issues. For instance, they steal fire, which is deemed the center of social and physical life, and their clever bungling frequently introduces death. They stir up such a riot of the senses with their playful conduct, that sex, food, and song become sacred emblems of incarnate life. The trickster's scheming prefigures human intelligence, which is based, ironically, on the realm of the senses.

Tricksters are usually animals that have bodies riddled with passages, or they may have excessively large orifices, any of which may be cut open or penetrated. The contemporary Huichol, who live in the Sierra Madre Occidental, in north-central Mexico, consider Káuyúumaari ("one who does not know himself" or "one who makes others crazy") one of their principal deities (Myerhoff, 1974). Káuyumarie is the animal sidekick of the supreme Huichol deity, Tatewari ("our grandfather fire"). Irreverent, clever, and amusing, Káuyumarie brought about the first sexual intercourse between man and woman. He guides pilgrims to Wirikúta, where the Huichol believe the beginning of time and the center of space are located, and where, as the Sacred Deer, he was dismembered. Pilgrims learn at Wirikúta that all paradoxes and contradictions—even the distinctions between deer, maize, and peyote—arise from the division of Káuyumarie's body (Myerhoff, 1974). The four directions are colored by his body parts, and these colors can be seen in flowers or in the visions induced by eating his flesh—the sacred peyote plant. The horns on Káuyumarie's head enable humans to penetrate the contradictions that make up human experience (Furst, 1976).

Tricksters distort sight and sound purely to create illusion and noise. The Aztec divinity, Tezcatlipoca ("smoking mirror"), uses an obsidian mirror to distort images. He was able to trick Quetzalcoatl, for example, into looking into the mirror in which Quetzalcoatl saw a repulsive and misshapen being. Tezcatlipoca in one of his assumed shapes is Huehuecoyotl ("drum coyote"), the puckish patron of song and dance, who was an ancient Chichimec divinity known for being a sly contriver (Brundage, 1979).

Extraordinary body designs or cross-sex dress, which the trickster sometimes manifests, is a way in which the contrary conditions of existence are mediated. In her study of Zinacantan myth from the Chiapas Highlands of Mexico, Eva Hunt links contemporary female tricksters to the sixteenth-century goddess Cihuacoatl, a female deity with a tail, a fake baby, and a snake, which emerges from under her skirt and from between her legs. In the contemporary Cuicatec region and the Puebla-Nahuatl area of Mexico, she is embodied as Matlacihuatl, and she is also known as Mujer Enredadora

("entangling woman"). Her name derives from *maxtli*, a loincloth. Matlacihuatl is adulterous and promiscuous, and she specializes in seducing homosexual men. She is sexually anomalous, having a vagina at the back of her neck that opens like a mouth. If a man does seduce her, he will become pregnant and give birth to a child that looks like excrement (Hunt, 1977).

A female turtle is the trickster of the Desána people in southern Colombia. She constantly outsmarts primordial monkeys, jaguars (the dominant supernatural beings of the primordial age), foxes, deer, and tapir, using their body parts to her advantage; for example, she uses the leg bone of the jaguar as a flute.

Tricksters often opposed the dominant supernatural beings of their day and embarrassed or humiliated the divine patrons of priests, shamans, and other privileged religious specialists. For example, the Maquiritaré, Carib-speakers of Venezuela, tell of divine twins; Iureke revives his twin brother, Shikiemona, who has been fixed in the form of a fish by the Master of Iron. In an effort to save his brother, Iureke assumes the form of a kingfisher and covers his brother with excrement. When the Master of Iron washes Shikiemona clean, the water removes the excrement and revives the dying twin, and he swims away (Civrieux, 1980). Later, the twins destroy the supernatural jaguar by exploiting his will for power. "I want some wind. I need some power," the jaguar exclaims. So the twins trick him into swinging on a vine after eating a smelly agouti (a kind of rodent). The jaguar breaks wind, filling the air with a foul smell on a cosmic scale, and ultimately the jaguar is propelled to the end of the earth, where he lands with a bang and breaks all his bones.

In other myths tricksters steal various forms of life from the underworld. For example, the Sanumá (Yanoama) of the Venezuela-Brazil border region, tell of Hasimo, a mythic bird-man, who steals fire from a primordial alligator, which stores fire in its mouth, by shooting excrement into its face, forcing the alligator to laugh (Taylor, 1979).

Manipulation of flesh and of bodily openings and closings is a key stratagem of tricksters. Among the Waiwai of Venezuela, an old man, who is a known liar and master of disguise, rescues his child from buzzards by making himself smell like putrid flesh (Fock, 1963). Yaperikuli, the transformer and trickster of the Baniwa of the upper Rio Negro region of northwestern Brazil, killed the chief of the Eenu-nai ("sky people") by opening his body and leaving it in a hammock like a "dummy." The trickster's role in general consists of his becoming enmeshed in a predicament and then rescuing himself through the use of his incarnate intelligence and the physical transformation of his body. Tricksters are sometimes wedged in the dangerous passages between two states of being, and through their efforts to rescue themselves—using perhaps a hole, or vine, as a passage—these states of being become altered forever.

The Yuküna people of the northwest Amazon region tell the story of two heroic brothers. The younger brother,

Maotchi, is extracted from a hole in a tree by a female agouti with whom he has promised to have sex in exchange for being rescued. Once night falls, he fears making love with her, and so they sleep foot-to-foot. However, she begins to devour him through her anus, and by midnight she has "swallowed" him up to his anus, which then begins to swallow her. On another occasion, Maotchi tricks his elder brother, Kawarimi, into jumping with him into an enormous hole that leads to another world at the center of the earth. Maotchi saves himself by grabbing a vine as he falls, uprooting the vine in the process. As his brother falls into the hole, Maotchi shouts "Stone, stone!" to make his brother fall faster and, eventually, break all his bones (Jacopin, 1981).

Cross-dressing constitutes another tactic of the trickster. In eastern Ecuador, the Shipibo trickster is an ant eater who manages to trade "clothes" with a jaguar. The result is the human world, in which appearances and body forms can be deceiving: that is, where an ant eater is really a jaguar, a jaguar really an anteater, and so on (Roe, 1982). Because death is the ultimate transformation, tricksters have been linked with it; they also mock death and extract benefit from its appearances. For example, in Brazil, the Tapirapé culture hero, Petura, is able to steal fire from the primordial king vulture by pretending to be a cadaver: When the king vulture comes to devour the maggots infesting the corpse, Petura steals his "red fire." He also gives the anteater its shape by thrusting a club up its anus and a wooden stick into its nostrils (Wagley, 1977).

In the Gran Chaco area of southern South America, the Mataco trickster Tokhwáh—also known as Tawkx-wax, Takwaj, Takjuaj, Tokhuah—is both good and bad, and, although he advances human capabilities, every step forward brings comic disaster (Simoneau and Wilbert, 1982). Tokhwáh acts bisexually, chasing women and often seduced by men. His exploits require an entire cycle of myths, and he is at once divine and earthly, creative and destructive. In order to retain nourishing foods, Tokhwáh uses mud to close up his anus, which had been torn open through intercourse with an iguana. In another episode, he is blinded with excrement that comes flying through the air when Tokhwáh strikes a pile of dung that has answered his questions by making inarticulate dropping noises, "pa pa pa pa." On another occasion, as punishment for eating a child, all of Tokhwáh's orifices are plugged with clay or wax. When a woodpecker reopens his orifices, various bird-beings are spattered with blood and waste, giving the various species their distinguishing marks (Simoneau and Wilbert, 1982).

The actions of Mesoamerican and South American tricksters reveal the contradictions at the heart of human experience: carnal and spiritual, living but mortal, ambitious but finite. With a blend of humor and tragedy, trickster myths describe the calamities that occur when contrary conditions of being collide and overlap in a single experience.

SEE ALSO Jaguars; Tezcatlipoca.

BIBLIOGRAPHY

For a consideration of trickster figures as general mythical types among American Indian people, see Åke Hultrantz's *The Religions of the American Indians* (Berkeley, Calif., 1967). For a treatment of trickster figures in Mesoamerica, see Barbara G. Myerhoff's *Peyote Hunt: The Sacred Journey of the Huichol Indians* (Ithaca, N.Y., 1974); Burr C. Brundage's *The Fifth Sun: Aztec Gods, Aztec World* (Austin, 1979); and Eva Hunt's *The Transformation of the Hummingbird: Cultural Roots of a Zinacantan Mythical Poem* (Ithaca, N.Y., 1977).

For tricksters in various parts of South America consult the excellent series of volumes on folk literature of South American peoples edited by Johannes Wilbert and Karin Simoneau and published by the UCLA Latin American Center at the University of California, Los Angeles. Each volume contains extensive indices directing the reader to specific trickster motifs. For example, this article refers to Johannes Wilbert and Karin Simoneau's *Folk Literature of the Mataco Indians* (Los Angeles, 1982). Gerardo Reichel-Dolmatoff, *Amazonian Cosmos: The Sexual and Religious Symbolism of the Tukano Indians* (Chicago, 1971) presents the mythic figures of southern Colombia. For references to tricksters in the northwest Amazon region, see the excellent collections of myths in Robin M. Wright's "History and Religion of the Baniwa Peoples of the Upper Rio Negro Valley," 2 vols. (Ph.D. diss., Stanford University, 1981), and in Pierre-Ives Jacopin's "La parole generative: De la mythologie des indiens yukuna" (Ph.D. diss., Université de Neuchâtel, 1981). Trickster mythologies from Venezuela may be found in Marc de Civrieux's *Watunna: An Orinoco Creation Cycle* (San Francisco, 1980); Niels Fock's *Waiwai: Religion and Society of an Amazonian Tribe* (Copenhagen, 1963); and Kenneth I. Taylor's "Body and Spirit among the Sanumá (Yanoama) of North Brazil," in David L. Browman and Ronald A. Schwarz's *Spirits, Shamans, and Stars: Perspectives from South America* (The Hague, 1979), pp. 201–221, which discusses people living on the Brazil-Venezuela border. LAWRENCE E. SULLIVAN (1987)
Revised Bibliography

TRIGLAV, a three-headed deity of the heathen Slavs, was literally named: from *tri*, "three," and *glava*, "head." Worship

of him in the temple at Szczecin (Stettin), Pomerania, is attested by Herbord, Ebbo, and Monachus Prieflingensis, the three biographers of Otto, a twelfth-century bishop of Bamberg. According to Herbord, the image of Triglav at Szczecin had three heads joined to one another. Ebbo states that the image was of gold; Monachus Prieflingensis asserts that all three heads were silver-plated. Another idol of Triglav stood in the town of Wolin. Both images were destroyed by Otto.

No detailed description of the image of Triglav exists. One of the interesting features of this god is that he was connected with the number three. His idol stood on the largest of the three hills of Szczecin, and the black horse consecrated to him and used in divination was led thrice across nine (thrice three) lances that were placed in front of the temple, about a yard apart.

In the words of the high priest of the temple at Szczecin, Triglav had three heads in order to make it known that he ruled over three realms: heaven, earth, and the underworld. Ebbo refers to him as the "summus deus" ("highest god"). Hence, Triglav may have been either a manifestation of three major gods or three aspects of one god. The black horse and the mention of the underworld suggest Triglav's ties with Veles-Volos, the god of death and the underworld, a deity standing in opposition to Sventovit, the god of heavenly light, who was associated with a white horse. Triglav may also have been related to Chernoglav, the "black god," who had a silver mustache and who was worshiped at Rügen, as mentioned in the *Knytlingsaga* (1265).

Tricephalous sculptures, mostly undated, have been found in South and East Slavic areas (Yugoslavia, Bulgaria, Russia); in France, Gallo-Roman sculptures of three-headed gods date from the second to the fourth century CE. A tricephalous figure called the Thracian Rider was known in the ancient Balkan world, particularly in Bulgaria, and his image is preserved on hundreds of stelae of the second and third centuries CE. The name of Triglav has been retained in the toponymy of all Slavic areas, proving its common Slavic origin.

Revised Bibliography

TRINITY. Trinitarian doctrine touches on virtually every aspect of Christian faith, theology, and piety, including Christology and pneumatology, theological epistemology (faith, revelation, theological methodology), spirituality and mystical theology, and ecclesial life (sacraments, community, ethics). This article summarizes the main lines of trinitarian doctrine without presenting detailed explanations of important ideas, persons, or terms.

The doctrine of the Trinity is the summary of Christian faith in God, who out of love creates humanity for union with God, who through Jesus Christ redeems the world, and in the power of the Holy Spirit transforms and divinizes (2 Cor. 3:18). The heart of trinitarian theology is the conviction that the God revealed in Jesus Christ is involved faithfully and unalterably in covenanted relationship with the world. Christianity is not unique in believing God is "someone" rather than "something," but it is unique in its belief that Christ is the personal Word of God, and that through Christ's death and resurrection into new life, "God was in Christ reconciling all things to God" (2 Cor. 5:19). Christ is not looked upon as an intermediary between God and world but as an essential agent of salvation. The Spirit poured out at Pentecost, by whom we live in Christ and are returned to God (Father), is also not a "lesser God" but one and the same God who creates and redeems us. The doctrine of the Trinity is the product of reflection on the events of redemptive history, especially the Incarnation and the sending of the Spirit.

DEVELOPMENT OF TRINITARIAN DOCTRINE. Exegetes and theologians today are in agreement that the Hebrew Bible does not contain a doctrine of the Trinity, even though it was customary in past dogmatic tracts on the Trinity to cite texts like *Genesis* 1:26, "Let us make humanity in our image, after our likeness" (see also *Gn.* 3:22, 11:7; *Is.* 6:2–3) as proof of plurality in God. Although the Hebrew Bible depicts God as the father of Israel and employs personifications of God such as Word (*davar*), Spirit (*ruah*), Wisdom (*hokhmah*), and Presence (*shekhinah*), it would go beyond the intention and spirit of the Old Testament to correlate these notions with later trinitarian doctrine.

Further, exegetes and theologians agree that the New Testament also does not contain an explicit doctrine of the Trinity. God the Father is source of all that is (Pantokrator) and also the father of Jesus Christ; "Father" is not a title for

the first person of the Trinity but a synonym for God. Early liturgical and creedal formulas speak of God as "Father of our Lord Jesus Christ"; praise is to be rendered to God through Christ (see opening greetings in Paul and deuterio-Paul). There are other binitarian texts (e.g., *Rom.* 4:24, 8:11; 2 Cor. 4:14; *Col.* 2:12; 1 *Tm.* 2:5–6, 6:13; 2 *Tm.* 4:1), and a few triadic texts (the strongest are 2 Cor. 13:14 and *Mt.* 28:19; others are 1 Cor. 6:11, 12:4–6; 2 Cor. 1:21–22; 1 *Thes.* 5:18–19; *Gal.* 3:11–14). Christ is sent by God and the Spirit is sent by Christ so that all may be returned to God.

The language of the Bible, of early Christian creeds, and of Greek and Latin theology prior to the fourth century is "economic" (*oikonomia*, divine management of earthly affairs). It is oriented to the concrete history of creation and redemption: God initiates a covenant with Israel, God speaks through the prophets, God takes on flesh in Christ, God dwells within as Spirit. In the New Testament there is no reflective consciousness of the metaphysical nature of God ("immanent trinity"), nor does the New Testament contain the technical language of later doctrine (*hypostasis, ousia, substantialia, subsistentia, prosōpon, persona*). Some theologians have concluded that all postbiblical trinitarian doctrine is therefore arbitrary. While it is incontestable that the doctrine cannot be established on scriptural evidence alone, its origins may legitimately be sought in the Bible, not in the sense of "proof-texting" or of finding metaphysical principles, but because the Bible is the authoritative record of God's redemptive relationship with humanity. What the scriptures narrate as the activity of God among us, which is confessed in creeds and celebrated in liturgy, is the wellspring of later trinitarian doctrine.

Dogmatic development took place gradually, against the background of the emanationist philosophy of Stoicism and Neoplatonism (including the mystical theology of the latter), and within the context of strict Jewish monotheism. In the immediate post–New Testament period of the Apostolic Fathers no attempt was made to work out the God–Christ (Father–Son) relationship in ontological terms. By the end of the fourth century, and owing mainly to the challenge posed by various heresies, theologians went beyond the immediate testimony of the Bible and also beyond liturgical and creedal expressions of trinitarian faith to the ontological trinity of coequal persons "within" God. The shift is from function to ontology, from the "economic trinity" (Father, Son, and Spirit in relation to us) to the "immanent" or "essential Trinity" (Father, Son, and Spirit in relation to each other). It was prompted chiefly by belief in the divinity of Christ and later in the divinity of the Holy Spirit, but even earlier by the consistent worship of God in a trinitarian pattern and the practice of baptism into the threefold name of God. By the close of the fourth century the orthodox teaching was in place: God is one nature, three persons (*mia ousia, tres hypostaseis*).

Questions of Christology and soteriology (salvation) occupied theologians of the early patristic period. What was

Christ's relationship to God? What is Christ's role in our salvation? The Logos Christology of the apologists identified the preexistent Christ of Johannine and Pauline theology with the Logos ("word") of Greek philosophy. The Stoic distinction between the immanent word (*logos endiathetos*) and the expressed word (*logos prophorikos*) provided a way for Justin Martyr (d. 163/165) and others to explain how Christ had preexisted as the immanent word in the Father's mind and then became incarnate in time. Third-century monarchianism arose as a backlash against Logos theology, which was feared to jeopardize the unity of God; the modalism of Sabellius admitted the distinctions in history but denied their reality in God's being. Origen (died c. 254) contributed the idea of the eternal generation of the Son within the being of God; although other aspects of Origen's theology later were judged to be subordinationist, his teaching that the Son is a distinct hypostasis brought about subtle changes in conceptions of divine paternity and trinity. In the West, Tertullian (d. 225?) formulated an economic trinitarian theology that presents the three persons as a plurality in God. Largely because of the theology of Arius, who about 320 denied that Christ was fully divine, the Council of Nicaea (325) taught that Christ is *homoousios* (of the same substance) with God. The primary concern of Athanasius (d. 373), the great defender of Nicene orthodoxy, was salvation through Christ; if Christ is not divine, he cannot save. Like the bishops at Nicaea, Athanasius had a limited trinitarian vocabulary; *hypostasis* (person) and *ousia* (substance) could still be used interchangeably.

The fourth-century Cappadocian theologians (Basil of Caesarea, Gregory of Nyssa, and Gregory of Nazianzus) formulated orthodox trinitarian doctrine and made it possible for the Council of Constantinople (381) to affirm the divinity of the Holy Spirit. The speculatively gifted Cappadocians made a clear distinction between *hypostasis* and *ousia* (roughly equivalent to particular and universal), thereby establishing orthodox trinitarian vocabulary. At the close of the patristic period John of Damascus (d. 749) summarized Greek trinitarian doctrine with the doctrine of *perichōresis* (Lat., *circumincessio*), or the mutual indwelling of the divine persons.

Western trinitarian theology took a different course because of Augustine (d. 430). Instead of regarding the Father as source of divinity, Augustine's starting point was the one divine substance, which the three persons share. He sought the image of the Trinity within the rational soul and formulated psychological analogies (memory, intellect, will; lover, beloved, love) that conveyed unity more than plurality. The Augustinian approach served to effectively refute Arianism, but it also moved the doctrine of the Trinity to a transcendent realm, away from salvation history, from other areas of theology, and from liturgy. In the Latin West Boethius (died c. 525) formulated the classic definition of person, namely, "individual substance of a rational nature." Augustinian theology was given further elaboration in medieval theology, especially by Anselm (d. 1109) and in the Scholastic synthesis

of Thomas Aquinas (d. 1274). Still Augustinian but focusing on person rather than nature, Richard of Saint-Victor (d. 1173) and Bonaventure (d. 1274) developed a psychology of love; charity is the essence of Trinity.

Although there are important exceptions to any typology, in general, Greek theology emphasizes the hypostases, the "trinity in unity," whereas Latin theology emphasizes the divine nature, or "unity in trinity." The Greek approach can be represented by a line: Godhood originates with the Father, emanates toward the Son, and passes into the Holy Spirit who is the bridge to the world. Greek theology (following the New Testament and early Christian creeds) retains the "monarchy" of the Father who as sole principle of divinity imparts Godhood to Son and Spirit. The Greek approach tends toward subordinationism (though hardly of an ontological kind) or, in some versions, to tritheism since in Greek theology each divine person fully possesses the divine substance. The Latin approach can be represented by a circle or triangle. Because the emphasis is placed on what the divine persons share, Latin theology tends toward modalism (which obscures the distinctiveness of each person). Also the Trinity is presented as self-enclosed and not intrinsically open to the world.

PRINCIPLES OF TRINITARIAN DOCTRINE. Trinitarian theology is *par excellence* the theology of relationship. Its fundamental principle is that God, who is self-communicating and self-giving love for us, is from all eternity love perfectly given and received. The traditional formula "God is three persons in one nature" compactly expresses that there are permanent features of God's eternal being (the three persons) that are the ontological precondition for the three distinct manners of God's tripersonal activity in the world (as Father, Son, Spirit).

Technical terms, theological theories, and official (conciliar) statements function together as a "set of controls" over the correct way to conceive both of God's self-relatedness as Father, Son, and Spirit, and God's relatedness to creation as Father, Son, and Spirit. Although one must guard against reducing the mystery of God to a set of formal statements, precise distinctions are useful insofar as they refine theological vocabulary or protect against distortions ("heresy"). Still, doctrinal statements are inherently limited; they address specific points of controversy, leaving other questions unsettled and sometimes creating new problems. Conciliar statements and theological principles guard against egregious errors (for example, "the Holy Spirit is a creature") and serve as boundaries within which trinitarian discourse may take place.

First, God is ineffable and Absolute Mystery, whose reality cannot adequately be comprehended or expressed by means of human concepts. Trinitarian doctrine necessarily falls short of expressing the full "breadth and length and height and depth" of God's glory and wisdom and love. Even though God who "dwells in light inaccessible" is impenetrable mystery, the doctrine of the Trinity is not itself a mystery, nor is the doctrine revealed by God, nor is the doctrine a sub-

stitute for the knowledge of God gained in the union of love that surpasses all concepts (see *Eph.* 3:18–19). Trinitarian doctrine is a partial and fragmentary exegesis of what has been revealed, namely, that God is self-communicating love. Further, because God is a partner in love and not an object to be scrutinized or controlled by the intellect, speculative theology must be firmly rooted in spirituality, doxology, and a concrete community of faith so that trinitarian doctrine does not become “heavenly metaphysics” unrelated to the practice of faith.

Second, the revelation and self-communication of the incomprehensible God, attested in the concrete images and symbols of the Bible and celebrated in Christian liturgy, is the proper starting point of trinitarian theology. Theological thinking proceeds from “God with us” (“economic” Trinity) to the nature of God (“immanent” Trinity). The starting point “within” God led to an overly abstract doctrine in the West and to a virtual divorce of the “immanent” Trinity from the Trinity of history and experience. Friedrich Schleiermacher (d. 1834) reacted against the cleavage between “God” and “God for us” by relegating the idea of the essential Trinity to an appendix to his summary of Christian theology. Karl Rahner’s (d. 1984) widely accepted axiom is pertinent: “the ‘economic’ Trinity is the ‘immanent’ Trinity and vice versa.” God is who God reveals God to be. Concepts that describe the ontological intrarelatedness of God must be drawn from and are subject to control by the “facts” of redemptive history.

Third, because the three persons together and inseparably (though without mingling or confusion) bring about salvation and deification, and because the one God is worshiped as Father, Son, and Spirit, no divine person is inferior to any other person. Although undivided, God exists as the pure relationality of love given and received. The decree of the Council of Florence (1442) that “everything in God is one except where there is opposition of relation” was regarded as a final answer to tritheism (belief in three gods), Arian subordinationism (ontological hierarchy of persons), Sabellian modalism (no real distinctions “in” God), and Macedonianism (denial of the divinity of the Holy Spirit).

There are two divine processions: begetting and spiration (“breathing”). Each divine person exists by relation to the other two persons (Gr., “relation of origin”; Lat., “relation of oppositum”), and each fully possesses the divine substance. In Greek theology the three hypostases have the distinguishing characteristics (sg., *idiotes*) of “being unbegotten” (*agennēsia*), “being begotten” (*gennēsia*), and “proceeding” (*ekporeusis*). The Father is the fountainhead of Godhood (*fons divinitatis*), who imparts divinity to Son and Spirit. According to Latin theology there are four relations (begetting, being begotten, spirating, being spirated) but only three “subsistent” relations: paternity, filiation, spiration. Latin theology (following Augustine) understands divine unity to reside in the divine nature that is held in common by Father, Son, and Spirit; Greek theology (following the Cappado-

cians) understands the unity to reside in the “perichoretic” relatedness of the three persons.

A corollary of the inseparability of the three coequal divine persons is the axiom that “all works of the triune God *ad extra* are indivisibly one” (“*opera trinitatis ad extra indivisa sunt*”). According to Latin theology it is the three-personed substance of God that acts in history; according to Greek theology every action of God toward creation originates with the Father, passes through the Son, and is perfected in the Spirit (Gregory of Nyssa). In any case, the axiom must not be understood to obscure what is distinctive to each divine person.

Fourth, a false distinction must not be set up between what God is and what God does, between essence and existence, between unity and threefoldness, between nature and person (relation). There are no “accidents” in God; the statement of the Fourth Lateran Council (1215) that each divine person is the divine substance countered the claim of some theologians (Joachim of Fiore) that God is a quaternity (three persons + essence = four persons).

Fifth, since the nature of God is to love, and love naturally seeks an object, it might appear that God “needs” the world as a partner in love. This would make the world co-eternal with God. Many Scholastic theologians speculated on this question. Thomas Aquinas admitted that while he saw no philosophical reason to deny the eternity of the world, the testimony of the *Book of Genesis* and his Christian faith constrained him to do so. In 1329 Meister Eckhart was condemned for asserting the eternity of the world. With respect to trinitarian theology, even though Rahner’s axiom (see above) suggests that God’s relations to us, including creation, are constitutive of God and vice versa, theologians traditionally speak of a perfect and reciprocal exchange of love “within” God, that is, among Father, Son, and Spirit independent of their relationship to creation, in order to preserve the absolute character of God’s freedom.

CURRENT DIRECTIONS AND REMAINING PROBLEMS. After centuries of disinterest in trinitarian doctrine in the West, the riches of this vast tradition are once again being explored. Three basic directions may be observed. First, some theologians have revised analogies of the “immanent” Trinity according to contemporary philosophy (for example, process metaphysics), linguistics, or interpersonal psychology. While this approach overcomes some of the aporia of classical expositions, it perpetuates the metaphysical starting point “within” God apart from salvation history. A second approach focuses on soteriology and Christology and is circumspect about the “immanent” Trinity, though without denying that historical distinctions are grounded ontologically in God. A third approach uses trinitarian symbolism to describe God’s deeds in redemptive history but resists positing real distinctions in God. Despite basic differences in method, these three approaches all move in a more personalist (relational) direction and, in the case of the latter two, a more “economic” direction.

Theologians who specialize in trinitarian doctrine suggest that several areas warrant further attention. First, most trinitarian doctrine is so abstract it is difficult to see its connection with praxis. The “summary of Christian faith” and the living out of that faith should be brought to bear more directly on each other. Creeds, doxologies, and liturgy are important loci of the trinitarian faith recapitulated in trinitarian doctrine.

Second, unlike the “mystical theology” of the Orthodox tradition, theology in the West has been separated from spirituality since the thirteenth century. Reintegrating theology and spirituality would help to overcome the rationalist tendencies of Western theology, to provide the field of spirituality with theological foundation, and also to strengthen the weakest component of Western theology, namely, pneumatology.

Third, the *filioque* (“and from the Son”) clause, inserted into the Western creed in the sixth century but denounced by the Orthodox church, remains a serious obstacle to reunion between East and West. Theologians should work assiduously for ecumenical agreement.

Fourth, to speak of God as “three persons” always has been problematic and remains the same today. In the modern framework “person” means “individual center of consciousness.” To avoid the tritheistic implications of positing three “persons” in God, the relational, or “toward-the-other” character of “person” should be reemphasized.

Fifth, the exclusively masculine imagery of trinitarian doctrine hinders full recovery of the trinitarian insight into the essential relatedness of God. The fatherhood of God should be rethought in light of the critique of feminist theologies and also in view of the nonpatriarchal understanding of divine paternity to be found in some biblical and early theological writings.

Sixth, revising trinitarian theology along soteriological lines raises the question of its place in the dogmatic schema, that is, whether it ought to be treated as a separate “tract,” as prolegomenous to theology, as its apex and summary, or as an undergird that is presupposed throughout but never alluded to explicitly.

Seventh, trinitarian theology must be pursued within the context of the “God question” of every age, whether this question takes the form of existentialist atheism, secular humanism, or some other.

Eighth, the Christian doctrine of God must be developed also within the wider purview of other world religions. Trinitarian doctrine cannot be Christomonistic, excluding persons of other faiths from salvation, nor can it surrender its conviction that God is fully present in Christ.

For trinitarian doctrine to be recovered as a vital expression of God’s nearness in Christ, theologians must translate into a contemporary idiom the mystery of God’s triune love in a way that does justice not only to the testimony of our predecessors but also to the ongoing and ever-new features of God’s relationship with a people.

BIBLIOGRAPHY

Biblical and Historical Sources

For the New Testament origins of trinitarian doctrine, see the article and bibliography by Franz Josef Schierse, “Die neutestamentliche Trinitätsoffenbarung,” in *Mysterium Salutis*, edited by Johannes Feiner and Magnus Löhrer, vol. 2 (Einsiedeln, 1967), and Arthur W. Wainwright’s *The Trinity in the New Testament* (London, 1962). A standard and nearly complete exposition of patristic and medieval, Greek and Latin trinitarian doctrine is Théodore de Régnon’s four-volume *Études de théologie positive sur la Sainte Trinité* (Paris, 1892–1898). Organized chronologically and full of helpful textual references is “Trinité,” by G. Bardy and A. Michel, in *Dictionnaire de théologie catholique* (Paris, 1950), vol. 15.2, cols. 1545–1855. Standard English-language works include George L. Prestige’s study of shifting terminology and concepts in early Greek trinitarian theology in *God in Patristic Thought*, 2d ed. (1952; reprint, London, 1964), J. N. D. Kelly’s historical study, *Early Christian Doctrines*, 5th rev. ed. (New York, 1977), and Edmund J. Fortman’s *The Triune God* (Philadelphia, 1972). Yves Congar’s three-volume *I Believe in the Holy Spirit* (New York, 1983) is more impressionistic but contains many historical gems and a seasoned approach to this vast field.

Theological Works

In Protestant theology, Karl Barth placed the doctrine of the Trinity as a prolegomenon to dogmatic theology in *Church Dogmatics*, vol. 1, pt. 1 (Edinburgh, 1936). See also Claude Welch’s summary of recent Protestant theology in *In This Name: The Doctrine of the Trinity in Contemporary Theology* (New York, 1952). Trinitarian theology that centers on the cross is represented in Eberhard Jüngel’s *God as the Mystery of the World* (Grand Rapids, Mich., 1983) and Jürgen Moltmann’s *The Crucified God* (New York, 1974). In Catholic theology, Karl Rahner’s monograph *The Trinity* (New York, 1970) summarizes but also seeks to go beyond standard Western trinitarian dogma. Heribert Mühlen’s *Der heilige Geist als Person*, 2d ed. (Münster, 1966) and *Una Mystica Persona* (Paderborn, 1964) develop a pneumatological and interpersonal analogy of the “immanent” Trinity. Walter Kasper’s *The God of Jesus Christ* (New York, 1984) is a magisterial summary of classical and contemporary trinitarian theology, developed against the backdrop of modern atheism and in light of current studies in Christology. On Orthodox theology, see Vladimir Lossky’s *The Mystical Theology of the Eastern Church*, 2d ed. (Crestwood, N.Y., 1976).

CATHERINE MOWRY LACUGNA (1987)
Revised Bibliography

TROELTSCH, ERNST (1865–1923), German Protestant theologian and cultural philosopher. Ernst Peter Wilhelm Troeltsch is considered “the most eminent sociologically oriented historian of Western Christianity” (Talcott Parsons, quoted by James Luther Adams, “Why the Troeltsch Revival? Reasons for the Renewed Interest in the Thought of the Great German Theologian Ernst Troeltsch,” in *The Unitarian Universalist Christian* 29, 1974, pp. 4–15). With regard to the impact of his work, Troeltsch was the most significant evangelical theologian since Friedrich Schleiermacher (1768–1834). As the central figure in German Protestant theology in the early twentieth century, he was able to exercise an enduring influence on philosophy, religion, sociology, and the study of history.

Troeltsch was born in Haunstetten, a small town near the old southern German imperial city of Augsburg. He spent his childhood and youth in Augsburg. Through the efforts of his father, a well-to-do physician, Troeltsch became acquainted at an early age with the modern natural sciences, and the famous preparatory school at Sankt Anna gave him the sense of a cosmopolitan Christian humanism.

In 1883, Troeltsch began the study of philosophy for two semesters at the Roman Catholic preparatory school in Augsburg and then, in the fall of 1884, of Protestant theology in Erlangen. He was particularly interested in the reconciliation of faith with knowledge and, therefore, attended lectures in art history, political science, national economics, history, psychology, and philosophy. Since the theological faculty at Erlangen was dominated by a neoorthodox Lutheranism, Troeltsch transferred, in 1885, to Berlin for a year and, in the fall of 1886, finally to Göttingen. Here the systematic theologian Albrecht Ritschl (1822–1889), the most prominent contemporary representative of a liberal, Lutheran, cultural Protestantism, exercised a primary and profound influence upon him.

As early as 1891, however, Troeltsch formulated a sharp criticism of Ritschl’s ethicizing modernization of Luther’s theology. He emphasized the far-reaching cultural differences between the “Old Protestantism” of the sixteenth and early seventeenth centuries and the modern world, which had emerged only with the Enlightenment of the eighteenth century. Insofar as Luther had remained committed to the ideal of a religiously dominated, homogeneous culture and had represented a pacifist ethic that sanctioned submission to the status quo, he was, for Troeltsch, still part of the Middle Ages. Thus for Troeltsch’s own theological development,

Enlightenment traditions were more important than the theology of the reformers. He believed that theology must be changed from the old dogmatic paradigm to a “historical method” and must be based upon a general, rational theory of religion.

Already in the *Disputationsthesen*, published on the occasion of his doctoral degree in 1891 (text in *Troeltsch-Studien I*, 2d. ed., Gutersloh, 1985, pp. 299–300), Troeltsch designated such a theology, which he believed compatible with modern consciousness, a “religious-historical discipline.” It is not yet clear to what extent this statement was influenced by the Göttingen religious historian and Septuagint scholar Paul Anton de Lagarde (1827–1891). Troeltsch was part of a very close and friendly exchange in Göttingen with the church historian Albert Eichhorn (1856–1926), as well as the exegetes Hermann Gunkel (1862–1932), Alfred Rahlfs (1865–1935), Wilhelm Wrede (1859–1906), Heinrich Hackmann (1864–1935), and especially Wilhelm Bousset (1865–1920). These “young Göttingers” wanted to transform traditional biblical scholarship into an undogmatic, sociologically informed religious history of Judaism and early Christianity. They therefore attempted to understand the origins of Christianity from the perspective of the ancient religions, especially of late Judaism. Since they were not interested in historically secondary theological dogmatics, but rather in the original productivity of religious consciousness, they, along with Johannes Weiss (1863–1914), emphasized very strongly the eschatological character of Jesus’ preaching of the kingdom of God, and also the autonomy of religion within culture. Troeltsch was considered the “systematician” of this “little Göttingen faculty,” which as a so-called religious-historical school exercised a significant influence on the theology of the early twentieth century.

In a well-known essay, *Über historische und dogmatische Methode in der Theologie* (On Historical and Dogmatic Method in Theology; 1900, included in his *Gesammelte Schriften*, vol. 2, Tübingen, 1913, pp. 729–753), using the historiographic principles of critique, analogy, and correlation, Troeltsch drew the radical conclusion of definitively separating a supranaturalistic view of Christianity as the only true religion from the old dogmatic understanding of Jesus Christ as the extraordinary and exclusive revelation of God. The breaking down of the traditional isolation of Christianity from other religions should not, however, imply any skeptical relativism, but rather should serve as a foundation for the specific validity that Christianity claims. The program for a general theory of religion, which Troeltsch first outlined in 1895 in *Die Selbständigkeit der Religion* (The Independence of Religion), should, therefore, produce a metacritique of modern religious criticism. It should demonstrate, moreover, in dialogue with Ludwig Feuerbach’s “suspicion of illusion,” the real meaning of religious consciousness, in order to prove thereby the special validity of the Christian tradition. Thus the connection of historical-empirical analyses of the history of Christianity with a variety of attempts at a sys-

tematic philosophy of religion is characteristic of Troeltsch's lifework. The difficulties of making such a connection, however, demanded extensive epistemological, historical, and philosophical analyses of the relationship between historical contingency and the absolute. This Troeltsch was not able to bring to completion. To that extent, his massive literary work is, for the most part, fragmentary.

After a short lectureship in Bonn, and at the age of only twenty-nine, Troeltsch was called to Heidelberg in 1894 as professor of systematic theology. After the turn of the century, he became known far beyond the narrow borders of academic theology. This was a result of his intensive engagement in ecclesiastical politics on behalf of different organizations in liberal Protestantism, and also his prominent position within the University of Heidelberg. From 1909 to 1914, Troeltsch represented the university in the lower chamber of the parliament of the grand duchy of Baden. He was especially known for his numerous publications. On the basis of religious-historical comparison in his famous lecture *Die Absolutheit des Christentums und die Religionsgeschichte* (The Absoluteness of Christianity and the History of Religion, Tübingen, 1902), he denied to Christianity its traditional claim of absoluteness and relative superiority as the religion of personality. In *Psychologie und Erkenntnistheorie in der Religionswissenschaft* (Psychology and Epistemology in the Study of Religion, Tübingen, 1905), an essay presented to the International Congress of Arts and Sciences in Saint Louis in 1904, he connected William James's psychological pragmatism with the Neo-Kantian assumption of empirically independent structures of consciousness to form a theory of the "religious *a priori*." In accordance with this, the production of religious ideas is seen as a constitutive accomplishment of human subjectivity. In *Wesen der Religion und der Religionswissenschaft* (Writings on Theology and Religion, 1977, pp. 82–123), Troeltsch sought to explicate the independence of religion on four levels: First, empirically given religion should be analyzed according to a psychology of religion as an autonomous phenomenon of life that is constitutive for all culture. Second, in the epistemology of religion, the level of reality proper to religious consciousness must be rationally justified. Third, within a special historical philosophy of religions, the general concept of religion should be realized specifically and concretely in terms of the plurality of real existing religions for comparative religious-historical studies. Fourth, a metaphysics of religion bases the religious understanding of worldly reality upon the self-revelation of God. In this way, the universal history of religion should be proven to be the progressive revelation of God, and the presence of the absolute would be demonstrated in finite consciousness.

Troeltsch was not, however, able to carry out this great program. The concept of the religious *a priori* remained especially unclear. For Troeltsch only partially appropriated Kant's understanding of *a priori* structures of consciousness. He could do justice to the statement that the pious subject

knows itself—or all finite reality—to be grounded in a divine substance only insofar as he understood the *a priori* as a product not proper to the intellect. To presuppose objects of cognition as directly given, however, contradicted the Kantian point of departure of his argumentation. The more Troeltsch sought to explain, in numerous small monographs on the philosophy of religion, the relationship of the religious consciousness to reality, the less he could still do justice to Kant's criticism. Although in close personal contact with the leading German representatives of Neo-Kantianism, Troeltsch did not share their basic assumptions.

After the turn of the century, in addition to his studies in the philosophy of religion, Troeltsch published in relatively quick succession several cultural-historical investigations into the profound transformation of the Christian consciousness during the transition to the modern period. These include the large treatise, *Protestantisches Christentum und Kirche in der Neuzeit* (Protestant Christianity and the Church in the Modern Age, in Paul Hinneberg, ed., *Die Kultur der Gegenwart*, Part 1, Section 4.1, Berlin and Leipzig, 1906; 1922, 3d ed.), on the basis of which the University of Greifswald conferred on him an honorary doctorate in philosophy, and a famous lecture, *Die Bedeutung des Protestantismus für die Entstehung der modernen Welt* (Munich, 1906; 1911, 2d ed.; abridged English version, *Protestantism and Progress: A Historical Study of the Relation of Protestantism to the Modern World*, London and New York, 1912). Both show the strong influence of Max Weber's investigations of 1904–1905 into the genetic connections between Protestant ethics and the spirit of capitalism. And Weber, in turn, was strongly influenced by Troeltsch's understanding of Lutheranism as a politically as well as economically premodern, patriarchal religion. Moreover, indications of the significance of the ascetic work-ethic of Calvinism for the development of capitalism can already be found in Troeltsch's work before the appearance of his friend's famous essays on Protestantism. The very close, seventeen-year friendship meant a substantial scholarly enrichment for both Troeltsch and Weber.

It is true that Troeltsch had established a sociological foundation for his understanding of the church even before the meeting with Weber. However, it was only under the influence of his friend that he distinguished precisely between church and sect as different types of religious community-building. *Die Soziallehren der christlichen Kirchen und Gruppen* (The Social Doctrines of Christian Churches and Groups), which, already partially published in 1908–1910, appeared in 1912 as the first volume of Troeltsch's collected works, also shows, however, significant sociological differences between the friends. Troeltsch wanted to present the social and ethical consequences of the Christian conceptual world and its interaction with cultural phenomena. The eschatological ideal of the kingdom of God of the Gospels stands in a relationship of unresolvable tension to the facticities of culture. Nevertheless, in that the church institutionalizes the grace of redemption sacramentally, it can become the

place of salvation for the masses and fit the Christian concepts to the political-social order and its needs for legitimation. In contrast to this, the sects, small groups on the margin of society with demands for high achievement on their members, radicalize the tensions of religion and society to the point of absolute opposition between the norms of culture and the *lex Christi*, the Sermon on the Mount.

From the types of church and sect, Troeltsch further distinguished mysticism as the third particular social form of Christianity. Here the opposites of religion and society are reconciled within the pious subject himself, to the extent that he knows himself to be a participant in the divine spirit and he glimpses the true reality of the kingdom of God in a purely spiritual and universal brotherhood of those gifted by God. Troeltsch especially ascribed to his third type significant historical effects for modern Christianity. Weber, however, did not consider mysticism to be a separate social form of religion. This difference is the expression of contradicting evaluations of the real meaning of religion for modern societies. Unlike Weber, Troeltsch was convinced that, even under the conditions of Western rationalism, religion was an extremely important factor in societal formation. He understood the Christian tradition primarily as a force for the strengthening of individual autonomy over against the depersonalizing developmental tendencies of modern capitalism. Moreover, the church's tradition had to be provided with a new cultural credibility; that is, "religious individualism," inspired by the mystical tradition, which had been forced out of the evangelical church, had to be again given a right to exist within a "flexible church of the people" (*Gesammelte Schriften*, vol. 2, Tübingen, 1913, p. 105). In connection with Schleiermacher's program of a practically oriented theology of consciousness, Troeltsch interpreted dogmatic statements as self-communications of the genuine Protestant consciousness, as is shown especially in *Die Bedeutung der Geschichtlichkeit Jesu für den Glauben* (1911; translated as *The Significance of the Historical Existence of Jesus for Faith*, in *Writings on Theology and Religion*, 1967, pp. 182–207) and in his posthumously edited lectures on *Die Glaubenslehre* (Munich and Leipzig, 1925).

In the spring of 1915 Troeltsch was transferred to Berlin by the minister for cultural affairs. The chair he occupied there was renamed specifically for him, as a professorship in "religious, social, and historical philosophy and the history of Christian religion" and was transferred from the theological to the philosophical faculty.

With his moving to the capital of the empire, Troeltsch's intensive political activity quickly gained in public significance. Troeltsch interpreted World War I as an imperialistic power struggle, at the root of which lay not only economic antagonisms, but also deep-seated political and cultural contradictions between the German spirit and Western rationality. In spite of this connection with his earlier analyses of the social and ethical differences between Lutheranism and Calvinism, Troeltsch was not a theoretician of a separate

political way for Germany. Since 1916 he had been fighting for a thorough democratization of the imperial constitution, the political integration of the parties of the workers' movement, and economic reforms aimed at breaking down class differences. This was reflected in manifold activities for the limitation of war and for peace negotiations. Troeltsch was a delegate of the leftist-liberal German Democratic party in the Prussian state assembly and undersecretary in the Prussian ministry for cultural affairs. After defeat and revolution, he was one of the leading representatives of that small minority in German Protestantism that interceded for the acceptance of the constitutional compromise of Weimar and for its concrete actualization as a social democracy.

In close connection with his political and practical activity, Troeltsch turned his attention in Berlin primarily to this question: to what extent could normative approaches to the solution of the present cultural crisis be found in the European cultural tradition? Because of his sudden death on 1 February 1923, Troeltsch was not able to realize concretely his program for a "European cultural synthesis." However, the basic theological structure of Troeltsch's philosophy of history can be recognized in the lectures *Christian Thought: Its History and Application* (London, 1923), edited by his friend Friedrich von Hügel (1852–1925), the so-called lay bishop of Roman Catholic modernism, and also the concluding part of *Das logische Problem der Geschichtsphilosophie* (The Logical Problem of the Philosophy of History), the first book of *Der Historismus und seine Probleme* (Historicism and its Problems), which appeared in 1922 as the third volume of the *Gesammelte Schriften*. Troeltsch now expressly restricted to the European-American cultural arena the old claim of Christianity to a position of relative superiority among the world religions. To pretend to understand foreign cultures was cultural imperialism. Against monistic worldviews, which presuppose that a universal history of humanity can be recognized, Troeltsch argued for a pluralistic understanding of reality. In that he was guided by the theological insight that an overview of history is possible only for God, but not for finite persons.

In the antiliberal, mostly antidemocratic, German Protestant theology of the 1920s, Troeltsch's cultural relativism encountered intensive criticism. Since the 1960s, however, one can see—on the international level as well as on an interdisciplinary level—a notable renaissance of interest in Troeltsch's thought. Indeed his theology of cultural modesty is important, in that it permits central problems of contemporary theological and philosophical discussion—for instance, the pluralism of religious traditions, the dependency of theology upon contexts, the relationship of Christianity to cultural modernity—to be grasped outside of all claims of dogmatic absolutism.

BIBLIOGRAPHY

A comprehensive listing of published works by Troeltsch is now offered by *Ernst Troeltsch Bibliographie*, edited and with an introduction and commentary by Friedrich Wilhelm Graf

and Hartmut Ruddies (Tübingen, 1982). This inclusive bibliography indicates numerous previously unknown publications of Troeltsch and various of Troeltsch's own editions of the same texts. Summaries of texts that have been published in English can be found in Jacob Klapwijk's "English Translations of Troeltsch's Works," in *Ernst Troeltsch and the Future of Theology*, edited by John Powell Clayton (Cambridge, 1976); see also the appendix, "Troeltsch in English Translation," in Troeltsch's *Writings on Theology and Religion*, translated and edited by Robert Morgan and Michel Pye (London, 1977).

Several introductions to Troeltsch's work have been published: Trutz Rendtorff's "Ernst Troeltsch, 1865–1923," in *Theology des Protestantismus im 19. und 20. Jahrhundert*, vol. 2, edited by Martin Greschat (Stuttgart, 1978); Karl-Ernst Apfelbacher's *Frömmigkeit und Wissenschaft: Ernst Troeltsch und sein theologisches Programm* (Munich, 1978); Giuseppe Cantillo's *Ernst Troeltsch* (Naples, 1979); Robert J. Rubanowicz's *Crisis in Consciousness: The Thought of Ernst Troeltsch*, with a foreword by James Luther Adams (Tallahassee, 1982); Trutz Rendtorff's and my discussion of Troeltsch in *Nineteenth Century Religious Thought of the West*, vol. 3, edited by Ninian Smart et al. (Cambridge and New York, 1985); and my and Hartmut Ruddies' "Ernst Troeltsch: Geschichtsphilosophie in praktischer Absicht," in *Grundprobleme der grossen Philosophen*, vol. 8, edited by Joseph Speck (Göttingen, 1986). A critical biography of Troeltsch does not yet exist. However, there are detailed studies for a biography of the young Troeltsch in *Troeltsch-Studien*, vol. 1, *Untersuchungen zur Biographie und Werkgeschichte: Mit den unveröffentlichten Promotionsthesen der "Kleinen Göttinger Fakultät" 1888–1893*, edited by Horst Renz and Friedrich Wilhelm Graf (Gutersloh, 1982).

Jean Séguy's *Christianisme et société: Introduction à la sociologie de Ernst Troeltsch* (Paris, 1980) offers an instructive introduction to Troeltsch's sociology of religion. Intensive work has also been done on Troeltsch's dogmatics and theory of religion. See *Ernst Troeltsch and the Future of Theology*, edited by John Powell Clayton (Cambridge, 1975); B. A. Gerrish's *The Old Protestantism and the New: Essays on the Reformation Heritage* (Edinburgh, 1982); Walter E. Wyman, Jr.'s *The Concept of Glaubenslehre: Ernst Troeltsch and the Theological Heritage of Schleiermacher* (Chico, Calif., 1983); Sarah Coakley's *Christ without Absolutes: A Study of the Christology of Ernst Troeltsch* (Oxford, 1986); and *Troeltsch-Studien*, vol. 3, *Protestantismus und Neuzeit*, edited by Horst Renz and Friedrich Wilhelm Graf, (Gutersloh, 1984). In addition to studies in the reception of Troeltsch's thought in the Anglo-American world, in Italy, and in the Netherlands, this last volume contains detailed examinations of Troeltsch's political activity. Moreover, an instructive introduction is offered by Arrigo Rapp in *Il problema della Germania negli scritti politici di E. Troeltsch, 1914–1922* (Rome, 1978).

FRIEDRICH WILHELM GRAF (1987)
Translated from German by Charlotte Prather

TRUBETSKOI, EVGENII (1863–1920), Russian Orthodox philosopher. Evgenii Nikolaevich Trubetskoi, a

brother of Sergei, was professor of philosophy at the University of Moscow from 1905 to 1918. He developed his philosophical views within the same general context as did Vladimir Solov'ev and was the author of a major study on him, *Mirosozertsanie Solov'eva* (Solov'ev's Worldview, 2 vols., Moscow, 1913). A theoretical disagreement with Solov'ev, which did not stand in the way of their friendship, led Trubetskoi to study Western theocratic ideas. In his two-volume *Religiozno-obshchestvennyi ideal zapadnogo khristianstva* (The Religio-Social Ideal of Western Christianity, Moscow, 1892; Kiev, 1897), which focused on Augustine and the medieval papacy, he concluded that a religious institution's primary responsibilities were incompatible with that institution's exercise of political power.

In his philosophy, Trubetskoi blended philosophical idealism, traditional Orthodoxy, and a voluntaristic-exhortative creed that shaded off into political activism. His posthumously published *Smysl zhizni* (Meaning of Life) was popular among the Russian émigrés whom it provided with the much-needed assertion that there was meaning in existence.

Trubetskoi was instrumental in stimulating increased interest in religious philosophy. He was active in the Moscow Psychological Society, in the Religio-Philosophical Society of Vladimir Solov'ev (named after the philosopher), and in the publishing house Put' (The Way). All three, on different levels, popularized metaphysics, religion, and, tangentially, liberalism. Trubetskoi worked for reform of the Russian Orthodox church and for a greater involvement of the laity in the church. He was appointed to the pre-Sobor meeting in 1906 that prepared for institutionalizing self-government in the church and was elected to the church council that pronounced the reestablishment of the patriarchate in 1917.

Evgenii Trubetskoi in his writing focused both on the individual, as the carrier of value, and on the state, which establishes conditions that can make moral value effective. He published a number of important works in law, and led between 1906 and 1910 a small moderate political party, the Party of Peaceful Regeneration. At the same time he edited the *Moskovskii ezhenedel'nik* (Moscow Weekly), a journal in which he expounded upon public issues. In 1910 he joined the Constitutional Democratic Party. During World War I his patriotic brochures, especially one containing an analysis of icons titled *Umozrenie v kraskakh* (Speculation in Colors), were quite popular.

Trubetskoi based his liberalism not on the will of the majority but on the rights inherent in each individual. He saw the state as a necessary buffer between the majority, which could, on occasion, be illiberal, and the individual. Equally outspoken about the dangers of violence from the left as from the right, he condemned the terrorist actions of radicals that the Russian progressives tended to condone.

Trubetskoi was an early and uncompromising foe of the Bolsheviks. In the last years of his life he placed great hopes

on the innate religiosity and conservatism of the Russian peasants to overthrow the oppressive Bolshevik regime. He died in Novorossisk, fleeing the Bolsheviks and predicting their early demise.

BIBLIOGRAPHY

There is no comprehensive study of Evgenii Trubetskoi. His philosophical views are discussed in the standard works on Russian philosophy. I have written an introduction to a new edition of his memoirs, *Iz proshlago* (Newtonville, Mass., 1976), in which can also be found a bibliography of his major works.

MARTHA BOHACHEVSKY-CHOMIAK (1987)

TRUBETSKOI, SERGEI (1862–1905), scion of an old noble family in Russia, was professor of philosophy at the University of Moscow. Weeks before his death Sergei Nikolaevich Trubetskoi became the university's first elected rector. He was instrumental in popularizing philosophical idealism. His philosophical and religious convictions led him to take public stands on the major issues of the day, positions which brought him national prominence. At an audience with the tsar in June 1905 Prince Trubetskoi was the spokesman of the moderate liberals. A close confidant of Vladimir Solov'ev, Trubetskoi worked within the philosophical tradition of idealism that encompassed Plato, Kant, the Russian Slavophiles, especially Ivan Kireevskii, and the Western mystics, particularly Jakob Boehme. Trubetskoi's interest in the history of philosophy led him to the history of religion. He wrote an introduction to the Russian edition of Karl Barth's *Religions of India* and prepared a bibliography on the history of religion for the Russian edition of P. D. Chantepie de la Saussaye's *Illustrated History of Religions*.

Trubetskoi's work was based on philological as well as historical study and demonstrates an amalgamation of philosophical and religious concerns. He maintained that while no strictly philosophical system can solve all the problems raised by philosophy, Christianity does hold solutions to these problems. For Trubetskoi, *sophia* (wisdom) is an intermediary between the absolute and humanity. He argued that the Logos, which he traced not to the philosophy of the Greeks but to Jewish gnosticism, refers to the concrete person of Christ rather than to a rational concept that might be linked to *sophia*. He rejected the notion of God as the absolute actualizing itself in history since, in his view, the absolute, by its very nature, could not be in the process of becoming. Trubetskoi held that Christianity, with its absolute and autonomous system of morality, is the vehicle through which the potential for the kingdom of God can be realized.

The source of true knowledge, according to Trubetskoi, lay in reason, sensibility, innate ideas, mystical experience, and faith, all of which reflect what he refers to as the "concrete consciousness" of each individual. Knowledge is possible because the human being is conscious of an external reali-

ty and is also part of that reality. Consciousness is not solely the function of the individual but of the species collectively. Hence, Trubetskoi considered the consciousness of causality to be both innate and based upon external reality. In his statement, "Whenever I make any decision I hold within myself a conference about all with all," Trubetskoi encapsulated a theory he characterized as "metaphysical socialism."

Because human beings have the capacity to reason, Trubetskoi argued, it follows that humankind can rise above natural causes and act morally. Eventually, humanity or society can develop the capacity to become a real organism, an eternal person. Although Trubetskoi posited the collectivity of consciousness, he maintained that value lay with the individual, since it is the individual who can reason and know. He defended the immortality of the individual soul and the freedom of the individual from external constraints. His conscious attempts to popularize philosophy drew him into the public arena. The reactionary wing of the Russian Orthodox clergy, which resented lay interference and the intrusion of philosophy into religion, accused Trubetskoi of undermining religion, while in actuality he sought to make it meaningful to the educated.

BIBLIOGRAPHY

Among Trubetskoi's major works are *Metafizika v drevnei Gretsii* (Metaphysics in Ancient Greece; 1890), *Uchenie o logose v istorii* (A Study of the Logos in History; 1900), "Psikhologicheskii determinizm i npravstvennaia svoboda" (Psychological Determinism and Moral Freedom; 1894), "Etika i dogmatika" (Ethics and Dogmatics; 1895), "Osnovaniia idealizma" (Foundations of Idealism; 1896), and "Vera v bezsmertie" (Belief in Immortality; 1902). The articles were published in *Voprosy filosofii i psikhologii* (Issues in Philosophy and Psychology), a journal Trubetskoi was instrumental in founding. His collected works are available as *Sobranie sochinenii kn. Sergeia Nikolaevicha Trubetskogo*, 6 vols. in 5, edited by L. M. Lopatin (Moscow, 1907–1912). For further discussion of Trubetskoi, see my book *S. N. Trubetskoi: An Intellectual among the Intelligentsia in Pre-Revolutionary Russia*, with an introduction by Georges Florovsky (Belmont, Mass., 1976).

MARTHA BOHACHEVSKY-CHOMIAK (1987)

TRUTH. The concept of religious truth expresses various aspects of human experience: reality that is permanent, immeasurable, unconcealed, effective, powerful; personal character that is sincere, good, genuine, valuable; and knowledge that is certain, accurate, pure, clear, and convincing. Truth emerges out of the basic human experience of valuation (both as assessment and appreciation) as a necessity for human survival and well-being. Human life is characterized by the need to distinguish between what is real and unreal, powerful and powerless, genuine and deceptive, pure and contaminated, clear and confused, as well as relative degrees of one extreme or the other. In an attempt to understand the character and variation of the existential engagement with

truth in different religious traditions, we can recognize three aspects of truth: (1) the character of accurate knowing, (2) the nature of the reality known, and (3) the formation of value as the power to actualize this reality in authentic living. As a general concept, religious truth can be defined as the knowledge and expression of what-is for the purpose of achieving the greatest well-being possible (i.e., salvation, absolute freedom, or total harmony).

Inherent in religious truth is the recognition that a person who knows, manifests, or orients his or her life to ultimate reality is achieving ultimate transformation—for example, being saved or attaining complete liberation. In knowing the truth a person becomes authentic because he or she places his or her self-consciousness in a comprehensive context of what-is. The object of religious knowing is not simply information about another thing or person; it is recognition of the deepest reality or resource for fulfillment of life. Such an object, called God, the Dharma, the Dao, *tathatā* (“thusness”), or *nirvāṇa*, is not a conventional object in a subject-object relationship, but the original source, the nature, or quality of all conventional objects as they really are. This understanding of truth cannot be limited to a conception of truth as a relationship between words or between ideas and things (though words, ideas, and mental images may evoke the quality of truth whereby self-consciousness responds appropriately to what-is). Religious truth entails the continuing development of a valid relationship between self-consciousness and one’s most extended and most profound environment (reality).

When people express religious truth, they are aware of different levels, kinds, or functions of truth. At the extremes are absolute and relative truth, or transcendent and conventional truth. The former expresses the deepest reality, the sacred, God, or “what-is”; the latter indicates accurate information about life the importance of which is limited to specific situations and short-term goals. The assumption of all religious truth is that personal estimations of what-is or decisions of momentary value must be affirmed only insofar as they are an aspect of the transcendent or absolute truth. Such absolute truth transcends and incorporates the concerns defined by information dependent on time-space conditions; it establishes an overarching value in relation to which the information has significance and meaning. This value is not external to the reality experienced, as an idea about something or a momentary feeling would be. Rather, it is experienced as a total orienting impetus providing coherence for the ideas and feelings that prompt a person to act in a certain way. Thus, truth is the valuation achieved by self-consciousness as it becomes a particular organizing center of self-awareness, meaning, feeling, and action—an individual participating in, and responding to, reality.

To respond appropriately or accurately to what-is can be understood as a release of ultimate power enabling a person to avoid self-deception and dissipating entanglement with unimportant activities and destructive forces. Religious

truth is a transforming orientation leading to superlative well-being, known in traditional religious terms as the conversion from sin to salvation, illusion to insight, bondage to freedom, and chaos to order. It expresses not only what is apparent or of relative worth but also what-is at the deepest level. From the standpoint of sin, bondage, or chaos, this ultimate reality is experienced as what *ought* to be. By affirming the highest truth, a person declares a strategy for both knowing the ultimate reality and actualizing it in his or her daily experience, because such truth is of highest value for achieving superlative well-being. It expresses a comprehensive purpose as part of a person’s perception of reality.

In world religions, truth is advocated as a corrective to three general sorts of deception: (1) intentional deception between people, or lying; (2) error due to lack of information; and (3) an inclination toward self-deception. These are inter-related because, in the last analysis, the expression of truth between people and the correction of ignorance find their capacity in the awareness developed through a continuing effort to avoid self-deception about “the way things really are.” People often lie to each other in the sense that they deceive themselves about their own deepest resource; they lack information about ultimate values and reality because they are too easily satisfied by short-term pleasures.

At the same time, there is a wide range of solutions to self-deception in the different world religions. This is due to the fact that there are different orientations having different structures of valuation for determining which way of being authentic is really the best and which is derivative or secondary. Since truth is a solution to a process of self-deception, the correcting process that communicates and actualizes what-is at the deepest level, and thus what ought to be, is a comprehensive transformation of one’s life-orientation. To examine different expressions of truth in world religions, we must not only look at different ideas about truth as a conceptual formulation but describe the processes in which the truth as description or information about reality is also a re-evaluation of what is significant in life. We will look at five different approaches or ways of knowing the truth so that it might actualize the deepest well-being possible, sometimes specified as the good, heaven, salvation, liberation, or total harmony. These approaches to truth are (1) intimate experience of spiritual presence(s), (2) symbolic duplication of sacred reality through myth and ritual, (3) cultivation of appropriate relationships, (4) awakening transcendent consciousness, and (5) cognition of necessary and eternal realities. Then we will consider some of the problems of formulating and reformulating the deepest truth in relation to other, general claims to truth in changing historical and social contexts.

INTIMATE EXPERIENCE OF SPIRITUAL PRESENCE(S). One way of knowing the ultimate truth is the awareness of what-is through the extraordinary experience of spiritual presence(s). These are most often unseen but powerful, controlling forces in life. This type of truth does not appeal for its validity to

universal ideas or the coherence and meaning of culturally accepted symbols, even though the social-mythic system communicates the reality of these powerful presences in symbolic and mythic language. For this type of truth the adequacy and meaning of reality is encountered by direct personal acquaintance with usually unseen spiritual presences as they provide healing, regenerative resources, wholeness, and joy. The validity of this truth depends on the intimate and direct experience of such a presence. I shall describe two kinds of intimate knowledge of sacred presence. The first is found in many archaic cultures in North and South America, Africa, Siberia, and the South Pacific islands; it is expressed in the ecstatic experiences of diviners and shamans. The second is found in the ecstatic devotion to, and often prophetic utterance for, God in Judaism, Christianity, Islam, and the theistic forms of Hinduism.

An essential element of this religious knowledge is the rupture of conventional, everyday experience, a personal, heightened sensitivity to the usually hidden, but ultimately real, presence of power(s). While the wisdom of the shaman is often described as “supernatural,” it is probably better to regard this—from the standpoint of the advocates—as a deeper or clearer knowledge of the natural forces that make all life possible. For example, the *kilumba* or *nganga* (one who possesses a healing vision) among the Bantu-speaking Luba in Africa is a man who is “seized” by a spirit or disembodied ancestor in order to reveal why some person or a society has inappropriately interfered with the powers of life and therefore has manifested disease, social disharmony, or natural catastrophe. Or, among the Huichol of north-central Mexico, the shaman (*mará'akáme*) is a person who is more deeply aware of the hidden forces contending with each other; he has transcended the apparent conditions of conventional existence and becomes the medium or mouthpiece of these forces in life. The unusual character of his knowledge is described as coming from the spirits (divine powers), who know and determine everyday happenings.

The shamanic communication requires crossing over from the biosphere to a hidden (spiritual) plane and then returning to the mundane world. The mundane sphere is a state of separation, pollution, and mortality, as evidenced by illness and social conflict. The hidden, but more powerful (spirit) realm is also one of contending forces who (which) can be benevolent or beneficent toward the members of the biosphere. The shaman needs to have the capacity and skill to maintain a balance between the contending forces; he engages the spirit forces as they “possess” him while deftly remaining balanced between two worlds. According to the Tucano of the Amazon forests, the soul of the shaman (*payé*) is said to be luminous, penetrating the darkness, and generative of life and health—like the sun. His skill and purity of soul allow him to ascend to the sky or descend into the netherworld, described as “death” or “dismemberment,” and then return to the everyday world.

When the shaman becomes “possessed” by a spirit, his ecstatic experience is interpreted by the audience within a

cosmology that affirms hidden vital forces, and his “seizure” is seen as a sign that they will soon hear the voices or sounds of these spirits that will aid them in dealing with vital problems. The truth of the shaman’s utterances, then, is part of a total orientation to life in which the members of the community respond emotionally, socially, and physically to the perceived forces affecting them day in and day out. Shamanic utterances are distinguished in these societies from psychotic experiences among the people by their predictive force and concrete results in solving problems. At the same time, when the utterances of a recognized shaman are not effective by empirical examination, some extenuating circumstance, such as impurity or inadequate following of a prescription, can be given to account for the failure.

The second kind of religious truth that requires an intimate knowledge of a sacred presence is the overwhelming experience of a devotee to God. This, too, requires a sense of a usually hidden force that directs one’s life as well as all existence. Direct personal experiences of God in Judaism, Christianity, and Hinduism are described as awesome, uncanny; they can provoke fear and terror. At the same time, they can provide deep comfort, evoke a sense of wonder and joy of life, and transform one’s self-consciousness from a feeling of weakness, corruption, and worthlessness to strength, purity of heart, and profound value. In the theistic traditions of all cultures are found examples of pious devotees whose personal experiences of God are described as spontaneous eruptions of a divine force that, on the one hand, compels them to lead a new kind of existence and, on the other, provides a serene strength to meet life’s traumas of personal loss, illness, and death. The devotee who lives his or her life in the presence of divine love and judgment feels reconnected with the source of life, so that even when mundane life is seen as full of evil and impotency, there is confidence in the divine power’s ability to overcome the apparent meaninglessness and self-destructiveness.

The validity of the truth known from personal experience depends directly on an evaluation of one’s self-consciousness within the context of a transcendent presence of the powers of life or the Holy One. The awareness is perceived as an overwhelming disclosure that transcends other norms of validity, such as empirical verification or rational analysis. Such divine disclosure provides a direction for living and a principle for knowledge not available in other norms of validity. The response to this disclosure is faith or trust in the final control of a powerful, loving, and caring divine presence. In the last analysis, such a divine presence remains a mystery, one that cannot be controlled by personal wants or verified by the mundane experience of health or prosperity. The response of faith is one of service in (and servitude to) the divine will. The truth known in such response is validated by the devotee in the experience of being known by the Holy One.

SYMBOLIC DUPLICATION OF SACRED REALITY THROUGH MYTH AND RITUAL. Symbolic expressions of truth in the

form of divine words, sacred myths, and sacramental rites and initiations are found throughout the world. They reflect the power of symbolic gestures and language to construct a realm of meaning. While often combined with the experience of powerful forces and the sense of social obligation and order, the communicative power of religious symbolic forms is found in their capacity to express several levels of meaning simultaneously, so that such activities as dancing, eating together, body marking, telling stories, and the use of special words or sounds can have more than a single signification. Verbal language, especially, has the mental-emotional force to construct multiple levels of meaning whereby self-consciousness attends to, and structures, experienced reality. The formation of ideas woven together by syntax (i.e., language) identifies and orders (often overlapping) conceptual units of consciousness into meaningful awareness. Thinking or imagining is more than a presentation of external sensations to the mind; the formation of ideas is a projection of self-consciousness toward, and into, the sensations of the experienced world. To speak about the world creates a relationship of symbolic meaning between self-consciousness and the world. The use of language demands a choice whereby a person separates one “thing” from another, classifies similar appearances into concepts, and makes evaluations between more or less significant features of one’s experience.

The power of language to construct a symbolic realm of meaning relates self-consciousness to the world by creating a “center” in the individual and, at the same time, placing the individual in a universe “as it is”—that is, as it appears directly to self-consciousness. Thus, symbols that express truth are those consistent with the deepest (often presumed) valuation inherent in one’s experience. Religious symbols are those mental-emotional lenses that provide images of oneself (a psychology) and the universe (a cosmology); they teach human beings not only what to see, but how to see. As scholars of mythology have pointed out, religious myths are those symbolic expressions that are recognized as true simply by being expressed.

A religious symbol, such as a divine name, sacred myth, ritual action, or visual image of a deity, is seen by religious advocates as the manifestation of a pure, original, mysterious, and powerful reality in a particular concrete form. The symbolic bodily gesture, sound, or physical image is a paradigm of reality—divine reality. Myths and rituals are repetitions of original life-creating actions by the gods, primal ancestors, and cultural heroes and, therefore, must be carefully preserved and meticulously duplicated. They disclose the divine resource that makes any life at all possible. It is the sacred that is eternal, genuine, whole, and pure—the opposite of the profane, corrupt, and fragmented mundane human experience—yet, paradoxically, it is expressed in and through the mundane form, where it usually remains hidden. The religious power of the symbols derives precisely from the fact that they claim to repeat the primal action of creation, the divine rescue of the world from devouring demons, or to de-

scribe the joys of paradise in the eternal realm. In providing the paradigmatic truth regarding reality, myth and ritual also provide a model for successful human living. The appeal to divine action is a basic principle of justification for social relations, morality, and, in many cases, all human activities.

Sacred words (divine names, sacred actions and laws, blessings, curses) and sounds (*mantras*, chants) are perceived by religious devotees to have a special capacity to release power. According to the perspective of Mīmāṃsā, a school of Hindu philosophical thought, the sacredness of *mantras* (sacred sounds, phrases, or verses) derives from the eternity of the word. The use of the *mantra* in prayer, meditation, or worship reveals the deity or divine energy because the sound is intrinsically related to the divine energy; it is an eternal causal principle. The sound (*śabda*) of words is not arbitrary; it represents an eternal principle or force that is manifested in many forms of changing existence. The *mantras*, thus, express the essence of divine powers in their very repetition; the sacred utterance in the hymns of the *R̥gveda* is a direct testimony to the primal energies of the universe. This view is basic for several subsequent Hindu theistic schools that appealed to the validity of verbal testimony on the basis of the intrinsic power of sound (speech) to express the eternal principles so long as the revealer, the source of knowledge, is adequate.

In Zoroastrianism, a sacred utterance, the Ashem Vohu, is used in most devotions to concentrate a person’s mind on *asha* (“truth”). *Asha* is the name of an abstract principle of truth or righteousness in the cosmos, but also the name of a divinity often invoked in the *Gāthās*, one of the Amesha Spentas (“bounteous immortals”). As one of the immanent powers who maintain the universe, Asha is also symbolically identified with fire, a focus of much Zoroastrian ritual. In this religious tradition, truth is symbolically expressed in a divine name, a concrete ritual image, and evoked through a sacred prayer. In Islam, “truth,” as identical to reality (*al-ḥaqq*), is an attribute of God, the creator of the world and maintainer of righteousness. *Al-ḥaqq* is that which is steadfast and permanent; it is genuine and authentic. God, as the reality, is the source of truth for humanity, especially as found in the sacred recitation (Qur’ān) given to Muhammad.

The validity for truth in religious symbolic expression, then, is found in the recognition that its source is eternal, of the realm of the sacred. The activity of God, of bounteous spiritual beings, or of primal ancestors is the real and significant activity. The duplication of the sacred realm in symbolic gestures, physical objects, names, stories, and sounds provides the paradigm for meaning, regeneration in life cycles, and the norm for righteousness. True human knowledge and behavior imitates that of the gods or God. In religious initiations, sacrifices, and sacraments, people release eternal power that purifies as it discloses the foundation for human well-being. The deepest problems in life arise from forgetting one’s sacred source, neglecting to repeat the sacred action

symbolically, or rejecting the sacred word (such as the Jewish Torah, Jesus Christ as the divine word made flesh, or the Muslim Qurʾān) as the basis for all well-being. When the effects expected from following the sacred rituals and words are not attained, the devotee usually recognizes some failure in perfectly duplicating the sacred paradigm. When there are conflicting myths competing for the loyalty of believers, the sacred reality of one myth is often judged to be demonic power by those holding another myth (an exclusive position), or it is seen as a lesser but related aspect of the true sacred reality according to advocates of another myth (an inclusive position).

CULTIVATION OF APPROPRIATE RELATIONSHIPS. Another approach to truth that expresses self-consciousness of what-is is through practical moral wisdom characterized by honesty, trustworthiness, and sincerity. Here the emphasis is on moral action that is consistent with personal integrity. This approach holds that a person cannot truly know the nature of reality without demonstrating what it means to “be” in everyday activities. The means for attaining wisdom combines intuition with observation and learning drawn from ancient tradition. We will discuss first the expression of this truth from Chinese and Indian sources, which appeal to a natural cosmic order (law), and then briefly note several theistic expressions whose ultimate source is divine but that emphasize the moral character of truth.

In the classical Chinese expression of truth there is no sharp distinction between the knowledge of what-is and a person’s moral action. Authentic awareness of reality is expressed more in daily practice than formulated in arguments about the nature of the good. The law of life is known not through a personal experience of a divine presence, duplication of a sacred word, or rational reflection; rather it is known through living out a sensitivity to the inherent cosmic harmony within the self and the world. Moral wisdom is found typified in the ancient Sage Kings by the phrase “sageliness within and kingliness without.” The goal is to develop a moral attitude that is tested in social relationships, one that is based on the general notion that there is an intrinsic order in all things that must be actualized in concrete relationships with nature and society.

Truth in both verbal expression and behavior is defined as *chang* (“constant”). A statement or behavior is “constant” when it promotes appropriate relationships within an organic order. Thus, truth is not an idea or abstraction but a human expression that shapes practical behavior. It has a practical function in communication that attempts to promote good behavior. In the Confucian classic *Zhong yong* (Doctrine of the Mean) the insight into the way (*dao*) of life focuses on “sincerity” (*zheng*). Sincerity is the demonstration that one perceives the reality of all life; it is a manifestation of the ultimate coherence between self-consciousness and the objective world. The capacity to cultivate such sincerity or integrity is inherent in human beings, but its actualization is not inevitable, so the potential must be fulfilled by constant personal effort.

In classical Hinduism, also, there is the recognition that truth about what-is is most profoundly expressed in everyday activity. From the beginning of the common era, when the Brahmanic tradition that grew out of Vedic rituals was synthesized with a concern for social order, down to the present a prominent notion has been that of *dharmā* (“law, reality, truth”). The cosmic order that pervaded all things is expressed also in appropriate social relationships. The *dharmā*, what people should do, is the correct arrangement of everything in life. Knowledge of oneself is found in following one’s *dharmā*, one’s way of being in relation to the organic whole. Everything and everybody has a place in the universe. The moral duties of farmer and ruler, husband and wife, or child and parent were defined by their appropriateness to each person’s station. To act contrary to one’s obligations and responsibilities destroys one’s own character and creates chaos in society and nature.

According to the Brahmanic text *Manusmṛiti* (The laws of Manu) the sources for knowing one’s *dharmā* were first the Veda, then the tradition, then the virtuous conduct of the religious leaders and holy men, and, finally, self-satisfaction. Most of the society did not study the Vedas, so they learned appropriate conduct from the tradition as expressed in popular stories, festivals, and social rules as they were reinforced by interaction with others. The truth of one’s existence was defined by participation in the fabric of society, and the cultivation of personal character was found in the virtues of sincerity, self-restraint, and honesty.

In the theistic traditions of Zoroastrianism, Judaism, and Islam there has also been a deep sense of expressing truth through moral behavior. Truth is expressed in the qualities of veracity, integrity, and trustworthiness. In Zoroastrianism, truth (*asha*) is the order that governs human conduct. Those who are honest, keep their oaths and covenants, and are loyal to Ahura Mazdā are the righteous ones (*ashavan*), those who uphold *asha*. They look for the final victory over the wicked (*drugvant*), those who follow falsehood. In Judaism, truth (*emeth*) is expressed in righteousness, justice, and peace. In such actions Jews worship “the God of truth.” God keeps his word, and those who speak the truth come near him. Thus, those who avoid deceit and hypocrisy in all their dealings practice the truth. In Islam, the word *ṣadaqa* means integrity, honesty, and trustworthiness. It is the quality of expression when one tells the truth; it requires that a person be honest with himself or herself and with others, as well as recognize the actual situation with which one is dealing. To express the truth is to follow the will of God, since he is the source of everything. A statement that corresponds to reality is an action that is trustworthy.

AWAKENING TRANSCENDENT CONSCIOUSNESS. A fourth religious way that truth is viewed as the accurate self-consciousness of what-is focuses on the quality of consciousness. Rather than centering the nature of truth on the intimate experience of a spiritual presence, on the symbolic structuring of a sacred realm of meaning, or on cultivating

appropriate relationships within a cosmic network, the power by which one can attain comprehensive well-being is the liberating insight that purifies inner dispositions, attitudes, and the thinking-feeling processes—all aspects of consciousness.

The truth of oneself and the world is perhaps partially expressed in symbolic imagery, ideas, and behavior, but the key condition for attaining true (or transcendent) knowledge, say the practitioners of this way, is the avoidance of attachment to these conventional habits of knowing. Here the concern to transform the manner or mode of knowing from a self-limiting, fabricating, and distorting process to a freeing, direct-intuitive insight is crucial because it is assumed that there is an intrinsic and reciprocal relation between the knowing process and the reality known. It is also assumed that there are different qualities of knowing, each of which leads to one or another kind of “becoming real.” For anything to exist, it has to come into existence, or “become something,” within the context of some manner of perception, process of knowing, and mode of consciousness. The concept of realization includes the two elements of knowing and becoming, as when we say that someone realizes certain possibilities. To realize transcendent consciousness requires a shift away from the conventional habits of consciousness aimed at perceiving (understanding) what-is. In this shift to another process of knowing, a person also comes to exist, “becomes,” in a new way.

The highest truth, then, in this approach requires insight into the nature of the process of becoming; it stresses how a person contributes positively or negatively to this process by the manner or quality of his or her awareness. This means that the expression of truth must “fit” the level or quality of the hearer. Truth is not a single idea or proposition that stands eternally and to which all particular forms partially correspond. Ideas and concepts are useful as pointers to truth, or catalysts for freeing a person from habitual mental-emotional entanglements, but a statement that would “fit” a lower spiritual condition, and thus be “true,” might be denied as an appropriate expression for someone at a higher level of spirituality. Because thought, emotions, and inner dispositions are interrelated, say the teachers of this way, a true statement is not a universal abstraction, an idea known by the intellect, but a catalyst for insight. Also, the hearer of truth must be prepared to receive it; for a religious idea to bear spiritual fruit, it must be received with a pure heart, or liberated mind. Such an apprehension requires more than intellectual skills or socially conditioned reflex responses; it is cultivated through serenity, courage, diligence, and love (compassion). To know the highest truth, then, is an illumination of “becoming” as an aspect of what-is, which is experienced as unconditional freedom.

The methods for attaining insight, which liberate one from self-imposed bondage according to several spiritual disciplines in India, include quieting the mind through meditation, separating oneself from conventional perceptual and

emotional stimuli, sustained and detailed awareness of the factors in one’s self-conscious “becoming,” concentration (*samādhi*) on the unmoving or unifying center of consciousness, and various levels of mental absorption (*dhyāna*). These are techniques through which a person is reeducated to “see” himself or herself in relation to the world so that he or she is not constructing mental-emotional chains that cause suffering. For example, in Theravada Buddhist practice, the meditation procedures are intended to help one to withdraw from external conditioning forces and to concentrate one’s consciousness, so that one can avoid the habitual confusion of one’s pure consciousness with the shifting appearances of things, people, ideas—all aspects of the “objective” world. Once a person is not attached to conventional perceptive and ideational imagery, he or she can expand consciousness through trance or mental absorption and eventually, in a freed state of mind, be intuitively aware of “the immeasurable” or “emptiness.” In such a state of awareness, say the Buddhist *suttas*, the Buddha perceived the nature of “becoming” as dependent coarising and also understood the root cause of suffering and the possibility of its elimination. Similarly, classical Hindu Yoga advocated the use of certain body positions, controlled breathing, detachment of the senses from external objects, and concentrated mental states to quiet—that is, to avoid producing—conventional procedures of knowing, such as habitual perceptions, inference, memory, or authoritative (sacred) words. These conventional means of knowing are useful as practical vehicles for business, getting physical pleasure, or establishing social relationships, but they are not useful in knowing the deepest reality, pure consciousness (*puruṣa*). Yoga intends to free one from the small, limiting consciousness, or the image of one’s ego, so that one may become directly aware of universal consciousness.

A common metaphor in both theistic and nontheistic religious traditions for the transcendent consciousness is the identity or union of the self with ultimate reality (God). Well-known examples of this are found in Advaita Vedānta Hinduism, in Muslim Ṣūfī recollection of God, and in Christian mysticism. Śaṅkara (eighth century CE), as an exponent of “nondual highest knowledge” (*advaita vedānta*), asserted that a genuine and deep investigation into *dharmā* led to the inquiry into *brahman*, the single undifferentiated reality that pervades all differentiated existence. The eternal *brahman* is pure being-consciousness-bliss (*sat-cit-ānanda*), and the most profound spiritual truth is to realize that self-consciousness (*atman*) is identical to *brahman*. The Ṣūfī master Ibn al-‘Arabī expresses a comparable insight in his assertion that true submission to God is an all-pervading sense that the self vanishes in the only true reality, God. He says in his *Fuṣuṣ al-ḥikam*: “When you know yourself, your ‘I’-ness vanishes and you know that you and God are one and the same.”

The Spanish Christian mystic John of the Cross (1542–1591) makes a similar claim in his manual on spiritual disci-

pline, *Ascent of Mount Carmel*, when he writes: “This union comes to pass when God grants the soul this supernatural favor, that all the things of God and the soul are one in participant transformation; and the soul seems to be God rather than a soul, and is indeed God by participation.” The soul, then, is like an unstained window that allows the divine rays to illumine it and “transform it into its own light.” These examples indicate a common concern to know the highest truth through emptying the self of its conventional consciousness so that the ultimate reality itself is manifest; however, because mystics each use a distinctive method interwoven with their own psychological and cosmological concepts, their statements about the nature of consciousness and ultimate reality remain significantly different.

COGNITION OF NECESSARY AND ETERNAL REALITIES. A fifth approach to the expression of truth is that found in classical Greek reflection on the nature of reality. While Greek philosophy is not a religious tradition in the conventional contemporary sense, Greek philosophers such as Socrates, Plato, and Aristotle wrestled at a profound level with the relation between self-consciousness, the perceived world, and eternal reality (or realities). Their reflection had a significant influence on patristic and medieval Christian theology and on Islamic theology, as well as on the post-Renaissance European philosophical discussion of truth. Despite important differences in the understanding of truth found in the philosophies of Plato and Aristotle, they shared several assumptions in their approach that have been carried forward in the way Western philosophers, and some Christian and Muslim theologians, have addressed the issue of truth.

One of the basic assumptions is that reality (the being of things) is universal, necessary, and, consequently, prior to any knowledge of it. Truth (Gr., *alētheia*, from *alētheuein*, “to disclose”) is a disclosure of what-is. Whether the eternal being is defined in terms of eternal ideas, as in Plato, or in terms of substances, as in Aristotle, the object of true knowledge is a necessary reality that is effective (even active) in the experienced world. The being of things is objective, presenting itself to the mind. Another important assumption is that whatever is real is intelligible; reality is that which can be known by the intellect. It has a signifying character, or a meaning of its own, which is known by cognition and, for Plato, intellectually contemplated by the mind. The “being” of things is the subject of any true judgment, which is basically a response to the disclosure of being. Whatever is real has a universal potential—it is potent and is a possibility—and is disclosed in particular forms and events. Plato asserted that being is itself a unity expressed by many particular forms, and such being is known by an integration of self-consistent judgments. By means of the intellect, human beings can know the universal potentials (reality), that is, can identify their meanings as they disclose themselves. By knowing the eternal ideas, especially the Good, human beings respond appropriately to life and achieve their own well-being.

In this context true knowledge is the mind’s inner appropriation of the universal potentials that are disclosed by

cognitive judgments pertaining to the continually changing appearances of the outer world. The mind has both a passive and an active role in becoming aware of the meaning that is exposed in the changing appearances. The passive aspect receives the impressions through observation, while the active aspect constructs the meaning mentally, by thinking or judgment. In this act the self-consciousness appropriates to some degree the meaning inherent in the being of things. The truth cognized is the valuable quality of the meaning appropriated, and it is evident to the degree that the mind signifies to itself what is disclosed by what-is. In this approach to truth, then, the primary effort is to respond with the intellect to a meaning found in an impersonal but active reality outside the mind. Truth is universal and has an inherent signification that must be reflected by the intellectual grasp of that objective meaning. The basic conceptual signification of reality should be the same in the mental experience of all human beings, regardless of their particular languages or symbolic systems.

Unlike the approach to truth through myth and symbol (which establishes the true meaning in symbolic duplication of a sacred realm), the meaning in this approach is assumed to be in an external reality that is only reflected in corresponding concepts. When mental images or concepts that intend to signify the meaning inherent in nonsymbolic facts conflict with each other, it is an indication that one or more of the symbolic significations do not correspond to the meaning, or self-signification, of reality. Such meanings are simply “beliefs,” which may have emotional force but are not regarded by people taking this approach as signifying what-is. In the Western religious traditions, this approach has led to both dogmatism and scientific theorizing; the former identifies eternal, universal, and objective signification with divine revelation and its explication in theological dogmas; the latter identifies eternal, universal, and objective signification with scientific theories based on empirical verification and general inferences that are presumed to function alike in the experience of all people.

INTERPRETATION, COMMUNICATION, AND VERIFICATION. All religious truth, as an existential expression of what-is, is tested and verified by ever-changing human experience. Regardless of the nature of ultimate reality and its relation to the process of its becoming actualized in self-consciousness, as discussed in the approaches to truth given above, the quality of one’s awareness, symbolic expression, or social relationship is tested in the changing circumstances of personal maturation and cultural-historical development. There is a basic question arising in each religious and cultural tradition: how is knowledge of the transcendent reality related to a general human means of knowing, for example, perception and inference? Another question arises: how is the original, eternal truth—which itself became manifest in a specific historical-cultural-linguistic situation—to be known in changing and sometimes quite different cultures? We will look at various answers to these questions by first considering the issues of continuity, meaning, and interpretation of symbolic and

moral truth. We shall then examine levels of meaning, practical techniques, and the use of language to communicate the special awareness found in the experience of spiritual presence(s) and transcendent consciousness.

In the claims of truth that are based on a sacred word (divine revelation) and/or found in a tradition of trained scholars (such as priests, lawyers, or Confucian literati) who conserve and interpret the eternal moral law, there is a profound concern to understand or make intelligible the meaning of the sacred word and the eternal moral law. Great effort is made to learn, preserve, and interpret the normative teaching so that it is relevant to a community of believers in a specific lived experience. The difficulty in exposing the genuine intention of the original symbolic expression in light of new situations and personal differences of interpretation has resulted in the development of various schools or denominations within all religious traditions. For example, the center of Jewish life is the study and interpretation of the Torah. In this tradition there are different interpretations regarding the relation between the written Torah and the oral Torah. All faithful Jews try to live in the basic myth of the Exodus and according to God's commandments, but there are different interpretations of the purpose of God relative to the historical experience of the Jewish community, the nature of the promised salvation (in this life and the next), and the degree to which certain customs and ritual laws are to be observed in different cultural situations, as well as the centrality and character of study, prayer, moral action, and observance of sacred days. For the past two millennia the leadership of the Jewish community has centered on the rabbi, who not only was trained to interpret the Torah in a creative fashion but also served in many communities as judge and administrator of the law. Especially since medieval times, the rabbis and philosophically inclined thinkers have had to relate the expressions of the Torah to reason and, in the last two centuries, to scientific analysis of the human condition. Such questions as the nature of free will, divine providence, and the psychological conditions for faith are important considerations for contemporary efforts to worship God in truth and to fulfill divine moral obligations of justice and love.

Similarly, Christian faith is based on the divine revelation in Jesus Christ, and study of the Bible, especially of the New Testament, has been central to the life of the Christian community. Already in the first centuries of the Christian church, as the New Testament canon was taking shape and the creeds (the "symbols" of the church) were formulated to define the normative understanding of faith, the impact of the Classical Greek philosophical language helped to shape the doctrines of the Trinity, the person of Christ, and the nature of humanity. A continuing issue in the proper interpretation of scripture, devotional life, and worship was the authority of one or another bishop to declare the official understanding of Christian faith, which was settled by the convening of councils in the fourth and fifth centuries.

The concern to formulate statements of belief that would gain intellectual assent by believers has pervaded the

history of the Christian church. During the thirteenth century a watershed formulation was made by Thomas Aquinas that eventually was recognized as authoritative and has remained the supreme theological statement for the Roman Catholic Christian community. In his *Summa theologiae* and *De veritates* he synthesized an understanding of Christian faith with Greek philosophical thought, especially from Aristotle, affirming that truth is a transcendental property of being that, in turn, is dependent on God, the ultimate intellectual cause. According to him, faith is human understanding, but the truth of faith rests on the truth of God, and belief—which includes church dogma—is a result of divine grace. In the sixteenth and seventeenth centuries, however, Christian reformers, such as Martin Luther and John Calvin, rejected the medieval understanding of a single ministerial (papal) office and, thus, many Roman Catholic dogmas; they emphasized the need to base Christian faith on the primal sacred word, the Bible. During the past three centuries, Christians in western Europe and America have engaged in theological reflection in a cultural context dominated by rationalism, scientific analysis, and industrial socioeconomic structures. These intellectual influences condition the formulation of Christian faith on issues such as the nature of human life, the meaning of revelation, and the role of men and women in the political and social order.

Some basic problems encountered by advocates of truth derived from an intimate experience of spiritual presence(s) and from transcendent awareness are (1) communicating an inconceivable reality through the use of words or appeals to conventional human experience, (2) relating unusual inner experience to general criteria of verification in common-knowledge perception or inference, (3) justifying the claims for a superior inner spiritual quality within the person who claims unusual and authoritative states of consciousness, and (4) avoiding the apparent circularity entailed in the claim that those who do not affirm the validity of supraconscious truth are not qualified to understand or judge the validity of this truth. The manifestation of the ultimate source of truth in an experience of spiritual presence(s) or an unconditional transcendent awareness is seen by its advocates to be a source of knowledge beyond logic, symbolic imagery, and conventional perception.

Nevertheless, advocates use words, symbols, and inference to argue by analogy or by logical analysis. For example, the vision of Lord Viṣṇu in the Hindu classic *Bhagavadgītā* (Song to the Lord) includes such imagery as "many mouths and eyes," and "the light of a thousand suns springing forth simultaneously in the sky" to portray the Lord. The Muslim devotional mystic Jalāl al-Dīn Rūmī (d. 1273) describes the true devotee as a person with "a burning heart." With regard to the use of inference to communicate transcendent awareness, a prime example is the second-century CE Indian Buddhist philosopher-monk Nāgārjuna, who used a rigorous logical dialectic to reject the claim of unchanging essences as the reality of existence. Or, in the Zen Buddhist tradition,

logical riddles (*kōan*) are used to break the habits of language and conceptual imagery that cause attachment to things or ideas. Logic and symbolic imagery, then, are never wholly descriptive of the transcendent reality—only suggestive, or preparatory to moving to a new level of awareness.

Critics, on the other hand, argue that since the religious reality that its advocates claim to know is so different from any communicable description of it, religious experiences indicate more about the simply subjective (perhaps only psychological) conditions of the knower than about any universal reality. Or, since the nature of religious truth requires a change in the quality of apprehension through special techniques or through transcendent power (e.g., God's grace), any special appeal to unusual states of consciousness cannot provide the norm of validity for a general theory of truth that also relies on conventional inference or perception.

Truth in world religions, then, is a concept that not only has different meanings and uses in religious language but also indicates different approaches to the religious concern for the becoming self-conscious of what-is that makes possible the attainment of the highest well-being. Each of the approaches described here provides an evaluative process that structures the conditions, goals, and nature of truth. The different approaches each have their own development, principles of validation, and impact on people's lives. While different religious and cultural traditions emphasize one or two approaches to truth, the major world religions and civilizations have included several of them as sometimes permissible options.

In the contemporary world, where people of different, and sometimes conflicting, religions and ideologies are in a network of political, economic, and ecological relationships, there is a heightened sense of urgency to develop strategies for at least existing safely within a plurality of ultimate commitments, if not for integrating or discovering the principle of unity in that truth that declares the source of well-being for all humanity. One of the most difficult issues in attempting to integrate the various approaches is that each holds that a distinction must be made between lesser, conventional truth and the highest, or divine, truth. Each approach is itself a system of evaluations about the nature of ignorance, the ultimate reality, and the mechanism of knowing the truth that rejects alternate systems of evaluation.

Especially in those communities that identify their survival and highest fulfillment with a single *form* of truth, through orthodoxy (normative or prescribed teaching) or orthopraxis (normative or prescribed behavior), the tolerance of alternative approaches to truth is difficult to maintain. Paradoxically, a society often holds rigidly to a form of truth when there is change in, or confusion about, the underlying system(s) of evaluation (as, for example, the conflict between the epistemological assumptions of the scientific method and those of the symbolic self-consciousness attained in myth and sacrament), and often an openness to explore alternative

forms (contents) of truth emerges when there is stability in the basic system of evaluation.

The contemporary world is characterized by rapid changes in technology and the development of a worldwide communication network. This situation requires new concepts of the self and the universe and an exchange of cultural and religious approaches to truth. The challenge for contemporary people is how to live within some system of comprehensive evaluation (as found in a religion or ideology) and how to respond in a mutually life-enhancing way with people committed to another system of evaluation. The survival and well-being of people in all cultures necessitates a creative re-examination and critical assessment of varied truth claims that implicitly give weight to different ways of valuation.

Introductory discussions of the concept of truth in world religions can be found in the following works: William A. Christian, Jr.'s *Meaning and Truth in Religion* (Princeton, 1964) and his *Oppositions of Religious Doctrines* (New York, 1972); *Truth and Dialogue in World Religions: Conflicting Truth-Claims*, edited by John Hick (Philadelphia, 1974); Wilfred Cantwell Smith's *Questions of Religious Truth* (New York, 1967); and my *Understanding Religious Life*, 3d ed. (Belmont, Calif., 1985).

For introductions to the nature of truth in shamanism and the symbolism of archaic cultures, see Joseph Campbell's *The Masks of God*, 4 vols. (New York, 1959–1968); Mircea Eliade's *The Sacred and the Profane* (New York, 1959) and his *Shamanism* (New York, 1964); S. F. Nadel's *Nupe Religion* (London, 1954); and Gerardo Reichel-Dolmatoff's *Amazonian Cosmos* (Chicago, 1971).

The religious significance of truth in Western traditions is discussed in Mary Boyce's *A History of Zoroastrianism*, 2 vols. (Leiden, 1975–1982); Jacob Neusner's *The Way of Torah* (Belmont, Calif., 1979); *Understanding Jewish Theology*, edited by Neusner (New York, 1973); Stephen Reynolds's *The Christian Religious Tradition* (Belmont, Calif., 1977); Leslie Dewart's *Religion, Language and Truth* (New York, 1970); W. Montgomery Watt's *Islamic Philosophy and Theology*, 2d enl. ed. (Edinburgh, 1984); and *Islam from Within*, edited by Kenneth Cragg and R. Marston Speight (Belmont, Calif., 1980).

The nature and cultivation of truth in Eastern traditions is described in Hajime Nakamura's *Ways of Thinking of Eastern Peoples* (Honolulu, 1964); *Revelation in Indian Thought*, edited by Harold Coward and Krishna Sivaraman (Emeryville, Calif., 1977); K. Kunjunni Raja's *Indian Theories of Meaning* (Madras, 1963); Padmanabh S. Jaini's *The Jaina Path of Purification* (Berkeley, 1979); Kulitassa Nanda Jayatilleka's *Early Buddhist Theory of Knowledge* (New York, 1963); Francis Dojun Cook's *Hua-Yen Buddhism* (University Park, Pa., 1977); *Tantra in Tibet*, translated and edited by Jeffrey Hopkins (London, 1977); Toshihiko Izutsu's *Toward a Philosophy of Zen Buddhism* (Tehran, 1977); *A Source Book in Chinese Philosophy*, translated and edited by Wing-tsit Chan

(Princeton, 1963); Fung Yu-lan's *The Spirit of Chinese Philosophy* (Boston, 1962); *Invitation to Chinese Philosophy*, edited by Arne Naess and Alastair Hanney (Oslo, 1972); and Tu Wei-ming's *Centrality and Commonality: An Essay on Chung-yung* (Honolulu, 1976).

A critical assessment of various principles of validity emerging from different cultures is found in Eliot Deutsch's *On Truth: An Ontological Theory* (Honolulu, 1979); *Modes of Thought: Essays on Thinking in Western and Non-Western Societies*, edited by Robin Horton and Ruth Finnegan (London, 1973); and *Knowing Religiously*, edited by Leroy S. Rouner (Notre Dame, 1985). For an examination of the relation of language, meaning, and truth in the mystical experiences of different religious traditions, see *Mysticism and Philosophical Analysis*, edited by Steven T. Katz (Oxford, 1978).

Revised Bibliography

TSADDIQ. The Hasidic *tsaddiq* (righteous one), also called *rebbe* (teacher) or *admor* (acronym for “master, teacher, and guide”), is the spiritual leader of a Jewish community, to whom members look for guidance in both spiritual and mundane matters. Throughout history, with a few exceptions, the overwhelming majority of Hasidic *tsaddiqim* (plural for *tsaddiq*) have been male. The *tsaddiq* is the officially designated intercessor to God (*shaliach tsibur*) whose prayers on behalf of the community or the individual, while not absolving them of their religious responsibility to address only God in prayer, are considered to be more efficacious than their own, due to his perceived close intimacy with—and influence on—divine providence. He prays with his community and often presides over sacred meals with them, where his followers observe his holy comportment and participate in his charisma, expressed in both communal song and verbal teaching. The source of his charisma is said to be his having transformed his material being into spiritual form and sacred

presence. His teachings often take on two forms: (1) exoteric explanations of biblical or rabbinic lore, said with his eyes open; and (2) esoteric teachings on the soul or on other mystical matters, which he says with his eyes closed, often in trance.

BIBLICAL AND RABBINIC DOCTRINES. The Hasidic use of the term *tsaddiq*—the righteous one—has deep roots in biblical and classic rabbinic literature, and was further informed by qabbalistic and late-medieval ethical treatises. Some of these sources shall be illustrated here.

In biblical writings, the term *tsaddiq* was used to designate both the divine nature—righteousness—and the one who carries out God's will. Given the biblical mythos that regards the human being as created in the divine image, the term represents the human ideal. The *tsaddiq* is one who has chosen to be an instrument of the divine nature and will. Attaining charisma thereby, he or she employs it for sacred purposes.

The persona of the *tsaddiq*, as reflected in the teachings of the rabbinic period (second century BCE—fifth century CE) often suggests the functions of one who in biblical times was described by the word *navi* (prophet). The rabbis state that a *tsaddiq* transforms divine wrath into divine compassion: God issues a heavenly decree, and the *tsaddiq* may annul it (Midrash Genesis Rabba 33:3). The divine presence (*shekhinah*) is said to be the *tsaddiq's* constant companion.

The rabbis appraised the deeds of the *tsaddiqim* as being even more valuable than the creation of heaven and earth; for the latter are the product of divine justice, whereas the *tsaddiqim* add kindness to the creation (Babylonian Talmud Ketubot fol. 5a). The *tsaddiq* is sometimes also called a *Hasid*—one who acts with kindness towards God and creation, beyond the obligations of the law; upon acquiring both wisdom and humility. The rabbis detested the ignorant *Hasid*, whom they regarded as a public nuisance. (The term *Hasid*, meaning “follower of a particular Hasidic *rebbe*,” has no textual witness before the 1850s.) In classical Midrash, the biblical Joseph was given the appellation *tsaddiq*, and refraining from sexual impropriety was regarded as the *tsaddiq's* hallmark.

In Babylonian Talmud Yoma there are esoteric statements such as: “the entire world was created for the sake of one *tsaddiq*” (fol. 38b)—where either or both God and the righteous individual are indicated; or “The *tsaddiq* is a foundation upon whom the entire world stands” (fol. 38b)—a source for the idea of the Hasidic *tsaddiq* as *axis mundi* (Green, 1977). The rabbis state that prior to creation, God's “first thought” was the creation of *tsaddiqim*, and that their primordial presence was “consulted” in the creation of the human being (Midrash Genesis Rabbah 8:7). The *tsaddiq* functions as the conduit through whom divinity pours blessings and liberation into creation; and it is stated that due to the merit of *tsidqaniyot* (female *tsaddiqim*), Israel was delivered from the bondage of Egypt (Babylonian Torah Sotah

fol. 11b). In the Qabbalah of the *sefirot*, which hypostasized the divine attributes, Joseph represents the archetype of the *tsaddiq*—the procreative power.

The sages declare that male and female *tsaddiqim* are exempted from the curses of Adam and Eve—meaningless toil and the pain of childbirth (Babylonian Torah Sotah fol. 12a). In this Edenic vein another rabbinic teaching that plays an especially important role in qabbalistic and *Hasidic* thought pronounces that: “By the light that was created on the first day, one could simultaneously gaze from one end of the world to the other. God, having observed that it could be abused by the wicked, hid this light and vouchsafed it for the *tsaddiqim* in ‘the future time’” (Babylonian Torah Hagiga fol. 12a).

It is within the potential of every human being, regardless of national affiliation, to be a *tsaddiq*. As for the minimal qualification of the title *tsaddiq*, the rabbis state that a *tsaddiq* is one who has chosen, more often than not, to function as a divine instrument: doing more good than evil, and attempting to establish a conscience-driven rapport with the divine presence (Babylonian Torah Qidushin fol. 40b).

Yet, even the greatest *tsaddiqim*—even the angels—are not perfectly free of fault. King David was accorded the role of the repentant *tsaddiq* who defeated his evil inclination by practicing austerities although the ascetic ideal was not universally embraced by the rabbis. According to some rabbis, human beings—endowed with freedom of choice—are more precious to God than the angels, who were expressly created to suit their particular functions (Babylonian Torah Sanhedrin fol. 93a). The principal inner voice of the human *tsaddiq* is the inclination to the good, construed as an angel nurtured by the *tsaddiq*'s good deeds, and the impetus that sustains the *tsaddiq* is faith in divine righteousness. All of these form the ideal of the Hasidic *tsaddiq*.

QABBALAH AND HASIDISM. Regarding the “light of the first day” in qabbalistic literature, we find a difference of opinion as to the meaning of “the future time” when it is stored away for the *tsaddiqim*. According to the *Sefer haBahir*, one of the earliest works of the Qabbalah (anon., twelfth century CE?), members of the Provence and Gerona schools of Qabbalah (1180–1230), the authoritative *Sefer haZohar* (anon., late thirteenth century), and the *Sefer haTemunah* (anon., early fourteenth century); this light is available to *tsaddiqim* during their earthly lifetime, by means of Torah study and contemplative prayer. Through uniting with the light, the *tsaddiq* theurgically and devotionally draws blessings to the entire creation. But according to the more conservative *Ma'arekhet haElohot* and the introductory qabbalistic treatise *Gates of Light* by R. Joseph Gikatilla (both are late thirteenth century), as well as the *Sefer haPeliah* (early fourteenth century?) “the future time” refers to the after-death state. In the sixteenth century, R. Moshe Cordovero (1522–1570) and R. Isaac Luria (1534–1572), both of whom greatly influenced Hasidic thought, accepted the view of the Zohar. In early Hasidic teaching, this light was said to inhere in the sacred-

ness of the letters of the Torah—through which the world itself was created. These holy letters are themselves a central object of contemplation. The famous *Epistle of the Besht* indicates that the Messiah revealed to R. Israel Baal Shem Tov (henceforth, Besht, an acronym for Baal Shem Tov; 1700?–1760), the founder of the Hasidic movement, that each letter contains aspects of the outer world the realm of the soul, and the divine realm, which all unite within divinity. Practice in this form of contemplative-union was said to have afforded the *Besht* (“Master of the Good Name”) clairvoyant vision.

This qabbalistic difference of opinion is similar to one found in medieval Jewish philosophy that deals with the possibility of conjunction—or *devequt*—during one's lifetime with the active (or agent) intellect, which is regarded as divinely emanated. This *devequt* union results from human awareness transcending the physical body, focusing on the divine presence within the human mind. Formulae to this effect are found in the explanations to the *yihudim* (unifications)—practices promulgated by the sixteenth-century Qabbalah of R. Isaac Luria, whereby the *tsaddiqim* unify their own conscious presence with the divine attributes, and raise them to higher levels, thereby drawing bounty from more sublime levels within the divine source for the sake of *tiquin*—the repair of the divine-human interface. Lurianic Qabbalah stipulates eight basic levels of theurgic union that provide sustenance, increase, renewal, or innovation, on the spiritual and/or material planes. During the millenia of the exile, nearly all unifications that occur are, in effect, the *tsaddiqim* uniting with the *shekhinah*—as it were, embodying the place of God—by uniting the divine primordial union with the temporal state. During the Temple period (first Temple, c. ninth century BCE to late fifth century BCE; second Temple, fourth century BCE to 70 CE) and in the Messianic era (yet to occur), we read that it is God who directly enacts this union.

LEVELS OF TSADDIQIM. Hasidism, following the Zohar and Lurianic Qabbalah, divided the soul into five levels: (1) *nefesh*, the animating soul of the material plane; (2) *ruah*, the emotive spirit; (3) *neshamah*, the consciousness soul; (4) *hayah*, the emanated wisdom-soul of divine Imminence; and (5) *yehida*, transcendent unity.

These soul levels correlate with four worlds and their defining *sefirot* (divine attributes) as follows:

1. *nefesh* = action-sovereignty;
2. *ruah* = formation-harmony;
3. *neshamah* = creation-understanding;
4. *hayah* = emanation-wisdom; and
5. *yehida* = crown of emanation = primordial Adam = unity within the absolute infinite. Each level contains all five, within its own context.

Whereas emanation is understood and experienced as a seamless divine dialectical unity, creation represents the unfolding of the individual's participation in this dialectic pro-

cess. Formation represents the emotional contours of this participation, and action, righteous effectuation. Given that all souls were originally within Adam, this schema was understood as forming a collective, living, human-form organism.

The potential of the human being as such, whether male or female, is likened to all five levels, as explicated in the Lurianic corpus. One who purifies all five levels of the *nefesh* attains to periodic transcendent unification with the aspect of sovereignty-in-emanation. This level constantly descends into the world of creation and needs to be raised to emanation by the *tsaddiq*, who has also descended. This is also the case with one who is in the process of purifying the fourth level of the *nefesh*. These two constitute the levels of most *tsaddiqim*. If one succeeds in purifying all five levels of the *ruah*, one would be in constant communion with the *Ruah haQodesh*, the Holy Spirit, and would abide—as active or passive—in the world of emanation, even when in descent to the “lower worlds,” and would no longer be subject to jealousy and competitiveness. This is perhaps the qabbalistic analog to the conceptions of the *tsaddiq* developed by R. Nahman of Bratslav (1772–1810), a great-grandson of the *Besht*, and by the founder of Habad Hasidism, R. Shneur Zalman of Lyadi (1745?–1814). The archetypal image of *tsaddiqim* mentioned in the Bible has them working on the five aspects of the *neshamah*. The biblical forefathers, for example, were regarded as the “Divine Chariot”—the instruments of the emanated divine attributes: kindness, judgment, and harmonizing compassion—uniting the second and the third levels of the cosmic *neshamah*. Moses was said to have attained the union of its third and fourth levels and received, as a gift from God, the emanated light of the fifth level. According to the Zoharic-Lurianic Qabbalah, Moses incarnates in every generation, and is potentially present in all Israelite and convert-souls. Upon completion of the *tiqun* of the fifth level of the *neshamah*, he will be in constant union with the unchanging compassion of the *yehidah*, and will manifest as the Messiah.

Luria states that *tsaddiqim* who during the course of their lifetime have always striven to “unite the part with the whole” are constant companions of the divine presence (*shekhinah*) and are themselves present in spirit whenever anyone enacts a *yibud*. Furthermore, these *tsaddiqim* may “impregnate” with their own souls the soul of one who contemplates in this way (striving to unify the part with the whole), thereby aiding the person’s spiritual development. According to the Lurianic explanation of the Zohar, higher-level *tsaddiqim* are able to voluntarily reincarnate, and they do so for the sake of furthering the cosmic *tiqun*. With this background it is easier to understand the insistence of R. Yaakov Yosef of Polnoya (died c. 1782), the chief spokesman of the doctrine of the *tsaddiq* as expounded by the *Besht*, that for the untutored laity as well as for the lesser *tsaddiq* to experience *devequt* with God, he or she must be aligned with the *tsaddiqim*.

In every generation a soul-spark of the Messiah is sent to incarnate, to redeem the generation that shows itself worthy; or, if there are worthy *tsaddiqim* in the generation, to illuminate them. By means of messianic consciousness, all the holy potential in human beings will be realized, and numerous texts of early Hasidic teaching (1750–1825) suggest that even the wicked will be transformed and released from hell. This transformative work, according to the Zohar and Lurianism, is performed by *tsaddiqim* in the present (both in this life and in the hereafter), rescuing the souls of those people who are associated with their own Adamic roots.

This work is the source of the Hasidic doctrine of “the descent of the *tsaddiq*,” who must periodically leave exalted states of divine union in order to raise up those for whom they are responsible. Lower-level *tsaddiqim* leave involuntarily, and may even temporarily fall. For higher-level *tsaddiqim* who have cultivated equanimity (as taught by the *Besht* and his disciples), in the words of Rabbi Elimelech of Lizansk (1716?–1787), “*oyven-hintzen, hintzen-oyven*” (“below [integrated with] above, and above [with] below”) (*Or Elimelekh*, p. 98, number 148). And as said by Rabbi Pinchas of Koretz (1726–1791), a companion of the *Besht*: “great *tsaddiqim* love the exceedingly wicked, and lesser *tsaddiqim* love the less wicked” (*Imrei Pinchas haShalem* vol. 1, p. 474, number 72). Elimelech and his disciples also stressed the practice of union with all the *tsaddiqim*. Since the appearance of the pioneering work of Mendel Piekartz (1978), scholars no longer believe that these aspects of Hasidic spirituality were influenced by the Sabbatean false-messiah movement (c. 1666). The anti-Hasidic *mitnagdic* (opponent [to Hasidism]) theology of Rabbi Elijah of Vilna (1720–1797) concurs with the conception of the *tsaddiq* in all of the above, and differs from the early Hasidic model on the public aspect of the intercessory role of the *tsaddiq* and on the breakdown of elitist stratification in the community. Indeed, the Hasidic “social revolution” and its displacement of previous rabbinic and communal forms became possible only as a result of the complete breakdown of centralized Jewish authority (and its well-established universal educational system) in Poland and Lithuania due to the continuing upheavals in the kingdom of Poland between the years 1648 and 1772 which resulted in a smaller and weakened state. In addition, the aforementioned failed popular messianic movement resulted in the near-interdiction of qabbalistic literature, which became the preserve of the elite, who were perceived as having coldly distanced themselves from the greater, largely uneducated, community. These two events seemed to have engendered a novel construal of social solidarity and a replacement of authority.

MODELS OF HASIDIC LEADERSHIP: A BRIEF HISTORY OF THE TSADDIQ IN HASIDISM. Defining the archetype of Moses as leader of his people was central to the formulation of the ideal *tsaddiq* in the teachings of the *Besht*, who described such a *tsaddiq* as encompassing all and uniting with all, from the pharaoh to the sage. The *tsaddiq*’s sense of responsibility is mirror-like; all facets of the world, both wicked and holy, become located in *tsaddiqim*, through recogni-

tion of their subtle forms within themselves. This causes them to repent, and opens the way for the wicked to repent as well. When they discern that heavenly inspiration is offered, they give honest and loving rebuke, being present within the dialectic of humility and innate worth, and realizing that the rebuke applies to themselves as well. Deriving from the qabbalistic procreative metaphor of the *tsaddiq*, Rabbi Yaakov Yosef of Polnoya regarded the desire, enthusiasm, and pleasure that a person has in performing the good as the expression of the attribute of the *tsaddiq* within the individual.

In early Hasidic applications of these teachings to petitionary prayer, the Besht and his successor, the *magid* (preacher) of Mezritch (1710?–1772) had always stressed the importance of the needs of the *shekhinah* as being the foremost of the *tsaddiq*'s concerns; the Besht, making allowance for personal petition when one's sincerity would be compromised by pretense. They counseled the *tsaddiqim* to observe their needs, and by applying qabbalistic tools of symbolic analogy, to discern the spiritual needs of the *shekhinah*. The *magid*, being of an ascetic bent, and having accepted the leadership of what was fast becoming a religious movement that was attracting the cream of the young spiritually and intellectually gifted, placed his entire stress on the needs of the divine presence. This emphasis was passed on to Rabbi Shneur Zalman of Lyadi, who asked his followers not to trouble him with personal petitions.

The *magid*, acting as the Hasidic movement's advocate, distinguished between two types of *tsaddiqim*, based on *Psalms* 92:12: "The *tsaddiq* shall blossom like a palm; like a cedar of Lebanon shall he rise high." The solitary *tsaddiq*, who may rise high as "a perfect *tsaddiq*," produces no fruit. But the one who causes others to flourish, raising the lower elements outside himself, although he may not rise "as high" as the cedar, will blossom with new fruit. It is interesting to note that this distinction is not found in the teachings of the *Besht* as recorded by Rabbi Yaakov Yosef and other disciples. This fact seems to conform to the view of scholars as of the 1980s that Hasidism cannot be construed as a movement prior to the succession of the *magid*.

Indeed, the recruitment efforts of the *magid*'s disciples enabled them to become the next generation's elite rabbinic authorities in most of the Ukraine and part of Poland (1772–1800), no doubt facilitated by the final division of Poland in 1772 and the vacuum in Jewish centralized authority. The socioreligious change that Hasidic ideology advocated in the teachings of the *Besht*, as recorded by Rabbi Yaakov Yosef, called for "men of form" to spiritually transform the "people of matter." This is in keeping with a narrative in the aforementioned *Epistle of the Besht*, which contains an exchange between the *Besht* and the Messiah. The *Besht* asked: "when will the Master (Messiah) come?" The Messiah answered: "when your teachings will be so well-publicized and revealed in the world . . . that they too will be able to enact unifications (*yihudim*) and soul-ascents as you do. Then the cosmic

obscurations will come to an end and the time of divine favor and salvation will be upon us." Whereas the *Besht* was distressed by this answer, his numerous teachings instructing the would-be *tsaddiq* in the ways of humility and the acceptance of mutual social responsibility reflect acceptance of the messianic challenge, albeit with the understanding that it is a slow process. Indeed, this messianic ideal is in keeping with Moses' aspiration (*Num.* 11:29) that "the entire People of God be prophets."

It is this ambivalence that led to differences of opinion among scholars as to whether early Hasidism was messianic, or represented a neutralization of acute messianism. In addition, we find statements from the *Besht* regarding the messianic spark inherent in all who serve God, and the proviso that one must pray for personal redemption before one can pray for cosmic redemption. We also find anecdotal testimony regarding at least two Hasidic masters who realized this spark within themselves, while renouncing pretensions of public messianic identity: Rabbi Menachem Mendel of Vitebsk (1730–1788), a senior disciple of the *magid* who guided Rabbi Shneur Zalman after the *magid*'s demise, before emigrating to the Holy Land in 1777; and Rabbi Menachem Mendel of Rymanov (d. 1815).

THE THIRD GENERATION AND THE NINETEENTH CENTURY.

Rabbi Elimelech of Lyzansk was an elder disciple of the *magid* who came to him after having already developed into a fairly accomplished *tsaddiq*. He is credited with the formulation of a new Hasidic model—"Practical *Tsaddiqism*." His understanding of the exigencies of the time empowered the Hasidic *tsaddiq* to directly intercede on behalf of the material needs of the Jews. This was acknowledged by Rabbi Ephraim of Sudlykov (1740–1800), a grandson and respected disciple of the *Besht*, as legitimate, even as he stated that it represents a change from previously accepted emphasis on the needs of the *shekhinah*.

The chief disciple of Rabbi Elimelech was Rabbi Jacob Isaac Hurwitz (1745–1815), the "Seer of Lublin," whose disciples (1795–1870) became the rabbinic leaders of Poland and Galicia and even penetrated into the Austro-Hungarian Empire. Hurwitz was allowed to function as a public *tsaddiq* during the lifetime of Elimelech. The Seer's school produced great practitioners of Lurianic theurgy, and further applied its practices to petitionary prayer. The rationale given for this was the conviction that with fewer material concerns, the laity would better apply themselves to spiritual pursuits. This gave rise to anti-acute-messianism and informed a proto-anti-Zionist ideology. Rabbi Tsvi Elimelech of Dynov (1783–1841), a disciple of the Seer, asserted in the name of the *Besht* that it is easier to attain the level of *Ruakh ha-Qodesh* (inspiration of the Holy Spirit) in exile than in the Holy Land, where the standards are more demanding. His descendants, the *rebbe*s of Munkacs, were among the foremost anti-Zionist Hasidic leaders in the pre-World War II period.

Returning to the theme of the Lurianic “cosmic organism” with its levels and shortcuts, the early Hasidim claimed that the *tsaddiq* can raise up some people only by eating or engaging in other mundane matters in a mode of holy intention, whereas others had to be elevated through the *tsaddiq*'s direct engagement in sacred matters. One of the contemplative innovations of the Besht involves the “raising up” of improper, distracted thought by recognizing the holy essence-nature of the thought: physical desire is rooted in kindness, anger and its effects are rooted in judgement, and pride is rooted in harmonious beauty. By subduing the evil impulse in these negative manifestations and recognizing their specific nature in holiness, the *tsaddiq* “sweetens them at their roots.” Rabbi Yaakov Yosef quotes the Besht as saying that one who doesn't believe that divinity inheres in everything, and who doesn't believe that an untoward thought during prayer contains a holy spark sent to the person by divine providence so as to find redemption, shows a lack of faith. Some of the disciples of the *magid* held that thought-transformation practices were reserved only for the elite, whereas some *tsaddiqim* from the school of the Seer of Lublin—notably, the great Hasidic qabbalist Rabbi Isaac of Komarno (1806–1876)—advocated them for anyone who can maintain honesty in the course of these practices.

There is an early Habad tradition (which traces its provenance to the Besht) that states that whereas in earlier times, souls were incarnated within a stratified rubric (peasants possessing souls from the world of action, business people possessing souls from the world of formation, and scholars possessing souls from the world of creation), as of the advent of the Besht, which constitutes the “footsteps of the Messiah,” the souls that enter the world contain sparks from all worlds. Thus, at one moment, one can be engaged in a sublime religious experience, and at the next, one can find oneself in totally different inner circumstances. For this reason the Besht counseled against self-satisfaction—the surest way to forsake the sacred path. Yet, Habad reserved thought-transformation practices for *tsaddiqim*. On the other hand, there is an oral tradition from the fifth Lubavitcher *rebbe*, Rabbi Shalom Dov-Ber (1860–1920), who recommended that each of his followers spend at least fifteen minutes a day cultivating the persona of the *tsaddiq*, observing all things as rooted in primordial Adam.

INTERNAL DISSENT; EXCEPTIONAL WOMEN; EXTERNAL OPPOSITION; DECLINE AND ACCOMMODATION. The Hasidism of Preshischa, formulated at the beginning of the nineteenth century by disciples of the Seer of Lublin as a breakaway reform of Hasidism, attempted to purify Hasidism from an ethos of the vain petitionary seeking of the miraculous. Instead, it stressed the values of inner truth and the study of the law, and demurred from the study of Qabbalah. This movement conquered Poland for the Hasidism of Kotzk, Gur, Aleksander, Biala, Amshinov-Worka, and Izbica-Radzin. During the first three generations, it upheld its antipetitionary position. There was mutual criticism between the schools of Lublin and Preshischa. The great *magid* of Ko-

zienice, Rabbi Israel Hopstein (1733–1815), a prolific writer of qabbalistic works and close friend of both the Seer and Rabbi Simha Bunim of Preshischa (1765–1827), attempted to act as a bridge between them.

His daughter, Perele (d. 1849?) observed many of the biblical commandments ordained specifically for men, and was recognized as a *tsadeqet* by Rabbi Elimelech of Lyzansk, who, together with her father, urged his followers to visit her with their prayer petitions. *The Rebbe's Daughter: Memoir of a Hasidic Childhood* (2002), a memoir by Malka Shapira, a descendent of the *magid* of Kozienice, sheds light on the elevated status of women in this branch of Hasidism. Harry M. Rabinowicz, a scholar of the Hasidim in the late twentieth century, profiled more than ten women who made their mark in the nineteenth-century Hasidic world, including one who was not born into a family of Hasidic *rebbes*. Rabbi Hannah Rachel Werbmacher (1805–1892), an exceptional self-taught *tsadeqet* known as the “Maid of Ludmir,” acted as a full-fledged Hasidic *rebbe*, receiving prayer petitions and delivering Torah sermons in public from a cordoned-off room. Since the late 1980s there has developed a controversy among scholars of Hasidism as to the correct assessment of these phenomena. Certainly, there is much research yet to be done in this field.

As of the 1870s, the elite of Preshischa renewed their interest in Qabbalah, including the works of Rabbi Isaac of Komarno, an opponent to the Preshischa path. Particularly good examples of such integration can be found in numerous works of Rabbi Tsaddoq haKohen of Lublin (1823–1900), a disciple of Rabbi Mordehai Joseph of Izbica (1788?–1854) who often placed his teacher's and his own deep psychological insights in a qabbalistic context, and also emphasized the aspect of the *tsaddiq* potential in all his followers; and Rabbi Yehudah Leib of Gur (1847–1905), whose voluminous *Sefat Emet* integrated many of the insights of the early Hasidim.

Throughout this period, Hasidism faced staunch opposition from the *maskilim* (enlighteners), who advocated antitraditional modernization and often attempted to accomplish it through government lobbying. Recriminations of unscrupulous manipulation were rife on both sides. The historiography of this period needs to be reevaluated, as its scholarship has been colored by modernist agendas that misvalue the efforts of the traditionalist Hasidim to preserve their culture. Although most Hasidic groups held secular education, and even job-training, as anathema, many Preshischa-influenced Hasidic courst (including Gur) were among the first to allow their communities access to Jewish trade schools, and to permit the formation of political parties that were more accommodating to the Zionist movement.

Piekarz has gathered evidence to produce a profile of the deteriorated state of East European *tsaddiqism* based on certain early twentieth-century Hasidic texts (c. 1920). This decadent tendency sustains an insular conformist mentality that fears and attacks all change. It views the stratification of souls as innate and unchanging—everyone has his station,

and must place their faith in an unerring *tsaddiq* who is described as “the root of all worlds, transcending and filling and giving life to them all.” These *tsaddiqim* and their families and close kin would often spend their time at Western European resorts, financed by their less-than-wealthy Hasidic followers (in accord with Hasidic perspective: in exile, the *tsaddiq* replaces the *Cohen*-priest, whose upkeep is incumbent on the laity), whom they encouraged to oppose other Hasidic “dynasties.” However, there is not enough data to ascertain the extent of this trend. Indeed, traditional Hasidism allowed for pluralism of opinion and indeed, by stressing the uniqueness of the individual, encouraged it. One of the reasons for this deterioration over time is surely the nepotism of Hasidic “dynastic succession”—appointing successors regardless of merit. This emerged from the process of institutionalization that took place during the nineteenth century.

During the interwar period (1918–1939), some of the conservative Hasidic elite began reluctantly opening up to the modern world. Overcoming opposition, but not precipitating a break, gifted members of various leading Hasidic families, such as Rabbi Dr. A. J. Heschel (1907–1972) and R. Menachem Mendel Schneerson (1902–1994), the seventh Lubavitcher *rebbe*, were among the significant few who studied in some of Western Europe’s major universities. In addition, Rabbi Abraham Isaac Kook (1865–1935), the first chief rabbi of modern Palestine (but not, strictly speaking, not a Hasidic *tsaddiq*), emphasized the role of the contemporary *tsaddiq* as one who also embraces the openness of modernity and forges new paths of creative spiritual speculation out of humanistic and scientific developments.

As for the period of the war itself, two works composed during that period are notable. *Esh Qodesh* (1960; Sacred Fire) was written by Rabbi Kalonymus Kalmish of Piasezna (1889–1943), who was descended from some of the chief disciples of the Seer, and before the war was a renowned educator. This work contains his sermons delivered in the Warsaw Ghetto until 1943, and its heartrending theodicy of faith is a testament to this *tsaddiq* and his internalization of some of the central messages of the Besht. The second book was written in occupied Hungary by Rabbi Yissachar Shelomoh Teichtal (1885–1945), a leading disciple of the brilliant scholar Rabbi Haim Elazar, the *rebbe* of Munkacs (1868–1937) and an irascible compassionate and extremely opinionated Hasidic leader of the Hungarian anti-Zionist movement. Rabbi Teichtal’s book, *Em haBanim Smecha* (A joyful mother of children), was an unpretentious repudiation of his teacher’s theological arguments for opposing Zionism. Rabbi Teichtal also left behind a wartime diary that was published in 1995.

POST-HOLOCAUST HASIDISM. Despite their population being decimated by the Holocaust, in the post-Holocaust world Hasidism made a remarkable recovery in the United States and in Israel, rebuilding their institutions and replenishing their numbers. Many of the eligible “future *rebbe*” who resurrected old dynasties were trained in the postwar pe-

riod by the few surviving elders. Most notable of those who trained these future *rebbe*s was Rabbi Joel Teitelbaum (1887–1987), the Satmar *rebbe*, whose lineage goes back to Rabbi Moshe of Ujhely (1759–1841), a leading disciple of the Seer of Lublin. An ultra-conservative and brilliant scholar-charismatic, the Satmar *rebbe* saw his mission as rebuilding Hungarian and Galician Hasidism in the United States so that it would be as similar as possible to prewar times. A complex elitist, he discouraged the public teaching of Qabalah and Hasidism, while apparently also training serious cadres of Hasidic-qabbalistic scholars. Following his death there was a flurry of publications of classic Hasidic works with extensive commentaries, originating both from his own community and from those aligned to it. Also, since the mid-1990s, several large anthologies of the teachings of the disciples of the Besht, such as Rabbi Pinchas of Koretz (1726–1791) and Rabbi Michael of Zlotchov (1734–1786) have appeared; these include manuscript material previously withheld by Hasidic dynastic leaders. In addition, some rare works written and published during the first four decades of the twentieth century which attest to the continuing creativity of Hasidic Qabalah have been reissued. After the death of the Satmar *rebbe* in 1987, his surviving wife, Alte Feiga, held the primary charismatic attention of a significant portion of his followers until her own death in 2001. The Lubavitcher *rebbe*, another brilliant charismatic *tsaddiq*, built a worldwide network of Hasidic institutions and outreach programs. A look at the messianic pretensions of this movement is beyond the scope of this article, but while the deep contemplative traditions of this movement are being cultivated by small numbers of his followers, the recent voluminous publications (many for the first time) of the teachings of the seven *rebbe*s of this dynasty (1777–1992) has led to a renaissance in the learning and teaching of this tradition.

In Israel Rabbi Shalom Noah Barazofsky (1918?–2000) the late *rebbe* of Slonim, had his discourses published in modern vernacular Hebrew. Like Rabbi Tsaddoq haKohen of Lublin, the *Slonimer rebbe*’s teachings addressed the *tsaddiq* potential in all who came to hear him or read his sermons. The *Amshinover rebbe*, Rabbi Yaakov David Milikofsky (b. 1947), is a premier type of charismatic *tsaddiq* in the Preshischa mode. His manner of prayer exemplifies genuine piety, and he is known as an extremely compassionate and astute listener in the private audiences that he freely grants. During the final decades of the twentieth century the charismatic authoritative and intercessory model of the Hasidic *tsaddiq* was widely adopted in the ultra-Orthodox Jewish world at large, both by the anti-Hasidic Lithuanian *mitnagdim* and by the renascent Orthodox communities of Jews originating from Moslem-dominated lands. Due to the unquestioned authority obliged by their homogeneous communities, which in each group results in stable voting patterns, these leaders have been increasingly sought after by politicians, and at times have been instrumental in shaping the balance of power in the larger political arena.

Finally, the twentieth century has also witnessed a surging of secular interest in the Hasidic ethos, thanks to both the person and the writings of Martin Buber (1878–1965), whose collections of Hasidic tales introduced the world at large to the spiritual relevance of this otherwise Jewish sectarian spirituality. In addition, numerous aphorisms as well as whole tracts of Hasidic teachings have been translated into English and other Western languages as of the second half of the twentieth century. The universal and ecumenical potential within Hasidic spirituality was further developed by Rabbi Dr. A. J. Heschel, who produced various academic studies on Hasidic history, the phenomenology of Hasidic piety, and wonder, and who also provided a living example of the religious activist-humanist *tsaddiq*. In the next generation, postmodern New Age spirituality found a Hasidic expression in Rabbi Zalman Schachter Shalomi (b. 1924), a Habad-educated spiritual master whose academic work on the *rebbe*-Hasid personal interview gave rise to a form of counseling that stresses the inner *tsaddiq*. He has continued the ecumenical trend by his intensive interactions with traditional spiritual teachers of non-Western religious traditions, and he champions a cross-cultural creative-Jewish paradigm in collaboration with traditional Hasidic texts. During the last decade of the twentieth century, he and Rabbi Arthur Green (b. 1941) established numerous retreat centers of Jewish contemplation that incorporate elements of Eastern (i.e., Sufi-Hindu-Buddhist) meditative traditions. Together in the late 1960s they began the Hasidic-influenced “conscious community” *havurah* movement in the United States. Rabbi Shlomo Carlebach (1925–1994), a charismatic Hasidic teacher and prolific composer and musician educated in the great traditional academies of Europe and the United States, was Rabbi Schachter-Shalomi’s lifelong partner in ecumenical activity, often providing its ecstatic element. As a teacher, he was largely responsible for the popular renewal of interest in Izbica, Bratslav, and Piasetzna thought, and touched countless lives with his unconditional personal expressions of universal love.

BIBLIOGRAPHY

There is as yet no scholarly history of Hasidic usage of the terms *tsaddiq*, *rebbe*, and *admor*. With regard to teaching with open or closed eyes, see Rabbi Hayim Elazar Shapira’s *Divrei Torah* (Munkacz, 1930; Israel reprint, n.d.), series 3, number 36.

The biblical and rabbinic theology of the *tsaddiq* was analyzed in the classic study by Rudolf Mach, *Der Zaddik in Talmud und Midrasch* (Leiden, 1957), which together with Ephraim E. Urbach’s *The Sages: Their Concepts and Beliefs* (Jerusalem, 1975), pp. 483–511 and elsewhere, formed the basis for the discussion of the classical period in Gershom Scholem’s “*Tsaddik: The Righteous One*” in his *On the Mystical Shape of the Godhead: Basic Concepts in the Kabbalah* (New York,

1991), see pp. 88–140 and 283–293. Scholem’s essay goes on to discuss the early and classical Qabbalah, but then ignores Lurianic Qabbalah and discusses Hasidism. Additional sources come from the excellent collection *Otsar haAgadah*, edited by Moshe David Gross (3 vols., Tel Aviv, 1954; 13th ed., Jerusalem, 1993), see vol. 3, pp. 1032–1057, which adduces over 500 rabbinic quotes regarding the *tsaddiq*; and from the works of Abraham J. Heschel, including *The Prophets* (New York, 1962), see pp. 200–205. *Theology of Ancient Judaism* (New York, 1965, Hebrew), see pp. 200–205. Also see Arthur Green’s “The Zaddiq as *Axis Mundi* in Later Judaism” in *Journal of the American Academy of Religion* 45 (1977): 327–347. Regarding the colloquial use of the term *Hasid* meaning “follower of a particular Hasidic *rebbe*,” the earliest citation found is in a text of Preshischa provenance, *Ramatayim Tsofim* by Shmuel of Shinyava (Warsaw, 1881), see pp. 200–205, based on the teachings of Rabbi Menachem Mendel of Kotzk (1787–1959) recalling events that took place in the 1820s that involved the Kotzker’s teacher, Rabbi Simha Bunim of Preshischa (1765–1827). The history of this usage requires further investigation.

The qabbalistic aspect of the “hidden light” was briefly discussed in Scholem, pp. 113–115, where he adduces the Zohar II, 166b–167a. See Isaiah Tishby’s *The Wisdom of the Zohar: An Anthology of Texts* (Oxford, 1989, vol. 1), p. 442. See also Zohar II 147b and Daniel Abrams’s *The Book Bahir: An Edition Based on the Earliest Manuscripts* (Los Angeles, 1994), numbers 97–100, 106, and related references in Scholem. And see, by Rabbi Azriel of Gerona, *Perush haAgadot*, edited by Isaiah Tishby (Jerusalem, 1945–1983), p. 111, and regarding the theurgic application, see “Principles Concerning the Secrets of Prayer” (Hebrew), included in Scholem’s “Newly Discovered Writings of Rabbi Azriel of Gerona” (Hebrew) in *Festschrift for A. Gulak and Sh. Klein* (Jerusalem, 1942), pp. 214–216, and see Moshe Idel’s “Some Remarks on Ritual and Mysticism in Geronese Kabbalah” in *Journal of Jewish Thought and Philosophy* 3 (1993): pp. 111–130. See also *Sefer haTemunah* (vol. 3 of *Torat haQaneh*, Jerusalem, 1997), pp. 176a–177b. This is to be contrasted with *Ma’arekhet haElohut* (Mantoba, Italy, 1558; reprint, Jerusalem, n.d.), folio 101b–102b; *Gates of Light*, by Rabbi Joseph Gikatilla (translated by Avi Weinstein, New York, 1994), pp. 76 and 327, and *Sefer haPeliab* in volume 1 of *Torat haQaneh*, p. 230a–b. Regarding Rabbi Moshe Cordovero, see Bracha Sack’s *The Kabbalah of R. Moshe Cordovero* (Jerusalem, 1995, Hebrew), p. 323 and sources there; and on his influence on Hasidism, see Moshe Idel’s *Hasidism: Between Ecstasy and Magic* (Albany, N.Y., 1995). With regard to Lurianic Qabbalah, see Menachem Kallus’s *The Theurgy of Prayer in Lurianic Kabbalah* (Ph.D. dissertation, Hebrew University, 2002), chapter 4, sections 12–14, and pp. 281–282; and for his influence on Hasidism, the same source at pp. 280–281, and chapter 3. See also Menachem Kallus’s “The Relation of the Baal Shem Tov to the Practice of Lurianic Kavvanot,” *Kabbalah: Journal for the Study of Jewish Mystical Texts*, vol. 2 (Los Angeles and Jerusalem, 1997), pp. 151–167. As for the *Besht* and the “hidden light,” see *Sefer Baal Shem Tov al haTorah* (ed. Rabbi Nathan Nata of Kalbiel and Shimeon Menachem Mendel of Gowarchov, Lodz, Poland, 1938; reprint, Jerusalem, 1993), vol. 1, “Noah,” p. 107, col. 1 of note number 13, and also p. 14,

number 27 and notes. This is the most complete anthology of the teachings of the Besht, and will be referenced here several times (cited as *Sefer Besht*, followed by volume number, Torah Portion and the number of teaching). A translation of it is due to appear in 2006–2007. Regarding the opinions of medieval philosophers, see Dov Schwartz's *The Philosophy of a Fourteenth Century Jewish NeoPlatonic Circle* (Jerusalem, 1996, Hebrew), pp. 153–208. See also the fascinating monograph by A. J. Heschel, *Prophetic Inspiration After the Prophets: Maimonides and Other Medieval Authorities*, translated and edited by Morris M. Faierstein (Hoboken, N.J., 1996). Returning to Lurianic Qabbalah, see *Sha'ar haYihudim* (Lvov, Ukraine, 1855; reprint, Jerusalem, n.d.), chapters 4 and 5, and see Kallus's dissertation, chapter 4 towards the end of note 357, and section 6 of note 383.

Regarding the levels of the soul and the implications of their perfections, see Menachem Kallus's "Pneumatic Mystical Possession and the Eschatology of the Soul in Lurianic Kabbalah" in *Spirit Possession in Judaism: Cases and Contexts from the Middle Ages to the Present*, edited by Matt Goldish, foreword by Joseph Dan (Detroit, Mich., 2003), pp. 159–184. See also, Gershom Scholem's "Gilgul: The Transmigration of Souls" in his *On the Mystical Shape of the Godhead: Basic Concepts in the Kabbalah* (New York, 1991), pp. 140–197, 300–312. And regarding *tsaddiqim* who have always striven to "unite the part with the whole" and are present in spirit whenever anyone enacts a *yibud*, see the Lurianic *Sha'ar Ruah haQodesh* (Jerusalem, 1912; reprinted 1983), folios 13a and 28a; and *Sha'ar Maamarei Rashby* (Jerusalem, 1898; reprint, 1978), folio 12b–c, and compare *Sefer Besht* vol. 2, Behukotai number 3. On the alignment of the laity to *tsaddiqim*, see *Sefer Besht*, vol. 2, VaEthan number 66, and Ekev numbers 12–15, 30, and 66–70. And see Samuel Dresner's *The Zaddik: The Doctrine of the Zaddik According to the Writings of Rabbi Yaakov Yosef of Polnoy* (New York, 1960), pp. 75–142. Regarding the "descent of the *tsadyq*" and release from hell, see *Zohar* II, 128b–129a and elsewhere, and *Sefer Besht* vol. 1, Bereshit numbers 70–75, Lekh Likha number 19; vol. 2, Ekev number 68 and elsewhere. And see from Rabbi Pinhas of Koretz, *Imrei Pinchas haShalem*, edited by Yehezkiel Shraga Finkel (Bnei Beraq, Israel, 2003), pp. 370, numbers 31–32 and 474, number 72; and see from Rabbi Elimelekh of Lizansk, *Or Elimelekh*, edited by Alter Elisha haKohen Paksher (Jerusalem, 1984), pp. 65–66, number 84, p. 89, number 129, p. 91, number 131, and p. 98, number 148; and from Rabbi Menachem Mendel of Rymanov, *Menachem Tsion*, edited by Tsvi Elimelekh Pannet (Jerusalem, 2004), p. 11, col. b. Regarding previous scholarship on the "descent of the *tsadyq*," see Dresner's *The Zaddik*, chapters 7 and 8; and regarding earlier sources of this doctrine, including Lurianic Qabbalah, and the refutation of Sabbatean influence, see Mendel Piekatz's *The Beginning of Hasidism: Ideological Trends in Derush and Mussar Literature* (Jerusalem, 1978, Hebrew), pp. 280–395. On *Mitnagdic* opposition to Hasidic conceptions of the *tsaddiq*, see Allan Nadler's *The Faith of the Mitnagdim: Rabbinic Responses to Hasidic Rapture* (Baltimore, Md., 1999), chapter 2.

For the sources of the teachings on Moses and the *tsaddiq*, see *Sefer Besht*, vol. 1, Bereshit numbers 121, 127, Noah, numbers 61, 62, 80, 81, 156–158; vaYishlakh, numbers 6–7; vol. 2, Shemot number 19; Ki Tisa number 9; Metzorah numbers 9,

10, 24; Qedoshim numbers 2–18; Qorah numbers 1–5; Ekev number 72, and elsewhere. Regarding the attribute of the *tsaddiq* within the individual, see *Sefer Besht*, vol. 1, Noah, number 2. With regard to the teachings of the Besht on petitionary prayer, see *Sefer Besht*, vol. 1, Noah, numbers 128–129 and 153–155, and on not compromising one's integrity in this, see especially *ibid.* numbers 124 and 152. For the teachings of the *magid* see *ibid.* numbers 80, 84, 87, 89–94, and especially, 130–131. For Rabbi Shneur Zalman's views on prayer, see Roman A. Foxbrunner's *Habad: The Hasidism of R. Shneur Zalman of Lyady* (Montgomery, Ala., 1992), pp. 19–22, 38, and 186–194. Regarding the two types of *tsaddiq* in the works of the *magid*, see *Liquitum Ye-qarim* (Jerusalem, 1974), numbers 256 and 273, and for the version quoted here from the teachings of Rabbi Elimelekh, where the dialectic between the two types is more pronounced, see *Torat Shimeon* by Rabbi Shimeon of Yaroslav, a disciple of Rabbi Elimelekh (Jerusalem, 1974) (beginning of Parshat Emor). On Hasidism during the generation of the *Besht*, see Immanuel Etkes's "Hasidism as a Movement: The First Phase" in *Hasidism: Continuity or Innovation*, edited by Bezalel Safran (Cambridge, Mass., 1988), pp. 1–26. On the teachings of the Besht regarding the role of the "men of form," see Gedalya Nigal's *Manbig vaEdah* (Jerusalem, 1962) and Dresner's *The Zaddik: The Doctrine of the Zaddik According to the Writings of Rabbi Yaakov Yosef of Polnoy* (New York, 1960). The *Epistle of the Besht* was translated into English several times, most recently in the monumental work of translation and commentary by Norman Lamm, *The Religious Thought of the Hasidim: Text and Commentary* (New York, 1999); see there pp. 541–555, and for our text, p. 550. For the textual problems of this epistle, the history of scholarship, and possible resolutions, see I. Etkes's *Ba'al Shem: The Besht—Magic, Mysticism, Leadership* (Jerusalem, 2000), pp. 292–310. On the scholarly controversy concerning early Hasidism and messianism, see Gershom Scholem's "The Neutralization of the Messianic Element in Early Hasidism" in his *The Messianic Idea in Judaism and other Essays on Jewish Spirituality* (New York, 1971), pp. 176–203, and see Ben Zion Dinur's "The Beginnings of Hasidism and its Social and Messianic Foundations" (translated, originally in Hebrew, 1945) in *Essential Papers on Hasidism*, edited by Gershon Hundert, pp. 86–209 (New York, 1991), whose insightful readings regarding the early Hasidic social "program," although attacked ad homonym have not been effectively countered. See also Isaiah Tishby's "The Messianic Idea and Messianic Trends in the Growth of Hasidism" (Hebrew) *Zion* 32, no. 1 (1967): 1–45. Regarding the messianic spark-potential and the emphasis on personal redemption, see *Sefer Besht*, vol. 1, Bereshit number 166 and Shemot number 5; and vol. 2, Nitzavim number 8. As regards Rabbi Menachem Mendel of Vitebsk, see Mordechai Hayim Perlow's *Liquitei Sipurim* (Brooklyn, N.Y., 1992), p. 284, number 8. And regarding Rabbi Menachem Mendel of Rymanov, see *Torat haMagid meZlotchov*, edited by Eliezer Eliyahu Horowitz (Jerusalem, 1999), p. 176, number 6.

On Rabbi Elimelekh of Lizansk, see Nigal's *Mehqarim beHasidut* (Jerusalem, 1999; originally, 1978), pp. 116–233, and the more recent work by Piekatz, "R. Elimelekh miLizansk uMamshichei Darko," *Gil'ad* 15–16 (1998): 42–80, where he also discusses Rabbi Ephrayim of Sydlakov, and the later

development of the school of the Seer. On the Seer of Lublin see Rachel Elior's "Between Yesh and Ayin: The Doctrine of the Zaddik in the Works of Jacob Isaac, the Seer of Lublin" in *Jewish History: Essays in Honour of Chimen Abramsky*, edited by Ada Rapoport-Albert and S. J. Zipperstein (London, 1988), 393–455. Regarding the easier availability of access to *Ruah haQodesh* in the exile, see *Sefer Besht*, vol. 1, VaYeshev number 4 and note 5. On Munkasz Hasidism, see Efraim Gottlieb's *Studies in the Kabbalah Literature*, edited by Joseph Hacker (Tel Aviv, 1976), pp. 584–586. For the techniques of and variety of Hasidic opinion on the "raising-up of distracted thought," see *Sefer Besht*, vol. 1, Noah numbers 97–124, and especially note 94 (pp. 152–155) for the range of third- to fifth-generation Hasidic opinion. This matter seems to be a litmus test with regard to the contrast between social realism and antileitist idealism in the development of Hasidic thought and its relation to the original democratizing impulse (see Scholem's "Devekut, or Communion with God" in his *The Messianic Idea in Judaism and other Essays on Jewish Spirituality*, pp. 208–226). Regarding the *Habad- Besht* tradition concerning the nature of the soul in later generations, see Rabbi Aaron of Staroselye's *Shaarei haYichud vihaEmunah* (Jerusalem, 1966), folio 3b, marginal note. On this important mystical thinker see Louis Jacobs, translator, *Tract on Ecstasy* (London, 1963) and Rachel Elior's *Paradoxical Ascent to God* (Albany, N.Y., 1993).

Regarding the Hasidic "revolt" of Preshischa, see A. J. Heschel's *Kotzk: The Struggle for Integrity*, 2 volumes (Tel Aviv, 1963), see vol. 1, pp. 285–320 and 388–370; Morris Faienstein's *All Is in the Hands of Heaven: The Teachings of R. Mordechai Joseph of Izbica* (Hoboken, N.J., 1989); Shaul Magid's *Hasidism on the Margin: Reconciliation, Antinomianism, and Mysticism in Izbica/Radzin Hasidism* (Madison, Wis., 2003); and for later developments, see Arthur Green's *The Language of Truth: The Torah Commentary of the Sefut Emet* (Philadelphia, 1998), especially his introduction, and Alan Brill's *Thinking God: The Mysticism of Rabbi Zaddok of Lublin* (New York, 2002). On women and Hasidism, see Harry M. Rabinowicz's *Hasidism: The Movement and its Masters* (Northvale, N.J., and London, 1988), 341–351; Nehemia Polen's *The Rebbe's Daughter: Memoir of a Hasidic Childhood/Malka Shapiro* (Philadelphia, 2002) and Nathaniel Deutsch's *The Maiden of Ludmir: A Holy Jewish Woman and Her World* (Berkeley, Calif., 2003); and for a contrary view, see Ada Rapoport-Albert's "On Women and Hasidism: S.A. Horodecky and the Maid of Ludmir" in *Jewish History: Essays in Honour of Chimen Abramsky*, edited by Ada Rapoport-Albert and S. J. Zipperstein (London, 1988), pp. 45–525. On the early anti-Hasidic slander (Vienna, 1819) by the *Maskilim*, see Dov Taylor (ed. and tr.), *Joseph Perl's "Revealer of Secrets": The First Hebrew Novel* (Boulder, Colo., 1997), and see Heinrich Graetz's *A History of the Jews* (Philadelphia, 1967), volumes 4 and 5 regarding his bias against Qabbalah and Hasidism. For a more recent treatment, see Raphael Mahler's *Hasidism and the Jewish Enlightenment: Their Confrontation in Galicia and Poland in the First Half of the Nineteenth Century*, translated from the Yiddish by Eugene Orenstein (Philadelphia, 1985), and see Israel Bartal's "The Imprint of Haskalah Literature on the Historiography" in *Hasidism Reappraised*, edited by Ada Rapoport-Albert (London, 1996). On the development of Polish-Hasidic political

parties, see Alan L. Mittleman's *The Politics of Torah: The Jewish Political Tradition and the Founding of Agudat Israel* (Albany, N.Y., 1996). On decadent forms of Hasidism, see Mendel Piekartz's "Religious Spiritualism against Zionism and Determinist Elitism: Lessons from the Discourses of the *Admor of Partzava* (1866–1930)" in *Hasidism in Poland*, edited by I. Bartal, Rabbi Elior, and C. Shmeruk (Jerusalem, 1994), and his earlier book, *Ideological Trends of Hasidism in Poland during the Interwar Period and the Holocaust* (Jerusalem, 1990). On the early life of Rabbi Dr. A. J. Heschel, see *Abraham Joshua Heschel: Prophetic Witness* by Edward K. Kaplan and Samuel H. Dresner (New Haven, Conn., 1998), and on the seventh Lubavitcher rebbe, see *Larger Than Life: The Life and Times of the Lubavitcher Rebbe, Rabbi Menachem Mendel Schneerson* by Shaul Shimeon Deutsch (New York, vol. 1 1995, vol. 2 1997). Although written by a follower of the late Lubavitcher rebbe, this work is an honest attempt at critical biography. For other examples of this trend, see Hillel Goldberg's *Between Berlin and Slobodka: Jewish Transition Figures from Eastern Europe* (Hoboken, N.J., 1989). Much has been written on Rabbi A. I. Kook. For some translations of his writings, see *The Essential Writings of Rabbi Abraham Isaac Kook*, translated with introduction by Ben Zion Bokser (Amity, N.Y., 1988), and *When God Becomes History: Historical Essays by Rabbi Abraham Isaac Hakohen Kook*, edited and translated with introduction and notes by Bezalel Naor (New York, 2003); and see *Rabbi Abraham Isaac Kook and Jewish Spirituality* by Lawrence Kaplan and David Shatz (New York, 1995). On Hasidic thought during the Holocaust, and on Rabbi Kalonymus of Piasetzna, see Nehemia Polen's, *The Holy Fire: The Teachings of Rabbi Kalonymus Kalman Shapira, the Rebbe of the Warsaw Ghetto* (Northvale, N.J., 1994). Three of his works on educational philosophy were translated: *A Student's Obligation: Advice from the rebbe of the Warsaw Ghetto* (tr. Micha Odenheimer; Northvale, N.J., 1991); *To Heal the Soul: The Spiritual Journal of a Chassidic rebbe* (tr. Yehoshua Starrett; Northvale, N.J., 1995) and *Conscious Community: A Guide to Inner Work* (tr. Andrea Cohen-Keiner; J. Aronson, N.J., 1996). See also regarding him, and on Rabbi E. Teichtal: Mendel Piekartz op. cit. (Jerusalem, 1990), and Eliezer Schweid: *Wrestling Until Day-Break: Searching for Meaning in the Thinking on the Holocaust* (Lanham, Md., 1994); idem. *From Ruin to Salvation* (Hebrew) (Hakibbutz Hameuchad, Israel, 1994).

Regarding Satmar, see Israel J. Rubin: *Satmar: Two Generations of an Urban Island* (New York, 1997) The Hasidic classic, *Toldot Yaakov Yosef* by Rabbi Y.Y. of Polnoye (originally published in Koretz, 1780) was published by Rabbi Shimeon Weiss, a *Hasid* of Satmar in a five volume edition with extensive commentary (Monroe, N.Y., 1998). The anthologized teachings of Rabbi Pinchas of Koretz and Rabbi Michael of Zlochov are referenced above, in sections 3 and 4. And see A.J. Heschel: *The Circle of the Baal Shem Tov* (ed. S. Dresner; University of Chicago Press, 1985) for monographs on these and other members of this circle. There have not yet been any studies on the *rebbe*s of Slonim and Amshinov. For a perspective on the political life of Post-Holocaust ultra-Orthodox society, see: "Religious Fundamentalism and Religious Jews: The Case of the Haredim" by Samuel C. Heilman and Menachem Friedman, in *Fundamentalisms*

Observed (ed. Martin E. Marty and Rabbi Scott Appleby; Chicago, 1991; pp. 197–264). Some of Martin Buber's voluminous writings bear directly on Hasidism, such as his classic: *Tales of the Hasidim* (translated by Olga Marx; Schocken, N.Y., 1947 and 1991) and his novel based on the dramas of the circle of the Seer of Lublin: *For the Sake of Heaven* (Schocken, N.Y., 1945). Regarding Heschel, see also *The Earth is the Lord's* (London, 1945; reprint, Jewish Lights, Woodstock, N.Y., 1995); *God in Search of Man* (New York, 1955); and a posthumous collection of his essays: *Moral Grandeur and Spiritual Audacity* (edited by Susannah Heschel, New York, 1996). Some of Rabbi Zalman Meshulam Schachter-Shalomi's books include: *Spiritual Intimacy: A Study of Counseling in Hasidism* (Northvale, N.J., 1991); *Paradigm Shift: From the Jewish Renewal Teachings of Reb Zalman Schachter-Shalomi* (Northvale, N.J., 1993) and *Wrapped in a Holy Flame: Teachings and Tales of the Hasidic Masters*, edited by Nataniel M. Miles-Yepes (San Francisco, 2003). Also see Jacob Yuroh Teshima's *Zen Buddhism and Hasidism: A Comparative Study* (Lanham, Md., 1995). On Rabbi Shlomo Carlebach, see, by Meshulam Brandwein, *Reb Shlomele: The Life and Work of Shlomo Carlebach*, translated by Gavriel A. Sivan (Jerusalem, 1997), and Yitta Halberstam-Mandelbaum's *Holy Brother: Inspiring Stories and Enchanted Tales about R. Shlomo Carlebach* (Northvale, N.J., 1997).

MENACHEM KALLUS (2005)

TS'AO TAI SEE CAO DAI

TSEVI, SHABBETAI SEE SHABBETAI TSEVI

TSONG KHA PA (1357–1419) is the founder of the Dga' ldan pa (Gandenba) or Dge lugs pa (Gelugba) school of Tibetan Buddhism. His official, monastic name was Blo bzang grags pa, but he is more typically known in the Dge lugs pa tradition under the honorific titles of Rje rin po che (Precious Lord) and Jam dgon bla ma (Lama who is the Protector Mañjuśrī). Tsong kha pa lived during a period of Tibetan history in which large portions of the country had been unified under a central authority. It was a time of great religious efflorescence, brought about in large part by the high level of political stability that the country enjoyed.

TSONG KHA PA'S LIFE. Tsong kha pa was born in the Tsong kha region of A mdo in Eastern Tibet. Hagiographical accounts tell us that Tsong kha pa's birth was prophesied by the twelfth abbot of Snar thang monastery, Blo bzang grags pa (1299–1375), who told his student Chos rje don grub rin chen (1309–1375) to find the boy and give him his own name. His birth was augured by all of the traditional auspicious signs. Chos rje Don grub rin chen traveled back from Central Tibet to his home region of A mdo, recognized the young boy, and took him under his tutelage. Tsong kha pa took lay vows at the age of three from the Karma pa Rol pa'i rdo rje (1340–1383), and novice (*dge tshul*) ordination from

Don drup rin chen at the age of seven. He spent the next decade or so receiving tantric initiations and teachings, and learning Buddhist doctrine. When he was sixteen or seventeen, following the advice of his teacher, he traveled to Central Tibet.

Central/Western (Dbus Gtsang) Tibet was the intellectual center of the country at this time. Tsong kha pa studied at many of the great monastic academies of the day, gaining expertise in all of the major texts and subjects of the Indian Buddhist scholastic tradition. In 1381 Tsong kha pa took full monastic (*dge slong*) ordination. He then began to focus more intentionally on the esoteric teachings of Tantra. It was during this period that he also met one of his major teachers, Bla ma Dbu ma pa (fourteenth century), a mystic and visionary, and a specialist on the practices of the deity Mañjuśrī, who, it was said, spoke to Tsong kha pa through Bla ma Dbu ma pa, answering his questions about the doctrine of emptiness.

Although Tsong kha pa studied with many teachers from all of the major schools of Tibetan Buddhism, it was the great Sa skya pa scholar Red mda' ba Zhon nu blo gros (1349–1412) whom Tsong kha pa would come to regard as his chief spiritual master. He studied with Red mda' ba extensively during this period, but eventually Red mda' ba and Tsong kha pa would become each other's teacher, spending a great deal of time together both teaching and in retreat.

By the early 1390s Tsong kha pa had completed his philosophical studies, and he had established his abilities and reputation as a scholar by engaging in the so-called monastic rounds (*grwa skor*), the practice of submitting to public examinations at various institutions. He continued to take teachings and initiations from various masters during this next phase of his life, receiving many lineages that would be important to the later Dge lugs order. But what really characterized this phase of Tsong kha pa's life was an emphasis on practice, teaching, and writing. For the next decade, he would alternate periods of teaching and learning with periods of retreat, all the while dedicating himself to "composition."

Tsong kha pa was also gathering disciples. One close group of students, the so-called eightfold pure retinue, accompanied him into a four-year intensive retreat at 'Ol kha, during which Tsong kha pa and his students had many visions of various deities. Visionary experiences, both in waking life and in dreams, had been a part of Tsong kha pa's life from his youth, but they became more frequent during this time, and would continue for the rest of his life. Especially important are a series of visions he had of Indian and Tibetan saints that were seen by Tsong kha pa (and by the later Dge lugs tradition) as legitimating his unique interpretation of the doctrine of emptiness.

Tsong kha pa had already begun to write before this period, but it was really during and after his time in intensive retreat that he wrote some of his most important philosophi-

cal and tantric works. In 1408 the Ming emperor invited Tsong kha pa to the Chinese court, but he declined, sending a close disciple in his stead. Clearly, Tsong kha pa thought that he still had much to accomplish in his native land.

In 1408, with the help of two patrons, Tsong kha pa founded the tradition of the Great Prayer Festival (Smon lam chen mo) in Lhasa, a New Year festival where the focus was on making offerings, both to the assembled clergy and to the image of the Jo bo rin po che (Tibet's most famous Buddha statue). This tradition would become one of Tibet's most important festivals, observed until the final Chinese takeover of Tibet in 1959. It also marks a turning point in Tsong kha pa's life, initiating a period of more public engagement, and one of greater concern with the institutionalization of his tradition.

The spectacle of the Great Prayer Festival brought even greater prominence to Tsong kha pa. With the help of patrons, he founded in 1409 the monastery of Dga' ldan, an institution that would become his principal seat (and that of his successors). He remained chiefly at Dga' ldan, giving extensive teachings and composing principally tantric works from 1410 until 1416. The monasteries of 'Bras spungs and Sera, the other two "seats" (*gdan sa*) of the Dge lugs pa school, were founded by two of Tsong kha pa's disciples in 1416 and 1419, respectively. In 1419 Tsong kha pa took ill. He passed away at Dga' ldan on the twenty-fifth day of the tenth Tibetan month. His body was preserved there in a golden reliquary, where it remained for over five hundred years until the monastery was bombed (and his tomb sacked) by Chinese troops.

TSONG KHA PA'S THOUGHT. Tsong kha pa believed himself to be following an intellectual and spiritual trajectory that extended from the Buddha, through the great scholar-adepts of India and Tibet, up to his own time. Whether or not he saw himself as actually reviving the Bka' gdams pa tradition, founded almost half a millennium earlier by the Indian scholar-saint Atiśa, Tsong kha pa's early followers came to refer to themselves as the "New Bka' gdams pa."

Conservative in his approach, Tsong kha pa believed that the great texts of Indian Buddhism were the standard by comparison to which the authenticity of doctrines and practices was to be judged. Bemoaning the fact that in his day "those who strive at yogic practice have studied little, while the learned are uninformed about the details of practice," Tsong kha pa sought to steer the tradition back to its Indian roots, grounding yogic practice in textual learning and philosophical analysis. He believed that the essence of Buddhism was not preserved in secret, oral lineages (*man ngag*), but that it was instead publicly accessible in the writings of the Indian Buddhist masters. His written work, therefore, can be seen as an attempt to critically reappropriate the Indian classics, and to show their relevance to practice.

His writings are holistic and synthetic, characterized by the impulse to harmonize all of the Buddha's teachings into

a consistent whole. He especially sought to do this in his *summa*. His *Great Exposition of the Stages of the Path* (*Lam rim chen mo*) and his *Great Exposition of the Stages of Tantra* (*Sngags rim chen mo*) are erudite, grand syntheses of exoteric and esoteric Buddhism that offer the reader complete maps of these traditions. His *Essence of Eloquence* (*Legs bshad snying po*) attempts to reconcile the apparent contradictions in the Mahāyāna philosophical corpus through the hermeneutical distinction between the provisional (*drang ba'i*) and definitive (*nges pa'i*) meaning of texts. Tsong kha pa devoted many of his works to the interpretation of emptiness. Candrakīrti's (seventh century) interpretation of emptiness—called the Consequentialist, or Prāsāngika (*thal 'gyur pa*), interpretation—was for Tsong kha pa the highest expression of the Buddha's philosophical view (*lta ba*). Tsong kha pa saw emptiness as a corollary of the Buddhist doctrine of dependent arising (*rtan 'brel*), and this became a hallmark of his analysis of "Middle Way" (Madhyamaka) philosophy. All told, Tsong kha pa's collected works comprise about seventeen volumes.

As is obvious from Tsong kha pa's own life, study, learning, and theory was only part of the equation. Equally important was practice. As he states in a letter:

Over many years I strove to understand the meaning of the [texts]. Based on that [understanding], and taking as the basis [for practice] the safeguarding of the moral discipline to which I had committed myself, I practiced many forms of accumulating [merit] and purifying [sin] [*bsag sbyang*], and devoted myself to the cultivation of the various meditational objects that constitute the path in its entirety. With this as the cause, I was able to achieve insight into at least the rough features of the path of Sūtra and Tantra.

Following in the footsteps of the Bka' gdams pa masters, Tsong kha pa believed that moral discipline (*tsul khrims*), epitomized by the monk's life, was the basis for the practice of both the sūtra and the tantric paths. The later tradition maintains that so crucial was the practice of monasticism to him that he eschewed taking a consort—and thereby postponed his own enlightenment until the after-death, intermediate stage—so as to teach to his followers the importance of celibacy.

THE CULT OF TSONG KHA PA. Like many Tibetan masters of his day, Tsong kha pa came to be considered an emanation (*sprul pa*) of a specific deity: in his case, Mañjuśrī, the deity of wisdom. Iconographically, Tsong kha pa is most often represented as a monk wearing a pandit's hat, with a text emanating from his left shoulder and a blazing sword (the symbol of Mañjuśrī) from his right shoulder. Tsong kha pa's apotheosis is celebrated in a variety of rites, arguably the most famous of which is a visualization/recitation practice called "The Hundred Deities of Dga' ldan" (*Dga' ldan lha rgya ma*), that concludes with the recitation of a verse of homage to Tsong kha pa called "The Object[less] Compassion [Verse]" (*dmigs rtsa ma*). The mantra-like "accumulation" (or repetition) of the verse is a common practice, and is touted as effi-

acious in everything from curing illness to achieving enlightenment.

The cult of Tsong kha pa has taken more popular forms as well. Pilgrimage to Dga' ldan monastery (and to his tomb) has always been a favorite practice among the laity and clergy alike. Devotees circumambulate the monastery, prostrate before his tomb, and collect small pieces of dough that have been molded (and thereby blessed) by coming into contact with a relic of Tsong kha pa's tooth. Finally, Tsong kha pa's death date is celebrated throughout Tibet in the religious festival called the "Dga' ldan Offering of the [Twenty] Fifth" (*Dga' ldan lnga mchod*), which culminates in offerings of butter lamps after nightfall. On this occasion, during a midwinter's night, entire monasteries become filled with the flickering of butter lamps, making it one of the most beautiful events in the Tibetan liturgical calendar.

BIBLIOGRAPHY

Various Tibetan-language editions of Tsong kha pa's collected works (*gSungs 'bum*) have been preserved and published in India, China, and Japan. These remain the standard references for his life and thought. In European languages, on Tsong kha pa's life, see Rudolf Kaschewsky, *Das Leben des lamaistischen heiligen Tsongkhapa bLo-bzan-grags-pa (1357–1419), Dargestellt und erläutert anhand seiner Vita: "Quellort allen Glückes"* (Wiesbaden, 1971), 2 vols; and Robert A. F. Thurman, ed., *The Life and Teachings of Tsong khapa* (Dharamasala, India, 1982). The latter work also contains translations of some of Tsong kha pa's minor works. The last two decades have seen the translation of some of Tsong kha pa's major works. The *Lam rim chen mo*, arguably his most important work, has now been translated as *The Great Treatise on the Stages of the Path to Enlightenment: Lam rim chen mo* by Joshua Cutler, Guy Newland, et al. (Ithaca, N.Y., 2000–2003), 3 vols. *Tsong Khapa's Speech of Gold in the Essence of True Eloquence*, translated by Robert A. F. Thurman (Princeton, 1984), is a translation of Tsong kha pa's *Legs bshad snying po*; this work has also partially been translated in Jeffrey Hopkins's *Emptiness in the Mind-Only School of Buddhism* (Berkeley, 1999). *Tantra in Tibet* and *Deity Yoga* (both Ithaca, N.Y., 1987) are translations by Jeffrey Hopkins of portions of the *Sngags rim chen mo*, with the commentary of the Dalai Lama. *Tsong kha pa's Six Yogas of Naropa* (Ithaca, N.Y., 1997) is Glenn Mullins's translation of the *Yid byes gsum ldan*, Tsong kha pa's main work on this subject. Tsong kha pa's *Dbu ma dgongs pa rab gsal*, his commentary to Candrakīrti's *Madhyamakāvatāra*, has been partially translated by Jeffrey Hopkins in *Compassion in Tibetan Buddhism* (Ithaca, N.Y., 1980), and by Jeffrey Hopkins and Anne Klein in *Path to the Middle* (Albany, N.Y., 1994).

TSUNG-MI SEE ZONGMI

TSWANA RELIGION. Traditional religion among the Tswana of the high veld of southern Africa centered upon the supreme being, Modimo, and ancestor spirits known as *badimo*. The fact that *badimo* is the plural form of *modimo*, an honorific term used to express awe and reverence toward elders as well as toward the supreme being, indicates that the difference between Modimo, the ancestors, and human beings is one of degree rather than kind. While they occupy different positions in a complex hierarchy of spiritual power, all beings—whether spiritual or human—are intimately connected with each other. As the Tswana Christian theologian Gabriel Setiloane indicates, it is a basic premise of Tswana thought that a representative is identical with the person being represented or that a symbol is that which it symbolizes. Hence, the Tswana say, "Motho ke modimo" ("Man is *modimo*"), something that implies a far greater degree of interaction than the English "There is something of the divine in every man" (Setiloane, 1976, p. 21).

Modimo is believed to be the source and root of all existence. Intangible and all-pervasive, irreparably part of human experience but not directly sensed, he is a source of appeal in times of affliction and the guardian of the moral order. The complexity of the Tswana concept of the supreme being is best indicated by the wide range of praise names that are used to characterize him. Modimo is *mme* ("mother") and *lesedi* ("light"), but he is also known as *selo* ("monster") insofar as he possesses dangerous powers that go far beyond those of normal humanity.

Because a person cannot come into direct contact with Modimo and remain unchanged, the Tswana have recourse to the *badimo*, ancestors who act as intermediaries between humanity and the supreme being. Closely involved in everyday life, the *badimo* function to preserve harmony in social relations and to ensure the fertility of humans, animals, and crops. Their attitude toward humans is basically parental—looking to the welfare of the community as a whole, they seek to correct faults and protect their descendants from harm. In return, they expect *tirelo* ("service"). The essence of *tirelo* is the sharing of benefits with others. The *badimo* are said to love company and are especially gladdened by feasts. Whenever food or beer is prepared, a portion is set aside or poured on the ground for the *badimo*. This is done to maintain their good favor, for without it, life cannot be kept in proper balance and lived to the full. When an individual has neglected to honor the *badimo*, the Tswana say that he suffers from *bolwetse*, a term that covers both physical illness and a range of other maladies. Principally, it indicates that an individual is in disharmony with the spiritual forces (including Modimo) that engender and sustain his existence.

The concern for the community as a whole that is a central part of Tswana religion is expressed in the Tswana theory of human personality, or *seriti* (pl., *diriti*). Each person is born with a "heavy" or "light" *seriti* that can act for evil or for good. If a child is born with a light *seriti*, it must be strengthened and imbued with good intentions. Healthy *seri-*

ti brings dignity, respect, and propriety; bad *seriti* causes ill will and discord in the social realm. A father of a household or a chief with good *seriti* strengthens the *diriti* of those who live in the house or chieftdom and vice versa. Because a man's *seriti* pervades much of his world, if he does wrong, his children, crops, or animals may suffer. Also, insofar as *seriti* originates from the *badimo* and is upheld by them, it functions as a spiritual force that knits together social and spiritual relations.

In times of suffering, people have access to religious specialists, or "doctors," known as *dingaka* (sg., *ngaka*). Both men and women can become doctors. There are six kinds of doctors in Tswana society, each classified according to the various divinatory and medicinal skills that he or she possesses. The best known, however, are the "horned" and the "hornless" doctors. The horned doctors divine by interpreting the pattern created by the throwing of four tablets, which represent an older and younger male and an older and younger female, or of pairs of astragalus bones, which represent the male and female of every common animal species. The hornless doctors divine by examining the patient. There are few doctors today and their practices, though still common, are officially illegal.

Human suffering is largely caused by incurring the displeasure of the *badimo* or by the actions of sorcerers. The complex Tswana term *boloi*, often translated as "sorcery" or as "magic," refers to both of these occurrences. There are two kinds of *boloi* that are socially constructive: *boloi* of the heart and of the mouth. Both involve offenses against a senior member of the kin group. If the senior member is slighted in some way, it is believed that he "puts the *badimo*" on the offender. The senior member need not be conscious of ill will toward the offender. In response to the offense, the *badimo* withdraw their support from the offender's *seriti* in order to call attention to his fault, and he is then susceptible to disease and other malign influences. Because of the encompassing nature of his *seriti*, much of his world is similarly threatened. In order to restore proper relations within the community (which includes the *badimo*), the offender provides an animal for slaughter; after it has been killed, the senior member uses a mixture of chyme and aloe to "wash" the offender and strengthen his *seriti*.

Two other types of *boloi* exist that are unquestionably evil. *Boloi ba bosigo* ("night sorcery"), which seems to be a form of witchcraft rather than sorcery, refers to the belief that certain witches (usually elderly women working in covens) cavort at night and cause mischief. Essentially tricksters, such witches gather naked, enter houses through closed doors and windows, upset pots, suck milk from nursing mothers or cows so that their yield is insufficient, exhume new corpses, and use owls as sentinels and hyenas as steeds. Day sorcery (*boloi ba motshegare*) is much more serious. It involves the purposeful manipulation of material substances for evil ends—usually to inflict disease or death upon a particular individual. Sorcerer and victim are often close relatives, such

as husband and wife, parent and child, or brother and brother, who are overcome by feelings of greed, envy, or vengeance. *Bongaka*, therapy performed by the various *dingaka*, is essential to the prevention of sorcery.

Contemporary Tswana religion can only be explained in light of the tragic history of the people since the beginning of the nineteenth century. The impact of Western civilization coincided with the beginning of the nineteenth century, and chaos reigned in Tswanaaland from 1810 until 1840. The first Christian mission was established in 1816 and four others were set up in the next thirty years; by 1870, missions had spread throughout Tswanaaland. The dispersal of Tswana groups—both by the onslaught of marauding refugees resulting from the Zulu expansion known as the Mfecane and by the Boers, who took Tswana lands and subjected the people to forced labor—greatly weakened orthodox religious practices. The Boers drove the Tswana into reserve pockets of land in the Transvaal, the northern Cape of Good Hope, the Orange Free State, and the territory that became the Botswana state. Here, the remnants of once cohesive groups recombined into artificial units.

The Tswana have therefore been subjected to a great deal of pressure and turmoil inimical and destructive to their own religion. The official religion of most Tswana groups is now Christianity. Although the public rituals of the indigenous religion are seldom encountered, the more private and individualized practices of witchcraft, sorcery, and traditional healing persist strongly, even among Christians. The relationship between old and new beliefs is complex; much more of the former may remain than meets the eye. As Setiloane points out, many zealous and longstanding Christians have never given up the old worldview but have instead fitted Christianity into it. A number of traditional religious skills and rituals, including *pha badimo*, a thanksgiving ritual that is performed to show gratitude to the *badimo*, continue to play an important role in Tswana Christianity. The new social, political, and economic order brought about by the colonial system had more impact in christianizing the Tswana than the missionaries' religious teaching, which was too blatantly contradicted by the harsh oppression and racism of southern Africa to carry conviction.

The fundamental belief in the supreme being and the *badimo* continues to inform convictions about the earth and home as sacred and holy as well as attitudes toward cattle, which still have strong emotional, religious, and practical value, for they form the basis of important transactions between Tswana. Such exchanges continue to provide a binding conception of marriage, paternity, kinship, and family bonds that Christianity cannot replace. Initiation ceremonies, with their acutely emotional and religious accompaniments, also retain central and unassailable roles, as they induct the young into the profound continuities and solidarities of community life, earth, kin, and cattle. These values can still give a fundamental sense of psychological security, personal adequacy, and proper place in the cosmic

scheme of things, and they function as an anchor in the stormy upheavals that afflict the Tswana in southern Africa in the early twenty-first century.

AIDAN SOUTHALL (1987)
Revised Bibliography

TUATHA DÉ DANANN. The Tuatha Dé Danann are the gods of pagan Ireland whose social order reflects the structure and values of early Irish society and includes poets and storytellers, kings and warriors, and practitioners of other professions and crafts. The name Tuatha Dé Danann (The Tribes or Peoples of the Goddess Danu) may originally have been simply Tuatha Dé—meaning simply the Tribes or Peoples of the Gods or of the Goddess—with Danann a later addition. Both Danu (genitive, Danann) and Anu are identified as personal names of the goddess of warfare and destruction known as the Morríghan (Great Queen or Phantom Queen), wife to Eochaidh Ollathair (Great Father), also called the Daghdha (Good God). Danu may, however, once have been a separate figure, parallel to the Welsh Dôn and Indic Danu, mother of the gods. The Tuatha Dé Danann war against and intermarry with the Fomhoire, a supernatural people associated with the sea, much as the Indic Devas and Asuras are both foes and kin.

Sources for information about the Tuatha Dé Danann include *Leabhar Gabhála Éireann* (The book of the taking of Ireland), a compendium of medieval prose and poetry associating legendary settlements of pre-Christian Ireland with classical and biblical chronology and presenting the gods as mortals descended from Noah. Additional sources, in which the Tuatha Dé are often explicitly called gods and goddesses, include texts whose language often reflects many chronological layers, some as early as the eighth century. These sources, including mythic and epic narratives, glossaries, and place-name lore, show elaboration and reshaping in response to cultural and political changes including those arising through Viking and Norman influences.

THE BATTLES OF MAGH TUIREDH. In the pseudo-historical framework of *Leabhar Gabhála Éireann* the Tuatha Dé are the fifth group to invade Ireland, conquering the previous settlers in the First Battle of Magh Tuiredh. After losing an arm in that combat, the Tuatha Dé king Nuadhu (subsequently called "Silverhand" for his artificial silver arm) resigns the kingship. The Tuatha Dé form an alliance with the Fomhoire, and Nuadhu's successor is the half-Fomorian, Bres, whose rule proves oppressive. After Bres flees to his Fomhorian kinsmen for reinforcements, Nuadhu (his natural arm miraculously reattached) is reinstated and invites Lugh, who is skilled in every art, to prepare the Tuatha Dé for war. Lugh's strategies are successful, and against great odds the Fomhoire are defeated in the Second Battle of Magh Tuiredh.

The subsequent treaty brings the Tuatha Dé specialized knowledge about agriculture, offered by Bres in exchange for his life and the end of Fomhorian aggression. After a long and peaceful rule, the Tuatha Dé are defeated by the Sons of Míl, legendary ancestors of Ireland's present inhabitants. The Tuatha Dé Danann retreat into Ireland's lakes and hills and into pre-Celtic sacred mounds, such as Newgrange, and their association with magical underground dwellings (*sidhe*) survives in beliefs about the fairies of later folk tradition. The Sons of Míl receive sovereignty over the surface of the land after promising that Ireland will continue to bear the names of three territorial goddesses, including Ériu (hence the name Erin).

FUNDAMENTAL CHARACTERISTICS. The Second Battle of Magh Tuiredh reveals fundamental characteristics of leading members of the Tuatha Dé when Lugh, practitioner of all the arts, asks how each will help defeat the Fomhoire. As a royal surrogate, whose many arts give him a rank equal to that of a king, Lugh both coordinates the preparation for battle and leads the Tuatha Dé to victory after Nuadhu is slain. Oghma, the strongman and champion, brings prowess as a warrior. Dian Cécht, grandfather of Lugh, serves as physician to the wounded. Goibhniu ("Smith") manufactures swords and spears. Eochaidh Ollathair, the "god of druidry," is a figure of extreme sexual potency (symbolized by his three testicles) and is known for his great strength, skill with a club as well as a sword, and mastery of magical arts. Morríghan, the goddess of battle who can take the form of a crow, determines the outcome of battles and can ensure victory through verbal magic. Other Tuatha Dé women appear as experts in magical practice, in the arts of warfare, in healing, and as artisans. Lugh's muster includes many other major and minor deities, some with highly specialized skills, facilitating comparisons with other Indo-European divine societies.

Tales about the gods illustrate early Irish social institutions and beliefs and were sometimes used as leading cases in native Irish law. Members of the Tuatha Dé Danann are cited as sources of specialized professional knowledge and are recognized as initiators of cultural practices. The Daghdha's daughter Brigh (Brighid), for example, is identified as the

first to keen (lament the dead) in Ireland when she mourns her son who was slain in battle. This goddess, whose name is linked to healing and smith craft as well as to poetry, is also associated with domestic animals, and the folk practices connected to the cult of Saint Brigid may reflect early beliefs about Brigh's influence over crops and herds. Her husband, Bres, is associated with agricultural and pastoral prosperity. Laws addressing legal liabilities for illness and injury are attributed to Dian Cécht, who is invoked in early healing charms; his daughter, Airmedh, was reportedly the first to recognize all healing properties of herbs. Lost laws associated with smith work and other crafts are attributed to Goibhniu and other craftsperson deities.

KINGS AND GODDESSES. Sovereignty, a key theme in mythic and epic tales involving the Tuatha Dé, is often represented by the relationship between the king (divine or human) and the goddess of the land he rules. Many women of the Tuatha Dé serve as goddesses of territorial sovereignty and are associated with sacred wells and rivers and with the land of Ireland itself. Tales surrounding Édaín, who becomes the wife of Midhir of Brí Léith, explore aspects of kingship and the necessary presence of the queen—whether she is seen as divine or as a symbol of the sovereignty of the land. Midhir woos Édaín through several reincarnations and finally reclaims her from her mortal spouse Eochaidh Airemh, king of Ireland. Interaction between the gods and human society often occurs when sovereignty is in jeopardy. For example, in the tragic destruction of Conaire Mór, a king descended from Édaín, the people of the *sidhe* surround him at the time of his death.

Far-reaching and ahead of its time, this work explores the range of Celtic mythic tradition in the Indo-European context, including references to the work of Georges Dumézil, with exhaustive notes that provide access to both specialist studies and more general works.

ELIZABETH A. GRAY (2005)

TUCCI, GIUSEPPE (1894–1984), Italian scholar of Asian religions. Giuseppe Tucci was born in Macerata in the Marche region of Italy on June 5, 1894, and died on April 5, 1984, in his house in San Polo dei Cavalieri, near Tivoli, in the province of Rome. Tucci fought during World War I, and after the war he graduated from the University of Rome (1919). From 1925 to 1930 he resided in India, teaching Chinese and Italian at the universities of Santiniketan and Calcutta. In 1929 Tucci was elected to the Accademia d'Italia, and in 1930 he accepted the chair of the department of Chinese language and literature at the Istituto Universitario Orientale of Naples. He then accepted the chair of the department of religion and philosophy of India and the Far East at the University of Rome (1932), where he remained until his retirement in 1969.

In 1933 he was instrumental in the founding of the Istituto Italiano per il Medio ed Estremo Oriente (IsMEO), the first president of which was Tucci's colleague and friend Giovanni Gentile. Tucci himself was president of the institute from 1947 to 1978; from 1979 he was its honorary president.

He was the editor of several periodicals, including *Alle fonti delle religioni* from 1921 to 1924, *Bollettino dell'IsMEO* (which became *Asiatica* in 1935) from 1933 to 1943, *Le scienze del mistero e il mistero delle scienze* in 1946, and *East and West* from 1950 to 1984. He founded many series of scholarly publications of the IsMEO, such as the "Serie Orientale Roma" (the first fifty-two volumes of which he edited) in 1950, "Reports and Memoirs" (documenting research) in 1962, and "Restoration" in 1969. From 1950 to 1973 he directed the series "Il nuovo Ramusio," published by the Libreria dello Stato. He edited many other works meant to diffuse and popularize knowledge about Asian civilizations.

Tucci's scholarly research was complemented by his field explorations—he was, perhaps, the last of the great explorers—as well as by his impassioned interest in the contemporary Asian world. The six years he spent in India were fundamental in his life, as were his eight expeditions to Tibet (1929–1948), his six expeditions to Nepal (1950–1954), and his missions of exploration to Pakistan (starting in 1955), Afghanistan (1957), and Iran (from 1959); Tucci continued to conduct archaeological research on field explorations such as these until 1976.

The highest honors of the countries of Afghanistan, Japan, India, Indonesia, Iran, Nepal, Pakistan, and Thailand were conferred upon Tucci. He received honorary doctorates from many European and Asian universities, including those of Delhi, Kathmandu, and Tehran; he was given various academic and scientific titles in Italy (from the Accademia d'Italia, the Accademia delle Scienze of Turin, the Accademia of San Luca, and the Società Geografica Italiana), in Austria (from the Österreichische Akademie der Wissenschaften), in France (from the Société Asiatique), in Germany (from the Deutsches Archäologisches Institut), in Japan

(from the Imperial Academy and the Tōyō Bunko), in India (from the Asiatic Society of Calcutta and Vishvabharati University of Santiniketan), and in England (from the British Academy and the Royal Asiatic Society).

Tucci received many international prizes, including the gold medal of the Calcutta Art Society (1965), the Sir Percy Sykes Memorial Medal (1971), the medal for archaeology of the Academy of Architecture of Paris (1972), the Jawaharlal Nehru Award for International Understanding (1976), and the Balzan Prize for History (1979). The Jawaharlal Nehru Award was always especially dear to Tucci because of his friendship with Nehru and his ties with great figures of modern India such as Rabindranath Tagore, Sarvepalli Radhakrishnan, and Mohandas K. Gandhi.

The entire Indian subcontinent and Tibet were the main areas of Tucci's interest as a scholar and explorer. A complete bibliography of his works contains 360 titles, including many dozens of books, about two hundred articles, numerous encyclopedia entries, reviews, and so on. His research actively touched on many fields other than Indian and Tibetan studies, however, and he focused especially on the study of religious and philosophical thought and on historical investigation. His interest in the latter field led him to study the archaeology of Hindukush and Iran; this study was also inspired by his perennial interest in the various points of encounter of the great Asian civilizations of the Himalayan regions, Northwest India, Pakistan, and Afghanistan.

He undertook his studies of China primarily during the first stage of his scholarly activity in works such as *Scritti di Mencio* (1921), *Storia della filosofia cinese antica* (1922), and *Saggezza cinese* (1926). At any rate, the most important object of his studies was Buddhism in the various forms it had taken as it expanded from India toward Tibet, Central Asia, China, and the Far East. Tucci interpreted Buddhism as the highest form of Asian humanism. Always in search of universal values in a humanistic perspective, Tucci felt that the history of Asia was closely interconnected with that of Europe, and he thus always considered Eurasia to be a single continent in cultural as well as geographical terms.

His most important scholarly works are *Linee di una storia del materialismo indiano*, 2 vols. (1923–1929); *Indo-Tibetica*, 6 vols. (1932–1941); *Tibetan Painted Scrolls*, 2 vols. (1949); *Teoria e pratica del Mandala* (1949); *The Tombs of the Tibetan Kings* (1950); *Minor Buddhist Texts*, 2 vols. (1956–1958); *The Religions of Tibet* (1970); *The Ancient Civilization of Transhimalaya* (1973); and *On Swāt: The Dards and Connected Problems* (1977).

Endowed with vast humanistic knowledge and intensely interested in religious and philosophical thought, Tucci possessed great erudition, extraordinary knowledge of languages, and philological skill. He knew Sanskrit and Tibetan in depth, and also had significant knowledge of Chinese and Pali (and other Indian languages). Nevertheless, he did not disdain the public at large, to whom he addressed many

works, among which are *Santi e briganti nel Tibet ignoto* (1937), *Forme dello spirito asiatico* (1940), *Asia religiosa* (1946), *Tra giungle e pagode* (1953), *To Lhasa and Beyond* (1956), *The Discovery of the Mallas* (1962), *La via dello Swat* (1963), *Il trono di diamante* (1967), *Tibet, Land of Snows* (1967), and *Rati-Lilā* (1969).

Many of Tucci's minor writings are collected (partially revised by him) in his *Opera Minora* (1971) published by the Oriental School of the University of Rome. The Istituto Universitario Orientale of Naples dedicated two volumes of Asian studies to him titled *Gururājamañjarikā: Studi in onore di Giuseppe Tucci* (1974), and the IsMEO published an international collection of Asian studies in three volumes dedicated to Tucci's memory, titled *Orientalia Iosephi Tucci Memoriae Dicata* (1985–1988).

BIBLIOGRAPHY

On May 7, 1984, the Istituto Italiano per il Medio ed Estremo Oriente solemnly commemorated its founder with the publication of my *Giuseppe Tucci* (Rome, 1984); an English version of this work, accompanied by an updated bibliography of Tucci's writings, appeared under the title "Giuseppe Tucci" in *East and West*, n.s. 3 (1984): 11–12 and 23–42. A year after Tucci's death, the institute published *Ricordo di Giuseppe Tucci* (Rome, 1985) by Raniero Gnoli with contributions from Luciano Petech, F. Scialpi, and G. Galluppi Vallauri; this work includes a biographical note, a discussion of Tucci's *cursus honorum* and his scholarly concerns, and a bibliography.

Short commemorative notices have been published in various scientific reviews, including S. Cleuziou's in *Universalialia 1984* (the annual supplement of the *Encyclopaedia Universalis*), pp. 614–615; P. Corradini's in *Mondo cinese* 45 (1984): 101–105; Mircea Eliade's in *History of Religions* 24 (1984): 157–159; K. Enoki's in *Tobogaku* 68 (1984): 127–154; Luciano Petech's in the *Journal of the International Association of Buddhist Studies* 7 (1984): 137–142; B. J. Staviskij's in *Narody Azii i Afriki* 1 (1985): 213–214; M. Taddei's in *AIUON* 44 (1984): 699–704; and R. Tamburello's in *Il Giappone* 24 (1984): 211–213.

A special commemorative issue (no. 2) of *India Past and Present: A Biannual Journal of Historical Research* (Bombay, 1985), is dedicated to Tucci and contains (pp. 3–11) an editorial on his life and work. Corrado Pensa's study "L'occidente e le religioni orientali nella prospettiva di Giuseppe Tucci," in *Paramita: Quaderni di Buddismo* 16 (1985): 19–25, deals with the West in relation to Eastern religions following the perspective of Giuseppe Tucci.

GHERARDO GNOLI (1987)
Translated from Italian by Rodica Blumenfeld-Diaconescu
Revised Bibliography

TU KUANG-T'ING SEE DU GUANGTING

TULSĪDĀS, late medieval Indian poet whose plays and other works have had great influence on Hindu devotionalism, especially in communities that make Rāma the focus of worship. Despite his great popularity, or perhaps because of it, very little accurate information is available about the life of Tulsīdās. There is abundant material about him in the form of hagiographies and oral legends, but these legitimize his saintly life and the holy nature of his literary works rather than record the actual events of the biography.

While there is disagreement as to the date of Tulsī's birth, his death is generally agreed to have occurred in 1623. The traditionally accepted date of his birth is 1503, which would mean that he lived for 120 years. This is logical from the point of view of his hagiographers, because the full life span of a sinless human being is believed to be 120 years. Modern scholars consider that he was born probably in 1532 to a brahman family in an eastern Hindi-speaking area. In his *Kavitāvali*, Tulsī writes that he was born to a very poor family and that his father and mother did not welcome his birth. It is believed that he was born under an unfortunate conjunction of planets, which meant that for astrological reasons his parents had to abandon him.

Tulsī says that in his childhood his mind was always on Rāma, but that he later fell into the ways of the world. Sometime during his life Tulsī went to Banaras, where he lived until his death.

In 1574 Tulsī began the composition of his most renowned work, the *Rāmcaritmānas*, or *The Holy Lake of the Deeds of Rāma*. Tulsī became famous through this work, and he himself remarks in his *Kavitāvali* that "the world even likens me to the great sage Vālmīki." In addition to the *Rāmcaritmānas* and the *Kavitāvali*, at least ten other works can be ascribed to Tulsī with certainty. Chief among them are *Vinay-patrika*, *Dohāvali*, and *Gītāvali*.

As a poet, Tulsīdās combines the grandeur and the majesty of Sanskrit with the lyrical grace and power of Vraj (or Braj) Bhāṣā, a dialect of Hindi. A master of alliteration and rhythm, Tulsī also shows great restraint in his use of words, blending the epic and the lyric styles. His choice of dialect and style was not in conformity with the scholarly standards of his time. Tulsī describes himself as *prākṛit kavi* ("uncultivated poet"), and from a scholarly viewpoint his language was *grāmya*—of the village, uncultured. Yet because of its poetic excellence, *Rāmcaritmānas* was the most revered of all Hindi texts both by scholars and by ordinary people.

The greatest achievement of Tulsī lies in making the popular devotional style acceptable to the orthodox Hindu community and the philosophical interpretations of the high culture accessible to ordinary people. His reinterpretation of the *Rāmāyaṇa*, based on the Sanskrit *Adhyātma-Rāmāyaṇa* and *Bhusundi-Rāmāyaṇa*, revolutionized the nature of the epic and transformed it into a popular devotional poem.

VELCHERU NARAYANA RAO (1987)
Revised Bibliography

TUNG CHUNG-SHU SEE DONG ZHONGSHU

TUNGUZ RELIGION. The peoples of Siberia speaking Tunguz languages numbered 65,900 persons, according to the 1989 census of the U.S.S.R. The most numerous of them are the Evenki (30,000) and Eveny (17,000), who are collectively called Tunguz in the older literature. Sometimes the ethnonym Lamut ("sea person") is employed, applying only to certain groups of Eveny. The close racial and cultural relationship of these two peoples makes it possible to examine their beliefs in the framework of a single system, which may be designated "Tunguz religion." Other peoples speaking Tunguz languages are the Nanay (Goldi; 12,000), Ulchi (3,200), Udege (1,900), Oroki and Orochi (1,200), and Negidal'tsy (600). They represent a special cultural area, extending as far as the basin of the lower Amur River and Sakhalin Island, that includes the ancient cultural legacies of the Ainu and Nivkhi (Giliaks) and the inhabitants of north-eastern China. A common religion has long been the primary factor uniting the atomized society of Tunguz hunters who, in small groups, mastered the vast space of taiga and tundra between the Yenisei River on the west and the Sea of Okhotsk on the east and between the Arctic Ocean on the north and Lake Baikal on the south.

The periodic religious ceremonies of the Tunguz are closely tied to their mythology, and in several instances they directly reproduce myths of creation and of the heroic deeds of their first ancestors, beginning with the words *tarnimngākāndu bičen* ("this was in *nimngākān*"). The term *nimngākān* means "myth, tale, legend; warm fairyland; bear ritual; shamanic séance." Each group of Tunguz has a myth on the creation of *bugha*—its own inhabited territory. *Bugha* has a variety of meanings: "locality, world, native land; cosmos, sky, earth; spirit master of the upper world/lower world/hunt, God, devil; paradise, hell; icon." The Tunguz also use this term to designate the entrance into a bear den or a small hut made of young larches with small figures of

beasts and birds placed therein in preparation for shamanic performances. The basic meanings of the term *bugha* embrace, in this way, notions of the creator, creation of the world, and of a model of the world. For designating the deity of the upper world the Tunguz also use the names Mayin, Ekseri, Seweki, and Amaka. The first of these names is tied to the concept of “success” or “hunting luck,” whereas the last is a kinship term referring to representatives of the older age groups: “grandfather, father, uncle,” and, in general, “ancestor.” The word *amaka* also has other meanings: “bear; God; sky.”

According to the perceptions of the Tunguz, the upper world (*ughu bugha*) is connected to the middle world (*dulu bugha*) through the North Star, termed *bugha sangarin*, “sky hole.” In turn the middle world is also connected to the lower world (*hergu bugha*) through an opening within it. In the *nimngākān* the first ancestors were able to move between all three levels of the world. Thereafter this became the privilege of the shamans, who use for this purpose Tuuruu, the Tunguz variant of the World Tree, or its equivalent. Engžekit, the mythical river called “the place that no one sees.” It flows from the place termed Timanitki (“toward morning; east”), transects the middle world, and enters into the place called Dolbonitki (“toward night; north”), beyond which stretches the realm of the dead, Bunikit or Buni. Into Engžekit flow the many branch rivers of individual shamans. Somewhere at the confluence of these tributaries with the mythical river are the Omiruk, territories inhabited by souls (*ōmī*); these lands comprise the sacred wealth of each clan.

One of the myths associated with Engžekit tells of the origin of the first people, of reindeer, and of cultural objects from the various parts of the mythic bear’s body. He voluntarily sacrificed himself to the heavenly maiden, who was carried off on an ice floe in the current between the upper and middle worlds. In other myths the bear, representing the ancestor of one or another Tunguz tribe, is similarly depicted as a culture hero, the creator of reindeer breeding, bequeathing after his inevitable death the ritual of the Bear Festival. This festival, which is essentially the same among all the Tunguz, is associated with the seasonal hunt of the animal in its den, which takes place in early spring or late autumn. The most important detail of the Tunguz bear ceremony, which has an explanation in their religio-mythological perception of the world, is the way in which they handle the bear’s eyes. Hunters, having cut off the head of the slain beast, take out its eyes with great care, seeking to touch them neither with a knife nor with their fingernails. Then they wrap the eyes in grass or birch bark and carry them away into the forest, where they place them high in a tree. The Udege did this in the hope that the bear’s eyes might be illuminated by the first rays of the rising sun. In the tabooed language of Tunguz hunters the bear’s eyes are called *ōsīkta* (“stars”). The connection of the bear with heavenly luminaries is well illustrated in a Tunguz myth in which the bear, named Mangi, follows the reindeer or moose who had stolen the

sun. Having caught up with his prey, the bear returns the sun to its place. Both protagonists in this myth form the constellation of Ursa Major, the Big Dipper, in Tunguz cosmology (Chichlo, 1981, pp. 39–44).

This myth of the heavenly (or cosmic) hunt was reenacted by the Tunguz during the greatest festival of the year, Ikenipke (a name derived from the word *ike*, “to sing”), which took place in a specially constructed cone-shaped dwelling (*žumi*), whose name designates not only “house, household, or family” but also “bear den” and *uterus animalis*. In the center of this dwelling is placed a pole called Tuuruu, along which Ekseri, the spirit of the upper world, and Hargi, the spirit of the lower world, travel in order to hold conversations with the shaman. The festival, which may be called the Tunguz New Year, consists of eight days of dancing, singing, and pantomime. The people, led by the shaman, would move inside the *žumi* in a circle in the direction of the sun’s movement as they traveled up the river Engžekit behind an imaginary reindeer. In his song, the shaman would describe all the details of the travel, which lasted a year—all the animals, spirits, and obstacles encountered. At the end of the festival the men would shoot from a shamanic bow at wooden reindeer figures, shattering them into pieces that each man kept until the next festival.

Other important shamanistic rituals of the Tunguz took place in specially constructed dwellings in the taiga. With complex auxiliary structures, these represented a model of the supernatural world. The first, *nimngāndek*, signifies “the place where *nimngākān* is fulfilled.” The second, *sevenčedek*, is “the place where a ceremony with *seven* is performed.” Among all Tunguz peoples, *seven* means “shaman’s spirit helper,” but this word is connected to one of the names of the high God, Sevek or Seveki, and to the taboo reindeer of light coloring, *sevek*, which is also called *bughadi oron*, “heavenly reindeer.” The ritual of dedicating the chosen reindeer as *sevek* is either independent or part of the ritual cycle in the Ikenipke festival. From the moment of this dedication, the *sevek* serves only for the transport of sacred objects. After its death, this reindeer is laid out on a platform set up in a tree.

The word *seven* also signifies the ritual dish at the Bear Festival, which is prepared from rendered bear fat mixed with finely chopped bear meat. Scooping the *seven* with a spoon, the hunter must swallow it without its touching his teeth. This method of partaking of the body of the beast deity is identical to the rules of handling bear eyes. The boldest hunters may swallow them but only without touching them with their teeth; otherwise the hunter will become blind. The meaning of these rules becomes more understandable in light of the strong prohibitions associated with the domestic hearth. The firewood and coals must not be stirred with a sharp object, nor may broken needles be thrown into the fire. Even to place a knife with its point toward the fire may put out the eyes of the spirit of the fire. This spirit, according to an Orochi myth, is a pair of bear cubs born from the mating of a bear and a woman. According to the Evenki,

the bear is a culture hero who gave people fire. Reconstructing the Tunguz spirit of the domestic fire discloses his bisexual nature, corresponding to an androgynous deity like the bear. It is therefore understandable why hunters do not risk swallowing *ōsīkta* ("bear's eyes"), preferring to return them to the taiga. The luster of these "stars" on top of the World Tree assured hunting success, and the projections of the luster are the light and warmth of domestic hearths.

When considered as a system, the myths, concepts, rituals, and customs of the Tunguz show what a large, if not central, role the bear occupies. The most powerful shamans have him as a guardian spirit. At the time of the séance they don his skin, thus receiving power over all zoomorphic spirits, which they gather in the darkness of the sacred dwelling that represents, in essence, the cosmic bear den. The moose as well plays a significant role in the religious life of hunters and shamans, but its significance cannot be explained, as it is by most scholars, by economic functions alone. It must be noted that, according to myth, the moose emerges from the bear's fur and is, in consequence, part of him. And if *Ursa Major* is termed *Heglen* ("moose") by the Tunguz, this denotes a shift of stress in the direction of one member of a binary opposition composing the structure of the myth (and constellation), in which prey and hunter can change places. In their ritual practice Tunguz shamans preferred to place this stress on the figure of the hunter, inasmuch as they considered *Mangi*, who tracked the cosmic moose, to be their forefather.

Traces of the myth of the cosmic hunt in the religious life of Tunguz peoples still remain, as attested by ancient wooden disks of the Nanay that represent the sun (*sii*). On the upper part of one of them is a drawing of a bear, and on the lower is the representation of a moose turned upside down. The Nanay hung such disks on the door of a dwelling or on a child's cradle; to the shamans they were an indispensable accessory of their costume. Possessing healing and protective functions, these disks are concise and expressive signs of the fundamental myth of the beginnings of human history. In the Nanay culture area, the myth of the bear *Mangi*, who freed the sun from captivity, and the myth of the hunter *Khado*, who killed the excess suns, which were burning all living things, came into contact with each other. Both myths are similar insofar as the Orochi, neighbors of the Nanay, consider *Khado* the father of the shamanistic spirit *Mangi*, the representation of which is on the shamans' staffs.

The Tunguz, whose livelihood depends upon success in hunting, conducted simple ceremonies that gave the hunter confidence in his own powers and in the benevolence of fate. He could do without a shaman, having enlisted the support of the master spirit of a locality and having gained a personal spirit helper. One of these rites is *Singkelevun*, "obtaining *singken* (success)." This ritual appears to be the simplest imitation of the concluding ceremony of the *Ikenipke* rite: the hunter makes an image of a reindeer or a moose, takes it with him into the taiga, and then shoots at it with a small bow.

If the image is hit immediately, it becomes a *singken*. The dried parts of previously killed animals (hearts, jaws, noses), which the hunter saves, are also guarantors of success. Certain groups of Tunguz began to call the spirit master of the taiga *Singken*. The Evenki and Orochi conducted a *Singkelevun* ceremony in October, before the beginning of the winter hunting season. It was performed among them as a complex shamanistic ceremony consisting of several cycles.

For the preservation of human life, the Tunguz prepared special repositories of souls, which were "earthly" miniature copies of *ōmīruk* found in the basin of the Engzekit River in the upper world. The domestic *ōmīruk* are small boxes with little figurines placed in them. Each figurine holds the soul of a person placed there by a shaman. Certain shamans placed tufts of hair from persons needing protection in the *ōmīruk*. Such little boxes were strapped to the saddle of the heavenly reindeer. The *ōmī* was evidently a reincarnated substance circulating within the limits of a determined social group. Among the Nanay, for example, the *ōmī* lived in the form of small birds on the clan tree, from which they descended into women's bodies. Depictions of these trees are still found on the robes of Nanay women today.

In the case of frequent deaths of children, the shaman had to set out for the upper world, where he snared one of the soul birds and swiftly descended to earth. Evidence of his successful trip was a fistful of wool strands pressed together, which he threw into a white handkerchief held up for him by an assistant during the séance.

The traditional method of disposing of the dead among the Tunguz was aerial: the body, washed in the blood of a sacrificial reindeer and clothed and wrapped in a hide, tent cover, or birch bark, was laid on a scaffold set up in the branches of a tree. Coffins, when used, were made of hollowed-out tree trunks and set upon tree trunks or on posts dug into the ground. The belongings of the deceased were left with him, and his reindeer was strangled and left at the place of burial. After christianization in the eighteenth century, the Tunguz began to practice underground burial. However, the traditional ritual persists in the Siberian taiga even today.

The Tunguz considered the cause of death to be the departure or theft by evil spirits of the *beye* soul, the name of which translates as "body." In conducting the mourning ceremony for the dead a year later, the Tunguz sometimes prepared a temporary "body" from a section of a tree trunk, which they clothed in part with the deceased person's clothing, provided with food, and bade farewell to forever. The shaman, completing the conveyance of the deceased into *Buni*, asked him not to return again nor to disturb the living. Among the Nanay, the initial conveyance of the deceased, termed *Nimngan*, took place on the seventh day. Here, the deceased was represented by a bundle of his clothing, in which the shaman placed the *han'an*, the "shadow" soul of the deceased, which he had caught. This bundle of clothes was treated like the living for a period of three years, until

the final farewell with him at the large *kasa* memorial festival, lasting several days. But even here, under the unquestionable influence of Manchurian Chinese customs, the Nanay and other Tunguz peoples of the lower Amur region observed traditional division between the living and the dead. An ancestor cult did not unfold here nor, more forcibly, was it characteristic of the Evenki and Eveny, the nomads of the Siberian taiga.

Shamanism and the traditional religion of the Tunguz have not totally disappeared, as is commonly believed, notwithstanding atheist propaganda and prohibitions. As recently as 1958, four nomadic Even communities, living in isolation for more than thirty years in the mountainous forest-tundra of Magadan oblast, were headed by eight authoritative shamans, one of whom was called by the honorific Amanža (Amaka). But, in spite of their forced settlement, these Evens (Berezovka village, north-east of Yakutia) preserved their religious beliefs and behavior. Thus at the beginning of October 2000, to cause a fall of snow waited so much by the reindeers herders and the hunters of the village, a woman left her house with a bear skin, shook it vigorously, then suspended it outside. People of the village while arriving in the taiga after the snowfall, achieved the following ritual: Men sacrificed a reindeer and a woman copiously coated three selected larches with the blood of the animal. Then they threw in fire some drops of vodka and pieces of meat. Thus they wanted to thank the spirits of the forest and to be ensured of their benevolence.

Translated from Russian by Demetri B. Shimkin

TUONELA, which means "the abode," is the mythical place of sojourn for the deceased in the religious traditions among Finns, Karelians, Ingrians and speakers of many other Finnish-related languages. The word concerns a sacred place in the otherworld, and is often used as a synonym of the words for the netherworld (*Manala*, *maanalainen*: "underworld") or for the mythical kingdom of the extreme north (Pohjola: "Northern Land"). In oral epics, laments, and lullabies it refers to "the home of the Tuoni," where Tuoni refers to the ruler of the world of the dead. The term *tuonilmainen* refers to "the other air," which is another term for the otherworld. A parallel Mansi word, *tammaa* (the otherworld) refers to the final destination of the journey of the breathing spirit (*lil*) of the deceased one in the northernmost edge of the universe. The spirit flies to *tammaa* across the Arctic Ocean in the shape of a migrating goose. In addition to its meaning as the mythical geographical destination of the spiritual voyage of a soul, *tuonela* also refers to the filled grave of an individual dead person, as well as the entire village graveyard.

Karelian, Ingrian, and Veps cemeteries at the Finnish-Russian border provide a good example of the long-lasting encounter between traditional folk belief and the deep influence of Russian Orthodox Christianity. Small log huts were erected above the graves, with a window set at one end, towards the direction of home, to let in light, and also to enable the dead to look out and guard the life and behavior of relatives at home for the benefit of family fortune and social control. A hole is made at another end through which the *lölly* (breathing soul) can leave the grave to visit its former home or to make its final journey to the home of the Tuoni in the shape of a bird.

Similar huts have been found in the cemeteries of other Finno-Ugric peoples (e.g., the Mordvins, Komi, and Mansi) in Russia. The custom of erecting huts in cemeteries was borrowed from the Russians, who erected similar house-shaped, pitched-roof structures over their graves. (These structures were forbidden by the tsarist government in the nineteenth

century.) The cutting of trees and the breaking of twigs was forbidden in such places.

Scholars of Finnish folk beliefs, epics, and rituals (Martti Haavio, Uno [Holmberg-]Harva, Lauri Honko, Aili Nenola-Kallio, Juha Pentikäinen, and Anna-Leena Siikala) have emphasized the importance of death as the essential element of Finnish culture. Within that culture the extended family unit extended beyond those members still living on this earth and those who have died and passed on to the “other air”: the realm of Tuoni. The deceased ones had strong power to enforce the values and norms of the society, and could punish the living for violating taboos. The dead were believed to have the same needs as the living—clothing, food, and work tools, so it was the duty of the living to provide these necessities. Of special importance was the provision of Tuoni footwear, in which the dead were dressed with woolen socks. Women who died unmarried were given the kerchiefs that married women wore, so that they could marry in the otherworld. Care for the dead continued beyond the funeral, for they continued to share in the family’s proceeds. On personal and annual commemoration days, plenty of food was taken to the graves. It was believed that the dead ones came to the graves in the form of birds, and ate the food that was left there as a sacrifice.

The topography of Tuonela varies in Finnish folklore and mythology. Beliefs and practices which are clearly based on neighboring cultures and missionary religions have also been adapted to Finnish-Karelian cosmography, and are elaborated in funeral laments, for example. According to these beliefs, the realm of the dead may be situated in heaven or at the northern end of the world, separated from the world of the living by a deep precipice. At the base of the precipice flows the black river of Tuonela, unilluminated by the sun or moon. The river contains a whirling, wild cataract and a stream of fire in which spears, swords, and needles stand upright and the dead can be seen swimming in bloody clothes. The crossing of the river was associated with great danger. The dead could wade through it, or they could cross a bridge made of thin thread. More frequently, the dead were transported across the river in a boat steered by the daughter of Tuoni. If a person heard a ringing in his or her ears, it meant that relatives in Tuonela were calling for the boat.

Fingernails and locks of hair were especially significant in the Karelian and Ingrian beliefs about Tuonela. The nails of the deceased were clipped on Saturday night, cut in two, and slipped into the neck-hole of the deceased person’s shirt. The clippings were thought to help the dead ascend Tuonela mountain, which was smooth as an eggshell. However, the nails had to be cut in pieces; otherwise, the Evil One would make a boat from the whole nails and use it to ferry the deceased to Hell. The picturesque nature of these beliefs about Tuonela stems partly from Baltic-Slavic, Byzantine, and Old Egyptian traditions, and partly from medieval Christian visionary literature and hagiography. In Finnish epics, these traditions have been merged with the older tradition of sha-

manic visions and journeys to the Land of the Dead. Lemminkäinen, who appears in folklore as both a god and a shaman is an example of how traditional shamanic epics have been combined to include elements of Egyptian Osiris mythology.

TURKIC RELIGIONS. Throughout the course of their long history, the Turkic peoples have simultaneously or successively practiced all the universal religions (Christianity, especially Nestorian Christianity; Judaism; Manichaeism; Buddhism; and Mazdaism) before the majority of them were won over to Islam. However, before yielding to these religions, they held their own system of beliefs, their own

personal representations. These are generally identified as “animism” or “shamanism,” even though the last term cannot even begin to cover the whole of the religious phenomena. Their “national” religion, largely shared by the Mongols and certainly the Tunguz, is still practiced today. It has been kept alive among certain Siberian and Altaic groups and, to a much greater extent than is realized, within the very institution of Islam, to which it has more or less adapted without abandoning or altering many of its original characteristics.

This is not to say that the indigenous Turkic religion is free of every foreign element. It developed in contact with other ideas, notably those from China and Iran. It has continually evolved and grown richer over the course of centuries, either through internal development or the influence of great civilizations. It is, in fact, quite flexible and is based on tolerance and religious coexistence. Certainly, it is essentially a mystic religion. Its beliefs have never been solidly unified, and, as we are beginning to better understand, they are like two diverging branches of a common trunk: the popular one is centered on shamanism, totemism, and a vigorous polytheism; the imperial one is antishamanist, antitotemist, and has monotheistic tendencies in its advocacy of the supremacy of Tengri, the sky god.

Although they are separate, these two branches have not escaped interpenetration. One branch developed under the tribal regime, the other during the formation of the great empires of the steppes, such as those of the Hsiung-nu, the T’u-chüeh or Türk (sixth to eighth century), the Uighurs (eighth to ninth century), or the Mongols (thirteenth to fourteenth century). It must be remembered that the Turkic peoples played a major role in the Mongol empire. This is reflected in the use of the name *Tartar* (Turkic, *Tatar*), which was used to refer to the armies of Chinggis Khan and is none other than the name of a very ancient vassalized Turkic tribe. This expressive name also evoked an infernal river of antiquity, the Tartarus, and had the connotation of “barbarian” as well.

Whether tribal or imperial, however, the prevailing political and social regime allowed a memory of the former to remain, and when the prevailing order was temporarily abolished, along with it was abolished a part of what it had imposed. Nevertheless, it is important to consider the beliefs common to both the popular religion and the imperial religion apart from the beliefs that pertain more particularly to one or the other.

Until recently, it had been considered impossible to understand the religion of the Turkic people in its ancient form. Studies, especially ethnographic ones, have been written on groups of people who continued to practice the religion in modern times (nineteenth to twentieth century). Only recently has it been observed that the inscribed Turkic stelae of the sixth to the tenth century, certain manuscripts (including the dictionary of Maḥmūd al-Kāshgharī, eleventh century), and foreign sources (especially Chinese but also Byzantine, Arabic, Latin, Armenian, and Syrian) present a

considerable wealth of information. This information takes on full meaning when compared with ethnographic notes, medieval Mongolian sources, and pre-Islamic remnants in Turkic-Muslim plastic and literary works. Thus we begin to have, if not a complete knowledge of the ancient Turkic religion, at least a satisfactory view of the overall picture.

Of course, we have acquired more information on some periods and peoples than on others. We have a fair understanding of the religious situation under the empires but know little of the religious situation of the tribes, at least before the modern era. We know something of certain ethnic groups but nothing at all of others. In general, we have sufficient documentation on the period between the foundation of the Türk empire (sixth century) and the conversion of the Oghuz to Islam (eleventh to thirteenth century), as well as on the present era.

THE COMMON HERITAGE. With a few small exceptions, the Turkic religion has offered structures to all peoples of all social classes in all regions of the Turkic world throughout history. Admittedly, there was a less influential period during which the religion was developing, but it appears to have been firmly established as early as the first century CE. It would be incorrect to believe, for example, that at the beginning of the Türk empire, the western Türk borrowed a cult of fire that was unknown to the eastern Türk from Iran (where it is known to have flourished), for the cult was already pan-Turkic. Because Sogdian, the language of an Iranian people, was used as a written language as far north as Mongolia in the early sixth century, the fact that literary evidence for the fire cult exists in an Iranian language cannot be used to prove that the cult was of Iranian origin. Far less important practices seem to be known in the east but not in the west, such as the wearing of plumes, which did not spread to the west until the Mongolian invasions.

Although the religion was fairly well established early on, certain innovations appeared over the course of time. Without doubt, the dualism already apparent in the Turkic religion has been accentuated through the influence of Manichaeism. From Buddhism has come a conception of hell as a cosmic zone situated under the earth in symmetry with the sky (a deity), as well as the transformation of one of the great mythological characters, Erlik or Erklik (“the virile one, the valiant one”) from a warrior who killed the stars at daybreak to the god of the underworld, a king of innumerable demons who not only live on the earth but haunt the entire universe. Equivalent to the Indo-Iranian Yama, he is attested to in Turkic sources as early as the 1200s. The idea of paradise seems to have taken shape in a similar way; the Sogdian word for it, *utchmaq*, has been confused with the Old Turkic infinitive *utchmaq*, which means “to fly away” and which was traditionally used, at least in speaking of great individuals, to signify “to die.” An innovation that seems to be more important was observed by the Chinese in about 628: “In the past, the Türk had the custom of burning the dead; now they bury them.” However, one must consider that the Turkic peoples

have always fluctuated between incinerating and burying the dead. Of the pre-Slavic Bulgarians and, in a general way, of the western Türk, it is said, "One phratry burns its dead, the other buries them." The Kirghiz continued to use incineration until they came into contact with Islam.

Ideas that have remained unchanged are those relative to death, the afterlife, and funerary rites (apart from the issue of burial versus incineration). Death, which one hopes will be violent and unnatural (in spite of the respect that is occasionally shown the elderly) is considered the Necessity, *Kergek* (perhaps a deity). However, it is deeply dreaded and has given rise to bitter regrets, supposedly issued from the mouths of the deceased. Death is eminently contagious and requires a sober approach toward the dying one (generally abandoned) or the deceased. The type of afterlife to be attained depends primarily on the treatment accorded the skeleton. It must be cleaned perfectly: the flesh must be scraped off and the cadaver set on a platform in a tree and exposed. When the bones are clean, they are either buried in the ground (if the deceased is to retain his earthly ties) or burned (if he is to lose them and gain access to the kingdom of the dead). The funerary ceremonies have also survived the centuries without having been changed: they include lamentations and ritual mutilations, declamations (*agit*) of the virtues of the deceased, a sacrifice, and a communal meal. The meal has been especially important, so much so that the word *yog*, originally designating the funeral as a whole, would eventually connote only the meal.

The varying forms of the obsequies clearly demonstrate the margin of liberty or of uncertainty that remained within a well-defined context. This latitude occurs again and again primarily in the view of the world. The universe is generally represented as composed of two parallel plains, the sky and the earth (ultimately extended to three with the addition of the underworld). At the same time, it is also seen as a square plateau (earth), covered by a circumscribed dome (sky), with the four corners of the earth being allowed to exist outside the shelter of the sky. The cosmic axis that links the sky, the earth, and the underworld can be a mountain or a tree with seven branches, each branch representing a level of the sky. The levels of the sky are in turn derived from the seven planets still known to have been popularly believed in during modern times but also attested to by prehistoric engravings and by every construction with symbolic value, for example, the pillar of the tent, the ensemble formed by the central hearth of the yurt, and its upper opening, through which the smoke escapes. This axis is at once the support for the sky and the path that permits access to it. Among the numerous microcosms consonant with this view, the yurt, a circular tent in the form of a bell, is the most characteristic. It is protected from exterior influences by the powerful deity of the threshold, which one must kiss upon entering. Although circular in shape, the yurt was oriented first toward the rising sun and then toward the south.

It is possible that the sky and the earth originally may have been placed side by side, but there is more speculation

than truth to this. The Orkhon inscriptions (eighth century) speak about origins in two lines: "When the sky above was blue and the earth below was dark, the son of man appeared between them." The Turkic peoples were little interested in the cosmogonical problem or in eschatology. Of the more recent cosmogonies (after the tenth century), the well-known one reported by Wilhelm Radloff (1884, vol. 2, p. 3) and all allusions to the creative power of the sky god were influenced by foreign religions.

The observation of stars is an important occupation. The phases of the moon are considered lucky or unlucky. No projects are to be undertaken when the moon is in its last quarter, although a good time to launch a military campaign is when the moon is waxing or is full. The last days of the lunar month are favorable for obsequies because they mark an end and announce a rebirth. Similarly, human life closely parallels plant life. Trees are born each spring and die each autumn; thus the cadaver is saved for the biannual obsequies, which take place either when the leaves begin to fall or as they grow green again, a fact that explains the aforementioned techniques used to preserve the skeleton. When great personages are taken to their place of final rest, an attempt is made to be in harmony with the vegetative season, the phases of the moon, and the beneficial moments of the solstices and the equinoxes.

The four classic elements make up the universe. Water and fire are of exceptional value. Moreover, they are antagonists and complementary components: fire comes from wood, which is born from water. The last has a fertilizing capacity but above all is pure. It is forbidden to dirty water, even though water does not purify. A "mass of water" is a symbol of knowledge and intelligence, qualities of the sovereign. Fire, which eventually would become a god, is an alter ego of the shaman because of its hypnotic, elevating, and healing powers. It is the great purifier. All defiled objects or those suspected of being defiled, notably anything that enters the camp, must pass between two fires, jump over the fire, or go around it. However, this ancient belief became obsolete in the nineteenth century, while fumigation, also a purifier, remained popular. The hearth, considered the reflection of the family, is protected by numerous taboos. To extinguish it and disperse the ashes would amount to destroying the race. Since ancient times, the great priest of this fire has been the "prince of fire," the *otchigin* (derived from *ot tegin*), the youngest son to inherit the paternal residence—the heart of the empire—after the older sons had been provided for or endowed with a distant appanage. Today, this office is held by various members of the family, occasionally women. Like thunder, lightning—fire from the sky—arouses terror and is seen as a divine punishment against the one it strikes.

Every existing thing is inhabited by a force of varying intensity that we could call, although not quite accurately, "spirit," "soul," or "master-possessor." Each force can be broken down into a multitude of forces or can be combined with others to constitute a more vast, collective force. The tree is

powerful, but the grove or forest is more powerful. The “eternal” stone is fully effective only when combined with others to form cairns (*obo*), piles generally located in dangerous passages or passages recognized as such by a sacred mystery. Anything complex like a man or woman, has several souls; human souls reside particularly in the blood (the shedding of which is forbidden), breath, hair, skull, sexual organs, and elsewhere. Thus nothing is simple or stable; everything has variable dimensions, a sort of ubiquity. But everything makes reference to the animal, zoomorphism being the form par excellence—the form of all spirits and of human spirits before their birth, during their life, and after their death. Consequently, everything that exists can appear as it is or in animal form.

In one way or another, all animals have had a numinous role, but certain animals are different from others: the bird of prey, the eagle or falcon, is a divine messenger that flies near Tengri and sits enthroned on the summit of the cosmic tree; the stag is often considered a saint, but is hunted nevertheless; the hare’s position is as ambiguous as that of the camel, which is totemized or tabooed as impure; the bear is the quintessential lunar animal, whose hibernation stirs the imagination; geese or swans, which appear in the widespread legend of the swan maiden, may symbolize the celestial virgin; all birds are souls; and the horse, a member of the clan, is the epitome of the sacrificial animal and also often a solar or aquatic symbol.

With the exception of the act of killing another human, combat between an animal and an adolescent, or another animal designated to represent him, constitutes the principal rite of passage. This rite allows a male youth to become part of adult society and gives him rights to women or, rather, constitutes marriage in itself. In effect, the match is an enactment of the sexual act: to conquer the animal is to become both its spouse and its son. It renews and reenacts the primordial ancestral struggle: murder, copulation, and birth. This rite is an ancient legacy clearly attested by the animal art plaques of the steppes, medieval manuscripts, and modern commentary.

Despite a strong family structure, accounts of adoption by animals or humans are numerous, and fraternity is not dependent upon birth alone. Fraternity can be pledged between two strangers through the exchange of significant gifts (osselets, arrows, horses) and particularly through the mixing of blood. The rite that establishes fraternity consists of the two postulants’ joining their slashed wrists or drinking mixed drops of their blood from a cup that is often made from the dried skull top of a murdered enemy chief. This giving of one’s blood to another man is actually only one variant of the oath. The other form is the giving of blood to the earth, realized through the pouring of one’s blood or the blood of a sacrificed animal; this act is performed before the sky, which deeply involves those making the pledge.

THE POPULAR RELIGION. Despite the pretensions of certain shamans to positions of tribal leadership, shamanism is es-

entially a religious phenomenon, a dominant one in the religious life of contemporary non-Muslim Turkic peoples and one that is at the heart of the popular religion. It speaks to the people of things that interest them most—the preservation of their life (magical healings), their future (divination), and their relations with the familiar gods and spirits (the shaman’s sacerdotal role, his cosmic voyage). The institution of shamanism is surely quite ancient. Although poorly discernible in antiquity, it was in full bloom by the time of the Middle Ages, despite the total silence of the Türk inscriptions on the subject. This silence does not prove the nonexistence of shamanism but, rather, reflects the care taken to exclude it from imperial records. The oldest descriptions of shamanic séances date back almost to the era when the Old Turkic word for shaman, *qam*, clearly appears, and when magical healings and divinations were attested to among the Oghuz. Descriptions of such rites among the nomadic Turkic tribes come to us from Ibn Sīnā (Avicenna), while similar accounts regarding the Kirghiz come from Marvazī.

Shortly after this period, numerous traces of shamanism appeared among the tribes converted to Islam who became part of the Seljuk hordes. From then on, the information continues to increase and become more precise. In the thirteenth century, van Ruusbroec provided a remarkable description of the séance. From all this medieval information, it appears that the shaman had the ear of the people, communicated with the sky god, was visited by demons, and went into trances to accomplish his cosmic voyages, during which he met many spirits and their auxiliary, or adversary, spirits. His objectives were to cure the sick by expelling the spirits that had entered them or by finding the spirits that had left their bodies, to predict the future, and to exercise certain sacerdotal and political powers. In other respects, the shaman seems to have been a sort of blacksmith, a manipulator of two numinous objects, fire and metal. In any case, he already had rivals: for healing, the first official doctors; for divination, the astrologers (seers who were closer to the princes than to the people) and all kinds of sorcerers, diviners, and prophesiers who waved their wands or arrows and used osselets and dice, who used haruspicy, scapulimancy, and, especially, oneiromancy, and who interpreted divinatory texts. One type of sorcerer who became the shaman’s most threatening rival was the “rainmaker,” the *yadadji*, who, with the help of a bezoar, produced thunderstorms on demand. These sorcerers, like the astrologers, worked more freely under the imperial religion than did the shamans, because the sorcerers had no pretensions to power or claims of intimacy with the sky.

The totemic system, which can exist only in tribal societies that employ it to determine basic structures (families, clans), plays a role in the popular religion that is almost as important as that of shamanism. For a long time, totemism was unknown among the Altaic peoples in general; however, in the mid-twentieth century pioneering research by P. J. Strahlenberg, Cho-dzidlo, A. Billings, N. Shchukin, and oth-

ers revealed a totemic system among both contemporary and extinct Turkic societies, such as the Bashkirs, the Oghuz, and the western Türk. Since the eighth century, the Arabs (as confirmed by certain medieval Turkic texts) have observed a tie between clans of certain tribes and certain animals. The study of these observations reveals, beyond all possible doubt, a totemism, naturally misunderstood in the Arab and medieval Turkic accounts.

It is clear that the people, organized under the tribal system, worshiped numerous gods of human dimension and that they cared little about great deities, notably the Sky. We have seen that they were surrounded by innumerable forces that they had to use or protect: natural forces and even fabricated objects (the “master” of the weapon, its “soul,” could render the weapon ineffective). The “masters” of the herd, of game, fish, hunting and fishing territories, and doubtless others all had to be conciliated. The masters that the Old Turkic texts call *idug yer sub*, “sacred lands and waters,” concerned them most. These also could be the ensemble of indivisible lands inhabited by the tribe, or better, their “master-possessors” (those of other tribes and of foreigners such as the Chinese were recognized). It could also refer to certain privileged parts of this ensemble, often cited by name. The latter lands were “left free,” as conveyed by the word *idug*. In these areas it was forbidden to carry out any secular activity: hunting, fishing, or felling trees. The idea that the parts of a whole should always be respected was extended to everything. There were also *idug* animals within the herd that could not be milked, sheared, or mounted. It was important for the hunters to allow some animals to escape from the game they encircled. At least the first fruits of the harvests had to be set aside unused. At each milking and at each meal, it was customary to set apart a portion of milk or meat to be offered to the gods.

Out of a desire to maintain control over the earth’s products, the people made “soul supports”; these represented the spirit protectors of animals and harvests. They were among the numerous idols placed in the yurts and were also transported in carts, which became veritable traveling altars. Constructed of felt, wood, and metal, these zoomorphic or anthropomorphic idols could also represent and contain the soul of ancestors and of all imaginable powers. One took care of them, fed them, and painted them with blood. Ethnographers eventually began to call these idols by the Mongol word *ongon* (Turkic equivalents: *töz*, *tyn*, *kürmes*), although *ongon* actually refers to totems. Some of the highest deities were affected by this idolization, either through a spontaneous irruption of the practice as applied to the lower spirit protectors or through absorption of elements from the imperial religion. In a general way, the cave, the waters, the trees, and the stars were venerated. Every elevation of ground became a place of cult worship: it established the image of an ascent toward the sky, a distant and vague god.

Whereas the tribal and familial deities of ancient periods are poorly understood, it is almost impossible to define the

possible ties of the people to the great gods as revealed to us by the imperial texts alone, at least for the period during which the people were not under the empire.

THE IMPERIAL RELIGION. It is difficult to comprehend the significance and the success of the imperial religion without taking into account the tribal organization of society, with its attendant instability, internecine wars, anarchy, and misery. Divided, the inhabitants of the steppes were powerless. United, they became invincible. Therefore, their strength assured free commerce and made possible raids and conquests of the rich lands of sedentary peoples. Despite the tribes’ pronounced taste for independence and their attachment to tradition, the empire presented certain advantages that the tribes were prepared to accept, even if it meant losing part of their patrimony along with their autonomy. Certainly the sovereign, promoted through his own genius or through circumstances, was descended from the tribal regime and practiced the popular religion. This fact, together with his need to secure mass support, inclined him to tolerate the tribal religion; but he reorientated it, promoting elements that had been secondary, diluting or eliminating elements that were in essence antimonarchist. The two great victims were shamanism and totemism.

From the imperial viewpoint, shamanism had no alternative but to adapt. During the long medieval periods, shamans had not only attained positions of tribal leadership (without necessarily having the gifts or the means for leadership) but had also pretended to maintain privileged relationships with the invisible, to climb to the sky. As tribal chiefs, they had to accept a superior authority, something that was more difficult for them than for others. As religious leaders, they had to acknowledge that the *kaghan*, the emperor, had relationships with the invisible world and the sky, relationships much closer than their own. Thus, there was an inevitable conflict between the shaman and the sovereign. However, the contest being unequal, it often ended abruptly or resulted in the inevitable elimination of the shaman. Chinggis Khan’s suppression of the influence of the great shaman at his court can be seen as an epitome of this conflict. Even though we have no information, we can assume that the process was the same in other political structures with pan-Turkic tendencies. It is characteristic that the Old Turkic texts do not contain a single word about shamanism: we have already seen why. Nevertheless, it took real courage on the part of the sovereign to disregard the fear inspired in the Turkic peoples by all those who held religious or magical powers, including priests of the religions with which they came in contact.

Totemism was an equally formidable obstacle erected by the tribal regime against the empire. Classificatory and divisive by definition, it was diametrically opposed to the imperial ideal. The duty to which the sovereign was thus called to devote himself consisted of renouncing the various totems of the clan cults and insistently promoting the totem or totems of the ruling dynasty. The ruling dynasty, like every family, like every tribe, was descended either from two unit-

ed animals or from an animal that had had sexual relations with a human. The sex of the animal or human was not as important in this matter as was the complementarity of the different species. The latter was indicated more clearly and can be seen in the animal art of the steppes: a wildcat and a herbivore, a bird of prey and a rodent, an animal and a human. The myth of origin that was the most widely believed (because it simultaneously served the Türk, the Mongols, and other, smaller, groups) first presented a she-wolf who fed a young boy, married him, and gave him children, thus becoming his mother and wife at the same time. Later this was changed: a wolf was believed to have united with a doe. The content of this myth is particularly rich, especially among the Türk, because it involves the intervention of fertilizing water (the marsh where the she-wolf finds the child), the cave (where she gives birth), and even the bird of prey, which flies above the couple.

However, widespread as it is, this myth is only one among many. One could say that there are as many myths as there are Turkic peoples. Hence, the ancestor of the Kirghiz was a bull or a dog married to forty virgins; the ancestors of the Karakhanids, a lion and a camel. The Oghuz have demonstrated how a theme was able to change owing to unknown influences. Oghuz Kaghan, the eponymic ancestor of the confederation (whose name was etymologically *ogush*, “tribe”) was first named “colostrum” (*agiz*), then “young bull” (*oghuz*) after his ancestor, while the wolf remained his guide and protector. Later, the Oghuz had six birds of prey as “totems” when they were divided into six clans and twenty-two or twenty-four when the number of their tribes increased. The exaltation of one’s ancestors was emphasized in the Türk empire. Each year the sovereign either went in person or sent a high dignitary to the birthplace (cave) of his family. Türk flagpoles were topped with golden wolves’ heads; thus the wolf continued to lead his descendants into battle and also to march ahead of them in migrations.

The imperial ancestor was clearly a divine animal who came from the sky. He was “blue” like the sky and, as described in a relatively recent (post-Chinggisid) text, he could be associated with luminous rays that emanated from the sun and moon. Thus, two different traditions concerning the origins of great men seem to have existed—one involving the sexual union of animals, one involving light that came and impregnated a woman or that, itself a radiant daughter, seduced heroes like Oghuz Kaghan. Some attempt was made to combine the two traditions, but never with much success, not even in the case of the Mongols, whose *Secret History* reveals the efforts made in this respect, or in the Turkic *Oghuz name*, which owes much to the former.

The popular gods suffered less from the imperial religion. Any major force that contributed to the power of the empire was welcomed, and the Turkic peoples, with their fundamental beliefs in the diffused divine, opposed the disappearance of these gods. (Popular sentiment also had to be respected.) Nevertheless, their fate was not always the same.

Some were more or less forgotten, while others were promoted. Still others were obviously approached from a new perspective. The various *idug yer sub*, the “forbidden places,” the “master-possessors of the earth and waters,” were apparently reduced to those originally belonging to the imperial family. The mountains saw their strength become concentrated in two or three summits, such as the Ötükän, where the prince was seated. On the other hand, everything that appeared to be universal, common to all humankind, grew disproportionately. The earth goddess was often associated with the sky god and partook of his indivisibility. The sky himself, principally Tengri, became the sky god and was “blue,” “elevated,” and “endowed with strength”; he clearly became, at least eventually, “eternal,” the supreme god above all others because he was the god of the emperor and was as exceptional as the latter was. The sovereign was “born from the sky,” “resembled the sky,” and was some times the sky’s son, acting in his name as if he were his great priest; but he was also more, something like the sky’s projection, his “shadow,” as the Muslims would say. He directed the sky’s cult, the collective prayers and ceremonial sacrifices in which he had all his people participate. From then on, Tengri concerned all people, all animals, all vegetables. He gave them life, made them grow, and protected them through two specific gifts, *kut*, a viaticum and celestial “soul,” and *ülüg*, “luck.”

The national god of the Turkic peoples, Tengri, was also the god of all men and demanded that all recognize him, that is, that they submit to the Turkic *kaghan*—a demand that caused him to take on the characteristics of a god of war. The worst transgression was to revolt against the prince, that is, against Tengri, and the god knew no other punishment for this than death. Before sending death, Tengri “applied pressure,” sent messengers, and intervened in a purely psychological manner. In serious cases, he intervened simultaneously with the more popular gods. In medieval times, at least, there does not seem to have been any notion of retribution or post-mortem punishment.

If the popular religion has been passed over in silence by imperial Turkic texts, and often by others, there are nonetheless numerous deities that appear around the sky god without our knowing their connections to him: the earth goddess, the *idug yer sub* and other master-possessors, the sacred springs and rivers, the trees, fire, and the mountain. Whether this last represented the “god of the earth,” as with Boz Tengri, or whether it constituted the earth’s axis, the center of the empire, like the famous Ötükän (in the Greater Khingan Range), its role eventually became so great and imposing that it was generally designated in Central Asia, as the god of the earth. (For example, the sacred mountain of the Mongolians is the Burkhan Qaldun.) The most powerful and stable of these deities that appear around the sky god is Umai (often still called this today but also known by other names, for example, Aïyysyt among the Siberian Yakuts), a placental goddess of whom al-Kāshgharī says, “If one worships her, a child will be born.” She protects newborns and

mares and safeguards against puerperal fever. Certain attempts seem to have been made to bring her closer to Tengri; she has been called “close to the khatun,” that is, to the empress.

Finally, in addition to grandiose ceremonies (in terms of the empire), the imperial religion apparently promoted cults and new rites. The banner cult supported a particular soul, either of an ancestral animal (often evoked through a statuette or horse or yak tails atop a pole) or of one of the sovereign’s ancestors. This gave rise to the feast of the unfurling of standards and to solemn sacrifices. The imperial family adopted the ancient practice of bloodless animal slaughter: they were strangled, suffocated, or stoned. Funerary temples, erected structures that are the only Turkic temples outside of natural sanctuaries (caves, groves, springs, mountains) or domestic sanctuaries (tents, carts carrying idols), have unfortunately come down to us in a deplorable condition. What remains of them, the *balbal* and the *baba*, may also be an imperial innovation. The *balbal* are shapeless stones (eventually wood was used, for instance among the Cumans and Kipchaks) erected to represent enemies slain in combat or immolated during obsequies. The slain enemies represented by the *balbal* are supposedly at the service of their murderers. For great personages, these monoliths number in the hundreds.

The *baba* are the funerary statues of deceased princes and, occasionally, princesses. They were not viewed as images of the departed but as images of the living, who, after their death, remained among the people. Not of great aesthetic value, these huge, crude statues, of which a good number of specimens are known, represent the individual standing or seated, always holding a cup in the right hand, which is drawn back over the stomach. These works were the original image of the “prince in majesty” of classical Islam.

It is impossible to know whether belief in an afterlife in the sky was of imperial or popular origin, although there is no lack of presumptions that favor imperial origins: having come from the sky and belonging to it, the prince can only return there. In so asserting, one says that he “flies away,” later that he “becomes a gyrfalcon” or that he “climbs up to the sky” where he is “as among the living.” But there are also attestations of a celestial beyond for those who did not attain sovereignty—a place for those close to the prince, his servants, horses, concubines, and all those who could serve him or be useful to him. However, even if the sky was easily accessible to all—something we do not know—there was nothing to prevent the various souls of the same man, even those of a *kaghan*, from finding other places to inhabit (the tomb, the banner, the *balbal*, the *baba*), from being reincarnated in a new body, or from roaming the universe as an unsatisfied phantom.

BIBLIOGRAPHY

Much research has been done on the formation of religious concepts among the people of the steppes and of Siberia. Mario

Bussagli’s *Culture e civiltà dell’Asia Centrale* (Turin, 1970) is a good historical presentation of nomadic cultures. For earlier periods, see Karl Jettmar’s *Die frühen Steppenvölker* (Baden-Baden, 1964), translated by Ann E. Keep as *The Art of the Steppes* (New York, 1967). For the Huns, see Otto J. Mänchen-Helfen’s *The World of the Huns: Studies in Their History and Culture* (Berkeley, 1973), which has a complete bibliography. Wilhelm Barthold gives the historical context of medieval Central Asia in *Turkestan down to the Mongol Invasion* (1900), 2d ed., translated from the Russian (London, 1958). For a comprehensive overview of Turkic religion, see my *La religion des Turcs et des Mongols* (Paris, 1984), which has a vast but nonexhaustive bibliography. For contemporary religious practice, Uno Harva’s *Die religiösen Vorstellungen der altaischen Völker*, “Folklore Fellows Communications,” no. 125 (Helsinki, 1938), is a useful reference work, although quite biased. It has been translated as *Les représentations religieuses des peuples altaïques* (Paris, 1959). Wilhelm Radloff has devoted himself to a vast study, most of which can be found in *Aus Sibirien*, 2 vols. in 1 (Leipzig, 1884). Wilhelm Schmidt collected considerable documentation in volume 9 of his *Der Ursprung der Gottesidee* (Münster, 1949), see also volumes 10–12 (Münster, 1955). On the subject of funeral rites and the beyond, see my *La mort chez les peuples altaïques anciens et médiévaux* (Paris, 1963). On the position of animals and vegetables, see my *Faune et flore sacrées dans les sociétés altaïques* (Paris, 1966). For a study of the phenomenon of shamanism, see Mircea Eliade’s *Shamanism: Archaic Techniques of Ecstasy*, rev. & enl. ed. (New York, 1964). For examples of pre-Islamic relics in Turkic Islam, see John K. Birge’s *The Bektashi Order of Dervishes*, “Luzac’s Oriental Religious Series,” no. 7 (1937; reprint, New York, 1982), and my *Les traditions des nomades de la Turquie méridionale* (Paris, 1970). Much work on Turkic religion has been widely published in journals, notably in *Central Asiatic Journal* (The Hague, 1957–). Noteworthy articles in English include those by John Andrew Boyle in *Folklore*: “A Eurasian Hunting Ritual,” *Folklore* 80 (Spring 1969): 12–16; “Turkish and Mongol Shamanism in the Middle Ages,” *Folklore* 83 (Autumn 1972): 177–193; and “The Hare in Myth and Reality: A Review Article,” *Folklore* 84 (Winter 1973): 313–326. See also *Glaubenswelt und Folklore der sibirischen Völker*, edited by Vilmos Diószegi (Budapest, 1963).

Revised Bibliography

TURNER, HENRY MCNEAL. Henry McNeal Turner (1834–1915) was the twelfth bishop of the African Methodist Episcopal (AME) Church and the U. S. Army's first African American chaplain. He studied history, theology, law, Latin, Greek, Hebrew, and German and received an LL.D from the University of Pennsylvania in 1872. Turner also served as vice president of the African Colonization Society (1877) and was a major spokesperson for the Back-to-Africa movement. The movement was an African American led effort that advocated their emigration to Africa. Most black leaders had been opposed to such schemes since the option was first pursued in 1816 with the formation of the American Colonization Society by whites. However, emigration became a viable option for some blacks in the 1880s, when many black leaders were becoming increasingly disillusioned about the prospects of achieving equal rights in America. Matters became especially bleak in 1883 when the United States Supreme Court outlawed the Civil Rights Act of 1875. This action by the Supreme Court paved the way for state legislatures to enact laws that segregated all aspects of southern society. In 1896 segregation was upheld in the *Plessy v. Ferguson* Supreme Court decision that set forth the "separate but equal" doctrine. Turner's career was profoundly shaped by these events. Elected to the Georgia legislature during the Reconstruction era following the Civil War, Turner became known as the "Apostle of Foreign Missions" because of his travels to West Africa to found two churches, one in Sierra Leone and the other in Liberia. Turner was also famous for frequently asserting that "God is a Negro."

Turner was converted to Christianity at the age of thirteen while attending a Methodist revival. At the age of fifteen he took a job as a janitor with a law firm in Abbeville, South Carolina. Turner's intelligence so impressed his employers that they provided him with his basic education in law and history. He received his preacher's license in 1853 and traveled as an itinerant evangelist throughout the South as far west as New Orleans. He also traveled to Missouri and then to Baltimore, where he furthered his study of grammar, Latin, Greek, Hebrew, and German while overseeing a small mission congregation. Turner was ordained a Methodist deacon in 1860 and an elder in 1862.

Turner married Eliza Peacher, the daughter of a wealthy African American house builder in Columbia, South Carolina, in 1856. The threat of slavery that hung over free blacks in the South before the Civil War caused Turner to move with his family to St. Louis, Missouri. Over the course of the next five years he filled pastorates in Baltimore, Maryland, and Washington, D.C.

Turner became a friend of Charles Sumner, Thaddeus Stevens, and other influential Republicans in the years before the Civil War. When war broke out in 1861, Turner was commissioned as the first black chaplain in the U.S. Army. After the war Turner helped to establish AME congregations throughout Georgia, but he was frustrated by the lack of trained clergy to continue his work.

With Congress's passage of the Reconstruction Acts in 1867, Turner involved himself more directly in politics by helping to organize Georgia's Republican Party. He was elected to Georgia's House of Representatives from the city of Macon. The white-controlled legislative body, however, ousted the African American representatives in 1868. After Turner protested this injustice, he received threats from the Ku Klux Klan. In 1869 he was appointed postmaster of Macon by President Ulysses S. Grant, but he was forced to resign from this position a week later. He finished his term in the Georgia legislature in 1870, after which he moved to Savannah, Georgia, where he served in local churches (including the prestigious St Philip's AME Church) and served as an inspector for the U.S. Customs Service.

In 1876 Turner assumed the management of the AME Book Concern in Philadelphia and the editorship of the *Christian Recorder*. In 1880 he became the bishop of the denomination in a hotly contested election.

Turner was extremely effective as bishop. After the Supreme Court circumscribed the civil rights of African Americans in 1883, Turner's critique of mainstream American society became scathing. Equally scathing were Turner's criticisms of black meekness in the face of white oppression. He urged blacks to defend themselves against mob violence and saw his educational and missionary initiatives as vehicles for enhancing black self-worth and freedom. He published a catechism, a hymnal, and such books as *The Genius and Theory of Methodist Polity* (1885) and *The Black Man's Doom* (1896). He founded the *Southern Christian Recorder* in 1889 and the *Voice of Missions* in 1892, as well as encouraging the organization of the Women's Home and Foreign Missionary Society (1896) and the formation of the *Women's Christian Recorder*. Turner was also the first AME bishop to ordain a woman to the office of deacon, which he did in 1885. Turner served as the editor of the *Theological Institute* and as the denomination's historiographer from 1908 to 1912. He died in 1915 while traveling on church business. Turner is numbered with Richard Allen (1760–1831) and Daniel Payne (1811–1893) as one of the greatest bishops in the history of the African Episcopal Methodist Church.

JAMES ANTHONY NOEL (2005)

TURNER, VICTOR (1920–1983). Scottish-born American anthropologist and comparative religionist. On the basis of fieldwork in central Africa, Victor Witter Turner produced the richest ethnographic achievement of the period after World War II, and he explained the nature of religious ritual and symbolism in an African society in more detail than anyone had before.

Turner was born in Glasgow, Scotland. In 1943, in the midst of his five years of military service, he married Edith Davis, who was to collaborate with him in field research and writing throughout his career. He received his B.A. degree with honors in anthropology in 1949 from the University of London, where he studied with some of the leading figures of structural-functionalism: A. R. Radcliffe-Brown, Meyer Fortes, Raymond Firth, and Edmund Leach. He went on to graduate study at the University of Manchester under Max Gluckman and was introduced to conflict theory and political anthropology. During 1950–1954 he was a research officer at the Rhodes-Livingstone Institute in Lusaka, Zambia (then Northern Rhodesia), where he undertook, with his wife, a two-and-a-half-year study of the Ndembu people. In 1954 he returned to the University of Manchester and was appointed to the positions of lecturer and senior lecturer in social anthropology. From 1963 to 1968 he was professor of anthropology at Cornell University, and from 1968 to 1977 he was professor of anthropology and social thought at the University of Chicago. From 1977 until his death he was the William R. Kenan Professor of Anthropology at the University of Virginia. He held numerous fellowships, visiting appointments, and distinguished lectureships at universities in the United States and around the world. He organized major international conferences and was editor of the important series “Symbol, Myth and Ritual” published by Cornell University Press.

Like other leading anthropologists, Turner’s ideas were shaped by his field experience. In the course of fieldwork he decided to abandon the social structural emphasis of his teachers and their bias against religion and to pursue a micro-sociological investigation of the actual processes of Ndembu village life that, he found, were articulated and resolved in ritual performances. Since Ndembu society is prone to conflict because of its inherent inconsistencies, he also rejected the static and mechanistic models of functionalism together with its goal of constructing universal social laws. Instead, he treated Ndembu society as a dynamic social process whose events were analyzable as “social dramas,” consisting of phases of breach, crisis, redressive action, and reintegration (or schism), in which ritual played a central role. He also set

aside the analytical perspective and alien categories of the outside observer and oriented his studies around the experiential context and cultural criteria of the Ndembu world, an approach that he later called the “anthropology of experience.”

Although his initial study, *Schism and Continuity in an African Society* (1957), was labeled “difficult” and “experimental,” Turner continued to refine his ideas about social drama and ritual process. He wrote one of the most detailed and perceptive studies of African divination, *Ndembu Divination: Its Symbolism and Techniques* (1961), viewing the subject in the context of social process and analyzing its use of social and ethical symbolism. He also wrote a short but brilliant clarification of methodological issues in African witchcraft studies, “Witchcraft and Sorcery: Taxonomy versus Dynamics” (1964), in which he treats a subject that had become bogged down in functionalist theorizing and confused definitions. He argues that witchcraft has to be viewed as a complex matter involving social process, cosmology, ecology, and biological factors. In addition he wrote a pioneering study of an Ndembu cult of affliction, *Chihamba, the White Spirit* (1962). In this work he attempted to go beyond the examination of social process and symbolic action and to formulate the implicit content of Ndembu thought by means of Thomistic concepts, long before the subjects of ethnophilosophy and ethnotheology had gained currency in anthropology. It was a venturesome effort and did not receive an entirely positive response. In subsequent and more detailed studies he examined Ndembu ethnomedical and ethnobiological concepts in the context of cults of affliction. One of these studies, *The Drums of Affliction* (1968), became the *locus classicus* of later scholarship in the field of African medical anthropology.

In the course of these ritual studies, Turner began to develop a theory of religious symbols. He noted in the field that certain symbols were dominant in ritual contexts and that they exhibited properties of condensation, unification of disparate significata, and polarization of meaning. Because of such semantic complexity, contextual variation, and attachment to ritual sequence, Turner rejected as overly simplistic the structuralist method of interpreting symbols in terms of synchronic, binary relationships. Instead, he proposed a threefold hermeneutic, based upon “exegetical,” “operational,” and “positional” levels of meaning. Moreover, he suggested that in the context of intense ritual experience, the ideological, or “normative,” and the sensory, or “orectic,” poles of meaning came together and reinforced one another in such a way as to produce powerful emotional effects and real transformations of character and social relationships. Herein, Turner felt, lay the power and efficacy of ritual.

Although he wrote two detailed accounts of Ndembu boys’ and girls’ initiation rites (the first appearing in *The Forest of Symbols*, 1967, the second in *The Drums of Affliction*, 1968), it was in the context of a brief comparative study of rites of passage, “Betwixt and Between: The Liminal Period

in *Rites de Passage*" (1964), that he began to focus upon the work of the Belgian anthropologist Arnold van Gennep. He found van Gennep's analysis of rites of passage into the phases of separation, threshold or *limen*, and reaggregation to be not only a useful cross-cultural model but also the source of a fundamental insight: the regenerative and transformational possibilities of ritual liminality. Whereas van Gennep emphasizes only the outward change of social status accomplished by these rites, Turner emphasizes the inward, moral, and cognitive changes that occurred, and where van Gennep examines only the social aspects of the liminal state, Turner examines its deconstructive and reconstructive processes. Thus Turner concentrated upon the heretofore neglected, strange, and amorphous properties of symbols and actions of the liminal phase. He regarded such symbols and actions both as channels for communicating basic social and cultural values and as channels for discovering new moral and metaphysical insights that tend to subvert as well as support established religious and social orders.

Turner developed his theory of liminality further in the seminal work *The Ritual Process* (1969). Here he defines the social form of liminality as *communitas*, the direct, egalitarian encounter and fellowship between people as people, which characterized both temporary ritual states and certain more enduring social groups. In this context he defined three forms of *communitas*, the "spontaneous," the "ideological," and the "normative," and he elaborated a host of contrasting liminal and status system forms. In addition to illuminating past religious and political movements as well as popular currents in American society of the 1960s, Turner brought his theory of liminality to bear upon the phenomenon of religious pilgrimage, a generally ignored subject in the history of religions. His contribution, presented in another important essay, "The Center Out There: Pilgrims' Goal" (1973), was to see pilgrimage as a rite of passage whose goals include both the experience of *communitas* and the liminal encounter with the sacred at the pilgrimage center. There followed a series of lectures and articles on this theme, and they inspired other scholars to take up the subject. Together with Edith Turner, he explored the subject further in relation to Mexican, Spanish, and Irish pilgrimage sites in a fieldwork study, *Image and Pilgrimage in Christian Culture* (1978). His subsequent search for liminality in the modern secular world led to his use of the word *liminoid* to represent the nonreligious genres of art, sport, and performance.

Although Turner often emphasized his departure from social functionalism, his vision of religion and society remained partly indebted to it. Like Émile Durkheim, he saw social order to be dependent upon ritual and ceremonial performances, and like Max Gluckman, he emphasized the cathartic effects of ritual reversal that helped to restore and legitimate established social structures. But he went beyond both Durkheim and Gluckman by examining the processes of social change and the ways in which ritual helped to create new social realities. His work, along with that of anthropolo-

gists Claude Lévi-Strauss, Clifford Geertz, and Mary Douglas, also helped to revive comparative studies in religious anthropology, which had been abandoned by British and American functionalists. But, although he agreed with Douglas and Geertz on the cognitive importance of ritual symbols, he refused to tie them closely to social structure as in Douglas's theory or to construe them as "texts" according to Geertz's formulation.

Following the American anthropologist Edward Sapir, Turner held that culture is not a completely or consistently articulated system, a set of dogmas or logically arrayed or Lévi-Straussian symbolic codes, but rather a changing entity, influenced by "root paradigms," that is, by axiomatic frames, or deep myths, that propel and transform people and groups at critical moments. In this respect Turner came to see that the Ndembu are not exceptional but typical, and thus that social order is fundamentally "processual" in form and "dramatic" in character.

Turner called his analytical method "dramatic," because, like Freud, he believed that examination of disturbances of the normal and the regular often gives greater insight into the normal than does direct study. Because of the episodic character of social systems, Turner preferred the sociologist Kurt Lewin's image of society as "social fields." He also saw affinities with the phenomenological sociology of Alfred Schutz and his followers, who regarded culture as a constantly negotiated set of meanings, and he found useful Wilhelm Dilthey's theory that the meanings and values of life are to be found in the "structures of experience" and not in the formal categories of thought. This approach led him to welcome a shift in anthropology away from such concepts as structure, equilibrium, function, and system to such concepts as process, indeterminacy, and reflexivity, and he envisioned a new anthropology based upon a synthesis of disciplines instead of the usual disciplinary specialization. Turner himself was not, however, given to sustained theoretical exposition, and he often let unclarity remain in his writings, for which he was sometimes taken to task by his colleagues. He preferred to forge his concepts as he went along. His approach was regarded as highly original, and he put forward his ideas with a strong personal conviction that gave his analyses great force.

His final studies led him into the field of performance theory. In theater, especially experimental theater in the United States in the late 1960s and early 1970s, Turner saw the same kind of liminal reflexivity, the public cognizance of social situations, that he encountered in rituals associated with the redressive phase of Ndembu social dramas. Together with the drama theorist and director Richard Schechner, Turner understood theater to be an important means of communicating a society's self-reflections and a means of cross-cultural understanding. Thus he encouraged anthropologists to study theatrical performances as well as ordinary social life. In the course of his teaching he also guided students in the performance of ethnographic rituals as a means

of learning about ritual and about the societies from which the students came.

At this juncture, he became interested in the subject of the neurobiology of ritual. It appeared that the contrasting functions of the cerebral hemispheres, the right and left brain, might correspond to the two aspects of society Turner had been looking at, structure and liminality. In a major essay, "Body, Brain and Culture" (1983), Turner speculated that the right hemisphere might also be the source of universal symbolic patterns, such as C. G. Jung's archetypes or his own root paradigms and deep myths, which seemed to exist at the subliminal level until activated and brought into the articulate realm of the left brain. The existence of different brain levels, especially the neocortex and the midbrain, also seemed to resemble the ideological and orrectic poles of dominant symbols. Perhaps at the height of ritual, Turner speculated, it was the interaction between these two levels with the right and left hemispheres of the brain that produced the transformational effect that was essential to successful ritual performance. Although these were but speculations about the possible biological mechanisms of the ritual process, they were consistent with Turner's fundamental conviction that it was in the dynamics and dramatics of social, ritual, and theatrical events that one came to understand the lives of others and oneself.

BENJAMIN C. RAY (1987)
Revised Bibliography

TURTLES AND TORTOISES. There is a widespread belief that the earth rests on the back of a turtle or tortoise. This archaic idea is found not only among North American Indians but also in South Asia and Inner Asia. The turtle now appears even as a symbol of the entire universe (e.g., in China). Moreover, according to creation myths involving an earth diver, the turtle, sometimes as an incarnation of the divine being, plays a prominent part in the cosmogony of various cultures.

According to the Maidu in California, a turtle dived to the bottom of the primeval ocean and procured a little soil under its nails. When it surfaced, God scraped its nails carefully and made a ball like a small pebble. The ball of soil then grew miraculously until it became as large as the universe itself. The Yokut narrate how at the time of beginning the eagle and the coyote sent a turtle into the waters. The motif of the turtle's successful dive is known also among the Algonquin. According to the Onondaga and the Mohawk (i.e., the Iroquois), it was a turtle that directed several different animals into the ocean; a beaver tried in vain, an otter also failed, but a muskrat returned successfully with soil in his claws and mouth. This soil was placed on the back of the turtle, and then the miraculous growth of earth began.

Inner Asia has preserved similar stories. According to the Buriats, in the beginning there was nothing but water and a turtle. God turned the turtle on its back and built the world on its stomach. In other versions, Mandishire (the *bodhisattva* Mañjuśrī) transforms himself into a great turtle and supports the earth he has made on the surface of the waters.

The great tortoise is often represented in India as the sustainer of the four elephants upon whose backs the world rests. In the *Mahābhārata* the tortoise, as an avatar of Visnu, supports the earth when the gods and demons churn the primeval ocean to obtain ambrosia.

In China, the turtle symbolizes the universe; its dome-shaped back represents the sky, while its belly, square in

shape, stands for the earth. It also appears as the god of the waters, presiding over the north, one of the four cardinal points of the universe. Black in color, it is symbolically associated with winter and other aspects of the *yin*, or female principle; as in ancient Egypt and Greece, the tortoise in China is a symbol of erotic power and fecundity. Moreover, the great age to which the tortoise supposedly lives has made it a symbol of longevity and immortality; in the mythico-iconographical tradition the tortoise often forms a complex together with immortality, the moon, and paradise. There are “stone” turtles in South Korea and southern Japan (Kyushu), at its seashore facing the Korean Peninsula. Dating from prehistoric times, these monuments indicate that people believed in the turtle bestowing new life or immortality on the dead and escorting them to the otherworld far across the sea or to paradise under the waters.

BIBLIOGRAPHY

On the turtle in cosmogonic myths, much useful information has been collected by Charles H. Long in his *Alpha: The Myths of Creation* (New York, 1963), pp. 192ff. On turtle symbolism in China, see Marcel Granet's brilliant discussion in his *La pensée chinoise* (1934; reprint, Paris, 1968), pp. 173ff. Johannes Maringer has studied “stone” turtles in East Asia in his article “Vorgesichtliche Grabbauten Ostasiens in Schildkrötenform und ihr mythischer Prototyp,” *Antaios* 5 (1963): 368–374.

Revised Bibliography

TU-SHUN SEE DUSHUN

ṬŪSĪ, NAṢĪR AL-DĪN. Naṣīr al-Dīn Ṭūsī (Muḥammad ibn Muḥammad ibn Ḥasan, AH 597–672/1201–1274 CE), addressed in general Islamic literature as *khawājah* (master) and the *muḥaqqiq* (scholar) of Ṭūs, was a Persian Shīʿī philosopher, theologian, mathematician, astronomer, and statesman. He is by far the most celebrated scholar of the thirteenth century in eastern Islamic lands. Very little is known about his childhood and early education, apart from what he reveals in his autobiography, the *Sayr wa sulūk*. He was born in Ṭūs, in northeastern Iran into an Ithnā ʿasharī (Twelver) Shīʿī family and died in Baghdad. He lost his father at a young age. Fulfilling the wish of his father, Ṭūsī took learning and scholarship very seriously and traveled far and wide to attend the lectures of the renowned scholars of the time. In a relatively short period, Ṭūsī mastered a number of disciplines. At a time when religious education was a priority, especially in his own family, which was associated with Twelver Shīʿī scholars, Ṭūsī seems to have shown great interest in mathematics, astronomy, and intellectual sciences.

In the *Sayr wa sulūk*, Ṭūsī gives a brief account of his theological and philosophical education, but he does not go into details about the scholars with whom he became acquainted, nor of his studies in mathematics and astronomy, which latter became important areas of investigation for him. But we know from other sources that Ṭūsī was a precocious learner and by the time he was seventeen he had studied the philosophy of Ibn Sīnā (d. 1037) with Farīd al-Dīn Dāmād (d. c. 1246) and attended the lectures of Quṭb al-Dīn Sarakhsī (d. 1221) in Nīshāpūr, where he is said to have met the famous poet and mystic Farīd al-Dīn ʿAṭṭār (d. 1220). At around this time, it is also certain that he studied jurisprudence.

At the age of twenty-two, Ṭūsī joined the court of Naṣīr al-Dīn Muḥtashim (d. 1257), the Ismāʿīlī governor of Qūhistān, in northeast Iran, where in his own words he was accepted into the Ismāʿīlī community. It is probable that in Nīshāpūr, which at the time was an active center of Ismāʿīlī preaching, he had become acquainted with its teachings. Later, in a journey from Iraq to Khurāsān, he met Shihāb al-Dīn Muḥtashim (d. c. 1245), a highly renowned Ismāʿīlī scholar, and gradually he became more acquainted with Ismāʿīlī teachings through the religious writings of the Nizārī Ismāʿīlī Imām Ḥasan ʿAlāʾ Dhikrihī al-Salām (d. 1166).

In Qūhistān, Ṭūsī developed a close personal relationship with the governor and dedicated to him and his family a number of scholarly works, such as the *Akhlāq-i Naṣīrī*, *Akhlāq-i Muḥtashimī*, and *Risāla-yi muʿīniyya*, which ultimately paved the way for his move to Alamūt, the seat of Ismāʿīlī political power in Iran.

Apart from editing, translating, and composing a variety of philosophical and scientific works, Ṭūsī produced a number of Ismāʿīlī texts, adding his scholarly background and talents to the unique collection of literature and archival materials in Alamūt. An example of this genre is his strong philosophical and esoteric interpretation of Ismāʿīlī thought, as represented in the *Rawda-yi taslīm* in particular.

The Mongol invasions of western Asia led to the collapse of Ismāʿīlī political power and the massacre of Ismāʿīlīs, who were perceived by the Mongols as a serious threat. Under these circumstances, Ṭūsī sought alternative patronage and was able to obtain employment in the emerging court of the Mongol conquerors, who wished to show support for learning and science. He also embarked on writing a series of Twelver Shīʿī works.

In the Mongol court, Ṭūsī witnessed the fall of the Abbasid caliphate, and after securing the trust of Hülegü (d. 1265), he was given the full authority of administering the *awqāf* (religious foundations). His primary concern during this period was to protect the life of scholars and their freedom to pursue learning. He also established probably the most important observatory and center of scientific learning of his time in Marāghah, in the northwest of Iran. Under

these circumstances Ṭūsī acted as a senior advisor to Hūlegū and continued his scholarly activities and writing on various aspects of Shī'ī thought.

The corpus of Ṭūsī's writings comprise approximately 135 titles on a wide variety of subjects, including astronomy, ethics, logic, mathematics, philosophy, theology, Sufism, poetry and popular sciences. Some of these works—for example, his commentary on Ibn Sīnā's *al-Ishārāt wa-al-tanbīhāt* on philosophy and the *Akhlāq-i Nāṣirī* on theoretical and practical ethics—are still used as textbooks in many centers of learning in the Muslim world.

Ṭūsī's interest in ethical writings begun in Quhistān when, in answer to the request of Nāṣir al-Dīn Muḥtashim, he produced a number of ethical works, namely the Persian translations of Ibn Muqaffah's (d. 759) *al-Adab al-wajīz lil-walad al-ṣaqīr*, *Akhlāq-i Muḥtashimī*, and *Akhlāq-i Nāṣirī*, as well as the twenty-second chapter of the *Rawda-yi taslīm*, which, in line with the content of *Akhlāq-i Nāṣirī*, could be classified as a text on philosophical ethics.

A proper scholarly investigation into Ṭūsī's contribution to philosophy, astronomy, trigonometry, and mathematics has only recently begun. His importance in religion lies partly in his being one of the subtlest and most learned of the Shī'ī theologians, and partly in his application of philosophical ideas and methods to Islamic contexts and problems, as well as his active involvement in the politico-religious debates of his time. Within the overall domain of Islamic philosophical thinking, by defending Ibn Sīnā's philosophy, Ṭūsī should be considered as representing a revival of philosophical thinking in the eastern Islamic lands. For him, differences between Muslim sects and persuasions were merely theological debates, allowing the partisans to move freely from one stand to another without necessarily having to take parochial positions. It is from such a perspective that his ideas contributed to the development of *ḥikmah muta'āliyah* (higher wisdom), later developed by Mullā Ṣadrā (d. 1641) and the school of Isfahan.

BIBLIOGRAPHY

There are still no comprehensive studies on Ṭūsī in European languages. See H. Daiber and F. G. Ragep, "al-Ṭūsī, Nāṣir al-Dīn," in *Encyclopaedia of Islam*, new edition (Leiden, 1999), vol. X, pp. 747–757; as well as Wilferd Madelung, "Nāṣir al-Dīn Ṭūsī's Ethics between Philosophy: Shi'ism and Sufism," in *Ethics in Islam* (Ninth Giorgio Levi Della Vida Conference, May 6–8, 1983; Malibu, Calif., 1985), edited by Richard G. Hovannisian, pp. 85–101; Hamid Dabashi, "Khwāja Nāṣir al-Dīn al-Ṭūsī: The Philosopher/Vizier and the Intellectual Climate of His Times," in *History of Islamic Philosophy*, edited by Seyyed Hossein Nasr and Oliver Leaman (London, 1996), pp. 527–584; Herman Landolt, "Khwāja Nāṣir al-Dīn Ṭūsī, Ismā'ilīsm and Ishrāqī Philosophy," and Farhad Daftary, "Nāṣir al-Dīn al-Ṭūsī and the Ismailis of the Alamut Period," in *Nāṣir al-Dīn Ṭūsī*, ed. N. Pourjavady and ž. Vesel (Tehran, 2000), pp. 13–30 and 59–67, respectively. Translations of some of Ṭūsī's works include: *Taṣawwūrāt*, edited and translated into En-

glish by Vladimir A. Ivanow as *Rawāatu't-Taslīm, Commonly Called Taṣawwūrāt* (Leiden, 1950), and into French by Christian Jambet as *La convocation d'Alamūt: Somme de philosophie ismaélienne* (Lagrasse, France, 1996); *Akhlāq-i Nāṣirī*, translated in English as *The Nasirean Ethics* by G. M. Wickens (London, 1964); *al-Tadhkirah fī 'ilm al-bay'a*, edited and translated into English by F. G. Ragep in *Nāṣir al-Dīn Ṭūsī's Memoir on Astronomy* (New York, 1993), and the *Sayr wa sulūk*, edited and translated into English by S. J. Badakhchani as *Contemplation and Action: The Spiritual Autobiography of a Muslim Scholar* (London, 1998).

TWELVERS SEE SHIISM, *ARTICLE ON* ITHNĀ 'ASHARĪYAH

TWELVE TRIBES. The Twelve Tribes (previously known as the Northeast Kingdom Community Church because of its location in the northeast corner of Vermont, and later as the Messianic Communities) is a communal, millenarian Bible-based movement that emerged from the Jesus Movement in the 1970s counterculture of the United States. Many of the Christian sects that emerged from this movement, such as the Children of God (the Family), Shiloh, and Jesus People USA, developed communal patterns of living. The Twelve Tribes is one of the few Jesus groups that survived from this period without disbanding or being absorbed into the U.S. religious mainstream.

Elbert Eugene Spriggs (b. 1937) had worked as a personnel manager and former schoolteacher when he joined a charismatic church in Glendale, California, in 1971. When the church disbanded, he moved back to his hometown, Chattanooga, Tennessee, with his new wife, Marsha Ann Duval. There the couple set up a small coffee shop in 1972 called the Light Brigade, where they held Bible study groups in the evenings. Attracting both young conservative Christians and hippies from the "lost generation," these Bible study sessions extended long into the night, so people brought their sleeping bags and gradually moved in with the Spriggses, who shared their resources with their flock. The coffee-house ministry expanded to include five Victorian houses that were renovated by Spriggs and his followers. They also opened as a "court of the gentiles" a small health-food café called the Yellow Deli. The Spriggses attended the First Presbyterian Church with their flock, and worked closely with the New Covenant Apostolic Order, a short-lived Christian group.

The group's break with the mainstream Christian church occurred in 1975, when the Spriggses and their friends arrived for the Sunday morning service at the local Presbyterian church and discovered that the service had been canceled on account of the Super Bowl. The Spriggses and their friends began to hold Sunday services in their commu-

nal homes, and called themselves the Vine Community Church. Spriggs began to baptize members in the local pond, an act that alienated the Chattanooga Christian community, because he was not ordained in any denomination. They also began observing the Saturday Sabbath, following Jewish custom. In 1980 the group relocated to Island Pond, Vermont, where they were called the Church in Island Pond, and as they spread through New England, they adopted a new name, the Northeast Kingdom Community Church.

“Gene” Spriggs is recognized by his followers as an “Apostle” (authoritative teacher). Although all community members believe that they are inspired by God and have the gift of prophecy, they believe that he exhibits these gifts on a higher level, and they call him *Yoneq* (Hebrew for “sapling”). This millenarian movement has grown to around 2,500 members (half of them are second and third generation) living in communities in nine countries on four continents as far-flung as New Zealand, Brazil, England, France, Germany, Spain, and Canada. Their early communities were established in New England—Vermont, Rhode Island, and Massachusetts, where the largest concentration of members can be found. Each community names itself after its local town or area.

Over their thirty-year history, the Twelve Tribes have come to believe that they are the restoration of the messianic Hebrew New Testament community of the first century CE. This belief evolved through members’ study of the Bible and personal experiences. They reject the “white-bread” Christianity of mainstream churches that worship a remote impersonal God and does not sustain the soul, and they replace it, both literally and symbolically, with the “wholegrain, home-baked bread” of their living communal “church” that seeks to bring about the return and loving union with Yahshua (Jesus). The community attempts to restore the New Testament church by developing a physical and artistic culture that interprets first-century messianic Judaism in twenty-first-century terms. They are divided into “tribes” that correspond to their geographical regions. Men grow full beards and women cover their heads with scarves, following the Jewish custom.

In the “church” (community), members follow a strict code of ethics, dress, and diet, and must surrender to the hierarchical authority that descends from God through Yoneq, the Elders, the Teachers, the fathers, and the mothers, to the children. The Twelve Tribes is dedicated to ushering in the millennium by “raising up a people” who are truly loving and free of sin and selfishness. The church defines itself as the “pure and spotless bride” of *Revelation* who is preparing for the return of her king, Yahshua—the second coming. The path of the Tribes is the restoration of the primitive Jewish/Christian church, as described in *Acts* 2:37–47 and 4:32–35. This restoration is both theological and practical, and has led to a whole new way of life based on renouncing possessions, worldly habits, and attachments, and sharing all goods in common.

Members give each other Hebrew names, accessed through inspired moments of prophecy. They consider themselves to be part of the Commonwealth of Israel forming in the last days, bound by the New Covenant in the blood of the Messiah (*Eph.* 2:12). The Tribes are strongly evangelistic, but instead of sending out missionaries to spread their doctrines, they seek to win converts by inviting outsiders into their communal houses in order to demonstrate the reality of a loving, sharing, orderly communal and family life. Visitors are invited to share their meals, and to witness their happy family life and joyful revival meetings, which combine circle dancing, singing, sermons, and prayer. Once there, visitors encounter a unique, spiritual culture that resembles the historic Shaker villages in its “hands to work, hearts to God” ethic. Twelve Tribes women are skilled in the crafts of baking, painting with watercolors, sewing and macramé, and making soaps and body lotions. The men are skilled in leatherwork, cabinet-making, candle-making, and making stained-glass windows. Their renovated Victorian houses preserve the historic style, and they repair antique furniture, expressing their doctrine of restoration. Their children sing and compose an impressive repertoire of original devotional songs. Boys work alongside their fathers in the candle factories and farms, and daughters assist their mothers in the kitchen and sewing rooms. All members spend at least two hours a day in devotional dancing and singing, and many play and even build their own musical instruments.

Another missionary strategy employs the community’s famous double-decker buses, which appear at Grateful Dead festivals, the Billy Graham Crusade, the Rainbow Gathering, and other mass events. Men, women, and children make friends by offering hospitality that includes free distribution of wholegrain baked goods, apple cider tea, and first-aid services, and members invite the crowd to join in their circle dancing and musical jams. They distribute the *Freepaper*, their missionary tract which portrays a utopian vision of perfect, loving families and service to one’s brothers and sisters preparing for the return of Yahshua.

Considering that this new religious movement is relatively small and lacks the controversial features of some other Christian millennial groups—such as the use of firearms or illegal drugs, and polygamy or “free love”—level of conflict between the group and the larger society has been extraordinarily high. The trouble began in Chattanooga in the mid-1970s with a series of eight kidnappings and “deprogrammings” of Spriggs’s youthful followers by Ted Patrick, the cofounder of FREECOG, the first anticult organization that formed in opposition to the Children of God (COG). FREECOG and was superseded by the nationally based Citizen’s Freedom Foundation, which networked with the media, labeling the Tribes a cult and attributing their success in winning converts to brainwashing. The conflict escalated in 1982 when a series of custody battles launched by parents who had left the community drew attention to the group’s sectarian methods of child rearing and their strict, Bible-

based practice of corporal punishment of children. Stigmatizing news reports proliferated, portraying the Island Pond Community Church as a scary, gothic, puritanical “neo-Salem,” where children were routinely neglected and abused.

The Twelve Tribes guidelines stipulate that children who do not obey upon first command must be punished, and the millenarian rationale is that they must be alert and ready to respond to Yahshua’s call when he returns. Chastisements usually consist of a few blows to the palm with a flexible stick, and they must not be given in anger. Through this discipline, parents believe that their children will achieve eternal life; otherwise, they are in danger of “dying” into sin.

On June 22, 1984, the Island Pond Community was the target of a massive raid to seize their children. Ninety Vermont state troopers and fifty social rehabilitation services workers arrived in the predawn hours with a court order; they searched the households and took 112 children into protective custody. Parents accompanied their children to the hearing in Newport, Vermont, where District Judge Frank Mahady held forty individual hearings in one day. At the end of the day, he ruled that the search warrant issued by the state was unconstitutional, and he noted that the children involved had been detained solely in order to provide evidence for charges of abuse, and that no concrete evidence other than hearsay had been produced by the state. The church-state confrontation thus ended abruptly, and the children were returned to their parents. Ten years after the raid, the Twelve Tribes held a festival (which has become an annual event) to commemorate their “deliverance” from the raid. Some of the children of the raid, many of whom are married with their own children, speak out in defense of their parents and their community.

The Tribes have also become a target for Christian countercult groups who are combating Christian heresy. Reverend Robert Pardon founded the New England Institute of Religious Research, and through his website he disseminates discrediting accounts of the Twelve Tribes’s Apostle, their “heretical” doctrines, and what he perceives to be excessive control by the group over the lives of individuals.

The two executive leaders of the Tribes are a married couple, Eddie Wiseman (“Hakam”) and Jean Swantko, a lawyer who experienced a religious conversion while working on Wiseman’s legal defense. They have responded to anticult pressure and social-control efforts by secular authorities by opening up dialogues with scholars at conferences, holding press conferences, and making persistent efforts to correct misinformation and reach out to their critics. The Twelve Tribes, who have adopted the colonialist hero Roger Williams as a sort of patron saint, have managed to realize their own “separation of church and state” by preserving strict boundaries between their community and the “sinful” society that surrounds them, while softening some of their sectarian attitudes. Their millenarian drama has evolved from an uncompromising and imminent catastrophic scenario in which all outsiders will fall into a lake of fire, to a more grad-

ual process in which, before the return of Yahshua, the Tribes must raise up a people of seven generations before the Yo-bell, the last trumpet of revelations, will be blown. A new revelation laid out in the *Stone Kingdom Freepaper*, a special edition of the *Freepaper*, adds a middle ground between the saved and the damned, where “just men,” or people who have never encountered the Tribes, will live.

TWINS

This entry consists of the following articles:

AN OVERVIEW
BALTIC TWIN DEITIES

TWINS: AN OVERVIEW

The notion of duality, which must be distinguished from dualism, is common to every human culture. It finds a particular expression in the concept of the couple, an idea understood as a generating agency not only in the field of animal physiology but also in numerical and metaphysical symbology (as, for example, in Pythagorean speculation). According

to this, the One and the Two, as generating principles, are perceived as masculine and feminine. The kind of duality expressed by the generating couple need not be viewed as dualistic in itself, but the shift from duality to dualism is obvious when the constituent elements (the One and the Two, male and female) are understood as principles that are, in effect, principal: that is, when their mutual relationship is responsible for the first origins of the world and of human beings and, at the same time, is one characterized by a strong disparity of value (or even a total opposition) between them.

Another privileged expression of duality, in both physiology and symbology, is the notion of twinship. The concept of twinship is not reducible to the projection of a physiological experience on a symbological plane. In fact, physiology requires the possibility of more than two twins, a possibility that is normally excluded in the symbological use of the notion. Thus, the duality of twins, an essential constituent of the notion in symbology, is given a peculiar function in the field of ontology, different from that of the couple. First, the couple is understood as a generating agency from the dynamic perspective of a sonship, which, on the symbological plane, can be unitary (as in the triadic pattern of father, mother, and son) or indefinitely plural. The notion of twins, however, is oriented toward stasis, whether there is a perfect symmetry between the two constituent elements, or, inversely, disparity between them. In fact, twinship is founded on the physiological experience of the diachrony of twins' conception in or emergence from the maternal womb. (This diachrony is the motivation behind seniorship, the notion that the twin born second was conceived first.)

HISTORICAL EXAMPLES. Diachrony is a decisive element in a famous mythical story about twins, the myth of the birth of Ōhrmazd and Ahriman, the God and the Antigod of Zoroastrian religion; this narrative is not explicitly accounted for in Zoroastrian literature but only in Christian and Islamic sources arguing against Zoroastrianism. It was not intended to resolve the radical dualism of Zoroastrianism but to provide an explanation of the origins of evil. Zurwān, the personification of time, performed a sacrifice in order to generate Ōhrmazd, the potential creator of all good things. But Zurwān doubted the efficacy of his sacrifice, and as a result he gave birth to twin sons, Ōhrmazd and Ahriman. The former was a result of his sacrifice, and the latter the consequence of his doubt. Since Zurwān had pledged to concede the royal privilege to the first son who appeared before him, the perverse Ahriman broke out of the maternal womb prematurely and demanded the fulfillment of his father's promise. Zurwān did not acknowledge him as a true son but was obliged to honor his promise; he declared that Ahriman would be king for nine thousand years, but that Ōhrmazd would be king forever.

Despite Zurwān's probable existence in the mythology of older times (in the cuneiform tablets of Nuzi and, according to some scholars, in a silver relief coming from Luristan), a similar myth of twinship appears in later religious contexts.

More significant and much older is a text belonging to the very old *Gāthās* in the Zoroastrian Avesta (*Yasna* 30.3). This poem mentions two spirits (Spenta Mainyu and Angra Mainyu) who "were seen in sleep as twins"; they are respectively good and bad in thought, word, and action and the foundations of life and its opposite. According to a recent translation of this text by Helmut Humbach, their aspects as the foundations of life and its opposite are not to be interpreted specifically in a chronological sense (that is, in the sense of a cosmogony); but one may still consider the two spirits as opposite principles that exist prior to any manifestation of their existence in this world and hold them accountable for the existence of good and bad, life and death. Thus, they express a radical formulation of dualism, not only moral but ontological.

It is not clear, however, whether the two spirits are literally twins. According to most scholars, they are sons of one and the same father, Ahura Mazdā (the former spelling of the name *Ōhrmazd*), because other texts in the *Gāthās* state that Ahura Mazdā is the father of the beneficent Spenta Mainyu. Moreover, the same scholars, noting that the text quoted above mentions a "choice" made by the two twins (a good choice by the first and a bad choice by the second), think that these choices were made freely, in keeping with the then-current Zoroastrian notion of the free choice between good and bad that can be made by any human being in this world. This interpretation appears highly improbable. Good and bad seem natural choices for the first and second spirit respectively (otherwise, why should there be precisely two?), in the sense that the spirits prefigure the radical character of the choice. Or, rather, they embody it, but as principles and preformate referents of the choice itself and its consequences for people and *daēvas*, that is, life and its opposite. This is the only interpretation that can account for the pregnancy and the profound intermixture of ontology and ethics (as well as cosmogony and moral struggle) that is characteristic of Zoroastrianism in every period of its history. Moreover, it would be impossible to conceive the great god Ahura Mazdā as the father of the evil spirit, for the simple reason that their respective essences have nothing in common. In conclusion, the term *twins*, as applied to the two spirits, should be understood in that Gathic text not as designating brothers, sons of one and the same father, but as a strong expression of their symmetrical and perfectly contrary essences. In order to compare this notion of the twin spirits with the myth of Zurwān and his two sons (who are also good and bad already in their respective natures and not as a consequence of a contrary choice made by them), one must take into account the precisely different natures of Ahura Mazdā and Zurwān. The former is a supreme being completely endowed with personality and ethics; the latter—as time or destiny personified—is not so endowed; he is an entity apt to have materially with himself and to generate from himself such contrary personal agents as the twin characters, God and Antigod, that is, Ōhrmazd (the old Ahura Mazdā) and

Ahriman (the old Destructive Spirit) and their mutually opposing activities.

These two examples show the mythical theme of twinning in the context of the dualistic conceptions of Zoroastrian religion. As has been seen, the opposition between the two twins in the *Gāthās* and in the myth of Zurwān is, in a sense, horizontal. A different use of the theme of twins is present in Manichaeism. Mani was said to have a counterpart in the celestial realm, a twin, (Syr., *at-Taum*) a pneumatic-divine entity who was both his protecting agency and his alter ego. In the Manichaean Codex of Cologne, a Greek biographical text, the term *suzugos* (“he who is bound in marriage”) is substituted for *twin*. This is reminiscent of the fact that in Valentinian Gnosticism the soul of the Gnostic was conceived of as feminine, destined to marry her divine counterpart, her angel. In Mani’s case, the terms *twin* and *husband* both point to a relationship that implies the Gnostic notion of the perfect consubstantiality of the celestial element and its counterpart active in the terrestrial realm. The terrestrial element waits to be reunited with the celestial element, the pneumatic self. At the same time, the heavenly twin and the angelic husband are an expression of transcendence in relation to whatever lives in the terrestrial realm: “The mysteries and [vi]sions and the excellence of my Father, and concerning me, who I am, and my *suzugos* . . . who he is” (*Manichaean Codex of Cologne* 23.1–5). It is clear that this ambivalence concerning the perfect consubstantiality (or even identification) between Mani and his twin and at the same time the difference between them (i. e., their respective, actual identities) before the final return of Mani’s soul to its original abode implies a vertical structure, well adapted to the general Gnostic notion of a devolution of some pneumatic essence or of its mission in this mixed world. This notion is antithetical to the radical, horizontal opposition of essences expressed in Zoroastrianism in the notion of twin spirits.

Among the nonliterate cultures in which dualistic and (needless to say) dual myths and conceptions exist, explicit radical dualisms are rare. The notion of two symmetrically opposed twins is found in the Iroquois myth of Iouskeha (“sprout”) and Tawiskaron (“flint”). More primitive tribes that profess a dualistic mythology do not share the idea of a symmetry between two opposed, superhuman beings (as, for example in the myth of Coyote, who has nothing in common—as far as his origin and ontological meaning are concerned—with the creator). The Iroquois are agriculturalists with matriarchal institutions. This may imply that the dualistic structure expressed in their myth, both in terms of the symmetry of opposing twins and their common origin from a maternal entity, derives from a lunar mythology. On the other hand, this symmetry must be distinguished from that found in Zoroastrianism between the opposed “twin” spirits, or between Ahriman and Ōhrmazd. The Zoroastrian notion of the ontological opposition between the two spirits or between God and Antigon is radicalized to such an extreme that it denies any dialectical or complementary function for

Ahriman (with the exception of some brief, very heterodox tales in which he is given some positive capacities that render him rather akin to the figure of a trickster: For example, it is he who knows what Ōhrmazd must do in order to create the great luminaries). However, some comparisons may be drawn between the Iroquois myth and the myth of the birth of Ōhrmazd and Ahriman from Zurwān. Some of the characteristics of the bad Tawiskaron may remind one of the deeds of Ahriman. The bad Iroquois twin breaks out of the maternal womb, emerging from his mother’s side. Iouskeha’s demiurgical activity, like that of Ōhrmazd, calls the good creatures of the world into existence; the creations of his twin are monstrous and maleficent. Tawiskaron calls into existence a gigantic frog who absorbs all the water in the world, causing aridity—a mythical motif that also exists in the Zurwān mythology. All in all, differences predominate. Even though Iouskeha (or Oterongtongnia) triumphs, he does not transcend his identity as a twin and grandson—not even the privileged one—of the female, primordial character, Ataentsic. Therefore, he has very little in common with the high god of Zoroastrianism, who does transcend his earthly role.

There are numerous problems connected with the myths of twins found among American Indians because of certain sociological elements common to many tribes; the tendency toward a dual organization, for instance, is shared by many populations of North and South America. It appears that the two moieties of a tribe are frequently connected with two mythical twins. According to Werner Müller (1956), this prevents one from interpreting the opposition between such twins as a crude opposition between good and evil. According to Mircea Eliade, the Iroquois myth “is a dualist myth, the only North American myth susceptible to comparison with the Iranian dualism of zurvanite type. . . . Nevertheless, as shall presently be seen, such an irreducible antagonism does not reach the Iranian paroxysm, and this for the simple reason that the Iroquois refuse to identify in the ‘bad’ twin the essence of ‘evil,’ the *ontological evil* that obsessed Iranian religious thought” (Eliade, 1969, p. 147f.). Moreover, the ontological basis of the Iroquois dual and (because connected with cosmogony) dualistic mythology is intertwined with sociological and cultural motivations; it implies a question not only of essence but also of function. Tawiskaron’s activity, though essentially negative in its value, is considered to have an effect on Iroquois institutions (their cult and calendar) and way of life. As Eliade observes (on the basis of Werner Müller’s argumentation), it was a prophet of the Seneca tribe, Handsome Lake, who, at the beginning of the nineteenth century “substituted for the couple of the mythical Twins that of the Great God, Haweniyo (the ‘Great Voice’) and the Devil, Haninseono (‘Who Dwells in the Earth’)” (ibid., p. 148). This substitution could be a result of the prophet’s monotheistic tendency, but as Müller and Eliade point out, it could also be a response to the accusation made by the Europeans that the Iroquois “adored the Devil.” This accusation has been leveled several times in response to dualistic theologies and mythologies; it implies that there is

a cult around the second element of the couple. This element may be a demiurge-trickster, a culture hero, or a twin, in no way an exclusively bad character because it is also connected with an important, complementary aspect of reality. Such a notion is a reminder of the Egyptian myth (as expounded by Plutarch) that Seth, the opposing and destroying agency complementary to Osiris, was defeated but not annihilated in order that the equilibrium of the universe remain unchanged.

According to Åke Hultkrantz, the theme of twins in American Indian culture is connected with the figure of the culture hero. This hero may be the father of the twins; in some instances, at least one of the twins has some of the hero's characteristics. One even gets the impression that the twins incorporate respectively the two essences or tendencies present in the culture hero: "the vocation to produce and the vocation to destroy" (Hultkrantz, 1963, p. 41). Hultkrantz maintains that there is also a kind of parallelism between the relationship linking the supreme being and the culture hero on the one hand and the relationship between the two twins on the other. "It seems verisimilar that the myth of the twins be a variation of the mythological theme expressed in the relationship between the Supreme Being and the cultural hero, and that it influenced the latter only secondarily, possibly emphasizing dualism present in this" (ibid., p. 41f.).

In other cases, the twins have nothing in common with the culture hero, but they may accomplish—individually or together—some of the deeds traditionally attributed to him. According to Paul Radin (1949), three types are to be distinguished at the core of American Indian myths of twinship. First, the mother of the twins dies as a result of outside aggression or the unnatural birth of the bad twin (as among the Iroquois). In both myths, the second twin is negative and violent, but the first—at least in the first type of myth—is scarcely more commendable in his *modus operandi*. Second, the twins are children of the Sun. They are different in character, but they cooperate. The third type of myth is a combination of the first two. The first type seems to be common among the northern regions of North America; the second is concentrated in the southwestern regions of the same continent; the third belongs exclusively to South America.

Particularly interesting is the respective quality of the achievements of the twins in the context of their demiurgical activity, an issue that adds new particulars to the generic statement that the second twin, as Eliade points out, "does not incarnate the idea of, 'evil' but only the negative, dark aspect of the world" (Eliade, 1969, p. 149). Thus, among the Tuscarora, an Iroquois tribe, the bad twin, "animated by a bad spirit," came violently to light, so killing his mother. The good twin tried to create plants and animals, but the other, trying to imitate him, succeeded only in bringing desert lands and reptiles into existence. The bad twin also created the bodies of human beings; his brother gave them souls. In the end, the bad twin was vanquished but not annihilated; he became the king of the dead (Hultkrantz, 1963). One

cannot but concur with Eliade that the twins in these mythologies form a complementary couple ruling "the two modes or two 'times,' which together constitute the living and fertile universe" (ibid., p. 149).

Another character from these Iroquois myths, the Grande Bosse, a double of Tawiskaron, who fought against the creator and introduced sickness and other evils, was finally defeated but was given the task of curing and helping people. This double lives on the cliffs at the borders of the world, in the land where diseases are born, accompanied by the False Faces, the abortive creations of Tawiskaron, who had tried in vain to imitate the human beings created by his brother. But, as Müller points out, as known from ritual, these creatures "in spring and autumn, drive away the maladies from the villages" (Müller, 1946, p. 272). This is a notion widespread both in North America and in Australia, namely, that bad entities or spirits that are guilty of homicide are endowed with the capacity to heal: They know the "medicine." In the Menomini cult of Manabozo, for example, the evil spirits responsible for the death of the brother of the hero are obliged to impart the medicine to those initiated in the cult, that is, to act against their previous homicidal activity. The same applies to the dreadful character of Crow in some Australian myths and also to the Egyptian myth already mentioned, in which the evil Seth is defeated but not annihilated. A providential decision by Isis allows him to continue his struggle against Apophis, the serpent, who day after day attacks the cosmic boat of the sun crossing the heaven. Eliade's discussion applies to the Egyptian situation as well as to the Indian:

In other words, though the adversary has been defeated by the Great God, his works, the "evil," persist in the world. The Creator does not seek to, or perhaps he cannot, annihilate the "evil," but neither does he permit it to corrupt his creation. He accepts it as an inevitable negative aspect of life, but at the same time he compels his adversary to combat the results of his own work. (1969, p. 149)

Eliade points out, too, that the Iroquois worldview displays a clearly dualistic view of evil. Considered a "disastrous innovation" brought about by some bad superhuman personage, evil is nonetheless

accepted as a henceforth inevitable modality of life and of human existence. . . . The universe is imagined to have a central portion, i. e., the village and the cultivated fields, inhabited by men; this central portion is surrounded by an exterior desert full of stones, swamps, and "False faces." (ibid., pp. 149–150)

The same situation is found in old Egypt, where the Nile and the land that is periodically flooded by it belong to Osiris; the desert and the barren sea (with the foreign, Asiatic) countries belong to the "red" Seth (red being the color of the desert), who is characterized by loneliness, infertility, and aggressiveness. A similar notion is found among the Dogon of West Africa. Nommo, the god of water (that of the Niger),

may resemble the high god of numerous mythologies in his creative activity. The infelicitous attempts of his evil brother, Yurugu, or Ogo (who is not properly a twin), at creation result in misshapen, monstrous creatures. Compelled by his experience of failure, he introduces pain into the existence of the good creatures. In doing so, Yurugu joins the ranks of the demiurge-tricksters at least in terms of his inability to imitate the efficacy of the creator. But a difference remains. The demiurge-trickster is more interested in particular occurrences in supposedly worsening the quality of life than is the bad twin or brother; he introduces painful conditions of life, creates cliffs and mountains that are difficult to cross, and causes people to become mortal (as does Coyote among some Californian tribes and the bad demiurge of some Asiatic mythologies). But he also justifies his actions by claiming that he challenges human cultural creativity by providing obstacles to survival.

Another important feature of American Indian mythologies of twins is that in South America and in the southwestern regions of North America twins are conceived as sons of the sun. Their birth is characterized by the violent death of their mother. The twins are not necessarily portrayed as rivals. The difference between them is sometimes attested to by the difference of their respective destinies; one of them experiences death but is resurrected by the other (a motif found in the classical myth of the Dioscuri). These twins represent universal duality at the cosmological and sociological levels, which fact, however, does not prevent a consideration of them as disparate in terms of their ontological consistency and their axiological evaluation. Similar interpretations apply when the mythical referents of the twins are respectively Sun and Moon, such as among the Apinagé (or Apinayé; see Ni-muendajú, 1939). Among the Caribbean population of the Kaliña, the first twin, Tanusi, is a kind of high god and ancestor, the creator of all good things, living in the “land without evening.” Yolokantamulu, his twin brother, is connected with obscurity and the pains of humanity and lives in the “land without morning.” By the standard tendency implicit in this kind of duality, the inborn disparity of the twins is not to be explained only as an expression of mere opposition between good and evil but also (or even preeminently) as an expression of ontological and cosmological (and sometimes sociological and psychological) complementarity (but see also the discussion by Josef Haekel, 1958, concerning Tanusi’s feature as high god). At the same time, a notion of the disparity of value between the twins in the American Indian mythologies and religions can find a counterpart, as Eliade (1969, pp. 137f.) has observed, in the conception of the two souls in humans, one of heavenly origin and the other of “animal” nature (as among the Apapocúva of Brazil). As for the Caribbean Kaliñas, they characteristically claim that things existing on earth have their spiritual counterpart in heaven. On the sociological plane, the twins may sometimes represent respectively the two moieties of a tribe, as among the already quoted Apinagé.

The principle of twinship is fundamental to the ideology of the Dogon of Mali. For them, twinship means perfection. One of the main characters of their cosmology and cosmogony is Nommo. He is perfect and beneficent. His personality is equivalent to a pair of twins, masculine and feminine, who represent the ideal couple. This couple is not to be imitated on this earth because the marriage between twins is prohibited as a result of the troubles caused by Yurugu, or Ogo, the first son of Amma and the Earth. Nommo as a spiritual entity is a married couple, which is, because married, completely perfect. Yurugu alone is single, imperfect, and unhappy. He personifies deficiency, ontological and ethical. Not directly linked to a twin (Nommo is his younger brother), Yurugu is only understandable as Nommo’s misshapen opposite. But it is exactly this opposition (and not the twinship inherent in the entity that is Nommo) that introduces a crucial dialectic between completeness and deficiency in the Dogon ideology. In this ideology, there is a kind of articulated totality in which deficiency—as represented by Yurugu—is an indispensable component. All in all, it may be concluded that in the Dogon ideology, twinship attains a higher status than in American Indian mythologies, because in those mythologies the principle of twinship is directly engaged in a dialectic of completeness and incompleteness as an element constituting a totality (so that even the “dark” element of a pair of twins is considered positive from a functional point of view).

According to the Dogon conception, twinship as such transcends evil but is pledged to coexist with it (i.e., with the single Yurugu). This kind of triadic ontology is very similar to that expressed in the Egyptian myth of Osiris and Seth told by Plutarch. The good Osiris and the bad Seth are not twins but brothers. Osiris’ counterpart is his wife, Isis; Seth is infecund and alone—which does not prevent him from being an element of a universal totality. Yurugu’s status as the older son of Amma is a feature not uncommon in dualistic conceptions. For instance, the birth of Ahriman precedes (though as a consequence of a trick and a violent act) that of Ohrmazd in the Zurvanite myth, while Satan is the younger (or older) brother of Christ in the dualistic and sectarian doctrine of the Bogomils. The violence that characterizes the birth or coming to light of a bad twin or brother is typical of such twinship mythologies; this feature probably expresses a kind of recrimination against the bad twin, which is intended to diminish but not to abolish his “legitimacy.”

Finally, as far as the “incompleteness” of Yurugu is concerned (i.e., his deprivation of the benefits of both twinship and marriage, or of the marriage implied in twinship), one can conclude that for the first entities of some cosmogonies the duality of twinship and the duality of the married couple are the same. (An example can be found in the Zoroastrian myth of the first human couple, Mashya and Mashyane, who were twins due to the fact that they were brought into existence as the result of a split within a rhubarb plant.) On the contrary, this identification between the two main forms of

duality on the anthropological level—between marriage and twinning—is prohibited in the actual life of the Dogon as a lasting consequence of the rupture of harmony caused by the “previous guilt” committed by Yurugu, a guilt that is both a cause and a consequence of his deficiency. According to a version recorded by Montserrat Palau Marti (1957), Yurugu’s deficiency was due to the fact that he was born irregularly to Amma and the Earth, a couple whose feminine component had not yet been excised and was therefore not yet ready for marriage and generation.

Another version ascribes the guilt to Yuguru himself, who could not believe that Amma would give him a wife for his twin. This ambivalence concerning the ontological level to which the first origin of deficiency is attributed reminds one of the sin of Sophia according to Valentinus and his followers. Sophia failed to obey the law that regulated the order and fecundity of the aeons, those spiritual couples (or syzygies) that exist in the divine Pleroma (“fullness”). Yurugu did not find his “twin soul” (literally, the feminine part of his soul) because of his lack of belief or, alternatively, because of his inborn deficiency, and therefore he cohabited incestuously with his mother, the Earth; this resulted in the birth of certain malevolent entities who live in the woods, outside of the culturalized and purified (i. e., ritually cultivated) land. On the other hand, the impurity and sterility of Yurugu does not prevent him from being an important element in the cosmological process; he is an essential part of the ordinary life of the Dogon. His “words” are essential to the development of life. Nommo, that is to say, one of the twins that compose his double personality, was sacrificed, and some cosmic entities were derived from him; he was later resurrected. Once the world is put in motion, the androgynous condition of existence (which was also peculiar to Nommo, whose two souls, masculine and feminine, were twins) is abolished, and sexual differentiation obtains—a differentiation, of course, that is different from the loneliness and incompleteness of Yurugu, the inhabitant of the woods. All in all, Yurugu remains a representation of limitation, but, for the same reason, also a referent of the growing cosmos of culture and agriculture. This corresponds to the will of Amma, that all be found and all be functional in nature, the perfect and the imperfect. Dogon dualism has its roots higher in the vertical series of the ontological levels; it affects the divine to some degree particularly if the first origin of deficiency is seen as deriving from the irregular maternity of Earth, whose feminine part was not yet excised.

One can conclude that the motif of twins in the ideologies of nonliterate cultures takes two main expressions: (1) symmetry, which being partial and not specular as in the Zoroastrian (Gathic) notion of the two spirits, is an adequate expression of the complementarity of twins; and (2) disparity in value, which also includes in itself a dynamism motivating some peculiarities related in the myth (e.g., when the second twin undergoes a crisis and is rehabilitated by the first). This complementarity, which is capable of integrating within it-

self the “bad” aspect, or simply the inferior quality, of the second twin, is not unqualified and static but articulated and dynamic; a distant equivalent is to be found in Platonic, Middle Platonic, and Neoplatonic speculation, where the existence of the lower, imperfect world, made after the image of the ideal one, is a requisite for the completeness of the All.

It is clear that this notion of an imperfection, which is a necessary component of a perfect totality, is extraneous to biblical creationism. It is dualistic in itself (when the two members of the couple are seen as disparate “principles” in the context of a cosmogony), and it in turn expresses a dialectical form of dualism. It must be distinguished from two other forms of dualism, where the “harmony” of the dialectical position is broken. The first is the Zoroastrian conception of the twins, one beneficent and the other maleficent; their relationship is one of radical opposition and mutual exclusion (a condition also present in the myth of Zurwān, despite the fact that the idea of Time as father of both Ōhrmazd and Ahriman is not to be confused with the Zoroastrian conception of the twin spirits, who cannot have God as their common father). The second form is found in Gnostic speculation, particularly Manichaeism, where matter, the substance of this visible world, is condemned, and Mani, the inspired founder, has a spiritual twin who is a heavenly counterpart of himself (i.e., his true self), to which he is to be “reduced” after his corporeal death.

INDO-EUROPEAN CULTURES. This article comes finally to some myths of twins in the Indo-European cultures. In India, Yama, whose name means “twin,” is accompanied by a female counterpart, Yamī, the feminine form of his name. But he underwent some essential modifications and became the king of the dead, a function well suited to his original quality as first man. In Iran, Yima (the equivalent of Yama), with his female twin, Yimak, remained a prototype of humanity. (Other prototypes were Gaya-maretan, a total figure with no female counterpart or twin, and Mashya and Mashyane, the primordial twins and human progenitors.) Yima later became the inhabitant of Var, a subterranean world in which different categories of living beings wait for the final rehabilitation. Yima’s connection with the principle of twinning is an important confirmation of the principle of duality in the field of cosmogony, no less important than another principle in the same field, androgyny.

The mention of a pair of Indian twin deities, the Nasatyas (or Aśvins), connected with the realm of health and fecundity (the third function of Indo-European tripartite ideology according to Georges Dumézil) provides an introduction to Castor and Pollux, the Dioscuri of Greek mythology. These can be seen as a privileged expression of ontological disparity, which is not necessarily ethical, contained within a set of twins. According to the characteristic and prevailing (but not necessarily older) formulation of the myth (first mentioned in the old epic poem *Kypria*, fragment 5k), Pollux was immortal, the son of Zeus—the supreme god—and of Leda; Castor was mortal, son of Tyndareus, the

human husband of Leda. A very particular mythical element mediated their relationship so that they were neither wholly disparate nor wholly equal: The immortal Pollux renounced half of his immortality in favor of his mortal brother when the latter was fatally wounded by some common enemies. As a consequence of this, Castor and Pollux live alternatively in the heavens and in the netherworld (or they sojourn in their tomb in Laconia, at Therapnae near Sparta). This particular aspect of the myth represents a very peculiar expression of the twinship motif. The twins' symmetrical affinity is emphasized by their common attribute of the *pilos*, a piece of headgear later interpreted as representing half of Leda's egg; on the other hand, their radical, original disparity is emphasized by the opposite natures of their respective fathers (Zeus and a human hero). However, this dialectical situation—of partial affinity and radical disparity—is transcended by the attribution to the mortal twin of one-half of the immortality of the other; this leads to the situation of an artificially produced, balanced equality. In this sense, twinship is both an ontological presupposition and a final acquisition for them: a pattern different from, or opposed to, that of other myths concerning twins or brothers who, on the basis of an ontological or merely ethical or behavioral disparity, come to represent opposing elements (sun or moon, life or death, etc.).

Unfortunately, there are versions of the myth of the Dioscuri that modify this basic pattern. In some texts, Castor and Pollux are sons of the same father, Tyndareus, whose name can also designate Zeus ("he who strikes"). According to other sources, they are sons of Zeus (hence the name *hoi Dioskouroi*, "the young sons of Zeus"). Moreover, there are different interpretations concerning the modalities of their alternating destinies apart from the fact that in old sources (Homer) they live as typical heroes in their tomb at Therapnae. The more widespread interpretation (Lucian) is that one lives in heaven and the other in his tomb or in the netherworld, and vice versa. There are also good reasons for understanding that they experience life and death together in alternation. In a famous song of victory (*Nemean Odes* 10), Pindar immortalizes this episode, making brotherly love the motivation behind the generous deed of Pollux, who renounces one-half of his (still to be experienced) immortality to show that life (even immortal life) is hard without friends. This throws a different light on the whole myth, more in accordance with the old Homeric statement that the two are together in their Laconian tomb, or *hērōion*.

Thus, the myth of the Dioscuri may be distinguished from such myths as that of the Sumerian Dumuzi, who alternates his stay in the netherworld with that of Geshtinanna, his sister. In other words, the Dioscuri do not belong fundamentally to the typology of the dying god (even a dying god split into two figures who take turns dwelling in the netherworld); they represent instead a special (duplicate) version of the hero, who lives in his tomb, from which emanates his protecting influence on the town and the territory. More precisely, the Dioscuri (*theoi hērōes*, "divine heroes") belong

to a typology in between that of the chthonic hero and the heavenly god. Their shared immortality, based on their geminate personality, allows them to act together as heavenly gods; as such, they manifest themselves on the summit of a ship's mast during a tempest, or they appear at the decisive moment during a battle. Their stay in a tomb links them to the classical heroes. All in all, this is a polytheistic interpretation of the motif of twins, different from those that are familiar in nonliterate cultures.

The most famous set of twins in myth and legend is Romulus and Remus, the founders of the Eternal City. Although the Dioscuri were worshiped in old Latium, as demonstrated by an archaic Latin inscription from Lavinium (fifth century BCE) dedicated to them, these twins were unrelated to the Roman twins. In contrast to the Dioscuri, who tended to be equated in their destiny and function (although Castor has special relations with the cavalry, and the temple on the forum was originally dedicated to—or at least named after—him, and only later after the Castores, the Roman name of the Dioscuri), Romulus and Remus tended to be differentiated, to the extent that the former kills the latter immediately after the marking of the sacred pomerium, which was intended to separate the domestic soil of the city from all external territory. The killing of the offender, Remus, because he had violated the pomerium, may be interpreted as prototypical of the drastic measures associated with this boundary for the protection of the city.

The legendary killing of Remus, however, did not prevent the Romans from continuing a ritual celebration, the Lupercalia, at which time two groups of Luperci, those allegedly instituted by Romulus (the Fabiani) and those said to be instituted by Remus (the Quinctiales), acted as rivals running around the old city acting out a rite intended to promote health and fertility and to reaffirm the ominous destiny of Rome. The rite was modified in 44 BCE, when a third group of Luperci was instituted (the Julii), the tradition behind the festivity being somewhat misunderstood. The owner of the third flock of Luperci, Caesar, who in those months was striving after kingship, could automatically be compared to the first founders of Rome as a candidate for kingship. All in all, the celebration of the Lupercalia—strictly ritualized and thus made inoffensive—could perpetuate in Rome's historical memory a significant notion, that of an endogenous source of rivalry and destruction, a duality threatening to become a dualism and, as such, dangerous; for this reason it was allowed to survive only within a strictly controlled ritual.

TWINS AND THE MYTHS OF ORIGINS. One must note some considerations concerning the cultural-historical setting in life of at least some of these traditions of twinship within the context of myths of origins. Such traditions are dualistic in character, whether they emphasize a horizontal or a frontal, mutually exclusive opposition between the twins (as in the case of Zoroastrianism), or, alternatively, a dialectical relationship between them. It would seem that this dialectic, as

it is manifested among the American Indians, has something in common with an ideology of agriculturists, based on matriarchal and lunar aspects (e.g., the Kalina situated the twins respectively on the bright and on the dark side of the moon). In the same way may be interpreted the extreme specialization and absoluteness of the dualism of the Iroquois twins, deriving probably from a lunar, female entity, as well as the type of culture present in the South American and Caribbean tribes. This means, as Hultkrantz (1963) has observed, that dualism in America (at least this kind of dualism) is a southern phenomenon (as opposed to that of the Arctic hunters). To be sure, one cannot forget, as Müller (1956) points out, that some mythologies of hunters, both in Canada and in California, are also dualistic. But this dualism (e.g., the well-known myth concerning the demiurge-trickster, Coyote, who opposes the high being in his creating activity and thus introduces death and the "heavy" physiology of human beings) is structurally very different from the dialectical symmetry of twins. The high being and the demiurge-trickster are of very different extraction; they cannot be reduced to a symmetrical, bipartite form of totality. On the other hand, dialecticism is not absent in the Californian myths of the supreme being and Coyote. The supreme being is a giver of life, but death is introduced by Coyote on the basis of an argument that tends to emphasize the cultural utility rather than the negative aspect of death.

Another issue concerning the twins motif in mythology concerns the direct impact of the physiological experience of twinship on the psychology of the relevant populations. According to Hultkrantz (1963, p. 45) the "superstitious" attention paid to the phenomenon of twinship could have been inspired by its appearance in the symbolical language of myth. On the other hand, what is exceptional on earth could also be seen as primordial, so that the inauguration of the terrestrial (imperfect) status of humanity would have meant also the transition from (perfect) twinship to (imperfect) singleness. Twinship, as it is experienced in this world, comes to mean something extraordinary. In addition, the rather extraordinary phenomenon of twinship has been differently evaluated in different cultures. In Africa, for instance, one moves from a feeling of dread before twins (in some cases, one or both of them may be killed) among the San and Damara in southern Africa to a feeling of happiness and expectation of good fortune in their presence, as in Sudan. One could also venture that the typical ambivalence found in the disparities between twins (the second twin as bad, or simply as terrestrial, or, as a part of a totality, destined for a sacrifice from which he is ultimately rescued, as among the Dogon) is not unrelated to the problematical nature of physiological twinship, in which the different values of duality (completeness, but also distinction or even disparity) can put in motion a plurality of interpretations, both at the mythological and the ritual-sociological level. The reverse possibility, namely that the motif of twinship, which originally developed on the mythological level, could have motivated with its different expressions the contradictory nature

of twinship on the ritual-sociological level, is perhaps too far-fetched.

TWINS: BALTIC TWIN DEITIES

The twin myth and various folk beliefs associated with the idea of twins and the concept of duality have an important place in Baltic religion. The divine or deified twins usually are demiurges, with various associated cosmogonic and anthropogonic functions. Thus, for Latvians, Dievs, the personification of light, is the twin of Velns. The world was created, according to ancient folk legend, as a result of their fight on a stone in the middle of the sea (*vidū jūras uz akmeņa*) or on an island in the middle of the sea (*vidū jūras salīnā*), a place that at a later date became the central axis of the cosmos.

The Baltic divine twins have often been associated with the cycle of death and rebirth. Thus in Latvian mythological folk songs the theme of the sons of Dievs marrying their twin sisters, the daughters of Saule (the sun), is widespread. Before the wedding a ritual wooing of Saule's daughters takes place, which Dievs's sons accomplish by looking through the petals of poppies (*Caur magoņu lapiņām*), flowers that at weddings symbolize death, rebirth, and also puberty. On the wedding night, while waiting for the appearance of Saule's daughters at the vault of heaven, the sons light two candles at sea. These heavenly weddings end unsuccessfully because of an implied but never quite articulated suggestion of a serious violation—incest.

In antiquity it is probable that sacral incest was differentiated from profane incest, the first being committed by a primeval human or demiurge, the second by a trickster. Incest demonstrably pointed to two diverse forms of sexual behavior: the cultured versus the natural (as exhibited in nature), or, in other words, the civilized versus the savage. Sacral incest likely occurred only in illo tempore (the beginning of time) when there was no other coupling possible except between brother and sister. Angered by the violation of incest being committed, Pērkons, the god of thunder, struck the cosmic tree, or tree of life. For three years Saule collected

the scattered branches of the damaged tree, the oak. It was only in the fourth year that she found the tip of the tree and, by piecing together all of the branches, made rebirth of the cosmos possible.

Another variation of this theme has it that during the heavenly wedding a daughter of the sun drowned. Her body was carried down the river into the sea, from the sea it was washed ashore, and in this spot grew a linden tree with nine branches. In Latvian mythology the number nine is an indicator of time and space in the cosmos. While carving from this linden tree a *kokles* (psaltery), a Latvian musical instrument considered to be the embodiment of a female deity or, in a broader sense, the soul and life of a woman, the son of Dievs recognized his twin sister, the daughter of Saule. Death and rebirth of the gods and of the seasons is the basis of this myth; it is analogous to the ancient Greek myth about Persephone. Latvian mythology scholars have tried to interpret the daughters of Saule as the sunlight at dawn or dusk (in autumn and winter, but also in the evening, the sun and its beams seem to die, while in the spring and at dawn they appear to be reborn), while the sons of Dievs are interpreted as Venus, which the Baltic people believed to be embodied in the two stars Rīta and Vakara (morning and evening). The divine twin sons of Dievs, in both Latvian and Lithuanian folklore, sources are associated with horses. In mythological folk songs the twins travel by boat or by horse, often transforming into or fusing with the horse. They appear also as water-loving beasts, otters, or beavers, dancing in either otter or beaver skins. They are also associated with the cosmic tree, the oak.

The sons of Dievs, usually two in number, are typically both called by the same name, but in some instances, each has a different name. Thus, in the spring season, the son of Dievs, as the embodiment of rebirth, is named Ūsiņš (from the verb *aust*, literally, "the rising of the sun," or "the emergence of light"). In autumn, the son of Dievs is the embodiment of death called Mārtiņš, possibly linked to the word *mirt* (to die). Both twins mirror the mythological idea of sequential change and continuity of the cycle of life and death. The sons of Dievs are perceived as the protectors of humans, primarily of men and specifically during war, at sea, when fishing, and when caring for horses. In Latvian mythological folk songs they reveal themselves as two candles in the sea to fishermen and sailors, thus lighting their way:

*Div svecītes jūrā deģa Sudrabiņa lukturos,
Tās dedzina
Dieva dēli, Zvejnieciņus gaidīdami.
Two candles burn at sea
In silver lanterns;
They're lit by the sons of Dievs,
Awaiting fishermen.*

The divine twins are also associated with fertility cults and productivity. For Latvians this is revealed in a particularly striking fashion in the cult of Jumis and his twin sister Jumala, at one time either his betrothed or his wife. *Jumis* and

Jumala are words for which parallels can be found in several Indo–European traditions: in ancient Gaelic, *e(a)main*; in Avesta, *yima*; in Indo-Iranian, *yama*—as found, for example, in the hymn in *R̥gveda* about Yama and his twin sister Yamī, wherein Yamī tries to entice her brother to take part in incestuous relations. The Iranian twins Yima and Yimāk, by getting married, become the predecessors of humanity. This theme is also found in Latvian mythological folk songs, where there is a direct allusion to incestuous relations between the brother and sister Jumīs and Jumala (Jumīts and Jumaliņa are diminutive forms):

Jumīts meklēj Jumaliņu
Pa tīrumu staigādams,
Brālīts meklēj līgaviņas
No māsiņas vaicādams.
 Jumīts looks for
 Jumaliņa
 Walking in the field;
 The brother is seeking a bride
 Asking his sister.

Latvians and Lithuanians also give the name *jumis* to any two fruits or nuts that have grown together, or to two sheaves of grain on one stalk. In ancient times (and still today), having harvested the rye, barley, and wheat, people tried to find and save two sheaves of grain intertwined, or they tied two bundles of the harvested grain together, saving this *jumis* over winter to ensure fertility and productivity for the coming year. On the subject of birth and fertility, according to Latvian folk beliefs, if a young woman wanted to have twins, she had to find and eat a *jumis*, such as two nuts or berries or some other fruit that have grown together. The Latvian Jumīs and Jumala are associated with the idea of the death and rebirth of nature. Another testimony to the Jumīs myth can be seen in the *jumis* nut found buried in a young girl's grave during an archeological dig of an eighth- to eleventh-century burial ground in Latvia called Kaugaru Beites.

Another son of Dievs who is mentioned in Latvian folklore, particularly in summer solstice songs called *Jāņu dziesmas* (Jānis's songs), is Jānis (*'Ai Jānīti, Dieva dēls*; Oh Jānītis [dim. of Jānis], son of Dievs). Jānis is typologically similar to Baldr in the Scandinavian indigenous religions; that is, he is a seasonal deity embodying the ideas of fertility and productivity associated with summer. We can assume that Jānis, like the Roman Janus, is two-faced—the two sons of Dievs united in one person, one linked to the spring and summer seasons, the other linked to autumn and winter. When one of them appears in the sky as a heavenly body (a star), the other, being underground, is not visible. The idea of promoting fertility predominates in the summer solstice songs. Folk-song texts indicate that during this time the mythical heavenly wedding takes place between the divine twins—the sons of Dievs and the daughters of Saule.

Twins also figure as the founders of ancient social organizations, such as tribes, nations, states, and cities. For the Prussians, the twin brothers Widewuttis and Brütens are the

founders of a tribe. Widewuttis is the founder of secular power and the first king of the Prussian tribe, while Brütens is the founder of its spiritual power and the *romow* sanctuary, being its first *Krive krivaitis* (high priest). In later times the Prussians worshiped Widewuttis and Brütens in the form of two posts, one called *Worskaito* (the elder), the other called *Iswambrato* (i.e., *Svais brāti*, “his brother”).

Even as late as the end of the nineteenth century (and into the twentieth), twins appear in Lithuanian and Latvian historical legends. A Latvian legend recorded in the nineteenth century tells of the twin brothers Turo and Tusko, who both loved the same girl. They were so similar that the girl could not tell them apart, and for this reason gave one a gold ring and the other a silver ring to wear. Turo finally succeeded in winning the girl's love, but Tusko, in a dreadful act of betrayal, posed as his twin brother and stole his betrothed. When the betrothed of Turo, on recognizing the ring, learned that she had been deceived, she killed herself with a sword, while the twin brothers killed each other. The graves of all three are located in Zilais kalns (Blue Hill), an important and legendary sanctuary in Latvia, located near the city of Valmiera. This legend about the twins, along with other legends that abound regarding Zilais kalns, reflects the concepts of death and rebirth associated with the twin myths.

There is another interesting element in the Turo/Tusko legend. The names Turo and Tusko start with the same letter. This also occurs in the Roman Romulus and Remus, the Germanic Hengist and Horst, and in another Latvian myth about twins, Auseklis and Ušiņš (both of which are derived from the Indo-European root-form **aus/*us*, with the ancient form of the latter being Ausiņš).

The divine twins as special patrons of the fertility and productivity cult are also revealed in traditional wood architecture in Latvia. Even today, one can find fastened to the ends of gables on houses or buildings two identical, symmetrically placed wooden horses, goats, or figurative carvings of other animals and birds. This tradition was practiced by all Baltic peoples, as can be seen from ethnographic drawings and written records of the eighteenth and nineteenth centuries, as well as from photographs taken during the first half of the twentieth century in Latvia, Lithuania, and East Prussia. Paradoxically, one of the places where zoomorphic and ornithomorphic images of twin deities have been preserved is East Prussia, which was most devastated during World War II and which now forms part of the Russian Federation as the Kaliningrad region and part of northeastern Poland. In districts where prewar buildings have been preserved, one can still see carved twin horse heads at roof gables and in the wooden trim above windows. This tradition has also been retained in the Curonian Spit in the Baltics. One part of the Curonian Spit territory is located in Lithuania, while the second part belongs to Russia; in Lithuania this twin-horse tradition at gable ends is being preserved, with the horse heads being restored, whereas in Russia such carvings are going to ruin, along with the buildings themselves. It is significant

that in Latvian Jumis and *jumts* (roof), as well as the verb *jumt* (to roof, to thatch) and the term *debesu jumts* (vault of heaven), are derived from the same root-form, based on the Indo-European root **ieu* (to tie together). Not only does the twin deity Jumis consist of two tied into one, but also a house roof having two sides joined into one whole.

The significance to the Baltic peoples of the twin myth, particularly as it relates to the birth of twins, was noted in the nineteenth century by such scholars as the German-born ethnographer and folklorist August Bielenstein. However, the Baltic twin myth has merited special attention and comparative analysis only since the 1960s, when it was included in an overview of various Indo-European twins written by Donald Ward (1968), and later by Vjačeslav Ivanov (1972 and 1983) and the Latvian-born folklorist Liene Neuland (1977). Evidently scholars have noted the similarities between the Baltic divine twins and the broader Indo-European twin concept, as in, for example, the Greek Dioscuri, Castor and Pollux (Polydeuces), and the ancient Indian twin, Aśvin.

JANĪNA KURSĪTE (2005)

Translated by Margita Gailītis and Vija Kostoff

TWO BOOKS, THE. The relationship between religion and science in the Christian West has often found expression in metaphors and models. Since the nineteenth century the strident "warfare model" has dominated interpretations of these different realms of human knowledge. However, a renaissance is occurring of a far more ancient metaphor, that of God's self-revelation through a pair of complementary books, the book of nature and the book of

Scripture. Pope John Paul II proclaimed, "From the greatness and beauty of created things comes a corresponding perception of their Creator (*Wisdom* 13:5). This is to recognize as a first stage of divine Revelation the marvelous book of nature, which, when read with the proper tools of human reason, can lead to knowledge of the Creator" (John Paul II, 1998, p. 19).

ORIGINS OF THE METAPHOR. The origins of the "two books" metaphor are embedded in the conviction of the Abrahamic faiths that God is knowable through revelation. The Hebrew Scriptures and the New Testament were understood to be transmitting the very word of God, and thus the "book" became of paramount importance in their respective traditions. *Psalms* 19:1 majestically articulates the idea that "the heavens declare the glory of God, and the firmament proclaims his handiwork." The theme in the *Book of Wisdom* that God is known through the divine works even by Gentiles is echoed in the New Testament locus classicus for the natural knowledge of God, the Pauline declaration in *Romans*. "For what can be known about God is plain to them, because God has shown it to them. Ever since the creation of the world his invisible nature, namely, his eternal power and deity, has been clearly perceived in the things that have been made" (*Rom.* 1:19–20). Paul elsewhere describes the visible worlds as "images of the invisible" (*Heb.* 11:3).

In patristic literature one finds the first full expression of the metaphor. Elements may be found as early as the second century in Justin Martyr's adoption of the Stoic idea of the *logos spermatikos* (*Second Apology*, chap. 8) and in Irenaeus of Lyons (130–202 CE) the idea of the works and the word of God (*Adversus haereses* IV.20). Tertullian prefigured it in his antiheterical argument that, because Marcion has eviscerated Scripture, he cannot provide a counterpart in revelation to the knowledge of God derived from nature (*Adversus Marcionem*, V.5). Athanasius (c. 296–373 CE) offered a proto-statement of the theme in his claim that nature and Scripture are the sole sources of knowledge of God (*Vita S. Antoni*, 78).

The clearest patristic statements of the metaphor of "the book of nature" were offered by John Chrysostom (c. 354–407 CE) and Augustine of Hippo (c. 354–407 CE). Chrysostom declared:

If God had given instruction by means of books, and of letters, he who knew letters would have learnt what was written, but the illiterate man would have gone away without receiving any benefit. . . . This however cannot be said with respect to the heavens. . . . Upon this volume the unlearned, as well as the wise man, shall be able to look, and wherever any one may chance to come, there looking upwards towards the heavens, he will receive a sufficient lesson from the view of them. (*Homilies to the People of Antioch*, IX.5, 162–163).

Augustine proclaimed:

There is a great book: the very appearance of created things. Look above you! Look below you! Note it. Read it. God, whom you want to discover, never wrote that

book with ink. Instead He set before your eyes the things that He had made. Can you ask for a louder voice than that? Why, heaven and earth shout to you: "God made me!" (City of God, 11:22).

But although these passages establish the complementarity of natural and revealed theology among the fathers, the metaphor only reached full articulation with the progressive re-discovery of Aristotelian natural philosophy, when the "two books" became a primary model for expressing a mature binary epistemology of revelation.

ESTABLISHMENT OF THE "TWO BOOKS" METAPHOR. Medieval thinkers employed the model of a twofold revelation with great plasticity. Alain of Lille wrote, "*Omnis mundi creatura / Quasi liber et pictura / Nobis est et speculum*" (Every creature is to us like a book and a picture and a mirror). Hugh of Saint Victor regarded both the creation and the incarnation as "books" of God and compared Christ as primary revelation to a book. Saint Bonaventure's (1217–1274) model of revelation included three volumes: sensible creatures are "a book with writing front and back," spiritual creatures are "a scroll written from within," and Scripture is "a scroll written within and without" (*Collations on the Hexaemeron*, 12.14–17). Thomas Aquinas in his *Summa Contra Gentiles* likewise speaks about a threefold knowledge that humanity may have of divine things: ascent through creation by the natural light of reason, descent of divine truth by revelation, and elevation of the human mind to a perfect insight into things revealed. For Dante, for whom the book in which everything is contained is the Godhead, perfect insight is eschatological in paradise, where everything that has been scattered throughout the entire universe like loose pages is now "bound in one volume" (*Paradiso* XXXIII, 82).

Raymond of Sabunde offered the fullest late-medieval articulation of the metaphor in *Theologia Naturalis* (1436):

Hence there are two books given to us by God, the one being the book of the whole collection of creatures or the book of nature, and the other being the book of sacred scripture. The first book was given to human beings in the beginning, when the universe of creatures was created, since no creature exists that is not a certain letter, written by the finger of God, and from many creatures as from many letters is composed one book, which is called the book of the creatures. Within this book is included humanity itself, and human beings are the first letters of this book. But the second book, Scripture, was given to human beings secondarily to correct the deficiencies of the first book, which humanity could not read because it is blind. The first book is common everyone, but the second book is not common to all, because only clerics are able to read what is written in it. (*Theologia Naturalis sive Liber Creaturarum*, 35–36)

Sabunde's incautious exaltation of the book of nature and his insistence that the book of Scripture is less accurate led to the condemnation of the work as heretical in 1595.

EARLY MODERN VARIATIONS ON THE THEME. The "book of nature" enjoyed its greatest currency in the early modern pe-

riod. The Reformers' emphasis on the literal sense of Scripture cut through the profusion of "meanings" and "signatures" found by medieval scholars in nature and reinforced the idea of two books. However, the book of nature was clearly subordinate to biblical revelation in the theology of John Calvin, who held Scripture to be a necessary corrective to the deficiencies of nature (*Institutes*, I.6.1). The Reformed tradition retained this Calvinist interpretation of the two books in the *Belgic Confession* adopted by the Dutch Reformed Church. In contrast, Paracelsus suggested an empirical approach: whereas Scripture was to be explored through its letters, the book of nature had to be read by going from land to land because every country was a different page.

The metaphor was affected in the seventeenth century by both the elaboration of natural theology and the development of the sciences in novel empirical and theoretical directions. Pierre Gassendi (1592–1655) saw purpose in all of nature and suggested that if René Descartes wanted to prove the existence of God he ought to abandon reason and look around him and that the two books were not to be kept on separate shelves. Although Francis Bacon seems in practice to have kept the two books distinct, he articulated their essential complementarity:

The scriptures reveal to us the will of God; and the book of the creatures expresses the divine power; whereof the latter is a key unto the former: not only opening our understanding to conceive the true sense of the scriptures, by the general notions of reason and rules of speech; but chiefly opening our belief, in drawing us into a due meditation of the omnipotency of God, which is chiefly signed and engraven upon his works. (*The Advancement of Learning*, VI, 16)

Bacon set the tone for the seventeenth-century scientific enterprise in his redirection of the "two books" metaphor toward the improvement of the human estate.

Galileo Galilei argued that the book of nature is written in the language of mathematics, not only implying that mathematics is the sublimest expression of the divine word but de facto restricting its full comprehension to those who are appropriately educated:

And to prohibit the whole science [of astronomy] would be but to censure a hundred passages of holy Scripture which teach us that the glory and greatness of Almighty God are marvelously discerned in all his works and divinely read in the open book of heaven. . . . Within its pages are couched mysteries so profound and concepts so sublime that the vigils, labors, and studies of hundreds upon hundreds of the most acute minds have still not pierced them, even after continual investigations for thousands of years. (*Letter to Grand Duchess Christina*)

Galileo's famous dictum that Scripture teaches "how the heavens go and not how to go to heaven" should be interpreted in light of his conviction of the complementarity of the two books.

The metaphor flourished in the natural theological climate of seventeenth-century England, particularly in the “physico-theology” of the Boyle Lectures, where the idea was used by many divines as shorthand for the assumed validity of the design argument. But its two terms were not always held in comfortable balance. The dissenting theologian Richard Baxter, for example, argued that “nature was a ‘hard book’; which few could understand, and that it was therefore safer to rely more heavily on Scripture” (*The Reasons for the Christian Religion*, 1667). In contrast, Sir Isaac Newton saw nature as perhaps more truly the source of divine revelation than the Bible, although he spent decades of his life investigating the prophetic books. It has been argued that in virtually abolishing the distinction between the two books, which he revered as separate expressions of the same divine meaning, Newton was attempting to keep science sacred and to reveal scientific rationality in what was once a purely sacral realm, namely biblical prophecy (Manuel, 1974, p. 49). By the early eighteenth century there was a significant faction within the Royal Society opposed to any mention of Scripture in a scientific context.

DECLINE AND SURVIVAL OF THE “TWO BOOKS.” Although the metaphor of the book of nature persisted vigorously into the nineteenth century, various movements began to weaken its cogency. The Enlightenment critiques of David Hume and Immanuel Kant undermined the project of natural theology in broad strokes, and the deist movement challenged the uniqueness of the Christian revelation. Thomas Paine asked defiantly: “Do we want to know what God is? Search not the book called the Scripture, which any human hand might make, but the Scripture, called the creation” (*The Age of Reason*, 1794).

The revolutions in geology and biology eroded longstanding traditions of a young earth and an immutable creation and wore away the bedrock beneath a coherent “book of nature” temporally coextensive with the “book of Scripture.” Whereas John Mason Good argued that the Bible must be the word of God, “for it has the direct stamp and testimony of his works” (*The Book of Nature*, 1833), Charles Babbage advanced a view that seemed almost to verge on asserting the superfluity of scriptural revelation in light of the book of nature (*Ninth Bridgewater Treatise*, 1838). Parallel to the “historicization” of geology and biology, the development of a historical critical approach to study of the Scripture challenged the profoundly rooted tradition about the Bible as an integral and timeless record of the word of God.

Despite the developments outlined above, the “two books” metaphor continued to thrive during the nineteenth century among both conservative anti-Darwinians and more liberal thinkers who enthusiastically adopted the principles and discoveries of contemporary science. For the Scottish Freechurchman Hugh Miller, the “two books” became the “two theologies” (*Testimony of the Rocks*, 1857). A decade after Charles Darwin’s *On the Origin of Species* (1859), Herbert Morris argued that Scripture and nature represent re-

spectively the verbal and the pictorial representations of divine wisdom, correlating the “inspired record of creation” with contemporary science (*Science and the Bible*, 1871). Paul Chadbourne regarded nature as an unchangeable record, written in the language of the sciences of which geology comprised the most clearly comprehended volume (*Nature and the Bible from the Same Author*, 1870). The geologist Joseph Le Conte declared that “the whole object of science is to construct the theology or the divine revelation in nature.” Although quite clear about the limits of science as a commentary on the book of Scripture, he held that “of these two books, nature is the elder born, and in some sense, at least, may be considered the more comprehensive and perfect” (*Religion and Science*, 1902).

The innovations in hermeneutics and science pushed the more religiously conservative wings of society in a pre-critical direction of maintaining verbal inerrancy and defending the ancient understanding of earth history. The metaphor of the “book of nature” gained weight as one of the cornerstones of their position, thriving in evangelical and fundamentalist-creationist circles right through the end of the twentieth century.

However, in both liberal and neo-orthodox theology the metaphor of “God’s two books” entered into steady decline after 1900. Parallel to the development of historical geology and biblical criticism was the erosion of confidence that one can easily interpret natural processes teleologically, as William Paley had once argued. The discovery of extinction in the fossil record disproved the ancient assumption of the immutability of species, rendering it increasingly difficult to read the “book of nature” as self-evidently revealing the divine plan or at least as a plan worthy of admiration. Additionally the metamorphosis of “natural philosophy” or “natural history” into the variety of sciences as understood in the early twenty-first century undercut both terms in the metaphor of “God’s two books.” As each new scientific discipline developed its own sphere of study, the “nature” underlying the “book of nature” lost its metaphorical coherence, and the replacement of science as commentary on authoritative texts by the empirical investigation of the natural world essentially removed the “book” from the “book of nature.” Finally, the gradual recognition over the nineteenth and twentieth centuries that the human community embraces a plurality of religious faiths has had the effect of relativizing the Bible as a source of revelation. The “two books” metaphor truly functions only if the claim can be defended that the Bible is the book of Scripture.

The complex metaphor of the “two books” has enjoyed a long and convoluted life cycle. For nearly two millennia the idea variously framed, constituted, negated, or otherwise reflected the relationship between the two human institutions now referred to as science and religion. It is an open question whether as a rhetorical device it can be rehabilitated in a world of historical critical interpretation of all sacred Scriptures and in which evolutionary or developmental mod-

els hold sway in scientific disciplines ranging from cosmology and geology to biology and neuroscience. But the changing fashions of metaphor cannot mask the conviction of believers that God does speak to God's creatures in pluriform ways: through religious traditions, through immediate intuition, through personal relationships, and through the revelations found in sacred writing and in nature.

PETER M. J. HESS (2005)

TYLOR, E. B. (1832–1917) was an English anthropologist, often called “the father of British anthropology.” Edward Burnett Tylor was born in London on October 2, 1832, the son of a brass-founder. Both his parents were members of the Society of Friends, and it was within the Quaker community that Tylor grew up. He entered his father's brass foundry at the age of sixteen, but a breakdown in health followed, and in 1855 he was sent to America in search of a cure. In Cuba in 1856 he met the noted archaeologist Henry Christy, who was also a Quaker, and they traveled together for some time. Out of this visit came Tylor's first book, *Anahuac, or Mexico and the Mexicans, Ancient and Modern* (1861), written and published before he was thirty. He had no university education of any kind, but he was a gifted writer and a tireless researcher in the emergent anthropological field. The two books for which he is chiefly remembered were written in his thirties: *Researches into the Early History of Mankind* (1865) and the even better known work *Primitive Culture* (2 vols., 1871). Although he wrote many more articles and reviews, he was to publish only one more book, the popular handbook *Anthropology* (1881). Gradually he gained academic recognition. He received an honorary doctorate from the University of Oxford in 1875. In 1883 he became keeper of the Oxford University Museum, and in 1884 reader in anthropology. From 1896 to his retirement in 1909 he was professor of anthropology, the first in Britain. He was knighted in 1912 and died on January 3, 1917.

During the years of Tylor's greatest activity, the question of the origin and evolution of religion was high on the agenda of social scientists, the dominant theorists being F. Max Müller on one level and Herbert Spencer on the other; Müller worked exclusively with language, while Spencer proceeded by way of vast generalizations learned in large measure from Auguste Comte. Tylor was no less interested than Müller in language, but he began at an earlier point in its evolution, far beyond “Aryan” roots and their meanings. To reach this point it was necessary for Tylor to formulate a comprehensive theory to bridge the gap between the present and the remote past. This was the theory of “survivals”—elements of culture or society that evolution has left behind. Gesture probably preceded language, though Tylor was too cautious to claim gesture to have been a separate stage in human communication. In matters concerning religion, he believed himself to be on firmer ground.

It was in 1866, in an article in the *Fortnightly Review* titled “The Religion of Savages,” that he first introduced his idea of “animism,” “the belief in Spiritual Beings,” as the earliest form of known religion—and of course accessible only through the study of survivals and by placing a particular interpretation on the difficult matter of “savage” mental processes. His theory was given a definitive statement in *Primitive Culture*, and the word *animism* is still widely used today, though more in a descriptive than in an evolutionary sense.

Otherwise, Tylor's approach to early forms of human religion has often been criticized as being too intellectual and too moral. According to one of his disciples, R. R. Marett, he was “a little blind to the spontaneity of the process whereby Man becomes at once religious and moral, without taking conscious thought to it, until he is fairly involved in an incoherent striving that is neither because it is both together” (Marett, 1936, p. 168). Looking into the past for a certain type of moralized religion, and failing to find it beyond a certain point, Tylor missed much of importance. He had no feeling for the ecstatic side of religion, perhaps partly because of his intense dislike of nineteenth-century spiritualism. Also he cannot be exonerated from having overlooked or deliberately ignored all the evidence later produced by Andrew Lang in support of “high gods of low races,” gods who were neither ghosts nor spirits. “Spirit” was perhaps the only category open to a pioneer such as Tylor, but when linked with “belief” (as it was in his celebrated “minimum definition” of religion), it had the effect of relegating much else to a subordinate place in the structure of religion and culture.

In the running debate between evolutionism and diffusionism it is generally supposed that Tylor was wholeheartedly on the side of the unilinear evolutionists. But he was prepared to consider diffusionism on its merits, and to stop only when the evidence would carry his argument no further. In his early years he was indeed something of a diffusionist, even to the extent of speculating that the Aztec god Quetzalcoatl was not only a man but may even have been an Irishman! Later his habitual caution prevented any further such flights

of fancy, and on the whole he sided with the evolutionists, while stopping short of absolute dogmatism.

It was characteristic of Tylor's immediate disciples that sooner or later they were forced to part company with his findings in the form in which he stated them. The ubiquitous and enigmatic Andrew Lang broke away on the issue of "high gods," the urbane R. R. Marett on the matter of "preanimism" and later on questions concerning performative ritual. But these scholars and others retained a deep affection for their mentor. Marett wrote that throughout his career Tylor appears as "the most ingenuous of men, open-minded because he is simple-minded, the friend of all mankind because he would be incapable of feeling otherwise; and withal hardheaded, of business antecedents, not easily fooled, pedestrian enough to prefer solid ground under his feet" (*ibid.*, p. 214). In short, though often unacknowledged, he laid foundations on which the study of primal religion has built for more than a century.

Revised Bibliography

TYNDALE, WILLIAM (1494?–1536), Bible translator and Reformation scholar. William Tyndale came from a well-established family in Gloucestershire in the west of England. After an excellent education at a local Grammar School, he was for ten years at the University of Oxford. In 1516 Tyndale's life took a decisive turn when the New Testament was for the first time printed in Greek, its original language, in an edition made by Desiderius Erasmus in Basle, Switzerland. Along with scholars throughout Europe, and particularly Martin Luther in Germany, Tyndale recognized the importance of a readily available Greek New Testament, and the need for a printed translation which could reach English readers and hearers at any level.

After spending perhaps a year in Cambridge (where Erasmus had been teaching Greek), Tyndale returned to Gloucestershire to begin work on an English New Testament. Such an enterprise was forbidden by the Church, for

whom any vernacular deviation from the Latin translation (made in the fourth century) was heresy. This censorship was at its most severe in England, where it was rigidly applied: in the 1380s, alarmed by the spread of handwritten Bible translations made from the Latin into English under the influence of John Wyclif, the English Church had punished many "Lollards," as Wyclif's followers were nicknamed, often by burning them alive. Tyndale needed the permission of a Bishop, and sought it from Erasmus's friend Cuthbert Tunstall, Bishop of London. He was snubbed.

With money from courageous London merchants, Tyndale went to Germany, and in Cologne began printing his English translation. He had reached Matthew's Gospel chapter 22 when the print shop was raided. Tyndale and his helper fled up the Rhine to the safe Lutheran city of Worms. There in 1526 he produced 6,000 copies of his first English New Testament, pocket-size like all his works. Smuggled down the Rhine and eagerly received in England and Scotland, copies were ruthlessly hunted and destroyed: Tunstall supervised their burning at St Paul's. Only three copies now survive, one on permanent display in the British Library.

In Germany, Tyndale learned Hebrew (unknown in England) and in 1530 printed in Antwerp his translation of the "First Five Books of Moses"—the first time that Hebrew had been translated into English. Finding that knowledge of Hebrew deepened his understanding of the Greek biblical text, Tyndale produced a revision of his New Testament, printed in Antwerp in 1534. He worked in Antwerp also on the second quarter of the Old Testament, the Historical books Joshua to 2 Chronicles.

Tyndale's 1534 New Testament, and half of the Old Testament, were reproduced largely unchanged in successive English Bibles throughout the rest of the century, culminating in the influential version made in the name of King James in 1611: five-sixths of that New Testament, and only slightly less of the Old Testament, were there taken over directly from Tyndale, without acknowledgement.

Tyndale's greatness lay in his accurate translation of the original Greek and Hebrew; his clarity of expression; and in his choice of a linguistic register just a little above ordinary speech. He gave English speakers very many phrases still in use, such as "Let there be light." His Plain Style, a Saxon vocabulary in a neutral word order, through his wide Bible readership established English as a good written language that anybody could use. Much of the remarkable development of literature in the hundred years after him came out of his work: it is not fanciful to remark "Without Tyndale, no Shakespeare."

His New Testament affected the nation. A neat definition of the Reformation is "people reading Paul." The Epistle to the Romans in particular, the bedrock of New Testament theology, and read or heard—as Tyndale famously intended—even by "the ploughboy," showed the believer's direct access to God through faith. Moreover, in the newly avail-

able Bible a large number of the Church's practices and dogmas were not found: confession to the ear, the celibacy of the priesthood, Purgatory, and so on.

Tyndale wrote other important books. *The Parable of the Wicked Mammon* (1528) demonstrates the New Testament emphasis on faith rather than works. His *The Obedience of a Christian Man* (1528) countered the lie put about by his enemies that the reformers preached sedition.

Tyndale had a price on his head as a heretic. Commissioned to do so, Thomas More attacked him at length. In Antwerp, Tyndale was tricked into arrest; he was imprisoned near Brussels for sixteen months, and in October 1536 taken out, strangled, and burned. His heresy was the making of the English Bible: his influence, long ignored, was very large.

DAVID DANIELL (2005)

TÝR ("God") is a Scandinavian deity associated with law and war. Although his name reflects the Indo-European words for "god" and "day" (IE, **deywos* >; PGmc., **Tiwaz*; cf. Sansk. *dyaus*, Gk. *Zeus*, and Lat. *deus*), Týr no longer represents the transcendence and majestic glory of the luminous sky. He must have played a more important role at some stage, for his name can simply mean "god," both originally and in Viking times. His sovereign powers also meant that Norse court poets could substitute his name for that of Óðinn when it was combined with an object or characteristic associated with Óðinn: Victory-Týr, Týr of the Hanged, and Týr of Ships' Cargoes all designate Óðinn. More mysterious is the occurrence of *Týr* as the name of a young boy in the Eddic poem *Hymiskviða*; this figure may not have any relationship to the god.

By the time of the first written sources, Týr was not a supreme being, a creator of the world, or a heavenly father, but he still had an honorable position among the leading Æsir, the primary group of Norse gods. According to Snorri Sturluson, Týr is the boldest and most courageous of the gods and is invoked by warriors because he can grant victory. He possesses extensive knowledge, whence the Old Norse expression *týspákr* (as wise as Týr). Yet few other details are given: the identity of his father is uncertain, he does not appear to be married, and the only myth in which he plays a significant role is the story of the fettering of the wolf Fenrir.

The gods had been warned that the monstrous offspring of Loki and the giantess Angrboða—Fenrir, the witch Hel, and the serpent Miðgarðsormr—would cause them great harm. Óðinn cast Hel into the cold, dark world of Niflheimr and dispatched the Miðgarðsormr to the rim of the cosmic ocean, but the wolf was still in the custody of the Æsir. As the whelp grew up, only Týr dared to feed him, and the gods thought it time to chain him. They tried twice, but the wolf easily broke loose. The Æsir got the dark elves to manufacture an unbreakable fetter. From the rustle of a moving cat, the beard of a woman, the roots of a cliff, the breath of a fish, the sinews of a bear, and the spittle of a bird, the elves made a band as soft as silk yet able to withstand any force. The gods took Fenrir to a remote island, where they challenged him to free himself again. Having prided himself on snapping the other bonds, he did not deign to pit himself against something so fragile-looking. When the gods insisted, he became suspicious and only consented to be bound with the ribbon if one of them placed a hand in his mouth as a pledge of good faith. All were reluctant to do this except Týr, who lost his hand when the wolf found himself bound fast. The gods chained Fenrir to a huge boulder and gagged him with a sword, where he remained until the Æsir's final battle against the giants and monsters at Ragnarök. Each god had his own special opponent in that conflict, and Týr was killed by Garmr, the monstrous dog that guarded the entrance to Hel's realm.

Týr's action is an example of heroic abnegation, and Georges Dumézil (1974; 1985, pp. 268–274) has noted the parallel between Týr and Mucius Scaevola, who sacrificed his right hand to convince Lars Porsena, the Etruscan leader threatening Rome, that he and three hundred young men were ready to give up their lives to kill him. Porsena then signed a peace treaty that saved Rome from destruction. There are also parallels with non-Germanic gods: the Irish god Nuadu and the Indian god Súrya are one-armed as well. Týr the one-handed seems to be juxtaposed with the spell-working, one-eyed Óðinn, just as Nuadu with his one hand stood beside Lug with his magic and his closed eye.

Týr's sacrifice has been correlated with his function as god of law (De Vries, 1967, pp. 13–14, 22–24; Dumézil, 1973, p. 45), mainly on the basis of his association with the Germanic *thing* (the assembly of the warriors), where priests, perhaps of *Tiwaz*, kept the peace (cf. Tacitus, *Germania* 11), and the Germanic concept of war as a *vápnadómr* (judgment by arms) with set rules. The *interpretatio Romana* of Germanic *Tiwaz* as Mars (cf. the translation of Lat. *dies Martis* as OE. *Tiwesdag*, Eng. *Tuesday*) can thus be correlated with Dumézil's view of Týr as the Germanic representative of the juridical aspect of sovereignty (Dumézil, 1977, pp. 196–200; Dumézil, 1985, pp. 265–272; Polomé, 1984, pp. 402–405). Dumézil, however, sees Týr's action not as heroic but as the embodiment of fraudulence, because it involves deliberate perjury—the gods had promised Fenrir that they would release him if he could not break the band. Most scholars

view the deceit as ethically acceptable because it neutralizes an uncontrollable danger threatening the community of the Æsir. Clunies Ross (1994, p. 221) points out that both the wolf and Týr show courage, and both suffer. She interprets this myth as illustrating the interrelatedness of the worlds of gods and giants: giant nature does not lie in a world different from that of the gods, but instead lies inside it.

Evidence for the worship of Týr is scanty outside of Denmark, where place-names such as Tislund (Týr's grove) attest to his widespread veneration. Týr is commemorated in only two place-names in Norway (Tysnes, "Týr's peninsula"; Tysnesø, "Tysnes island" or "The island near Týr's peninsula"); here the cult appears to have been adopted from Denmark. Týr's name has also been seen in some of the place-names of southern England, and Old English writers occasionally glossed the Latin *Mars* by *Tiw* or *Tig*. There are no Swedish place-names associated with Týr. Most likely, the importance of his cult elsewhere in the Germanic region diminished over time. He is also associated with the t-rune, which was called the "victory rune." Warriors engraved it on their sword hilts and guards, thereby invoking Týr twice.

ELIZABETH ASHMAN ROWE (2005)

TYRRELL, GEORGE (1861–1909), leading Roman Catholic theologian of the so-called modernist movement. Adversity and agitation marked Tyrrell's life from the beginning. Born in Dublin on February 6, 1861, two months after his father had died, Tyrrell was raised in penury and vaga-

bondage by his devoted mother and schooled in gospel kindness by Charles W. Benson of Rathmines School, but was swayed oppositely by the acerbity and agnosticism of his elder brother William.

William's untimely death sent Tyrrell on a search for stable footing in the externals of religion. Experimentation with Anglicanism and Roman Catholicism led to friendship with Robert Dolling, the later famous "Father Dolling," who served briefly as Tyrrell's mentor and spiritual director, first securing his matriculation at Trinity College (1878), then inviting him to London to see sane Anglo-Catholicism at work, hoping thereby to prevent his anticipated conversion to Roman Catholicism. Dolling's strategy failed. On May 18, 1879, Tyrrell was received into the Catholic church and a year later into the Jesuit order as well.

Although Tyrrell felt confirmed in those momentous decisions, he was unprepared to conform to the rigid ultramontanist and rationalist neoscholasticism of the post-Vatican I church and to the mechanistic spirituality of the "restored" Society of Jesus. Two of Tyrrell's seminary professors suggested more congenial paths. Thomas Rigby encouraged him to bypass the scholastics and to read Thomas Aquinas for himself, while Joseph Rickaby was no doubt the one who gave him John Henry Newman's *Grammar of Assent* in 1885 and thus occasioned "a profound revolution in my way of thinking." From Thomas, Tyrrell learned the principle of modernization, or *aggiornamento*; from Newman, he derived an experience-based psychology of religion and an inductive, historical method, as opposed to the *a priori*, deductive method of scholasticism.

In 1894 Tyrrell was appointed to the chair of ethics at the Jesuit school of philosophy at Stonyhurst, but two years later, no longer tolerable to the established faculty, he was removed to London and the staff of the Jesuit religious periodical, the *Month*. Thus began a writing career that would propel him into ever-widening circles of liberals, modernists, and modernist sympathizers (among them Wilfrid Ward, Friedrich von Hügel, Maude Petre, and Henri Bremond) and lead him to the thought of a host of nonscholastic scholars (Bergson, Blondel, Dilthey, Harnack, Loisy, Sabatier, Schweitzer, Troeltsch, and Weiss).

Tyrrell's work anticipated Vatican II's effort to bring church polity and doctrine into constructive dialogue with the best and most enduring elements of post-Enlightenment thought. Initially Tyrrell allied himself with Ward's mediating tactic of palliating ascendant policies with liberal doses of Newmanism, but as he encountered historical and biblical criticism, he concluded that Newmanism could not be made to answer questions it had never asked. In *Christianity at the Cross-Roads* (1909) Tyrrell sought to establish Newman's assumed identity between the "idea" of Christ and Christianity and the "idea" of Roman Catholicism by showing that the categories of apocalyptic and eschatology had carried the "idea" of Christianity unadulterated from epoch to epoch.

He also went beyond Newman in criticizing not only the doctrinal expression of faith but the act of faith itself.

On February 19, 1906, Tyrrell was dismissed from the Society of Jesus for refusing to retract a published excerpt from his *Letter to a University Professor* (1903). The following year, on October 22, 1907, he was excommunicated for publicly criticizing Pius X's encyclical *Pascendi dominici gregis*, which condemned modernism. Tyrrell died on July 15, 1909, a victim of Bright's disease, and was buried in the Anglican churchyard in Storrington, Sussex.

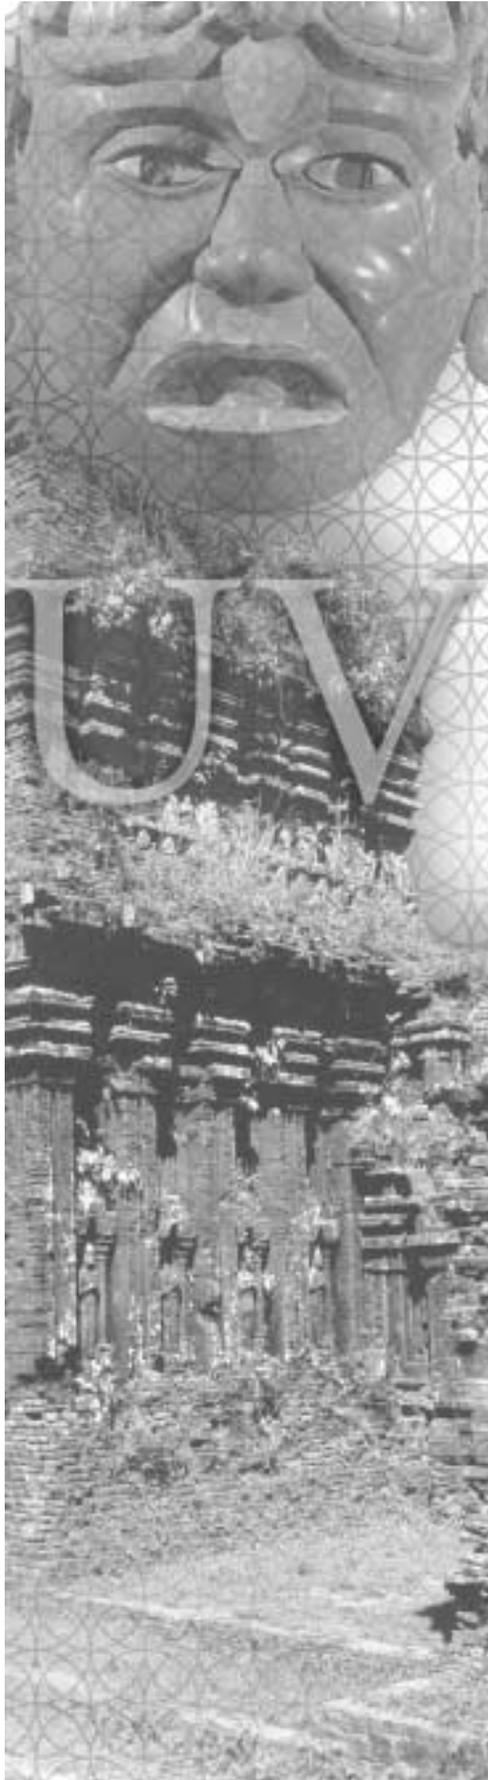

BIBLIOGRAPHY

Tyrrell's early apologetic essays are collected in *The Faith of the Millions*, 2 vols. (New York, 1901), while his later essays on the revelation-dogma-history issue are given in *Through Scylla and Charybdis* (London, 1907). His most substantive

monographs are *Lex Orandi, or Prayer and Creed* (New York, 1903), on psychology of religion; *The Church and the Future* (1903; reprint, London, 1910), originally published under the pseudonym Hilaire Bourdon, an apologetic for Roman Catholicism; and *Christianity at the Cross-Roads* (London, 1910), an attempt to incorporate the implications of eschatology and apocalypticism. M. D. Petre's *Autobiography and Life of George Tyrrell*, 2 vols. (London, 1912), of which Tyrrell wrote volume 1, is an indispensable, if biased, account. My own book, *George Tyrrell: In Search of Catholicism* (Shepherdstown, W.Va., 1981), with extensive notes and bibliography, provides the fullest introduction to Tyrrell's thought.

DAVID G. SCHULTENOVER (1987)

TZU CHI SEE CIJI

U–V

UCHIMURA KANZŌ (1861–1930), Japanese essayist, scholar of the Bible, and Christian leader. Uchimura’s unique place in modern Japanese thought results from his insistence on human independence before the biblical Christian God. Four prophetic acts by Uchimura dramatize and represent themes in his writing. In two of these acts Uchimura questioned the growing authoritarianism of the government. His scrupulous hesitation in 1891 to bow before the signature of the emperor and his outspoken avowal of pacifism in 1903, immediately before the onset of the Russo-Japanese War, raised the issue of Christian loyalty to the state. He also proclaimed the imminent return of Christ in 1918 and appeared to renounce in a posthumously published document the Christian movement associated with his name.

These acts resulted from a heightened sense of individual worth and responsibility apparent in Uchimura’s personal history. His father, a capable samurai civil servant, lost his status, position, and self-respect with the political changes that followed the revolution of 1867–1868. He turned the leadership of the family over to his sixteen-year-old son after the boy received a government scholarship large enough to support the whole family. Uchimura studied at a government agricultural college, where, under the influence of evangelical American Calvinist teachers, he became a Christian.

After graduation in 1881, dissatisfaction with government service as a fisheries scientist and a disastrous marriage drove him to the United States. There he found sympathetic mentors at Amherst College and obtained a second bachelor’s degree in 1887. Back in Japan, Uchimura administered a school manned largely by American missionaries. Disagreement over evangelical methods—he wanted to cite Japanese examples of the upright life before he taught Christianity—led Uchimura to resign and forsake cooperation with missionaries. His hesitation before the imperial signature while a teacher in a government school cost him the possibility of further official employment. As a result, he determined to live by writing. After several lean years, he became the editor of a newspaper that he was to make into Japan’s largest daily, but his declaration of pacifism cost him that posi-

CLOCKWISE FROM TOP LEFT CORNER. A deceased man sails through the underworld in a painting on papyrus from the ancient Egyptian *Book of the Dead*. Kunsthistorisches Museum, Vienna. tion. He had already started in 1900 a monthly called *Seisho no kenkyū* (Biblical Studies). This publication fulfilled a long-standing ambition to write popular Bible commentaries and provided him with a livelihood until his death. Through his magazine, numerous individuals came to look upon Uchimura as their spiritual mentor. His many large lecture meetings after he joined the Second-Coming Movement in 1917 returned him to the center of national attention. The meetings developed into two-hour commentaries on the Bible for weekly audiences of five to seven hundred. He continued his magazine and lectures until death stilled his voice.

All of Uchimura's writings reflect a concern for a Japan suddenly introduced into the modern world. At the time, "the modern world" signified the European and North American nations, whose people believed in a hierarchy of states with those of the Christian culture ranked highest. Uchimura, through his English-language works, interpreted Japanese concerns to Westerners, emphasizing the rectitude of traditional Japanese virtues. His early Japanese-language works commented on contemporary Japanese society. His later writings introduced the Bible and the fruits of Christian culture to Japan. These essays were frequently based upon the notes he had written for his weekly lectures. The commentaries on the Bible form a major part of these writings and constitute the largest corpus of biblical studies by one author in the Japanese language.

The concept associated with Uchimura's name is *mukyōkai* or *mukyōkai shugi*, usually translated as "no church," "nonchurch," or, in Uchimura's translation, "Christianity of no-church principle." It proclaims a faith linking humans to God through prayerful use of the Bible alone. The church as it existed in the Christian nations seemed to Uchimura so burdened with the associations of Western history and tradition as to lack meaning for Japanese. On the other hand, Japanese, through faithful reading of the Bible, could develop a Christianity true to their needs and consistent with their traditions. Uchimura's denial in an article published after his death of "what is today commonly called *mukyōkai*" did not reflect any change in his belief. Instead, it expressed his dismay at the incipient development among his followers of a church based on their interpretation of *mukyōkai shugi*.

Uchimura's followers, most concerned that they must not start a church, continue in small Bible-study groups known collectively as *mukyōkai*. They have no other organizational ties than their respect for the Bible and the works of Uchimura. Adherents include a number of figures important in the shaping of Japanese institutions after 1945: Tanaka Kōtarō, Yanaihara Tadao, Nambara Shigeru, Takagi Yasaka, and Matsumoto Shigeharu.

BIBLIOGRAPHY

The definitive *Uchimura Kanzō zenshū*, 20 vols. (1932–1933; reprint, Tokyo, 1961–1966) has been replaced by another work of the same name in 38 vols. (Tokyo, 1981–1984). The

latter version will include some more articles and many more letters. The best biography is by Masaïke Megumu, *Uchimura Kanzō den* (1950; Tokyo, 1977). In English, *Culture and Religion in Japanese-American Relations: Essays on Uchimura Kanzō, 1861–1930*, edited by Raymond A. Moore, Michigan Papers in Japanese Studies, no. 5 (Ann Arbor, 1981); and my article "Uchimura Kanzō," in *Pacifism in Japan: The Christian and Socialist Tradition*, edited by Nobuya Bamba and me (Kyoto, 1978), discuss aspects of Uchimura's legacy. I have written a complete critical biography, which is ready for publication.

JOHN F. HOWES (1987)

UFO RELIGIONS. The rise of interest in unidentified flying objects (UFOs) has been amply demonstrated over the last few decades. It is not surprising that in an age of scientific discoveries, especially in the field of astronomy, the search for extraterrestrial life is a legitimate and respectable enterprise. But the quest for alien life on planets both within and outside our galaxy appears to have gone beyond the usual pursuit of scientific data supported by empirical evidence. It has also surpassed the quest for adventure beyond the confines of planet Earth. Many people do not just speculate about the possibility of alien life elsewhere but claim to have actually encountered or been visited by aliens. The search for UFOs has become the center of a belief system with most, if not all, of the features that are usually linked with religion. The phrase *UFO Religions* can thus be applied to those organizations that exhibit many of the various dimensions that have been routinely applied to other, more established, religious organizations.

While the precise definition of *religion* is still a matter of debate among scholars, there seems to be some agreement about those key features or characteristics that are central to any religious system. Among these are a communally shared belief system or worldview in which a sacred or transcendent reality figures prominently; a belief that the human race needs some kind of salvation or redemption from its present condition; an ethical system; experiences such as devotion, ecstasy, rebirth, and inner peace; central myths or stories, especially those dealing with the creation and future of humankind; and rituals. Many of these features are also found in UFO religious groups, though not all have been accorded the central place given them in most of the world's religions. Several UFO groups are noted for forming well-knit communities with a mission to propagate the teachings of their faith. Others stress individual spiritual development and/or healing. Still others, while having some of the main features of religion, are mail-order organizations and thus lack the communal and ritual aspects typical of some UFO religions.

HISTORY. The rise of the modern UFO religions can be traced to Kenneth Arnold who, in the mid-1940s, reported to have seen several flying saucers. Sightings by other individuals followed, and soon people were relating their experi-

ences of meeting and communicating with aliens from other planets.

George Adamski (1891–1965) was the first contactee of the modern era. Believing that he had been visited by a being from the planet Venus on November 20, 1952, Adamski saw himself as the chosen person with the mission of communicating important messages from the aliens to human beings. Adamski never founded a religious organization as such, but he attracted a following interested in the wisdom and knowledge that the aliens had to offer to the human race. This led to the foundation of the International Get Acquainted Club. Several organizations to disseminate his teachings were later founded by his followers. The largest is the George Adamski Foundation, which has since 1965 continued to circulate his works and to promote his view that contacts with aliens have been made throughout the ages and that advancement in various sciences has been achieved through such contacts.

The George Adamski Foundation became the spearhead of the religiously oriented UFO groups that have emerged since the 1950s. The leaders of these groups reported contact with aliens, mainly from various planets in our solar system, and at times maintained that they had traveled to other planets, where they were shown advanced civilizations that made human cultures look rather primitive. Some of these leaders were charismatic and/or prophetic and succeeded in gathering a clientele around them, eventually forming cult movements, “which are full-fledged organizations that attempt to satisfy all the religious needs of the converts” (Stark and Bainbridge, 1985, p. 29). They became an elite group of individuals who were accepted as contactees with extraterrestrial intelligences who delivered their messages and teachings through their chosen mediums or prophets.

Some UFO groups, such as the Aetherius Society, Unarius Academy of Life, and the Association for Sananda and Sanat Kumara, with the passing away of their leaders in the 1990s, are now becoming institutionalized and have continued to survive and carry on their agenda without the presence of a contactee.

Some scholars have pointed out that there is a connection between UFO beliefs and the Theosophical Society and the I AM Religious Activity, though these latter groups cannot, strictly speaking, be called UFO religions if for no other reason than that the existence of, and communication with, aliens is not one of their central characteristics. Yet many of the aliens are similar and at times identical to the masters of the Theosophical Movement. The teachings of quite a few UFO religions have incorporated Eastern religious notions, such as karma and reincarnation, that were already made popular by theosophy. The Association of Sananda and Sanat Kumara is an excellent example of the link between theosophy and extraterrestrials. The late Sister Thedra, the founder of this organization, channeled for years the ascended masters, while later on she also communicated with the angel Moroni (prominent in Mormonism), with beings from other planets, and with Sananda (Christ). In the same way,

George King, the founder of the Aetherius Society, maintained contact with aliens, many of which are identical to the ascended masters, which include founders of world religions such as Jesus and the Buddha.

GENERAL WORLDVIEW AND AIMS. The worldview adopted by UFO groups is much broader than that proposed by traditional religions. It indirectly includes modern astronomical discoveries and takes for granted the existence of intelligent creatures on other planets in the vast cosmos. These beings are superior to the human race intellectually, scientifically, and spiritually. In spite of this expansive view of the universe, the main concern is still planet Earth, which is conceived as a somewhat backward planet where men and women need outside help to advance in the course of evolution.

While UFO religions offer little, if any, speculation about the origin of the universe, they often have elaborate theories of the origins of the human race and its condition here on Earth. Raëlians, for instance, hold that human life on Earth was created by beings from another planet through their knowledge of DNA and its use. A similar view had already been popularized in Erich von Daniken’s book *Chariots of the Gods* (1969) and has become part of UFO mythology.

Central to any UFO religion is the belief that contact with aliens is the way to salvation and improvement. The teachings of Adamski describe the aliens as “beings of amity, intelligence, understanding and compassion,” while the Semjase Silver Star Center in California points out that they come with a mission to assist the human race out of its present ignorance. Some groups, especially those that originated in the 1950s such as the Aetherius Society, White Star, the Ashtar Command, and Cosmic Star Fellowship, stress the need to be saved from the dangers of the atomic (or nuclear) age that can lead humans to self-destruction. Others, such as the Solar Light Retreat, expect aliens to help solve the energy and environmental crisis. Spiritual development, a higher consciousness, healing from spiritual, psychological, and physical maladies, emancipation from the fear and chaos that beset human beings, and evolution to higher spiritual and self-awareness levels are among the benefits that many UFO groups hope to accrue with the advent of intelligent and advanced beings from other planets. In some UFO groups, such as the Aetherius Society and Unarius, healing is one of the main ritual practices. In others, such as the Extraterrestrial Earth Mission and Mark-Age, the stress is on achieving a higher consciousness or a more advanced evolutionary stage.

The belief system of UFO religions is often considered as part of the New Age movement and tends to be syncretistic. Thus, Chen Tao (God’s Salvation Church), which in 1997 migrated from Taiwan to North America, is a prime example of such amalgamation, with Buddhist, Daoist, and folk beliefs intertwined and later combined with a Christian apocalyptic and millenarian worldview.

One of the common features of UFO religions is that their founders are convinced that they have been contacted by aliens. Adamski related how he had been visited by a humanlike being from Venus who imparted certain knowledge that he was instructed to pass on to humankind. He also could communicate with the aliens by telepathy. Other contactees who followed him made the same claim. George Hunt Williamson of the now defunct Brotherhood of the Seven Rays had contact with Martians via automatic writing. William Ferguson of the Cosmic Circle of Fellowship was transported to both Mars and Venus, where he was given messages to bring back to Earth. George King, of the Aetherius Society, received messages from aliens either while in a trance or by telepathy. The founders of Unarius, Ernest and Ruth Norman (known as Archangels Raphael and Uriel respectively), authored books containing teaching received from advanced intelligent beings living in other worlds. Nada-Yolanda (Pauline Share) of Mark-Age, Inc., uses both automatic writing and telepathy to convey messages from beings in spacecrafts. In like manner Valerie Donner of the Ground Crew uses channeling as a means of communication with extraterrestrial beings. Claude Vorilhon (now known as Raël) of the Raëlian Movement met several times with an alien who entrusted him with the good news of the true origins of human beings and of the return of the Elohim. The two leaders of the Extraterrestrial Earth Mission (known since 1993 as Drakar and Zrendar) go a step further and proclaim that different aliens have periodically taken possession of their bodies, presumably enabling them to communicate more freely and regularly to human beings.

As in the classical monotheistic religions, where God takes the initiative to call prophets, it is the aliens who approach specially selected individuals and commission them to act as messengers to the human race. The aliens, though not elevated to the status of gods or goddesses, are obviously transcendent and suprahuman beings even in those UFO religions like the Raëlian movement in which belief in God or supernatural beings is not found or does not occupy an important place.

Besides an elaborate soteriology, UFO groups also teach an eschatology, the chief element of which is the actual arrival of the aliens, an advent that, as Solar Light Retreat teaches, will initiate a new heaven and a new earth. The Ground Crew maintains that at least one angel will accompany each spaceship and that Earth will be transformed into a paradise.

The advent of aliens can be apocalyptic and/or millenarian. In most instances the time of the extraterrestrials' arrival is not specified but is expected to be relatively soon. Probably the most recent attempt to pinpoint the time of arrival was made by Chen Tao in Garland, Texas. In typical prophetic fashion, its leader, Hon-Ming Chen, said that God would announce his descent by taking control of the television networks on March 25, 1998. In similar fashion Unarius Academy of Science has foretold the advent of the aliens in their flying saucers. As in many prophetic instances, the failure of

the prophecy to materialize has not led to the demise of the group.

Another UFO religion, Mark-Age, believed that the arrival of the aliens would be around the year 2000 and stated that its mission was to externalize on Earth the Hierarchical Board, namely, the spiritual government of our solar system, in preparation for the advent of the aliens. Borrowing the concept of the second coming from Christianity, it teaches that this Christian belief has a dual meaning, namely (1) the second coming of each one's I Am Self, expressed through the mortal personality; and (2) the second coming of Sananda/Jesus the Christ, Prince of Earth, in his resurrected, light body.

Other groups are more cautious. The Aetherius Society expects a new master, presumably to precede the advent of the aliens, but does not give a specific date. While many members believe that it will be soon, the society states that he will come when human beings are ready for his arrival. Raëlians think the extraterrestrials will arrive around the year 2020. But before they arrive, human beings must first have established world peace and built an embassy for them in or near Jerusalem.

SIGNIFICANT FIGURES AND ORGANIZATIONS. While many people believe in UFOs, the number of UFO religious organizations and of those who have joined their ranks is rather small. J. Gordon Melton (2003) lists twenty-three flying saucer groups, while Mikael Rothstein (2002) estimates that they are twenty-five different groups active today, but he does not list them. Melton's list, only slightly updated from the previous edition of his encyclopedia, omits such groups as Heaven's Gate, Chen Tao, the Nuwaubians, and the Ground Crew and its splinter group the Planetary Action Organization (PAO). It still remains, however, the most complete and provides short descriptions of the origins and belief systems of each group.

Melton's list also indirectly points to the some of the difficulties involved in studying these groups. Thus, Melton states that two of the groups he lists are defunct. He could not trace the addresses of eight groups and found that six provide only a post office box address. Nine of the groups mentioned have a web page, as have the more recent ones. The vast majority do not report the number of members of the organization. The membership of most groups may be somewhat fluid and probably consists of a few hundreds or thousands at most. At least two, the Ground Crew and Zeta-Talk (the latter led by Nancy Lieder), exist only on the internet. By far the largest UFO group is probably the Raëlian movement, which boasts sixty thousand members in almost a hundred countries. Unarius Academy of Science states that tens of thousands of individuals have participated in its programs. It is not clear how each organization counts its membership. The Aetherius Society lists three levels of membership, full, associate, and friends, the last including interested individuals and scholars, but it provides no figures.

Not all UFO groups prefer to be called a religion. The Aetherius Society's web page states explicitly: "This is not a religion. . . . It's a spiritual path to enlightenment and the cosmic evolution of mankind." Unarius Academy of Science tends to view itself as a philosophy of life, while the Nuwaubians prefer to call themselves a fraternal organization. One group in particular, the Raëlian movement, is highly critical of established religion, particularly Christianity. It describes itself as an "atheist, spiritual organization" and states that one of its goals is to lead human beings to understand true religion. Its founder, Raël, starts by reinterpreting the biblical concept of Elohim, which, he asserts, refers not to God but to beings from another planet who created life on Earth.

CONTROVERSIES. Until recently, UFO religions have not been controversial. They rather left the impression of being innocuous, eccentric groups. In 1997, however, the members of Heaven's Gate took the initiative to transport themselves to a spacecraft by committing suicide in order to move into a higher state of being. This was perceived by many as a warning sign that UFO religions might be dangerous. Chen Tao's claim that God would speak over the television networks and then come down in flying saucers to save people created quite a stir and raised the fear that its members might follow in the path of those of Heaven's Gate. Such fear proved unfounded, and when the prophecy failed, many members abandoned the group, though some have remained loyal to Hon-Ming Chen's teachings and prophetic utterances.

The view that UFO religions are dangerous has been buttressed by the fact that several UFO groups, including the Raëlian movement, the Ground Crew, Unarius, and the Nuwaubians, share the apocalyptic view that the arrival of extraterrestrials is imminent. In fact, however, most UFO religions are benign and pose no threat to their members or to the public. Their predictions, no matter how far-fetched they might appear to be, are not of doom and disaster but of the betterment of the human race on Earth.

In late 2002 and in early 2003 the Raëlian movement made headlines by announcing that its scientists had succeeded in cloning human beings. Cloning is considered by Raëlians as the first step in the human quest for eternal life, and although the scientific reactions to their claim have been negative, it still remains part of their agenda.

During the last few years the Nuwaubians, who moved from New York to the Georgia countryside in 1993, have become one of the most controversial UFO groups. They have been accused repeatedly of child abuse and of encouraging Black Nationalism. Their leader, Malachi York, has spent three years in jail for assault, resisting arrest, and possession of weapons. In January 2004 he was convicted of sexual abuse of children and sentenced to a long jail term. Other, much less serious charges have been leveled at leaders of several UFO groups. George Adamski and Eduard Meier of the Semjase Silver Star Center were both accused of faking photographs and plagiarism, while William Ferguson of the Cos-

mic Circle of Fellowship was convicted of fraud and sentenced to a year in prison.

CONCLUSIONS. The presence of UFO religions has elicited the attention of many scholars from different academic fields. Both sociologists and psychologists have offered different interpretations of why they might come into being and of the psychological and mental state of their members.

The rise of belief in UFO religions is interesting from the point of view of both religious studies and theology. UFO religions seem to be making an attempt to relate religion with science more positively. The adherents of UFO religions see their beliefs confirmed by scientific data regarding the nature of the universe and the possibility of intelligent extraterrestrial life. Ryan Cook (2002) has called them "Technospiritualities."

From a theological standpoint, UFO religions attempt to incorporate a scientific view of the universe in their ideology. Traditional theology is Earthbound. In terms of myths of creation, beliefs regarding the origin of the human race, its current problems and destiny, and spirituality, theology has been confined to the planet Earth. Although theological speculations about the possibility of other worlds have been going on long before modern astronomy and its discoveries (O'Meara, 1999), Earth still remained the theological center of the universe. Speculations about the spiritual nature of beings in other worlds, their need for salvation, and the possibility of divine intervention were never considered in the context of contact with extraterrestrials who visit Earth in flying saucers. UFO religions offer a new worldview and propose a novel vision of the future. Whether these will captivate the human imagination further or not remains to be seen.

ŪICH'ŌN (1055–1101), also known as National Master Taegak; Buddhist cataloger and founder of the Ch'ont'ae (Chin., Tiantai) school of Korean Buddhism. Ūich'ōn was the fourth son of the Koryō king Munjong (r. 1046–1083), and one of the premier scholiasts of the Koryō (937–1392) Buddhist church. Early in his life, he is said to have mastered all of the main currents of Buddhist philosophy as well as much of Chinese classical literature. Korean Buddhism during his time was bifurcated between two increasingly hostile traditions: the scholastic schools (*kyo*; Chin., *jiao*), dominated by Hwaōm (Chin., Huayan) philosophy, and the Nine Mountains schools of Sōn (Chin., Chan), which were chiefly concerned with meditative practices. Ūich'ōn deplored the sectarianism that had infected the order and criticized adepts of both the Sōn and scholastic schools for their intransigence.

To resolve this conflict, Ūich'ōn proposed an approach to Buddhist religious training that placed equal stress on both scriptural study and meditation practice. Ūich'ōn developed a curriculum based on such seminal texts as the *Abhidharmakośa*, *Vijñaptimātratāsiddhi Śāstra*, *Dasheng qixin lun*, and *Avatamsaka Sūtra*, in order to engender a comprehensive understanding of the Buddhist teachings in his students. While acknowledging the value of scriptural study in conceptualizing the goal of practice and the course to be followed in reaching that goal, Ūich'ōn recognized its limitations. Formal meditative training was also essential if the adept were to achieve any personal experience of what was learned in Buddhist doctrinal writings. Hence, a viable Buddhist vocation would maintain a careful balance between both learning and meditation.

Ūich'ōn seems to have anticipated drawing upon his royal prerogative as a means of reconciling the rift between the Sōn and *kyo* schools. In order to effect his vision of a unified Buddhist tradition in which equal stress was placed upon both study and practice, Ūich'ōn traveled surreptitiously to China in 1085, where he received transmission in the Tiantai lineage, one of the more ecumenical of the Chinese Buddhist schools. After returning to Korea the following year Ūich'ōn then attempted to merge the Sōn and Kyo branches of the Korean church into a new Ch'ont'ae school, which he felt provided a banner under which both branches could unite. While Ch'ont'ae was known in Korea before his time, it was

Ūich'ōn who was first able to establish the school as a fully viable, autonomous school; it is for this reason that he is regarded as the founder of the Korean Ch'ont'ae school. Whatever his chances for success might have been, Ūich'ōn's death at the young age of forty-seven brought his efforts to a premature end, and Korean Buddhism remained divided until the similar endeavors of Chinul (1158–1210), some three generations later.

Along with his efforts to unify the Korean church, Ūich'ōn was also an avid bibliophile and one of the first Buddhist catalogers to recognize the importance to the tradition of native East Asian treatises and commentarial writings. In 1073 Ūich'ōn made a vow to compile a complete collection of such indigenous Buddhist literature, and dispatched agents to all areas of East Asia to obtain copies of texts not then available in Korea. Many of these books were obtained by exchange, as, for example, in the Khitan Liao region of northern China, where Wōnhyo's works were traded for twenty-nine books by Liao authors. On his own trip to Southern Song-dynasty China, Ūich'ōn reintroduced a number of seminal works by noted Chinese exegetes that were no longer extant in China, including treatises by the Huayan patriarchs Zhiyan (602–668), Fazang (643–712), and Chengguan (738–840); these were exchanged for over three thousand fascicles (*kwōn*) of Chinese materials. Finally, in 1090 he published his renowned catalog of this collection, the *Sinp'yōn chejong kyojang ch'ongnok* (New compilation of a comprehensive catalog of the repository of the teachings of all the schools; T.D. no. 2184), with listings of 1,010 titles in a total of 4,740 *kwōn*. Xylographs were carved for each of these texts, forming what was termed *Sokchanggyōng* (Supplement to the canon). Unfortunately, the woodblocks of the supplement were burned by the Mongols during their invasion of the Korean peninsula in 1232, and many of the texts so painstakingly collected by Ūich'ōn were lost to history. Nevertheless, his catalog does survive, and remains one of the most valuable sources of information on the scholastic literature of medieval East Asian Buddhism.

UIGHUR RELIGION SEE INNER ASIAN RELIGIONS

ŬISANG (625–702), also known as the National Master Taesŏng Wŏn'gyo; founder of the Hwaŏm (Chin., Huayan) school of Korean Buddhism. Ŭisang, one of the most important scholiasts of the Unified Silla period (688–935), helped to forge the doctrinal perspectives that would become characteristic of the mature Korean Buddhist tradition.

Ordained as a monk at the age of twenty-nine at Hwangbok monastery in the Silla capital of Kyŏngju, he soon afterward decided to travel to Tang China together with his friend Wŏnhyo (617–686) to study under Chinese masters. As Ŭisang's biography relates, on their first trip in 650 (during the unification wars that were then raging between the three kingdoms of early Korea) the two pilgrims were arrested for espionage in the Liaodong area by Koguryŏ border guards and were only repatriated after several weeks of incarceration. In 661 they tried again, this time traveling to a seaport in the Paekche region of southwestern Korea, which had been conquered by Silla the preceding year, where they hoped to board a ship bound for Tang China. Prior to their embarkation, however, Wŏnhyo is said to have gained enlightenment and returned home to Silla, leaving Ŭisang to continue on alone.

Arriving in Yangzhou on the lower Yangtze River, Ŭisang made his way to Zhixiang monastery on Mount Zhongnan, where he studied under Zhiyan (602–668), the putative second patriarch of the Chinese Huayan school. Ŭisang's arrival at Zhixiang monastery is said to have been anticipated by Zhiyan, and he quickly became one of his chief disciples along with Fazang (643–712), who would eventually be recognized as the third patriarch of the school.

After Zhiyan's death in 668, Ŭisang became one of the leaders of the developing Chinese Huayan tradition. In 670, Ŭisang learned from two Korean envoys detained in the Tang capital that a Chinese invasion of Silla was imminent. Ŭisang returned to Korea to warn King Munmu (r. 661–680), and, thanks to his monition, Silla was able to forestall the attack. Partially out of gratitude, the king sponsored the construction of Pusŏk monastery on Mount T'aebaek and installed Ŭisang as its abbot. This monastery became the center of the Hwaŏm school, from where the new teachings that he had brought from China were propagated throughout the peninsula. His fame was so widespread in Korea that more than three thousand students are said to have congregated there to hear his lectures. Due in large part to Ŭisang's efforts, Hwaŏm philosophy came to dominate Korean Buddhist scholasticism.

Ŭisang's Hwaŏm thought is epitomized in his *Hwaŏm ilsŭng pŏpkyedo* (Diagram of the *Avatamsaka* one-vehicle realm-of-reality), a short poem of 210 logographs in a total of 30 stanzas written in 668 while he was still a member of

Zhiyan's congregation. The poem is arranged in a wavelike form, the "ocean seal diagram" (*Sāgaramudrā Maṇḍala*), which symbolizes the Hwaŏm teaching of the "six marks" (*yuksang*)—that is, of universality and particularity, identity and difference, and integration and disintegration. The entire structure of the diagram represents the marks of universality, identity, and integration, while its curves designate the particularity, difference, and disintegration marks. The chart is woven into one continuous line to show that all phenomena are interconnected and unified in the *dharmā*-nature; the fact that this line ends at the same place where it began illustrates the cardinal Hwaŏm doctrine of interpenetration. The diagram is divided into four equal blocks, indicating that the *dharmā*-nature is perfected through such salutary practices as the four means of conversion: giving, kind words, helpfulness, and cooperation. Finally, the fifty-four corners found along the meanderings of the line of verse indicate the fifty-four teachers visited by the pilgrim Sudhana in his quest for knowledge as narrated in the *Gaṇḍavyūha* chapter of the *Avatamsaka Sūtra*. Hence, the diagram serves as a comprehensive summary of all the teachings found in the sixty-fascicle recension of the *Avatamsaka Sūtra*. Besides Ŭisang's autocommentary to this poem, his only other extant work is the short *Paekhwa toryang parwŏn mun* (Vow made at the White Lotus enlightenment site), which combines Avalokiteśvara piety with Hwaŏm philosophy.

Although Ŭisang may not have been a prolific writer, his mastery of Huayan thought was highly regarded throughout East Asia. Fazang, for example, continued to correspond with Ŭisang even after the latter's return to Korea and, in one of his letters to Ŭisang in 692, he asks for corrections and suggestions on one of his manuscripts. Indeed, an examination of Fazang's writings reveals that the Korean exegetes Ŭisang and Wŏnhyo exerted strong influence on the development of his own thought, and, by extension, on the evolution of Chinese Huayan philosophy.

ROBERT EVANS BUSWELL, JR. (1987 AND 2005)

UKKO. Finnish incantations dating from the Middle Ages call upon Ukko, the supreme god or the god in heaven. Typi-

cal is the following such invocation: "O Ukko, god supreme, old man in heaven, god of the skies." His name, which means "old man," and other of his epithets, Isä ("father") or Vaari ("old man, grandfather"), reveal the dominant character of this deity. On the other hand, *ukko* and its diminutive form, *ukkonen*, also mean "thunder." Ukko is in fact most often connected with thunder; like Jupiter, he was thought to drive a chariot that caused the sound of thunder during storms. Above all, Ukko is described in incantations as ruler of the weather and giver of rain. His protection was also sought in healing and at births, on behalf of cattle or humans against evil spirits, and in hunting. It seems that Ukko, originally the god of thunder and rain, gradually emerged under the influence of the Christian concept of God to become the supreme god, helping humans in all their worldly needs.

Ukko's attributes are widely known symbols of lightning: a golden club, hammer, ax, sword, and arrow. "Ukko's wedges," ax-shaped stones found in the ground, have often been ascribed to the god of thunder as the implements with which he smote a tree or carved off shavings. Stones thought to belong to Ukko were used to protect their owners from fire or from evil spirits. Ukko's characteristics are reminiscent of the Scandinavian god of thunder, Þórr (Thor); Viking pendants depicting Þórr have also been found in Finland. In eastern and northern Finland thunderstones are called "Ukko's claws," suggesting that in the oldest Finnish beliefs thunder was represented as a giant bird with stone claws, as in northern Asia and America.

The list of Finnish deities given by the Finnish prelate Michael Agricola in the preface to his psalter (1551) notes that a toast was drunk to Ukko when seeds were sown in spring. Various later sources also describe village beer festivals, Ukon Vakati, held in Ukko's honor in spring or summer whenever there was threat of drought. In Karelia these rites merged with the worship of Saint Ilja, or Elias. The rites in question were performed to bring rain and to ensure a successful crop. Agricola mentions that women drank during the festival, following which "many shameful deeds took place." Ukon Vakati has in fact been connected with the rites reenacting the holy alliance of the god of fertility and his wife, the god of the earth, known, for example, to the farming cultures of eastern Europe. Agricola further mentions Rauni as Ukko's wife. The Saami (Lapps) also knew of Ukko's wife Ravdna, a childless deity to whom rowan berries are dedicated. The names *Rauni* and *Ravdna* are derived from the Scandinavian word meaning "rowan" (Swedish, *rönn*; Old Icelandic, *reyrnir*). The rowan is mentioned in Scandinavian mythology as being Þórr's "castle," his savior in times of danger. No mention is made of Ukko's wife in later descriptions of rites, but the Earth Mother is sometimes mentioned alongside Ukko in eastern Finnish incantations in which he appears as the Sky Father.

According to accounts written between the seventeenth and nineteenth centuries, the beer for the festivals held in honor of Ukko was sometimes made from malt germinated

on the roof in a birchbark container. Food was also served. The site of the festival was often the organizer's farm, a lake shore, or, in inland areas, on "Ukko's hill" (*Ukon vuori*), a hill to which Ukko's share of the beer and sacrifices was brought. A ritual poem performed at festivals in Ukko's honor and asking him to increase the crop has been preserved in Ingria and Karelia.

'**ULAMĀ**' ("the learned"), the religious scholars of Islam, are the guardians, transmitters, and interpreters of its sciences, doctrines, and laws and the chief guarantors of continuity in the spiritual and intellectual history of the Islamic community. The term is a generic one and embraces all who have cultivated the religious disciplines or fulfilled certain practical functions such as judgeship. [See figure 1 for individual titles given to 'ulamā'.]

It is an axiom that the scholars are the heirs of the prophets; the emergence of the 'ulamā' as a distinct group had, therefore, to await the passing of the prophet Muḥammad and the completion of revelation. However, the Qur'ān itself indicates the necessity and excellence of a learned class, quite apart from extolling, in numerous verses, the virtue of knowledge ('ilm). The word 'ulamā' appears in *sūrah* 35:28, although obviously not in the precise sense later usage conferred on it, and the expressions "those well rooted in knowledge" (3:7), "the people of remembrance" (16:43), and "those who have been given knowledge" (58:11) have also been interpreted as referring to the 'ulamā'. Numerous utterances attributed to the Prophet define the purpose and status of the 'ulamā': in addition to being "the heirs of the prophets," they are described as "the best of my community," "the trustees of the prophets" (in the sense of being repositories of the laws promulgated by the prophets), "the trustees

of God over his creation,” “the lamps of the earth” (in that through their knowledge they dissipate the darkness of ignorance), and “equivalent to the prophets of the children of Israel” (in stature and authority). The authenticity of some of these utterances has been questioned, but their content has shaped the self-image of the ‘*ulamā*’ and their role in Muslim society.

The antecedents of the learned class of Islam may perhaps be sought in the *ahl al-ṣuffah* (“the people of the bench”), a group that customarily gathered outside the mosque in Medina for the cultivation of religious knowledge and from whom lines of transmission went forth to the great early authorities in Qur’anic exegesis, prophetic tradition, and law. Antecedents may be found also in certain individuals who excelled in a particular branch of learning (such as Ibn ‘Abbās, described by the Prophet as “the foremost of the exegetes”). It was not until the ninth century that a distinct class of learned men crystalized, bearing the title of ‘*ulamā*’. This development went together with the elaboration and differentiation of the various branches of religious knowledge, with the vast expansion of the Islamic realm beyond the Arabian Peninsula, and with the accelerating conversion of non-Arab peoples to Islam (the high proportion of Iranians among the ‘*ulamā*’ of what has been called the formative period of Islamic thought cannot be overlooked). But the most important single impetus to the emergence of the ‘*ulamā*’ class was the desire of the Islamic community to codify the provisions of Islamic law, for the ‘*ulamā*’ were primarily concerned with law, of which other subjects were the virtual adjunct. Jurisprudence has remained the core of the ‘*ulamā*’ curriculum down to the present.

Various explanations have been offered for the emergence of the *madrasah*, the institution for the training and formation of the ‘*ulamā*’, but once the *madrasah* appeared and spread throughout the Islamic world, it remained remarkably stable, and its resistance to change became one of the most important elements in the ability of the ‘*ulamā*’ to function as guarantors of continuity. The *madrasah* had a hierarchy of posts ranging from the *mubtadi*, or beginning student, to the *mudarris*, or fully qualified professor of law; intermediate stages were the *mutawassit* (“intermediate”), the *muntahī* (“terminal”), the *mufīd* (“docent”), the *mu‘īd* (“repetitor”), and the *nā‘ib mudarris* (“deputy professor”).

Two elements lay at the heart of the *madrasah* education: the study of texts and the personal relationship between student and teacher. Particularly from the eleventh century onward, when all major developments in the field of jurisprudence had been completed, it was texts rather than the subjects they treated that defined the *madrasah* syllabus. The text was made the object of assimilation, discussion, elaboration, commentary, and criticism, so that an important part of ‘*ulamā*’ writing came to consist of glosses and commentaries on curricular texts.

The relationship between teacher and student consisted of far more than the transmission of a fixed body of knowl-

Ākhānd: Originally a title given to scholars of unusual merit, primarily in Iran, it was subsequently devalued and became a pejorative term for the lowest stratum of ‘*ulamā*’. From it is derived the Chinese *ahung*, meaning any Muslim religious functionary.

Āyatullāh (anglicized Ayatollah; “sign of God”): A title of recent origin given to the highest ranking Shi’ scholars in Iran.

Faqīh: Originally one who had a broad and complete understanding of religion as a whole; it occurs in this sense in several of the traditions of the Prophet that delineate the general rank of the ‘*ulamā*’. It later came to designate a specialist in Islamic jurisprudence (*fiqh*).

Hujjat al-Islām (“proof of Islam”): Originally a title reserved for scholars of quite exceptional status, it is now applied in Iran to scholars beneath the rank of *mujtahid*.

Imām Jum‘ah: Leader of the congregational prayers performed at midday on Friday.

Khaṭīb: The scholar who delivers the Friday sermon (*khuṭbah*).

Marja‘-i taqlīd (“source of imitation”): A *mujtahid* whom the ordinary Shi’ believer is obliged to follow in the details of religious law.

Mawlānā (“our master”): A title of respect for a senior scholar.

Mawlawī: A variant form of the preceding, used in South Asia and Afghanistan to designate any religious functionary.

Muftī: A jurisconsult; one who delivers binding opinions on a matter of religious law.

Mujtahid: One who exercises *ijtihād*, that is, the search for a correct opinion in deducing the specific provisions of the law from its principles.

Mullā (anglicized Mullah): In origin probably a corrupt form of the Arabic *mawlā* (“master”), it has had the same semantic history as *ākhānd*.

Qāḍī: Judge of the religious law.

Shaykh (“elder”): A title of respect used particularly in the Arabic-speaking lands and not implying the exercise of any particular function.

Shaykh al-Islām: The main religious dignitary of a Muslim city in Iran and Central Asia; in Ottoman usage, the head of the entire scholarly hierarchy.

Wā‘iz: Preacher.

FIGURE 1. Glossary of titles given to ‘*ulamā*’.

edge. An entire worldview and distinct method of thought, as well as a sense of corporate identity, were also passed on. Accordingly, dealings between teachers and students were regulated by ethical and behavioral norms that were codified in a number of handbooks. These twin elements, the text and the teacher, were recorded in a document known variously as the *sanad* and the *ijāzah*, in which the competence of the student to teach various books was attested and the entire chain of authorities, to which his name was added as the most recent link, was enumerated.

Although the ‘*ulamā*’ were defined as a social unit by their cultivation and transmission of religious learning (together with the application of that learning in their own lives: ‘*ilm* had always to be complemented by ‘*amal*, “practice”), they also exercised a variety of practical functions that made them indispensable to traditional society. Apart from preaching and leading congregational prayers in the mosque (a task that, outside the largest and most prestigious mosques, was often delegated to junior members of the class), they acted as judges, notarized and witnessed all important civil and

commercial transactions, served as trustees for the estates of minors, and arbitrated popular disputes. All of these activities created a closeness between them and the rest of society (particularly the mercantile and artisan classes of the cities) that was singularly lacking in the relations of the state with its subjects.

Early 'ulamā' (like early Ṣūfīs) appear not to have drawn salaries or charged fees for the functions they fulfilled, and down to the present some 'ulamā', particularly in the countryside, have continued to earn their livelihood from the practice of a trade. But despite initial misgivings, it soon became normal for the 'ulamā' to charge fees for exercising notarial functions and issuing legal opinions (*fatwās*) and to accept stipends from the endowments that were settled on the learned institutions. Because the stipends were not always generous, it was often necessary to supplement them with income from other sources; 'ulamā' biographies are replete with stories of material hardship. But certain 'ulamā' are recorded to have accumulated great wealth, particularly when religious learning and prestige became hereditary in some families.

Islamic political theory, especially as elaborated by the Sunnī segment of the community, quickly came to an accommodation with the dynasties (often of military origin) that seized rule over the Islamic lands from the tenth century on; rebellion was generally equated with irreligion. Despite this, the 'ulamā' sometimes acted as the spokesmen for popular grievances. In addition, there was the lasting conviction that the 'ulamā' should shun close association with the state and its officers in order to maintain the superior degree of piety that was meant to undergird their learning. A frequently quoted tradition made the successorship of the 'ulamā' to the prophets conditional on their "not associating with the sultan." Those who did associate were designated by the celebrated al-Ghazālī (d. 1111) as "scholars with worldly motivation" ('ulamā' *al-dunyā*) or "scholars of evil" ('ulamā' *al-sū*) by contrast with "scholars of otherworldly motivation" ('ulamā' *al-ākhirah*), that is, those who shunned such association. Tangential association with the state was, however, inevitable in the case of posts—above all, judgeships—that were at its disposal, and in Ottoman times the entire corps of 'ulamā' became in effect part of the state bureaucracy and thus lost its autonomy.

It is often supposed that a fundamental and consistent opposition existed between the 'ulamā' and the Ṣūfīs, the other great class of religious specialists in Muslim society, and certainly cases of mutual hostility are to be encountered. The overall historical record suggests, however, that a symbiotic relationship existed between the 'ulamā' and the Ṣūfīs: while the 'ulamā' cultivated 'ilm, formal knowledge acquired through mental exertion, the Ṣūfīs pursued *ma'rifah*, inward knowledge resulting from the purification of the heart. The 'ulamā' were designated as "scholars of the exoteric" ('ulamā' *al-zāhir*) and the Ṣūfīs as "scholars of the esoteric" ('ulamā' *al-bāṭin*); the purview of religion was seen to in-

clude harmoniously the concerns of both groups. Theoretical Ṣūfism was often taught in the *madrasabs*, and the Ṣūfīs recognized the authority of the 'ulamā' in matters of law. From the fifteenth century onward, it was even common for many of the 'ulamā', especially in India and the Ottoman empire, to be affiliated with one of the Ṣūfī orders, often the Naqshbandiyah. One who combined formal scholarship with Sufism in this way would be designated as "the possessor of two wings" (*dhū al-janāḥayn*).

In modern times, the authority of the 'ulamā' in Muslim society has generally declined. The increasing secularization of law and education has deprived them of many of their most important functions, so that in some cases they have become little more than state-supported dignitaries with purely cultic and ceremonial responsibilities; vigorous and ambitious minds have found little stimulus to join the ranks of the 'ulamā'. In addition, the emergence of Islamic movements that bypass the 'ulamā' and even criticize them for alleged failings, such as intellectual stagnation and political passivity, has undercut their standing with the believing masses. In some cases, however, the 'ulamā' have collaborated with these movements, as in late twentieth-century Syria, where prominent 'ulamā' were involved in the Muslim Brotherhood. Independent 'ulamā' ventures in politics with parties such as the Nahdatul Ulama in Indonesia and the Jamī'at al-'Ulamā' in Pakistan have not been notably successful. The case of Iran, where the 'ulamā' not only defied the secularizing bent of the state but led a revolution to victory and founded an Islamic republic, is an exception to the prevailing trend of diminishing influence, owing to a number of special factors such as the organizational autonomy of the Iranian 'ulamā' in the prerevolutionary period and the charismatic appeal of Imām Khomeini. It is nonetheless possible that the present current of Islamic renewal may ultimately enhance the prestige and position of the 'ulamā' in other countries.

BIBLIOGRAPHY

There is no single work describing the origins, development, functions, and present status of the 'ulamā'. The formation of the *madrasah* and the salient features of the pedagogical tradition have, however, been expertly discussed in George Makdisi's *The Rise of Colleges: Institutions of Learning in Islam and the West* (Edinburgh, 1981). Developments in the *madrasah* system under the Ottomans are the subject of Hüseyin Atay's *Osmanlılarda yüksek din eğitimi* (Istanbul, 1983). Among the many works delineating the ethical norms that surrounded the cultivation of learning mention may be made of Ibn Jamā'ah's *Tadhkirat al-sāmi' wa-al-mutakallim fī adab al-'ālim wa-al-muta'allim* (Beirut, 1974). Relations between the 'ulamā' and the state, with particular reference to 'ulamā' defiance of injustice, have been surveyed by 'Abd al-'Azīz Badrī in *Al-Islām bayn al-'ulamā' wa-al-ḥukkām* (Medina, 1966). The organization and functions of the Ottoman learned hierarchy are described by Ismail Hakkı

Uzunçarşılı in *Osmanlı devletinin ilmiye teşkilâtı*, 2d ed. (Ankara, 1984). Two collective works that contain essays on the 'ulamā' in different periods and lands are *The 'Ulamā' in Modern History*, edited by Gabriel Baer (Jerusalem, 1971), and *Scholars, Saints and Sufis*, edited by Nikki R. Keddie (Berkeley, 1972). See also my study *Religion and State in Iran, 1785–1906: The Role of the Ulama in the Qajar Period* (Berkeley, 1969).

HAMID ALGAR (1987)

ÜLGEN, sometimes called Bai Ülgen ("rich Ülgen"), is a deity venerated by the Turkic peoples living in the Altai and Sayan mountains in southern Siberia. Ülgen is also known to the east, among the Mongol Buriats.

In Altai-Sayan Turkic mythology Ülgen figures as the highest deity. He created earth and heaven and all living beings. He is the master of the good spirits, the lord of the upper world, the realm of light; he is the protector of humankind. After him stands Erlik Khan, the lord of the lower world, the realm of darkness; Erlik is the master of the evil spirits. Both Ülgen and Erlik Khan determine the fate of human beings, who live in the middle world.

In the Buriat pantheon Ülgen plays a secondary but revealing role: the deity is regarded as female, a goddess of earth. The Buriats call her Ülgen Ekhe ("mother Ülgen") and consider her the female counterpart of Ünder Tengeri ("high heaven"). Ülgen becomes directly equated with earth in the expression *ülgen delkhei*, which connotes both "wide earth" and "mother earth."

The Buriat Ülgen seems to be a relic of an ancient Turco-Mongol cult dedicated to Ülgen as a terrestrial deity. Her character, however, has undergone an essential transformation in the religion of the Altai-Sayan Turkic people. Ülgen has gradually usurped functions of the male deity Tengere Kaira Khan ("heaven, the gracious khan"), the highest god of heaven, thus changing herself into a male deity. But Ülgen has not been able to supplant Tengere Kaira Khan completely. Thus Ülgen sometimes figures as the first of Tengere Kaira Khan's sons, not residing, as he does, on the seventeenth level of heaven, but on the sixteenth.

Nevertheless, in some of the myths, as well as in popular belief, Ülgen has succeeded in attaining the rank of highest deity. His name has been placed beside those of other deities used by Turkic and Mongol peoples to designate their highest being: Tengri ("heaven"; Türk); Köke Mönge Tengri ("blue eternal heaven"; Mongols, Buriats); Esege ("father") and Malan Tengeri (Buriats); Khormusta (Mongols, Buriats, Tuvin, and Altaic Turkic peoples); Iuriung Aıyy Toïon ("white good lord"; Yakuts); Burkhan Bagši ("teacher Buddha"; Tuvin); and Kudai ("god"; Altaic Turkic peoples).

The various sources do not give a uniform description of Ülgen's character. Several indigenous conceptions of different historical and regional origin became mixed with for-

eign ideas, owing to Russian Orthodox missionary work and contact with Buddhist neighbors. Nevertheless, Ülgen's form and functions are sufficiently clear, in spite of discrepancies and contradictions in detail.

Hovering over the primeval ocean, Ülgen and the first man, in the form of two ducks, create the earth from mud taken from the bottom of the sea. In other traditions Ülgen uses mud to create the first human. Both motifs are indigenous conceptions. Christian influence may be evident in two other motifs: Ülgen makes the first woman from two ribs of one of the first seven men, who then becomes her husband; the woman, seduced by a snake, eats forbidden food from the first tree and then gives it to her husband.

Having attempted to become like Ülgen, the first man is expelled to the lower world by the deity, who names him Erlik—a figure also well known in Buddhist mythology. The second man, Mangdyshirä, the Buddhist *bodhisattva* Mañjuśrī, directs the three fish that support the earth, using a leash that is fastened to heaven. Thereby he controls heaven and earth. Having created the first parents of humankind, Ülgen retreats into his castle on the top of the cosmic mountain. He entrusts the supervision of humans to the third man, Maitärä, the Buddha Maitreya.

Ülgen is described as an old man with a long beard. Thus he becomes identical with White Old Man, a fertility god who is also known among other peoples. Ülgen also preserves distinct characteristics of a tribal deity. He has a wife, sons, daughters, and servants; many of his sons are spirits of Altaic clans.

The fact that Maitärä, the third man, is Ülgen's representative on earth does not exclude people from direct contact with Ülgen and does not prohibit them from asking him, for instance, for abundant cattle, for good crops, or for protection against all kinds of evil. The means that can be used for this purpose are prayer and sacrifice, which are also offered to other good gods and spirits, including Erlik Khan. The animals used for sacrifice seem primarily to be horses and sheep. Sacrifices can (but need not) be made with the help of a shaman, as in the famous horse offering described by Wilhelm Radloff. The shaman kills a horse and, accompanying its soul, penetrates through all the layers of heaven until he reaches Ülgen. The deity informs the shaman whether or not the offering has been accepted favorably, and the shaman learns of impending dangers, such as bad harvests. It is uncertain if the cult of Ülgen has survived to the present day.

BIBLIOGRAPHY

Ülgen's character, cult, and position in the religion of the Turkic peoples of southern Siberia have been discussed in great detail by Wilhelm Schmidt in volume 9 of his classic *Der Ursprung der Gottesidee* (Münster, 1949). Schmidt gives ample quotations from the works of Russian scholars, partic-

ularly from Wilhelm Radloff's *Proben der Volksliteratur der türkischen Stämme*, vol. 1 (Saint Petersburg, 1866), and *Aus Sibirien* (Leipzig, 1893), and from A. N. Anokhin's *Materialy po shamanstvu u altaitsev* (Leningrad, 1924). Ülgen and the horse sacrifice dedicated to him have also been dealt with by Mircea Eliade in his *Shamanism: Archaic Techniques of Ecstasy*, rev. & enl. ed. (New York, 1964). Brief but valuable elucidations of Ülgen's role in Turkic and Buriat religions have been given in recent Soviet publications by such authors as V. P. D'iakonova, T. M. Mikhailov, and S. Iu. Nekliudov.

Revised Bibliography

ULTRAMONTANISM is the tendency of Roman Catholicism that emphasizes the authority of the papacy in the government and teaching of the church. Originally articulated in opposition to Gallicanism, ultramontanism stressed the unity of the church centralized in Rome ("over the mountains") and its independence from nations and states. Ultramontane principles can be traced to the struggles of popes and councils in the fifteenth century. The papalist position received a full exposition by the Jesuit Roberto Bellarmino at the end of the sixteenth century. However, ultramontanism acquired its definitive meaning in the conflict over the Gallicanism of Louis XIV in the seventeenth and eighteenth centuries. The term *ultramontanism* seems to date from the 1730s, although *ultramontane* was used with various meanings in the Middle Ages. During the eighteenth century, exponents of ultramontanism waged a generally losing struggle against Gallicanism and similar statist movements in other countries, such as Febronianism and Josephism.

The French Revolution dealt a fatal blow to Gallicanism by destroying the monarchy on which it had rested. In the ensuing age of uncertainty, the attractiveness of the papacy as the only stable source of authority stimulated a Roman Catholic revival, of which ultramontanism was the essence. Count Joseph de Maistre forcefully expressed this position in *Du pape* (1819), proposing absolutism in state and church under the ultimate supremacy of the pope. The traditionalism of Viscount Louis de Bonald disparaged individual reason, for which Félicité de Lamennais (*Essay on Indifference*, 1817) substituted the "universal consent" of humanity, as embodied in the pope, as the ultimate test of truth. But Lamennais, developing the democratic implications of "universal consent," appealed not only to the pope but also to the people, seeking the freedom of the church in the freedom of

society. Thus he commenced the liberal Catholic movement in the context of ultramontanism. The appeal made to Pope Gregory XVI by Lamennais and his associates on the journal *Avenir* was rejected (*Mirari vos*, 1832) by a papacy still seeking safety in alliance with authoritarian monarchies. Lamennais left the church. Nonetheless, his more moderate colleagues, notably Count Charles de Montalembert and Henri Lacordaire, were able to build a party, at once ultramontane and liberal, that supplanted Gallicanism as the political expression of French Catholicism. This party seemed to triumph during the revolution of 1848, securing its chief goal, freedom of Catholic education, with the passage of the Falloux law in 1850.

The Falloux law brought to the surface a latent division in the Catholic party, many of whose members had followed Montalembert's quest for liberty only as a means toward the end of the ultimate dominance of the church in French life. Louis Veuillot, editor of *L'univers*, led an intransigent group that rejected the compromises inherent in the Falloux law and advanced the most extreme claims on behalf of the church and, within it, of the authority of the pope. This new ultramontanism thus rejected liberal Catholicism, a product of the older ultramontanism, and set itself against all forms of liberalism in church, state, and intellectual life.

The attitude of the papacy was decisive. Although Pope Pius IX (1846–1878) had flirted mildly with liberalism early in his reign, he reacted sharply after the revolution of 1848, which had driven him out of his temporal dominions. After 1850, the church under his leadership regarded itself as besieged and embattled, hostile to all liberalism in political and intellectual life, and concentrating in the pope himself both the devotion of the faithful and the plenitude of authority. This was the final meaning of ultramontanism. Having already overcome Gallicanism, it now fought and defeated liberal Catholicism. Veuillot in France, the Jesuits associated with the periodical *Civiltà Cattolica* in Italy, William George Ward and Henry Edward Manning in England, Paul Cullen in Ireland, and, more moderately, the Mainz school led by Wilhelm von Ketteler in Germany were the leading exponents of a movement that rapidly triumphed among committed Catholics. The *Syllabus of Errors* (1864), a set of theses condemned by Pius IX, marked the height of ultramontane militancy. The definition of papal infallibility by the First Vatican Council in 1870 set the seal on its victory. However qualified the wording of this definition, it was manifest that the ultramontane program of a centralized and authoritarian church under an irresistible pope had been achieved.

From the First to the Second Vatican Council, ultramontanism was effectively synonymous with orthodox Roman Catholicism. The movement in its final form had won so complete a triumph that the term itself fell out of use.

BIBLIOGRAPHY

Encyclopedic or reference entries on ultramontanism tend to be either partisan or unhelpful, but F. F. Urquhart's essay "Ultramontanism," in the *Encyclopaedia of Religion and Ethics*, edited by James Hastings, vol. 12 (Edinburgh, 1926), is a solid brief sketch. Good extended treatments of nineteenth-century ultramontanism can be found in Wilfrid Ward's *William George Ward and the Catholic Revival*, 2d ed. (London, 1912); Adrien Dansette's *Religious History of Modern France*, vol. 1, translated by John Dingle (New York, 1961); and especially Roger Aubert's *Le pontificat de Pie IX, 1846–1878*, "Histoire de l'Église," vol. 21 (Paris, 1952).

JOSEF L. ALTHOLZ (1987)

UMAI. The name *Umai* (*Umay*) first appears in the Old Turkic inscriptions of Mongolia (mid-eighth century CE), where it is borne by a feminine deity of unspecified but benevolent functions. There is a gap of more than a thousand years in the relevant documentation, but belief in Umai has remained alive among some of the Turkic peoples of the Altai region, and also among the Tunguz of northeastern Siberia. Here Umai may be male or female, or even androgynous. In one set of beliefs, where Umai is personified, the role of the spirit resembles that of a guardian angel of small children. Illness may signal Umai's abandonment of her ward, and a shaman's intervention may be sought to effect her return. Often Umai is thought of as the keeper of the soul of unborn children.

Among the Turkic Sagays, Shors, and Beltirs, *umai* is the term applied to the soul of a child from the moment of his birth until about the time when he walks freely and speaks with some fluency. On occasion, the help of a shaman may be requested for the sinister purpose of transferring the *umai* of a healthy infant either into the body of one seriously ill, or into the womb of a woman thought to be sterile. As a result of such an abduction, referred to as *Umay* (or *Imay*) *tutargha*, the donor will die. The term *umai* is applied also to the umbilical cord, which, after being cut, is placed in a small leather pouch and attached to the child's cradle.

The inconsistencies and contradictions shown by nineteenth- and twentieth-century beliefs and practices suggest that these are but surviving fragments of an ancient cult no longer definable. Since *umai* is the standard Mongol word for "womb" or "placenta," it can safely be assumed that, although the name *Umai* first appears in a Turkic text and the cult of Umai is strongest among Turkic peoples, originally the deity was part of a Mongol religious system.

SEE ALSO Turkic Religions.

BIBLIOGRAPHY

Most works dealing with Siberian mythology in general, or with the spiritual civilization of the peoples of the Altai in particular, devote some space to Umai. By far the best and most up-to-date study is that of L. P. Potapov, "Umai: Bozhestvo

drevnikh tiurkov v svete etnograficheskikh dannikh," *Tiurkologicheskii sbornik* (1972): 265–286, which contains many references to earlier, mostly inaccessible studies. Important observations are made on pp. 234–235 of S. V. Ivanov's *Materialy po izobrazitel'nomu iskusstvu narodov Sibiri XIX-nachala XX v.*, "Trudy Instituta etnografii im. N. N. Miklukho-Maklaia," vol. 22 (Moscow, 1954). S. M. Shirokogoroff's *Psychomental Complex of the Tungus* (London, 1935) gives valuable Tunguz data. My article "'Umay,' a Mongol Spirit Honored by the Türks," in *Proceedings of the International Conference on China Border Area Studies, National Chengchi University* (Taipei, 1984), shows the Mongol origin of the cult.

DENIS SINOR (1987)

UMĀPATI ŚIVĀCĀRYA (fourteenth century CE) was a Tamil Śaiva Siddhānta teacher, author, and theologian. Umāpati Śivācārya, who flourished in the South Indian temple city of Chidambaram during the early fourteenth century, was the last of the four *santāna ācāryas* ("hereditary teachers," a term here referring to four theologians in teacher-disciple succession) of the Tamil Śaiva Siddhānta school of philosophy-theology. (The other three *ācāryas* were Meykaṅṭar, Aruṅanti, and Maṛaiṅāna Campantar, all of whom lived in the thirteenth and fourteenth centuries.) According to tradition, Umāpati was a Vaiṣṇava brahman from Koṛṛavaṅkuṭi, near Chidambaram. One day, coming from the temple, he encountered the Śaiva *ācārya* Maṛaiṅāna Campantar. This meeting resulted in Umāpati's conversion to Śaivism. Under the tutelage of Maṛaiṅāna Campantar, who became Umāpati's guru, Umāpati studied Śaiva religious texts and himself became a prolific contributor to the Tamil Śaiva Siddhānta literature.

Fourteen theological texts are considered canonical in the Tamil Śaiva Siddhānta school and are collectively referred to as the Meykaṅṭasāstra. Umāpati wrote eight of these treatises, the most important of which is the *Civapīrakācam* (The Light of Śiva). The *Civapīrakācam* is a hundred-stanza "supplementary treatise" (*cārpunūl*) related both to Meykaṅṭar's "root treatise" (*mutanūl*) the *Civaṅānapōtam*, the basic sutra of the Tamil Śaiva Siddhānta, and to Aruṅanti's secondary treatise-commentary (*valinūl*) on the *Civaṅānapōtam*, the *Civaṅānacittiyār*. This clearly situates Umāpati's work and thought within a typical medieval Hindu sectarian lineage, scholastic in style and substance. Umāpati shares with the other Tamil Siddhāntins a threefold ontology—*pati* ("the lord," i.e., Śiva), *pacu* ("the creature," i.e., souls), and *pācam/malam* ("bondage"/"dirt," i.e., phenomenal reality and consciousness). In the *Civapīrakācam* he displays considerable psychological acumen in delineating the various levels of knowledge-experience that the soul passes through on its journey from an original benighted state of intimate connection with *malam* to an ultimate illumination with the light of Śiva.

Other works by Umāpati in the *Meykaṅṭasāstra* are briefly described as follows. The *Tiruvaruṭṭupayan* contains ten

sets of ten couplets in the style of the renowned Tamil ethical work known as the *Tirukkuraḷ*. Since the *Tirukkuraḷ*'s maxims treat only right conduct (*dharma*), wealth and power (*artha*), and eros (*kāma*), Umāpati offers the *Tiruvārūṭṭayan* to supply a section on *mokṣa*, the fourth Hindu "aim of life" (*puruṣārtha*). The thirteen-quatrains *Vināvenpa* records a dialogue between the author and his guru concerning details of Siddhānta ontology and epistemology. The *Porriṭṭakroṭai*, a ninety-five-stanza composition in the form of a hymn of praise, describes the soul's transformation thanks to Śiva's grace. The *Koṭikkavi*, a mere four quatrains, plays upon an analogy between the ascent of the soul to Śiva and the raising of a flag at a temple festival. The 125-stanza *Neṅcuviṭṭutū* casts the author's heart as a messenger to her beloved (Śiva), who is described as a king, and expounds the soul's transformation by him. The *Uṇṇaineriṭṭakkam* contains six quatrains treating the soul's development and enlightenment. The *Caṅkarpanirākaraṇam* consists of twenty stanzas refuting other sectarian views, especially those of Advaita Vedānta.

Besides the works in the *Meykaṇṭāśāstra*, Umāpati is also the traditionally ascribed author of a number of Tamil Puranic works: a condensation of Cēkkiḷār's great hagiography on the lives of the Tamil Śaiva devotional saints; a sacred biography of Cēkkiḷār himself; the *sthalapurāṇa* ("sacred history of a place") of Chidambaram; and a *purāṇa* on the origins of the Tamil Śaiva collection of sacred hymns the *Tirumurai*. Umāpati also wrote a Sanskrit commentary on the *Paṅṅkarāgama* and compiled an anthology of the ŚaivĀgamas, the *Śataratnasamgraha*.

BIBLIOGRAPHY

Two of Umāpati's Tamil works have been more or less adequately translated into English: the *Civapirakācam* in Henry R. Hoisington's *Tattuva-kaṭṭāḷai, Śiva-gṇāna-pōṭham, and Śiva-pirakāsam* (New Haven, Conn., 1854); and the *Tiruvārūṭṭayan* translated by G. U. Pope in the introductory "appendix" of Pope's *The Tiruvācagam* (1900; reprint, Madras, 1970), pp. xxxix–lxxxvii. There is a translation with commentary on the anthology of the Āgamas: Periyaperumal Thirugnanasambandhan's *Śataratnasamgraha of Śrī Umāpati Śivācārya* (Madras, 1973). For an extended summary and discussion of Umāpati's contributions to the *Meykaṇṭāśāstra*, see Mariasusai Dhavamony's *Love of God according to Śaiva Siddhānta* (Oxford, 1971), pp. 260–324. On Umāpati's Puranic works, see Kamil V. Zvelebil's *Tamil Literature* (Leiden, 1975), pp. 200–201, 221.

GLENN E. YOCUM (1987)

'**UMAR IBN AL-KHAṬṬĀB** (assassinated AH 23/644 CE), second caliph and founder of the Muslim Arab empire. Born in pagan Mecca, he accepted the mission of Muḥammad as God's prophet before the emigration (*hijrah*)

of that city's nascent Muslim community to Medina. Muḥammad later married his daughter Ḥaṣṣah, whose name is linked with the collation of the Qur'ān. 'Umar's fame as caliph (634–644) justly rests on his energetic leadership and shrewd counsel during the expansion of the Medinan commonwealth, which was ultimately transformed into an imperial structure displacing both Byzantine and Persian power in the Middle East.

While traditional accounts attribute a great number of "firsts" to 'Umar, modern scholars have not always been able to distinguish 'Umar's achievements from those of a later period. His adoption of the title Amīr al-Mu'minīn ("counselor of the believers") rather than Khalīfat Rasūl Allāh ("successor of the Messenger of God"), as his predecessor Abū Bakr was called, indicates at least the emergence of a selfconscious, permanent community, if not that of a well-defined political office. It seems clear that he set the precedent for religious endowments (*awqāf*, plural of *waqf*), first on his own land and then on the conquered land of the Sawād in Iraq, the revenue from which was to be used for the benefit of future generations of Muslims. He probably also instituted the prayers (*al-tarāwīḥ*) during the fasting month of Ramaḍān, the obligatory pilgrimage (*ḥajj*), and the Hijrah as the commencement of the Muslim era (622 CE). Of more doubtful origin are the specific punishments for drunkenness, adultery, and lampooning, and most controversial of all is the so-called Covenant of 'Umar, promulgating fiscal, religious, and civil regulations with regard to the non-Muslim population. The document is almost certainly a conflation, with only the fiscal and religious provisions properly belonging to 'Umar's time.

BIBLIOGRAPHY

A fifteenth-century account of 'Umar's life is available in H. S. Jarrett's English translation of al-Suyūṭī's *History of the Caliphs* (1881; reprint, Karachi, 1977). A modern account, useful albeit brief, is the biographical entry by Giorgio Levi della Vida in the *Shorter Encyclopaedia of Islam* (1953; reprint, Leiden, 1974). Daniel C. Dennett's *Conversion and the Poll Tax in Early Islam* (Cambridge, Mass., 1950) summarizes various views on and details of the Covenant of 'Umar. Also of interest is Hava Lazarus-Yafeh's "'Umar b. Al-Khaṭṭāb—Paul of Islam?" in *Some Religious Aspects of Islam: A Collection of Articles*. (Leiden, 1981), published as a supplement to *Numen*, vol. 42.

DAVID WAINES (1987)

'**UMAR TĀL** (1794/7–1864), known in Fūta as al-Ḥājj 'Umar ibn Sa'īd ibn 'Uthmān of Gede, was an intellectual and military leader in the central and western Sudanic region. Born in Fūta Tōro, a Fulbe state in the middle valley of the Senegal River, 'Umar first achieved prominence during the pilgrimage to Mecca and Medina, which he completed three times in the years 1828–1830. At the same time he obtained an appointment as the chief representative

(*khalīfah*) in West Africa for the Islamic order called the Tijānīyah, which had been founded in North Africa in the eighteenth century. With these credentials ‘Umar returned to West Africa, visited the capitals of the principal Islamic states, attracted a following of disciples, wives, and slaves, and established a reputation as a brilliant scholar, miracle worker, and military strategist. Much of his reputation emerged during a stay of seven years in Sokoto, the capital of the Islamic confederation of northern Nigeria. In 1839 ‘Umar traveled through the inland delta of the Niger River, where another Fulbe-dominated Islamic state called the caliphate of Hamdullāhi held sway. In 1840 he settled in Fūta Jalon, yet another Fulbe polity in the mountains of Guinea. In the small town of Jegunko he taught, formed his growing community, and completed his major work, *Rimāh*, which serves as an important guide for Tijānīyah clerics today.

Beginning in 1846 ‘Umar moved in the direction of a military *jihād*, or war against unbelievers. He recruited in his original homeland of Fūta Tōro. He moved his rapidly expanding community to Dingiray, a settlement east of Fūta Jalon under the control of the Mandinka king of Tamba. In Dingiray the Umarian forces collected arms, built fortifications, and created the conditions of conflict with the Mandinka. Their victories over Tamba in 1852–1853 launched the *jihād*, established ‘Umar’s reputation as a military leader, and attracted thousands of new recruits.

‘Umar subsequently directed his forces to the north, to the upper valley of the Senegal River. With an army of about 15,000 he defeated the Bambara kingdom of Kārta, which had dominated the upper valley for decades. In 1857 ‘Umar laid siege to Medine, a new post established by the expanding French, but he suffered heavy casualties when Governor Louis Faidherbe arrived with new troops from the coast. ‘Umar then led his survivors to the east to regroup, then back to the west in 1858–1859 in a bold recruiting campaign along the river valley. With his predominantly new army he defeated the renowned Bambara kingdom of the Middle Niger, Segu, and made the city of the same name the capital of his far-flung but poorly organized state.

In 1862 ‘Umar led most of his troops against the caliphate of Hamdullāhi in retaliation for Hamdullāhi’s assistance to Segu against the *jihād*. He achieved an initial victory, but the Hamdullāhi Fulbe, aided by the Kunta clerics of Timbuktu, revolted in 1863, destroyed the Umarian forces, and killed ‘Umar in 1864. The Umarian *jihād* ended at this point, but the fragile polity it created endured until the French conquest some thirty years later. The principal leader of the state was ‘Umar’s oldest son, Aḥmad, commonly called Amadu Sheku, and its principal capital was Segu.

The basic structure of the Umarian *jihād* consisted of recruitment of men and weapons in the west, in the regions of Senegal and Fūta Jalon, to wage war in the east, against the Mandinka and Bambara. ‘Umar relied particularly on the Muslims of the west who, like himself, were dissatisfied citizens of the Fulbe states of Fūta Jalon, Bundu, and Fūta Tōro.

He fought against people who could be generally classified as non-Muslims and who blocked the emergence of Islam in the western Sudan. The Segu Bambara were regarded as particularly notorious “pagans.” The campaign against Hamdullāhi was not part of the original design of the *jihād*. When ‘Umar decided to undertake it he wrote a long apologia to justify his actions, and the dissension produced by the conflict of Muslim against Muslim, and Fulbe against Fulbe, helped produce the revolt of 1863–1864.

The basic structure of the Umarian *jihād* contrasts with the experience of earlier Fulbe-led *jihāds* and the states (Sokoto, Hamdullāhi, and the two Fūtas) that resulted from them. The earlier pattern consisted of internal revolutions against “pagan” or nominal Muslim ruling classes, followed by expansion to the exterior. This pattern was codified in the writings of the Sokoto leadership and adopted by ‘Umar himself in his own writings. ‘Umar could not, however, lead a second internal revolution in his native land, and he decided to recruit in the west and fight to the east. He was highly successful militarily, but he laid little basis for an Islamic administration or for the incorporation or conversion of his new subjects. His twelve years of war have left decidedly different impressions in today’s Senegal and Mali: In the first he is the crusading Islamic hero; in the second he is the invader who used Islam as a pretext.

‘Umar left one lasting precedent to Muslims of all persuasions in West Africa: the example of emigration (*hijrah* in Arabic, *fergo* in Fulfulde) away from European expansion. In his desperate recruiting drive of 1858–1859, he called on Senegalese Muslims to leave a land that had become “polluted” by French expansion. His son Amadu followed his example in the 1890s at the time of French conquest of the interior, and other Muslim leaders, such as the caliph of Sokoto in 1903, did the same thing. They journeyed to the east, along the old pilgrimage routes, in search of places where the faithful could preserve Islamic state and society.

BIBLIOGRAPHY

The most complete work on the holy war of ‘Umar Tal is my own book *The Holy War of Umar Tal: The Western Sudan in the Mid-Nineteenth Century* (Oxford, 1985). The most complete account of the state after ‘Umar is B. O. Oloruntimehin’s *The Segu Tukulor Empire* (London, 1972). Sidi Mohamed Mahibou and Jean-Louis Triaud have produced an excellent annotated translation of ‘Umar’s apologia for his campaign against Hamdullahi in *Voilà ce qui est arrivé: Bayān mā waqa‘a d’al-Hāgg ‘Umar al-Fūtī* (Paris, 1983), while John Ralph Willis has studied ‘Umar’s earlier works in “*Jihād fī sabīl-Allāh: Its Doctrinal Basis in Islam and Some Aspects of Its Evolution in Nineteenth Century West Africa*,” *Journal of African History* 8 (1967): 395–415.

Revised Bibliography

UMBANDA SEE AFRO-BRAZILIAN RELIGIONS

UMMAH is an Arabic term denoting a grouping of individuals constituting a larger community with a single identity. The term is often translated as “community” or “people,” and the plural (*ummam*) is commonly used in Arabic with the meaning “nations.” Other Semitic languages also employ this root (*ʿMM*) to designate social groups that share a common language, ethnicity, or set of laws and customs.

QUR’ĀN AND ISLAMIC EXEGESIS. The term *ummah* and its plural occur numerous times in the Qur’ān, referring to groups of animals (Qur’ān 6:38) and people. According to Qur’ān 7:34 and 15:5, each *ummah* has an appointed time, which is fixed and cannot be delayed. To every *ummah* is sent a messenger (Qur’ān 10:47) or warner (35:24), calling each *ummah* back to the worship of God. Muslim exegetes relate that on the Day of Judgment the prophet Muḥammad will intercede on behalf of all the *ummahs* to whom prophets had been sent.

Perhaps this is reflected in Qur’ān 16:120, where Abraham is said to be an *ummah* obedient to God, being *ḥanīf*, and not one of those who associate things with God. In Qur’ān 2:124, God tells Abraham that he is making him an example (*imām*) for people. The terms *imām* and *ummah* are derived from the same root, and are sometimes understood as being a necessary pair. The *imām* shows by example and the *ummah* follows that example. Muslim exegesis on Qur’ān 3:94 equates the religion (*millah*) of Abraham with the *ummah* of the prophet Muḥammad, and Qur’ān 4:125 refers to the *millah* of Abraham, being *ḥanīf*, whom God took as a friend (*khalīl*). Qur’ān 43:22–23 also uses the term *ummah*, as *millah*, to refer to a religion or a community following a particular religion.

Qur’ān 10:19 states that all people are a single *ummah* (*ummah wāḥidah*), but the people disagreed. According to several early exegetes, this refers to the primordial existence of all humanity as a single *ummah* with a single religion, a state that was ruined by sin as exemplified by the murder of Abel by Cain. In Qur’ān 2:128, Abraham and Ishmael ask God to make their offspring an *ummah* submitting (*ummah muslimah*) to God. In Qur’ān 3:103, God says that there will be an *ummah* that commands right and forbids wrong. Exegetes interpret this to be a reference to the faithful remnant of the original single *ummah* that, on the Day of Resurrection, will demonstrate the righteousness of those who submitted to God.

ISLAMIC LAW AND PRACTICE. Islamic law does not define the *ummah* in a direct sense, but it does outline in detail the structure of Muslim society. Human actions are divided into two types: rituals (*ʿibadāt*) and social acts (*muʿamalāt*). In general, rituals define a relationship between God and individuals, or between God and the *ummah*, as a whole. Laws relating to social acts govern relations among individuals within a society, and between different societies or nations, and vary according to different Muslim schools of law in certain respects.

Laws defining purity do not make social distinctions outside of allowing for certain variations in practice based upon natural differences. For example, menstruation requires women to perform certain purification rituals, but men are also required to purify themselves from blood flowing from their own bodies, such as from the nose or a wound. The causes of impurity include both substances (urine, feces, semen, vomit, blood, pus) and activities (sleep and unconsciousness, sex, menstruation, parturition, touching of certain body parts). Those substances and activities that require ablution (*wuḍūʿ*) are natural occurrences necessary to human life. Activities and substances that require washing (*ghusl*) are all related to sexual reproduction and are thus necessary to the continued existence of human society.

Other rituals, such as prayer, offering, fasting, and pilgrimage, do make social distinctions. For example, in certain legal texts women are not to attend the group prayer (*jumʿah*) on Fridays and are not allowed to pray in mixed groups with men, nor are virgins allowed to perform any prayers or fasting during the month of Ramaḍān. The qualifications of the prayer leader are based upon social standing according to age, piety, and learning. Thus, the free person is better suited than the slave, the city dweller than the nomad, the healthy than the handicapped, the heir than the bastard. Similarly, the standing order for the group prayer places the pure before the impure, the literate before the illiterate, and the clothed before the naked. Other rituals are restricted to certain segments of society. *Zakāt* is only required of relatively wealthy people with extra income over and above that required for their regular upkeep, just as the *ḥājj* and *jihād* is not required for a person who does not have the means to both perform the duty and provide for his family during that time.

Certain rituals are made responsible upon the *ummah* as a whole. Islamic law distinguishes between individual ritual requirements (*farḍ ʿayn*) and communal requirements (*farḍ kifāyah*). Individual daily prayers, for example, are incumbent upon each individual. Those rituals that are incumbent upon the community as a whole, such as the group prayer (*jumʿah*) on Fridays and defense of the *ummah* (*jihād*) are not obligatory on each individual. The *ummah* is required to provide a group prayer on Fridays, which would necessitate a certain number of individuals to attend, but not all eligible members of the *ummah* must attend.

Spatial and temporal distinctions are also demarcated through ritual. For example, when traveling outside of a

civilizational center (*miṣr*), people are not allowed to perform the congregational prayer. Nor is purification without water (*tayammum*) allowed within the confines of a civilizational center. People traveling more than three days distance from their home are only required to pray three daily prayers. These rituals parallel commercial and criminal laws, such as the prohibition against a city dweller selling goods for a desert dweller, or a bailed defendant being deposited in a market (*sūq*) but not in open country.

Laws regulating social acts differentiate a number of social spheres within the *ummah*. The most localized are individuals and their interactions with other individuals. In commercial law, exchanges are regulated between specific individuals. Jurists hold that the basic principle underlying commercial law is establishing equity between the two individual parties. Criminal law also regulates activity between individuals. Punishment for murder, for example, takes the form of an exchange between the murderer and the individuals affected by the murder. The payment of wergild is a compensation for the loss of the life. In adjudicating such exchanges or punishments, the role of the state is to facilitate the establishment of this “balance” (*‘adl*) between individuals.

The second major social sphere within the *ummah* is that of the family. According to jurists, personal law regulates the balance among family members. Laws of marriage, divorce, maintenance, and inheritance are designed to maintain the fundamental structures of the *ummah*. Fornication, which is defined as specific types of sexual activity outside of marriage, is punishable by death because it threatens the balance of the family and the relation of the family to the larger society. The laws of slavery, and particularly those concerning concubines, found in classical Islamic law are also based upon the principle of social balance.

The third major social sphere is that of the society as a whole. This includes laws relating to land reclamation, which would affect productivity and ownership rights of large areas pertinent to the *ummah* as a whole. It also includes the laws of *jihād* or *siyār*, which require certain segments of the *ummah* (capable adult men) to defend the *ummah* in case of attack. Jurists conceptualize two realms: the “Place of Islam” (*Dār al-Islām*) and the “Place of War” (*Dār al-Ḥarb*). The *Dār al-Islām* designates civilized area in which Islamic law is practiced, whereas the *Dār al-Ḥarb* is the place of barbarism, lacking law and order.

POLITICAL THEORY AND PRACTICE. Medieval Muslim political theorists defined the *ummah* vis-à-vis the relation of the *ummah* to its ruler and the relation of both to God through the law as formulated by jurists on the basis of revelation. According to the political theorist al-Māwardī (974–1058), the *ummah* is constituted by its allegiance to the *imām* in a sort of contractual relationship. The responsibility of the *imām* is twofold: to enforce laws pertaining to social relations (*mu‘amalāt*), and to ensure that the *ummah* can fulfill its ritual obligations (*‘ibadāt*). Māwardī maintained that the of-

fice of the *imām* is required by revelation and necessary to the proper functioning of the *ummah*, but the legitimacy of any individual *imām* is based on his adherence to the well-being of the *ummah*. Ibn Khaldūn (1332–1406) similarly argued that God created human beings so that they would be required to work together as a society and develop civilization in order to survive on the earth after the fall from Eden. This requires a state that provides individuals with food, shelter, and the opportunity to abide by God’s commandments.

Some contemporary Muslim theorists contend that the *ummah* can still only be constituted with an *imām* or caliph, and must be inclusive of all Muslims regardless of ethnic or national origin. Some older theorists, such as Ibn Jamā‘a (1241–1333) argued that any effective leader could be considered an *imām*. Others, such as Ibn Taymīyah (1263–1328) and the ayatollah Khomeini (1902–1989), maintained that jurists could take the place of an *imām* even when the *ummah* already had an otherwise de facto ruler. The Iranian-born Jamāl al-Dīn al-Afghānī (1839–1897) proposed a pan-Islamic *ummah* to replace the fragmentation of modern states. The Ottoman sultan Abulhamid II (r. 1876–1909) attempted to reestablish the caliphate and the notion of a pan-Islamic *ummah*.

Modern reformist movements, such as the Ḥizb al-Taḥrīr, have called for the return to a caliphal state as a means to reconstitute the *ummah* and defend Islam against colonialist and imperialist incursions. Reformist political theorists include Sayyid Quṭb (1906–1966) from the Muslim Brotherhood in Egypt, Mawdūdī (1903–1979), founder of the Jamā‘at-i-Islāmī in Pakistan, and ‘Alī Shari‘atī (1933–1977), a leader in the Iranian revolution. According to these theorists, Islam is in the midst of a new age of ignorance (*jahiliyyah*), which requires the reformation of the *ummah* under the aegis of an Islamic state upholding the principles of Islamic law.

Other groups define the *ummah* in more restrictive terms. ‘Alid or Shī‘ī political theorists define the *ummah* more restrictively, based on its allegiance to an *imām* who is chosen because he possesses special attributes. Non-Shī‘ī groups, such as the so-called Five Percenters, also restrict the *ummah* to an elect and narrowly construed group of believers, possessed of secret knowledge or other special characteristics. Early Kharijī leaders denied membership in the *ummah* to any Muslim who refused to follow the strict interpretation of the Qur‘ān laid down by acknowledged Kharijī authorities. The Nation of Islam under Elijah Muhammad (1897–1975) delineated the *ummah* in exclusivist historical ties and racial terms.

In the modern period, nationalists have tied the definition of the *ummah* to ethnic and national identities. The Egyptian writer Rifā‘ah al-Ṭaḥṭāwī (1801–1873) argued for a national *ummah* based on patriotism for a homeland (*waṭan*). Muḥammad ‘Abduh (1849–1905) broadened this national *ummah* to include all Arabs in a capacity that would

allow Arabs to purify and establish a more international Islamic *ummah*. Muslim thinkers in East and Southeast Asia have called for a recognition of the Arab roots of the *ummah* while championing their own cultural and regional identities as the flowering of a true international *ummah*.

In 1924 Mustafa Kemal Atatürk (1881–1938) abolished the caliphate and founded the secular state of Turkey. Political movements in Arab states, such as the Ummah Anṣār or Sudanese Ummah Party founded in 1945 by supporters of the son of the founder of the Mahdist movement, sought to rally support for political causes with an ideology of the *ummah*. Many Arab states, especially in the 1960s, have legislated separate religious and national identities in an attempt to create a secular society distinct from and overriding religious allegiances. Some contemporary states with large Muslim populations sanction an official Islamic identity as a means to gain legitimacy and protect against threats from nonsanctioned religious groups. Certain forms of Islamic expression are considered subversive to the state and are outlawed as expressions of allegiance with an *ummah* that represents a different political order.

BRANNON WHEELER (2005)

UNARIUS ACADEMY OF SCIENCE. Ernest Norman (1904–1971) and Ruth Norman (1900–1993) founded in 1954 the Unarius Science of Life, which began with a small circle of students and clients who requested psychic readings. Members refer to their practice as the "Science" and to themselves as "students." Ernest Norman purportedly possessed clairvoyant abilities that he used to read the past lives of people who requested the service and to contact ascended masters living in other realms of existence. Believing himself to be the reincarnation of Jesus Christ and other cosmic dignitaries, Ernest Norman channeled messages about his trips to Mars and Venus (Norman, 1956). He also channeled extended lessons in "highly advanced" Unarian Science that is sometimes called *interdimensional physics*. These basic lessons of Unarian Science are delineated in Ernest Norman's early work, *The Infinite Concept of Cosmic Creation* (1970). Ruth served as Ernest's helpmate as they built the small organization out of their series of homes in different locations throughout southern California. In 1971, Ernest Norman died, leaving Ruth in charge. Mrs. Norman carried on the "mission" with the help of two early followers, Thomas Miller and Charles Spaegal. Together they channeled messages from the cosmos, which they compiled into a book series called *Tesla Speaks*.

Ruth Norman and her followers opened a storefront center in 1975 in El Cajon, California. This center includes its own classrooms, library, offices, and print shop, and continues to serve as the spiritual hub of Unarian Science. Although Mrs. Norman claimed many distinguished incarnations, she is best known for her persona of Uriel the Archangel, or her higher self—the Goddess of Love and the Healing Archangel from what Unarians believe is the planet Aries. In order to display her divine nature as Uriel, Mrs. Norman would pose in an elaborate costume, complete with a glittering tiara, as she waved some type of a scepter. Frequently photographed and interviewed by news organizations, she promoted her prophecy of the coming of thirty-three spaceships that would save the earth in 2001.

According to Unarian millenarian prophecy, the Space Brothers, as the extraterrestrials are called, would usher in a new age of logic, reason, love, and peace for all the beings in the universe. They would solve all social and ecological problems by ending privation and want with their spiritual science. The large spaceships (usually depicted in Unarian art as flying saucers) would land on top of one another in order to form a towering university that would serve humankind. Using the construction materials brought by the ships, the Space Brothers would build a "Power Tower" that could supply every earthly energy need from a nonpolluting cosmic source. The planets of the Interplanetary Confederation that would supposedly send spaceships are called: El, Rey, Basis, Yessu, Luminus (once called Severus), Valneza, Osnus, Idonus, Vixall, Earth II, Vidus, Anzea, Po, Deva, Endinite, Dollium, Ballium, Dal, Shunan, Brundage, Kallium, Delna, Farris, Serena, Vulna, Emil, Sixtus, Eneshia, Glenus, Din,

Zeton, Jena, and Myton. Each ship would contain one thousand Space Brother scientists, who could teach the people of earth how to use their advanced technology.

In anticipation of this prophesied landing, Unarius purchased acreage for the ships in nearby Jamul, California, during the 1970s. Despite the fact that no ships landed in 2001 as predicted, Unarians believe that the landing will take place "when earth people are ready." Unarians frequently receive clairvoyant channeled messages from the spaceships and their deceased leaders, which are published in their literature. An annual celebration that honors the prophecy and features a parade of the banners of the planets occurs every October.

CURRENT ORGANIZATION. Ruth Norman headed the Unarius Academy of Science until her death in 1993. Charles Spaegal, whose spiritual name was Antares, succeeded her by running the center until he passed away in 1999. Thereafter Unarius was guided by a board of directors composed of long-term committed students of the Science. All jobs that entail the daily running of the Unarian center are unpaid volunteer positions. Current local members attend classes at the center, where they study Unarian literature and give testimonial accounts of the benefits of their spiritual science. Although some followers expressed a deep prior interest in UFOs, adherents more frequently report a familiarity with beliefs in the paranormal before joining Unarius. The local core membership ranges from forty to sixty dedicated students, while considerably more people are in contact with the organization through various types of correspondence, such as phone, email, and letters. Unarius has translated some of their works into Spanish in an attempt to reach out to American Latinos and those in Central and South America. Thousands of people remain on the Unarian mailing list after having either seriously or casually contacted the group. Through mail-order supply, those interested in Unarian Science can take correspondence lessons, read books, and watch video lessons.

Unarians insist that their pursuit is a science not a religion. Unarius offers classes in past-life therapy, interdimensional physics, and art therapy. Trusted students who are considered advanced in the science facilitate the classes. When a person regularly attends classes and participates in the volunteer activities that keep the group operational, he or she is considered a good student, or good member, of the group. More responsibility falls to those students who are able to channel messages from the Space Brothers. In addition, Unarian channelers contact Ernest and Ruth Norman as part of the "Spiritual Hierarchy" that communicates with the group.

Although there is no tendency toward androgynous clothing or expression, gender roles tend toward an egalitarian model partly because of the strong belief in reincarnation. Members believe they have lived as both sexes in their past incarnations. They share tasks and cooperate without making reference to any gender specificity, except in the case of

lifting heavy objects, when men are usually called upon to do the job.

HEALING. Unarian philosophy focuses strongly upon healing through past-life therapy. Healing comes from the recognition of past-life imbalances and indiscretions that surface through feelings, visions, or dreams. Unarians welcome these so-called memories of past lives, a phenomenon called *recovered memory* in modern psychology. As a recommended healing process, members act out "memories" of past lives in psychodramas, which are often videotaped. Historically and contemporaneously, Unarian films have recorded many stories of past lives that are available to the general public when they play on local cable access stations in many American cities.

The Unarius Academy of Science remains significant because it is one of the oldest and most enduring UFO religions. The history of Unarius exemplifies a typical feature of such religions inasmuch as it initially functioned around charismatic leaders who telepathically communicated with supernatural extraterrestrials. Despite the eventual loss of both Ernest and Ruth Norman, Unarius continued to operate, and it even withstood a failed prophecy in 2001 without any appreciable loss of membership. Like other such groups, it considers the advent of extraterrestrials as a millenarian act of spiritual salvation, and this belief persistently gains adherents in the postmodern age.

UNCTION SEE SACRAMENT, *ARTICLE ON* CHRISTIAN SACRAMENTS

UNDERHILL, EVELYN (1875–1941) was an English poet, novelist, and writer on mysticism. Born in Wolverhampton, England, the daughter of barrister Arthur Underhill, Evelyn Underhill supplemented her secondary education by studies at King's College, London, and by travel abroad. Underhill's early letters show some precocity for self-study and her personal and literary career may be regarded in light of this capacity. Her marriage in 1907 allowed Underhill the kind of financial support and unencumbered way of life necessary for her both to seek personal guidance essential to her spiritual growth and to undertake the voluminous research that her work would demand.

Underhill was both beneficiary and catalyst in the revival of the metaphysical discussion current in the early years of her career. She was influenced by Arthur Waite, a figure of manifold interests in the occult, magic, and religion, associating herself for some time with the Hermetic Order of the Golden Dawn. Later, and in another vein, Underhill shared in the enthusiasm aroused by the ideas of contemporaries Henri Bergson and Rudolf Eucken and fell briefly under the influence of Hindu poet Rabindranath Tagore. More significant influences, however, were William Ralph Inge, the eminent dean of Saint Paul's Cathedral in London, and the Roman Catholic scholar Friedrich von Hügel, whose erudition and sensitivity had the most profound and lasting effect on her.

Underhill's work reveals her deep personal commitment to spiritual development. It reflects, for the most part, her conviction that Christianity provides an exceptionally vital medium for mystical communion. Although the focus of her work does not exclude the pagan experience, her insights are developed primarily within the Christian tradition.

Underhill's book *Mysticism* (1911) is her most important work. It is a decidedly nonacademic study of mystical experience. In part historical and primarily comparative, its lasting significance lies, however, in the psychological insight of Underhill's commentary. The experiences of mystics from a wide range of disciplines and cultures are presented. Underhill, emphasizing their similarity of expression, asserted the essential kinship of mystical experience wherever it is found. Early editions of *Mysticism* depict Christianity as exceptional only in its greater facility for fostering this experience. The appearance in 1930 of the revised twelfth edition revealed a significantly greater awareness of the differences between the Christian and non-Christian experience. The clarity and depth of understanding with which *Mysticism* was written have given it an unsurpassed value and accessibility as a guide to the mystical tradition.

Subsequent work was taken up in the midst of a growing preoccupation with the contemplative life. Prayer, public service, and guidance from devout and intelligent people such as von Hügel served to deepen Underhill's already substantial appreciation for the uniqueness of the Christian way. This is borne out in her revision of *Mysticism*. In general such changes in Underhill's perspective tended to move her work toward the center of the Anglican faith to which she had returned. This tendency is manifest in her last major work, *Worship* (1936). This book deals with more orthodox forms of Christian practice. It stresses the practical virtues of prayer and the great importance and centrality of the Eucharist in Christian life.

BIBLIOGRAPHY

In addition to the works cited above, see *The Mystic Way: A Psychological Study in Christian Origins* (London, 1913) in which Underhill describes the unique character of Christian mysticism, distinguishing it from its Greek predecessors. *Practical Mysticism* (1914; reprint, New York, 1948) is a shorter introductory companion to *Mysticism* (1911; 12th rev. ed., New York, 1961). Underhill's novels produced between 1903 and 1909 are best represented by *The Column of Dust* (London, 1909). For selections of verse as well as representative prose excerpts see *An Anthology of the Love of God*, edited by Lumsden Barkway and Lucy Menzies (1953; reprint, Wilton, Conn., 1976). A very balanced and lucid introduction is Christopher J. R. Armstrong's *Evelyn Underhill (1875–1941): An Introduction to Her Life and Writings* (Grand Rapids, Mich., 1976).

Revised Bibliography

UNDERWORLD. The term *underworld* refers to the subterranean region inhabited by the dead. It is often the place of punishment of the wicked, the unrighteous, the unredeemed, the unbelieving, or the lost. The concept of an underworld is an ingredient in most belief systems in the history of religions, but there is no definite evidence indicating that the idea was present in the earliest stages of human culture. In the oldest strata of Egyptian and pre-Vedic Indian cultures, however, there exists a rich store of archaeological material suggesting that the aristocratic segments of society, at least, believed in some kind of an afterlife. But even in these early records of postmortem existence, there does not seem to have been a distinction between heaven, the realm of the blessed, and hell, the realm of the damned.

Later, when the two realms came to be differentiated, each religion appealed to its own set of criteria when determining the fate of an individual after death, whether blessed or damned. These criteria could be defined by birth, by ritual initiation into the community, by the performance of prescribed sacramental rites, by belief in a deity or in a set of teachings, and so on. Such standards were commensurate with the way the religion defined the proper relationship to the sacred.

PRIMITIVE AND ARCHAIC RELIGIONS. Tales of heroic journeys to the underworld, often undertaken on behalf of the entire community, are extremely widespread among tribal peoples throughout the world. Particularly notable for such lore are the Maori of New Zealand; the Algonquin, the Ojibwa, and various Plains tribes of North America; the Zulu, the Ashanti, and the Dogon of Africa; and numerous other societies in North Asia (especially Siberia and Mongolia), Central America, and South America.

If one disregards for the moment the detailed differences among the various accounts of the postmortem journey to the underworld, one can observe a common theme among many such stories. A heroic figure undertakes a descent into the belly of a chthonic or marine monster, a creature often identified as Mother Earth, the Mother of Death, or the Queen of the Night. He pursues a strenuous journey through her body, during which he encounters numerous obstacles and dangers. He finally reemerges into the world of the living, either through a natural orifice in the monster's body or through an opening that he himself creates. As numerous scholars have convincingly demonstrated, the ordeal of being ingested by a theriomorphic creature and of passing through the various channels of its body is symbolic of an initiatory ordeal whereby the hero conquers death or the fear of death and, in some cases, wins the prize of immortality.

The hero is submitted to a test or an ordeal in which he must either prove himself capable of overcoming the obstacles that lie in his path or prove himself capable of defeating the enemy that blocks his passage. The descent into the underworld is also a quest for special, esoteric knowledge or wisdom that is denied all other living beings who have not undertaken such a journey. As the possessor of this secret knowledge, the hero often serves as a mediator between the living and the dead or as a psychopomp who personally conducts the souls of the deceased to the underworld.

The typical shamanistic story of the descent into the underworld is exemplified in a tale of the Goldi peoples of Siberia. A shaman traps the soul of the deceased in a sacred pillow by beating his sacred drum. After mounting a notched tree in order to get a preview of the journey to follow, he summons two tutelary spirits to assist along the way and then, with the deceased and his ghostly companions, sets off on a specially prepared dogsled, furnished with a basket of food for nourishment. After encountering numerous obstacles along the way, the travelers arrive in the underworld. Using a fictitious name to protect his identity, the shaman deposits the deceased with his relatives in the underworld. He then returns immediately, armed with warm greetings and small gifts for the living from their subterranean kinsmen.

A prototypical example of the story in which the descent into the underworld is symbolically identified with the return to the mother's womb is found in the religious lore of the Maori of New Zealand. Maui, the heroic representative of the Maori, returned at the end of his life to the hut of his ancestress, Hine-nui-te-po, the Great Mistress (of the Night). He leapt into her body as she slept, made his way without difficulty through the various channels within her body, and had just emerged halfway from her open mouth when the birds that had accompanied him burst into laughter. Aroused by the screech of the birds' laughter, the ancestress abruptly clamped her mouth shut and cut the hero in two with her sharp teeth. Because of this misfortune, humans ever since have been mortal; had Maui successfully escaped his ancestress's body, they would have become immortal.

Many tribal peoples situate the land of the dead in the west, on the western side of the world, or simply at some distance west of the village. Many scholars (most notably E. B. Tylor and F. Max Müller) have argued that this practice is confirmation that most myths and rituals pertaining to the journey to the underworld are elaborations of a core solar myth.

While there no doubt is a kernel of truth in this view, there are other equally significant layers of meaning invested in these stories and practices. One important theme concerns the descent of a hero into the belly of a ferocious marine creature and his reemergence through the mouth or anus of the beast in an effort to conquer death and gain immortality. A second theme is of an arduous journey through wild and monster-infested areas in search of a precious object (magical ring, sacred fruit, golden vessel, elixir of immortality, etc.)

that will benefit the hero or his people. In a third theme, a tribesman submits himself to a deadly ordeal in order to pass from a lower to a higher stage of existence and thereby achieves a superhuman or heroic state of being. In yet another theme, a hero shoulders the onerous task of traveling to the subterranean regions where the Mother of Death or the Queen of the Night reigns supreme, thereby gaining knowledge of the route to the shadowy realm and of the fate of those who reside there.

ANCIENT EGYPT. The afterlife of the Egyptian nobility is described in the Pyramid Texts. Royalty were believed to ascend at death to the Blessed Lands, or Fields of the Blessed, in the heavens. According to the Pyramid Texts, members of the aristocracy traveled to the celestial spheres to dwell there like gods, often traveling on the ship belonging to Re, the sun god. Highly elaborate and expensive mortuary rites, charms, and incantations were offered for the nobility to guarantee that the soul of the deceased would enjoy a blissful existence in the world beyond. The life in that world is largely similar to this one but is free of the difficulties and misfortunes that plague the lives of even the powerful and wealthy. The afterlife of the common people is outlined in the Coffin Texts. Commoners were believed either to remain near the tomb after death or to travel to the netherworld.

The dead traveled to many different realms, some to the east but most to the west. It is now believed that the dead went in different directions because the disembodied spirits were thought to move about with the sun and the stars. The west was the primary destination of the souls (*ka*) of the dead. Darkness and night were identified symbolically with death and postmortem existence. The realm of the dead was located sometimes in the sky and sometimes beneath the earth. This region was ruled by Osiris, the king of the dead. While still a mortal, Osiris was murdered by his brother Seth and then resurrected by his sister-wife Isis. He subsequently became the chief ruler of the nether realm.

ASSYRIA AND BABYLONIA. In the views of the ancient Akkadians and Babylonians, the underworld is a dreadful place. To get there one has to pass through seven gates and remove a piece of clothing at each. The realm is organized on the order of a political state under the tyrannical rule of a king and a queen, Nergal and Ereshkigal. In the text entitled "Descent of Ishtar to the Nether World" (Pritchard, 1969, p. 107), this realm of the dead is described as

the Land of no Return . . . the dark house . . . which none leave who have entered it . . . the road from which there is no way back, the house wherein the entrants are bereft of light, where dust is their fare and clay their food. Where they see no light, residing in darkness, where they are clothed like birds, with wings for garments, and where over the door and bolt is spread dust.

Once in the underworld, the fate of the deceased is improved or worsened depending on whether the body is buried according to the prescribed funeral rites and is provided by the

living with food, clothing, and other accoutrements required for the journey to the other realm.

One name for the netherworld is Kigal ("the great subterranean realm"). *Kigal* is an element in the name of Ereshkigal, the "queen of the underworld" and sister of Ishtar. This domain was also known as Kutu, the sacred city of Nergal, a chthonic deity who was lord of the netherworld. The gateway through which each soul is required to pass is situated in the west, where the Babylonians watched the descent of the sun. All graves provide entrance to this shadowy realm. Having entered the main gate, the dead are then ferried across the river Hubur by a four-handed, fierce-faced ferryman to "the Great City." This city is a gigantic metropolis, encircled by seven walls, each wall surmounted by a gate and each gate guarded by a demon. At the very center of the complex is the lapis lazuli of Ereshkigal. Befitting her position as queen of the realm, she is surrounded by numerous attendants: a plague god who executes her orders, a scribe who announces the names of the new arrivals, and seven fierce, iron-willed judges called the Anunnaki. There are a host of demons who spread pestilence and suffering throughout humanity and keep the queen plentifully supplied with new residents.

GREECE AND ROME. In ancient Greece the belief in the postmortem survival of the soul stretches back to earliest times, as is suggested by evidence of food, drink, clothing, and entertainment provided in the grave. Already in Homer a clear distinction between the corpse and the ghost was made. The *Iliad* (3.278-279, 19.259) contains the belief that the gods punished or rewarded souls at death. It was thought that the souls of the living are supplied from the stock of souls in Hades.

Despite the rich stock of ideas native to the Greek islands regarding the dead and the underworld, from the time of Homer Greek writers showed no hesitation in drawing freely from other religious traditions and in synthesizing these foreign elements with indigenous material. Most of the borrowed elements were derived from Egypt (particularly the Osiris cult and the *Book of Going Forth by Day*) and from Mycenae. From Crete they adopted the idea of *elusion* ("paradise") and the figure of Rhadamanthys (one of the three infernal judges). From Mycenae they received the idea of weighing the soul in the balance.

The earliest Greek accounts of the postmortem journey of the soul to the underworld are to be found in the *Iliad* (1.595, 3.279, 5.395-396, 15.187-188) and in the *Odyssey* (11). At the moment of death, the soul (*psyche*) is separated from the body, transformed into a ghostly double of the person (*eidolon*), and transported down to Hades, an enormous cavern below the surface of the earth (*Odyssey* 11.204-222). Here the souls of the dead are capable only of "flitting around as shadows while exuding shrill chirping sounds." This dismal domain is the very antithesis of the realm of the "blazing sun"; it is a place where one sees only "the cold dead" and is an altogether "joyless region." The shades of the

dead are unconscious and incommunicative until they have imbibed a quantity of blood, the essence of life. So morally neutral is the life of the dead that all distinctions pertaining to social station, political position, and religious latitude are obliterated, thus rendering even a mean and destitute existence in the world highly preferable (*Odyssey* 11.487–491) to the office of rulership over Hades.

In ancient Greek cosmology, Hades lies within the ocean, perpetually shrouded in clouds and mist. Here there is no sunlight, only eternal darkness. The shades are depicted as being weak and extremely melancholy, always in search of escape from their sufferings and finding none. Especially painful are the sufferings of those who were either not properly buried on earth or not suitably nourished with sacrificial food offerings. The dire nature of the torments suffered by the inmates is graphically depicted in the story of Tantalos. Standing in water up to his chin, he found to his chagrin that the water mysteriously evaporated each time he sought to quench his thirst; surrounded by flowering fruit trees, he found that the wind blew the fruit away as he reached out to grasp it (*Odyssey* 11.582–592). Hades is separated from the realm of the living by a treacherous body of water, made up of five rivers (Lethe, Styx, Phlegethon, Acheron, and Cocytus). The entrance is guarded by Kerberos, a ferocious dog with three (earlier poets said fifty or one hundred) heads whose necks are encircled by venomous serpents. Here Minos judges the deeds of the deceased and provides the laws that govern them in the underworld. But the evidence seems to indicate that none of the laws meted out justice in the form of rewards for the righteous and punishment for the wicked.

According to Vergil, Rhadamanthys presides over a court of justice in which a variety of corporeal, mental, and spiritual retributions are distributed according to the nature of sins committed in the upper world. Nowhere in all of world literature is the drastic distinction between the two destinies after death presented in more painfully dramatic terms than in his *Aeneid*:

This is the place where the road divides and leads in two directions: one way is to the right and extends under the ramparts of Dis [i.e., Pluto] to Elysium [i.e., Paradise], but the left path leads to the evil realms of Tartarus, where the penalties for sin are exacted. To his left Aeneas spots a deep cave enclosed by a triple fortification around which flows Phlegethon, seething with flames and tossing rocks about in its tumultuous torrents. (6.540–579)

Aeneas encounters a gargantuan door that even the gods are powerless to penetrate, guarded by the ever-wakeful Tisiphone (one of the Furies). From inside, he hears horrifying groans and wailings from victims being lashed with whips and chains. Within this dismal kingdom of darkness and death reside a host of personifications of abstract entities: Grief and Cares, Diseases, Senility, Fear, Hunger, Toil, War, Discord, and countless other forces that afflict the life of every creature with misfortune and distress.

Not until the time of Plato does one encounter the notion that the righteous will be feted with sumptuous banquets “with garlands on their heads,” or that the wicked will be plunged into a pit filled with mud, “where they will be forced to carry water in a sieve” (*Republic* 2.373c–d). Plato may have believed that the earthly experience of the fear of Hades is equivalent to being there already and that the suffering inflicted by a guilty conscience is sufficient punishment for the wicked act committed. This view coincides with the theory that Plato adopted many primitive beliefs about the fate of the soul and gave moral and psychological interpretations to allegorical tales (see *Gorgias* 493a–c). Similarly, for the poet and philosopher Empedocles the *psyche* (“soul”) is the bearer of guilt, and the world of the senses is the Hades where the individual suffers for that guilt (frags. 118, 121). Also, Plato, who perhaps more than any other ancient thinker shows a genuine concern for the immortality of the soul and the judgment it undergoes after death, presents divine rewards and punishments in terms of reincarnation into a better or worse earthly life, rather than in terms of heaven and hell. In the *Laws* (904d) he suggests that Hades is not a place but a state of mind and adds that popular beliefs regarding Hades should be invested with symbolic value only.

JUDAISM. References to the underworld in the Hebrew scriptures are vague and derive largely from beliefs common throughout the ancient Near East (especially Egypt and Babylonia). Numerous terms are used to designate this shadowy realm, the two most popular names being *She'ol* (a word that seems peculiar to Hebrew) and *Gei' Hinnom* (Gr., *Geeenna*; Eng., *Gehenna*). Some euphemistic substitutes for the latter are *erets* (“earth” or “underworld,” *1 Sm.* 28:13, *Jb.* 10:21–22), *qever* (“grave,” *Ps.* 88:12), *'afar* (“dust,” *Is.* 26:5), *bor* (“pit,” *Is.* 14:15), and *shahat* (“pit,” *Ps.* 7:16; “the land of darkness,” *Jb.* 10:21).

The historical Gehenna, or Gei' Hinnom—“Valley of ben Hinnom,” or “Valley [of the son(s) of] Hinnom”—was located near the city of Jerusalem at the site of a cult in which children were sacrificed (*2 Kgs.* 23:10, *Jer.* 7:31); it was known popularly as the “Valley of Slaughter” (*Jer.* 19:5–6). Even before this time, the valley was used as a site for human sacrifices to the god Moloch (*2 Chr.* 33:8), and afterward, as a place where the city's rubbish was burned. In mythology, Gehenna was located beneath the earth or at the base of a mountain range (*Jon.* 2:7) or beneath the waters of the cosmic ocean (*Jb.* 26:5). This realm is sometimes pictured as a horrifying monster with mouth agape (*Is.* 5:14), a realm where persons of all classes are treated as equals (*Ez.* 32:18–32).

She'ol is another term used to designate the realm of the dead or the subterranean spirit world, where the destinies of the righteous and the wicked are the same. Heaven and *She'ol* are thought to be the two farthest extremities of the universe (*Am.* 9:2). *She'ol* is positioned at the nadir of a dark pit at the very base of the universe, into which the blasphemer who aspires to be equal with God will fall. But the term

also refers simply to the state of death or to the grave (see *Prv.* 23:13–14, *Ps.* 89:49). The viability of this interpretation of the term is further confirmed by the fact that the Septuagint frequently translates *she'ol* as *thanatos* (“death”).

The Hebrew scriptures place the domain of the dead at the center of the earth, below the floor of the sea (*Is.* 14:13–15, *Jb.* 26:5). Some passages locate the gates that mark the boundary of *She'ol* in the west. This realm has been depicted as a place pervaded by dust and darkness (*Jb.* 10:21–22), as it was in Mesopotamian thought. In contrast to the Babylonian netherworld, which boasted a large company of demonic creatures, both the Hebraic underworld and heaven are ruled over by one and the same God whose sovereignty extends throughout the universe (*Ps.* 139:7–8, *Prv.* 15:11, *Am.* 9:2). There is a strong suggestion in Psalm 73 that God will manifest his grace to the righteous by taking them to heaven, where they will exist eternally with him. The people of God will, therefore, be saved from *She'ol* to live with God forever, but the unrighteous will face a deprived existence in the chambers of the subterranean regions (*Ps.* 49).

According to the Ethiopic *Apocalypse of Enoch* (22:9–13), *She'ol* is not an abode of all the dead, where the souls merely exist as vague shadowy figures devoid of individual characteristics, but is a spacious realm with three subdivisions: One realm is allotted to the righteous who have been vindicated in life, one to sinners who were not submitted to divine judgment before death, and one to those whose deeds were judged during life and found wanting. In time, *She'ol* came to be identified with Gehenna, the pit of torment, an idea that, in turn, informed the Christian concept of Hell (*Hb.* 2:5).

In the postbiblical Jewish apocalyptic tradition, among the seven heavens that extend above the earth, sinners are confined to the second heaven to await final judgment. North of Eden lies Gehenna, where dark fires perpetually smolder and a river of flames flows through a land of biting cold and ice. Here the wicked suffer numerous tortures (2 *En.* 3–9).

Elsewhere within the same book, the Angel of Death inquires of Jehoshua whether there are any gentiles (or “descendants of Esau”) in Paradise or any Children of Israel in Hell. Included in the reply is the observation that those descendants of Esau who performed righteous deeds on earth are rewarded here but sent to Hell after death; Israelites on the other hand receive punishment while living and inherit the joys of Paradise after death. According to Josephus Flavius (37–100 CE), historian of the Jewish War of 66–70, the Essenes of the Dead Sea area believed that the righteous retire to the western region, where their lives are undisturbed by rain, cold, or heat and where they enjoy cooling breezes continuously. The wicked, however, are condemned to a dark, chilly hell where they suffer eternal torments.

CHRISTIANITY. New Testament writers drew upon the post-exilic Hebraic picture of Gehenna in formulating their un-

derstanding of the destination of the damned. Gehenna was imagined to be an enormous, deep pit that perpetually ejects clouds of putrid-smelling smoke from burning garbage, a pit where bodies of criminals and lepers are disposed of. Two significant alterations in the Hebraic concept of hell deserve mention: (1) there is a much sharper distinction between the realm of the blessed and the realm of the damned, and (2) the standard applied at the Last Judgment is defined by a person's attitude toward the person of Jesus and his teachings. In the Gospels the prevailing concept of the underworld is epitomized in the story of the rich man and Lazarus (*Lk.* 16:19–31). It would appear that the rich man is sent to Hell merely on account of his great wealth in this realm, whereas Lazarus is transported to “the bosom of Abraham” (Heaven, Paradise) in recompense for his sufferings and poverty. Hell is imagined as an invisible world, situated beneath the realm of the living, a blazing inferno of such intensity that even a drop of water applied to the tip of the tongue could bring welcome relief. It is also a distant land beyond a great gulf across which no movement is possible in either direction.

Whereas Hades remains at a great remove from the realm of the living, Paradise is situated in the immediate presence of God. The wicked in Hades and the righteous dead “at home with the Lord” await the final resurrection.

According to the eschatology of the *Book of Revelation*, a millennial reign is followed by the resurrection of the saints, and then by a period of universal conflict at the end of which Satan will be cast into a lake of fire and brimstone, preparatory to the resurrection of the remaining dead and the Last Judgment. Both Death and Hades are hypostatized as subterranean vaults that surrender the dead to be judged, after which Death and Hades themselves are thrown into the lake of fire, thus actualizing “the second death,” that is, condemnation to the eternal fires of Hell (*Rv.* 20:11–15, 21:8). The remarkable feature of this account of “final events” is that Hell is homologized with the lake of fire to which the wicked are condemned, and it is itself punished by being cast into the same lake of torment. Supposedly the cosmic cataclysm that signals the termination of the current world order, the final defeat of Death and Satan and the Last Judgment, is a preview of the fate of the wicked in Hell. The nature of Hades can be inferred from the depiction of the realm of the blessed as a perpetually sunlit land in which the righteous are never discomfited by the blazing sun. There they are faithfully fed by the divine shepherd, refreshed by ever-flowing fountains, and relieved of their tears of grief.

Augustine (354–430 CE), the father of early medieval theology, perpetuated the concept of Hell as a bottomless pit containing a lake of fire and brimstone where both the bodies and the souls of humans and the ethereal bodies of devils are tormented (*City of God* 21.10). Thomas Aquinas (1225–1274) laid much of the foundation for the philosophical concept of Hell that shaped and informed the idea of Hell in the minds of poets, painters, sculptors, and novelists for centuries to come. For him, Hell never lacks space to accommo-

date the damned. it is a place where unhappiness infinitely exceeds all unhappiness of this world, a place of eternal damnation and torment where the suffering of the damned is intensified by recalling the glory of the blessed while no longer able to perceive the glory firsthand.

Dante (1265–1321) derived the theological framework for his notion of the underworld from the Old and New Testaments and Thomas. In the third chapter of the *Inferno* he describes the descent into Hell. Accompanied by his guide Vergil, Dante approaches the Inferno and sees the gate of Hell, the entrance to the city whose inhabitants live in suffering and eternal pain. Dante is conducted along a circular pathway leading from the gateway to the bottommost zone of Hell. He passes in succession through nine separate circular zones, each of which contains smaller cells where individuals or groups of the damned live. Charon waits on the near bank of the river Styx, ready to ferry his miserable passengers across the waters. As Dante and his guide move from circle to circle they encounter a variety of types of sinners sorted into groups according to their chief vices. On reaching the fourth ring of the ninth circle, the two travelers are confronted by Dis (Lucifer), who with his three mouths devours Judas, Brutus, and Cassius. The arduous journey of Dante and Vergil through the Inferno is completed with a horrifying descent into the interior of the body of Lucifer. Finally they arrive at a spot situated directly beneath the place of Christ's crucifixion on Mount Golgotha from where they once more see the stars.

The history of Christianity is dotted with periodic expressions of heretical dissent concerning the existence of Hell, notably by Origen, Erigena, Voltaire, and Nietzsche. But it was not until the seventeenth and eighteenth centuries, when rationalism began to find its voice, that a widespread decline of belief in Hell developed in Western culture. The concept of Hell as an actual spatial domain has virtually disappeared or been reduced to the level of allegorical interpretation. This transformation of the idea is exemplified in *The Fall* in Camus's warning "Don't wait for the Final Judgment. It takes place every day" and in Sartre's declaration in his play *No Exit* that "hell is other people."

ISLAM. Cosmology appears to have been a matter of interest in early Islam not for its own sake but "only as a doctrinal framework for understanding the cosmic field of divine providence and human accountability" (Smith, 1981, p. 9). Muhammad himself does not seem to have held to a clearly defined and detailed picture of a realm of the dead.

According to the Qur'an, there are seven layers of heaven extending above the earth toward the celestial abode of God. Corresponding to the layers of heaven are seven descending depths of a vast funnel-shaped fire (*alnār*). The topmost level of the netherworlds is Gehenna. This realm of death and torment is connected to the world of the living by a bridge that all the souls of the dead must traverse on the day of judgment. The varieties of punishment meted out

to the damned become more painful and severe with each level of descent.

At the partition between Paradise and the Fire stands Zaqqum, a tree that exudes a stifling odor and has blossoms composed of demons' heads. Eating the fruit of Zaqqum burns the stomach like molten metal (surah 7:46–50). The tree separates the two worlds, yet provides a point from which a person can see both realms simultaneously. Beside it is a wall or barrier that divides humanity into separate classes according to the moral quality of their deeds in the temporal world.

Each of the seven fiery realms is assigned a specific name. An inventory of these names reflects the Muslim attitude toward nonbelievers: *hāwiyah* (abyss for hypocrites), *jaḥīm* (fierce fire for idolators), *sa'ir* (blazing fire for Sabaeans), *jahannam* (purgatorial fire for Muslims), *lazā* (flaming fire for Christians), *saqar* (scorching fire for the Magi), and *ḥuṭamah* (raging fire for Jews).

The Qur'an depicts Gehenna in highly pictorial and terrifying terms. It is referred to as the "Fire of Hell" (89:23) and is depicted as a kind of four-legged beast. Each leg is composed of seventy thousand demons; each demon has thirty thousand mouths. Each of the seven layers of the Fire is punctuated by a gate manned by a guardian who torments the damned. The term *Gehenna* refers both to the topmost sphere and to the entire realm of seven spheres. Whenever this beast of hell is transported to the place of final judgment, it sends forth a buzzing, groaning, and rattling noise, along with sparks and smoke that shrouds the entire horizon in total darkness (15:43–44, 39:71).

The realms of the blessed and the damned are separated by a towering wall. Those who inhabit the heights of this partition can view the inhabitants of both worlds and recognize each group by their distinguishing marks. The blessed are recognizable by their smiling countenances; the damned, by their black faces and blue eyes (57:13). There is also a hint of the existence of a purgatory or limbo for beings whose deeds are neither extremely good nor extremely bad.

Both the Qur'an and the *ḥadīth* present a wide variety of reasons why a person may be condemned to a life of torment. The fundamental cause is lack of belief in God and in the message of his prophet, Muḥammad. Other reasons include the following: lying, corruption, lack of faith, blasphemy, denial of the advent of the judgment day and of the reality of the Fire, and lack of charity. Leading a life of luxury and believing that wealth brings immortality also lead to condemnation.

The postmortem journey of the soul of the redeemed or the blessed through the various layers of Heaven in the company of the archangel Gabriel is contrasted with the difficult and painful journey of the souls of the damned downward through the many spheres of Fire. The victims of the torments of Gehenna are represented as sighing and wailing in their wretched condition (11:106). Their skins are alter-

nately scorched to a black crisp and then renewed so that they can suffer the torments of Fire over and over again. They are compelled to wear garments made of fire or scalding pitch, and boiling water is poured onto their heads, melting their insides and skins. Iron hooks are used to retrieve them every time they try to escape (22:19–22).

In time, Muslim theologians began to emphasize God's grace and mercy and to downplay his anger and wrath. The belief arose that after a certain period of purgation the angel Gabriel would intercede on the sinner's behalf and release him from the Fire. It was later believed that in time the Fire would be extinguished and all sinners pardoned.

HINDUISM. Vedic references to an underworld are so few in number and so vaguely conceived that many scholars have argued that Vedic religion lacked a concept of hell. More recent studies (see Brown, 1941) have demonstrated that references to a realm of postmortem suffering do signal a genuine, if relatively undeveloped, conception of hell in the Vedic literature.

According to *Rgveda* 7.104 and *Atharvaveda* 8.4, the Vedic Hell is situated beneath the three earths, below the created order. It is characterized as a gigantic, bottomless chasm or abyss, a place of no return. In this infinitely deep pit, there is no light, only deep darkness (cf. *Rgveda* 2.29.6). In the very deepest realm lies the cosmic serpent, the archdemon Vṛtra (*Rgveda* 1.32.10), who fell there after Indra slew him.

Some texts describe the Vedic Hell as insufferably hot or unbearably cold. It is a realm of absolute silence (*Rgveda* 7.104.5) and of total annihilation, a state that is depicted semi-anthropomorphically as lying in the lap of Nirṛti, the destroyer. This region of eternal torment is populated not by those who committed wrongs inadvertently but by those who consciously and intentionally pursued unrighteous ends: Vṛtra, antidivine forces (*asuras* and *dasyus*), demonic powers (*rākṣasas*), and sorceresses (*yoginīs*) dwell here. The inhabitants of Hell are those who live at cross-purposes with the universal law (*ṛta*).

Hell stands in an antithetical relation to the ordered universe, based not on *ṛta* but *anṛta*. Here there is no order, no gods, no sun, no warmth, no fecundating waters, nor any of the elements vital to the creation and maintenance of creaturely existence. Here in the lap of destruction (*nirṛti*), there is only death and nonexistence (*asat*). It is the opposite of the created, ordered, and illuminated realm.

Later, in the Vedānta, hell came to be conceived in more strictly philosophical terms as the realm of pure nonbeing. Contrasted with this was the realm of being (*sat*), the realm of living beings and of life itself that came to be referred to as *brahman*, the limitless and indefinable fulcrum of being.

In the Upaniṣads, the paths leading to the realms of the blessed and the wretched are envisioned as the way of the ancestors and the way of the gods, respectively. Little importance is accorded to the idea of hell as the destiny of the unrighteous. The emphasis is rather on rebirth as the

consequence of an unrighteous past life. In the Yama-Naciketas episode in the *Kaṭha Upaniṣad*, the young man Naciketas receives instruction on the postmortem state from Yama, the lord of the dead. Rather than directly addressing a matter so subtle that not even the gods understand it, Yama informs Naciketas of two paths leading to different ends: the way of pleasure and the way of goodness. Yama recommends that Naciketas choose the latter, thereby avoiding rebirth.

But in the Purāṇas (collections of classical Hindu mythologies), hells are depicted in terrifyingly graphic terms as places of extreme suffering and deprivation. In the *Rāmāyaṇa* (7.21.10–20), Rāvaṇa, the ten-headed demon, witnesses a scene of indescribable wretchedness on entering Yama's abode. He hears the agonizing cries of the wicked being gnawed by dogs and devoured by worms. Pitiful screams shoot across the Vaitarani River from parched people on hot sand who are being sawed in half. The thirsty cry out for water; the hungry, for food. Pale, emaciated specters run to and fro. The righteous, on the other hand, inhabit grand palaces and dine on sumptuous meals, surrounded by beautiful, sweet-smelling maidens dressed in exquisite garments. In the *Mahābhārata* (12.2.25) Yudhiṣṭhira is ushered into an enormous dark chamber that is cluttered with foul-smelling hair, heaps of raw flesh, and countless pools of blood, corpses, worms, deformed animals, hideous monsters of incomparable ugliness, and ghosts of terrifying presence. As will become standard in the later Purāṇas, a specific form of punishment is assigned to each of the subterranean chambers. In the underworld called Kumbhīpāka ("cooked victuals") the wicked are boiled alive in giant vats of boiling oil; in Śalmali, thorns from a silk-cotton tree are used to torture the wicked.

The *Agni Purāṇa* (chaps. 340 and 342), one of the eighteen major collections of classical mythology, perpetuate a theme that blossomed in the Upaniṣads. This is the idea that the course of a person's life in this world is governed by the ritual and moral quality of his deeds. One's experience in the next world is governed by the fruits of those deeds. Yama determines the infernal region to which each wicked soul repairs or the womb into which it is to be born, according to the deeds of the previous existence. The terrifying members of Yama's retinue usher the soul to a place where they prepare an account of its good and evil deeds. The soul initially reaps the benefits of its good deeds in the form of physical and spiritual delights, after which it is returned to hell for a period of suffering in order to purge the residual effects of its evil deeds. If the number of merits outweighs the demerits, the person is reborn into a pure and prosperous family; if the obverse is the case, he may be committed to a lengthy life of suffering in one of the hells or be reborn as an animal, insect, or other base form of life.

The pathways connecting this world with the various hells are dreadful to behold and extend for a total of 164,000 human miles. According to most classical cosmologies, there are a total of 28 major infernal regions situated below the lowest stratum of another 7 netherworlds. Each region lies

along a vertical line of descent and is subdivided into 144 smaller chambers, to each of which is assigned an appellation describing its definitive characteristics, for example: Ghora (“horrificing”), Taralata (“trembling”), Bhayanaka (“terrifying”), Kālarātri (“dark night of devouring time”), and Dīpta (“the blazing realm”).

Each chamber is presided over by five guards with the terrifying faces of carnivorous animals and birds, who administer the form of punishment appropriate to the place. The guards cast their condemned wards into dreadful places of punishment. Some souls are cast into gigantic frying skillets or into caldrons filled with boiling oil, molten copper, or iron, while others are tossed onto the upturned tips of sharp pointed lances. Others are submitted to severe lashings with leather straps or heavy bastinados or are forced to drink beverages of boiling metals or noxious solutions of animal urine and human excreta. Still others are broken physically on the rack, dismembered, and then parceled out to vultures, hyenas, and other avaricious creatures of the infernal regions. Each of these dreadful realms is filled with the sounds of screaming, wailing, and moaning.

SECULAR VISIONS. Among a growing number of religious intelligentsia the world over, both heaven and hell are gradually being sublimated or transmuted into psychological entities or realms, with the personal and collective unconscious serving as the source of both positive and negative feelings, images, and attitudes. Even the general mass of people in industrialized countries who claim to retain a belief in an underworld of some description have, in practice, largely transposed many of the ideas and themes previously associated with the underworld (e.g., divine judgment, suffering, torment, disease, death, and mental and physical anguish) into the arena of contemporary human affairs.

J. BRUCE LONG (1987)
Revised Bibliography

UNGARINYIN RELIGION. Members of the Ngarinyin (Ngarinjin) language group, along with their regional neighbors the Worrora (Worrora/Worora), Wunambal (Unambal), and Gambre (Gamberre), whose combined, adjacent territories cover the northern Kimberley region of Western Australia, share a religious tradition primarily focused on the figures known as *wandjina* and *wunggurr* and an associated set of beliefs and practices. While variants of *wunggurr*, the Rainbow Serpent motif, are evident in Aboriginal cosmologies across Australia (Radcliffe-Brown, 1926), in the northern Kimberley region the Rainbow Serpent beliefs take on a distinctive cast through their interaction with the *wandjina* complex (cf. Elkin, 1930, "Rock Paintings of North-West Australia," p. 279).

WANDJINA AND WUNGGURR. Whereas *wandjina* and *wunggurr* are in some respects distinguishable from each other, in local beliefs and practice they are not entirely separate entities. *Wandjina* are named and localized "spirits of place" believed to reside in specific tracts of country associated with a particular patrilineal clan and appear in narratives that describe their travels and adventures in the *Larlan* (the original creative epoch). *Wunggurr* is a more diffuse life force animating and underlying the particular manifestations of its power that find expression in all species of things, including the *wandjina*. Some local expressions use the terms *wandjina* and *wunggurr* interchangeably in contexts where powerful forces emanating from the land are discussed in general. A further set of terms, *gulingi* (properly translated as "rain," but also a personage or group of personages indistinguishable from *wandjina*) and Galaru (a sky-snake personage particularly associated with the more dangerous aspects of cyclonic rain and lightning) are also at times used to refer to both *wandjina* and *wunggurr*. One further term, Wanjad, is used to refer to an aspect of *wunggurr* that becomes incarnate in the Rock Python. Representations of *wandjina* and *wunggurr* often occur together, alongside depictions of various natural species, in the painted cave galleries of this region. It is believed that *Wandjina* came to dwell eternally in the caves, in which they painted themselves. An oneiric mirroring between *wandjina* and *wunggurr* was noted by Andreas Lommel, who reported on the neighboring Wunambal's belief

that “Ungud [*wunggurr*] finds the soul of a Wondschina [*wandjina*] in a dream in the water” (Lommel, 1997, p. 16).

D. Mowaljarlai explained the relationship between *wandjina* and *wunggurr* in this way:

Every man or girl they come out from each *wunggurr* water. *Wandjina* gives us back. Then we know where that child come from. Everybody know. And that is where the land is because all the power connected. We find children from water. That’s why we’re water people. We spirits hide in the water come out in the open. We all belong water because *wandjina* belong water. He not a dry *wandjina*. He belong rain. (Doring, 2000, p. 238)

Wandjina are usually depicted as mouthless, anthropomorphic figures representing the body of an apical clan ancestor (or rarely an ancestress). They occur as polychromatic paintings in sandstone caves and in stone arrangements throughout the region. *Wandjina* are also identified in other features of the landscape, in various animal and plant (especially aquatic) species, in pools of freshwater and sometimes salt-water, and most importantly in the cumulonimbus rain-bearing clouds (*gulingi* or *angguban*) that move across the Kimberley landscape in the cyclone season, *Winjin* (December through to April). The actions of moving and then laying down performed by the *wandjina* in their travels in the creative epoch, *Larlan*, by the rain clouds (also known as “the travelers”) each wet season, and by the flowing rivers gradually contracting to isolated pools are all perceived as processual moments in the continual reanimation of Dreaming forces that works toward everything in the country becoming *yayiyurru* (also transcribed as *yorro yorro*), “standing up together in a bunch” (Redmond, 2001, p. 227; also Mowaljarlai and Malnic, 1993).

Wandjina are most often represented only with head and shoulders, though occasionally an entire anthropomorph (usually with no gender marking) is depicted. In such cases the torso, arms, and legs are often filled in with a series of parallel red ochre lines representing falling rain. The head is generally encircled with radiating lines said to be both feathered head decorations and lightning. The head commonly shows a horseshoe-shaped red-ochre band said to be the encircling body of *wunggurr*, the Rock Python.

Wandjina cave paintings are regarded by the Ngarinyin people as the imprint or “shadow,” *anguma*, left by the *wandjina* after their creative travels across the landscape in the *Larlan*. The word *anguma* also denotes a person’s “spirit” or “soul,” linking *wandjina* closely to beliefs about conception (see below). *Wandjina* are said to be visible in the present because they pressed their bodies into the rock faces of this landscape during the earth’s formative period, while its surface was still soft. The apparent absence of a mouth has been explained by some senior Ngarinyin men as resulting from the fact that the mouth is located on the inner side of the visible image, facing in toward the rock upon which the image appears. *Wandjina* sometimes left behind other sorts

of markings, such as the footprints said to be visible in the rock at Aynggulura. Paddy Neowarra, a senior Ngarinyin man, tells how “*wandjina* walked through that flat ground, through the opening and made his print behind him for us to see” (Redmond, 1998, p. 24). At the painting site known as *Yalgi andi*, on the central Kimberley Plateau, the qualities of this primordially soft world are still said to be clearly evident. Here an extensive series of cup-shaped markings appear in both vertical and horizontal rock faces. These small hollows, *dagula* or *bindingarri*, are said to have been created by the action of the “sweat of *wandjina*” falling onto the soft rock in the *Larlan* (Redmond, 1996, p. 35).

The painted *wandjina* images, then, are regarded not as the artistic work of the ancestors of present-day people but rather as actual ancestors, autochthonous creations whose images have merely been maintained by human agency: “kept bright” by ritual repainting. This periodic repainting is believed to have profound consequences as far as maintaining the natural and social balances of the cosmos (Mowaljarlai and Malnic, 1993; Rumsey and Mowaljarlai, 1994; Crawford, 1968; Blundell and Layton, 1978). Persons of both genders feel a ritual obligation to countries where they have a strong connection deriving from one of a number of potential links (i.e., patrilocality, mother’s country, conception site). It seems that socially mature persons other than patrilineal members could be invited to repaint an image in another person’s clan country. Such persons would then be given gifts (*ngurlu*), such as kangaroo meat or wild honey. Paddy Neowarra explained, “In *Winjin* [Cyclone Season] time when that *wilmi* [mist] come out from the stone in early morning, *jurri* we call it, the ‘smoke’ goes into the paint and renews it and it’s just like it paint up again so we can go always go back and renew it” (Redmond, 1995, p. 98).

In this sense even the act of retouching is not seen as being initiated by humans but by the saturated air emanating from the sun-warmed rocks that gives a new life to the painted images. There is indeed a noticeable glow in the paintings at this time of year because the kinds of ochre used in the paintings (the white huntite, particularly) absorb moisture readily, enriching the colors, restoring to them something of the vividness these paints display when wet (cf. Crawford, 1968).

Ngarinyin use the term *we awani* for the “laying down” of the *wandjina* as they pressed themselves into the soft jelly-like surface of the earth in the *Larlan*. They speak of the rock caves (tight niches into which painters often had to squeeze themselves) as actually being cloud formations, stating unequivocally “that stone is a cloud” (cf. Mowaljarlai and Vinicombe, 1995: 236; see also Crawford, 1968).

The annual wet-season deluge finds its earliest mythic archetype in the focal story of Wanalirri. This story and its associated painting site and songs tell of a primordial flood of cataclysmic proportions that submerged the world and all within it. In this saga a boab tree (*Adansonia gregorii*), actually a disguised *wandjina*, “opened its legs” and swallowed up

two juvenile miscreants who had originally provoked the wrath of the *wandjina* by plucking the feathers from Dumbi the Owl, an animal highly favored by *wandjina* (Redmond, 1995, p. 89). The boys were then trapped inside the boab body forever despite the efforts of their relatives (who then appeared to be saved from the flood) on the outside of the boab tree. These two boys who were trapped in the boab were said to be the only survivors of the great flood, but having grabbed a kangaroo by the tail to escape the floodwater, they were tricked into a premature burial. As in the various Arnhem Land versions of the swallowing myths and rites given by L. R. Hiatt “as a substitute for the natural model of female generation,” the two boys of the Wanalirri story were imprisoned, but the other people of the world were re-gurgitated after the flood (Hiatt, 1975, p. 157).

This cosmogonic event is replicated in the floods of the wet season and in the radical contraction of the river systems as the dry season moves in. Thus there is an annual recurrence of the “breaking up” of the visible body of *wunggurr* into distinct pools. The long ribbons of the river courses, which are visible from the elevated rock ledges in which many of the *wandjina* caves are located, slowly break up into large, relatively isolated rock pools, the *ngawan* or “living water” that never disappears, no matter how dry the season.

The night sky is also said to be replete with pools of freshwater that are made most visible in the body of the original *wandjina*, Walanganda, the Milky Way. This galaxy is said to be the body of Walanganda lying across the heavens, with his head in the north and feet in the south. Within this body of swirling white mists are pools of “dark, sweet water” that are pointed out in one dark hole in particular just to the east of the Southern Cross constellation (Redmond, 1996, p. 18). All freshwater on the earth is said to have come from water that originally “fell down” from these dark pools of freshwater in the body of Walanganda.

The whiteness of the body of Walanganda is said to come from the smoke from the cooking fires of the two moiety heroes: Jun.gun (Owlet Nightjar), who was cooking *yali* (female kangaroo), and Wodoy (Spotted Nightjar), who was cooking *jebarra* (emu) in the *Larlan*. These two totemic figures are central to the foundational myths of Ngarinyin sociality. They are said, for example, to have come to blows over the issue of primordial incestuous desire, leading to the introduction of the all-important law of moiety exogamy through daughter exchange. At the Walanganda *wandjina* painting in Jibilingarri clan country, the *wandjina* and a smaller second figure, identified as his son, are represented on the roof of a cave. In the burnished rock floor immediately below them is a dark, well-polished depression said to be the *wunggurr* pool visible in the Milky Way itself. Here the *wandjina* and his son are perpetually “mirrored” in the “water” that forms part of Walanganda’s own body. Parallel red lines emanating from the *wandjina* body are said to be the swirling mists making up the galaxy. Importantly, these lines of celestial mist also formed an *angga* (or *coolamon*), traditionally

used by women for carrying vegetable foodstuffs, babies, and the bones of the dead (cf. Love, 1936, p. 158). The curved outside surface of *angga* are usually decorated with the same kind of striated red lines carved into the wood. J. R. B. Love noted that at Kunmunya “the mother will often paint her child with stripes of red ochre” (Love, 1936, p. 118).

DEATH AND FUNERARY PRACTICES. The relationship of continuity between living persons and the *wandjina* of their clan was traditionally underscored by the practice of interring the skulls and femur bones of deceased men in the main *wandjina* cave of their patriline. Most modern burials take place in township or community graveyards following a Christian service accompanied by country gospel singing interspersed with the intense keening of the women in a maternal kinship relationship to the deceased. These funerals are marked by strict observance of avoidance relationships that prescribe that the widow of a deceased man (but not vice versa) enters a lengthy period of seclusion from other members of the community. The occasional performance of precolonial burial practices, in conjunction with the narratives of senior Ngarinyin people about these practices when they were more widespread, permits considerable insight into Ngarinyin beliefs about death.

Once the bones of the deceased were regarded as sufficiently “clean and dry,” after perhaps a year or more exposed to the elements in a stone cairn, they were gathered and given a final scrub in water by people in a maternal kinship category to the deceased (Redmond, 1997, p. 34). The skull and long-limb bones were anointed with a mixture of fat and red ochre before being wrapped in sheets of *wulun* (paperbark). The paperbark wrapping, particularly associated with femininity, symbolically “restores” to the bones their fleshy envelope. In this regard it is important to note that babies were also usually rubbed with fat by the maternal kin in the early days of their lives (cf. Love, 1936, p. 113).

Grieving relatives thus participate in ceremonies that “return” the individual subject to the ancestral realm, reuniting the deceased person with the enduring *wandjina* ancestor and ancestral clan country. This *wandjina* identity endures through various reincarnations of the ancestral being (through the *abi* relationship). A deceased person’s *anguma* (shadow or spirit) is believed to rejoin with the body of *wunggurr* when his or her bones are lodged in the cave. The person’s spirit travels to Dulugun, an island in the western sea (Numenbu, Champagny Island) and, after some indefinite interval, resurfaces through a water hole and attaches itself to the person it has chosen as its new father, thus enacting the *abi* identity of a person with his or her father’s father’s brother or sister. Each of these reciprocal relationship categories are glossed in English simply as “brother” and “sister.” Afterward, one part of the *anguma* is said to remain in the rock cave where the bones are deposited. In Dulugun, spirit children are said to be mired in *jalad-gu*, a green water grass in the water holes where the *anguma* reside. It is said that this water grass acts as a kind of sponge that absorbs the *anguma* in Dulugun until they are ready to be reborn.

The identification of the sandstone caves in which the bones of the dead are placed with *an.guban* (rain clouds) is a crucial element in the understanding of the cosmography of this region—it is in these “watery” recesses that the *wandjina*, as the living part of a person’s patri-identity, continues to dwell (Mowaljarlai and Vinnicombe, 1995; Mowaljarlai and Malnic, 1993; cf. Lommel, 1997; Crawford, 1968). The symbolic equivalence of cloud and stone highlights the series of transformations that link living persons, their *wandjina*, and the more universalizing aspect of the creative forces believed to be immanent in the figure of *wunggurr*.

CONCEPTION BELIEFS. *Wunggurr* also embodies *yarri*, dreaming activity in a general sense. This is most evident in the reciprocity of “dreaming” child spirits between the father-son dyad in the Ngarinyin social world, in which a person is identified as a reincarnation of an *abi* (father’s father’s brother or sister, depending on the gender of the child) from whom one’s name is taken. *Wandjina* are thus personified in contemporary living persons, who identify with a particular *wandjina* by referring to him as “I” or “me,” or as the speaker’s *abi* when narrating stories of that personage in the *Larlan*. The association of *wandjina* and *wunggurr* with fertility is clearly apparent in the affectionate calling of newborn babies “*wandjina*,” and in the practice of divining where a fetus’s *wunggurr* (conception place) is by family discussions about where the mother first knew herself to be pregnant, what happened on that day, where the husband was, and what he might have caught hunting or fishing that day, thus conferring the name of that place upon the child.

The senior Wunambal man W. Goonack stated, “We born from water, from *wulu*” (Redmond, 1995, p. 28). *Wulu* is a polysemous Ngarinyin term that Paddy Neowarra glosses as the “colour seen in water when a man finds dream for baby” or simply “dreams in the water” (Redmond, 1997, p. 72). This color, the spectral dispersion of light in water, is regarded as having “strong *wunggurr*” just as the rainbow is regarded as a powerful embodiment of *wunggurr*. In the latter case the shimmering spectral light is as important to the image of *wunggurr* as the snakelike shape it forms arching across the sky from one point on the earth to another.

WUNGGURR AND BARNMARN. Beneath the *wunggurr* pools it is said that there are entire “worlds—big dry ground” in which *wandjina* dwell, worlds that are mirrors of the airy world above the rock pools but are contained in world-sized caves complete with kin, game, and vegetation. These worlds, also identified with Dulugun, the realm of the dead (see below), are believed to have something like “trap-doors with lid” or “windows” that allow entry and exit for those with the knowledge to do so, such as the *barnmarn*, a traditional healer and composer. A human being can enter and exit this realm through these “windows” or “trapdoors” as though in a “lift” (i.e., an elevator). The sensation of vertiginous descent was said to be similar (Redmond, 1996, pp. 56–59). According to D. Mowaljarlai, “A man who had healing powers came to that *wunggurr* place, snake place,

punched a hole there with his heel, with foot, and he made a window . . . hollow ground, it just went down in a door” (Lommel and Mowaljarlai, 1994, p. 285).

The process of “dreaming” songs requires a composer to travel in a dream on the back of *wunggurr* through the air or deep beneath the water to Dulugun, the land of the dead. The composer’s mortal body meanwhile remains on the ground, where it is cared for by the composer’s assistants. The sleeping body remains connected to the *wunggurr* self by *buyu*, a long, thin, invisible thread connected to the body, now colloquially known as “radar” or “fishing line.”

Miriru (or *mururu*) is a name for the *wunggurr* power possessed by the *barnmarn*. D. Mowaljarlai has explained that *mururu* is the “clear vision, no longer blind” imparted from *wunggurr*. Others have described it as “strong *wunggurr* dreams” and also as the “blood, juice of kangaroo” (Redmond, 1995, p. 25). There are a number of senses in which the *wunggurr* power of the composer-healer is comparable to that which comes from a person’s dreaming of a spirit child. Both are referred to by the same term in Kimberley Aboriginal English: “finding” a song or “finding” a spirit child, respectively. Both require a penetration of the screen that normally shields humans from the spirit realm. Composers take the journey through the bottom of the water hole to Dulugun, where bundles of green leaves are held in front of their eyes so they will not be too frightened to look at the emerging dancing spirits. In the case of a man finding a child, the *anguma* itself takes the journey out of the water hole and lands on the body of the prospective father.

Beliefs about *wandjina* and *wunggurr* continue to have a powerful salience in contemporary Kimberley Aboriginal communities, despite great changes in economic and social circumstances. The people of this cultural domain continue to place these images and beliefs at the very heart of their social and cultural identity vis à vis other Aboriginal groups of the region and the encompassing non-Aboriginal world. In everyday discourse and the interpretation of events, *wandjina* and *wunggurr* figure prominently for all age groups, even though the differences in levels of knowledge and specificity are marked. One of the ways in which all participate in this shared body of beliefs is in the attribution of “uncanny” and troubling events to the actions of *wandjina*, *wunggurr*, and the host of other supernatural beings in this cosmology. The practice of depicting *wandjina* and *wunggurr* on canvases for sale in the contemporary art world is another means by which the salience of these images is transmitted across generations.

ADOLESCENT MALE INITIATION. Another continuing aspect of Ngarinyin religious life is the annual performance of ceremonies at which boys who have reached adolescence are circumcised. This may take the form either of the local tradition of *walungarri* (a circle dance performed over three nights accompanied by a long and intricate song cycle and clapping sticks) or *wangga* (imported to the Kimberley in the 1930s from the Daly River area of Northern Territory in which the

didjeridu is employed as an accompaniment to singing in a Murin-patha language).

The practices of *walungarri* are said to have come from the ancestral bird personages, Gwion Gwion (Doring, 2000; cf. Lommel, 1997, and Crawford, 1968, where their role is understated). The local origins of circumcision are also given in myths such as the Worrorra story of Ngayangananyi (Mount Trafalgar) and the Wunbangguwa people, told by Elkin Umbagai as “the Mountain of Initiation” (McKenzie, 1980, p. 76). Here the Ancestral Beings first dug a trench around a mountain so it was cut off from its surrounding stone matrix. To celebrate their achievement they instituted “the first initiation ceremony for young men” (McKenzie, 1980, p. 76). Here the *walungarri* circle dance is an emulation of digging around the base of the mountain. Flying Fox and several other ancestral animals, including Ring-Tail Possum, Crab, and Shovel-Nose Shark, “change their shapes”—that is, attained their present animal morphology through the process of digging out the trench around the mountain (McKenzie, 1980, p. 76). Flying Foxes, the first initiates (said to show circumcision marks on their penises), play a particularly prominent role in this story. The whirling flight of flocks of flying foxes when roused from sleep is said to be a re-enactment of the *walungarri* circle dance. The *walungarri*, says Umbagai, “goes on all night. When the first streak of daylight shows, the lads are taken away from the families—from the women and children” (McKenzie, 1980, p. 76). The women then “wail and sometimes beat their heads with stones” (in the manner of widows at the deaths of their husbands), and the initiate is entrusted to the care of a classificatory brother-in-law (a potential wife’s brother), who will nurse him through the circumcision and its aftermath. This relationship remains significant to both parties throughout their lives.

Extensive travels to gather initiation performers are an important part of the ceremonial process and foster close ties of reciprocity between individuals and groups in far-flung settlements across the Kimberley. Other forms of exchange (*wurnan*) of both a ceremonial and mundane nature, the arrangements for which which tend to be all-consuming for the participants, are instituted and perpetuated through these visits, which in turn impart vitality and complexity to Kimberley social and religious life.

ANTHONY REDMOND (2005)

UNIATE CHURCHES. *Uniate* is the name given to former Eastern Christian or Orthodox churches that have been received under the jurisdiction of the Church of Rome and retain their own ritual, practice, and canon law. The term carries a strong negative connotation and is seldom used by these churches to describe themselves.

The term was first used by opponents to the Union of Brest-Litovsk (1595) to indicate a betrayal of Orthodoxy and

a yielding to political pressure enforced by alleged violence. The problem of this terminology emerged again in the new alignment of eastern Europe after communism. Many Orthodox view these churches as an obstacle in the way of reconciliation between the Catholic and Orthodox churches. They feel that their very existence constitutes a denial by Catholics of the ecclesial reality of the Orthodox Church and that these unions grew from efforts to split local Orthodox communities.

Attempts at the reunion of the Christian churches of the East and the West usually ended in failure, especially in the centuries immediately after the mutual excommunications of 1054. Later political necessity forced Emperor Michael VIII Palaeologus (1234–1282) to seek the help of the Western powers for the support of Byzantium at the Council of Lyons (1274). Subsequently, this agreement was revoked by the new pope in Rome, Martin V (r. 1281–1285). In the East its acceptance was forced, and it was soon repudiated by Michael's son, Andronicus II (1260–1332). The Council of Florence, after long negotiations, issued a bull of reunion, *Laetentur coeli*, on July 6, 1439, but the Greek signatories began to deny the reunion as soon as they arrived in their home environment. Yet all these attempts at union were not futile because they kept the idea of union alive in Christian consciousness. After the initial optimism of the post–World War II ecumenical movement and the World Council of Churches in the Protestant dialogue with the Orthodox and in the Catholic International Dialogue with Orthodoxy after the Second Vatican Council, a period of retrenchment set in.

MELKITE CATHOLICS. The term *Melkite* refers to a Christian of the Byzantine rite—Catholic or Orthodox—from the patriarchates of Alexandria, Antioch, or Jerusalem. (The word derives from the Syriac word *malka* and the Arabic word *melek*, which mean “king” or “emperor.” These Christians were given this name by the anti-Chalcedonian party because they adhered to the Christological position of the Byzantine emperor after the Council of Chalcedon in 451 CE.) Until the 1300s the Melkites used the Antiochene rite. In the countryside the liturgy was celebrated in West Syriac or Aramaic and in the cities in Greek. With the advent of Islam, Arabic gradually replaced Syriac. Over the course of the fourteenth century the Byzantine rite replaced the Antiochene rite.

The Melkite faithful tried to preserve allegiance to both Rome and Constantinople. By 1724, renewed communication with Rome had resulted in the creation of a Catholic Melkite Church alongside the Orthodox Melkite Church, although no formal written agreement of union was ever drawn up. In the intervening history the Melkite Catholic patriarch of Antioch, Maximos Mazloum (1833–1855), added the sees of Alexandria and Jerusalem to his title. Patriarch Maximos IV Sayegh (1947–1967) defended the traditions of the East in his patriarchate and at the Second Vatican Council. The Melkite bishops, including Patriarch Maximos IV, have supported the idea that, in the event of

a reconciliation between the Orthodox and Catholic churches, their church should be reintegrated into the Orthodox Patriarchate of Antioch. A bilateral commission for dialogue between the Melkites and Antiochene Orthodox was established in 1995, and both sides expressed the firm intention to heal the schism of 1724. The Melkites have achieved the closest union with their former counterparts in practice if not yet in name. Many Melkite Catholics immigrated to North and South America at the beginning of the twentieth century and formed two eparchies (dioceses) in Newton, Massachusetts, and in São Paulo, Brazil.

MARONITE CHURCH. The Maronite Church traces its origins to the fourth century CE and the monk Maron (d. c. 423), who received a Greek and Syrian literary education and went to Antioch to complete his studies. In Antioch he met and befriended John Chrysostom (c. 347–407 CE), who soon became the bishop of Constantinople. Centuries later a community of Maronites grew up around the monastery of Saint Maron on the banks of the Orontes River in northern Syria. Seeking to escape from the persecutions of the caliphates of Damascus and Baghdad, Maronites began to seek refuge in the mountains of Lebanon. Although the Maronite Church never rejected the primacy of the Roman See, communication between the two churches was interrupted for centuries, and only after 1182 and the advent of the Crusaders was Roman recognition of the Maronite rite restored. During the time of the Crusades, Maronite priests and faithful were the only Eastern Christians allowed to worship in Latin churches. Maronites had the same rights as Latins, and their own magistrates judged them according to their own customs and laws. The head of the Maronite Church began to use the title “patriarch” during the fifteenth century. The title became definitive in a bull of Pope Paul V (ruled 1605–1621) in 1608.

The Maronite Church is one of two Uniate churches that do not have a parallel Orthodox hierarchy. The other is the Italo-Albanian Catholic Church. The Maronite Church has undergone many influences tending to conform it to the Latin rite. The rite of the Maronite Church belongs to a group of Antiochene rites, and its liturgical language is West Syriac or Aramaic. The Maronites adopted more and more the use of Arabic as that language became the vernacular. The words of institution in the canon of the liturgy are usually sung in Syriac; the rest of the liturgy is usually recited in the vernacular language of the place. Political and economic turmoil in the Middle East has caused the immigration of a large number of Maronites to the United States, where they have established two dioceses.

RUTHENIANS. The term *Ruthenian* designates former Orthodox who come from the region that is bounded on the north by the Vistula and Neman Rivers and on the south by the Danube and Dnieper, and that includes territories of present-day Poland, the former Soviet Union, Czechoslovakia, Hungary, and Romania. *Ruthenian* is derived from the Latin *Rutheni*, meaning “Russian,” and is used by Western histori-

ans to designate Catholic Slavs of the Polish-Lithuanian state or of the Austro-Hungarian Empire. The Russian authorities preferred the term *Little Russian* to distinguish those people from the Russians to the north. The Ruthenians divided into two branches. To the north of the Carpathian Mountains under Polish or Russian control were the Galicians. The Subcarpathians lived on the southern side of the mountains and were influenced by Austro-Hungarian political and social conditions. The Galicians rapidly formed a church as a result of the Union of Brest-Litovsk (1595), which was signed by several bishops. The Union of Uzhgorod (1646) initiated a series of unions through the course of the next 125 years before Subcarpathian union was actually achieved and a see established at Mukacheve in 1771.

The subsequent political division of Galician territory subjected Byzantine Catholics there to persecution by their Orthodox brethren, who thought they had changed their traditions by allowing Latin rite deviations. The Catholics belonged to the peasant classes and lived in the villages, whereas the Orthodox for the most part belonged to the lesser landed nobility. Catholics were obliged to pass over to Orthodoxy under threat of violence, despite the assurances of Russian officials. In 1805 the See of Kiev was abolished. The Ruthenians were placed under the protection of the Austro-Hungarian Empire and the jurisdiction of the archbishop of L'viv (Lemberg), who was recognized as the primate of the Ruthenians of Galicia, Subcarpathia, Hungary, and Slovakia.

Nascent nationalism began to divide the Galician Church. After 1848 the term *Ukrainian* designated the people and nation to the north of the Carpathian Mountains. The term *White (Byelo) Russian* meant those inhabiting the northern regions around the Pripet Marshes. The remaining Ruthenians slowly developed a national consciousness in the Subcarpathian region and continued to refer to themselves as *Greek Catholics*, an ethnic as well as a religious term. Those Ruthenians who assumed Hungarian culture called themselves Hungarians. The creation of the Czechoslovak state and the advent of the Soviet Union reinforced these divisions. Ruthenian immigration to Yugoslavia in the sixteenth century created a substantial community there that survived persecution after World War II.

After World War II the Soviet government actively persecuted Ruthenian Catholics to force them into the Russian Orthodox Church. The major hierarchs of the Ukrainian Catholic Church were arrested in 1945 and 1946 and exiled to Siberia or killed. In a council of reunion held at L'viv, the remaining faithful, whose families had been threatened with deportation, voted in March 1946 to abolish the union with Rome. The metropolitan see of Galicia was placed under the jurisdiction of the Patriarchate of Moscow. In the case of the Subcarpathian Ruthenians, the territory of the diocese of Uzhgorod was ceded to the Soviet Union by Czechoslovakia after its occupation by the Soviet army. The Orthodox began to occupy Catholic churches under the protection of the civil administration. The Ruthenian bishop, Theodore Romzha

(b. 1911), died mysteriously in 1947. The abrogation of the union with Rome was signed in August 1949 in the Monastery of Saint Nicholas in Mukacheve. The underground Ukrainian Catholic Church began to reemerge even before the fall of the Soviet regime.

The liturgy and ritual of the Ruthenian Catholics remained conservative for centuries and followed the main lines of the Orthodox tradition. Ancient Greek melodies were preserved in the Ruthenian *prostopenie* (plainchant) at the time that the Russian Orthodox Church introduced polyphony and Renaissance melodies into their church music. The Synod of Zamość (1720) introduced a number of innovations as a result of pressure from the Polish government to conform the Ruthenian usage to the Latin. These included the addition of the phrase "and the Son" (*filioque*) into the text of the creed; the commemoration of the pope; the teaching that the sacred moment of the liturgy, when the transformation of the elements occurs, was at the words of institution ("This is my body"), and not at the *epiklesis* (the calling down of the Holy Spirit) as had been taught in the East; the prohibition of communion to infants; the prohibition against using sponges to clean the *diskos* (paten); the prohibition against pouring hot water into consecrated wine; and the use of only one priest as well as a shortened formula in the administration of the anointing of the sick. Western types of Marian devotion and devotion to the Sacred Heart were introduced under the influence of the Polish Jesuits. Popular hymnody was often Western-inspired or based on folk melodies.

Austro-Hungarian emigration in large numbers began in the 1870s as a result of poor distribution of agricultural land, rising expectations from industrialization, and political and social pressures. A second wave of immigrants, consisting mostly of Ukrainian professionals and intellectuals, reached the United States after World War II, but large numbers of this group settled in Europe and other countries.

ROMANIANS. The Jesuits began to work as missionaries among the Transylvanian Romanians in 1693. Their efforts, combined with the denial of full civil rights to the Orthodox and the spread of Protestantism in the area, which caused growing concern among the Orthodox clergy, contributed to the acceptance of a union with Rome by the Orthodox metropolitan Atanasie of Transylvania (Atanasie Anghel [1697–1713]) in 1698. He later convoked a synod that formally concluded the agreement on September 4, 1700. At first this union included most of the Romanian Orthodox in the province. But in 1744 the Orthodox monk Visarion Sarai led a popular uprising that sparked a widespread movement back to Orthodoxy. In spite of government efforts to enforce the union with Rome, even by military means, resistance was so strong that Empress Maria Theresa (1717–1780) reluctantly allowed the appointment of a bishop for the Romanian Orthodox in Transylvania in 1759. In the end, about half of the Transylvanian Romanians returned to Orthodoxy. It proved difficult for the new Greek Catholic

community, known popularly as the United Greek Catholic Church, to obtain in practice the religious and civil rights that had been guaranteed it when the union was concluded. Bishop Ion Inochentie Micu-Klein (1692–1768), head of the church from 1729 to 1751, struggled with great vigor for the rights of his church and of all Romanians within the empire. He died in exile in Rome.

COPTIC CHURCH. Despite attempts at union in the twelfth, thirteenth, fifteenth, sixteenth, and eighteenth centuries, the numbers of Uniate Copts remained small. Pope Leo XIII (r. 1878–1903) created a Coptic Patriarchate of Alexandria, Egypt, in 1895, and a Catholic Coptic synod elected Cyril Makarios (1867–1909) as patriarch in 1898. The see remained vacant from 1908 to 1947, when Mark II Khouzam (1888–1958) was elected patriarch. Four dioceses were erected, and the number of faithful began to increase dramatically. Upon the death of Mark II in 1958, Stephanos I Sidarous (1904–1987) was elected patriarch and subsequently was made the first Coptic cardinal. After that, great progress was made on the resolution of understanding of Christological differences between the Catholic and Oriental Orthodox churches. In no other ecumenical relationship has a dogmatic disagreement of this type been overcome so unequivocally and with such official approbation. This was achieved without any official bilateral dialogue. The interplay of unofficial theological consultations and official pronouncements made by church leaders proved to be an effective means of resolving a centuries-old problem. The solution of the ecclesiological and ministerial differences remained much more elusive.

MALABAR CHURCH OF INDIA. The Malabar Church, according to tradition, was founded by the apostle Thomas. Hence the Malabarians refer to themselves as “Thomas Christians.” From remote times Malabar fostered relations with the churches of Persia and Seleucia. From the ninth century to the sixteenth century the Syro-Chaldean patriarchs alone usually sent bishops to Malabar. Little is known about the Malabar Church before the sixteenth century. Portuguese missionaries arrived in India in 1498. The Malabarians, who did not consider themselves separated from Rome, welcomed the Portuguese as brothers in the faith, but they refused to allow Latin practices into their church. After 1552, two lines of Syro-Chaldean patriarchs sent bishops to Malabar, but only the bishops of the line of Sulaqa were confirmed in office by the pope of Rome.

When Mar Abraham, the last Chaldean bishop, died in 1597, the Portuguese archbishop of Goa, Alexis de Menezes (1559–1617), acted against what he thought were Nestorian errors in the Malabar Church. He convoked and presided at the synod of Diamper in 1599. At the synod the Malabar liturgy was changed. The anaphoras of Theodore of Mopsuestia (c. 350–428 CE) and of Nestorius (d. c. 451 CE) were suppressed; the formula “mother of God” was introduced wherever “mother of Christ” was discovered; the calendar of saints was rejected; and many Latin practices were introduced into the eucharistic liturgy and other sacramental rites.

TABLE 1.

Further the creed was inserted immediately after the reading of the gospel; unleavened bread and communion of the faithful under one species only was introduced; and a consecration prayer, translated from the Latin, was inserted at the fraction rite instead of before the anamnesis and epiclesis.

Rome appointed Bishop Francis Roz (1557–1624), a Jesuit, as Abraham’s successor in November 1599. His policy of Latinization met with great opposition. Archdeacon George, who had earlier been given the right of succession to Abraham by Rome, died in 1637. George’s nephew Thomas assumed the leadership of the opposition. In 1653, when the Portuguese sent Ahattallah, a Syro-Chaldean claiming authority from Rome, to Goa, the opposition swore that they would never be under the control of the Jesuits. This was called the Coonan Cross Oath. Four months later twelve priests ordained Thomas as their bishop. Rome made efforts to heal this breach. Over the course of the next decade, eighty-four opposition congregations returned to Rome, and thirty-two remained with Thomas. This party, now called the “new party,” accepted Jacobitism and the Syro-Antiochean rite, and from them descend the Malankara Catholics. Attempts at reunion made by Mar Thomas IV and Mar Thomas V in the early eighteenth century were fruitless. On September 20, 1930, Mar Ivanios George Thomas Panickerveetil (1882–1930), metropolitan of the Bethany congregation of Jacobite monks, Mar Theophilos

James Abraham Kalapurakal (1891–1956), bishop of Tiruvavur, and their whole community signed a union agreement with Rome. These Malankar Catholics retain the West Syrian liturgy but use the native dialect of Malayalam as their liturgical language.

BIBLIOGRAPHY

For an honest assessment of contemporary difficulties with Uniatism see Robert Taft's "The Problem of 'Uniatism' and the 'Healing of Memories': Anamnesis, Not Amnesia," *Logos: A Journal of Eastern Christian Studies* 41–42 (2000–2001): 155–196. A good historical survey is Robert Roberson's *The Eastern Christian Churches: A Brief Survey* (Rome, 1999). An in-depth study of the Slavic unions is Oscar Halecki's *From Florence to Brest, 1439–1596* (Rome, 1958), in which the Polish historian works almost exclusively with primary sources to debunk some established positions about the motives of those who sought union. A good case study of an individual union is Michael Lacko's *The Union of Uzhorod* (Cleveland, Ohio, 1966). For a good treatment of Subcarpathian nationalism, politics, and intellectual life see Paul Robert Magocsi's *The Shaping of a National Identity: Subcarpathian Rus', 1848–1948* (Cambridge, Mass., 1978). A modern treatment of the complexities of Ukrainian nationalism and religion is Serhii Plokhy and Frank E. Sysyn's *Religion and Nation in Modern Ukraine* (Edmonton and Toronto, Canada, 2003).

THOMAS F. SABLE (1987 AND 2005)

UNIFICATION CHURCH. The Unification Church is a messianic, millenarian religion, dedicated to the goal of restoring the kingdom of heaven on earth. It was founded in Korea in 1954 by the Reverend Sun Myung Moon (b. 1920) as the Holy Spirit Association for the Unification of World Christianity (HSA-UWC). Within a quarter of a century it had become one of the best known and controversial of the contemporary wave of new religious movements. In Korea it is known as the Tong Il movement; in the West it has been referred to by various names such as the Unified Family, or the Moon Organization; then, during the 1990s, it was reconceived as the Family Federation for World Peace and Unification (FFWPU), with the Unification Church being merely the religious arm of the movement. However, despite their attempts to be rid of the label, the movement's members continue to be widely known as "Moonies."

HISTORY. Moon was born in what is now North Korea in 1920. He claims that on Easter Day 1936 Jesus appeared and asked him to assume responsibility for the mission of establishing God's kingdom on earth. During the next two decades Moon is said to have communicated with various other religious leaders (such as Moses and the Buddha) and with God himself. This resulted in a body of teachings eventually published in English as the *Divine Principle* (1973).

During the movement's early days in Korea it met with considerable opposition from both the established churches and government officials. Moon was imprisoned several times, and at one point spent two and a half years in a Communist labor camp. In the late 1950s Unification missionaries went to Japan and the West, but it was not until the early 1970s, when Moon himself moved to the United States, that the movement became known to more than a handful of Westerners. Over the next ten years, however, Moon's name became a household word as he spoke on lecture tours and at large rallies, and hosted leading academics at international conferences and local and national dignitaries at lavish dinners. The movement also received considerable attention by supporting U.S. president Richard Nixon during the Watergate crisis.

Several valuable properties (including the New Yorker Hotel and the Tiffany building in Manhattan) were acquired by the organization. Businesses affiliated with the movement (including fishing concerns and ginseng production companies) appeared to prosper. Cultural activities (including the Little Angels dance troupe, the Go World Brass Band, and the New Hope Singers) flourished. The Unification Theological Seminary was established in Barrytown, New York, in 1975, Sun Moon University appeared in Korea (1993), and the University of Bridgeport, Connecticut, which had been founded in 1927 as the Junior College of Connecticut, was rescued from financial disaster by the Professors' World Peace Academy, an organization created and supported by Moon, in 1992. Newspapers and other publications, including the *Washington Times* (in 1982), were launched in Tokyo, New York, Latin America, and elsewhere.

Clean-shaven, well-groomed Unificationists became a familiar sight on the streets of North America and Europe, selling candles, candy, cut flowers, potted plants, Unification literature—and the Unification Church itself. Those who joined as full-time members in the 1970s and 1980s were disproportionately white, middle-class people in their early twenties. As in Japan, they lived in communal centers, but by the early 1990s most grass-roots members had been sent to their hometowns, where (like the Korean members) they tended to live as nuclear families, no longer working full-time for Unification-related businesses.

Partly because of a high drop-out rate, the number of fully committed members has always been considerably lower than the media (or the movement itself) have suggested; indeed, there have never been, at any one time, many more than 10,000 full-time members in the West, where the movement has not grown substantially since the 1970s, but has come to rely on second-generation members to sustain its membership (although, following the fall of the Berlin Wall in 1989, a modest number of new converts were recruited in Eastern Europe and the former Soviet Union). In Asia, full-time membership is unlikely to have exceeded two or three times that number. There is, however, a considerably larger category of people who express support for Unifi-

cation beliefs and/or other aspects of the movement while, perhaps, maintaining allegiance to another religious tradition. Indeed, with the passage of years, it has become increasingly difficult to distinguish between core Unificationists (rather like priests or monks) and those who are more or less loosely associated members of the wider Unification congregation. As with many new religions, the aging of converts and the arrival of second and subsequent generations has been accompanied by a tendency towards “denominationalization,” or general accommodation to the wider society with a lessening of sharp dichotomies between “them” and “us.”

BELIEFS. Unification theology is one of the most comprehensive among the contemporary new religions. The *Divine Principle* offers an interpretation of the Bible that, it is claimed, can unite all religions. God is portrayed as a personal being who created the world according to a few universal principles. All creation consists of positive and negative (male and female) elements; these unite into larger units, which in turn unite to form still larger wholes. Adam and Eve were created so God could have a loving “give-and-take” relationship with them. The original plan was that they should mature to a stage of perfection when they would be blessed in marriage; their children and their children’s children would populate a sinless world in complete harmony with God. This, however, was not to be. The fall is interpreted not as the result of eating an apple, but as the consequence of a disobedience that involved the misuse of the most powerful of all forces: love. The archangel Lucifer, whom God had entrusted to look after Adam and Eve, became jealous of God’s love for Adam and had a (spiritual) sexual relationship with Eve. Eve then persuaded Adam to have a (physical) sexual relationship with her. As a result of this premature union, which was Lucifer-centered rather than God-centered, the fallen nature, or original sin, of Adam and Eve has been transmitted to subsequent generations, and the whole of history can be seen as an attempt by God and man, especially key figures in the Bible, to restore the world to the state originally intended by God.

Ultimately, restoration is possible only through the person of a messiah, who with his wife will perform the roles in which Adam and Eve failed—that is, those of True Parents. They (and those whom they bless in marriage) will have children born without original sin. But for this to happen, humankind has to create a foundation ready to receive the messiah. In practical terms this involves the concept of “indemnity,” whereby a good, sacrificial deed can cancel “bad debts” accumulated by a person or his ancestors. The role of the messiah is seen as an office filled by a man born of human parents, but free of original sin. Jesus was such a man, but, largely through the fault of John the Baptist, he was murdered before he had a chance to marry. Thus, he was able to offer the world spiritual but not physical salvation through his death. Numerous parallels between the period before the time of Jesus and the past two millennia are believed to indicate that the present is the time of the second coming. In 1992 Moon publicly declared what his followers had long

believed—that he was that messiah, he and his wife being the True Parents of all humanity.

Unification teachings now extend well beyond the *Divine Principle*. In particular, there has been the development of what might be termed *Moonology*, which elaborates on the achievements of Moon and his immediate family, both on earth and in the spirit world. In 1993 Moon announced that the first True Family had been established (by him and his wife, children, and grandchildren) and that the world had entered the Completed Testament Age (CTA). In 1997 Moon instituted a new tradition, *Hoon Dok Hae*, meaning to meet for reading and discussion, enjoining members to read, from 6:00 to 7:00 every morning, passages from his speeches, which now constituted the basic scriptures for the CTA. On the first day of each week, month, and year, and on the movement’s holy days, members take the Pledge, a short statement in which they vow allegiance to God and “True Parents” (Moon and his wife), but on May 5, 2004, Moon announced the change from the “era before heaven” to the “era after the coming of heaven,” and, henceforth, the pledge services would be observed every eighth day. The most important Unification rites are the mass weddings, known as Blessings. In the movement’s early days, members were “matched” with a partner suggested by Moon, and were expected to practice celibacy before and for some time after the Blessing. By the mid-1990s, however, Blessings were extended to include millions of couples, many of whom did not attend the ceremony and had little awareness of their being associated with a Unification practice, let alone the practice’s spiritual significance.

Moon has always spoken of a close relationship between activities in this world and the spirit world, but the connection became increasingly pronounced with two revivalist movements. First, several members claimed to have received messages from Moon’s son, Heung Jin Nim, following his death in 1984; then, in the late 1980s, Moon’s family recognized his embodiment in a young Zimbabwean member. For several months “Black Heung Jin Nim” enjoyed a privileged position, traveling the world and meting out punishments to members who confessed to having strayed. Eventually, however, he was denounced and returned to Africa, where he started his own movement. Another Unificationist revival, associated with Chung Pyung Lake in Korea, dates from the mid-1990s and involves the channeling of messages from Mrs. Moon’s mother (and others in the spirit world). Members are expected to attend forty-day workshops for healing, contact with the spirit world, and participation in ceremonies to liberate their ancestors. According to the Unification Church, billions of couples have been Blessed in the spirit world, and in 2003 advertisements appeared in major newspapers containing testimonies from religious and political leaders (including Moses, Jesus, Muhammad, Karl Marx, Pol Pot, and John F. Kennedy) declaring Moon to be the True Parent of humanity.

CONTROVERSIES. Throughout the world, the Unification Church has attracted considerable hostility from the media,

cult-awareness movements, several government bodies, and, indeed, the general public. Among the many accusations are that it uses brainwashing or mind-control techniques to recruit and keep its members; that it breaks up families; that its leaders live in luxury while the rank and file are exploited and oppressed; that it manufactures armaments; that it is politically right-wing and has had connections with the South Korean intelligence agency (KCIA); that it is merely a front for a seditious organization that is attempting to take over the world and establish a theocracy with Moon at its head; and that it violates tax and immigration laws. (In 1982 a federal-court jury convicted Moon of conspiracy to evade taxes and sentenced him to eighteen months' imprisonment.) Other controversies have surrounded the financial situation of Unification-related businesses and the church's attempt to establish a large community, New Hope East Garden, in South America.

Attacks on Moon's personal behavior have come from a variety of sources. In 1993 an early member, Chung Hwa Pak, published *The Tragedy of the Six Marys*, claiming that Moon had frequently indulged in the sexual "restoration" of the world by having sex with women who would then be expected to have "restoring" sex with six men. In 1995, however, Pak publicly retracted his account. Another book, published in 1998 by Nansook Hong, the estranged wife of Moon's eldest son, described how her husband was addicted to hard drugs, committed adultery, and beat her while she was pregnant. The book also mentioned Moon's illegitimate son and suggested that, far from presenting the ideal example of a God-centered family, the Moons seem to constitute an uncommonly dysfunctional unit, with several of their children deserting the movement. The movement has vehemently denied the criticisms leveled against it, expressing particular concern where such accusations have been used to justify kidnapping members to make them renounce their faith (although, apart from Japan, few countries continue this practice of "forcible deprogramming"). Except for the occasional, short-lived exposé, the media and cult-watching organizations for the most part have lost interest in the movement as it has matured and become less high profile than it was in the 1970s and 1980s.

BIBLIOGRAPHY

Unification theology exists in various versions. *Exposition of the Divine Principle* (New York, 1996). There have been many versions of this text, and this is the most recent version. Basically the theology is the same, though stresses and presentation vary. The first full translation into English from the Korean is *Divine Principle*, New York: Holy Spirit Association for the Unification of World Christianity, 1973. Moon has not actually penned any of the versions; they were taken down by his disciples from his talks/sermons and later plished/translated/interpreted by other Unificationists. English version is accessible at <http://www.unification.net/dp96>. Numerous books, mostly partisan, have been written by members and close associates of the movement, ex-Unifications, and conservative Christians; Nansook Hong's

In the Shadow of the Moons: My Life in the Reverend Sun Myung Moon's Family (Boston, 1998) is one of the most critical exposés, and the 600-page volume *40 Years in America: An Intimate History of the Unification Movement 1959–1999* (New York, 2000), by Michael Inglis and Michael L. Mickler, provides an extremely useful overview of public and internal developments from the church's own perspective. Sebastian Matczak's *Unificationism: A New Philosophy and World View* (New York, 1982) provides a theological critique and comparison with other thought systems. For sociological approaches, see John Lofland's *Doomsday Cult: A Study of Conversion, Proselytization, and Maintenance of Faith*, ed. (New York, 1977); David G. Bromley and Anson D. Shupe Jr.'s *"Moonies" in America: Cult, Church and Crusade* (Beverly Hills, Calif., 1979); and Eileen Barker's *The Making of a Moonie: Choice or Brainwashing?* (Oxford, 1984). Massimo Introvigne's slim volume *The Unification Church* (Turin, Italy and Salt Lake City, Utah, 2000) follows events up to the end of the twentieth century.

EILEEN BARKER (1987 AND 2005)

UNION, MYSTICAL SEE MYSTICAL UNION IN JUDAISM, CHRISTIANITY, AND ISLAM

UNITARIAN UNIVERSALIST ASSOCIATION. The Unitarian Universalist Association is a religious denomination that is the result of the 1961 merger of the American Unitarian Association and the Universalist Church of America. Those two denominations derived from different backgrounds.

UNITARIANISM. Unitarianism is a religious view that was organized in institutional form in Poland, Transylvania, England, and the United States. Its emergence is primarily the result of indigenous factors in each country. The separate movements had common characteristics: affirmations of the unity of God, the humanity of Jesus, and human religious responsibility, and rejections of the doctrines of the Trinity, the divinity of Jesus, and human corruption or total depravity. Formulations of these views differed in each country.

In Poland, disputes in the Polish Reformed Church in 1555 led to a schism and the formation of the Minor Reformed Church of Poland in 1565. The physician and theologian Giorgio Biandrata (1515–1588) encouraged Gregory Paul, Martin Czechowic, Georg Schomann, and other leaders of the new movement in their views. A central community was founded at Racow in 1579. Fausto Sozzini (1539–1604), who came to Poland in that year, became the recognized leader of the Polish Brethren, who adopted his name by calling themselves Socinians. Sozzini's theology emphasized prayer to Christ, as the man whom God resurrected and to whom God gave all power in heaven and earth over the church. The Lithuanian Brethren, a sister group led by Simon Budny, were nonadorantist in theology, which meant they rejected prayer to Christ. The Polish and Lithuanian

movements flourished primarily from 1580 to 1620. Roman Catholic opposition resulted in the destruction of the Socinians' famed school and printing press in Racow in 1632 and finally in a legislative decree in 1658 that required the Socinians to become Roman Catholics or go into exile or be executed. A few Socinian exiles found refuge with the Transylvanian Unitarians in Kolozsvár (present-day Cluj-Napoca).

Ferenc Dávid (1510–1579) was the outstanding leader of Transylvanian Unitarianism. Dávid converted from Roman Catholicism to Lutheranism after studying in Wittenberg and then became a leader, with Biandrata's encouragement, of the Reformed Church in Transylvania after debates with Peter Mélius. Together, Dávid and Biandrata published *Two Books on the False and True Knowledge of the One God the Father, of the Son, and of the Holy Spirit* in 1568, an antitrinitarian book that contained Lelio Sozzini's interpretation of the prologue to John's gospel. Sozzini, an uncle of Fausto Sozzini, denied that Christ's person was that of the cosmological Logos.

In 1568 John Sigismund, the Unitarian king of Transylvania, granted religious freedom to Catholics, Lutherans, members of the Reformed church, and Unitarians. (The name Unitarian gradually came into use after debates at Gyulaférvár in 1568 and at Nagyvárad in 1569.) The Transylvanian diet (legislature) gave these four Received Religions constitutional recognition in 1571, shortly before Sigismund's death. The next king, Stephen Báthory, forbade innovations, that is, religious beliefs that were different from those that had prevailed under Sigismund. Dávid became increasingly insistent about his nonadorantist Christology, but his view was an innovation, which could endanger legal protection of the Unitarian church. Therefore Biandrata cooperated in the arrest, trial, and imprisonment of Dávid in 1579, and Dávid died that year in prison. His nonadorantist theology eventually prevailed. The Transylvanian Unitarians still survive in Romania and Hungary.

In England, John Biddle (1615–1662) published *Twelve Arguments Drawn Out of the Scripture* (1647) and other works that based Unitarian beliefs on New Testament texts. Thomas Firmin and others spread Biddle's views. Unitarians were excluded from the protection of the Act of Toleration (1689), but their views lived on both in the Church of England and among Dissenting churches in the form of an Arian Christology, which was named after the theologian Arius (c. 256–336), who maintained the Son was inferior to the Father, placing the Son among created things. When Dissenting ministers met at the Salters' Hall in London in 1719, they split into two groups. One group insisted on agreement with confessional statements, the other group required only the use of biblical terms and conformity with biblical views. Members of the latter group and their congregations gradually moved toward Unitarian views.

Theophilus Lindsey (1723–1808) opposed the Anglican church's creedal restrictions, left that church's ministry, and founded Essex Street Chapel in London in 1774, the first

English Unitarian congregation. Joseph Priestley (1733–1804) was an outstanding Unitarian leader whose scriptural rationalism, materialist determinism, and humanitarian Christology influenced many Unitarians. Richard Price (1723–1791) emphasized free will in opposition to Priestley's determinism. Priestley and Thomas Belsham, Lindsey's successor at Essex Street Chapel, made a humanitarian Christology the dominant view, driving out Arian views.

The British and Foreign Unitarian Association, founded in 1825, was aided by the repeal of laws against nonconformity and by parliamentary approval of the Dissenters' Chapels Act (1844), which assured Unitarians of their churches.

James Martineau (1805–1900), who exercised great influence among English Unitarians, challenged Priestley's theology with his emphases on ethics and intuition. Martineau, who desired comprehension in a national liberal church, preferred the name *Free Christian* to *Unitarian*. In 1928, English Unitarian denominationalists and those who were influenced by Martineau's Free Christian views united to form the General Assembly of Unitarian and Free Christian Churches. The Non-Subscribing Presbyterian Church of Ireland, which derives from the influence of Thomas Emlyn (1633–1741), and some Welsh and Scottish churches, are different expressions of English Unitarianism.

American Unitarianism gradually emerged during the eighteenth century within Congregationalism, largely because of the influence of Arminian theology, which stressed the human capacity to respond to grace, and Arminian Christology. This gradual development resulted in conflicts that culminated in the appointment of a liberal, Henry Ware, as Hollis Professor of Divinity at Harvard College in 1805. The liberals were accused of covertly agreeing with Belsham's humanitarian Christology. Boston minister William Ellery Channing (1780–1842) replied that, instead, most of the liberal ministers were Arians, for they believed that Christ's character included ethical, intellectual, and emotional perfection, and that he was subordinate to God.

Channing's famous Baltimore sermon "Unitarian Christianity" (1819) gave the liberals a coherent theological view that embraced assertions of the unity and moral perfection of God; of the unity of Jesus Christ, his inferiority to God, and his mediatorial mission; and of human moral responsibility. The American Unitarian Association (AUA), an association of individuals, not of churches, was organized in 1825. Ralph Waldo Emerson, in his Cambridge Divinity School address (1838), and Theodore Parker in his sermon "The Transient and Permanent in Christianity" (1841), challenged the prevailing Unitarian emphasis on the authority of rationally interpreted scripture. These addresses initiated a controversy over Transcendentalism within Unitarianism. Parker has influenced many Unitarians as an exemplar of public ministry, for he expressed his theology in outspoken sermons on social and economic issues, ceaseless efforts for social reform, and a willingness to disobey the Fugitive

Slave Act of 1850, which he regarded as immoral, in obedience to a higher moral law.

Henry Whitney Bellows led the effort to organize the National Conference of Unitarian Churches (an association of churches) in 1865. The preamble to the constitution was almost a Christian creed, so Francis Ellingwood Abbot and others withdrew in protest and formed the Free Religious Association in 1867. In 1886 in the Western Unitarian Conference, a regional organization founded in 1852, a similar controversy emerged over whether the conference should be limited to those who accepted a Christian, theistic religious belief. William Channing Gannett wrote a nonbinding statement, "Things Commonly Believed among Us," which was adopted in the Western Conference in 1887. In 1894 the National Conference revised its constitution in a manner that enabled many members of the Free Religious Association to rejoin the conference. In 1925 the National Conference, which had been renamed the General Conference, was merged with the AUA.

In the early twentieth century, religious humanism appeared within Unitarianism under the leadership of John Dietrich and Curtis Reese, who were among those who signed the Humanist Manifesto (1933). A serious decline among the Unitarian churches during the depression led to the creation of a denominational Commission on Appraisal (1934–1936), whose chair, Frederick May Eliot, reluctantly agreed to become president of the AUA. Eliot's leadership revived the movement.

UNIVERSALISM. Universalism is a religious view that affirms the ultimate salvation of all humans. In some formulations, that has meant the ultimate reconciliation of all, even Satan, with God. *Acts* 3:21 is one of the scriptural bases for the belief that some Universalists have in a universal restoration (Gr., *apokatastasis*). Modern Universalism derives from radical Pietism and from dissenters from the Baptist and Congregational traditions.

In 1681, Jane Leade (1624–1704) became the recognized leader of a Philadelphian Society of Pietists in London. The group's name came from the sixth church mentioned in *Revelation* 3:7–13. In Germany, Johann Wilhelm Petersen, a follower of the founder of Pietism, Philipp Jakob Spener, became a convinced chiliast, anticipating the reign of Christ after his second coming. Petersen led a group of German Philadelphian pietists. He reinterpreted Leade's views, gave them scriptural foundations, and published his reinterpretation in *The Mystery of the Restoration of All Things* (2 vols., 1700–1710). Volume 1 contains a small treatise by one of Petersen's disciples, Georg Klein-Nicolai, under the pseudonym Paul Siegvolck. This effective treatise was reprinted frequently, for both in the original German, *Das von Jesu Christo . . . Evangelium . . .*, and in English translation, *The Everlasting Gospel . . .*, it converted many people to Universalism. The title was taken from *Revelation* 14:6. Groups of German Philadelphian Pietists and people from other groups took copies of the treatise with them when they

migrated to Pennsylvania in the eighteenth century. George de Benneville (1703–1793), who moved to Pennsylvania in 1741, maintained contacts with different groups in colonial Pennsylvania whose members affirmed Universalism and thus prepared the way for Universalism's later growth in America.

James Relly (1720–1778) left George Whitefield's movement in England in 1750. He wrote *Union, or A Treatise of the Consanguinity and Affinity between Christ and His Church* (1759), in which he argued that a result of the indissoluble union of Christ with his people is that there is no guilt and punishment for sins because Christ bore both the guilt and the punishment. All humans are among the elect, for whom Christ suffered. John Murray (1741–1815) brought Relly's universalized variation of Calvinist theology to New England in 1770. He became minister of the first Universalist congregation in America at Gloucester, Massachusetts, in 1780.

Elhanan Winchester (1751–1797), a Baptist minister, was converted to Universalism by *The Everlasting Gospel* and by his friend de Benneville. Winchester argued in *The Universal Restoration . . .* (1794) that future punishment is both finite and remedial in nature, to be followed by the ultimate reconciliation of all, even of the devil and his angels, with God.

Individuals in several European countries affirmed Universalism, but they founded no effective organizations. In England, however, Universalism survived within Unitarianism after Winchester converted William Vidler (1758–1816), a General Baptist minister, to Universalism. Vidler succeeded Winchester as minister of Parliament Court Chapel, London, and then became, also, a Unitarian, together with some members of his congregation. This congregation and other English Unitarian congregations soon contained as members former General Baptists and other persons who held universalist views.

The institutional growth of Universalism was to be in America, where Hosea Ballou (1771–1852) wrote *A Treatise on Atonement . . .* (1805), which made him the movement's preeminent authority in the nineteenth century. Ballou argued that sin is finite in nature, that its effects are completely experienced in this life, and that therefore all will be saved. He rejected the doctrine of the Trinity and affirmed an Arian view of Christ. These views were soon widely accepted by American Universalists.

In 1803 at Winchester, New Hampshire, the General Convention of Universalists in the New England States adopted a statement of agreement that is referred to as the Winchester Profession. The wording of the document embraced the varied Universalist views of the time. Between 1831 and 1841, a temporary schism occurred when believers in finite, future punishment founded the Massachusetts Association of Universal Restorationists in opposition to Ballou's view. By the end of the nineteenth century, restoration-

ism was the predominant view, at the time characterized by movements attempting to transcend the divisions of denominationalism and to restore Christianity. In 1870 the Universalist General Convention approved a resolution that required the Winchester Profession to be interpreted so as to affirm the authority of scripture and the lordship of Jesus Christ. This creedal period ended in 1899, when the restrictions were rescinded and a noncreedal statement was adopted in Boston. A revised noncreedal Bond of Fellowship, known as the Washington Profession, was adopted in 1935 and revised in 1953.

Clarence Skinner (1881–1949), dean of Crane Theological School, was the leading spokesperson for Universalists in the twentieth century. His influence and that of others led to a reinterpretation of Universalism as focused on the unities and universals of human life rather than on an endless life after death. Thus many Universalists no longer hold a supernatural worldview.

THE UNITARIAN UNIVERSALISTS. Sporadic contacts between the Unitarians and the Universalists in the nineteenth and early twentieth centuries were followed in 1953 by organization of the Council of Liberal Churches (Universalist-Unitarian). Cooperation in this council's departmental programs prepared the way for the churches' merger in 1961 into the Unitarian Universalist Association (UUA), of which Dana McLean Greeley became the first president.

The churches and fellowships of the UUA are primarily located in the United States and Canada. (There are a small number of fellowships in other countries in Central and South America, Europe, Africa, and Asia.) Ministers and ministers of religious education who are granted associate or full professional fellowship are required to have completed training at a theological school or through a supervised program of independent study. The UUA follows the practice of congregational ordination.

Unitarian Universalists hold a wide variety of religious views, including liberal Christianity, naturalistic theism, mysticism, religious humanism, scientific theology, and aspirations toward a universal religion. They emphasize such values as human dignity, freedom of religious belief, the use of reason in formulating religious beliefs, and the expression of such beliefs in movements for social reform.

The theological diversity that characterizes Unitarian Universalists is expressed in worship that varies greatly from congregation to congregation, ranging from structured liturgy to thematic or sermon-centered emphases. Von Ogden Vogt (1879–1964), minister of the First Unitarian Society of Chicago, contributed the view that worship, as the celebration of life, is the central discipline of religion. His books *Art and Religion* (1921), *Modern Worship* (1927), and *The Primacy of Worship* (1958) led many religious liberals to modify thematic or sermon-centered emphases in the direction of patterns of worship that express basic communal religious experiences: attention or vision, humility, exaltation,

illumination, and dedication. The hymns and worship materials contained in *Hymns of the Spirit* (1937), jointly produced by Unitarian and Universalist commissions on hymns and services, were predominantly liberal Christian in character, with some expressions of religious humanism. *Hymns for the Celebration of Life* (1964), which was prepared by a new commission after the merger of the two denominations, contained an increased proportion of materials expressive of religious humanism, particularly through the hymns and readings of Kenneth L. Patton, who portrayed humanist worship in *A Religion for One World: Art and Symbols for a Universal Religion* (1964) and *Services and Songs for the Celebration of Life* (1967). In 1980 the UUA's Commission on Common Worship continued the task of the preceding commissions, that of providing materials that will enable people holding widely differing theological views to worship together.

The UUA is one of forty-nine member groups of the International Association for Religious Freedom. In 2002, adult membership in the UUA, including those in the affiliated Canadian Unitarian Council, totaled about 220,000 in 1,051 churches and fellowships.

BIBLIOGRAPHY

The basic history of Unitarianism can be found in Earl Morse Wilbur's *A History of Unitarianism: Socinianism and Its Antecedents* (Cambridge, Mass., 1945) and *A History of Unitarianism in Transylvania, England, and America* (Boston, 1952). An important companion volume for the seventeenth-century period is *The Polish Brethren: Documentation of the History and Thought of Unitarianism in the Polish-Lithuanian Commonwealth and in the Diaspora, 1601–1685*, 2 vols., translated and edited by George H. Williams (Missoula, Mont., 1980). *The English Presbyterians: From Elizabethan Puritanism to Modern Unitarianism*, by C. Gordan Bolam, Jeremy Goring, H. L. Short, and Roger Thomas (London, 1968), is an illuminating description of English Unitarianism. *The Beginnings of Unitarianism in America* by Conrad Wright (Boston, 1955) gives a precise analysis of theological issues in the eighteenth century. Wilbur's few chapters on American Unitarianism have been supplemented by *A Stream of Light: A Sesquicentennial History of American Unitarianism*, edited by Conrad Wright (Boston, 1975).

Universalism in America, 2 vols. (Boston, 1884–1886), by Richard Eddy, had been the basic history for nearly a century, until publication of the two-volume work by Russell E. Miller, *The Larger Hope*, vol. 1, *The First Century of the Universalist Church in America, 1770–1870* (Boston, 1979) and vol. 2, *The Second Century of the Universalist Church in America, 1870–1970* (Boston, 1986). Ernest Cassara edited a selection of basic source documents, *Universalism in America: A Documentary History* (Boston, 1971). Charlotte Irwin provided a useful description of the European background of American Universalism in "Pietist Origins of American Universalism" (M.A. thesis, Tufts University, 1966). The original theological interpretation by George H. Williams in *American Universalism: A Bicentennial Historical Essay* (Boston, 1971) is an important contribution. Another study of the merged de-

nominations is David Robinson's *The Unitarians and the Universalists* (Westport, Conn., 1985).

Revised Bibliography

UNITY is the largest movement in the New Thought tradition and shares New Thought's formative influences and general worldview. Founded in Kansas City, Missouri, by Myrtle Fillmore (1845–1931) and Charles Fillmore (1854–1948), a married couple, Unity is the second oldest and most distinctly Christian community within New Thought. The impetus to the formation of Unity was Myrtle Fillmore's recovery from tuberculosis through the use of mental healing rituals.

The founding of the movement occurred in 1889, one year after Myrtle Fillmore pronounced herself healed. The first venture for Unity, the periodical *Modern Thought*, began publication in 1889, and in 1890 the movement's original prayer ministry was established—The Society of Silent Help. In 1891 the name Unity was given to the Fillmores' enterprise, and the couple began publishing a new periodical, *Unity*, whose masthead bore what would become the traditional symbol for the movement, a winged globe. Concurrent with the initiation of the movement, the Fillmores studied with New Thought founder, Emma Curtis Hopkins (1849–1925), who had established a Christian Science ministry and seminary in Chicago, which was independent of the Boston-based religion of Mary Baker Eddy (1821–1910). Of the various influences on the Fillmores' religious development (e.g., Spiritualism, Vedānta, New England Transcendentalism), Hopkins's teachings were the most significant.

The movement's first formal institutional expression was the Unity Society of Practical Christianity (1903), and in 1906 Unity ordained its first ministers—including Myrtle and Charles Fillmore. In harmony with the practice initiated by Hopkins and consistent with all other New Thought groups, from this time onward Unity has ordained women along with men and maintained a thoroughgoing egalitarianism with regard to all ecclesiastical roles and functions. It is notable that the majority of Unity ministers are women, making it perhaps the largest Christian community in which this is the case.

When incorporated as the Unity School of Christianity in 1914, Unity was a fully developed religious organization with an international outreach. Unity School's withdrawal in 1922 from the International New Thought Alliance and its initiation of its own annual convention the following year accelerated Unity's growth and development, soon making it the largest and most recognized movement within New Thought. It remains so to the present, with nearly one thousand ministries in more than sixty countries worldwide.

Unity is represented by two major corporate bodies, Unity School of Christianity, located at Unity Village, Missouri (just outside Kansas City), and the Association of Unity Churches in nearby Lee's Summit. The two groups are independent but work in harmony with one another. Unity School, which was originally founded by the Fillmores, publishes religious books and periodicals, serves as a retreat and education center, and operates the movement's prayer and healing ministry (Silent Unity, the successor of the Society for Silent Help). Governance of the school is vested in a board of directors, with a president and chief executive officer holding senior executive authority. From its inception to the early twentieth century, members of the Fillmore family have served as president of Unity School, with Connie Fillmore Bazy, the founders' great-granddaughter, being the last member of the Fillmore family to hold the office.

The Association of Unity Churches, a successor to the earlier Unity Ministers' Association, was established as an independent corporation in 1966. The association is responsible for management and direction of the vast majority of the movement's congregations, supervising ministerial education, granting ordinations, sanctioning churches, and assisting in the placement of ministers. The association is governed by a board of trustees that is elected by representatives from member churches, regional organizations, and the board itself. Senior executive authority is vested in a president and chief executive officer.

In the 1990s, two Unity organizations emerged, independent of and in some tension with Unity School and the association—the Unity-Progressive Council and the Federation of Independent Unity Churches. A related organization, the Universal Foundation for Better Living, bases its teachings on the works of the Fillmores, although it affirms no formal linkage with the Unity movement.

Important to Unity has been its publishing enterprise. Although all of Charles Fillmore's books have remained in print, during the latter part of the twentieth century, Unity School began to reduce its list of titles, eliminating some of the movement's classic texts. Its periodical list has also shrunk, so that Unity now publishes only two magazines, *Unity* and *Daily Word*. By far the more popular is *Daily Word*, a prayer manual for each day of the month, initiated in 1924. Another important periodical, *Wee Wisdom*, Unity's children's magazine, was discontinued in 1991. First published in 1893, it holds the record as the longest continuously published children's periodical in American history.

In addition to the books by Myrtle and Charles Fillmore, Unity School has remained committed to the publication of *Lessons in Truth*, by H. Emilie Cady (1848–1941), a homeopathic physician and student of Hopkins. First appearing in serial form in *Unity* magazine in 1894, *Lessons in Truth* is Unity's all-time best-seller and the most widely circulated book in all of New Thought. Together with the works of Charles Fillmore (most notably *Christian Healing*

[1909] and *Metaphysical Bible Dictionary* [1931]), Cady's book is the primary source of Unity's theological system.

The system itself is largely consistent with the general principles of popular religious idealism found in New Thought as a whole and, like other New Thought groups, Unity allows individuals and affiliated churches significant freedom in matters of belief and practice. Although decidedly Christian in its terminology and self-affirmation, Unity has no formal creed or doctrine. This has led to considerable variation in teachings and practices within the movement, with some congregations de-emphasizing ideals and practices deemed significant to the founders. This phenomena has become especially noticeable since the 1980s, largely due to the appeal of various New Age teachings to Unity teachers and ministers. Despite the evident diversity in the movement and the appearance of nontraditional teachings in individual churches, a number of beliefs can be specified as foundational and generally accepted throughout the movement. Derived from the works of Cady, Charles Fillmore, and other representative thinkers, the more important beliefs are:

1. The ultimate basis of existence is mental (God as Mind), and all material/physical conditions are secondary to and products of mental states and conditions.
2. God (Divine Mind) is understood as supremely good (the Good) and the ground of perfection.
3. God (the Good) is omnipresent and, as a consequence, evil (typically referred to as "error") is unreality.
4. As spiritual beings, humans are innately divine and one with God. This innate divinity is referred to variously as the Christ within, the superconsciousness, and the Christ Mind.
5. Through realization of their innate divinity and appropriation of ideas in Divine Mind, humans are able to transform their lives, replacing negative states and conditions with positive ones.
6. Individuals have full freedom in matters of personal belief.
7. Christian doctrine, idealistically interpreted, is normative.

As with New Thought as a whole and individual movements within the tradition, Unity has received little scholarly attention, although it has received more attention than other New Thought groups, such as Religious Science, Divine Science, and the Universal Foundation for Better Living. In this regard, encyclopedias and general texts on new religious movements and religion in the United States often have brief sections on Unity. There are no critical histories of the movement and no significant scholarly treatments of its theology. Unity has published a biography of Myrtle Fillmore and two nonscholarly histories, all of which are generally reliable in terms of facts and data. In addition, a book by Hugh D'Andrade and two by Neal Vahle, although written for a Unity audience and largely informed by perceptions and un-

derstandings of Unity insiders, supply helpful information not found elsewhere. The chapters on Unity in Charles Braden's *Spirits in Rebellion* (1963) and J. Stillson Judah's *The History and Philosophy of the Metaphysical Movements in America* (1967) remain the best critical sources on the movement.

DELL DECHANT (2005)

UNKULUNKULU is a mythic figure among the Zulu people, a large ethnic group in South Africa. Properly speaking, uNkulunkulu, a name meaning “the old, old one,” is not a deity (the Zulu had a weakly developed pantheon) but is rather the “first man.” One oral tradition identifies uNkulunkulu as a man and a woman (often identified as uThlanga), but the common myth holds that uNkulunkulu is the first man. He appeared, or was created, by the “breaking off” of reeds—it is said of him that he “came out of, or broke off from, a bed of reeds.” Thus, he is also called uMvelinqangi (“the first outcomer,” i. e., “the ancestor of all”). All humans are derived from him and from his design and plan. It is also thought by some that uNkulunkulu was merely an early ancestral figure, understood as the ancestor of the Zulu, who was later believed—perhaps under the influence of Christianity—to have been the creator. There is a possibility, from the early sources, that uNkulunkulu was originally thought of purely as an ancestor and human being.

Because uNkulunkulu has no identifiable children there are no ancestral rites or specific families that can claim to be descended from him. Nonetheless, he created humanity and even gave humans their social institutions, such as marriage and chieftainship. In addition, he gave them spirits (of the dead), diviners to discover the past and the future, and doctors to treat various diseases.

JAMES S. THAYER (1987)
Revised Bibliography

UNTOUCHABLES, RELIGIONS OF. At the beginning of the twenty-first century there are well over 160 million untouchables on the Indian subcontinent. They be-

long to numerous *jātīs* at the bottom of the caste order, their low position deriving from the belief that they embody extreme impurity. Throughout the twentieth century, constitutional categories such as “depressed classes” and “scheduled castes” and the term *harijan* (“people of god”), coined by the nationalist leader Mohandas Gandhi, have all been widely used to refer to untouchable communities in nonprejudicial ways. The practice of untouchability was legally abolished in 1948, but the disabilities suffered and discrimination faced by untouchable individuals and groups have been only partially mitigated and have at the same time acquired new shapes in independent India. Strong links between their religious and social subordination and their widespread poverty and economic exploitation make untouchables some of the most disadvantaged groups in South Asia. Furthermore, the lowly position of the untouchables under Hinduism also extends to those sections of Christian, Muslim, Buddhist, and Sikh populations that belonged to untouchable castes before their conversion. It is thus entirely meaningful to speak of the religions of untouchables, especially if the term untouchable is aligned with the word *dalit* (“broken” or “oppressed”), an untouchable self-description that challenges subordination and reveals the limitations of ready separations between religious-ritual patterns and social-political processes in any discussion of untouchable castes.

DEBATES. Discussions of untouchable religions turn on charged questions. Does the extreme impurity of the untouchables place them outside the caste order? Do they have entirely separate religions? Or, does the very ritual lowness of the untouchables hierarchically yet vitally link them to other castes through an encompassing, consensual caste ideology of purity and pollution? Is their religion, then, primarily a lower form of the one practiced by those higher up in the caste order?

When scholars such as Louis Dumont and Michael Moffatt present the untouchables as primarily reproducing the homogeneous scheme of the ritual hierarchy of purity and pollution, they ignore the other matrices—for example, of ritual kingship, colonial governance, non-Brahmanic religions, and the modern state—that shape caste. By focusing singularly on concepts of purity and pollution as cementing the caste structure, they also externalize the terms of power that inhere in caste, especially as these bear on untouchables. Finally, such emphases underplay the creation within untouchable religions of novel meanings and distinctive practices. Conversely, various scholarly and commonplace positions stressing the radical disjunction between untouchable norms and practices and the caste order tend to overlook the manner in which the ideologies and relationships of caste not only exclude untouchable peoples from several processes but also hierarchically include them in other arrangements. Furthermore, they underplay the structures of hierarchy and authority in the religions of untouchables themselves, reflected in practices of endogamy and commensality, within various occupations, and in interactions between untouchable castes.

Questions of untouchable religions do not admit singular solutions. Shaped as part of wider hierarchies and relationships of caste, which differ from one region to another, these religions show marked regional variations. Even within a particular region, untouchable religions can display distinct expressions in different locales depending on the distribution of land ownership and on arrangements of authority among castes that diverge across villages. Further, far from being static and timeless, untouchable religions have undergone profound changes as a part of historical processes such as state formation, agrarian and urban mutation, and political transformation. The salience of these religions is found precisely within such variety and change.

EXCLUSION AND INCLUSION. The extreme impurity attributed to untouchables has denied them entry into Hindu temples and the services of the Brāhmaṇ *purohit* (priest), has spatially segregated their living quarters at the margins of rural and urban settlements, and has excluded them from the several sets of ranked relationships, ritual exchanges, and social interactions among discrete castes that are at the core of quotidian life. Highly codified prescriptions, such as those requiring deferential bodily movements and speech patterns in the presence of members of the upper castes, have governed the appropriate conduct of untouchables in public spaces, and have frequently forbidden them the use of various markers of honor and status, from modes of transport such as elephants, horses, and palanquins to apparel and accessories such as upper-body garments, turbans, and shoes. On the other hand, the very impurity of the untouchables has included them in the practices and processes of caste. They have exclusively performed the most defiling activities, entailing contact with severely polluting substances, in rural and urban arenas: from the scavenging of waste to work with leather and labor on cremation grounds, and from cleaning toilets and clearing human excrement to rearing unclean animals such as pigs and removing the impure carcasses of sacred cattle. Some of these tasks constitute the primary occupations of discrete untouchable castes; others are undertaken by untouchables who are more generally employed as agricultural or manual laborers. This situation simultaneously defines the subordination of the untouchables and places them at the core of caste, because only they can perform such pollution-ridden yet essential activities. Unsurprisingly, the untouchable presence in the social order has been variously acknowledged: they have received customary dues, especially on ritual occasions, for their caste-sanctioned duties and their agricultural labor; their participation has been critical in ceremonies celebrating the unity of the village; and their deities—like those of “tribal” or indigenous groups that bear an ambiguous relationship with the caste order—have been feared as violent yet venerated as guardians of villages. Thus, untouchable religions have been integrally related both to *dalit* exclusion from and *dalit* inclusion in caste hierarchies and ritual processes.

HIERARCHY, POWER, AND DISTINCTION. Untouchables have not accepted and experienced such processes passively.

Rather, precisely while participating in hierarchical relationships, untouchable actions and understandings have imbued their religions and caste formations with specific distinctions. The untouchable religions in all their staggering heterogeneity have emerged bound to the historical constitution of Hinduism itself. They have been shaped through the wider interplay between Brahmanic hierarchical conventions that emphasize purity and pollution within a schema positing partial continuity between the human and the divine, and non-Brahmanic Hindu traditions that manifest rather different, even contending, orientations toward hierarchy, impurity, divinity, and worship.

Specific untouchable castes have been intimately associated with particular divine beings—such as the village goddess of smallpox (called Maṛiammaṇ in South India) and Mātā Māī—who are figures that are also feared and venerated by other castes as part of non-Brahmanic Hindu traditions. The worship and festivals of the lower castes, including untouchables, emphasize the use of blood sacrifice, liquor, possession, and different degrees and various forms of bodily chastisements and self-inflicted tortures. All over India the untouchables have also venerated major Hindu gods such as Viṣṇu and Śiva as well as the formless divine, through diverse means—including mystic-ecstatic cults, esoteric adoration, and ascetic piety—that engage and extend various modes of *bhakti* (devotional) practice, often preestablished by non-Brahmanic traditions. In each of these cases, untouchable religions have displaced and interrogated—as well as negotiated and negated—concepts of purity and impurity and established Hindu hierarchies, through ecstatic worship and possession, sensuous devotion, and pilgrimage. Sometimes this even entails religious, social, and gender inversions in which men acquire female attributes and Brāhmaṇs become impure.

Conversely, the origin myths of untouchables all over India have subverted and rejected upper-caste representations of their ritual lowness, yet they have done so by retaining notions of their own collective impurity. Throughout the nineteenth and twentieth centuries, untouchable communities such as the Satnāmīs of central India have elaborated new mythic traditions and distinctive caste/sect practices centered on their *gurūs* and on a formless God, and have also constructed novel depictions of deities such as Śiva and Draupadī. These innovative religious formations have questioned and contested but also reworked and reiterated the forms of power encoded in caste schemes of purity and pollution and kingly authority. Still other untouchable groups have participated in spirit cults, and while propitiating ancestors and ghosts have both articulated and reproduced labor bondage and caste hierarchy. The worship among untouchable castes of demonic figures and personal deities has negotiated yet accepted caste and ritual inequalities. This tension can also be seen in the way untouchable religions have distinctively absorbed the attributes of Hindu worship (*pūjā*) and sacrifice (*bali*) as well as the patterns of village festivals.

Furthermore, untouchable membership of sects such as the Kabīrpanthī, Dādūpanthī, Ravidāsī, and Rāmnamī has led to an elaboration of relatively egalitarian devotional practices developed precisely through a broader acceptance of caste divisions. While the untouchable religions have widely expressed the distinctions of their own actions and understandings, these have generally been articulated in relation to the ritual authority encoded within Hindu hierarchies.

Taken together, distinct yet overlapping tendencies have characterized the untouchable religions. In each case, these religions have created their own forms of faith and practice, which have variously negotiated and subverted caste hierarchies. On the one hand, discrete dispositions of the untouchable religions have far exceeded an exclusive preoccupation with Brahmanic conventions of ritual hierarchy. On the other hand, within the untouchable religions the unequal relationships and ritual power at the core of caste have also been differently reproduced, reworked, and reconfigured. These contradictory tendencies have defined the identities, resistance, and solidarities of untouchables, as well as their submission, vulnerability, and subordination. The distinct dispositions of untouchable religions have, however, far exceeded an exclusive preoccupation with ritual hierarchy. These faiths have been more concerned with the *dalit* struggle to achieve political and social power than with efforts to improve the untouchable's position within the ritual caste system. At the same time, within the untouchable religions the unequal relationships and ritual power at the core of caste have been reproduced and reconfigured. Taken together, these contradictory tendencies have defined the identities, resistance, and solidarities of untouchables, as well as their submission, vulnerability, and subordination.

rites and gender. Among untouchable castes, rites of passage associated with every life stage from birth to death suggest varying degrees of concern with ritual purity. Karin Kapadia argues in *Śiva and Her Sisters* that among the untouchable Paraiyar caste in southern India the puberty rituals occasioned by a girl's first menstruation show marked differences from the Brahmanic concern with the pollution and purification of the menstruating woman: instead such rites involve quintessentially non-Brahmanic attempts to safeguard "the precious, distinctively female ability to create children" (1998, p. 93) and to symbolically construct fertility as sacred female power. The implication here is that pollution motifs are less important for the untouchables. In contrast, another account, focused on a specific Paraiyar woman (see Viramma, Racine, and Racine), reveals more ambivalent and earthy orientations to purity and pollution and female sexuality. It is not only that the untouchables' elaborations of purity/impurity and auspiciousness/inauspiciousness entail varied negotiations of shifting arrangements of caste and power, but also that even when certain untouchable groups closely follow the rules governing purity and pollution—during rites of birth and death, for example—they do so by conjoining such observances with the distinctive symbols and practices of their own castes and sects.

Marriage and gender among the untouchables have been characterized by practices common to most lower-status and varied middle-ranked castes, such as secondary marriages for men and women, widow remarriage, the payment of a bride price (rather than dowry), and women's freedom from the requirements of physical seclusion. Yet such arrangements have been themselves embedded in wider patterns of patrilineal kinship in their regional manifestations. This has meant that even though untouchable women have often possessed a degree of autonomy to negotiate hierarchical relationships of kin and community and marriage(s) and motherhood, and even though their physical labor has been positively valued, practically and symbolically, they have nonetheless not escaped the asymmetries of gender and caste and the inequalities of ritual and class. This is reflected in a multitude of ways, from widespread depictions of women as inherently engendering yet equally subverting the religious and social order to representations of the deviant sexuality of untouchable women, and from the sexual and economic exploitation of untouchable women by upper-caste and socially superior men to attempts at controlling their bodies and labor within their communities. Within these overlapping and constraining contexts, the actions and desires of untouchable women have left their mark on untouchable religions and life-cycle rituals, as well as on wider gender arrangements and caste hierarchies.

BEYOND HINDUISM. Much of what has been said above concerning untouchable religions within Hinduism also holds for the other untouchables faiths. In principle, Christianity, Islam, and Sikhism should have no place for caste, but in practice caste divisions in South Asia have found particular configurations within these religions. Indian Islam refers not so much to the *varṇa* distinctions of caste Hinduism, with their constitutive concerns with purity and pollution, as to the social separation between *ashraf* (well-born) and *ajlaf* (low-born) Muslims. High and low Muslims might worship together in the mosque, but in relations of marriage, commensality, and occupation they remain separate. Further, low-born Muslims who were converts from untouchable and other lower castes have distinctively understood and practiced Islam, especially by vigorously participating in popular religious traditions such as the cults of various saints whose veneration cuts across religions. The untouchables who became Sikh have created specific faiths that combine their understandings of the official doctrines and purity norms of Sikhism with popular practices of Hinduism and Islam.

In the case of Indian Christianity, the Roman Catholic Church, with an extensive membership in southern India, has historically accepted caste divisions, including their expressions in endogamy and commensality, on the grounds that these are "social" rather than "religious" mores and institutions, and has traditionally provided entirely separate or spatially segregated services for their higher and lower caste constituents. Even though Protestant churches all over South Asia have opposed caste, the taint of impurity and its attendant discrimination have clung to their untouchable mem-

bers. Untouchable Christians have retained yet reworked prior practices and wider principles of caste and worship and ritual and kinship, creating distinct forms of untouchable identity and indigenous Christianity—including novel representations of Hindu and Christian divinities in which the former can complement but also oppose the latter.

HISTORY AND POLITICS. Historical transformations during the colonial and postcolonial periods have profoundly shaped untouchable religions. The coalescing of forms of British administration and indigenous authority from the late eighteenth century and the emergence by the mid-nineteenth century of an agrarian order clearly characterized by discrete agricultural castes together served to distinctly delineate untouchable groupings, and also led to their creation of and conversion to new faiths. Such processes among the untouchables were further heightened from the 1860s through the 1940s by the colonial state's emphasis on caste categories and religious communities in census enumeration and representative politics, by diverse non-Brahmanic movements in western and southern India, and by an increase in Christian missionary activity that challenged upper-caste authority. In this wider context, the untouchables formed caste associations and joined movements that undertook internal social reform. As they did so, they claimed a higher ritual status or contested their low position and pressed the state for concessions in high school education, government jobs, and political office. Untouchables also converted to Christianity, created distinctive forms of devotional worship, participated in the nationalist struggle, and initiated and endorsed movements to allow them entry into Hindu temples. Here the untouchables' questioning of upper-caste domination and the powerful affirmation of their identities were expressed as part of changing yet still relevant hierarchies of caste, religion, and politics.

Since the 1920s, political processes in which untouchables have participated have crucially influenced their religious and caste practices. The politics and legacy of B. R. Ambedkar have played a key role here. Belonging to the large untouchable Mahar caste of western and central India, Ambedkar received a Ph.D. from Columbia University and entrance to the bar from Grey's Inn, London, and served as chairman of the drafting committee of the Indian constitution in the 1940s. Drawing on earlier devotional and non-Brahmanic traditions of religious dissent as well as on constitutional law and rationalist individualism, Ambedkar's formulations on caste, Hinduism, and untouchable action were directly opposed to the Gandhian perspective within Indian nationalism, which condemned untouchability without renouncing the *varṇa* concept of caste. The political parties founded by Ambedkar were only partially successful and his demand that untouchables be recognized as a separate electorate drew wide criticism as a proposal that would divide both Hindus and the nation, but he nonetheless exerted significant political influence through arguing the position that discrimination against untouchables constituted the very core of caste—a position leading to his rejection of Hindu-

ism in 1935. When Ambedkar converted to Buddhism in 1956, he was followed by a significant section of his own Mahar caste as well as by members of the Jātav caste of northern India, resulting in a *dalit* Buddhism that has combined distinctive caste practices with the egalitarian emphases of the new faith. Increased *dalit* resistance to upper-caste authority has also been seen in southern India, where it has been strengthened by regional, non-Brahmanic political initiatives present since the early twentieth century. Political developments emphasizing the role of the lower-castes after the late 1970s have further extended such processes to North India. *Dalits* in rural and urban areas have seized upon these advances not only to participate in electoral politics but also to express their identities and articulate power relationships in local and national arenas, and in so doing have defined the changing contours of untouchable religions and caste practices in contemporary India. At the same time, precisely such *dalit* expressions have repeatedly led to violent higher-caste reprisals and have engendered a political reaction centered on ideologies of a homogeneous Hindu nation. The gradual emergence in late colonial and independent India of a *dalit* middle-class through policies of affirmative action in public education, government employment, and political office has been accompanied, especially since the 1970s, by the growth of a vigorous *dalit* consciousness and by creativity in literature and art drawing on experiences of widespread discrimination and religious exclusion. This assertiveness continues to be reflected in, for example, the claims of *dalit* women, the terms of *dalit* Christian theology, and campaigns for *dalit* human rights that draw parallels between the injustices of caste and the wounds of race, not only in South Asia but also in the *dalit* diaspora. Today, as in the past, the religions of untouchables play a central part in these varied negotiations of, interactions with, and challenges to ritual authority, caste hierarchy, and political power.

SAURABH DUBE (2005)

U NU. U Nu's life (1905–1995) extends over decades of profound political and social change in Burma (Myanmar). He was a prominent member of the Thirty Comrades during the struggle for independence and played a historic role in the country's transformation from a British colony to an independent nation-state. He served as Prime Minister of democratic Burma between 1948–1956, 1957–1958, and 1960–1962. U Nu was a gifted politician, a deeply religious man, and a remarkable writer.

LIFE. U Nu's politics and worldview reflected the values of the early nationalist era in which he grew up. His father was a merchant in Wakema, a town in the delta region of Lower Burma where he was active in the local chapters of the Young Men's Buddhist Association (YMBA) and later in the General Council of Buddhist Associations (GCBA). These anti-colonial organizations equated national identity with Burmese language, culture, and Buddhism, and Nu's father would consent only to enrolling his son at a local Anglo-vernacular government school. Unlike many of his political contemporaries, U Nu never studied abroad. He finished high school in Rangoon and graduated from Rangoon University in 1929. For a number of years he taught English, English history, and Burmese in the national school system.

By 1934, U Nu, now married to Daw Mya Yee, returned to the capital to join the civil service, but soon decid-

ed to seek a law degree at Rangoon University. U Nu emerged as a leader in the student strike of 1936, together with Aung San and others in the anti-colonial elite who later also gained prominent positions in the post-independence era. Like many of his peers, Nu adopted the anti-colonial title *Thakin* (Master). He rose to leadership positions in the pre-war nationalist Dobama Asiayone and the post-war Anti-Fascist People's Freedom League (AFPFL). In the aftermath of Aung San's murder, U Nu became the first Prime Minister of independent Burma in 1948. On several occasions, he withdrew from public life strategically to meditate and thus force a favorable resolution of political struggles.

Ethnic insurgencies, factionalism over the state's role in religious education, and the constitutional amendment to establish Buddhism as Burma's state religion led to Ne Win's final military takeover in 1962. Like the British in 1942, Ne Win imprisoned Nu from 1962–1966. In 1973 U Nu traveled to Thailand and then to exile in India. He was pardoned and returned to Burma in 1980 to oversee the new Pali text editions commissioned by the Mahasangha Nayaka Council. Following the popular uprising and the collapse of Ne Win's regime in 1988, U Nu established an interim government in a futile effort to regain political office. Ne Win's successor regime, the State Law and Order Restoration Council (SLORC) placed U Nu under house arrest from 1989 until 1992. He passed away on February 14, 1995.

POLITICAL VIEWS. A pragmatist about political ideologies and a skilled negotiator, U Nu advocated democracy or the Burmese Way to Socialism as exigencies dictated. His politics indicated a greater nexus to his Buddhist beliefs as he became increasingly religious in his adult life. As early as his twenties, he took vows to affirm his disciplined actions: to abstain from liquor; to be faithful to his wife; to observe temporary celibacy to effect political outcomes; and in 1948, to remain sexually abstinent. He meditated daily for hours, observed a vegetarian diet, and removed himself from his family's affairs. U Nu's ascetic practices and charisma were significant facets of his public persona.

The inception of parliamentary governance in post-independent Burma coincided with millennial expectations of an imminent, powerful Buddhist ruler (*cakkavatti*) in the Theravāda world where many believed that the second half of the Buddha's dispensation had begun. In popular Burmese culture, U Nu was often seen as that future king or future Buddha. On the advice of Nehru, he promoted a programmatic Buddhist revival (1947–1958) to further nationalism. The revival was intended to secure world peace and progress, ensure the expansion of the state into tribal areas, bring stability, and institute Buddhism as Burma's state religion. It culminated in the construction of a religious complex, Kaba Aye Pagoda, to house the Buddhist canon (*tipitaka*) and the convocation of the Sixth Theravāda Buddhist Synod, *Buddha Sasana Sanghayana* (1954–1956) that was modeled after earlier Buddhist councils, especially King Mindon's Fifth Buddhist Council (1871). Kaba Aye was the

site of important state rituals, including the veneration of the Buddha's Tooth relic that had been temporarily conveyed from Sri Lanka to Burma. Such diplomatic exchanges celebrated Buddhist identity among some new Asian nations.

U Nu's political career eclipsed when his policies failed to integrate ethnic minorities into the national community. His government further deteriorated under economic pressures despite, or as his critics assert, because of, U Nu's practice of and the state's support for Buddhism. The political crisis escalated when he could not restrain demands by monks to require Buddhist instruction in public schools and to prohibit ethnic minorities from offering equivalent religious instruction. Ne Win's coup d'état in 1962 ended parliamentary democracy and limited the role of Buddhism in the modern state until the 1980s.

LITERATURE. Writing and translating literature into Burmese (e.g. Dale Carnegie's *How to Win Friends and Influence People*) was U Nu's first passion in college. He soon gained a reputation as a gifted speech writer and orator, both talents that fostered his rise in politics. He authored plays, novels, translations, political speeches, and essays on Buddhism. Although his written work is extensive, some of it has been termed polemic, underscoring an intended message rather than an art form. His novel, *Man, the Wolf of Man*, emphasized personal themes, while his best known play, *The People Win Through*, focused on a communist insurrection and political rule by force as immoral. He authored other plays like *Converting the Elder Brother*, a drama about political and personal betrayal, and *Thurya*, an allegorical fable about political corruption under colonialism. In *Saturday's Son*, an autobiographical novel, he recounted the turbulent events of his life until 1962. His religious writings primarily followed traditionalist forms. In *Buddhism: Theory and Practice* he detailed the moral and mental stages of meditation.

Throughout his life, U Nu's religiosity encompassed both modernist meditation and cosmological beliefs. In his 1987 inaugural speech for the Center for Burma Studies at Northern Illinois University, he affirmed the power local spirit lords (*nat*) exert over worldly matters. U Nu was deeply committed to Buddhist practice as moral legitimation for public office and employed religion to promote national culture and nation building. He achieved a prominent place among charismatic statesmen in twentieth century Asia.

JULIANE SCHOBEL (2005)

UPANIṢADS. The Upaniṣads are codified Sanskrit philosophical speculations of varying lengths in both prose and verse form, composed orally and set to memory mostly by anonymous South Asian sages, primarily in the classical and medieval periods. While the most important and influential Vedic Upaniṣads date from the eighth to the fourth centuries BCE, some lesser-known sectarian Upaniṣads appear as late as the sixteenth century CE. Individually and as a whole, the Upaniṣads present insights and doctrines that serve as the foundation for much of India's philosophical thought.

Traditional South Asian teachings based on the Upaniṣads have been called the Vedānta, the "end of the Veda," for the Upaniṣads chronologically and formally set the closure of the Vedic canon. Perhaps more to the point, Upaniṣadic lessons are said to be the end of the Veda in that they purport to present the "hidden meaning" or the "real message" of religious practice and thought.

The central teaching presented by the Upaniṣads as a whole centers on the notion that behind all of the spatial swirl and temporal flux of the world as it is experienced by the senses is a subtle, pervasive, timeless, and unchanging reality that is identical to the undying essence of the human being as well. The early Vedic Upaniṣads call this unified and imperishable world soul *brahman* or *ātman*, the former applying more typically to the godhead and the latter signifying the correlative divine "self" residing at the deepest level of one's person. The theistic Upaniṣads teach that this *brahman* or *ātman* is a single deity known generically as Īśv Īśa (Lord) living deep within one's being and identified particularly as Śiva, Viṣṇu, or the Goddess by particular sectarian communities.

While they explicitly or implicitly admit the difficulties of comprehending a hidden reality that either transcends or simply cannot be known through the structures of time, space, and causation, the Upaniṣads hold that through disciplined practices of meditation and the cultivation of extraordinary knowledge, it can in fact be discerned. Such discernment releases one from the apparent cycles of life and death caused by one's ignorance of the fact that the essential self does not die. Thus, Upaniṣadic religious anthropologies, theologies, and soteriologies all revolve around a key lesson that

appears ubiquitously but that might well be characterized by the *Adhyātma Upaniṣad's* assertion that "he is a free person who through insight sees no distinction between his own self and *brahman*, and between *brahman* and the universe" and the *Kaṭha Upaniṣad's* proclamation that, having comprehended this identity, "one is released from the jaws of death" (3.5).

The Upaniṣads were first put into written form in 1656 CE, when Sultan Dara Shokoh sponsored the translation of fifty Upaniṣads from Sanskrit into Persian. In 1801–1802, these Persian works were then translated into Latin by Antequil du Perron, becoming the first, although poor, European version. Since that time, all of the Upaniṣads have been rendered into various Indian scripts, and the more important or influential ones have been translated into virtually all of the world's major languages. The Upaniṣads stand as works of monumental significance in the history of India and of the world.

CONNOTATIONS OF THE TERM UPANIṢAD. Built from the Sanskrit verbal root *sad* ("sit") and the prefixes *upa-* and *ni-* ("nearby"), the word *upaniṣad* represents the act of sitting at the feet of someone. The pedagogical tradition in which a student in search of sacred knowledge sat on the ground in front of a *guru* typifies, in part, the practices of the Vedic *vānaprasthas* ("forest dwellers") and *saṃnyāsins* ("renunciants") who had retired to forest retreats to meditate and study. The practice also appears in various Agamic and Tantric traditions, many of whose followers lived beyond the boundaries of settled civilization, where they practiced yogic meditation under the guidance of a *guru*. Through combinations of dialogues, monologues, questions and answers, riddles, and speculative discourses, the student privately heard from the teacher secret lessons that had been passed down through the generations of the sacred lineage. Such a "secret lesson" was an *upaniṣad*. Isolated as a textual genre, the collections of such secret teachings are known as the Upaniṣads.

The term *upaniṣad* thus connotes an element of esotericism. In fact, the Upaniṣads state explicitly that such lessons are not intended for the general population: "Let none who has not maintained the vow think on this," demands *Muṇḍaka Upaniṣad* (3.12.11), and the *Rāmāpūrvatāpanīya Upaniṣad* warns the teacher to "give not [his lessons] to common people" (84). That the teachings were to be heard by only select ears is demonstrated by the texts themselves, for synonyms and appositions of the word *upaniṣad* include not only such terms as *satyasya satyam* ("the truth of truth," *Brhad. Up.* 2.1.20), but also *rahasyam* ("that which is hidden," *Nṛsimhottaratāpanīya Up.* 8) and *paramam guhyam* ("that which is a supreme secret," *Kaṭh. Up.* 3.17).

The esoteric tone of the Upaniṣadic teachings derives in part from the place they hold in the larger Vedic literary corpus. The earliest Vedic literatures are the inspired hymns, chants, and incantations of the *Rgveda*, *Sāmaveda*, *Yajurveda*, and *Atharvaveda*, which were composed by the visionaries and priests of the various Vedic traditions and codified

around 1200 BCE (although some are earlier and some later). To these Samhitās (“collections”) of poems and songs are attached ritual instructions known as the Brāhmaṇas, which date to roughly 1000 to 800 BCE. As early as the ninth century BCE, individuals and small groups of people, most often of the *kṣatriya* (warrior) rather than the *brāhmaṇa* (priestly) class of society (see *Bṛhad. Up.* 1.4.11), began to leave the villages to live and meditate in the forest. There, unable or unwilling to perform the sometimes elaborate and expensive Vedic religious ceremonies, they contemplated the allegorical rather than literal significance of the hymns and rituals. These allegorical interpretations formed the basis of texts known as the Āraṇyakas, or “forest books.” Toward the early part of the eighth century BCE these contemplative sages began to formulate more abstract philosophical interpretations of the metaphors and homologies used in the Brāhmaṇas and Āraṇyakas as they sought to gain knowledge of the deeper ontological status of the world and of the place the human being holds in that world. Out of this context came the Upaniṣads, the non-sacerdotal philosophical musings on the nature of reality itself.

The composers of the Upaniṣads diverged from the religious tradition of their time in that, unlike earlier Vedic poets and visionaries, they found little interest in proclaiming the wonder of the objective world or in praising the gods said to have enlivened that world. The forest sages understood the outer world to be less significant than the inner, and the gods to be nothing more than reflections or expressions of subjective processes within one’s own being. “All of the gods are within me,” asserts an early forest work, the *Jaiminīya Upaniṣad Brāhmaṇa* (1.14.2). The *Kaivalya Upaniṣad*, a later text, teaches that “the highest *brahman*, which is all forms, which is the supreme reality of the universe, which is the most subtle of the subtle and which is eternal, is nothing but yourself.” The Upaniṣadic stress on the inner world rather than on external religious practices similarly distinguished the forest sages from the composers of such ritual texts as the Brāhmaṇas and, later, the Kalpasūtras; for the forest sage had no need for “ritual baths, nor periodic rites, nor deity, nor location, nor sacred space, nor worship” (*Tejobindu Up.* 4).

The lines separating the Brāhmaṇas and the Āraṇyakas, and the Āraṇyakas and Upaniṣads, as textual genres are not distinct; the early Āraṇyakas resemble in form the later Brāhmaṇas, and the later Āraṇyakas are nearly indistinguishable from the early Upaniṣads. Some traditions hold that the first true Upaniṣad is the *Ṛgveda’s Aitareya Āraṇyaka* (ninth century BCE), while most others mark that line with the emergence of the *Śukla* (“White”) *Yajurveda’s Bṛhadāraṇyaka Upaniṣad* and the *Sāmaveda’s Chāndogya Upaniṣad*, both of which date to the eighth century BCE.

UPANIṢADIC TEACHINGS. Symbolic representations in the Upaniṣads of ultimate reality are consistent with the notion that such reality is unmanifest yet vital. *Brahman* (*ātman*, *Īśvara*, etc.) is described as life-giving breath (*prāṇa*), wind

(*vāyu*), or empty space (*ākāśa*); as pure consciousness (*cit*), bliss (*ānanda*), or eternity (*ananta*); and as the infinite subject by whom all objects are known, the “inner guide” (*antaryāmin*) of all that is.

Given its acknowledged immanent yet transcendent nature, ontological discourses in the early Vedic Upaniṣads depict *brahman* both cosmically (*saguṇa*, “with characteristics”) and acosmically (*nirguṇa*, “without characteristics”). *Saguṇa brahman* is understood to be the finest essence (*aṇimā*, *rasa*, etc.) of all things in the world, as honey is the essence of beeswax and oil is the essence of sesame seeds (see *Ch. Up.* 6.9ff.). Understood cosmically, therefore, *brahman* is the substance of the universe. This does not mean that *brahman* is the material stuff of the world that can be perceived sensually. Rather, it is the hidden and subtle reality that allows all things to exist in the first place. Thus, when the sages of the *Muṇḍaka Upaniṣad* note that “this whole world is *brahman*” and that *brahman* is the “hidden mover . . . within all that moves, breathes, and winks” (2.2.1–2), they imply the cosmic ontological notion that *brahman* is the very “beingness” of all beings, including the human being. Transformative insight allows one to understand that this cosmic substratum is unified and indivisible, or—as the *Chāndogya Upaniṣad’s* Uddālaka Āruṇi teaches his son, Śvetaketu—“Thou art That!” (6.9.1–6.16.3).

Understood acosmically, *brahman* cannot be described through definitive or positive statements, because *brahman* transcends the limitations of language. Thus, *nirguṇa brahman* is not subject to categorization, and therefore, can neither be perceived nor conceived. *Brahman* “cannot be heard, nor touched. It has no form [and] is imperishable. Similarly, it has no flavor, nor odor. It is eternal, without beginning [and] without end” (*Kaṭh. Up.* 3.5), and it “cannot be known through language, nor by the mind, nor by sight” (6.12). That the content of ultimate reality cannot be depicted is summarized most succinctly in the *Bṛhadāraṇyaka Upaniṣad’s* recurring assertion that “the self [*ātman*] is not this, not that” (4.4.22ff.).

Thus, while the Upaniṣadic student seeking knowledge of *saguṇa brahman* was to comprehend the unity of all things in a world constructed on the essence of *brahman*, the student who looked for an understanding of *nirguṇa brahman* was to “deconstruct” the phenomenal world, as it were, in order to comprehend the imperishable self that lies behind the world of life and death.

Whether they considered *brahman* to be cosmic or acosmic, Upaniṣadic teachers generally distrusted empirical knowledge gained through sensual experiences. According to these thinkers, the physical world is a “measured” or “constructed” world, the world of *māyā*, a term that in the Upaniṣads denotes those aspects of the world that are empirically perceived but not ultimately real. *Māyā*, in other words, characterizes the world of time, space, and causation. According to Upaniṣadic teachings, then, that world which the ignorant call the “real world” is not, in truth, real.

Upaniṣadic ontologies are thus closely linked with epistemology. They are similarly related to physiology and psychology. Drawing on Sāṃkhya metaphysics, the Upaniṣads generally recognize a dualism of matter (*prakṛti*) and spirit (*puruṣa*). The former constitutes the objective and phenomenal world. The latter comprises the knowing subject that has no temporal or spatial limitations, and at times is used as a synonym for *ātman*. Within the world of *prakṛti*, the human body and mind may be divided into the gross body (*sthūla-śarīra*) and the subtle body (*sukṣma-* or *līṅga-śarīra*). Everyday consciousness revolves around the gross body made up of the senses and the objects of those senses (known collectively as the *indriyas*). Sensations gained from the gross body are then categorized by the subtle body, which consists of the mind (*manas*), the mechanism of personal identity or “ego” (*ahaṃkāra*), and the “awareness” (*buddhi* or *antahkāraṇa*), the basis of one’s ability to live and act in the world.

Upaniṣadic physiology declares that both the gross and subtle bodies, however, are phenomenal (and therefore unreal) constructions relative to the spirit, the true self (see *Kaṭh. Up.* 3.10–11). Thus, the farther one’s awareness is removed from its attachment to the external world experienced by the gross and subtle bodies, the closer one comes to a full yet nonempirical experience of the true self. Accordingly, the Upaniṣads emphasize the importance of dream states in the comprehension of deeper realities (see, e.g., *Bṛhad. Up.* 4.3.9). In sleep one loses awareness of the outside world, a world that is in effect a bad dream to begin with. The deeper one sleeps, the closer to eternal reality one gets.

The Upaniṣads recognize four states of waking and dreaming awareness, each successively purer and closer to the direct comprehension of *ātman*. The grossest psychological level is that of waking consciousness, a level in which apparent objects are mistakenly understood to be distinct entities and in which the subject does not recognize itself. The second, more refined, level of awareness is that of active dreaming, a state in which objects lose their solidity and appear more as they really are—as changing and unreal events. The dreaming subject is a “creator” (*kartṛ*) of the world, which exists only because he “projects” (*srjate*) it (see *Bṛhad. Up.* 4.3.10). The third level is that of dreamless sleep (*samprasāda, suṣupti*), in which one loses all awareness of oneself as an object in relation to other objects and no longer experiences the constrictions of time and space. In dreamless sleep one is said to have gained complete tranquillity. Here, one momentarily enjoys complete reunion with *brahman* and experiences, albeit nonempirically, the highest bliss (*paramānanda*; see *Bṛhad. Up.* 4.3.32).

Later Upaniṣads, especially those influenced by the practices and ideologies of Yoga, add to these states another level to one’s psychological being, known simply as *turiya* or *turya*, “the fourth.” *Maṇḍūkya Upaniṣad* 7 describes this state: “It is not cognitive, nor is it noncognitive. It is unseen, unable to be spoken of, ungraspable, without any distin-

guishing characteristics, unthinkable, unnameable. It is the essence of the knowledge of the One Self [*ekātma-pratyaya-sāram*], that into which the world resolves. It is peaceful and benign. It is indivisible.” Such a state sounds like the Upaniṣadic notion of ultimate reality. Indeed, the passage continues: “It [*turiya*] is *ātman*. It is to be known.”

The waking somatic body, therefore, is unreal relative to ultimate reality, a point that carries ethical and eschatological implications. The “self” of one’s being leaves the body at death, as the mango fruit at maturity separates from its stalk (see *Bṛhad. Up.* 4.3.36). If one has not renounced one’s attachment to the world of the senses, then one will be reborn in another physical body, the existential situations of which are determined by the ethical laws of *karman*; and sooner or later one will suffer and die again. This continually turning wheel of death and rebirth (*samsāra*) is understood to be a painful trap from which one is released only when one understands that the physical body is not the real self, and that the world which the senses perceive is an insubstantial and effervescent illusion.

Most of the Upaniṣads agree that the best way one would cultivate such a freeing insight would be through the rigors of yogic meditation. While the Vedic Upaniṣads as a whole reflect the influence of yogic practice and ideology (see, for example, *Maitri Up.* 6.19–30 or *Śvet. Up.* 2.8–10), it is in the Yoga Upaniṣads that such teachings are most fully presented. For example, the *Amṛtabindhu*, *Śāṇḍilya*, and *Yogātattva* Upaniṣads, among others, contain long passages on the eight “branches” (*aṣṭāṅga*) of yogic practice (discipline, self-restraint, correct body posture, breath control, suppression of sensory awareness, mental concentration, intuitive meditation, and final union with the Absolute), the proper means to master each, and the characteristics of the successive levels of yogic “powers” (*siddhis*) one gains as one becomes more adept at the particular practices.

While continuing to uphold the efficacy of yogic practice, some of the Upaniṣads also present the more theistic teaching that one cannot truly know one’s soul without what might be termed the “grace” of the soul. Such appears to be the position of *Kaṭha Upaniṣad* 2.23, which maintains that “this soul [*ātman*] cannot be attained through instruction, nor through rational thinking, nor by great learning. He is to be attained only by the one whom [the supreme self] chooses. The soul [*ātman*] reveals his own nature to such a one.” The soteriological dimensions of this theistic teaching are much more explicit in the *Śvetāśvatara Upaniṣad*’s statement that “more subtle than the subtle, greater than the great, is the soul [*ātman*] that is set within the heart of the creature. One beholds it to be actionless and becomes free of sorrow, when through the grace of the Creator [*dhātuh prasādāḥ*] he sees the Lord [*Īś*] and his greatness” (3.20).

CLASSIFICATION OF THE UPANIṢADS. It is somewhat problematic to arrive at a precise number of Upaniṣads, because if all Sanskrit works claiming to present secret teachings were

to be classified as Upaniṣads the number would be indefinite. Nearly 250 texts call themselves Upaniṣads—including the *Allopaniṣad* (“secret teachings about Allāh,” composed at the time of Akbar) and the *Christopaniṣad*, dated well after the rise of Christian communities on the subcontinent—but it appears that most of these do so merely as a way to align themselves with a respected literary genre or religious tradition.

The *Muktika Upaniṣad* and other medieval South Indian works mention 108 separate Upaniṣads in an enumeration that has become somewhat of a stock list. Using the methods of historical, thematic, and textual criticism, twentieth-century scholars have isolated 123 genuine Upaniṣads. These works may be classified into two general categories, the Vedic Upaniṣads and the later Upaniṣads.

The Vedic Upaniṣads. Virtually all Vedic and most sectarian traditions recognize ten to eighteen Upaniṣads as revealed authoritative scripture (*śrūti*). Furthermore, all of the more important traditional theologians and philosophers throughout classical and medieval India recognized the central importance of these ancient works, and have written extensive commentaries on them. For these reasons, the Vedic Upaniṣads have also been called the Major, or Principal, Upaniṣads. They may be divided into three historical and textual groups.

1. The earliest Upaniṣads (the *Bṛhadāraṇyaka*, *Chāndogya*, *Taittirīya*, *Aitareya*, and *Kauṣītaki* Upaniṣads and the prose parts of the *Kena Upaniṣad*) predate the rise of Buddhism in the sixth century BCE, the *Bṛhadāraṇyaka* and the *Chāndogya* being the earliest and the *Kena* being the latest. All are explicitly aligned with one or another of the various *sakhās*, or “schools” of Vedic interpretation, and are composed in a prose that closely resembles Vedic Sanskrit. These texts make frequent use of allegorical modes of interpretation and are often almost indistinguishable in style from the *Āraṇyakas*. In many ways these six works serve as the philosophical foundation for all of the later Upaniṣads.

2. A second group of Upaniṣads (the *Kaṭha* [or *Kaṭhakā*], *Īśa*, *Śvetāśvatara*, *Muṇḍaka*, and *Mahānārāyaṇa* Upaniṣads and the metrical parts of the *Kena Upaniṣad*) reflects a growing sectarian orientation and dates to the sixth and fifth centuries BCE. These works, which are composed primarily in verse, are only loosely attached to the Vedic *sakhās*, and make less use of metaphorical, allegorical, or other tropic means of expression.

3. The Upaniṣads of a third group (the *Praśna*, *Maitri* [or *Maitrāyaṇīya*], *Jābāla*, *Paiṅgala*, and *Māṇḍūkya* Upaniṣads) return to prose form, but in a language that resembles classical Sanskrit much more than Vedic Sanskrit. They probably emerged in the late fifth and early fourth centuries BCE although the dates for a few of them are uncertain.

All of these works are attached to the textual collections of specific priestly Vedic traditions. The *Aitareya* and *Kauṣītaki* Upaniṣads belong to the *Ṛgveda*. The *Kaṭha*,

Maitri, *Taittirīya*, and *Śvetāśvatara* Upaniṣads are attached to the *Kṛṣṇa* (“Black”) *Yajurveda*, while the *Bṛhadāraṇyaka* *Īśa*, and *Paiṅgala* Upaniṣads are aligned with the *Śukla* (“White”) *Yajurveda*. The *Chāndogya* and *Kena* Upaniṣads belong to the *Sāmaveda*, and, finally, the *Muṇḍaka*, *Māṇḍūkya*, *Praśna*, and *Jābāla* Upaniṣads form a part of the conclusion of the *Atharvaveda*.

The later Upaniṣads. To this list of principal Vedic Upaniṣads most authorities would add a large number of less known and, for the most part, medieval works that may be classified as the later Upaniṣads. These works are not universally accepted as *śrūti*, and they have not received the extensive attention from traditional South Asian philosophical commentators as have the Vedic Upaniṣads. This does not mean that they are less important than others. Indeed, these texts may well be more influential in their respective communities than the principal Vedic Upaniṣads. Such works reflect the increasing influence of Sāṃkhya philosophy, Yoga practice and ideology, and sectarian theistic traditions through the classical and medieval periods. While many align themselves with the *Ṛgveda*, *Yajurveda*, or *Sāmaveda*, most of these Upaniṣads are attached, at least nominally, to the *Atharvaveda*. Most are in prose form and are composed almost entirely in classical Sanskrit.

The number of the later Upaniṣads is too large to list all of them here. Only the most important or representative ones will be mentioned; readers seeking a more complete list are directed to the bibliography.

1. *Vedānta Upaniṣads.* These works, which include the *Muktika*, *Piṅḍa*, *Garba*, *Ātman*, *Prāṇāgnihotra*, *Adhyatman*, and *Brahmā* as well as perhaps two dozen other Upaniṣads, fairly consistently maintain the general doctrines presented by the Vedic Upaniṣads, and show relatively little sectarian influence. They differ from the Vedic Upaniṣads only in that they are not cited in traditional commentaries.

2. *Yoga Upaniṣads.* These texts arose out of a more specifically ascetic context than did many of the Vedic and Vedānta Upaniṣads, and reflect the influence of Yoga ideologies and practices within Upaniṣadic circles. This group includes the *Yogakuṇḍalī*, *Nādabindhu*, *Sāṅḍilya*, *Yogatattva*, *Tejobindhu*, *Haṃsa*, *Amṛtabindhu*, *Dhyānabindhu*, and *Varāha* Upaniṣads. These works center on the direct experience of the eternal self (*ātman*) through specific techniques of Yoga and through the meditation on the sacred syllable *om*.

3. *Samnyāsa Upaniṣads.* These works tend to extol the life of the wandering ascetic’s search for release from the cycle of rebirth (*samsāra*) and teach ways in which such release may be obtained. They include the *Nārada-parivṛājaka*, *Bhikṣuka*, *Paramahaṃsa*, *Āśrama*, and *Samnyāsa* Upaniṣads.

4. *Mantra Upaniṣads.* These teachings center on esoteric interpretations of specific sounds and syllables and place those interpretations into Yogic as well as Śaiva, Vaiṣṇava, and Durgā theistic contexts. Typical of such works would be the *Tārasāra*, *Kalisantāraṇa*, and *Nārāyaṇa* Upaniṣads.

5. *Śaiva Upaniṣads*. The earliest Śaiva Upaniṣad might well be said to be the Vedic *Śvetāśvatara Upaniṣad*, which praised the role of Rudra (a Vedic precursor to the god Śiva) in the religious quest. The more well-known of the medieval Śaiva Upaniṣads would include the *Nīlarudra*, *Kālāgnirudra*, *Kaivalya*, and *Atharvaśiras* Upaniṣads, all of which understand the person of Śiva (also known as Maheśvara, Bhairava, Īšana, and other names) to be an embodiment of the deepest self, *ātman*.

6. *Vaiṣṇava Upaniṣads*. These texts tend to interpret the various incarnations of the god Viṣṇu as representative forms of the *ātman*. Some Vaiṣṇava traditions look to the *Īśa Upaniṣad* as the Vedic antecedent to, or oldest sectarian representative of, this particular genre. Works associated with this group include the *Nṛsimha-pūrvatāpanīya*, *Nṛsimbotarātāpanīya*, *Mahā*, *Rāmapurvatāpanīya*, and *Ramottaratāpanīya* Upaniṣads.

BIBLIOGRAPHY

Readers seeking a stock list of what have been termed Vedic and later Upaniṣads should turn to the opening lines of the *Muktika Upaniṣad*, which lists 108 such works. J. N. Farquhar, a historian of Indian religious literatures, has distinguished 123 distinct Upaniṣads, which he lists in his *An Outline of the Religious Literature of India* (1920; reprint, Delhi, 1967), p. 364.

The last hundred years have seen the publication of a large number of Upaniṣads in modern languages, many of which suffer from a lack of perspicuity due to the somewhat esoteric nature of the original works. The most objective English translation of most of the Vedic Upaniṣads remains Robert Ernest Hume's somewhat stilted *The Thirteen Principal Upanishads*, 2d rev. ed. (Oxford, 1949). A more fluid translation is Sarvepalli Radhakrishnan's *The Principal Upaniṣads* (New York, 1953). Radhakrishnan's work is better than Hume's in that it includes the Sanskrit and it translates sixteen rather than thirteen works. Some students will find Radhakrishnan's commentaries on the works to be of some help, although many of them reflect his neo-Vedantic bias. Another good translation, and one that openly admits an Advaitic point of view, is Swāmī Nikhilānanda's *The Upanishads*, 4 vols. (New York, 1949–1959). Readers interested in the later Upaniṣads would be advised to look to Paul Deussen's *Sechzig Upanishads des Veda* (Leipzig, 1897), to K. Nārāyanasvāmi Aiyar's *Thirty Minor Upanishads* (Madras, 1914), and to Jean Varenne's *Upanishads du yoga* (Paris, 1974). Readers seeking only selections from the Vedic Upaniṣads might turn to Sarvepalli Radhakrishnan and Charles Moore's edited volume, *A Source Book in Indian Philosophy* (Princeton, N.J., 1957), pp. 37–96, or to Juan Mascaró's *The Upanishads* (Baltimore, 1965), although the latter is somewhat colored by a theistic understanding of the texts.

Those readers interested in short introductions to Upaniṣadic thought are advised to consult Paul Deussen's *The Philosophy of the Upanishads* (1906), 2d ed., translated by A. S. Geden (New York, 1966); Arthur Berriedale Keith's *The Religion*

and Philosophy of the Veda and Upanishads, 2 vols. (1925), 2d ed. (Westport, Conn., 1971), pp. 551–570; or to Surendranath Dasgupta's *A History of Indian Philosophy*, vol. 1 (1922; reprint, Cambridge, 1951), pp. 28–61.

WILLIAM K. MAHONY (1987)

UPĀYA is a Sanskrit and Pali term meaning “device, strategem,” or “means.” The term has a technical function in Buddhism, especially in the Mahāyāna, where it is frequently used in the compound *upāyakauśalya* (“skill in means”). In Buddhist usage, it refers to certain manners of teaching or forms of practice that may be employed along the path to final release, and in which a buddha or *bodhisattva* is especially skilled. Often, these involve the skillful evaluation of the spiritual capacities of beings on the part of a buddha or *bodhisattva*, and a concomitant revelation of just that degree of truth that is most beneficial to the specific religious needs of the devotee. The usual Chinese equivalent is *fangbian* (Jpn., *hōben*). Although *fangbian* is an ordinary Chinese word with its own distinct meaning, owing to various terminological confluences its meaning in East Asian Buddhist texts is “(skillfully applied) means.” The usage has given rise to the convenient English expression “skillful means.” The concept of *upāya* also figures prominently in other Mahāyāna Buddhist cultures, notably that of Tibet.

PALI USAGE. The terms *upāya* or *upāyakusala* occur in the Theravāda canon, but only incidentally or in late texts. The *Dīgha Nikāya* and the *Anguttara Nikāya* speak of three kinds of skill: skill in entering (*aya*), skill in leaving (*apāya*), and skill in approach or means (*upāya*). Leaving etymological speculation aside, it is clear that this terminology refers to the spiritual attitude of a monk who is supposed to be expert in the management of his practice on the road to Buddhahood. In the *Suttanipāta*, it is the expert boatman taking others across a swift stream who is described as a “skillful knower of the means.”

In spite of the paucity of references in Pali writings, it is remarkable that *upāya* here assumes a double aspect, referring to the activities both of aspiring monk and good teacher, skilled in the ways of helping others across the spiritual threshold. Various emphasized, this double usage is frequently found in early Mahāyāna, although not direct textual lineage should be assumed. Other Pali usage is either non-technical or late and incidental. This relative inattention to the term in Pali texts does not mean, however, that the way of thinking assumed in this terminology is foreign either to Theravāda Buddhism in its fully developed form or to the earliest Buddhists in general. Admittedly, there is no direct evidence that the Buddha himself made use of this specific term to explain the way his teaching was to be understood. Nevertheless, there are many indications that his message was presented with conscious, pragmatic skill. In support of this, one need only think of such well known scriptural similes as the raft, the poisoned arrow, the pith, and the water snake,

in which the provisional and practical nature of the Buddha's teachings is made clear.

UPĀYA IN THE LOTUS SŪTRA. The opening chapters of the *Lotus Sūtra* (*Saddharmapūṇḍarīka Sūtra*) are an extended reflection on the nature of the Buddha's teaching. This reflection is advanced partly by means of a series of parables and partly by a retelling of the story of the Buddha's decision to teach others the religious path he had perfected (chaps. 2 and 7). The concept of skill in means plays an important role throughout, occurring over eighty times in the first eight chapters.

Traditionally, the story of the Buddha's decision to teach following his enlightenment had portrayed him as hesitant to do so because of the depth and subtlety of the Dharma and the sensuality and ignorance of humankind. In this account, only the urging of the god Brahmā led to the Buddha's decision to teach the four noble truths and the Middle Way. To this hesitancy was linked the Buddha's perception of the diversity of human faculties and dispositions, a diversity that is likened to a pond full of lotuses, only some of which rise undefiled above the water. In the retelling of this story in the *Lotus Sūtra*, the discrepancy between the Buddha's knowledge and the ignorance of living beings provokes an explanation that the teaching of the Buddha is an *upāya*, that is, a provisional expedient able to draw people into the Buddha's Dharma. In other words, although the Buddha realizes that the true, ultimate, and indeed originally nirvanic quality of things cannot be precisely stated in words, he nevertheless teaches the doctrine of *nirvāṇa* as a "means" to lead people toward detachment.

A parable in the third chapter of the *Lotus Sūtra* tells how a father lures his children from a burning house by the expedient of offering them three fine chariots for their enjoyment. Only on emerging from the fire do they realize that they have been tricked, as it were, into safety by the attractive inducements offered by their father: their real reward, their lives, far outweighs their original expectations. So too, according to the parable, does the Buddha lure sentient beings from the "burning house" that is *saṃsāra* (the round of birth and death) by proposing a variety of apparently distinct religious careers, all of which are in fact reducible to one: the path leading to Buddhahood. Thus understood, the otherwise polemically differentiated "vehicles" (*yāna*)—*śrāvaka* ("hearer of the Dharma"), *pratyekabuddha* (self-enlightened Buddha), and *bodhisattva*—are only provisional constructs designed to appeal to persons of different religious capacities. Ultimately, it is only the path of the Buddhas (*buddhayāna*) that is real.

While the means used to ensure deliverance may thus seem to involve an element of deception, or at least, of withholding the full truth, the discrepancy between the form in which the message is couched and its ultimate meaning is understood to arise owing to the relative ignorance of the living beings who receive it. The sincerity and the consistency of the Dharma regarded from the point of view of the Buddha

is considered to be unimpeached. In chapter 5, the simile of a rain cloud, which bestows on diverse plants moisture equal to their needs, explicitly treats this point. Other parables stress that the religious path eventually brings rewards out of all comprehension to those just beginning their practice. In chapter 4, the process of winning enlightenment is compared to that of a son who abandons his father's estate. When the prodigal returns years later, in dire poverty and ignorant even of the fact that he has come to the place of his birth, his father only gradually reveals his patrimony to him, fearing that a premature revelation of the truth would frighten his son away once again.

Finally, not only is the teaching of the Buddha declared by this text to comprise a series of skillfully devised expedients, but the very appearance of the Buddha in this world is declared (chap. 15; chap. 16 in the Chinese) to be a mere stratagem to draw beings to the Dharma. The actual Enlightenment is an event that took place, if it occurred in history at all, aeons ago. The Buddha's apparent *pārinirvāṇa* at age eighty is a mere simulacrum, comparable to that of a physician who feigns death in order to induce his willful sons to take an essential medicine. Chapter 7 tells of a guide who leads his charges to a magic city he has conjured up as a resting place for the weary. Only when they have rested do the travelers learn that the city is a mirage, not the ultimate goal of their journey after all.

Thus, in the *Lotus Sūtra* it is not merely a question of particular teachings being regarded as secondary formulations. The very appearance of the Buddha, his setting the wheel of the Dharma in motion, and his winning of *nirvāṇa*, have a provisional, dialectical nature related to the needs of living beings in their diversity.

UPĀYA IN THE PERFECTION OF WISDOM LITERATURE. In the early Mahāyāna sūtras, known as the Prajñāpāramitā ("perfection of wisdom") literature, the notion of skill in means is closely linked to that of *prajñā*, that is, to wisdom or insight into the true character of things. Such insight implies a recognition of the metaphysical voidness or insubstantiality of all phenomena and all factors of experience (*dharma*s). Insight and skill in means are two of the perfections in which a *bodhisattva* has to school himself. Hence, this usage (especially in the *Aṣṭasāhasrikā-prajñāpāramitā Sūtra*) complements that of the *Lotus*. As an adept in training, the *bodhisattva* must manage the various features of practical religion that articulate his path, but without becoming attached to them in any way. He must, for example, practice *dhyāna* ("meditation, trance") without being subject to its karmic consequences, that is, without rebirth in the various *deva* heavens that such meditation entails. These heavens, the teaching holds, are pleasant but religiously irrelevant existences; attachment to them is an impediment to the religious life: "But what is the skill in means of a Bodhisattva? It is just this perfection of wisdom. And he applies himself to this skill in means in such a way that, endowed with it, the Bodhisattva enters into the trances without being reborn through the influence of the trances" (Conze, 1973, p. 250).

Upāya, however, is not only a matter of individual spiritual welfare. The *bodhisattva* would lose his own way if he abandoned living beings.

If the mind of a Bodhisattva forms the aspiration not to abandon all beings but to set them free, and if in addition, he aspires for the concentration on emptiness, the Signless, the Wishless, i.e., for the three doors to deliverance, then that Bodhisattva should be known as one who is endowed with skill in means, and he will not realise the reality-limit midway, before his Buddhadharmas have become complete. For it is this skill in means which protects him. (Conze, 1973, p. 225)

Thus the *bodhisattva* is both the adept and the benefactor. In Mahāyāna thinking it is not possible to be the one without also being the other.

A closely related early Mahāyāna text, the *Vimalakīrtinirdeśa Sūtra* (Teaching of Vimalakīrti) dramatizes this principle with a narrative centered on an illness feigned by the *prajñā*-adept Vimalakīrti. In conversation with Mañjuśrī he declares that his illness is without characteristics but arises only through compassion as a skillful means. It will be healed only insofar as all beings depart from belief in self and from dualistic thought. The close connection between *upāya* and *prajñā* ("insight") is evident in statements such as: "Again, insight without (skillful) means is bondage, but insight with (skillful) means is release; (skillful) means without insight is bondage, but (skillful) means with insight is release" (T.D. no. 14.545). Applied to the body, that fundamental object of Buddhist meditation, the implications of this are as follows:

Yet again, seeing the body in terms of impermanence, suffering, emptiness and non-self, this is called insight. To stay in birth-and-death even though the body is sick, bringing benefits to all and not getting disgusted or tired, this is called (skillful) means . . . To see that the body is never without sickness . . . and that there is no renovation and no passing away, this is called insight. To recognize that the body is sick and yet not to enter eternal cessation, this is called (skillful) means. (T.D. no. 14.545)

IMPLICATIONS. The concept of *upāya* plays an incidental role in many other Mahāyāna texts, especially in connection with *bodhisattvas* as savior figures. Its implications are also clearly present, however, in the more philosophical Madhyamika distinction between two levels of truth. Both provisional truth (*lokasaṃvṛtisatya*) and supreme truth (*paramārthasatya*) are essential, according to the *Mādhyamakakārika* (Middle stanzas) of Nāgārjuna, for the proclamation of Buddhist Dharma.

Skill in means, or skillful means, is an idea known to every experienced monk in Mahāyāna Buddhism and has often been used to interpret the function of various aspects of Buddhist teaching or practice. Its role as a regulative principle in situations of accommodation or syncretism should never be overlooked. At the same time, many implications

of its use as a principle of interpretation both in Buddhism and in a wider religious sense remain to be explored.

MICHAEL PYE (1987)
Revised Bibliography

URMONOTHEISMUS SEE SCHMIDT,
WILHELM; SUPREME BEINGS

USENER, HERMANN (1833–1905), was a German classical philologist and historian of religion. From 1866 to

1902 Usener was professor at Bonn. His major writings include *Das Weihnachtsfest* (1889); *Religionsgeschichtliche Untersuchungen* (2 vols., 1889); *Götternamen: Versuch einer Lehre von der religiösen Begriffsbildung* (1896); and *Die Sintfluthsagen* (1899).

In *Götternamen*, Usener presented a once-influential theory. Taking his method from philology and his data mainly from demons (the *indigitamenta*) invoked by name in ancient Roman rites, Usener claimed to show that the history of the idea of deity had three phases. First, the concept of deity emerges as that of momentary gods (*Augenblicksgötter*) whose power is manifested during some fleeting experience, such as plowing and harrowing, but then vanishes. Next, as activities are repeated, these deities gain a certain continuity; they come to stand as functional powers over an entire class of phenomena or activity. Usener calls these “special gods” (*Söndergötter*). In a later phase still, when the name of the god is no longer connected with his function, the god is seen as an autonomous being or personality. Such gods often have many divine names, but this means only that several special gods with different names have become fused into one. Usener also cited data on Lithuanian religions in support of his views.

Usener’s heavy reliance on philology and his claim that the history of the concept of deity could be adequately clarified through the history of the names of the gods was attacked by Jan de Vries, who pointed out that there is no instance of a specialized functional god having evolved into a principal deity. According to de Vries, the momentary gods likely represent a late phase of priestly speculation or juridical elaboration (de Vries, 1967, pp. 134–138). Georges Dumézil has argued similarly that a comprehensive historical approach shows that the *indigitamenta* are relatively unimportant phenomena (Dumézil, 1970, vol. 1, pp. 32–38).

Usener’s other major effort was to show how Christianity took over pagan rites and feasts. He traced the Christmas festival to the birthday of the pagan sun god celebrated on the winter solstice (December 25, according to the Julian calendar), and he argued that certain saints derived from pagan prototypes (e.g., Pelagius from Aphrodite).

BIBLIOGRAPHY

For brief and telling criticisms of Usener’s theory of momentary gods, see Jan de Vries’s *The Study of Religion* (New York, 1967) and Georges Dumézil’s *Archaic Roman Religion*, 2 vols. (Chicago, 1970). Ernst Cassirer, the German philosopher of “symbolic forms,” sympathetically discusses Usener in *Language and Myth* (New York, 1946), pp. 15–36, 72–83.

Revised Bibliography

UŞÛL AL-FIQH. The Arabic phrase *uṣūl al-fiqh*, which means literally “the roots of understanding,” takes on a specialized sense in the classical literature of Islam; it may be rendered either as “sources of law” or as “principles of jurisprudence.” The former rendering may be regarded as best expressing the primary sense of the phrase and the latter as conveying a broader, extended sense. It must be kept in mind that “law” in Islam is much more comprehensive than Western law: It includes not only civil and criminal law but also regulations pertaining to worship, hygiene, and other aspects of the private lives of individuals. It furthermore recommends and disapproves actions as much as it requires and forbids them, and while it specifies temporal penalties for certain offenses, its ultimate sanctions are otherworldly.

There are two Arabic terms that may be translated as “law”—*sharī‘ah* and *fiqh*. The *sharī‘ah* is the law of God, immutable, all-encompassing, and transcendent. Strictly speaking, *fiqh* is the understanding of the law of God that jurists acquire through pious scholarship. However, because it is this understanding of the law of God, as expressed in concrete rules formulated by the jurists themselves, which

governs the daily lives of Muslims, it may be considered law in its own right. It is, in fact, the nearest thing to a positive law that the Islamic tradition affords. *uṣūl al-fiqh* thus designates, in its primary sense, the sources of this positive law, that is, the sources of a human *prudentia juris* conceived as a norm of human conduct. A source (*aṣl*) is that from which something else is derived. The law of God cannot, in its essence, be a derivative of anything; only human constructions of law can have that status.

The necessity for the distinction between the law of God and the positive law as the expression of the human understanding of that law becomes evident when reflecting on cases where the jurists differ among themselves in their construction of rules. Although some Muslim jurists subscribed to a kind of relativism, according to which any rules that emerged from the deliberations of a particular jurist constituted the law of God for him, the majority of Sunnī jurists insisted upon the absolute uniformity and preventiveness of that law such that, where jurists propounded conflicting rules, they could not all be right and the possibility of error had necessarily to be admitted. But as the Sunnī jurists acknowledged no higher authority that might resolve differences among them, they were constrained to regard all rules propounded by duly qualified jurists on the basis of a diligent investigation of the sources of law as equally valid and normative, even if contradictory. What was required for a rule to be normative, therefore, was not that it be an infallible statement of the divine law but simply that it express a qualified jurist's genuine understanding of that law. It is the fallibility of that understanding that compels one to draw a clear line between it and the law of God, its object.

The derivation of positive law from its proper sources is governed by carefully formulated methodological principles so as to leave as little as possible to human ingenuity. These principles, which are partly hermeneutical, partly text-critical, and partly theological, are included in the extended meaning of *uṣūl al-fiqh*. They, together with the sources of law, constitute the "principles of jurisprudence."

THE THEORY OF THE FOUR SOURCES AND ITS ORIGIN. Classical Sunnī Muslim legal thought enumerates four primary sources of positive law: the Qur'ān; the *sunnah*, or custom, of the prophet Muḥammad; consensus (*ijmā'*); and analogical deduction (*qiyās*). The first three of these sources consist of, or are embodied in, texts and as such may be described as the material sources of positive law. The Qur'ān and the *sunnah* of the Prophet (as recorded in the special literature called *ḥadīth*) have, by virtue of their inspired character, a special status not accorded the consensus: They alone have been compiled into discrete textual corpora classified as *nuṣūṣ*. The consensus, though not ranked among the *nuṣūṣ*, is nevertheless necessarily expressed in relatively fixed verbal formulations that may be regarded as essentially textual, or at least quasi-textual, in character. These are preserved *within* the larger literature of Islamic jurisprudence. The fourth source of positive law, on the other hand, is, in contrast to

the other three, a *method* of deriving from texts rules of law that are not contained within the meaning of the texts. It may accordingly be described as a formal source of law. To the extent that the principle of analogy is strictly applied, the exclusive authority of the texts as material sources of law is maintained, for although the derived rule may not be said to be contained within the meaning of the texts, it may quite definitely be said to have its ultimate basis in the texts, that basis being an analogous rule contained within the texts' meaning. To these four sources of law most theorists add further "supplementary" sources, to be considered shortly.

Joseph Schacht's monumental study of the early development of Islamic jurisprudence (*Origins of Muhammadan Jurisprudence*, Oxford, 1959) singled out the famous jurist Muḥammad ibn Idrīs al-Shāfi'ī (d. 820) as the real architect of the "four source" theory. As Schacht showed, Shāfi'ī formulated this theory in response to the interaction of two movements that had been contending for supremacy in the shaping of Islamic law before his time. The earliest of these was represented by what Schacht called the "ancient schools of law." These schools, which were located in the principal Muslim urban settlements of the Umayyad period (661–750), especially Kufa and Medina, despite certain differences shared a common acceptance of the consensus of legal scholars as constituting the ultimate criterion of correct legal doctrine. While in no way minimizing the preeminence of the prophet Muḥammad, which the passing of generations only enhanced, the representatives of these schools came to view the *sunnah* of the Prophet as most faithfully represented in the unanimously agreed-upon doctrine. Thus the ancient schools in effect identified the *sunnah* of the Prophet with the consensus of legal scholars. In reaction to this view, the second movement, namely that of the traditionists (*ahl al-ḥadīth*), took the position that the consensus of the legists, far from adequately representing the *sunnah* of the Prophet, was in reality the product of human reasoning and was therefore of no value whatsoever and that the *sunnah* of the Prophet was properly represented only by formal traditions (*ahādīth*; literally, "narratives") reporting actual sayings or deeds of the Prophet and accompanied by lists (*isnāds*) of accredited transmitters. The *sunnah* of the Prophet was thus, in their view, categorically distinct from the consensus of the legists. Both the ancient schools and the traditionists recognized, as any Muslim must, the authority of the Qur'ān, but as the Qur'ān supplies relatively little material of a specifically legal nature, the question of whether the consensus of legists or formal traditions from the Prophet was to be the primary norm after the Qur'ān was of crucial importance for the development of Muslim legal thinking.

Shāfi'ī himself leaned decidedly toward the traditionist point of view. At the same time, being a lawyer by disposition, like the representatives of the ancient schools in whose circles he had studied (and unlike the traditionists, who though much preoccupied with piety had little instinct for legal matters), Shāfi'ī realized that some principle of legal

construction beyond that of sheer adherence to texts was necessary if law was to develop in accordance with the ongoing needs of the community. He therefore affirmed the validity of analogical deduction, a technique of legal construction that had been developed to near perfection by the ancient schools. However, he distinguished analogical deduction sharply from the purely private judgments of the legists, which the ancient schools had permitted in certain cases. The latter he ruled out entirely, as he did likewise the consensus of the legists, which, like the traditionists, he believed to be the product of private judgment. In its place he did, however, accept the general consensus of the entire Muslim community on essentials. Thus did Shāfi'ī assemble as complementary principles of legal construction four items: the Qur'ān, the *sunnah* of the Prophet as represented by formal traditions, the consensus of the community as a whole, and analogical deduction from any of the foregoing. By insisting on adherence to formal traditions, which in Shāfi'ī's time were fast being fashioned into a textual corpus, Shāfi'ī secured for Islamic law a strong literary base, thus introducing into juristic activity a larger measure of stability and predictability than had previously existed.

THE CLASSICAL THEORY OF THE FOUR SUNNI MADHHABS.

During the third century of the Islamic era (roughly the ninth century CE), the ancient schools of law gave way to a new type of school called the *madhhab*. Whereas the ancient schools had been essentially regional in character, encompassing all legists in a particular locality such as Kufa or Medina, the *madhhabs* derived their identity (and their names) from particular authoritative teachers of law, whom they claimed as their founders and whose essential doctrine they claimed to uphold. Two such "personal schools" (Schacht's term)—the Ḥanafī and the Mālikī schools—emerged out of the ancient schools of Kufa and Medina, within which they had originated as circles of followers of two teachers of great prominence, Abū Ḥanīfah in Kufa and Mālik ibn Anas in Medina. The emergence, after Shāfi'ī's death, of another school claiming to uphold his doctrine gave added impetus to the development of the new type of school. By the early tenth century at least seven such schools were in existence within Sunnī Islam, although only four of these survived beyond the thirteenth century: the Ḥanafī, Mālikī, Shāfi'ī, and Ḥanbalī schools.

Despite certain differences that persisted between them and despite the diversity of their origins, the four *madhhabs* came eventually to agree upon a version of the theory of the four sources that is often described as the classical theory. This theory differed in one important respect from Shāfi'ī's version: It accepted the consensus of legal scholars as equal in weight to the consensus of the entire Muslim community, and because the latter was scarcely if at all ascertainable after the Muslim community had spread beyond its place of origin in Medina, it was the former alone that became the effective principle of legal construction (despite many difficulties in its application). Thus in effect the classical theory allowed the cardinal principle of the ancient schools, which Shāfi'ī

had rejected, to creep back into Muslim legal thinking. Within the classical theory, it had, however, a position far less exalted than the one it had enjoyed in the thinking of the ancient schools, for it was now subordinated, not only to the Qur'ān, but also to the vast body of traditions. The classical theory, which inherited from Shāfi'ī the notion that the authority of the *sunnah* of the Prophet was grounded in the Qur'ān, went on to make the authority of the consensus dependent on both of these.

The differences between the four *madhhabs* in the realm of legal theory have to do with the so-called supplementary principles of legal construction alluded to above. Of these, two are predominant, namely those referred to by means of the terms *istiḥsān* ("preference") and *istiṣlāḥ* ("consideration of public utility"). The first, which is acknowledged by the Ḥanafī school, allows a jurist to set aside a rule deduced analogically from a text in favor of another rule, whose basis in the text is less obvious but that in the jurist's personal judgment provides a more equitable solution to the case at hand. The second, which originated within the Mālikī school but was also later accepted by some legists of the Shāfi'ī and Ḥanbalī schools, allowed a jurist to formulate a rule on the basis of a perceived contribution to the common good (*maṣlaḥah*). Discussions of what was entailed in the notion of the common good proceeded from the conviction that the essential guidelines were to be found in the texts and culminated in some very profound probings into the "ultimate purposes" (*maqāṣid*) of the law of God. Because *istiḥsān* and *istiṣlāḥ* are kindred principles, and because neither in its classical formulation entailed a conscious turning away from the texts in favor of a totally independent use of human reason but looked to the texts for ultimate guidance, the differences between the *madhhabs* in regard to these principles may be assessed as relatively minor.

The large measure of agreement that the four *madhhabs* eventually arrived at in the theoretical realm helped to foster toleration of the differences between them in the realm of positive legal doctrine. The formulation of rules of law on the basis of the recognized sources was understood to be an arduous scholarly task, leading frequently to results of a quite tentative nature. A jurist who was qualified for this task was, in fact, called a *mujtahid* ("one who strives"), and the work of the *mujtahid* is accordingly called *ijtihād* ("striving"). The result of this work was classified as "opinion" (*ẓann*). Thus the rules formulated by the *mujtahids* represented at best their considered opinion, reached after much "striving," as to what the sources dictated with respect to specific cases presented to them. This recognition of the tentativeness of at least part of the positive law constructed by the jurists militated against a dogmatic attachment to any one *madhhab* as the sole valid expression of the law of God.

ALTERNATIVES TO THE CLASSICAL THEORY. Although the espousal of the classical theory by the four Sunnī *madhhabs* assured it a position of undisputed predominance within the larger world of Islam, this theory by no means monopolized Muslim thinking completely.

The Zāhirī theory. Among the earlier Sunnī *madhhabs* that eventually disappeared, one—the Zāhirī *madhhab*—propounded a literalist theory of legal construction that, through the writings of the *madhhab*'s greatest representative, Ibn Ḥazm of Cordova (d. 1064), was to remain after the demise of the *madhhab* as a permanent challenge to the classical theory, to be considered whenever the works of Ibn Ḥazm were studied. The most distinctive feature of the Zāhirī theory was its decisive rejection of analogical deduction. Its literalism was of a radical sort requiring exclusive adherence to legal rules contained within the text's meaning as determined solely through the tools of the Arabic linguistic sciences. Analogical deduction was considered too speculative, as it seemed, in the Zāhirī view, to entail a purely human determination of a legal rule, even if the presumed basis (*'illah*) were said to be inferred from the texts; and rules, according to the Zāhirīyah, were not for humans to determine in any degree. The presence of the Zāhirī legacy within the Islamic legal tradition promoted intensive reflection among the legists upon the fundamental question of what constitutes the meaning of a text. The Zāhirīyah, in the interests of legal development, tended to stretch the concept of meaning to include much of what the four principal *madhhabs* considered to be established by analogy, so that the dispute was, partly at least, over methodological

The Shī'ī theory. Even more potent than the Zāhirī theory as a challenge to the thinking of the four *madhhabs* were the theories developed within Shī'ī Islam and especially within that branch known as Imāmī, or Twelver, Shiism. Twelver theory, like the Zāhirī, rejects analogical deduction, but the prevailing school of thought among the Twelvers, that of the Uṣūlīyah, posits in its place “reason” (*'aql*) as the fourth source of law. Included under this rubric are a number of “rational” operations. Some of these are essentially interpretative activities and as such are considered to be “dependent” upon the texts, in the sense that they do not lead to any conclusion apart from the texts; others are completely autonomous. Of the latter operations, the most significant is the rational perception of good and evil, a notion derived from an early Muslim school of thought known as the Mu'tazilah but denied universally by later Sunnī thinkers. The three remaining sources posited by the Sunnī *madhhabs* are accepted in Twelver theory but with important modifications. The *sunnah* of the Prophet is expanded into the *sunnah* of the “infallible authority” (*al-ma'ṣūm*) so as to include also the sayings of the imams, or spiritual heads of the community, who are deemed no less infallible than the Prophet. As for the consensus, which Twelver theorists take to be the general consensus of the community as a whole, it is reduced to the role of disseminator of the doctrine of the infallible authority, and the notion of an infallible consensus coequal as a material source of law with the Qur'an and the *sunnah* of the Prophet is regarded as a Sunnī aberration stemming from the treasonous election of Abū Bakr as the first caliph. During the long period intervening between the entry of the twelfth imam into a state of “occultation” (believed to have

occurred in 876) and his anticipated return, the community depends on the spiritual guidance of *mujtahids*, who, though not infallible—even when in agreement—are qualified by virtue of their superior knowledge of the Qur'an and the *sunnah* of the “infallible authority” (as enshrined in Shī'ī *ḥadīth* collections) to carry on the task of developing the positive law in response to communal needs. Unlike the Sunnī legists, however, these *mujtahids* are not divided into a plurality of *madhhabs*—a most reprehensible situation, to the Shī'ī way of thinking—but constitute one unified and exclusively valid *madhhab*, that of the imams and the Prophet themselves.

ILM UŞÛL AL-FIQH. Interest in the methods and principles governing the derivation of positive rules from the sources of law gave rise to a special Islamic science called *'ilm uşūl al-fiqh*, whose business it was to spell out these methods and principles in detail and to deal with every conceivable issue that might arise in connection with them. This science was distinguished from *'ilm al-fiqh*, the science of positive law as such. Together, these two sciences constitute the two main branches of what may be called, in the broadest sense of the term, Islamic jurisprudence.

Although Shāfi'ī, described already as the architect of the theory of the four sources, may also be regarded as the founder of *'ilm uşūl al-fiqh*, especially by virtue of his treatise known generally as the *Risālah*, the primary agents in the development of this science in the century or so after Shāfi'ī were a number of prominent members of the Mu'tazilī school, mentioned above. There is, in fact, a close connection between the development of *'ilm uşūl al-fiqh* and that of speculative theology (*'ilm al-kalām*), in which the Mu'tazilah played a prominent role; and as the agents in the one were also the agents in the other, it is not surprising that the method of investigation that prevailed in speculative theology, namely that of dialectic, prevailed also in *'ilm uşūl al-fiqh*. After the eclipse of the Mu'tazilī school of theology by the “orthodox” Ash'ari and Māturidi schools, the further development of *'ilm uşūl al-fiqh* was carried on by theorists of all four *madhhabs*, many of whom adhered to these two later schools.

It should be noted, finally, that despite its great thoroughness and finesse *'ilm uşūl al-fiqh* was seldom put to practice for the purpose either of producing new law or of reforming existing law. The greater part of the legal doctrine of the four *madhhabs* was formulated long before *'ilm uşūl al-fiqh* reached maturity and is, in fact, in large measure a legacy of the ancient schools of law, as Schacht has shown. The methods and principles elaborated in *'ilm uşūl al-fiqh* were consequently viewed as identical with those presumed to have been employed by the great masters of an earlier period, especially the eponyms of the four *madhhabs*. *'Ilm uşūl al-fiqh*—at least in its later mature form—sought simply to articulate what was supposed to have been implicit in the work of the masters. At the same time it always stood as a potential resource for any daring mind that might wish to

take a fresh and independent look at the inherited doctrine and embark on a new *ijtihād* in emulation of the masters themselves.

BERNARD G. WEISS (1987)

UTOPIA. The term *utopia* (from the Greek *ou-topos*, "no place," or *eutopos*, "good place," and evidently coined as a pun by Thomas More for the title of his book published in 1516) has very diverse, often confusing connotations. Sometimes it is used to mean any idealization of the distant or primordial past, when humans lived closer to the gods (or God), as found in Sumero-Akkadian cuneiform accounts of Dilmun; in the Hebrew story of Eden of *Genesis*; in portrayals of the Golden Age by Hesiod, Vergil, Symmachus, and other Greek and Roman writers; in myths of the "perfect great period" (*kitayuga*, *suśamā*, etc.) in later Vedic, earlier Jain, and Buddhist traditions; or in accounts of the early age of the four (mythic) emperors of popular Chinese thought. In some ancient cultures, the original inhabitants of certain foreign regions were imagined to live in an innocent, trouble-free state (the Greeks, for instance, wrote of the Ethiopians, Scythians, and others in this fashion), while not a few students of prehistory in modern times have visualized the earliest humans as herbivores, free from war (as held by Richard Leakey), or as without the sexual constraints and inequalities of later ages (as held by Friedrich Engels).

In contrast, the term *utopia* at other times refers to the future realization of some perfect place and time. It can take on futurist instead of primitivist associations, thus becoming a lost paradise regained, the projection of the hopes and dreams of a millenarianism (the kingdom of God or its equivalent on earth), or the establishment of an ideal society divinely or otherwise sanctioned to replace the glaring ills of the day. Occasionally notions of heavenly worlds—such as the mythic Isles of the Blessed in Greco-Roman belief, the Chinese Māhāyāna Buddhist Pure Land of the West, or the Qurʾānic vision of heaven as fertile gardens with maid-servants—have been described as utopian, as also have visions of an eternal city set above the known order, such as Augustine's City of God, which nevertheless partakes of earthly affairs.

A more traditional understanding of utopia (as in More) is that of a distant, wondrous land allegedly discovered and described by a traveler returning home. Hints of this are found in Homer's *Odyssey* (the account of the Phaeacians), and the earliest extant written description of utopia is that of Euhemerus, who not only argued that the gods were originally deified mortals but also described an idyllic social order outside the bounds and difficulties of ordinary human life. Interestingly, priests are the effective rulers of the Sacred Isle, although they have no official political status.

Pertinent comparisons here include the Greek romancer (and perhaps Cynic) Iambulus writing on the island City of the Sun (early first century BCE), the church historian Socrates on the location of Eden (440 century CE), More's *Utopia* (1516), the Spanish explorer Garcilaso de la Vega's impressions of the Inca empire (1617), the Rosicrucian Johann Valentin Andreae's *Christianopolis* (1619), the Dominican Tommaso Campanella's *City of the Sun* (1623), empiricist Francis Bacon's *New Atlantis* (1627), and *philosophe* Denis Diderot's *Tabiti* (1772), all Western in origin. More's crescent-shaped, two-hundred-mile-long, substantially urbanized island utopia is the most famous, remarkable for its religious tolerance and its endearing priests, who do not persecute but instead constrain those few who happen to hold to the three destructive, forbidden views: that the soul is mortal, that the world is the outcome of mere chance, and that there is no reward or punishment after death.

Possible Eastern analogues to these strangely removed lands are found in Chinese and particularly Daoist beliefs from the fourth century CE onward. Accordingly, select individuals could secure, by some potion or other means, virtual immortality, and "not somewhere else out of this world," as Joseph Needham puts it, "nor in the underworld of the Yellow Springs, but among the mountains and forests here and forever." Looking further afield, from the pre-Christian Americans one learns of South American Indian migrations (the Guaríní, in particular) in quest of the "land without evil" to the east. In transitional Melanesia, individuals who have managed to journey well beyond their own cultural bounds during colonial times (such as police, recruited laborers, and others) have often spun together novel mythic histories about where the whites came from—Britain, Germany, Jerusalem, Sydney, and so on—and how they acquired "cargo" (European goods). From such far-off utopias, where God, the ancestors, and culture heroes are present, cargo came as transformation and blessing to the islanders.

In the present day, the idea of utopia has become inseparable from utopianism, the systematic attempt to engineer a preferable, even perfect society. The origins of utopia in this sense might be said to go back to the construction of the first cities (according to Lewis Mumford) or at least to the schemes of Plato (and the lesser-known Greek thinkers Hippodamus and Phaleas). But many scholars do not consider this exercise in model building for revolutionary social transformation much older than the eighteenth century (the mod-

erately aristocratic *Oceana* scheme by the Englishman James Harrington in 1656 being only faintly precursory), and they have pointed out the central role of the Western ideal of universal progression toward utopianism's realization. They also recognize the secondary importance of practical experimentation in the Americas, where, especially in North America, European colonists attempted to establish new kinds of community or sought a new paradise in the wilderness away from the evils of the Old World.

Utopianist designs for social reconstruction have not always been distinctly religious, except insofar as their ethical stances reflect spiritual values. As the chief protagonist in Plato's *Republic*, Socrates was an atheist when it came to the old gods, yet the guardians of his new polity were to be fully enlightened by the supreme idea of the good (the equivalent of God). In modern times, utopianists have voiced radically anticlerical, if not anti-Christian sentiments, yet they have been dominated by a vision of what is ethically right regarding human relationships. The first utopia as a projected, future program rather than a millennial fiat was that of the French progressivist Sebastian Mercier. In his tract on the year 2440 (written in 1770) he expressed his wish that the church as he knew it would not survive, but nonetheless he imagined an initiation ceremony using telescopes and microscopes, in which young people would discover God, the author of nature (which, in turn, would serve as the basis of justice). Disillusioned with ecclesiastical orthodoxy, in 1825, one of his successors, Saint-Simon, wrote *New Christianity*, and the renowned Charles Fourier described a New Earth in the dawning of the Third Age, like Joachim di Fiore's Age of the Spirit (1847). If François-Noël Babeuf and Pierre-Joseph Proudhon, two other French utopianists, were secular communists in their approach, each nevertheless preached with a religious intensity against injustice. There were other European utopian thinkers in the nineteenth century, both English and continental, from Scottish industrial reformer Robert Owen, a man touched by Christian millennial hopes in his *New Vision of Society* (1813), to vehemently antireligious anarchists, including Petr Kropotkin, a Russian litterateur active at the end of the century.

Marxism has been characterized as a species of secular utopianism, even millenarianism, for presaging a future, supranational society free of classes following a series of proletarian revolutions. Both Karl Marx himself and his collaborator Engels, however, detached themselves from the utopians (especially Proudhon) by arguing that the historical process rather than artificial reorganization would produce a radically better order. However, the fact that the programs of Lenin and Stalin in Russia, Mao Zedong in China, Kim Il Sung in North Korea, and others reveal massive political manipulation and forced mobilizations to support communist state policies suggests that where Marxism has been dominant in certain societies, politics have typically drifted toward the utopian, social-engineering model that Marx himself disdained. The end product of these maneuvers was meant to be a society free not only from classes but from religion.

Communism and socialism take a number of forms, although many less obviously political expressions are often referred to as communalisms, communitarianisms, or communes. Many and varied small-scale utopian communities have been established in the modern-day West, with the greatest number in North America. One discovers parallel and prototypic communities in earlier religious history: the Chinese Daoist and Neo-Confucian retreats of sagehood (Zhang Daoling at Dragon Tiger Mountain, Kiangsi, during the first century CE, or Zhou Dunyi at Lu Shan, c. 1050); in the early monasticisms (both the Jain and Buddhist traditions in India, the Jewish Qumranites and Therapeutae, the Christian Pachomians, Benedictines and their medieval successors, etc.); in the elitist, and for all appearances sectarian, spiritual fraternities (Indian *āśramas*, the ancient gnostic and hermetic schools of Egypt, the medieval Brethren of the Free Spirit in Germany and the Low Countries, the Rosicrucian Order, and other esoteric groups in seventeenth-century England and Germany); and in the communities of the radical Reformation (Anabaptists, Hutterites, etc.) with this tradition generating Mennonite, Amish, and other experiments in North America, including the Quaker City of Brotherly Love, Philadelphia.

By the nineteenth century the United States was sprinkled with many religious communities, at that time often dubbed "socialisms" (John Humphrey Noyes documented at least forty-eight in his *History of American Socialisms*, 1870) but today more likely called utopias or (somewhat pejoratively) "cults." The most famous, distinctly religious examples were Amana in Iowa, New Harmony in Indiana (inspired by Owen), the Shaker and Oneida communities (in New York and elsewhere), as well as the Mormon settlements in Utah. During the first half of this century such communities were spawned in the northwestern states, and since World War II the popularity of life in communes or special retreats has grown, especially in California because of the impact of Eastern meditative traditions and the rejection of highly mechanized and plutocratic North American society (in favor of, for example, a drug culture, anarchy, or a more highly disciplined, ascetic way of life). Some have been inspired by Thoreau's *Walden* and other American celebrations of seclusion in the wild, others by ravaged Amerindian traditions. Comparable postwar communes were established in northern Europe and Australia.

In view of these developments and the growth of state communism, Christian theologians have debated whether Christianity is a utopian faith. Reinhold Niebuhr characterized the Christian position as anti-utopian because evil can never be eradicated from society, while Paul Tillich argued that utopian dreaming has positive value in setting ideal goals but must be transcended when only enslavement or force can secure its long-lasting actualization. Modern Eastern philosophers, particularly Indian gurus who have encouraged or founded new communes, characteristically teach that such communities are but transitory supports before liberation from the realm of physical contingency and karmic law.

Utopia is a subject for both the sociology and psychology of religion. When attempts are made to realize a utopian scheme, it is important to ask questions about social dynamics, the role of a charismatic leader or elders, its degree of durability, and the rate of attrition. A stringently prestructured scheme usually results in a more legalistic orientation and a greater resort to authoritarianism, while in looser efforts at cooperation unity is maintained more by common hope of labors rewarded or a coming transformation. A shared sense of purpose, however, especially by the genuinely faithful, is crucial for the survival of either kind of movement. Apropos to religious categorization, utopianism tends to characterize sectarian, spiritualistic, and mystical persuasions, just as most utopists in the political arena tend to reject the current order of realpolitik, feeling it reflects the morally bankrupt established system.

Utopianism in practice is as attractive psychologically as millenarianism is for idealists, or for those in quest of some certainty and an anxiety-free existence in a sea of cultural, religious, and ethical pluralism. Utopia can also provide, as can the millennial transformation to come, satisfaction for feelings of resentment toward the world's ills or the society from which utopists secede. A need for the certainty a utopia can provide often coincides with extensive rule making and authoritarianism, while recriminatory tendencies can lead to isolationism and relative xenophobia.

Utopianism, when viewed as an oneiric tendency to project a vision of a better life or as exercises of the imagination that lead to social questioning, is more a product of the mind and religious intellectual activity than social organization. The contemplation of happiness and what it entails is a perennial feature of philosophical reflection in religious or quasi-religious traditions, and utopianism is one of its clearer manifestations. Students of the unconscious will note that the displacement of reality for imagined visualization can compel archetypally vivid dreams and rich symbols. Psychoanalytically interesting, moreover, is the aspect of utopias that touches on sexual mores. Thomas More imagined an ideal marriage state, with children being brought up by the community as a whole. An actual attempt at reconstructing Eden-like conditions of the male-female union came with the Adamites, one pre-Reformation group of which was isolated on an island in the river Elbe in Germany from the fifteenth century onward. Members went naked (a reminder that nudist colonies are essentially utopian), and the "naturalness" in the sexual relations of later groups are portrayed in the indelible symbols of Hieronymus Bosch's *Garden of Worldly Delights* (1506?). A modern utopia of particular interest regarding the relationship of religion and sexuality is the Oneida community which was governed by Noyes's complex books of instruction.

Whether as a product of thought or action, or analyzed in a sociological or psychological sense, utopianism characteristically betrays assumptions about the limited relevance of historical change. Utopias are often conceived, sometimes

unwillingly, "as good patterns of life in an ahistorical cosmos" (Olson, 1982). Little thought is given to what may lie beyond or develop out of these Utopias in the future, since, like the millennium, they constitute an end or proper fulfillment of the known order. Unlike the millennium, however, utopia can be discovered, and although it may also be the product of dreaming and imagination, it can be devised rationally and is not constructed only from the elusiveness and ambiguities of apocalyptic literary authorities. Admittedly some forms of millennialism, particularly those of American theologians who preached that the kingdom of God had to be worked for on earth (as documented best by Ernest Lee Tuveson), compare better with utopian visions. On the other hand, such visions are not intrinsically incompatible with noneschatological or more decidedly secular approaches to social reform. Marx, Freud, and other atheist commentators, however, suggest that all religion is inherently utopian in reflecting the presumptions or hypothesizing about a given realm—especially the afterlife—that escapes the ordinary contingencies of material existence and selfhood. And if this is at least arguable, so too it can be proposed that utopia is fundamentally a given of religious consciousness.

Revised Bibliography

UTU. Utu was the Sumerian god of the sun (he is identified with the Akkadian Shamash) and the city god of both Sippar and Larsa, where he had temples bearing the same name “shining house.” Utu was the son of the moon god, Nanna, and therefore brother of Inanna and Ishkur. Hence he belongs to the fourth generation of gods after the supreme god An, and he represents the third cycle, coming after that of the *annus sideralis*—related to the sky vault of An—and that of the lunation of the moon god Nanna—who is the first divinity of light, a bridge between the “invisible” (New Moon) superior divinities, namely Enlil, Enki, and Ninhursaga, and the “illuminator” divinities, namely the sun, Venus, and lighting. The cycle attributed to Utu is the diurnal one, not the annual one, and it is this aspect that determines his functions. As god of the sun, Utu was believed to ride the heavens from sunrise to sunset in a chariot pulled by four storm-beasts and then to descend to the netherworld at sunset to continue his circuit until the morning. A frequent scene in cylinder-seal iconography shows Utu rising in the eastern mountains holding a “saw” (the sun’s rays).

Utu held an important position in the pantheon, although he does not figure prominently in mythological tales. According to the myth of Enki and the world order, Enki entrusted Utu with the borders of the universe; all of Utu’s other functions derived from this role. Foremost was the administration of justice by defining the borders of rights and wrongs; in this task his attendants were Justice and Righteousness, two deities of his suite which included—among others—his wife Aja and his main assistant Bunene. Judgment actually took place in the morning, when the gods assembled; without Utu’s rising, there could be no justice. Hence kingship—regulating society according to the divine laws and defending or enlarging the borders of the cosmos (i. e., the kingdom,) against the chaos—is placed under Utu’s

jurisdiction. The evil actions of ghosts and the harm brought about by demons or sorcerers—all affecting the outlines of the cosmic order—are battled by the god, who, for this reason, is invoked in the incantations. Yet an Utu hymn, which also concerns ghosts, may be imploring Utu to allow a dead man into the netherworld (Cohen, 1977).

UTU AS HELPER AND RESCUER. In the same cultural frame Utu plays a crucial role in purification ceremonies such as the *bit rimki*, an ablution ritual against evil caused by eclipses. Of capital importance too is his role in the counter-witch *maqlû* (“burning”) ritual. After the night trial that convicted the witch and absolved her victim (originally judgment took place by day) and the witch’s consequent destruction in the morning under the sun’s beams, the purifications were carried out, thus freeing the victim from evil and restoring his or her previous relationship with his or her personal god (Abusch, 2002). Sunlight also provides the means of detection, and consequently Utu is the one who knows the most hidden aspects of the universe. Because of this skill he (together with Ishkur/Adad) is the “lord of the *omina*,” for the truth the oracle manifests reveals the ways of the cosmic order known to the god. The omen is signifier of other realities; hence in the poem “Enmerkar and the Lord of Aratta” the god plays a determining role in the invention of writing. Being all-knowing of hidden connections, he can also indicate the right direction to anyone who is lost or does not know the way (see the myths of Gilgamesh and Huwawa and of Lugalbanda). In addition he is merciful. Misfortune is a consequence of the actions of evil entities, and the god repels them into the darkness. Utu was considered to be the helper and advocate of the oppressed, safeguarding the orphan, the widow, and the poor (a task entrusted to the sovereigns), a role that was also attributed to the goddess Nanshe. It was Utu’s function to right injustice, and the oppressed turned to him with their cry “I-Utu” (“O Utu!”), a phrase that came to mean oppression itself, and even (complaining) malcontents. As master of the borders, of the signs, and of the laws that govern them all, he is also master of all physical features, that is, of people’s borders. In fact Utu transforms Dumuzi, pursued by the demons, into different animal forms in order to rescue him.

COROLLARIES. Utu has control over access to and egress from the netherworld, a power possibly related to his own ability to enter the netherworld every evening and emerge at sunrise as lord of the border between day and night. Thus in the myth of Gilgamesh, Enkidu, and the netherworld, Enkidu is trapped in the netherworld until Enki has Utu open a “window” so that Enkidu may ascend. Utu also served as judge of the netherworld, a function shared somewhat with the deified dead Gilgamesh and Dumuzi. This judgment of the dead and of the other denizens of the netherworld does not seem to have involved a concept of eternal reward and punishment, and it probably consisted of settling disputes and keeping the peace between the souls there. The character of Utu/Shamash, as mentioned above, is an element wedged between two related systems: binary (invisible versus visible

divinities) and trinary (year, month, day). This could be the reason for his limited diffusion outside Mesopotamia (although his qualities of omniscience, justice, and mercifulness made him popular where Mesopotamian culture penetrated). A solar divinity is mentioned in the Eblaite texts (twenty-fifth century BCE) with the Sumerian cuneiform ideogram *Utu*. Although a Semitic reading *Sipish* for that ideogram is supported by a geographic name, it is not clear whether only a masculine sun god was meant, as in Mesopotamia, or a solar goddess, in accordance with the Western Semite tradition of the eastern Mediterranean coast in later times. The most realible hypothesis is that two sun divinities were present in Ebla, a masculine one occurring in royal rituals (which were certainly Eblaite in origin) and a feminine one found in an exorcism. From Hittite Anatolia comes an important hymn—with evident and very strong Babylonian influences—to the sun god Iltanu, notwithstanding the importance of the sun goddess of Arinna.

In later times the “sophisticated polytheism” led the major divinities to be considered aspects of Marduk (Lambert, 1975). Shamash was Marduk when exercising justice. It was perhaps with this configuration that Shamash was emancipated from his original double frame, and his importance was felt even outside the bounds of Mesopotamia. Thus in Hellenistic times he was ready to meet—possibly through the mediation of the ancient Iltanu of Hittite times—the character of Apollo, who was in many aspects similar and who had been formerly present on the Anatolian coasts from the end of eighteenth century BCE. For more on the diffusion in late antiquity Hellenistic culture of the god Shamash in Hatra, in the Nabatean site of Khirbet Tannur, and in the Syrian region, in towns such as Harran, Edessa, Dura Europos, Palmyra, and Heliopolis (Baalbek in the Beqaa Valley), see Tubach 1986 and Fauth 1995.

TIKVA FRYMER-KENSKY (1987)
PIETRO MANDER (2005)

VAIKHĀNASAS. The chief “priests” (*arcakas*) in more than half the Viṣṇu temples in the South Indian states of Tamil Nadu, Andhra Pradesh, and parts of Karnataka—including the renowned Hindu pilgrimage center, Tirupati in Andhra Pradesh—Vaikhānasas are a tiny, widely dispersed brahman community of about 3,000 families. Claiming to be a surviving school of Vedic ritual performance, the Taittiriya *śākhā* of the *Kṛṣṇa Yajurveda*, Vaikhānasas have their own complete Vedic Kalpasūtra in addition to prescriptive manuals on temple performances exemplifying the so-called Āgama literature. Beyond the intrinsic interest of their literature and the evidence it provides for further inquiry into questions of continuity and change in India’s religious traditions, Vaikhānasas command special interest and attention because of their contemporary temple activities and efforts to maintain community integrity despite accelerating social and technical change.

Manā’s discussion of *vanaprastha* (“forest-dweller,” the third of the four classical *āśramas* mentions a “Vaikhānasa rule” (*Mānava Dharmasāstra* 6.21). As other ancient authorities seem to support this reference, it appears quite likely that there existed a distinct Vaikhānasa reclusive community some time before the beginning of the common era, though the extant Vaikhānasa *sūtras* seem to be no older than the fourth century CE. The Vaikhānasa Gr̥hyasūtras prescribe a daily worship of Viṣṇu that involves the fabrication of an image and is said to be “equal to the worship of all the gods” (*Vaikhānasa Gr̥hyasūtra* 4.10–12). In essential details, this devotional service “prefigures” the *arcana* (service to images) detailed in the Vaikhānasa Saṃhitās; and it is plausible that Vaikhānasa literature documents the community’s transition from a Vedic “school” of ritual observance to a “school” of the religious performances characteristic of Hindu devotional cults.

Louis Renou proposed (*L’Inde classique*, vol. 1) that the Vaikhānasa is a *bhāgavata* tradition that, while emphasizing Viṣṇu-Nārāyaṇa *bhakti*, did not exhibit the sectlike exclusivity apparently characteristic of early Pāñcarātra *ekāntins* (“monotheists”). Certainly, the Vaikhānasas’s own insistence that they are *vaidikas* and not *tāntrikas* clearly evidences their concern with distinguishing themselves from *pāñcarātrikas*. This concern is further illustrated in their refusal (at least

since the mid- to late nineteenth century) to undergo *Vaiṣṇavadīkṣā* (“initiation” as a Vaiṣṇava) on the grounds that they are “Vaiṣṇavas at/from birth” because their mothers underwent a particular life-cycle rite (*samskāra*) during their first pregnancies. Still, the exact historical relationship between Vaikhānasas and *pāñcarātrikas* remains unclear.

Inscriptions from perhaps the eighth century CE identify Vaikhānasas as temple functionaries. According to Vaikhānasa tradition, the sage Vikhanas (a manifestation of Brahmā or Viṣṇu) composed the *Vaikhānasa Kalpasūtra* and taught four disciples—Atri, Bhṛgu, Kāśyapa, and Marīci—the procedures of *samūrtārcana* (“devotional service [to Viṣṇu] with images”). *Samhitās* (“collections”) of versions of these instructions, said to have been authored by these four disciples, constitute the core of Vaikhānasa literature.

More so than their Pāñcarātra counterparts, the Vaikhānasa *Samhitās* are the literature of ritual prescription, providing detailed instructions from priest to priest for constructing and dedicating temples and images and for conducting religious ceremonies involving them. While not negligible (as some scholars have asserted), the explicit *jñāna* sections of these texts are brief, and thus certain important features must be inferred from their discussions of ritual. These texts emphasize the distinction between Viṣṇu as the pervasive, unfigured (*niṣkala*) presence in the universe and his figured (*sakala*) presence occasioned in his graceful response to intent devotional meditation. Initially, this is the meditation of the *arcaka* who conducts the proceedings through which the deity comes to dwell in prepared images; subsequently, it is the essence of the behavior of devotees toward images so enlivened. Discussion of cosmogony in the Vaikhānasa texts principally traces the backgrounds of the human predicament: being caught in *samsāra*. According to Vaikhānasa teaching, *mokṣa* is “release” into Viṣṇu’s heaven, and the nature of one’s *mokṣa* depends on a devotee’s service: attentive repetition of prayer (*japa*), sacrifice (*huta*), service to images (*arcana*), or meditation conforming to yogic regimen (*dhyāna*). Among these four, the *Marīci Samhitā* declares that *arcana* is the realization (*sādhana*) of all aims.

BIBLIOGRAPHY

Those who read French will profitably consult Gérard Colas’s *Viṣṇu, ses images et ses feux: Les métamorphoses du dieu chez les vaikhānasa* (Paris, 1996), a comprehensive study of Vaikhānasa teachings and ritual. Colas’s earlier *Le temple selon Marīci* (Institut Français d’Indologie, Pondichéry, 1986) provides annotated translation of passages in the *Marīcisamhitā* dealing with the construction of temples and icons. In English, Jan Gonda’s summary overview of Vaikhānasa literature in his *Medieval Religious Literature in Sanskrit* (Wiesbaden, 1977), pp. 140–152, remains useful as does Willem Caland’s landmark essay *On the Sacred Books of the Vaikhānasas* (Amsterdam, 1928).

Caland’s translation of the *Vaikhānasasmārtasūtram* (Calcutta, 1929) gives reliable access to a crucial text and is comple-

mented by Wilhelm Eggers’s *Das Dharmasūtra der Vaikhānasas* (Göttingen, 1927). Of the Vaikhānasa ritual handbooks, or *Samhitās*, the *Kāśyapajñānakāṇḍa* is ably translated into English by Teun Goudriaan as *Kāśyapa’s Book of Wisdom* (The Hague, 1965). Also, Teun Goudriaan’s “Vaikhānasa Daily Worship According to the Handbooks of Atri, Bhṛgu, Kāśyapa, and Marīci,” *Indo-Iranian Journal* 12 (1970): 161–215, is an invaluable reference. Supplemented by the appropriate sections of Carl Gustav Diehl’s *Instrument and Purpose* (Lund, 1956) that outline daily performances in South Indian Śiva temples, Goudriaan’s essay affords an excellent idea of the essential structure and details of Agamic temple performances. And my “Mahāsamprokṣaṇa, 1981: Agama and Actuality in a Contemporary Temple Renovation,” *Agama and Silpa* (Bombay, 1984), pp. 69–102, and “Tradition, Text, Person,” *History of Religions* (May 1986) shed some light on the Vaikhānasas’ contemporary circumstances.

G. R. WELBON (1987 AND 2005)

VÄINÄMÖINEN is the protagonist of the Finnish national epic, the *Kalevala*, and an important figure in ten ancient Finnish poems in *Kalevala* meter. He is the inventor of the *kantele* (the ancient psaltery used to accompany the chanting of the *Kalevala* epics), an expert singer, and a master musician. Väinämöinen has taken part in the primeval acts of creation; were he to be killed, joy and song would depart this earth.

Väinämöinen’s name is derived from the word *väinä*, meaning a strait or a wide, slowly flowing river. The derivation seems to indicate that Väinämöinen was originally associated with water, but scholars are not in agreement about this or any other explanation of the hero’s original character. He often goes by the epithet “the old one,” and he is repeatedly characterized as “the everlasting wise man.”

The images of Väinämöinen that occur in folk poetry can be grouped into four basic types: (1) creator of the primeval sea, (2) culture hero, (3) shaman hero, and (4) sea hero and suitor.

1. As creator of the primeval sea, Väinämöinen shapes the seabed by creating holes and shoals in it. Once his work is done, a bird—an eagle, a scaup duck, or a goose—makes a nest on his knee and lays an egg (in some versions, eggs). When Väinämöinen shifts his knee the egg breaks, and the pieces become the various elements of the world:

What was the egg’s upper shell
became the heavens above
what was the egg’s lower shell
became mother earth below
what was the white of the egg
became the moon in the sky
what was the yolk of the egg
the sun in the sky
what on the egg was mottled

became the stars in heaven

what on the egg was blackish
became the clouds in the sky.

(Bosley trans., in Kuusi et al., 1977)

Väinämöinen then joins his brother Ilmarinen in the upper aerial regions to strike a spark that falls through the nine heavens to Lake Alue. Väinämöinen's association with celestial bodies is reflected in the old Finnish names for Orion and the Pleiades, which mean "Väinämöinen's scythe" and "Väinämöinen's birchbark shoes," respectively.

2. As culture hero, Väinämöinen builds the primeval boat, which one day strikes a great pike from whose bones he makes the first *kantele*, which he uses to enchant the world. In Ingria (the region between Estland and Lake Ladoga) various goods are made from the great oak felled at Väinämöinen's command. In some regions Väinämöinen was believed to be the first cultivator of flax and hemp as well as the inventor of the fishnet. He is also credited with concocting various ointments and curing diseases and with the ability to stop the flow of his own blood. Like most culture heroes, Väinämöinen departed from the world, in his case in an iron-bottomed boat, once humanity had reached a certain level of development, and is prophesied to return in the future.

3. As shaman hero, Väinämöinen uses his singing to charm the young Saami (Lapp) Joukahainen, a rival shaman, into a swamp, where he abandons him by revoking his magical song. Other shamanistic motifs include Väinämöinen's crossing a river to visit Tuonela (the land of the dead) and returning as a snake, and his obtaining knowledge from Antero Vipunen, a dead wise man. Väinämöinen also resorts to shamanistic power in his quest for the *sampo*, a support of the world. A belt worn by Finnish shamans up to the nineteenth century, from which magic objects were hung and which was used as an aid in incantation, was known as "the belt of old Väinämöinen."

4. As sea hero and suitor, Väinämöinen appears in those parts of the extensive *Sampo* epic cycle concerning his theft of the *sampo* and the contest among heroes for the mistress of Pohjola ("homestead of the north"). In one episode a Saami shoots Väinämöinen, who falls into the sea and drifts until he is rescued by the mistress of Pohjola. At other times he engages in a dispute with Ilmarinen's sister Anni or makes an unsuccessful attempt to capture a mermaid. Finally, he orders the killing of a fatherless half-month-old boy in a marsh. When the baby suddenly begins to speak, deprecating the old man, Väinämöinen is compelled to rescind his order. In Elias Lönnrot's redaction, this final scene of the *Kalevala* is intended to be an allegory for the retreat of paganism and the rise of Christianity.

The tradition of poem-cycles and miniature epics with Väinämöinen as chief protagonist began in the distant past. The oldest stratum of this tradition represents Väinämöinen as an epic or cosmological figure. The newer stratum depreci-

ates his role, or even satirizes him. The two strata tended to mix during the eighteenth or nineteenth centuries; Lönnrot brought this process to its logical conclusion when he compiled and edited the *Kalevala*. At the same time, he strengthened Väinämöinen's central position by casting him in roles originally occupied by other characters. He also divested him of mythological features and endowed him with human, though manifestly heroic, traits.

MATTI KUUSI (1987)

VAIŠEṢIKA. The Vaiśeṣika school of Indian philosophy, founded by Kaṇāda (sixth century BCE?), has concentrated mostly on issues and themes of ontology and has closely cooperated with the Nyāya, its sister philosophical school, on matters of epistemology. Like many other schools of Indian philosophy, it upholds that all living beings, human or non-human, have souls that are different from the body, eternal, and ubiquitous; that the supreme goal of life is liberation from the bondage of *karman* and the cycle of birth and rebirth; and that the attainment of liberation is the only means of ensuring freedom from all suffering.

According to Vaiśeṣika teaching, the soul is a kind of substance that is conceived as the substratum of quality particulars (*guṇas*) and motion. Both quality particulars and motion are related to the substance by way of inherence (*samavāya*). *Samavāya* is a special kind of relation as well as an independent ontic category that binds only those two kinds of relata, one of which must be destroyed with the severance of the relationship. Substances, quality particulars, and motions share common properties, or universals, that are eternal and independent of their substrates and yet related to them by way of inherence. Physical substances are produced from combinations of atoms, which are eternal, indivisible, and imperceptible. Each eternal substance is characterized by an ultimate differentiator (*viśeṣa*), which serves as a basis of distinction under circumstances where no ordinary means of distinction is available. Besides the above six kinds of positive ontological categories—substance, quality particular, motion, universal, inherence, and ultimate individual—there is a negative ontic category, including such entities as absence (as of a book on the table), difference (as of one thing from another), and so on.

The Vaiśeṣika school seeks to prove the existence of the soul by arguing that desire, cognition, and other attributes are quality particulars and must be supported by a substance that is nonphysical because they are radically different in many ways from the quality particulars of physical substances. Such a substance must also be permanent and endure through time; otherwise no satisfactory account can be given of such phenomena as memory. It must further be eternal and in particular, preexistent before birth, or else one cannot account for the fact that a newborn child reaches out for its mother's milk, given that the infant's action is claimed to be purposive and involve memory (which can only have been acquired in a previous life).

One of the souls, called Īśvara (God), is said to be endowed with superhuman qualities such as omniscience. Īśvara's existence is inferred from the premise that a conscious agent is required not only for the creation of artifacts such as a pot, but indeed for all effects, and that the conscious agent responsible for bringing about a conjunction of atoms leading to the production of macrocosmic objects can only be Īśvara. He is also inferred as the author of revealed scriptures and further as the original bestower of significance on linguistic symbols, an act making all communication possible.

PĀÑCARĀTRAS

VAIṢṆAVISM: AN OVERVIEW

The origin of Vaiṣṇavism as a theistic sect can by no means be traced back to the Rgvedic god Viṣṇu. In fact, Vaiṣṇavism is in no sense Vedic in origin. Indology has now outgrown its older tendency to derive all the religious ideologies and practices of classical India—indeed, all aspects of classical Indian thought and culture—from the Veda. It must be remembered that when the Vedic Aryans migrated into India, they did not step into a religious vacuum. On the strength

of newly available evidence, it is possible to identify at least two pre-Vedic non-Aryan cults. One was the *muni-yati* cult, which must be distinguished from the exotic Vedic Aryan ṛṣi cult. The *muni-yati* cult, with its characteristic features such as yoga, *tapas*, and *samnyāsa*, was an intrinsic component of both the Śiva religion, which had been deeply rooted and widely spread in pre-Vedic India, and the ancient Magadhan religiophilosophical complex, which later served as the fountainhead of such heterodox religions as Jainism and Buddhism. The second cult, that of *bhakti*, is more pertinent to our present purpose. The autochthonous character of *bhakti* in the sense of exclusive devotion to a personal divinity, as evidenced by several aboriginal Indian religions, is now generally accepted. These two cults can be seen to have influenced the hieratic Vedic cult to a certain extent both positively and negatively. Positively, the Vedic religion adopted into its pantheon the pre-Vedic non-Aryan Śiva in the form of Rudra. Similarly, there is every reason to assume that some of Vasiṣṭha's hymns to Varuna in the seventh book of the *Rgveda* reflect certain essential traits of *bhakti*. Negatively, the hieratic Vedic religion clearly betrays its aversion to such adjuncts of the Śiva religion as *yatis*, *śiśnadevas*, and *mūradevas*.

Once established, the Vedic religion succeeded in keeping the indigenous religious cults of India suppressed for a fairly long time. When, however, about the end of the period of the major Upaniṣads (eighth to sixth centuries BCE), the authority of Vedism began to decline, the non-Vedic religious cults again came into their own. Whereas some of them, like the ones that later developed into Jainism and Buddhism, refused to accept Vedic authority, the theistic cults sought its blessing and sanction.

VĀSUDEVISM. The theistic cult centered on *bhakti* for the deified Vṛṣṇi hero Vāsudeva, who is not mentioned in any early text. With the decline of Vedism, the cult emerged as a significant force. Strangely, the available evidence shows that the worship of Vāsudeva, and not that of Viṣṇu, marks the beginning of what we today understand by Vaiṣṇavism. This Vāsudevism, which represents the earliest known phase of Vaiṣṇavism, must already have become stabilized in the days of Pāṇini (sixth to fifth centuries BCE), for Pāṇini was required in his *Aṣṭadhyāyī* to enunciate a special rule (4.3.98) to explain the formation of the word *vāsudevaka* in the sense of a "*bhakta* or devotee of the preeminently venerable god Vāsudeva."

The tradition of the Vāsudeva religion continued almost uninterrupted since that time. Megasthenes (fourth century BCE) must be referring to this religion when he speaks of the Sourasenoī (people of the Śūrasena or Mathura region) and their veneration of Herakles. A passage in the Buddhist *Nid-deśa* also points to the prevalence of Vāsudeva worship in the fourth century BCE. The *Bhagavadgītā* (third century BCE) eulogizes the man of knowledge, who, at the end of many births, betakes himself unto the god in the conviction that "Vāsudeva is All" (7.19). According to the Besnagar inscrip-

tion (last quarter of the second century BCE), the Garuḍa column of Vāsudeva, the “god of gods,” was erected by Heliodoros, the Bhāgavata, of Takṣaśilā. The historical tradition that Vāsudeva originally belonged to the tribe of the Vṛṣṇis is also well attested. In the *Bhagavadgītā* (10.37) Lord Kṛṣṇa declares that of the Vṛṣṇis he is Vāsudeva. The *Mahābhāṣya* of Patañjali (150 BCE) also clearly speaks of Vāsudeva as belonging to the Vṛṣṇi tribe (*vārttika* 7 of 4.1.114). The inscriptions of Ghosundi and Nanaghat (both of the first century BCE) and the grammatical work *Kāśāika*, all of which associate Vāsudeva with Saṃkarṣaṇa (another deified Vṛṣṇi hero), further confirm the Vṛṣṇi lineage of Vāsudeva.

It may be noted that the Pāṇinian *sūtra* which establishes the Vāsudeva religion also suggests the existence of an independent religious sect, with Arjuna as its chief god. It would seem, however, that even in the initial stages of its development the Arjuna religion was subsumed by the Vāsudeva religion and thus disappeared completely from literature and history. The religion of Saṃkarṣaṇa also seems to have arisen independently of the Vāsudeva religion. In the *Mahābhārata*, Saṃkarṣaṇa (or Balarāma) is represented as the elder brother of Vāsudeva, but there is no indication in the epic of any religious sect having developed around him. However, the *Arthasāstra* of Kauṭilya (fourth century BCE) refers to spies disguised as the ascetic worshippers of Saṃkarṣaṇa (13.3.67). The Mathura sculpture (second century BCE) which depicts Saṃkarṣaṇa by himself is also highly suggestive in this context. The evidence of the *Niddesa*, the *Mahābhāṣya* of Patañjali, and the Ghosundi and Nanaghat inscriptions, on the other hand, shows that, presumably on account of their original Vṛṣṇi affiliations, the Saṃkarṣaṇa and Vāsudeva religions had come to be closely allied. With the development of the doctrine of the *vyūhas*, whereby Saṃkarṣaṇa came to be regarded as one of the *vyūhas* (standing for the individual self) subordinate to Vāsudeva (standing for the Highest Self), the Saṃkarṣaṇa religion lost its independent existence.

KṚṢṆAISM. Another theistic cult which gathered strength with the decline of Vedism centered on Kṛṣṇa, the deified tribal hero and religious leader of the Yādavas. There is sufficient evidence to show that Vāsudeva and Kṛṣṇa were originally two distinct personalities. The Yādava Kṛṣṇa may as well have been the same as Devakīputra Kṛṣṇa, who is represented in the *Chāndogya Upaniṣad* (3.17.1) as a pupil of Ghora Āṅgīrasa and who is said to have learned from his teacher the doctrine that human life is a kind of sacrifice. Kṛṣṇa seems to have developed this doctrine in his own teaching, which was later incorporated in the *Bhagavadgītā*. In time, the Vṛṣṇis and the Yādavas, who were already related to each other, came closer together, presumably under political pressure. This resulted in the merging of the divine personalities of Vāsudeva and Kṛṣṇa to form a new supreme god, Bhagavān Vāsudeva-Kṛṣṇa. Evidence in Megasthenes and in Kauṭilya’s *Arthasāstra* indicates that this new divinity was established as early as the fourth century BCE. Indeed,

the names *Vāsudeva* and *Kṛṣṇa* began thereafter to be used indiscriminately to denote the same divine personality.

A third current was soon added to this swelling religious stream, in the form of the cult of Gopāla-Kṛṣṇa, which had originated among the nomadic cowherd community of the Ābhīras. Suggestions that the Gopāla-Kṛṣṇa cult shows traces of Christian influence or that it developed from Vedic sources are unacceptable. On the contrary, the religion of Gopāla-Kṛṣṇa seems to have spurned the Indra-dominated Vedic religion (as is evidenced by the Govardhana episode) and to have promoted religious sublimation of sensuous love (as represented by Kṛṣṇa’s relationship with the *gopīs*). The amalgamation of the Vāsudeva cult of the Vṛṣṇis, the Kṛṣṇa cult of the Yādavas, and the Gopāla cult of the Ābhīras gave rise to what may be called Greater Kṛṣṇaism. New legends came to be invented whereby Vāsudeva, Kṛṣṇa, and Gopāla were integrated into a single homogeneous mythological pattern. If Vāsudevism represented the first phase of Vaiṣṇavism, Greater Kṛṣṇaism represented its second (and perhaps most outstanding) phase.

VAIṢṆAVISM. The seventh to fourth centuries BCE were a period of great philosophical ferment in India. Vedism was on the decline, and non-Vedic religions such as Jainism and Buddhism were gradually gaining ascendancy. That period also saw vigorous attempts by the vanguards of Vedism to resuscitate the Vedic way of life and thought through the Sūtra-Vedāṅga movement. Kṛṣṇaism followed an eminently practical course with a view to consolidating its position in the face of the expanding heterodoxy on the one hand, and the resurgence of Vedism on the other. The amalgamation of the three theistic cults was an important step in the direction of such consolidation.

The other line of action adopted by Kṛṣṇaism was of a more vital character. Non-Vedic in origin and development, Kṛṣṇaism now sought affiliation with Vedism so that it could become acceptable to the still not inconsiderable orthodox elements among the people. That is how Viṣṇu of the *Ṛgveda* came to be assimilated—more or less superficially—into Kṛṣṇaism. Viṣṇu had already been elevated from the subordinate position that he had occupied in Rgvedic mythology to the position of supreme godhead (*Aitareya Brāhmaṇa* 1.1). Further, the belief had already become well established that whenever *dharma* (righteousness) languishes and *adharma* (nonrighteousness) thrives, Viṣṇu, the supreme God, incarnates in order to save the world. Kṛṣṇa accordingly came to be regarded as an incarnation (*avatāra*) of Viṣṇu. Kṛṣṇaism thus grew in its mythological and practical scope so that in some ways it became a form of Vaiṣṇavism. One of the classic works of Kṛṣṇaism, the *Bhagavadgītā*, reflects the syncretic use of Vedic as well as Vāsudeva traditions in such a way that Kṛṣṇa himself is said to be the supreme Lord.

PĀÑCARĀTRA; BHĀGAVATA. The inclusion of the Nārāyaṇa cult into Kṛṣṇaism is generally regarded as the second major factor in the process of the so-called brahmanization of Kṛṣṇaism. However, the Nara-Nārāyaṇa cult itself seems to

have originated in Badari (the northern ridge of the great Hindu Kush arch) independently of the Veda. Indeed, tradition assigns great antiquity to that cult (*Mahābhārata* 7.172.51). It is not unlikely that the ancient non-Vedic concept of Nara-Nārāyaṇa was absorbed into the Vedic ideology in the form of Puruṣa Nārāyaṇa of the *Śatapatha Brāhmaṇa* (12.3.4). The latter, in its turn, was perhaps later transformed into the pair Arjuna (Nara-Puruṣa) and Kṛṣṇa (Nārāyaṇa) of Kṛṣṇaism. Nārāyaṇa is represented as the founder of one of the two early sects of Vaiṣṇavism, namely, Pāñcarātra, as distinguished from the other early sect, namely, Bhāgavata. The distinction between these two sects is emphasized if we consider that the Pāñcarātrins were the worshipers of Nārāyaṇa, whereas the Bhāgavatas were the worshipers of Vāsudeva-Kṛṣṇa; that the Pāñcarātrins were the followers of Tantric Vaiṣṇavism, whereas the Bhāgavatas were the followers of brahmanic Vaiṣṇavism; an Vaiṣṇavism d that the Pāñcarātrins accepted the doctrine of *vyūhas* (according to which Vāsudeva, Saṃkarṣaṇa, Pradyumna, and Aniruddha were the four “emanations” [*vyūhas*] of God, standing respectively for the Highest Self, the individual self, mind, and egoism), whereas the Bhāgavatas accepted the doctrine of *avatāras* (ten incarnations of Viṣṇu).

VAIṢṆAVISM IN HISTORY. Vaiṣṇavism has generally enjoyed the patronage of various ruling dynasties, although foreign tribes like those of the Śakas and the Kushans (first centuries before and after the beginning of the common era) do not seem to have been favorably inclined toward that religion. Similar was the attitude of the early Vākātakas and the Bhāraśivas (second and third centuries CE). On the other hand, epigraphic and numismatic evidence shows that most of the Gupta sovereigns (who reigned from the fourth to the seventh century CE) were devout Vaiṣṇavas or Bhāgavatas, although their overall religious policy was remarkably liberal and tolerant. It was also during the age of the Guptas that most of the Vaiṣṇava Purāṇas and the Saṃhitās of Tantric Vaiṣṇavism took final shape. In the course of the post-Gupta millennium (700–1700 CE), Vaiṣṇavism, like Hinduism in general, came to be fragmented into further sects and subsects. The emergence of these sects and subsects usually followed a certain set pattern: some particular religious leader would start a movement either to reform the existing vulgarized religious practices of the parent sect or to widen the appeal of that sect by abjuring social inequalities. The main purpose of these new sects and subsects was not so much to sponsor any specific philosophical or theistic tenets as to establish and popularize certain distinct kinds of *bhakti*. This renewal of *bhakti* is known to have received its main impulse from South India. It is, indeed, striking that Nakkirār (late first century CE) should mention in one of his poems “the blue one with the eagle flag” (i. e., Kṛṣṇa) and “the white one of the plowshare and the palmyra flag” (i. e., Baladeva). But it was the Āḷvārs (sixth to ninth centuries CE) who denounced all social distinctions and expressed in their Tamil songs a deeply emotional and intensely personal devotion for Viṣṇu. The *bhakti* tradition of the Āḷvārs was given a Vedan-

tic foundation by the *ācāryas* of the Śrī Vaiṣṇava school, such as Nāthamuni, Yāmunācārya, and Rāmānuja. Two sub-schools evolved out of the Vaiṣṇava theology of Rāmānuja: the southern school (the Teṅkalai) insisted that *prapatti*, or complete surrender to God, was the only way to obtain God’s grace, whereas the northern school (the Vāṭakalai) required the devotee to resort also to other ways of salvation prescribed by the scriptures.

VAIṢṆAVA BHAKTI CULT. It is in northern and central India that one sees a truly exuberant ramification of the Vaiṣṇava *bhakti* cult (thirteenth to seventeenth centuries CE). Two main currents of devotional worship can be distinguished in this connection, one relating to Rāma and the other to Kṛṣṇa. In the case of the latter, again, there are two distinct lines of development, one centering on Kṛṣṇa and his spouse Rukmiṇī (as generally sponsored by the saints of Maharashtra) and the other centering on Kṛṣṇa and Rādhā (as popularized by, among others, Nimbārka, Caitanya, and Jayadeva). One of the most remarkable Vaiṣṇava saints of India, Kabīr (fifteenth century), was born to the family of a Muslim weaver of Banaras. Early in life he became influenced by the Hindu ascetic Rāmānanda (the fifth in descent from Rāmānuja), who symbolized for the young aspirant the spirit of revolt against religious exclusivism and abstruse philosophizing. Kabīr taught Sahaja-Yoga, which aimed at an emotional integration of the soul with God. The Kabīr sect extended to Kathiawar and Gujarat but in the process split up into twelve different Kabīrpanthas. Dādū (sixteenth century CE, Gujarat-Rajasthan), for instance, was a follower of Kabīr, but he founded his own Brahma-Saṃpradāya with a view to uniting the divergent faiths of India into a single religious system. Another outstanding Vaiṣṇava saint, Caitanya (or Gaurāṅga, 1486–1533), though not the founder of Bengal Vaiṣṇavism, left the indelible mark of his personality on that religious movement. He initiated a new mode of congregational worship, called *kīrtana*, which consisted of choral singing of the name and deeds of God, accompanied by drums and cymbals and synchronized with rhythmic bodily movements, all this culminating in ecstasy. Among other typical teachers and saints who fostered Vaiṣṇava *bhakti*—each in his or her own way—may be mentioned Jñāneśvara (thirteenth century, Maharashtra), Narsī Mehtā (fifteenth century, Gujarat), Śrīpādarāja and Purandaradāsa (both fifteenth century, Karnataka), Śaṃkaradeva (c. fifteenth-sixteenth century, Assam), Mīrā Bāī (sixteenth century, Rajasthan), Tulsīdās (sixteenth century, Uttar Pradesh), and Tukārām (seventeenth century, Maharashtra).

LITERATURE. In the literature of Vaiṣṇavism, the first place—in time as in importance—has to be conceded to the *Mahābhārata*. Notwithstanding its ultimate encyclopedic character, there is no doubt that the *Mahābhārata* was, at an earlier stage, redacted in favor of Kṛṣṇaism, Kṛṣṇa having been represented almost as its prime mover. The inclusion in the Great Epic of such Vaiṣṇava religious tracts as the *Bhāgavadgītā* and the *Nārāyaṇīya* and of the *Harivaṃśa* (as

an appendix) confirms its basic Vaiṣṇava orientation. The Rāmāyaṇa, on the other hand, can hardly be called sectarian.

Among the eighteen Purāṇas, six—the *Viṣṇu*, *Nārada*, *Bhāgavata*, *Garuḍa*, *Padma*, and *Vārāha*—are traditionally regarded as Vaiṣṇava or *sāttvika*. Out of these, the *Bhāgavata Purāṇa* has all along been looked upon as an authoritative scripture of Vaiṣṇavism. From among the sectarian Upaniṣads, which, incidentally, are fairly late (second to fifteenth centuries CE), seventeen are said to be Vaiṣṇava. Several of them are of the nature of Tantras. However, the principal Tantric Vaiṣṇava sect is the Pāñcarātra. Traditionally, 108 Saṃhitās of the Pāñcarātra are mentioned, although their number is sometimes given as 215 or even 290. Among the Pāñcarātra Saṃhitās, which are variously referred to as *Ekāyanaveda*, *Mūlaveda*, or *Mahopaniṣad*, the *Sāttvata*, the *Paṅskara*, and the *Jayākhya* are said to constitute the “jewel triad” (*ratnatrayī*). The more commonly known *Ahīrbudhnyā Saṃhitā* is believed to have been produced in Kashmir in the early fifth century. The four main Tantric topics dealt with in the Saṃhitās are *jñāna* (soteriological theology), *yoga* (psychophysical discipline), *kriyā* (cultic practices), and *caryā* (personal and social behavior). Side by side with the Pāñcarātra, there also developed a Tantric Vaiṣṇava cult known as Vaikhānasa. It may be noted that specific Saṃhitās govern the religious practices at specific Vaiṣṇava temples. Profuse philosophical literature has originated in the four major schools of Vaiṣṇava Vedānta. Reference may also be made to the various manuals dealing with *bhakti*, such as the *Bhaktisūtras* of Śaṅḍilya and Nārada (tenth century).

There are also quite a large number of prayers and hymns of praise (*stotras*), known for their great literary and religious appeal, which are addressed to Viṣṇu in his various forms. All this literature is in Sanskrit. However, many of the newly arisen sects and subsects of Vaiṣṇavism adopted as their gospels the sayings and sermons of their promoters (or of the immediate disciples of those promoters), which were usually delivered not in Sanskrit but in the vernaculars of the people for whom they were meant, and these were preserved in oral or written form.

VAIṢṆAVISM: BHĀGAVATAS

Quite probably Hinduism’s most famous and widely encountered epithet for divinity conceived as ceaselessly and actively solicitous of human welfare is *Bhagavat* (“having shares”). *Bhagavān* (the more commonly cited nominative singular form of the word) occurs as early as the *R̥gveda*. It expressly refers to Rudra-Śiva in the *Śvetāśvatara Upaniṣad* (5.4), and it is the common honorific of the Buddha in the Pali texts. But *Bhagavān* doubtless is most familiar in reference to Viṣṇu-Nārāyaṇa/Vasudeva-Kṛṣṇa. Indeed, *bhāgavata* (“related to/devoted to Bhagavān”) may be the most common, even earliest, general designation of a devotee of Viṣṇu.

If it is readily agreed that history’s most prominent *bhāgavatas* are Viṣṇu *bhaktas*, there is disagreement and not a little confusion concerning what—if anything—distinguishes them from *pāñcarātrikas* and other Vaiṣṇavas. In fact, *bhāgavata* frequently has meant simply a Vaiṣṇava (or proto-Vaiṣṇava) as such without further characterization. Until perhaps the eleventh century, this nonsectarian sense generally prevailed, and *bhāgavatas* were part of a growing but diffuse movement that emphasized a personal, active devotional relationship between the human and the Absolute but did not have a single, fixed set of specific beliefs and rituals. The variety of attitudes is readily seen by comparing Bhagavatism’s most famous texts, the *Bhagavadgītā* and the *Bhāgavata Purāṇa*. The *Bhagavadgītā* is formal and intellectualized, and offers *bhakti* as a refined yoga, a way of release. Thus, its tenor contrasts distinctively with the vibrant emotionalism of the *Bhāgavata Purāṇa*’s *bhakti*. Further, the religion of the *Bhagavadgītā* harkens expressly to Vedic sacrificial models, whereas the religious inspiration of the *Bhāgavata Purāṇa* is more varied.

Some have claimed that Bhagavatism and, indeed, the “*bhakti* idea” are rooted outside of Vedic ceremonialism altogether—that they originated from “indigenous” or “tribal” sources or perhaps are linked to extra-Indian (Iranian) prototypes. Suggestions that they are ultimately alien impositions or incursions, however, ought to be treated cautiously. For one thing, the available evidence will allow only the most hedged, vague, and inadequate historical account. For another, no aspect of Bhagavatism is encountered apart from the embracing set of characteristics of Hindu religious civilization that interpenetrate and link it with Vedic/Brahmanic values. Extant texts and current practices are embedded in this larger context, and this enables a reference without discomfort to “Hinduism” and to mean by it more than a mere collocation of discrete sects. As the *śāstris* and *paṇḍits*—the erudite commentators whose explications are the dynamics and the definition of Hindu tradition—have consistently attempted to show, often with considerable ingenuity, it is diversity rather than simple pluralism that ultimately characterizes Hinduism.

Linguistically, *bhaga*, *Bhagavat/Bhagavān*, and *bhakti* are derived from the Sanskrit root *bhaj*, meaning “apportion,

distribute” as well as “partake, participate, choose.” Already in the *R̥gveda Saṃhitā*, *bhaga* means “portion, share,” *inter alia*, and it occurs also as the name of one of the divine *Ādityas*. *Bhagavān* thus denotes “having a share(s), lucky, fortunate, blessed.” But the *Bhagavān* is more than simply fortunate. He is someone (human or divine) who both “takes a share in” and bestows shares. Being lucky encompasses beneficence.

Crucially, the *Bhagavān* known to the historical *Bhāgavata* movement is no other than the Absolute itself. *Bhāgavatas* identify themselves as beneficiaries of the *Bhagavān*’s essential nature: “choosing, loyal to, devoted to” the *Bhagavān*. While “sectarian” *Bhāgavatas* answer variously when asked the precise nature of their relation with the *Bhagavān* and how they, as *bhaktas*, can achieve some kind of union with Him, they often refer to a “perfect embrace.”

EARLIEST BHĀGAVATAS AND THE PĀÑCARĀTRIKAS. Perhaps the earliest inscriptional evidence of Vaiṣṇava *bhāgavatas* dates from about 115 BCE, at a temple site at Beshnagar (Bhilsa District, Madhya Pradesh). Here, Heliodoros, native of Takṣasīlā and ambassador of the Greco-Bactrian king Amtalikita (Gr., Antialkides), declares himself a *bhāgavata* in the dedication of a *Garuḍadhvaja* (a column with *Garuḍa*, the bird that is Viṣṇu’s distinctive vehicle, as its capital) to *Vāsudeva*, *devadeva*, “lord of lords.” The inscription attests to *Vāsudeva*-Viṣṇu worship in North India in the late second century BCE among “foreigners” as well as native Indians (Heliodoros’s mission was to king *Bhāgabhadra*, apparently another *bhāgavata*). Despite his name, of course, it is not known how “foreign” this Heliodoros was; and the suggestion that the *Vāsudeva* “sect’s” popularity among foreigners indicates its distance from Brahmanic convention, or even its particular success among the *ksatriyas* (nobles), is only conjecture.

Somewhat later—in the first century BCE—a cave inscription at Nanaghat (Western Maharashtra) includes reference to *Vāsudeva* and *Samkarṣaṇa* (the latter known from the *Mahābhārata* as *Vāsudeva*-Kṛṣṇa’s brother); at Ghosundi (Rajasthan), *Vāsudeva* and *Samkarṣaṇa* are also invoked in a fragmentary inscription at what is presumed to be a temple enclosure. Similar evidence is found near Mathurā (Uttar Pradesh), a celebrated center of Kṛṣṇa devotion.

These lithic records, in addition to references in the Pali Buddhist *Niddesa*, Pāṇini’s *Aṣṭādhyāyī* (4.3.92–95), and Paṭāñjali’s *Mahābhāṣya* seem to confirm the existence of a *bhāgavata* movement in north-central and northwest India in the centuries immediately preceding the common era. Still, none of this evidence clears up *Vāsudeva*’s background or the way he became identified with Viṣṇu. There is unmistakable evidence of identifications but no clear pattern of the process(es) whereby they emerged. Even in the face of the most familiar evidence there is controversy. Witness, for example, J. A. B. van Buitenen’s insistence that Viṣṇu “does not figure at all in the *Gītā* as author of the Kṛṣṇa *avatara*” (*The Bhāgavadgītā in the Mahābhārata*, Chicago, 1981,

p. 167; cf. pp. 27–28), and Alf Hiltebeitel’s counterargument that such claims (that Kṛṣṇa in the *Bhāgavadgītā* “is not yet identified with Viṣṇu”) are made “despite the clear evidence of the text” (“Toward a Coherent Study of Hinduism,” *Religious Studies Review*, 1983, vol. 9, p. 207).

Beyond the psychological likelihood that certain aspects of Vedic belief and ceremony engendered at least some “proto-*bhakti*” sentiments, there are more substantial hints of *bhakti*-like attitudes discernible in a few hymns of the *R̥gveda Saṃhitā*. Surely the *Śvetāśvatara Upaniṣad* shows that the basic elements of a *Bhāgavatism* are essentially in place, even though the *Bhagavān* in this text is *Rudra-Śiva*. However, it is in three works—the *Mahābhārata* (Book Twelve), the *Harivaṃsa* and the *Bhāgavadgītā*—that a quite elaborate “Vaiṣṇava” *Bhāgavatism* first emerges in literature. Ironically, though, the *Mahābhārata*’s *Nārāyaṇīya* section (12.326–352) is almost too rich a source. It refers to “*Sāttvatas*,” “*Bhāgavatas*,” “*Ekanti-bhāgavatas*,” and the “*Pāñcarātra*,” and, again, it is difficult to tell if these designate essentially one and the same movement or discrete sectarian groups.

Commonly, *Bhāgavata* and *Pāñcarātra* are held to be distinct movements. It also has been proposed that the *Pāñcarātrikas* are historically the first *Bhāgavata* sect or school. In both views, the majority of *Bhāgavatas* are considered to be both “eclectic” and conservative, concerned with reconciling and integrating *bhakti* with Vedic social and ritual order. *Pāñcarātrikas*, on the other hand, are characterized as coming from the fringes of the Aryan cultural and religious universe. This view tries to persuade one to see *Bhāgavatas* in a strict sense as *smārtas* (“orthodox” brahmins) of sorts and, by extension, *gṛhasthas* (“householders”). By contrast, the original *Pāñcarātrikas* would be socially marginal renunciants-ascetics—even “proto-*tāntrikas*.” Some scholars also point out that the absence of the distinctive *Pāñcarātra* notion of *vyūhas* (“manifestations” of the divine) or, indeed, of any direct reference to the *Pāñcarātra* in either the *Bhāgavadgītā* or the *Bhāgavata Purāna* signals discrete historical traditions. Similarly, some have argued that the cosmogony and cosmology depicted in the *Pāñcarātra Saṃhitās* (the earliest of which date perhaps from the sixth century CE) emphasize distinctively the world-creating and world-maintaining instrumentality of Viṣṇu-Nārāyaṇa’s *śakti*, whereas the *Bhāgavadgītā*, in making roughly the same point, draws rather on other imagery: the *Bhagavān* is fully and freely at work in the world without being limited by it in any way.

But early *Bhāgavatas* and *Pāñcarātrikas* seem rather to represent different tendencies of conceptualization and ritual orientation than formally distinct sects. Early *Pāñcarātrikas*, then, may well have been certain among the *Bhāgavatas* who were closely associated both with renunciants and with formal ritualist traditions. Their developing ideas and ritual practices possibly yielded, in their *Saṃhitās*, the first sectlike tradition among the *Bhāgavatas*. As Adalbert Gail put it succinctly, all *Pāñcarātrikas* were *Bhāgavatas* but not all

Bhāgavatas were Pāñcarātrikas. (Adalbert Gail, *Bhakti im Bhāgavatapurāna*, Wiesbaden, 1969, p. 7.)

BHĀGAVATAS, SMĀRTAS, AND VAIKHĀNASAS. Although it would be entirely wide of the mark to think of the earliest Bhāgavatas principally as brahmans accommodating ideas newly discovered by renunciant adventurers or encroaching from tribal or other extra-Vedic populations, the manifest processes whereby Bhagavatism becomes an idiom of Hinduism center among brahmans. Of them, those who carefully uphold and observe the precepts set forth in Vedic Smārtasūtras are known as Smārta brahmans. Historically, this appellation has come to designate in particular those brahmans who adhere to principles and teachings usually attributed to Śankara (or, occasionally, to Kumārilabhaṭṭa). These Smārtas are often mistakenly identified simply as Śaivas, but in fact, Smārta ritual centers expressly on observances enjoined by the *sūtras* and performance of *pañcāyatana* to five divinities: Śiva, Viṣṇu, Durgā, Sūrya, and Gaṇeśa.

Even taking into account Śankara's (or Kumāri's) traditional reforming role, most scholars see in the Smārtas not a sect but rather a formalization and renewal of persisting Vedic values better thought of as constituting a Hindu "orthodoxy" or "orthopraxy." And, too, reaffirming obligations to Smārtasūtra injunctions was to some extent a reaction to the emerging strength and popularity of the general *bhakti/bhāgavata* movement. In a sense, then, the Smārtas are an "antisept."

Some have claimed that it is precisely among groups or "schools" of careful adherents to one or another Smārtasūtra that there is found a Bhagavatism that is consciously concerned with linking itself to Vedic and Brahmanic proprieties. Hence it has been suggested that the Vaikhānasas represent either a Vedic ritual school accommodating Bhāgavata elements or a group of Bhāgavatas attempting Brahmanic legitimation by adopting the trappings of Smārtahood. Which hypothesis is closer to the historical truth cannot be determined now, but certainly Vaikhānasas are Bhāgavatas; and Vaikhānasas differ from Pāñcarātrikas in important part by identifying themselves as strict *vaidikas* (i.e., conforming to the Vedas) who carefully maintain Smārta standards.

EARLY BHĀGAVATAS OF TAMIL NADU: THE ĀLVĀRS. Although assumed to be rooted in North India, both Pāñcarātra and Vaikhānasa traditions are historically more prominent in south India than in the north, particularly in Tamil Nadu and Andhra Pradesh. The spread of such movements as the Pāñcarātra, however, most likely was not the first introduction of Viṣṇu *bhakti* to the South, for Tamil literature of the first and second centuries already attests to the existence of a Viṣṇu cultus. Together with the Śaiva Nāyanārs, the most famous early South Indian *bhaktas* are the Ālvārs, Tamil Vaiṣṇava poet-ecstatics who apparently lived and sang praise to Viṣṇu from the seventh to the ninth centuries.

In fact, what is especially noteworthy about these Tamil Bhāgavatas—a fitting designation although the word *Bhāgavān* does not appear in their poetry—is the strongly emotional nature of their *bhakti*. In an important sense, it is in and through the Ālvārs that *bhakti* and Bhagavatism acquire a voice independent of Vedic or Vedantic formalism. With the Ālvārs, *bhakti* is neither the crowning achievement of yoga nor, as Śankara especially would have it, the foremost among preliminary practices prior to final realization; rather, it is a self-validating expression of sentiment and a definition of the human-divine relationship. In the Ālvārs' Tamil poetry, *bhakti* is first heard in its independent maturity—as song.

THE BHĀGAVATA PURĀNA AND ITS INFLUENCE. Certainly written in South India and receiving more or less final form by the tenth century, the *Bhāgavata Purāna* was strongly influenced by the Tamil Alvars to such a degree that some portions of the text are little more than paraphrases or outright Sanskrit translations of Alvaric originals. It is in *Bhāgavata Purāna* that an intellectually and emotionally rich Bhāgavata perspective first appears in Sanskrit literature.

Only subsequent to the appearance of the *Bhāgavata Purāna* does a vigorous, specifically sectarian Bhagavatism emerge; the most famous Vaiṣṇava devotional sects trace their origins or crucial reforms to a period from the twelfth and (particularly) the thirteenth centuries to the sixteenth and seventeenth centuries. Especially prominent among these are the four so-called classical *sampradāyas* ("traditions, sects"), all linked in one way or another to South India: Rāmānuja's Śrīsampradāya, Madhva's Brahmasampradāya, Nimbārka's Sanakādisampradāya, and Viṣṇusvāmin's Rudrasampradāya, this last-named absorbed by Vallabhācārya's Vāllabhāsampradāya. Connecting these sects are commentaries in which their founders elaborate not only Bhāgavata devotional attitudes but also alternative interpretations of the Vedantic *pramāṇatraya* ("three authorities"): the *Bhāgavadgītā*, the Upaniṣads, and the *Brahma Sūtra*. Through these commentaries Vaiṣṇava Bhagavatism becomes a full, articulate participant in Vedantic Brahmanism. No doubt the adherents of Hinduism's various sects have tended to be relatively few. Most Hindus are not sectarians in any rigorous sense, identifying rather with individual *sampradāyas* without becoming initiates or being strictly bound to their teachings and practices. But if it could be written at all, a "history" of Bhagavatism would trace the rise of individual Bhāgavata sects, and, cumulatively, the particularities of each would highlight the concrete actualities of Bhagavatism.

THE BHĀGAVATAS OF KARNATAKA AND THE MĀDHVAS. The movement founded by Madhva (also known as Ānandatīrtha; 1199–1278) is commonly held to be the first founded solely on the *Bhāgavata Purāna*. (Although the pre-existent Śrīsampradāya of Rāmānuja is usually considered a Pāñcarātra-based sectarian development, its principal indebtedness may be rather to the Ālvārs.) Earlier than Madhva and even the *Bhāgavata Purāna*, a formal Bhāgavatasampradāya

had emerged in the Kannara/Tulu country of western Karnataka. Probably influential in the development of Madhva's thought and still active today, this group descends from certain Smārta brahmins who became increasingly attached to Viṣṇu (possibly due to the growing general popularity of an informal Bhagavatism flowing in particular from the Maharashtra region).

Madhva's fame in the history of Vedantic thought rests on his unconditionally "dualist" position. According to him, the ineradicable distinction between the Absolute and humans must be understood. Madhva's goal is neither to become one with the Absolute nor to realize essential unity with it but rather to participate in it. Knowledge and its concomitant joy in eternal individuality are the heart of Madhva's teaching, which represents the most eloquent articulation in traditional Vedantic idiom of devotees' heartfelt sentiments. And it is perhaps in Madhva's traditions and practices that the complexities of earliest Bhagavatism most authentically survive.

VĀRAKARĪS AND OTHERS: BHAKTAS OF MAHARASHTRA. Bhāgavatas are known to have existed in Maharashtra from before the beginning of the Common Era. A particularly vigorous and complex vernacular Maratha *bhakti* tradition began to emerge in the thirteenth century, however, partly in consequence of the coming together of several traditions both within and beyond Maharashtra. Most significant of these appear to have been the Mādhyas, the Nāthas, the Sants, and the resurgent Vārakarī tradition.

The so-called Haridasas or Vaiṣṇavadāsas, vernacular hymnists to Viṣṇu, seem to have been inspired directly or indirectly by Madhva's teachings. Their influence quickly spread beyond the Kannada-speaking area, partly because of increasing attention they paid to Viṭhobā/Viṭṭhal, the regional divinity whose cult center was and remains Pandharpur in Maharashtra. Viṭhobā may originally have been (partly) the focus of a Śaiva cult, but the identification "Viṭhoba-Kṛṣṇa-Rāma" quickly established Pandharpur as the principal pilgrimage center for Maharashtrian Bhāgavatas—a very significant factor in the spread of this popular, vernacular Bhagavatism in Maharashtra and also farther south and east.

In the mid-1200s the "radical" and secretive Mahānubhāva (Manbhau) sect arose in Maharashtra, founded by Cakradhāra, who was a Gujarati. This Kṛṣṇa-centered movement evidences influences as various as Pāñcarātra and Vīraśaiva. But toward the end of the century, Jñāneśvar (or Jñāneśvara; also known as Jñāndev or Jñānadeva) founded or "reformed" the Vārakarī order, which was to become the most celebrated of Maharashtra's bhakta traditions. The *Jñāneśvari*, a Marathi commentary on the *Bhagavadgītā*, is Jñāneśvar's best-known work. His *abhaṅgas* (lyrical devotional hymns), however, may well have been more influential in the development of Maharashtrian bhakti, remaining a favored devotional vehicle of his successors. Tradition has it that Jñāneśvar's father had been a

Nātha, which suggests that there were some Śaiva influences on the development of Jñāneśvar's own thought.

Possibly more important even than Jñāneśvar for the growth of the Vārakarīsampradāya was Nāmdev (or Nāmadeva; 1270–1350?), a native of Pandharpur. Maharashtrian Bhagavatism owes to Nāmdev a strong tradition of depreciating the externalities of devotional service. Giving up *pūjā* and pilgrimages and rejecting monkish asceticism, Nāmdev celebrated an inner quest for purity of spirit and direct communion with the Bhagavān through reciting his holy names. This rejection of the image cult has suggested an Islamic influence, but although Muslims were a significant minority in Maharashtra in Nāmdev's time, no clear evidence supports this suggestion. In addition, Nāmdev's influence has remained strong, even though subsequent important Maharashtrian Bhāgavatas such as Eknāth (or Ekanātha; 1548–1598?) and Tukrām (or Tukārāma; 1608–1649) did not advocate abandoning *pūjā* and the image cult. However, they stressed that cult images are more significant as "symbolic" aids to worship than as the literal, living presence of divinity.

Another noteworthy feature of Kṛṣṇa Bhagavatism in Maharashtra is the emphasis on Kṛṣṇa as the faithful husband of Rukmiṇī, herself viewed as embodying the Bhagavān's dynamic and creative nature. This contrasts markedly with the focus of many Kṛṣṇa-Bhāgavatas farther north and east—especially in Bengal and Orissa—for whom the central female is rather Rādhā, Kṛṣṇa's "mistress" and the personification of the Bhāgavata's longing for the Lord.

RĀDHĀKṚṢṆA BHĀGAVATAS. Young Kṛṣṇa's amorous play with the *gopīs* epitomizes the many ways that *bhakti* is "new" in the *Bhāgavata Purāṇa*. *Kāma* ("desire"), traditional enemy of the spiritual quest, is transformed through erotic imagery and becomes a symbol for the Bhāgavata's devotion to the Bhagavān. Selfless maternal affection for the child Kṛṣṇa influences the *gopīs'* love for the mature Kṛṣṇa. Their passion becomes *prema*, *kāma* transcendent: a love transcending the worldly, selfish love in the structured dharmic realm of spouse and family. The *Bhāgavata Purāṇa* hints that one *gopī* may be special to Kṛṣṇa, but does not name her. By the twelfth century, however, Rādhā is known in North India as Kṛṣṇa's favorite, eventually taken as an *avatāra* of Śrī-Lakṣmī. Rādhā is first celebrated in Sanskrit in Jayadeva's *Gītagovinda* (early thirteenth century?). Subsequently, Rādhā and Kṛṣṇa together are central to Bhāgavata sects founded by Viṣṇusvāmin, Nimbārka, Vallabha, and Caitanya.

NIMBĀRKA. Possibly a friend of Jayadeva and a contemporary of Madhva (though doctrinally linked rather to Rāmānuja), Nimbārka (thirteenth century?) was a Telugu brahmin who settled early and permanently at Vṛndāvana. As was characteristic of Bhāgavatas, Nimbārka was captivated by the problem of the relation of the Absolute to the world. As a Vedantin, he proposed an alternative to the positions of Śaṅkara, Rāmānuja, and Madhva through a realistic

dvaitādvaita doctrine of *bhedābheda*, “distinct yet not different [from the phenomenal world].”

Unfolding in Nimbārka’s writings (all in Sanskrit) is the notion of *prapatti* (“surrender”); the idea was derived from Rāmānuja and was especially elaborated by certain of Rāmānuja’s successors. According to Nimbārka, this is the necessary first of two stages of the Bhāgavata’s right relationship to the Bhagavān. The roles of human and divine in the drama of salvation are at issue; *prapatti* proposes that the initiative for this process is exclusively the Bhagavān’s. The Bhāgavata can only surrender utterly to the Bhagavān’s grace, abandoning all sense of personal capacity for efficacious action. To the sincere *prapanna* (“suppliant”) the Bhagavān gracefully bestows direct perception of himself.

Although Nimbārka’s Sanakasampradāya, extensively reformed in the fifteenth century, is itself generally restricted to an area around Mathurā and to some centers in Agra and in Bengal, Nimbārka’s influence seems apparent in the teachings of Caitanya. Strongly influenced by Ramanujist tradition, Nimbārka distanced himself from an early, rather eclectic *smārta* Bhagavatism, emerging as among the most adventuresome of those Bhāgavatas who explored bhakti’s more radical implications.

VIṢṆUSVĀMIN AND VALLABHA. Viṣṇusvāmin was the reputed founder of the Rudrasampradāya, which was regarded, along with those of Rāmānuja, Madhva, and Nimbārka, as one of the four great Bhāgavata schools or sects. Viṣṇusvāmin lived perhaps in the thirteenth century and, according to one account, was the *mantri* (“minister”) of a South Indian prince. Some traditions hold that Viṣṇusvāmin was a teacher both of Maharashtra’s Jñāneśvar and of Madhva, but the evidence is meager and conflicting. And, although Viṣṇusvāmin apparently was a Vedantin, his commentaries on the *Bhagavadgītā* and the *Brahma Sūtra* have not survived. Tradition holds that he was a “dualist” who taught that “creation” was inspired by Brahmā’s primordial loneliness and that individuals and the world itself proceeded from the Absolute as sparks leap from a flame.

Apparently, it is in Vallabhācārya’s teachings that Viṣṇusvāmin’s thought survives. Vallabha (1479–1531), son of a Telugu brahman and *Yajurveda* schoolman, was born in what is now Madhya Pradesh and spent his childhood mostly in Banaras. His Vedantic teachings are known as *śuddhādvaita* (“pure, or purified, nondualism”). In his view, Vallabha “corrected” or “purified” Śaṅkara’s *advaita* by demonstrating that *māyā* (“appearance, illusion”) is entirely a power of the Absolute (that is, Kṛṣṇa), and thus is in no sense independent of it. Real fragments of that Absolute, individuals are lost in forgetfulness and egotism until Kṛṣṇa manifests himself. That crucial act of grace inaugurates the *puṣṭimārga* (“way of sustenance [of the soul]”), leading to eternal, joyous (re-)union with Kṛṣṇa.

Vallabha’s personal example was no less consequential than his theology. Tireless pilgrim, dedicated attendant on

images, he became for his followers the preeminent, paradigmatic *sevaka* (“servant”) of Kṛṣṇa. Decrying external acts empty of sincere emotion, Vallabha the ritualist urged that all acts be performed fully in a spirit of sweet and playful joy, a spirit captured most impressively in the *rāslīlā* celebrations associated with the Vallabhācārīs.

In literature, the emotional fervor engendered amongst the Vallabhācārīs is particularly evident in the poetry of Sūrdās (1483–1563). Occasionally, the emotional abandon urged by Vallabha’s example and nurtured by his successors led to “excesses” that, in the nineteenth century, even summoned restrictions from civil authorities. The teachings of Vallabhācārya are part of the inspiration for the “radical” Rādhāvallabhī and Sakhībhaḥva movements in which Rādhā rather than Kṛṣṇa becomes central, Sakhībhaḥva adherents going so far as to wear women’s clothing and to attempt to lead the life of Rādhā. Overall, Vallabhācārya’s *puṣṭimārga*—prominent and influential across North India—is a particularly impressive and vital expression of Bhagavatism and its pervasive influence on learned tradition and popular piety.

CAITANYA. Bengal’s Sena dynasty (fl. twelfth through thirteenth centuries) championed the *Bhāgavata Purāṇa*, and its spirit is witnessed early in the Bengal/Orissa region in the Sanskrit *Gītagovinda* as well as in the devotional Bengali lyrics of such poets as Ḍimboka, Candidāsa, and Vidyāpati, who flourished from the twelfth through the sixteenth century. Doubtless the most famous Bhāgavata of this complex cultural region is Viśvambara Miśra, known best by the name he assumed as a *saṁnyāsīn*: Kṛṣṇacaitanya. Born in Nadiya, probably in 1486, Caitanya is reported first to have been influenced by an itinerant Madhva teacher, though it is reasonable to assume that vibrant local devotional traditions were very significant as well. A definitive “conversion” to Kṛṣṇa Bhagavatism seems to have occurred in his early manhood. Henceforth, Caitanya was a phenomenon rarely observed even in Bengal’s diverse culture. He became an extreme example of “god-intoxication”; and, swept at one moment by the ecstasy of experiencing Kṛṣṇa directly, and at the next moment by the agony of separation (*viraha*), he is reported to have staggered, fallen, danced, sung, roared, wept, laughed, and ranted in ways that attracted, challenged, and even threatened many of his contemporaries.

Only a few lines traditionally attributed to Caitanya survive. But his personal example and direct teachings drew about him disciples whose biographical, ritual, and theological writings—especially in the course of the sixteenth century—quickly and securely established an enduring religious movement that is the basis of the Gauḍīyasampradāya and the Hare Krishna group of the present time.

From the writings of his principal immediate disciples, the Gosvāmins, it is learned that Caitanya’s “religious Vedanta” is most aptly characterized as *acintyabhedābheda*: Kṛṣṇa, the Absolute, and the individual *jīvas* (“souls”) are “inconceivably discrete (yet) not different.” But it is less for

this variant on a familiar theme of Vaiṣṇava Vedānta than for the living example of his person that Caitanya is most significant historically. From “intentional” enactment of Kṛṣṇa’s sports Caitanya drifted almost insensibly to a personal sense of reactualizing them, or, at least, so he was experienced by many of his followers. Devotees and object of devotion lost clear-cut boundaries in such “performances,” which became nearly a “Tantric” *sādhana* (“actualization”). As such, these witness also the potent influence of Bengal’s (ultimately Buddhist?) Sahajiya tradition. However, the latter’s monistic thrust properly differentiates it from the fundamentally dualistic vision evident in Caitanya’s alternating joy and despair in his separateness from Kṛṣṇa. Caitanya, as other Bhāgavatas, remained a *bhakta*, a devotee whose enduring problematic was also his *raison d’être*.

BIBLIOGRAPHY

Jan Gonda’s *Die Religionen Indiens*, vol. 2, *Der jüngere Hinduismus* (Stuttgart, 1963) continues to be the single most valuable general account of Bhāgavata backgrounds and individual sectarian developments; the notes contain numerous important bibliographical references. Anne-Marie Esnoul’s “Le courant affectif à l’intérieur du Brahmanisme ancien,” *Bulletin de l’École Française d’Extrême Orient* (1956): 141–207, is a stimulating and beautifully nuanced comprehensive account. Although dated, R. G. Bhandarkar’s classic *Vaiṣṇavism, Saivism, and Minor Religious Systems* (1913; reprint, Varanasi, 1965) and J. N. Farquhar’s *An Outline of the Religious Literature of India* (Oxford, 1920) remain obligatory reading.

Among the most significant and appealing of relevant primary sources in English translation are A. K. Ramanujan’s translation of selected hymns of Nammālvār, *Hymns for the Drowning* (Princeton, 1981); Barbara Stoler Miller’s rendering of Jayadeva’s *Gītāgovinda, Love Song of the Dark Lord* (New York, 1977); and Edward C. Dimock, Jr. and Denise Leveret’s translation of representative Bengali lyrics, *In Praise of Krishna* (1967; reprint, Chicago, 1981).

G. R. WELBON (1987 AND 2005)

VAIṢṆAVISM: PĀÑCARĀTRAS

A movement or sect called Pāñcarātra figures significantly in some of the earliest textual evidence used by scholars to trace the historical emergence of Hindu, specifically Vaiṣṇava, devotional (*bhakti*) cults. Pāñcarātra is known to have influenced the development of Vaiṣṇava sectarian thought in several parts of India, and it remains a vigorous presence in South India today as an essential constituent of Śrī Vaiṣṇava religion and one of two Vaiṣṇava *āgamas* (traditions) that inform South India’s Hindu temple culture.

The beginnings of the historical Pāñcarātra—and even the original sense of the word *pañcarātra*—remain matters

of uncertainty and considerable scholarly dispute. Initially, the movement may not have been associated with any single doctrinal position. And when it first became associated with one, that position seems only secondarily to have been Vaiṣṇava. “The origin of Pañcarātra is obscure,” J. A. B. van Buitenen observed, “because it has no[t] one origin” (van Buitenen, 1971, p. 6).

The problems begin with the word itself. Deprived of context, the compound *pañca-rātra* yields no clue beyond its literal sense: as a noun, it means “five nights” or “night of (the) five”; as an adjective, “five-night (ed).” Explanations given in the Pāñcarātra Saṃhitās (classical school manuals, none of which may be earlier than the sixth century CE) seem clearly ex post facto rationalizations embedded in apologetic and polemic. However faithfully such explanations record what certain Pāñcarātrikas (members of the Pāñcarātra tradition) came to mean by the word, they offer no secure insight into what it meant originally.

Śatapatha Brāhmaṇa 13.6.1.1 asserts that the primordial Puruṣa Nārāyaṇa, “wishing to become all things,” performed Puruṣamedha (“human sacrifice”), a *pañcarātra sattra* (“five-day sacrifice”). In light of this occurrence (apparently the earliest) of the word in Vedic-Brahmanic literature, some scholars have found irresistible the temptation to seek the original meaning of the name *Pāñcarātra* in the Vedic sacrificial milieu. Thus, as F. Otto Schrader concluded, “it appears . . . that the sect took its name from its central dogma which was the Pāñcarātra Sattra of Nārāyaṇa interpreted philosophically as the fivefold self-manifestation of God by means of his Para, Vyūha, Vibhava, Antaryāmin, and Arcā forms” (Schrader, 1916, p. 25). Quite possibly this passage from the *Śatapatha Brāhmaṇa* evidences Nārāyaṇa’s integration and legitimization into the Vedic ritual and intellectual world; but it may as well be an accommodation of certain Pāñcarātric associations as the source of them. In any case, except for Nārāyaṇa’s centrality, the details of the *Śatapatha Brāhmaṇa* ritual neither confirm nor reinforce the preoccupations and central features of historical Pāñcarātra literature and practice.

Moreover, van Buitenen has argued persuasively that particular literary, doctrinal, and ritual associations such as those mentioned above are only secondary or subsequent specifications of an older, more wide-ranging acceptance of the word. In his view, *pañcarātra* initially referred to a characteristic of the way of life of itinerant recluses: their living apart from “towns” (that is, major settlements) except during the two-month rainy season. A *pañcarātrika* in such early texts as the *Bṛhatkathāślokaśamgraha*, then, “is not distinguished by any particular faith or creed, but by a more or less ascetic life-rule,” one prescribing five nights in the forest for every night spent in a town (van Buitenen, 1971, pp. 14–15). If van Buitenen is correct, it would not be the first time in India that practice has crucially preceded systematic theory. And his thesis would support a plausible solution to the longstanding puzzle concerning the relationship be-

tween Pāñcarātrikas and Bhāgavatas: the former may simply have been Bhāgavatas who led generally reclusive and ascetic lives.

EPIC PĀÑCARĀTRA. While certain texts (e.g., Ānandagiri's *Śaṅkaravijaya*) distinguish between Pāñcarātras and Bhāgavatas—and, indeed, consider Vaiṣṇavas distinct from both—it is not clear that the two necessarily were discrete in any sectlike way. The essence of “epic” Pāñcarātra is *bhakti*: unconditional devotion to the Lord (Bhagavat). The earliest unambiguous evidence of this “historical” Pāñcarātra seems to be that found in *Mahābhārata* 12.321ff, the *Nārāyaṇīya*, or *Nārādīya*, section, which introduces a religious attitude and a cosmology that agree in essential details with the teachings of the later Saṃhitās. Responding to a query concerning what god to worship, this “secret” teaching tells of a “hidden” god, invisible to all but his *ekānta-bhaktas* (“exclusive devotees”), to whom he graciously reveals himself. Such an *ekāntin* (“exclusivist”) was King Uparicara, who worshiped Nārāyaṇa according to Sātvata rites and, believing kingdom, wives, and wealth to be his by Nārāyaṇa's boon, offered all these possessions to the Lord (*Mahābhārata* 12.322.17ff). Other *ekāntins* inhabited Śvetadvīpa (“white, or pure, island”), located to the north in the Milk Ocean. Knowing Pāñcarātra teachings, they saw Brahman-Nārāyaṇa while others were blinded by his radiance (*Mahābhārata* 2.323.26ff).

Sātvata is another name for the Vṛṣṇi, who are part of a larger population of Yādavas, commonly thought to have been the society in which Kṛṣṇa-Vāsudeva *bhakti* rose. Epic Sātvatas are Nārāyaṇa *bhaktas* (“devotees”); but the *Nārāyaṇīya* explains that Nārāyaṇa, “formerly single-imagined,” caused himself to be born as the “fourfold” son of Dharma: Nara, Nārāyaṇa, Kṛṣṇa, and Hari (*Mahābhārata* 12.321.15–16).

The unitary god's multiple births or manifestations are familiar in Vaiṣṇava religious thought in general; and the historical Pāñcarātra seems to have contributed significantly to developing and enriching this notion. Doubtless, the epic Nārāyaṇa's four *vyūhas* (“appearances, modes of being”) elaborate upon longstanding habits of identifying (or confusing) one divinity with another (or a divinity with a devotee), habits reinforced by factors such as the multiplication of divine epithets and the intensifying interaction between socio-religious groups, their ideologies and practices. Practically, this scheme facilitated the organization and “rationalization” of historically discrete devotional cults under a single, overarching principle, here Nārāyaṇa-Vāsudeva. In the *Nārāyaṇīya*, in fact, is found not one but two sets of multiple births that possibly developed independently. In addition to the more or less abstract Nara-Nārāyaṇa-Kṛṣṇa-Hari tetrad, there is the genealogical series Kṛṣṇa-Saṃkarṣaṇa (=Balakṛṣṇa)-Pradyumna-Aniruddha; that is, Kṛṣṇa, his brother, his elder son, and his grandson. Which set is the prior cannot be determined, although the latter is ultimately the more significant.

But something even more important is at work here: Pāñcarātrikas wanted to show how their supreme god could pervade the world and yet not be limited by it. To account for this, they drew upon several explanatory aids. And *vyūhas* were not the least important among them; for, as Jan Gonda observes, “already in Vedic ritualism the idea of *vyūha* implied an effective arrangement of the parts of a coherent whole” (Gonda, 1970, p. 50).

Epic *pāñcarātrikas*, then, are first and foremost *bhāgavatas* and *ekāntabhaktas*; and it is reasonable to conclude that the roots of their devotionalism are extra-Vedic. The Pāñcarātrikas are distinguished from similar groups of devotees by their particular efforts to show that their Lord is the underlying reality of all gods and that he is everywhere in the world without being subject to its manifest limitations. Crucial in this enterprise is their thoroughgoing exploitation of a theistic Saṃkhya to explain the relation between this world and the supreme reality, as will be elaborated upon in the next section. Further, there is an equally insistent attempt to link the Nārāyaṇa-Vāsudeva-Kṛṣṇa of religious experience to prestigious Vedic explanations, which, by allusion, include even the fourfold Puruṣa of the *Puruṣasūkta* (*Rgveda* 10.90).

PĀÑCARĀTRA THOUGHT IN THE SAṂHITĀS. The principal texts of historical Pāñcarātra are the Saṃhitās (“collections”), of which there are 108 works according to tradition, and more than double that number reckoning all titles cited in lists. Far fewer texts are readily available for study, and among them the most significant seem to be *Paṇḍara*, *Jayākhyā*, *Sātvata* (constituting the “three gems” and presumably among the oldest), *Ahīrbudhmyā*, *Pārameśvara*, *Sanātkumāra* (quoted more than once by Yāmuna), *Parama*, *Padma*, *Isvara*, and *Lakṣmī*. It is uncertain exactly when any of these was composed. Some may be as early as the sixth or seventh century CE although confirming citations date no earlier than the tenth century, and several are referred to only in the thirteenth or fourteenth century and later.

Formally, these texts closely resemble the Śaivāgamas (indeed, in this context, the terms *saṃhitā*, *āgama*, *tantra*, and *śāstra* are essentially interchangeable). Traditionally, they purported to deal with four topics: *jñāna* (“knowledge”), *yoga* (“disciplined concentration”), *kriyā* (“action”), and *caryā* (“conduct”). In fact, only one or two actually approximate this paradigm. The majority concentrate almost exclusively on *kriyā* and *caryā*: prescriptions for constructing and consecrating temples and “images” (of various materials) in which Bhagavān Nārāyaṇa is pleased to dwell, and for conducting the appropriate daily and festival services. Essentially, this is the literature of temple priests, and the bulk of it deals with practical details. The explicit *jñāna* sections (*pādas*) are usually brief and bound up with stories about the creation of the world.

The Pāñcarātra's cosmogony is complex and many-tiered; and it incorporates influences and otherwise distinct ideas from many sources, Vedic and extra-vedic. But, while they differ on certain details and in the elaborateness of their

presentations, the extant Saṃhitās share an understanding about the principal features of the three-stage “order of creation” (*ṣṛṣṭīkrāma*); and this core account may be sketched here in simplified outline. At the beginning (of every world age), the *śakti* (“energy, force, power”) of *parabrahman* Nārāyaṇa-Viṣṇu awakens, opening her eyes as “action” (*kriyā*) and “becoming” (*bhūti*). She is Lakṣmī, distinct from Viṣṇu yet at the same time as inseparable from him as sunlight from sun. Although she acts independently, each act merely implements a wish of Nārāyaṇa-Viṣṇu’s. As *kriyāśakti*, Lakṣmī is the “instrumental cause of the universe” and identical with Viṣṇu’s great discus, Sudarśana. As *bhūtiśakti*, she is the “material cause,” governed by *kriyāśakti* “as the thread governs pearls in a necklace.”

In this *śuddhaṣṛṣṭi* (“pure creation”), the first *guṇas* (qualities) appear. Non-prakritic (because they are “pre-prakritic”), these qualities of the supreme Lord number six: knowledge (*jñāna*), lordship (*aiśvarya*), power (*śakti*), strength (*bala*), virility (*vīrya*), and splendor (*tejas*). The *guṇas* then pair together as knowledge/strength, lordship/virility, and power/splendor; and these three pairs respectively constitute the *vyūhas* Saṃkarṣaṇa, Pradyumna, and Aniruddha. The Lord is entirely present (with all his six qualities) in every *vyūha*, but only one pair of qualities is openly manifest in each.

These *vyūhas* appear successively, then act together—again sequentially—in the second, intermediate or “mixed” (*śuddhāśuddha*) creation. There, “impure” creation initially is carried embryo-like as an undifferentiated potentiality in Saṃkarṣaṇa’s body. Pradyumna differentiates it as *puruṣa* and *prakṛti* (“spirit” and “material potential”) and transfers it to Aniruddha, who in turn organizes it by means of his *śakti*. He is the *brahman* and *māyā* (apparent reality) of the material world, presiding over the cosmic eggs whence life as humans know it—the “prakritic” *guṇas* (*sattva*, *rajas*, *tamas*), *karman*, and time—devolves in the third, impure (*aśuddha*) creation, itself consisting first of a subtle and then a gross stage. Here the account links to familiar Sāṃkhya categories: Vāsudeva appears as the supreme *puruṣa*. Through his contact with the (material) body arises the *jīva*, otherwise called Saṃkarṣaṇa, who in turn produces *manas*, that is, Pradyumna. And from Pradyumna issues the creative agent, the *ahaṃkāra* who is Aniruddha.

In addition to their cosmogonic roles and cosmological significance, the *vyūhas* have important moral, theological, and pedagogical functions: Saṃkarṣaṇa teaches the true monotheism; Pradyumna translates that teaching into practice; and Aniruddha instructs about Pāñcarātra doctrine and the attainment of release.

Vibhavas (“manifestations”) or *avatāras* (“descents”) of the Lord are subordinate to and dependent upon the *vyūhas*. They are of two kinds: those belonging to *śuddhaṣṛṣṭi* are *mukhya* (“primary”), and the major Saṃhitās agree that they number thirty-nine. “Secondary” (*gauṇā*) *avatāras* usually are said to descend from Aniruddha. Primary and secondary

avatāras differ importantly in their natures and in the benefits to be derived by devotedly concentrating on them. Those who seek mokṣa should worship primary *avatāras*, which spring directly from the Lord’s body “like flame from flame.” Secondary *avatāras* are “ordinary” beings pervaded by a fraction of the Lord’s *śakti* to accomplish particular purpose for world maintenance. Worshiping them yields worldly rewards such as wealth or sovereignty.

With this theory of secondary *avatāras* one reaches the central preoccupations of the compilers of the Saṃhitās. It is not only “ordinary beings” who are fit receptacles for the Lord’s descent: properly consecrated through Pāñcarātra ritual, a representation in stone, metal, wood, or clay also can become an *avatāra*. Descending into the material form with a part of his inexhaustible *śakti* when the appropriate consecration rituals are performed, the Lord thereby becomes fully present in the object, which is then known as *arcā avatāra*, or “worthy of worship.”

PĀÑCARĀTRA IN PRACTICE. At the heart of epic and later Pāñcarātra is the driving insistence that salvation comes only through knowledge of ultimate truth, a knowledge that is the grace of the Lord revealed by single-minded devotion. This knowledge, open to members of all four *varṇas* (classes), depends on an understanding of the Pāñcarātra teachings. Such understanding requires the assistance of a qualified teacher (*guru*), who guides the aspirant until he determines that the student is fit to be initiated. Initiation (*dīkṣā*) consists of five rituals (*pañcasamskāra*): branding the initiate’s shoulders with the discus and conch emblems (Tāpa), instruction in the application of the cosmetic sectarian mark on the forehead (Puṇḍra), assigning a new name to the initiate (Nāman), confiding a secret *mantra* and explaining its sense (Mantra), and teaching the details of external ritual (Yāga). In addition, the adept learns a yoga for internal worship, that performed in the heart.

Services to the Lord combine with a life of purity and harmlessness (*ahimsā*) to the end of realizing “devotional union” with the Lord. The Pāñcarātrika is assured that there will be moments when “absolute union” with the Lord will be experienced. But this is not a realization of primordial unity in any metaphysical sense. Rather, it is an active experience of rapt devotion to the Lord, whereby individuals never lose their individuality. Indeed, as “parts” of Lakṣmī or Śrī, they too are eternally distinct from the Lord. Even during the intervals between world ages, they remain separate from if latent in him.

Pāñcarātrikas have made a considerable point of stressing that they are *vaidikas*, hence that Pāñcarātra not merely ranks alongside the Veda but is in fact part of it. Nārāyaṇa-Vāsudeva, according to them, is the god of the Upaniṣads, author of the Veda and the world. They assert, in effect, that the known world is incomprehensible in terms of *karman* alone. Underlying it, grounding everything, must be the supreme person.

The mildest rejoinders to such Pāñcarātra apologetics suggested that, at the very least, there was no way to prove their Vedic claims. Most responses were more severe. *Manusmṛiti* 10.23 declares, for example, that Sātvatas and *ācāryas* are offspring of despised unions. And commentators identified both as temple functionaries. Denying the propriety of the lifestyles of temple priests, Smārta brahmins consider all their claims suspect. Association with a presumably extra-Vedic (i.e., tribal or nomadic) society—the Sātvata-Yādavas—combined with the importance assigned to the dynamic, creative, female principle, Lakṣmī, doubtless contributed strongly to the (negative) assessment that Pāñcarātrikas were *tantrikas* (practitioners of Tantra). In an important sense, the assessment is correct; indeed, even the Pāñcarātrikas themselves called their system a *tantra*.

PĀÑCARĀTRA IN HISTORY. It is generally accepted that the historical Pāñcarātra first emerged in northern, probably northwestern, India—it being clear, however, that Pāñcarātra itself was more an increasingly detailed set of cosmological speculations and devotional attitudes and procedures than it was a sect proper. This Pāñcarātra “system of thought” became the rationale of increasing numbers of Vaiṣṇava Bhāgavatas who were involved in temple and domestic devotional ritual. Its influence seems especially strong among the Mahānubhāvas of Maharashtra (from the mid-thirteenth century) and among the Narasiṃhas.

Even more apparent than its northern heritage is the fact that Pāñcarātra has prospered more obviously in South India than in the north for at least the past millennium. Pāñcarātra’s destiny in the south is closely related to the rise of the Śrī Vaiṣṇava tradition, in which Pāñcarātra cosmological and ritual theory and practice combine with the unique vernacular devotional poetry of the Ālvārs. The early Śrī Vaiṣṇava “doctors” Nāthamuni, Yāmuna, and Rāmānuja become the most noteworthy personalities associated with the propagation and defense of Pāñcarātra ideas. Later developments in Śrī Vaiṣṇava theology and the emergence of two distinct traditions—Vaṭakalai and Tenkalai—realize and expand upon more of what was present in Pāñcarātra thinking from the start than is often recognized. Through the Śrī Vaiṣṇavas, Pāñcarātra thought informed Rāmānanda (fl. mid-fifteenth century?) and his following of Rāma *bhaktas*, thus reentering North India. Again through Śrī Vaiṣṇavism, Pāñcarātra teachings strongly influenced the non-brahman Sātānis in Karnataka.

The circumstances of Pāñcarātra’s introduction into South Indian temples are not entirely clear. Perhaps temple procedures had earlier been only customary and generally informal. In that case, the Pāñcarātra systematically introduced order and regularity. It is also possible, however, that (at least some of) the earlier Viṣṇu temple ritual was conducted according to Vaikhānasa prescriptions. More self-consciously linked to Vedic ceremonial, Vaikhānasas tended to a certain conservatism, resisting the incorporation of devotional material from the Ālvārs (to which the Pāñcarātra were quite re-

ceptive). At the same time, Vaikhānasas are closer to earlier Pāñcarātra than to its later form in their conception of such deities as Rudra-Śiva as manifestations of Viṣṇu, and thus both groups appropriately included ritual proceedings that the evolving Śrī Vaiṣṇavas often found offensive. On the other hand, however, modern-day Vaikhānasas have argued that both Pāñcarātra “*tāntrikas*” and the Śrī Vaiṣṇavas offend the Lord precisely because they allow “saints” and teachers of Śrī Vaiṣṇava tradition to intrude into temple devotional ritual in ways that improperly detract from the worship of Lord Viṣṇu.

BIBLIOGRAPHY

Jan Gonda’s *Medieval Religious Literature in Sanskrit* (Wiesbaden, 1977) is the most helpful comprehensive account of Pāñcarātra (and other major Agamic) literature and ideas. His two-volume *Die Religionen Indiens* (Stuttgart, 1960–1963) contains the best overview of the Pāñcarātra in the context of India’s religious history, and chapter 3 of his *Viṣṇuism and Śivaism* (London, 1970) significantly augments discussions of early Vaiṣṇava “theology.” Of assistance in sorting out *tantra* and *āgama* is *Hindu Tantrism* by Teun Goudriaan, Dirk Jan Hoens, and Sanjukta Gupta (Leiden, 1979), especially Goudriaan’s survey (pp. 3–67). J. A. B. van Buitenen’s crucial thesis concerning the original sense of the term *pañcarātra* is included in the introduction to his translation of Yāmuna’s *Āgamaprāmānyam* (Madras, 1971), itself a primary source of great importance, and his “On the Archaism of the *Bhāgavata Purāṇa*,” in *Krishna: Myths, Rites, and Attitudes*, edited by Milton Singer (Honolulu, 1966), pp. 23–40, remains important. Walter Neevel’s *Yāmuna’s Vedānta and Pāñcarātra*, “Harvard Dissertations in Religion,” no. 10 (Missoula, Mont., 1977), gives valuable information especially on Yāmuna’s “Vedantic gentrification” of Pāñcarātra. Suvira Jaiswal’s *The Origin and Development of Vaiṣṇavism* (Delhi, 1967) is useful so long as its historical reconstructions are read with caution.

Of course, one wants to encounter Pāñcarātra through primary sources. For this, F. Otto Schrader’s classic *Introduction to the Pāñcarātra and the Abirbudhnya Saṃhitā* (Madras, 1916) remains the best point of departure. H. Daniel Smith’s *A Descriptive Bibliography of the Printed Texts of the Pāñcarātrāgama*, vol. 1 (Baroda, 1975), and vol. 2, *An Annotated Index to Selected Topics* (Baroda, 1980) are indispensable guides. Sanjukta Gupta’s translation of the *Lakṣmī Tantra* (Leiden, 1972) is excellent, and S. Krishnaswami Aiyangar’s reading of the *Paramasaṃhitā* (Baroda, 1940) is adequate. Finally, a precious record of actual practices is Kadamba Rangachariyar’s *The Sri Vaishnava Brahmins* (Madras, 1931).

G. R. WELBON (1987 AND 2005)

VAJRABODHI (671–741) was an Indian Buddhist monk and Zhenyan teacher in China. Vajrabodhi (Chin., Jingangzhi) was the second of three Vajrayana missionaries

to eighth-century China. He was born of a South Indian brahman family, and his father was a priest for the royal house. Vajrabodhi probably converted to Buddhism at the age of sixteen, although some accounts place him at the Buddhist university of Nālandā at the age of ten. He studied all varieties of Buddhism and was said to have studied for a time under the famous Buddhist logician Dharmakīrti. Under Śāntijñāna, Vajrabodhi studied Vajrayāna teachings and was duly initiated into yoga, the “Three Mysteries,” and *dhāraṇī*. Leaving India, Vajrabodhi traveled to Sri Lanka and Śrīvijaya (present-day Sumatra), where he apparently was taught a Vajrayāna tradition distinct from that taught at Nālandā. From Śrīvijaya he sailed to China and by 720 was ensconced in the Jianfu Temple at the Chinese capital, Changan. Accompanying him was his soon-to-be-famous disciple, Amoghavajra.

Like Śubhākarasiṃha, who preceded him by four years, Vajrabodhi spent most of his time in ritual activity, in translating texts, and in the production of Esoteric art. Particularly important was his partial translation of the *Sarvatathāgatātattvasaṃgraha* (T. D. no. 865) between the years 723 and 724. This Yoga Tantra—along with the *Mahāvairocana Sūtra* (T. D. no. 848), translated by Subhākarasiṃha the same year—provides the foundation of the Zhenyan school in China and the Shingon and Esoteric branch of the Tendai school (Taimitsu) in Japan. Like Śubhākarasiṃha, Vajrabodhi had ties to high court circles and enjoyed the patronage of imperial princesses; he also worked with the Chinese monk Yi Xing. Vajrabodhi died in 732 and was buried south of the Longmen caves. He was posthumously awarded the title Guoshi, “Teacher of the Realm.”

Vajrabodhi’s importance was twofold. Although the doctrines of the Yoga Tantras were known to Śubhākarasiṃha, Vajrabodhi was the first translator and systematic teacher in China of the *Sarvatathāgatātattvasaṃgraha* and of Vajrayāna as practiced in South India and in Śrīvijaya. Second, Vajrabodhi reinforced the presence and visibility of the Vajrayana at the Chinese court, a presence that, under his disciple Amoghavajra, would become the dominant force in the court during the second half of the eighth century.

Zhou Yi Liang provides a copiously annotated translation of the standard biographies of Vajrabodhi, Subhākarasiṃha, and Amoghavajra in his “Tantrism in China,” *Harvard Journal of Asiatic Studies* 8 (March 1945): 241–332.

CHARLES D. ORZECZ (1987)

VAJRADHARA (Tib., Rdo rje chang [Dorje chang]; Mongolian, Ochirdana) is, in the last stages of Indian Tantric Buddhism and in the continuing Tibetan traditions, the

distinct embodiment of the highest state of being, the primordial Ādibuddha, and the revealer of all the Tantras. But he was not always thus, for in the beginning in India *Vajradhara* was simply another name for Vajrapāṇi (Tib., Phyag na rdo rje [Chagna dorje]), both *bodhisattva* and deity. One can explain this development as the logical expansion of the tiny terminological difference between the less concrete “bearer (-dhara) of the *vajra*” and the unambiguous “*vajra* in hand.” Vajrasattva (Tib., Rdo rje sems dpa’ [Dorje sempa]; Chin., Wo tzu lo sa tsui; Jap., Kongosatta) further complicates the historical picture. “*Vajra* being” was at first another early synonym for Vajrapāṇi, then both a synonym for Vajradhara and a distinct deity in his own right. Nor had Vajrapāṇi played a single unitary role in the history of Buddhism in India and beyond.

THE REAL VAJRADHARA. Given the logic of terminological abstraction, one might expect Vajrasattva to be loftier than Vajradhara (when they are distinguished). But it is Vajradhara alone who represents one of just two possible representations of the *dharmakāya*, the highest, in Tibetan Buddhism. The other is Samantabhadra (“All Good”; Tib., Kun tu bzang po [Kuntu zangpo]), depicted completely naked to illustrate his distance from conventions. In the Mahāyāna and Tantric Buddhist analysis of the nature of enlightenment, the *dharmakāya* is the least compromised form of the Buddha or a buddha, out of space and time. Thus its representation should not be taken literally, however anthropomorphic in appearance.

Vajradhara is indeed depicted seated cross-legged in a *vajraparyāṅka* pose, on a moon disk and lotus, two-armed, hands crossed over his heart in the *vajrahūṅkara* or union gesture. His left, female hand is inside (signifying his inner wisdom and emptiness) and bearing the bell; his right, male hand holding the *vajra* is above the left to symbolize the method and compassion directed outwards. He is blue, like his historical “forefather,” Vajrapāṇi. If in union, Vajradhara’s consort is red Vajrayoginī (Vajravārāhī), embodiment of *prajñāpāramitā* (the “perfection of wisdom”), skull in left hand and flaying knife in right. Emptiness expanded, like the personification of *prajñāpāramitā*, he should not be mistaken for an individual buddha-being. Although *dharmakāya*, and therefore not individual, he wears the regal finery of a *sambhogakāya*—eight jewel ornaments and five silks. In paintings he is frequently surrounded by the eighty-four *mahāsiddhas*, Tantric Buddhist saints.

In Rdzogs chen (Dzogchen), the “Great Perfection,” or Atiyoga traditions of the Rnying ma (Nyingma, “old”) school of Tibetan Buddhism, and in Bon, the so-called pre-Buddhist religion of Tibet, Samantabhadra, not Vajradhara, is the *dharmakāya*, albeit also known as Mahāvajradhara Samantabhadra (Kun bzang rdo rje chang chen [Kunzang dorje chang chen]). Vajradhara instead manifests as the *sambhogakāya*, while the Rdzogs chen Samantabhadra is utterly separate from the Mahāyāna *bodhisattva* of that name.

At these rarefied elevations of the *dharmadhātu*, the pure *dharma* realm, Vajradhara is real, definitive (Skt., *nīścitārtha*; Tib., *nges pa don gi*), sheer concept, and the nature of everything. Such pantheism requires that nothing is not Vajradhara, if one could but realize this truth. Vajrasattva, meanwhile, is simply the *sambhogakāya* of the intangible Samantabhadra.

RELATIVE/CONVENTIONAL VAJRADHARA. To teach *bodhisattvas* and humans, the ultimate essence takes a form, a provisional symbolic (Skt., *neyārtha*; Tib., *drang don rtags*) one. This side of the dichotomy further subdivides into *sambhogakāya* and *nirmāṇakāya*, bodies of so-called “enjoyment” and “emanation.” The first is supramundane, visible only to enlightened audiences such as dwell in paradisiacal buddha-realms, Akaniṣṭha, and so forth. The *nirmāṇakāya* is a buddha’s manifestation in the world, as Śākyamuni or *bodhisattva*.

Vajradhara revealed the *mahāmudrā* teachings in India to Tilopa (c. 988–1069), thereby founding the Bka’ bryud (Kagyū) lineage. Bka’ bryud subjects agree that Tilopa instructed the Bengali Nāropa (1016–1100), who taught the Tibetan seeker Mar pa (Marpa, 1002/12–1097), who then carried the lineage back to Tibet and passed it on to Mi la ras pa (Milarepa, 1028/40–1111/23). In the Bka’ bryud traditions, Vajradhara receives special worship as both the revealer of mysteries and the mystery itself.

Vajradhara’s ultimate position is as Khyab bdag rigs drug pa, all-pervasive lord of the sixth family (Khyab dag, Samantabhadra in Rdzogs chen traditions). The six families are the typical Indian upward extension of the earlier *maṇḍala* of five, in turn the expansion of the earlier three (via an occasional intermediate four). These structures belong to different historical phases of Tantric Buddhism, chronologically successive, but carried along and incorporated into succeeding classification systems. Kriyā Tantras have three families; Yoga Tantras, five; and the highest, Yoganiruttara Tantras, six. The sixth is overlord of the five as the zenith above four cardinal directions around a unifying center. Sometimes Vajrasattva, a further essentialization of Vajradhara’s immanent nature, is conceptually located symmetrically opposite him at the nadir.

More than a millennium earlier, Vajrapāṇi had been a mere *yakṣa* sprite, albeit the “master of the mysterious [*yakṣas*]” (*gubhyakādhipati*). The epithet stayed with him and grew ever more meaningful until he was the “master of the mysterious” truth at the heart of the secret esoteric tradition, and, as Vajradhara, the ultimate source of all its unfolding scriptures.

VAJRAPĀṆĪ UNARMED. Vajradhara was once but a synonym of Vajrapāṇi, originally the Buddha’s humble attendant who happened to wield a mighty weapon. In early Indian Buddhist art his weapon is personified, in the form of Vajrapuruṣa. But by the time Vajradhara is clearly distinct from his namesake, the attribute has been further de-

personified into its essence, with the *vajra* no longer a weapon but the underlying principle of phenomenal reality.

ISABELLE ONIANS (2005)

VAJRAPĀṆĪ. “As for Vajrapāṇi . . . I confess to finding him by far the most interesting divine being throughout the whole history of Buddhism, for he has a personal history and considerable personal character.” David Snellgrove’s words were published in his magnum opus, *Indo-Tibetan Buddhism* (p. 134) in 1987, the year of this encyclopedia’s first edition. Only now has Vajrapāṇi (Tib., Phyang na rdo rje [Chagna dorje]) gained his own independent entry. His promotion in the secondary literature echoes his unparalleled rise within the history of Indian and Tibetan Buddhism (with successes also in Central Asian, Chinese, Southeast Asian, and Japanese Buddhisms). From a half-tamed spirit who became the Buddha’s constant companion, this protean shape-shifter graduates first into a *bodhisattva* and then into a deity before transcending everything as the primordial Ādibuddha, Vajradhara. However, Vajrapāṇi’s progress extends backwards too, before Buddhism, to the beginnings of Sanskrit literature, the Vedas.

INDO-EUROPEAN ETYMOLOGY AND DIVINITY. In Sanskrit, *vajrapāṇi* means “he who has a *vajra* in hand.” The word *vajra* refers to a thunderbolt, thunder crash, or lightning flash, and to its embodiment in unbreakable diamond (cf. the Tibetan neologistic translation *Rdo rje* [dor je], “Lord of Stones”) and the invincible weapon made thereof. *Vajra* is linguistically related to its Indo-European cousin, the Zoroastrian Zend *vazra*, Mithra’s “club” (cf. Vedic Mitra), and the English cognates *vigor*, *wacker*, and *wake*.

In pre-Buddhist Indian literature, the *vajra* is wielded by powerful gods, above all Indra, lord of the gods, sky, and rains. From the *Rgveda* onward, Indra’s attribute is the *vajra*. Nevertheless, while the *Rgveda* often refers to *vajrabāhu*: (*vajra* in arm) and *vajrabasta* (*vajra* in hand), their synonym, *vajrapāṇi*, is not found before the *Śaḍvimsabrahmaṇa*.

The *vajra*'s bearer has close correspondents in Greek, Roman, and northern European mythology. Zeus and Jupiter, kings of the gods and sky gods, hold the thunderbolt, while the Norse Þórr (Thor) brandishes a meteoric hammer that flashes lightning. Greco-Roman depictions of the bundle of thunder and lightning are barely distinguishable from the double-ended trident *vajra* used today across the northern Buddhist world. A Buddhist legend explains the adapted form, since the Buddha had grasped Indra's weapon and blunted it, forcing the aggressive open prongs together to create a peaceful regal scepter.

Following his Ṛgvedic supremacy, Indra, whose avatar Vajrapāṇi originally is, comes down in the world. A second-rank divinity, his supremacy is usurped by his storm-god colleague Rudra (Śiva), an opponent Vajrapāṇi will meet again many centuries later. In the *Mahābhārata*, for example, Indra is defeated, kidnapped, and humiliated, whether with the epithet *vajrapāṇi* or *vajradhara*. By this point, Vajrapāṇi had begun an alternative career that would lead him to the innermost heart of the Buddhist fold.

Separated from his godly prototype, Vajrapāṇi is an ambivalent *yakṣa*, neither divine nor human, albeit the general of the *yakṣa* army (*yakṣasenādhīpati*) and master of the whole *guhya* (secret) class of *yakṣas* (*guhyaśādhīpati*). His mastery over secrets was reinterpreted to apply to the mysteries of esoteric Buddhism. With him, military metaphors are always explicit and sustained, and his *vajra* was conceptually assimilated to the legal staff (*danda*) of a law enforcer.

VAJRAPĀṆI AND THE BUDDHA. Although Vajrapāṇi's initial Buddhist incarnation may have been as the Buddha's associate, he was not a pushover. In a rare appearance in the Pali canon, Vajrapāṇi extracts a response from Ambaṭṭha to the Buddha's twice-unanswered question about his ancestry. To illustrate the threat that a third refusal will result in his head being shattered, Vajrapāṇi appears in the sky, visible to only the two interlocutors, wielding a blazing iron thunderbolt. The terrified Ambaṭṭha's tongue is loosened, and he keeps his head.

In the fifth century CE Buddhaghosa, the preeminent Pali commentator, glosses Vajrapāṇi as Indra, possibly reflecting the contemporary Brahmanization of Buddhism during and after the Gupta period. But the memory of their earlier identity is re-remembered everywhere in Indian Buddhist history. Vajrapāṇi and Indra are certainly depicted together enough times to have autonomous existences.

Numerous postcanonical narratives depict Vajrapāṇi's feet on the ground. Many Gandharan Buddhist bas reliefs from northern Pakistan from the first centuries of the Common Era show a Herculean strongman, under obvious Hellenistic influence, holding a *vajra*. Like a bodyguard, Vajrapāṇi is ever-present (*nityānubaddha*), mostly silent, at the Buddha's side. His desolation at the Buddha's deathbed even inspired an entire sūtra, transmitted in Chinese: *On Guhyaka Vajrapāṇi's Grief and Love When the Buddha Entered into Nirvāṇa*.

However close to the Buddha, Vajrapāṇi remained a menial. Smashing a boulder dropped by Devadatta, Vajrapāṇi's ill-judged blow sent a shard into his Lord's foot. Later, to spare the Buddha's nonviolent reputation, he defeated the *nāga* dragon Apalāla. Varying accounts of the episode, detailed in Étienne Lamotte's authoritative *Vajrapāṇi en Inde* (2003), eventually credit him with single-handed conquest, in the *Mūlasarvāstivāda Vinaya*, localizing the event in northwest India.

When with the Mahāyāna, the historical Buddha and his human entourage lost their preeminence, while Vajrapāṇi, still judiciously aggressive, became venerable.

THREE BODHISATTVAS. Around the beginning of the Common Era, the young Mahāyāna Buddhism enthusiastically adopted Vajrapāṇi, if at first as a glorified protecting assistant, in such early classics as *Aṣṭasāhasrikāprajñāpāramitā Sūtra* (The perfection of wisdom in eight thousand verses sūtra).

With the Mahāyāna multiplication of *bodhisattvas*, Vajrapāṇi also becomes one, and he too is multiplied in the new tradition's proliferating style. The *bodhisattva* equivalent of the Buddha's intimate attendant, he mirrors Ānanda's function, with added Mahāyāna expansiveness: just as Ānanda guards and transmits the Śrāvakayāna sūtras, Vajrapāṇi protects and compiles fresh Mahāyāna sūtras. He is by the side of countless buddhas in multiple buddha realms, and constantly attends any *bodhisattva* who has attained the eighth to tenth of the ten *bodhisattva* stages.

Of the myriad Mahāyāna *bodhisattvas*, few merited dedicated religious cultivation. Apart from Maitreya, in particular, three stand out. Early Buddhist protectors, the Brahmanical gods Indra and Brahmā, are consequently recast as Vajrapāṇi and Padmapāṇi, bearers of the *vajra* and lotus respectively. Padmapāṇi became identified with the great *bodhisattva* of compassion, Avalokiteśvara, a Mahāyāna discovery, prompting Vajrapāṇi's subsequent parallel upgrade. With Mañjuśrī as the *bodhisattva* manifestation of Śākyamuni Buddha, the triad is complete.

In *Mañjuśrīmūlakalpa* (Mañjuśrī's fundamental instructions) in the earliest Kriyā Tantra phase of Tantric Buddhism, the trio lead three families (Skt., *trikula*), symbolized by the wheel, lotus, and *vajra*, specializing in wisdom, compassion, and power or energy (positive transmutations of the immemorial Buddhist root poisons: ignorance, greed, and hatred). Spiritual sons and heirs of the three crowning buddhas (Vairocana, Amitābha, and Akṣobhya (Tib., Mī bskyod pa [Mi kyō pa]), immovable as the adamant *vajra*), the three are ranked vertically, or at least on a slope. On the less auspicious left, Vajrapāṇi, with his entourage of fierce goddesses, remains inferior to the two embodiments of more primary Buddhist qualities. Their inequality means that one consecrated in the *vajra* family is entitled to perform fierce activities (coercing, destroying, and slaying), but not the beneficent ones, while those initiated into the gentler families

are also entitled to perform the fierce activities in an emergency.

Bodhisattvas, not buddhas, the lords of the three families (Tib., *Rigs gsum mgon po* [Riksum gönpo]) are commemorated throughout the Himalayas wherever there is Buddhism, in wayside shrines, images, or a row of three stupas—white for compassionate Avalokiteśvara, orange for wise Mañjuśrī, and black or blue-grey for powerful Vajrapāṇi. Most common are *maṇi* walls of piled-up flat stones carved with the *mantras* of the three *bodhisattvas*: *om maṇi padme hūṃ*; *om vāgīśvarī hūṃ*; and *om vajrapāṇi hūṃ*. Later Tibetan historians retrospectively identified their incarnations in the three kings who promoted Buddhism in Tibet: Srong brtsan sgam po (Songtsen gampo, r. 627–649/650); Khri Srong lde btsan (Trisong detsen, r. 755–c. 797); and Ral pa can (Rālpachen, r. 815–838), respectively Avalokiteśvara, Mañjuśrī, and finally the fierce Vajrapāṇi. Many people have been, and continue to be, recognized as incarnations of Vajrapāṇi, and of the others. While Mañjuśrī and Avalokiteśvara inspired philosophers and enduring Mahāyāna cults, Vajrapāṇi was going right to the top.

FIVE BUDDHAS. Tantric Buddhism is the Vajrayāna, the “Vajra Way.” Naturally, the *vajra* holder will be most powerful in such an eponymous religion. In earlier Kriyā and Caryā Tantras, the *vajra* family had been inferior, but in the Yoga Tantras, the family system operates with theoretical equality, graphically expressed in the *maṇḍala*’s horizontal layout.

In the Yoga Tantra *Sarvatathāgatattvasaṃgraha* (Congregation of the truth of all the buddhas, seventh century CE at the latest), Vajrapāṇi comes to the fore. With the main Vajradhātu *Maṇḍala*, his family is paramount, pervading all others. The buddha family’s Vajradhātu *Maṇḍala* is scarcely distinguished from the *vajra* family’s Trailokyavijaya *Maṇḍala*, where the expertise remains slaying and destroying. Here are located the non-Buddhist deities that Vajrapāṇi has forcibly converted, the achievement that gave him everlasting fame in Indian and Tibetan Tantric Buddhist institutional literature.

Without a single Tantric Buddhist origin myth, alternative stories compete. The literary winner is the account of Vajrapāṇi’s defeat of Maheśvara Śiva. Many texts narrate Śiva’s slaying and subjugation by Vajrapāṇi. Key is the *Sarvatathāgatattvasaṃgraha*’s telling, translated in Snellgrove (1987, pp. 136–140). Enlightened, Vairocana generates Vajradhara, from whom arises Vajrapāṇi to order Maheśvara into the *maṇḍala*. Śiva objects to obeying a mere *yakṣa*, but Vajrapāṇi threatens to destroy the whole threefold world (*trailokya*). Even when reduced to a prostrate corpse and then resurrected, the proud god refuses to submit. Finally, Vajrapāṇi triumphs and stands with his right foot on Maheśvara, and his left on that god’s consort, Umā. Thus is mythologized the assimilation of non-Buddhist traditions, mediated by Vajrapāṇi, who acquires a new title, Trailokyavijaya, “Conqueror of the three worlds.”

In the *Sarvatathāgatattvasaṃgraha*, Vairocana had been in the center of the *maṇḍala*, but in the transitional Yoga/Yogottara *Guhyasamāja Tantra* (Secret union Tantra), the *vajra* family’s buddha, Akṣobhya, takes the central position as the direct Sambhogakāya incarnation of Vajradhara. Vajrapāṇi’s erstwhile synonym is now the sum of everything, and will be of supreme importance in the Tibetan tradition. In Yoganiruttara cycles the chief deities are all *vajra* family. Akṣobhya’s emanations—Heruka, Hevajra, Saṃvara, Yamāri, Vajrakīla, Buddhakapāla, and Mahāmāya are buddhas in the style of Vajrapāṇi, with Akṣobhya on their crown, blue, fierce, and personifications of *vajra* power.

MULTIPLE VAJRAPĀṆIS. Already before the plethora of Yoganiruttara wild buddhas, Vajrapāṇi—the *bodhisattva* himself—had multiple wrathful aliases in addition to Trailokyavijaya, conqueror of Śiva: these included Mahābala (great strength), subjugator of Māra and subject of the *Mahābala Sūtra* (dateable to between the *Mañjuśrīmūlakalpa* and the *Sarvatathāgatattvasaṃgraha*); Uchuṣma (the “incinerator” of impurities); Kuṇḍali; “fierce” Caṇḍavajrapāṇi (Tib., Phyang rdor gtum po [Chagdor tumpo]); and four-armed Bhūtaḍāmara (Tib., “Byung po”i dul byed [Chungpö dulched]), his spirit-subduing form. Many of these independent deities are still cultivated today in the Tibetan tradition. The triple practice of Hayagrīva, Vajrapāṇi, and Garuḍa for the removal of obstacles, particularly *nāga* afflictions, reflects Vajrapāṇi’s association with Garuḍa, natural enemy to snakes and *nāgas*.

ICONOGRAPHY. Given the wealth of identity-shifts Vajrapāṇi has enjoyed over the last 2,500 years, his iconography is manifold. From his late Mahāyāna phase on he is crowned with the *vajra* family buddha, Akṣobhya. Like Akṣobhya, he is blue, the color of space or the night sky, or black like thunderclouds or kohl. Vajrapāṇi wears the tiger skin that represents hatred harnessed (elephant skin signifies ignorance, and a flayed human skin, desire). The tiger skin’s phallic stripes make it male, while the consort wears a female leopard skin. Yet, Vajrapāṇi is rarely depicted in union. The emphasis on wrath seems to have precluded passion, however explicitly phallic the *vajra* is in Tantric Buddhism (where it is regularly united with the female “lotus”). Usually Vajrapāṇi wields only a *vajra* (five- or nine-pronged) in his raised right hand, while his left is held at the heart in the threatening (*tarjanī*) gesture. His left hand can hold the noose to bind enemies, actual or metaphorical, or a bell. In more wrathful manifestations, the big-bellied dwarf has three eyes, a skull crown, and a snake necklace, and he steps towards the right to show his energy, standing on a sun disk on an open lotus, orange hair flaring upwards as if on fire. His *bodhisattva* form is peaceful, holding a lotus with *vajra* atop in his right hand, and making the gesture of generosity with his left.

VAJRAPĀṆI’S COMMENTARY. In addition to all his ahistorical history, Vajrapāṇi was also the name of one of the three “*bodhisattva*” authors who interpreted Tantric Buddhism in the light of the *Kālacakra Tantra* (Wheel of time Tantra) in the late tenth century CE. His *Laḡbutantraṭīkā* (Commentary on

the shorter Tantra) analyses the first ten and a half stanzas of the *Cakrasaṃvara Tantra* (Wheel of bliss Tantra).

ISABELLE ONIANS (2005)

VAJRASATTVA (Tibetan, Rdo rje sems dpa' [Dorjé Sempa]; Chinese, Jingang sadou; Japanese, Kongōsatta), the "Adamantine Being," is a *bodhisattva* affiliated primarily with the Buddha Akṣobhya (Unshakeable) but in many contexts is identified conceptually with Vajradhara (Vajra Holder). Vajrasattva is traditionally depicted iconographically as white in color with one face and two hands. In his right hand he holds close to his heart a *vajra* (thunderbolt), representing the active means toward enlightenment, and in his left hand beside his left hip an upturned bell (*ghaṇṭā*), a symbol of

emptiness (*śūnyata*) and the perfection of wisdom (*prajñāpāramitā*). Lavishly attired in the colorful garments of a princely *bodhisattva*, he sits with legs crossed in the *vajra* posture (*vajrāsana*) on a moon disk above a white lotus blossom. In some cases he is shown sitting with his right leg outstretched, and in others he is standing. He wears a crown often inscribed with an image of Akṣobhya. From his richly adorned body, rays of light (often dark blue) radiate outward to form a golden halo adorned with wish-fulfilling jewels and an outer rainbow. In this way he represents the embodied essence of all the peaceful buddhas.

Iconic images of Vajrasattva are found in statuary form and more frequently in paintings, especially of the *maṇḍala*. As a central deity of esoteric Buddhism or Vajrayāna (Adamantine or Thunderbolt Vehicle), Vajrasattva first rose to prominence in the Yoga class of Tantras. The ritual practices centered on him, including visualization of the *maṇḍala* and recitation of his hundred-syllable *mantra*, are popular among all followers of Tantric Buddhism, particularly in Tibet and in Japan. Vajrasattva's significance in the development of the Buddhist Vajrayāna tradition in India and in neighboring regions and beyond is well confirmed, although the precise details of his role in that historical process are complicated and require understanding of his divine adamantine allies, the closely related deities Vajrapāṇi (Vajra-in-Hand), Vairocana (Resplendent), and Vajradhara.

VAJRASATTVA IN INDIA. Vajrasattva first emerges as a central deity in the Yoga Tantras. The foundational text of this literary category is the *Sarvatathāgatātattvasaṃgraha* (Symposium of Truth of All the Tathagathas), also known simply as the *Tattvasaṃgraha*. Other significant Yoga Tantras include the *Sarvadurgatipariśodhana Tantra* (Tantra on the Elimination of All Evil Rebirths), the *Vajrasekhara Tantra* (Vajra Pinnacle Tantra), and the *Mañjuśrīnāmasaṃgīti* (The Litany of Names of Mañjuśrī). Evidence suggests that the *Tattvasaṃgraha* and associated Tantric works date to the beginning of the eighth century, although some scholars now argue that the *Tattvasaṃgraha* itself may have been completed slightly earlier at the end of the seventh century.

Vajrapāṇi, a closely affiliated divine precursor to Vajrasattva, first takes center stage, along with the famous *bodhisattvas* Avalokiteśvara (Lord Who Looks Down) and Mañjuśrī (Gentle Glory), in the proto-Tantric *Mañjuśrīmūlakalpa* (Fundamental Ordinance of Mañjuśrī). In this text, the three deities are described as taking up honorable positions around the Buddha Śākyamuni: Avalokiteśvara, identified here as Padmapāṇi (Lotus-in-Hand), to his right; Vajrapāṇi to his left; and Mañjuśrī (Gentle Glory) appearing below Śākyamuni at the center. This formal arrangement of Buddhist deities seems to represent an early and simplified prototype of the more elaborate fivefold arrangement of buddhas that would later become fully systematized in the Yoga Tantras. In the *Mañjuśrīmūlakalpa*, Avalokiteśvara is associated with the symbol of the lotus, the divine emblem of purity and com-

passion. The central figure of Mañjuśrī is symbolically identified as *tathāgata* (Thus Gone), a term synonymous with the Buddha and enlightenment. For Vajrapāṇi and his retinue, the preeminent symbol is the *vajra*, signifying divine and magical power—the power to pacify, augment, control, and destroy. It is largely for this reason, owing to the power associated with the *vajra*, that Vajrapāṇi is the one given the daunting task of subjugating and converting to Buddhism the Hindu god Śiva (Maheśvara) in a dramatic and influential tale first recounted in the *Tattvasaṅgraha*.

It is in this work, also, that Vairocana first appears as a manifestation of the unity of all buddhas. The *maṇḍala* of Vairocana, introduced in the *Tattvasaṅgraha* with the name Vajradhātu (Adamantine World), places Vairocana in the center surrounded by the Buddhas Akṣobhya in the eastern quarter, Ratnasambhava (Jewel Born) in the south, Amitābha (Boundless Light) in the west, and Amoghasiddhi (All Accomplishing) in the north. In time this symmetrical arrangement of five principal buddhas became standard, though with the identity of the central deity frequently changing to reflect the affiliated lineage of a particular Tantric ritual tradition. Nevertheless, the Yoga Tantras continue to maintain that in whatever form the central deity manifests, whether as Vairocana, Vajradhara, Vajrasattva, or some other buddha figure, he is always to be understood as the same in essence, that is, as the unity of all buddhas.

With the development in the Yoga Tantras of this five-fold buddha *maṇḍala* coincided the expansion of various buddha families (*kula*). It was in the proto-Tantric *Mañjuśrīmūlakalpa* that this concept of families first emerged, with the introduction of three divine groups, Tathāgata/Buddha (Mañjuśrī), Lotus (Avalokiteśvara), and Vajra (Vajrapāṇi). The *Tattvasaṅgraha* added to this list a Gem (*ratna*) family, and a fifth, Action (*karma*) family, seems first to have been introduced in the *Vajrasāekhara Tantra*. The Yoga Tantras, moreover, refer also to a transcendent sixth family represented by a supreme primordial buddha (Ādibuddha), understood as the source of the five principal buddhas. This supreme buddha is known variously as Mahāvairocana (Great Resplendent), Samantabhadra (Universal Goodness), Vajradhara, or more commonly, Vajrasattva.

Given the overall emphasis on power in Tantric Buddhism, it is the Vajra family that reigns supreme in the Tantras. Thus, it is the buddhas and *bodhisattvas* who embody the symbolism of the *vajra*—identified as such in the very names themselves—that stand at the center of the Tantric universe represented graphically in the form of the *maṇḍala*. Although originally Vairocana held the central position in the *maṇḍala* outlined in the *Tattvasaṅgraha*, it is Vajradhara, the transcendent sixth buddha, who, linked by name and power to the older Vajrapāṇi, comes eventually to replace Vairocana as the quintessential Tantric deity. Vajradhara is also identified with Vajrasattva, the *bodhisattva* associated most closely with the fierce Buddha Akṣobhya. In some

of the later Tantras, therefore, Akṣobhya is placed in the center of the *maṇḍala* and Vairocana is shifted to the east in Akṣobhya's former position. Vajradhara and Vajrasattva, both symbolically identical, and thus interchangeable, remain the transcendent embodiments of adamant power, the source and unity of all buddhas.

VAJRASATTVA IN TIBET. In Tibetan Buddhism, the iconography and ritual traditions of Vajrasattva are derived largely from the class of Indian Buddhist Yoga Tantras referred to above, though additionally in Tibet there are other primary Tantras associated with this deity. The most significant is the eighth-century *Gsang ba'i snying po* (Sanskrit, **Guhya garbha*, "Secret Nucleus"), a work belonging to a distinctively Tibetan cycle of *mahāyoga* scriptures collectively titled *Sgyu 'phrul drwa ba* (Sanskrit, *Māyājāla*, "Web of Magical Emanation"). In the *Gsang ba'i snying po*, Vajrasattva appears at the center of the *maṇḍala* of the peaceful deities (Tibetan, *zhi ba'i lha*). This *maṇḍala* is the tranquil counterreflection of an elaborate arrangement of fierce divinities (Tibetan, *khro bo'i lha*). Together, both *maṇḍalas* constitute the Tantric system of the peaceful and wrathful deities most famously represented in the *Tibetan Book of the Dead* literature.

In Tibet there are numerous ritual programs (Tibetan, *sgrub thabs*; Sanskrit, *sādhana*) dedicated to Vajrasattva, and their practice is widely popular among all the main orders of Tibetan Buddhism. These Vajrasattva rituals serve as purificatory practices and constitute a key component of the preliminaries (*sngon 'gro*) to Tantric initiation and empowerment. In this context, Vajrasattva's hundred-syllable *mantra*, recited during the preliminary rites, is held to be a particularly potent method for purifying past sins and unwholesome *karma*.

For the Rnying ma pa (Ancient Ones) school of Tibetan Buddhism, Vajrasattva is also celebrated as a key lineage holder of the Rdzogs chen (Great Perfection) teachings, and is credited with the transmission of this esoteric system into the human realm in a vision revealed to the Indian mystic Dga' rab rdo rje (Sanskrit, Prahevajra).

VAJRASATTVA IN JAPAN. The identification of Vajrasattva as a divine lineage holder of the Tantric Buddhist teachings is found also in Japan, specifically in the esoteric (*mikkyō*) sūtras of the Japanese Shingon tradition. Here, Vajrasattva, known as Kongōsatta in Japanese, is recognized as the direct recipient of the esoteric teachings of the supreme Buddha Mahāvairocana (Japanese, Dainichi), the teacher of the *Mahāvairocana* and the *Vajrasāekhara Sūtras*. Vajrasattva thus appears as second patriarch after the Great Vairocana in all established Shingon transmission lineages. From Vajrasattva the teachings were then transmitted in the human world to Nāgārjuna, and, through a succession of further Indian masters, eventually extended to the Japanese Buddhist priest Kūkai (774–835).

As in the Indian and Tibetan traditions, Vajrasattva in Japanese Shingon represents the adamant enlightenment of all buddhas. Recognized as the active and manifest power

of Mahāvairocana, he holds leadership positions within the two exclusive *maṇḍalas* of the Shingon tradition, the *taizō* (Sanskrit, *Garbhadhātu*, “Womb/Matrix World”) and *kongōkai* (Sanskrit, *Vajradhātu*, “Diamond World”). In the ritual arena, during the esoteric initiation ceremonies and construction of the *maṇḍala*, Vajrasattva is invoked by practitioners to help them attain buddhahood in this lifetime.

VAJRAYĀNA SEE BUDDHISM, SCHOOLS OF, ARTICLE ON TANTRIC RITUAL SCHOOLS OF BUDDHISM

VALHÖLL is the hall of Óðinn (Odin) in Norse mythology. The fullest descriptions of it are found in the *Prose Edda* (c. 1220–1230) of the Icelandic mythographer Snorri Sturluson and in the Eddic poem *Grímnismál* (Lay of Grímnir), one of Snorri’s main sources; tenth-century skaldic poems also make particular use of the conception. These and other texts describe Valhöll as a stately palace, with a roof of shields and spears. A wolf hangs by the west portal and an eagle droops above; both these animals are associated with Óðinn, the god of the spear, and their actions recall his self-sacrifice. Valhöll had 540 doors, through each of which 800 warriors could pass at once. (These numbers probably employ the Germanic long hundred and should be read as 640 and 960, respectively.)

Valhöll served specifically as a hall for the *einherjar*, the dead warriors of Óðinn. These chosen heroes were fetched from the battlefield by valkyries, who also served them mead in Valhöll, a scene probably reflected on such picture stones as the eighth-century Ardre VIII from Gotland, Sweden. Legendary heroes, human kings, and even the god of poetry, Bragi, are numbered among the *einherjar* in Valhöll. The god

Baldr’s arrival is mentioned once, although the mythology usually associates him with Hel. The *einherjar* spend their days in endless combat, but in the evenings they join in reconciliation for feasting and drinking. The boar Sæhrímnir is boiled each day for their food but is restored again each night. Mead runs from the udders of the goat Heiðrún. She stands above Valhöll, feeding on the foliage of Læráðr (Yggdrasil), the World Tree. The stag Eikþyrnir also chews on the tree; from his horns fluid runs into Hvergelmir, the Well of Wisdom, and thence into mighty rivers. The proximity of the tree and well suggests that Valhöll is located at or near the center of the world.

The *einherjar* (those belonging to one army, or splendid warriors) share a special relationship with Óðinn. Called his *óskasynir* (adopted sons, or beloved sons), they are his retainers, destined to fight with him in the final battle at Ragnarök. This relationship may be the key to the religious background of Valhöll. Some scholars have sought this background in ecstatic cults of Óðinn, characterized by initiation into warrior bands (perhaps secret cult groups that used animal masks). Valhöll would then represent a mythic projection of the Germanic chieftain’s hall, and the activities within would be a similar projection of the warrior life. Certainly other sources emphasize the ritual importance of feasting and drinking.

Many scholars believe that the Norse sources express a late development of conceptions of Valhöll, appropriate particularly to the warrior elite of the Viking age. At an earlier period, Valhöll may have simply indicated a grave mound. Supporting this notion is the Icelandic conception of a local mountain inhabited by dead family members; the sagas report that feasting was occasionally glimpsed within. Furthermore, in Sweden, certain rocks associated with the dead are called *valhall*. If this explanation is correct, *valhöll* (carriage hall) may actually be derived from *valhallr* (carriage rock, or carriage hill). Since *val-* may also mean “foreign,” *valhöll* might also denote “foreign hall,” and the term is used of kings’ halls in the Eddic poem *Atlakviða*.

SEE ALSO Baldr; Eddas; Óðinn; Snorri Sturluson.

BIBLIOGRAPHY

- The standard treatment of Valhöll remains that of Gustav Neckel, *Walhall: Studien über germanischen Jenseitsglauben* (Dortmund, Germany, 1913). Franz Rolf Schröder’s *Germanentum und Hellenismus* (Heidelberg, Germany, 1924) discusses the development of the concept of Valhöll under Middle Eastern influence; for instance, he points out that the sacred number 432,000 is the product of the 540 doors multiplied by the 800 warriors. In an important article, “Valhall med de mange dører,” originally published in 1931 and reprinted in his *Norrøne studier* (Oslo, 1938), Magnus Olsen argues for Roman influence in the form of amphitheaters, perhaps even the Colosseum; there, crowds surged through many doors, warriors fought regularly, and the emperor presided, not unlike a god. On ecstatic cults of Óðinn, see Otto Höfler’s *Kultische Geheimbünde der Germanen* (Frankfurt am Main, Germany, 1934); this volume is all that appeared of a projected

two-volume work. In her *Prolonged Echoes*, vol. 1, *The Myths* (Odense, Denmark, 1992), pp. 253 ff, Margaret Clunies Ross discusses the picture of what she calls the “Valhøll complex” in Snorri Sturluson’s *Edda* as an attempt to portray Óðinn as warrior chieftain in charge of a warrior elite. Ann-Lili Nielsen, “Hedniska kult—och offerhandlingar i Borg,” in *Religion från stenålder till medeltid*, edited by Kerstin Engdahl and Anders Kaliff (Linköping, Sweden, 1996), discusses cult activities in the chieftain’s farm found in Lofoten, Norway, some of which may be relevant to notions of Valhøll.

JOHN LINDOW (1987 AND 2005)

VALKYRIES, supernatural female figures of Norse myth and literature, share many features with the *disir*, *fylgjur*, *hamingjur*, Norns, and *landvettir* in the extant texts, and there is little terminological consistency. A primary function of the valkyries is indicated by the etymology of the word *valkyrja*, a compound of *valr* (carrion) and a *nomen agentis* based on the verb *kyrja* (to choose). Regarded as the maidens of Óðinn, the valkyries chose who was to die in battle and brought the chosen ones to him in Valhøll, where they joined the *einherjar*, Óðinn’s warriors. Valkyries rode through the air, bore weapons, and could be fierce in appearance, although they may have been shape-changers. Their personal names ordinarily make reference to battle. In Valhøll, valkyries served mead to the *einherjar*, a scene perhaps portrayed on the Ardre VIII picture stone (Gotland, Sweden; eighth century) and elsewhere. Sometimes, however, valkyries protected heroes in battle, a characteristic shared with the *fylgjur*. The valkyrie Sigrdrífa of the Eddic poem *Sigrdrífumál* may be associated with healing, which suggests the *matronae* of early Germanic religion. Like the Norns, valkyries weave fate in the poem *Darraarljóð*. There is also confusion with human or semidivine heroines, and in one heroic cycle a valkyrie is twice reborn in different identities.

Given the existence of the *matronae* in ancient Germanic times, the general prominence of male gods and the relative importance of the Æsir over the Vanir in Norse mythology, it seems apparent that female figures were of greater importance in Germanic religion than Norse mythology would indicate. Scholars have regarded the valkyries as derived from earlier goddesses of death or perhaps a fertility cult, but their association with Óðinn may be ancient and primary. If so, believers may once have attributed to valkyries shape-changing powers and the ecstatic “sending” of their spirits.

SEE ALSO Eddas; Óðinn.

BIBLIOGRAPHY

Nils Lid discusses the various female figures of Scandinavian religion in the section “Valkyrjer og diser” of his “Gudar og gudedyrking,” in *Religionshistoria*, edited by Nils Lid (Oslo, 1954). Folke Ström’s *Diser, norner, valkyrjor* (Stockholm, 1954) treats three of these groups and argues for association with a fertility cult and sacral kingship. Useful studies of the

literary valkyrie are those of Lise Præstgaard Andersen, *Skjoldmøer—en kvindemyte* (Copenhagen, 1982) and Helen Damico, *Beowulf’s Wealththeow and the Valkyrie Tradition* (Madison, Wis., 1984).

JOHN LINDOW (1987 AND 2005)

VALLABHA (1479–1531), also called Vallabhācārya, was a Vaiṣṇava Hindu philosopher and religious leader. Vallabha was born in central India at Campāranya (Raipur District, Madhya Pradesh) into a family of Vaiṣṇava brahmins originally from the Telugu country. During his childhood, which was spent in Vārānasi (Banaras), Vallabha displayed unusual precocity in mastering the scriptures of orthodox Hinduism. In the course of his life he visited most of the holy places of India, publicly expounding his own interpretation of the events of Kṛṣṇa’s life as presented in the *Bhāgavata Purāṇa*. In a series of debates with adherents of the nondualism (*advaita*) promulgated by the eighth-century philosopher Śankarācārya, Vallabha defended the doctrines of devotional worship (*bhakti*). On one of these occasions he was offered and accepted the position of leader (*ācārya*) of the Vaiṣṇava school established earlier by Viṣṇusvami.

Vallabha’s own sect, the Vallabh Sampradāy, originated from two events that occurred in the Braj region around the city of Mathura. In the first of these, Kṛṣṇa appeared to Vallabha in a vision and revealed to him the *brahmasambandha mantra* by which human souls could be brought into direct relationship (*sambandha*) with the Supreme Being (*brahman*). In the second, Vallabha discovered on Govardhan Hill the stone image called Śrī Govardhananāthajī (“the auspicious lord of Govardhan”), usually abbreviated as Śrī Nāthjī; the statue is a representation of Kṛṣṇa holding up Govardhan Hill as a shelter for his devotees. The *brahmasambandha mantra* remains to this day the primary component of the rite of initiation into the Vallabh Sampradāy, and Śrī Nāthjī, now at Nathdwara (Udaipur District, Rajasthan), is the sect’s chief divine image. Vallabha was married and had two sons, Gopīnātha (1512–1543) and Viṭṭalanātha (1516–1586).

After Vallabha’s death, first Gopīnātha and then Viṭṭalanātha took charge of the sect. Each of Viṭṭalanātha’s eight sons formed his own branch of the sect and the leadership within these branches passes down by inheritance through Vallabha’s male line. With most of its membership drawn from the mercantile section of Hindu society, the Vallabh Sampradāy is found in all important Indian cities but is strongest in the states of Rajasthan and Gujarat and in the city of Bombay. Vallabha’s sect was in decline during most of the nineteenth century, but in recent years it has regained its position of eminence among devotional varieties of Hinduism.

According to Vallabha the chief philosophical flaw in Śankarācārya’s concept of *advaita* is that it accepts illusion (*māyā*) as a force independent of *brahman*. Vallabha rectified

this defect by presenting *māyā* as one of the powers of the Supreme Being. In this way he made pure (*śuddha*) the non-dualism of his philosophical system, which is, in consequence, called *śuddhādvaita*. The fundamental principles of *śuddhādvaita* are as follows: Kṛṣṇa is the Supreme Being and sole existent entity. Both human souls and the material universe are real but limited manifestations that Kṛṣṇa projects out of himself. The souls on earth have, however, forgotten their true nature as fragments of the divine and have become centered on themselves. This egoism is the primary sin that dooms human beings to separation from Kṛṣṇa and to an endless succession of births and deaths. In his mercy Kṛṣṇa himself came in human form to earth in the Braj area and showed through his own actions the way to salvation through *bhakti*. The divine grace, which cannot be earned through mere piety or ritual, is available to anyone, regardless of sex or caste, who will forget the ego and center himself or herself on Kṛṣṇa. Since Kṛṣṇa's grace is said to be the way (*mārga*) for the nourishment (*puṣṭi*) of the soul, followers of Vallabha call their religion the Puṣṭmārg. Salvation, the goal of the Puṣṭmārg, consists of eternal association with Kṛṣṇa in his paradise beyond ordinary time and space.

BIBLIOGRAPHY

The most important of Vallabha's writings, all of which are in Sanskrit, is his *Subodhinī* commentary on the *Bhāgavata Purāna*. There is no satisfactory English translation, but the text has been well edited by Nandkishor Sharma (Nathdwara, 1928). Vallabha outlined his basic philosophical ideas in the *Tattvārtha-dīpa-nibandha*, which has been edited in two volumes by Harishankar Onkarji Shastri, with introduction and notes in English by J. G. Shah (Bombay, 1943). This edition includes both English and Gujarati translations of the text together with expository material. In sixteen short works collected together as the *Ṣoḍaśāgranthāḥ*, Vallabha explained his approach to *bhakti*. An excellent three-volume edition of the *Ṣoḍaśāgranthāḥ* with commentaries has been published under the title *Mahāprabhu Śrīmadvallabhācārya Viracitāḥ Ṣoḍaśāgranthāḥ* (Nathdwara, 1980–1981), and an English translation of all but two of the sixteen works is included in Manilal Chhotal Parekh's *Sri Vallabhacharya: Life, Teachings and Movement*, 2d ed. (Rajkot, 1943). A general introduction to Vallabha's teachings and sect is provided by my study *The Bhakti Sect of Vallabhācārya* (Faridabad, 1976), and a survey of his philosophical thought is given by Mrudula I. Marfatia in *The Philosophy of Vallabhācārya* (Delhi, 1967).

VĀLMĪKI. Legendary sage and author of the Hindu epic *Rāmāyaṇa*, Vālmīki also plays a role in the epic itself. The first book of his *Rāmāyaṇa* tells the story of the invention of poetry by Vālmīki: One day Vālmīki saw a hunter kill the male of a pair of birds making love. Filled with compassion for the birds, the sage spontaneously uttered a curse at the hunter for his cruelty. Vālmīki's words came forth as well-formed, beautiful verse. The sage himself was surprised by his utterance, which was immediately memorized and recited on the spot by his disciple Bharadvāja, who had accompanied him. Later, after Vālmīki returned home, Brahmā, the creator, visited him and asked him to compose the story of the virtuous hero Rāma as outlined by the *ṛṣi* Narada, using the new meter that Vālmīki had created. Indian literary tradition therefore considers Vālmīki as the first poet (*adikavi*) and his *Rāmāyaṇa* the first poem (*adikavya*).

In the seventh book of the epic, Vālmīki is spoken of as a friend of King Daśaratha. Rāma's brother Lakṣmaṇa leaves the pregnant Sītā (Rāma's wife) in Vālmīki's hermitage. Finally, it is Vālmīki who shelters Sītā, raises her twin sons, and plays the role of reconciler between Rāma and Sītā by testifying publicly to Sītā's purity. In this context, Vālmīki describes himself as a son of Pracetas, which makes him a member of the family of Bhṛgu, an influential lineage of brahmins in ancient India.

A folk legend records that the sage was born out of an "anthill" (Sanskrit, *valmīka*) and therefore was called Vālmīki. This legend also records that he was originally a bandit, but some sages, pitying him, taught him the *mantra* "marā, marā, marā." As he repeated the syllables, they produced the name *Rāma*, and while he was deeply immersed in meditating on the name of Rāma, ants built anthills around him. This story appears with minor variations in the *Skāndapurāna* and also in the *Adhyātma Rāmāyaṇa* and *Ānanda Rāmāyaṇa*. Many popular *bhakti* Rāmāyaṇas, including the *Kṛittivāsa Rāmāyaṇa* of Bengal, adopt this story.

Thus, there are two kinds of biographies for Vālmīki. One type describes Vālmīki as a sage-poet born of a high-caste brahman family and endowed with supreme wisdom and the divine sensibilities that made him the creator of poetry, while the other type describes him as a sinner transformed into a saint. The first type of biography is in conformity with the status of the *Rāmāyaṇa* as the great epic that it is in the Brahmanic tradition. The second type of biography relates to the status of the *Rāmāyaṇa* as a *bhakti* poem that transforms its readers from sinners into devotees of the god Rāma. The two types of biographies thus reflect the two major orientations and interpretations of the *Rāmāyaṇa* in Hindu culture.

Scholars have suggested a historical Vālmīki, who probably was a resident of Kosala (a region of the modern state of Uttar Pradesh) and traveled extensively in North India, though he did not know much of the South. This opinion is based on the textual evidence from the *Rāmāyaṇa* that gives detailed and geographically correct descriptions of

North India, whereas its descriptions of South India are purely fanciful. It is also suggested that Vālmīki was one of the *kuśīlavas* (“singers, bards”) who sang the epic. No firm evidence is available, however, in support of a historical Vālmīki. Tradition holds, however, that Vālmīki is also the author of the medieval work *Mahārāmāyaṇa*, or *Jñānavāsīṣṭa*, a philosophical text in the form of a dialogue between the sage Vaśīṣṭa and Rāma.

VANUATU RELIGIONS. Formerly known as the New Hebrides, Vanuatu is a Y-shaped archipelago of mostly volcanic islands located about sixteen hundred kilometers northeast of the Queensland coast of Australia. The physical, linguistic, and cultural diversity of the 100,000 or so indigenous inhabitants of the sixty-three occupied islands is extreme even for the western Pacific, a diversity that is fully reflected in religious belief and practice. While the dominant traits in all contexts may be described as Melanesian, Polynesian influences, including those pertaining to religion, are sufficiently widespread and important to set this area apart from the rest of Melanesia. This article will ignore the profound impact of Christianity on contemporary religion, but it should be stressed, however, that much of what is described here as traditional continues today to be a major part of belief and practice, even among those who have been converted to Christianity for some generations.

SUPERNATURAL POWERS AND SPIRIT BEINGS. The traditional religions of Vanuatu, like religions universally, have as their identifying theme the cultural and social elaboration of people’s ideas and emotions concerning the nature and locus of supernatural powers. Throughout the archipelago such powers, though mostly associated with various classes of spir-

it beings, are also commonly attributed to a wide range of “natural” phenomena, including humans, animals, birds, fish, plants, and stones. It is this diffuseness of supernatural power, together with its transferability, by means of ritual, from its various sources to human agents, that gives Vanuatu religions their distinctive character. The primary aim of Vanuatu religious practitioners is, through ritual, to gain direct control of extraordinary powers, rather than to supplicate spirit beings to act on their behalf. The ni-Vanuatu (“people of Vanuatu”), though deeply concerned with establishing and maintaining positive relations with the relevant power sources, cannot be said to worship such sources. Their religions, though replete with the powerful, the sacred, and the tabooed, are almost wholly devoid of deities, priests, and acts of worship.

As R. H. Codrington (1891, p. 123) long ago noted, the ni-Vanuatu recognize two classes of spirits, those who were once living people and those who were not. Though the former, which include both the ghosts of the dead and ancestral spirits, are everywhere the prime focus of ritual attention, it is the latter who figure most prominently in an elaborate body of mythological tales.

MYTHOLOGY. A widespread feature of Vanuatu mythology is the representation of the leading figures as of two distinct kinds—on the one hand, the exclusively male beings whose personal names are often local variants of such well-known Polynesian gods as Tangaroa or Māui, and on the other, the sexually variable, though frequently female, beings whose personal names are of a purely indigenous kind. The Polynesian-type beings—such as Qat and his eleven Tangaro brothers in the Banks Islands; Takaro and his brothers or supporters on Maewo, north Raga, and Ambae; Tahar in the Small Islands; Takaru and Tokotaitai in Malo; Barkulkul (or variant) in south Raga and north Ambrim; Ambat, Hambat, Kabat, and so forth on Malekula; and a variety of local variants of Māui from Efate southward—are commonly associated with the sky, mountain peaks, treetops, volcanic fires, the sun and the moon, acts of a creative or originating kind, and the attainment of a satisfactory life after death. By contrast, the non-Polynesian-type beings—such as Sukwe or Marawa in the Banks; Gaviga in Maewo; Mwerambuto or Ngegelevu in Ambae; Lehevhev (or variant) in Malekula and surrounding islands; Marrelul in south Raga; Bugliam in north Ambrim—are commonly associated with the underground, caves, mazes, snakes, spiders, rats, acts of a devouring or destructive kind, and the failure to attain a satisfactory afterlife.

PIG SACRIFICES. Though both classes of mythological beings are often depicted as having transformative powers that are greatly in excess of those normally possessed by humans, they are only rarely the subject of ritual attention and are generally deemed to be of small consequence in human affairs. There is, however, one major exception: Throughout the northern and central islands there existed in the past, and still exists today in modified form in some of the northern islands, an elaborate institution that centers on the ceremonial slaughter

of pigs, most especially tusked boars and hermaphrodites. Though this institution has important secular functions throughout the area, most notably in providing an elaborate social and political hierarchy, the key symbolic act, that of pig sacrifice, is nevertheless of deep religious significance. This is evident in two contexts, one of which relates the institution to the mythological beings and the other to the ancestral spirits. In mythology there is a widespread belief that there are two alternative fates that await the spirits of the recently dead: All those who have sacrificed at least one high-grade tusked boar are admitted to a pleasant abode presided over by the principal benign spirit; all others are excluded from this abode, usually through being devoured by the principal malignant spirit.

These mythic themes are, however, of relatively minor significance in accounting for the religious importance of the institution compared with the belief that the sacrificial act results in the transfer of ancestral power from the slaughtered animal to its human executioner. Through a complex cognitive and emotional process the killing of the pig has as its end result a further advancement in the spiritual progress of the sacrificer toward the attainment of full ancestral status. Men who have advanced to high rank through the slaughter of numerous tusked boars are regarded as having attained a spiritual condition not very far removed from that of the ancestors. Such men must eat and sleep alone because of the danger that their high spiritual condition poses for others, especially women and children.

ANCESTRAL SPIRITS. Further evidence for the importance of the ancestral spirits, especially in the context of the sacrificial rites, can be found in the Ambrim practice of setting up carved tree-fern effigies of the dead. Also on Ambrim, as on Malekula, Epi, and as far south as Efate, the slit-gongs, which are used both at pig sacrifices and at funerary rites, stand upright on the ceremonial ground and are carved and painted so as to represent human forms. On the Small Islands, and most probably elsewhere also, the sounds that issue from the gongs are said to be the voices of the ancestral spirits. In the southern districts of Malekula, life-size effigies of the dead are made in which the head is formed from the deceased's skull. These effigies are kept for some generations in the men's clubhouse and, though not the focus of specific rituals, are nevertheless treated as being in some degree sacred.

On Ambae Island, where one finds none of the above iconographic representations of ancestral spirits, they are nevertheless regularly made small offerings of food in the hope that they will not cause their descendants any problems. Such offerings are usually made in a generalized way to any potentially troublesome spirits that may be lurking in the vicinity of the living. Occasionally, ghosts, as well as other varieties of spirit beings, are believed to befriend individual humans and to assist them by imparting magical knowledge.

SECRET-SOCIETY RITES. In the period immediately prior to the spread of Christianity, there existed on many of the

northern and central islands, though especially in such matrilineal areas as the Banks, Maewo, north Raga, and Ambae, a variety of more secret and voluntary cults that centered around the acquisition of highly dangerous powers of a predominantly destructive kind. Whereas the kinds of powers invoked through pig sacrifices derive from the benign ancestors and impart to practitioners a positive and highly esteemed form of sanctity, those invoked in the secret society rites derive either from malignant ghosts of the dead or from what may be described as the "dark" side of human spirituality. Prominent symbolic themes include representations of ghosts and sharks, usually in the form of masks and head-dresses worn by members, and of such normally abhorrent and dangerous activities as incest, genital exposure, contact with menstrual blood, and sodomy. The powers generated in the context of these rites were primarily utilized by participants to create fear in others, and were hence closely associated both with warfare and sorcery. It is therefore no surprise that such rites mostly ceased to be practiced at about the same time that warfare was prohibited and sorcery came under increasing Christian and governmental attack.

MALE INITIATIONS. Though similar cultural themes figure in the ritual corpus of the more patrilineal areas of north Vanuatu (notably in Malekula, the Small Islands and Ambrim), in these communities they occur in the context of compulsory initiations into manhood rather than voluntary initiations into discreet secret societies. That the two institutions are closely related is evident in the common occurrence of shark symbolism, representations of threatening ghosts, long periods of seclusion, the importance of the phallus as a locus of power, and either real or symbolic ritual male homosexuality. But whereas the secret rites were deemed both dangerous and antisocial, the compulsory versions were, and in most communities still are, positively valued as generating a form of sanctity similar to that attained by pig sacrifices. Everywhere the key symbolic act is the removal of either part or all of the novice's foreskin and the subsequent wearing of a penis wrapper. Through such an act a boy takes his first step toward achieving spiritual maturity, a goal only fully attained when, after the slaughter of numerous additional tusked boars throughout his life, he finally succeeds, at death, in breaking his dependence on and identification with women. Needless to say, many men do not progress very far in their efforts to attain such a goal.

WOMEN'S RITES. The ritual life of women, though everywhere less elaborate than that of men, is nevertheless of importance in those relatively few areas about which there exists adequate knowledge. In some of the districts of Malekula there is a ritual association known as Lapas whose membership is restricted to women and which in many respects parallels the principal male ritual association, Nimangki. As in the latter, the women kill pigs, purchase sacred insignia, erect effigies of the dead, and are secluded for some days in a ceremonial house that may not be entered by nonmembers of the association, especially men. Furthermore, just as the men are believed to generate through their ritual actions a specifically

male form of sanctity or holiness, so too are the women deemed to generate a specifically female sanctity. These two forms of sanctity, though both ultimately derived from the ancestral spirits, are nevertheless so entirely antipathetic to one another that they must be rigorously kept apart. Hence the pervasive importance of the sex dichotomy in the religious life of the people of Malekula, the Small Islands, and Ambrim.

Elsewhere (though most notably in the northern matrilineal islands of Maewo, north Raga, and east Ambae, where the sex dichotomy is a great deal less pervasive and important) the women, though the principal participants in and organizers of rites that are of primary concern to themselves, such as first menstruation or body tattooing, do not exclude the men from such activities. Likewise, the men, though again the key actors in the sacrificial rites of the graded society, encourage their womenfolk to kill an occasional pig and take supplementary titles. In west Ambae the women even participate as novices in the local versions of what are elsewhere exclusively male secret-society rituals.

SORCERY AND MAGIC. Various kinds of sorcery and magic are practiced throughout Vanuatu, though the former was, at least until recently, of special importance in Ambrim, while magic, rather than religion, seems to be the dominant ritual theme in some of the southern islands, notably Tanna. Indeed, in Tanna there are no major communal rites of the clearly religious kind that have been described for the northern islands. Even the male initiation rites, which, as in the north, focus on circumcision, seclusion, and the donning of penis wrappers, are seemingly of a more secular and ceremonial, rather than religious and ritual, character; the emphasis is primarily on individual status transition rather than on joint initiation into a secret male cult. However, ethnographic information concerning the traditional cultures of all the southern and central islands, including Tanna, is either fragmentary and unreliable or nonexistent. Since this applies most especially to their traditional magico-religious systems, the intention here is to not be too emphatic in thus relegating the religious component to a secondary position.

MOON WORSHIP. Such caution seems especially relevant in the case of Aneityum, where, in addition to the widespread practice of making offerings, usually of food, though sometimes also human sacrifices, to a variety of unnamed spirit beings (*natmas*), a more elaborate ritual of worship, including prayer, song, dance, and offerings of food and kava placed on wooden altars, was periodically performed in sacred groves dedicated to the moon. As on the neighboring islands of Aniwa and Futuna, the moon, who is known by the Polynesian name *Sina*, is represented in mythology as the wife of the sun. Unfortunately, little has been recorded of this mythology and even less of what seems to have been an important religious practice.

VĀRĀNASĪ SEE BANARAS

VARDHAMĀNA MAHĀVĪRA SEE MAHĀVĪRA

VARṆA AND JĀTI. The two separable but intertwined concepts of *varṇa* and *jāti* may be regarded as different levels of analysis of the Indian system of social structure called *caste*. While some scholars regard *varṇa* and *jāti* as reflecting quite separate dimensions of Indian social and religious thought, others insist, following the native traditions of Hinduism, that the two are inextricably linked. In any event, whereas the term *caste* is sometimes applied to social formations in places other than India, the terms *varṇa* and *jāti* are invariably applied exclusively to the Indian social (and religious) contexts.

The caste system has occasionally been regarded as so intrinsic, so enduring, and so distinctive to India and its long history that it is thought to be both the kernel of Indian culture and virtually identical to the definitional essence of Hinduism. While there are many different beliefs and practices associated with the Hindu religion, and while sectarian, regional, linguistic, and other variables make it difficult indeed to see any unifying features in that religion, it has been argued that the caste system and its attribution of hierarchical superiority to the *brahman* caste is one (and perhaps the only one) feature all (or at least the vast preponderance) Hindu traditions share. Although there are many problems in defining *Hinduism* as "the religion of caste" (not the least of which being that in India caste cuts across religious boundaries;

there are Muslim, Sikh, Parsi, and Christian—as well as Hindu—castes), the fact that the two are sometimes equated indicates the importance, ubiquity, and deep roots of caste in Indian society and history.

The word *varṇa* means "color"—not, as was previously thought, to refer to "race" but rather in the sense of "characteristic" or "attribute." The best translation is probably "class." As applied to the realm of society, it refers to four social classes that epitomized Vedic (and Aryan) India: the *brahmins* or priests, the *kṣatriyas* (warriors and rulers), the *vaiśyas* (commoners; merchants and agriculturalists), and the *śūdras* (servants). These four classes, while separate in terms of function and given hierarchically different values, are also quite obviously interdependent. Taken together, they constitute a complete and well-ordered society according to a religiously and ideologically imbued indigenous social vision.

Evidence of such a division of society into four classes (ideologically, at least, if not in actuality) first appears in a cosmogonic hymn found in the earliest text of Indian history, the *R̥gveda*. In that hymn, the entire universe is produced from the primordial sacrifice and dismemberment of a Cosmic Man, including the four classes of the social order: "When they divided the Cosmic Man, into how many parts did they apportion him? What do they call his mouth, his two arms, his thighs and feet? His mouth became the *brahman*; his arms were made into the *kṣatriya*; his thighs the *vaiśya*; and from his feet the *śūdras* were born" (*R̥gveda* 10.90.11–12).

Here, then, is the much repeated and cited charter myth of an ideal Indian society. Each class is produced from the body part of the Cosmic Man that most resembles the supposed traits and assigned function of that class. From the mouth comes the *brahman* class, the priests charged with ritual functions and the oral preservation of sacred texts. From the arms, the source of physical strength and power, derive the *kṣatriya* warriors and rulers, and from the "thighs" (perhaps a euphemism for the genitals) arise the *vaiśya* commoners, who are charged with material wealth and fecundity. And from the feet, the lowest and most impure of the body parts but also the foundation upon which everything rests, come the *śūdras*, or servants.

In this system (as it was represented in the religious texts composed and preserved by the *brahmins*), the *brahmins* are invariably portrayed as hierarchically superior. They are created prior to others and therefore take precedence over others; they are created from the uppermost portion of the creator god and therefore are at the top of the social order; they are charged with (and indeed have a monopoly on) religious functions and are therefore the most pure, the most sacred, of the four classes. The *brahmins*, it is said, are also the most "complete," or the perfected instance of the human being. Indeed, some texts go much further and claim that members of this class are "human gods" (*manushya devas*): "There are two kinds of gods, for the gods are gods, and those *brahmins*

who have studied and teach the Veda are human gods. . . . With oblations into the fire one pleases the gods, and with sacrificial fees one please the human gods” (*Śatapatha Brāhmaṇa* 2.2.2.6).

As such, the *brahman*s are sometimes said to represent the principle of “purity” in Indian social thinking. The supposed inherent characteristics and distinctive activities (the sacerdotal duties, but also practices such as nonviolence and vegetarianism) are thought to be the standard against which others are gauged. The other classes (and castes) are thus ranked into a hierarchical order of relative purity—to the extent they resemble the *brahman*, their status increases, while to the degree that they diverge from the *brahman* and the principle of purity their place in the system is diminished.

This elegant and orderly vision is complicated and compromised, however, by the high place of the second of the four *varṇas*, the *kṣatriyas*. Even in the religious texts, they are ranked only below the *brahman* priests, and it is possible, if not likely, that in actuality throughout Indian history (at least up until the time of the British Raj, when traditional political power was dispossessed) they took the highest places in the social order. The characteristics and duties of the *kṣatriyas*, however, are quite different from those of the *brahman*s (and the “purity” they supposedly embody). They control the worlds of politics and power, coercion and physicality. The functions of both rulership and the military are, ideally, monopolized by the class most suited to them, the *kṣatriyas*.

The high place of the *kṣatriya* in a hierarchy supposedly governed by relative resemblance to the *brahman* has sometimes been explained as the pragmatic insertion of a secular principle of “power” into a system otherwise organized according to religious “purity.” Be that as it may, together, the two highest *varṇas* clearly constitute the “ruling classes” of the caste system. In the religious texts, the cooperation of the two is constantly emphasized for the proper ordering and operation of society (and, indeed, the cosmos as a whole). And in practical ways, bonds between the two highest *varṇas* are both symbolized and actualized in the important traditional (and symbiotic) relationship between the king and his court priest (the *purohita*).

The *vaiśya* class comprises all those engaged in the many professions other than, on the one hand, those of the priests and rulers and, on the other, those of the lowly servants. Farmers, traders, proprietors, bankers, herders—all these, and others involved in professions entailing wealth, increase, and productivity of all kinds, were classified as *vaiśyas*. Finally, at the base are the *śūdras* who, it is said, have but one duty to perform: to serve the others. While the *brahman*, *kṣatriya*, and *vaiśya varṇas* are designated the “twice-born” classes (because of the ritual “second birth” that boys from these classes undergo, which makes them eligible to study the sacred Veda), the *śūdras* are labeled “once-born” and are prohibited from studying (or even hearing) the Veda and from other religious prerogatives.

The relationship between the “classes” or *varṇas* and the “castes” or *jātis* (the latter term is related to the word for “birth,” indicating that one is “born into” his or her caste) is a subject of scholarly debate among anthropologists and Indologists. For some, the terms are virtually interchangeable, and indeed the texts of the indigenous tradition often use the terms synonymously. Other scholars, also following the native traditions, see the *jātis* as historically deriving from intermixtures between members of an original four classes. Still others see the two as fundamentally different but nevertheless intellectually related, noting that the *varṇa* system forms the superstructure for the more complex system of *jātis*. The *varṇas*, under this conceptualization, are the “base categories” of social analysis, which can then generate any number of new, ranked social groupings, which may be termed *jātis*. Many anthropologists observe that while there are but four *varṇas* there are thousands of discrete *jātis* found “on the ground” in Indian society. For some of these observers, the *varṇas* are at best “theoretical,” while it is the *jātis* that form the real social units of actual Indian society.

For many in Indian society, however, the *jāti* to which they belong is conceived of in terms of one or another of the classical *varṇas*. All *brahman*s, regardless of their identification as members of a wide variety of locally various, distinct, and endogamous *jātis*, claim membership in a pan-Indian and ancient *varṇa*, and the same is true with members of various *jātis* identifying themselves as *kṣatriyas*, *vaiśyas*, and *śūdras*. There are also large numbers of people assigned to *jātis* regarded by those of higher rank to be outside of or below the *varṇa* system altogether. These are what were once termed *untouchables* or, to use the preferred term of self-identification, the *dalit* castes.

In anthropological discourse, it is usually the *jātis* that are the referent of the term *caste*. Each *jāti* typically preserves a mythical account of its origins and a distinctive set of life-cycle rites observed by its members. Each is overseen by a local council that oversees and enforces a set of rules governing, among other things, acceptable occupation. It is, indeed, occupation that usually lends its name to the *jāti* (e.g., Barber, Potter, Leatherworker), although, especially outside the traditional rural areas, these caste labels no longer necessarily apply to the actual economic pursuits of individuals. While the indigenous tradition insists on ancient roots for these occupational assignments, some modern scholars have suggested that the castes of present-day India need not ever have been derived from ancient occupational associations that over time became hereditary and endogamous marriage groups.

Another definitive characteristic of the *jātis* is the set of rules governing marriage. A member of a particular caste is not to marry outside of that caste, and to disobey the rules of endogamy usually results in expulsion from the group. Those who are so punished become, literally, “outcastes.” This practice reinforces the widely held belief that the multitude of *jātis* came into existence from the four original *varṇas*

through an intricate series of mixed unions and subsequent expulsions.

Commensality, food exchange, and other transactions between castes are also highly regulated. Acceptance or non-acceptance of food (cooked in different ways or uncooked), grain, water, and leftovers play a large role in the relative placement of castes at the local level.

The *jātis*, like the *varṇas*, are organized hierarchically, although with many local variations. Often enough, these hierarchical placements are disputed and subject to constant renegotiation and jockeying for position. Research on the caste system has focused on the following areas: criteria for ranking, regional differences in ranking, ranking and social distance, local conflicts over rank order, strategies and circumstances of change in rank order, and the significance of hierarchy in Indian thought and society.

Essential to the traditional underpinnings of both the *varṇas* and the *jātis* is the belief in *karma* and rebirth. Birth into a particular class or caste was traditionally understood to be the result of *karma* created in the past, and thus any attempt or even inclination toward changing one's social situation in this life was severely discouraged. Caste was religiously ordained and legitimated in the concept of one's "own duty" or *svadharma*. And, as it is put in one of the sacred texts of the Hindu tradition, the *Bhagavadgītā*, "it is better to do one's own duty poorly than to do another person's duty well." If one performs his inborn caste duty well in this life, the promise is of a higher birth in the future.

The religious basis of the caste system is perhaps the principal reason for its endurance and pervasiveness in Indian history and society. The caste system can provide a modicum of stability, especially in times of political chaos or change. In the past there have, however, also been religious movements that have challenged, but never successfully undermined, the caste system. These include some of the cults within Hinduism itself, as well as certain elements within Buddhism, Sikhism, and some of the groups associated with the Neo-Hindu movement of the nineteenth and early twentieth centuries. And while the caste system endures in modern India, many forces are challenging its traditional pillars and especially the abuses that often have accompanied the system. The political rise of the *dalits*, the breakdown of traditional caste boundaries due to urbanization and modernization, reformational movements, and the general influx of democratic, secular and, to some extent, Western values into contemporary India have shaken, but not destroyed, this millennia-old institution.

BRIAN K. SMITH (2005)

VARUṆA replaced the earlier god Dyaus as the sky god in the Vedic pantheon, but early in his mythological career he became the god of the night sky; the myriad stars were his eyes and, still later, his spies. The importance of such a sky god seems to belong to the pastoral history of the nomadic Aryans. The Bogazköy inscription of the fourteenth century BCE mentions a Mitanni god, Uru-van-nas-sil, Varuṇa's prototype. Ouranos, Varuṇa's Greek parallel, was also a sky god.

With his thousand eyes, Varuṇa watched over human conduct, judging good and evil deeds and punishing evildoers. Varuṇa is the only god in the Vedic pantheon with such strong ethical bearings. The word used in the Vedas to refer to his eyes, *spaśa*, derived originally from the verbal root *spac* ("see"), later came to mean "spy." Still later, in the epics and the Purāṇas, the word underwent further linguistic evolution and became *pāśa* ("noose"); Varuṇa then ensnared the wicked in his noose.

Scholars have traced Varuṇa's name to various Indo-European roots such as *uer* ("bind"), *ver* ("speak"), *vṛ* ("cover"), *vār* ("shower"), as well as to noun stems like Lithuanian *weru* ("thread"). It is possible that these all contributed to the many layers of his mythological attributes.

Ahura Mazdā, the supreme god of the Avesta, is another parallel of the Vedic Varuṇa. In Vedic the Avestan name would be rendered *Asura Medhya* ("holy spirit"), and indeed the Vedas frequently refer to Varuṇa as an *asura*. In the Avesta, Mithra is closely related to Ahura Mazdā, just as the Vedic Mitra is related to Varuṇa. Mitra is the god of the daytime sky whose eye is the sun. Together Mitra and Varuṇa constitute the sky god and replace the earlier Dyaus. In the *R̥gveda*, Varuṇa enjoyed sovereignty and supremacy for a brief period; he was frequently called *samrāj* ("emperor"), an epithet used only occasionally for Indra. The Rājasūya sacrifice, offered for attaining imperial grandeur, belongs to Varuṇa and Mitra; in the *R̥gveda* Varuṇa is said to have performed this sacrifice, presumably with the intention of becoming the supreme god in the pantheon.

Because of his innumerable star-eyes, Varuṇa was regarded as omniscient. His knowledge and his function as a moral judge were the chief sources of his power, as he had no remarkable achievements to his credit. He watched over human beings: When two persons conversed, he was the invisible third; when anyone sinned, Varuṇa afflicted the transgressor with disease, and until the god relented, the victim would not be restored to health. In the solemn Varuṇapraghāsa rite, a seasonal sacrifice, the sacrificer's wife was required to confess her sin (i.e., conjugal infidelity) before the officiating priest. This is a unique instance of confession of sin in the early Vedic literature, and Varuṇa was the god associated with this sacrifice. The punishment he meted out in such cases was called a "seizure," hence the elaborate prayers to Varuṇa for forgiveness of sins.

In later literature Varuṇa's ethical role diminishes, but early texts frequently associate his majesty or supremacy with his function as upholder of the moral order referred to in the *Rgveda* as *ṛta* or, sometimes, *dharmā* (i.e., "that which upholds") or *satya* ("truth"). In the Avesta this all-pervasive moral order that controls and regularly maintains the cosmic forces is *arata*, *aša*, *urta*, or *arta*; a cardinal concept in Zoroastrianism, it is first mentioned in the Tel-el-Amarna Tablet (c. fourteenth century BCE). *Rta* is Varuṇa's special domain, and it is often mentioned in connection with him.

Another concept associated with Varuṇa is the magical power known as *māyā*; for example, Asura's (i.e., Varuṇa's) *māyā*. In the Vedic context *māyā* meant both wisdom and power. With his *māyā* Varuṇa envelops the night and creates the dawn. *Māyā* predominantly links him with demons, for in later literature *asura* meant "demon," and demons wielded *māyā*.

Varuṇa's dark associations bring him close to the primarily chthonic gods such as Yama, Nirṛti, Soma, and Rudra. As a chthonic god, Varuṇa is associated with snakes (indeed, in Buddhist literature he is sometimes called the "king of snakes"), with barren black cows, or with deformed and ugly creatures. His ritual symbols are dark, depraved, and deformed things or creatures. His son Bhṛgu is said to have descended into hell. His connection with Vasistha, however, goes back to Indo-Iranian times: In the Avesta, Asha Vahishta (Vedic, *Rta* Vaśiṣṭha) is one of the Amesha Spentas who were Ahura Mazda's active assistants. Varuṇa is Soma's brother. Of his wife, Varuṇani, nothing more than her name is known.

The dynamic character of Varuṇa's mythological career subsided in the later Vedic literature, where he is associated with the celestial waters. In the epics and Puranas, however, his domain shifted from the firmament toward the earth, and he became the overlord of the terrestrial waters, rivers, streams, and lakes, but primarily of the ocean. He dwelt in royal splendor in an underwater palace. Like Poseidon, Greek god of the ocean, he is often associated with horses. Finally, he is relegated to the position of "lord of the West," another dark and chthonic association. Here the circle of his

mythological career closes, because as a *dikpāla* ("lord of a quarter [of the sky]") he is no more than a wholly passive god.

SUKUMARI BHATTACHARJI (1987)

VASUBANDHU (fifth or fourth century CE) was an eminent Indian Buddhist teacher. Said to be a younger brother of the great Māhāyāna teacher Asaṅga, Vasubandhu was first ordained in the Hīnayāna Sarvāstivāda school but later converted to the Māhāyāna. Like his brother Asaṅga, Vasubandhu became a great exponent of the Yogācāra-Vijñānavāda teachings. He is believed to be the author of the *Abhidharmakośa* and many Māhāyāna treatises.

Various problems continue to vex historians concerning the biography of Vasubandhu. The *Bosoupandou fashi zhuan* (Biography of Master Vasubandhu, T.D. no. 2049), translated—or rather, compiled—by Paramārtha (499–569), one of the main exponents of Yogācāra doctrine in China, is preserved in the Chinese Tripiṭaka and is the only complete biography. Apart from this, fragmentary information is found in various Chinese sources, the most important of which are the writings of the great Chinese translator Xuanzang (600–

664). Various histories of Buddhism written by Tibetan historians also give accounts of Vasubandhu's life. But Chinese and Tibetan sources alike disagree with the *Biography of Master Vasubandhu* (hereafter *Biography*) in many places. Moreover, two or three persons in Buddhist history bear the name *Vasubandhu*: According to some texts, a *Vasubandhu* is the twenty-first patriarch in the transmission of the Buddha's Dharma; elsewhere, Puguang (one of the direct disciples of Xuanzang) refers to an "ancient Vasubandhu" who belonged to the Sarvastivada school; and both Puguang and Yaśomitra, a commentator on the *Abhidharmakośa*, refer to a third, known as Sthavira-Vasubandhu. The identification of and relationship between these three persons is still unclear.

BIOGRAPHY. Vasubandhu's *Biography* can be divided into three sections. The first section is introductory. It begins with a legend of Puruṣapura (modern Peshawar), the native city of Vasubandhu, and then introduces his family: his father, the brahman Kauśika, and the latter's three sons, Asaṅga, Vasubandhu, and Viriñcivatsa. After a brief reference to Viriñcivatsa's life, an account is given of Asaṅga's life, including the famous story of his meeting with the *bodhisattva* Maitreya in the Tusita Heaven.

Vasubandhu's life comprises the second section. It begins by sketching the history of the Sarvastivāda school in Kashmir and tells of the composition of the Abhidharma treatises and the great commentary on them, the *Mahāvibhāṣā*, there. Knowledge of the *Mahāvibhāṣā*'s contents was jealously kept secret from outsiders, the account alleges, but somehow it became known in Ayodhyā (near modern Faizābād), a city far removed from Kashmir. At the time, Vasubandhu was residing in Ayodhyā, then the capital of the Gupta dynasty. Vindhyavāsīn, a Sāṃkhya teacher and a disciple of Vārṣaganya, came to Ayodhyā to challenge the Buddhists there to a debate while Vasubandhu and his colleague Manoratha were absent. Their fellow teacher Buddha-mitra thus had to meet the challenge alone, but because of his age he was defeated. This defeat deeply mortified Vasubandhu, who wrote a treatise, *Paramārthasaptatikā*, in order to confute Vindhyavāsīn. It was after this that Vasubandhu composed his *magnum opus*, the *Abhidharmakośa* (hereafter *Kośa*), in six hundred verses (*kārikās*). The *Kośa* was an eloquent summary of the purport of the *Mahāvibhāṣā*, and it is reported that the Kashmiri Sarvastivādins rejoiced to see in it all their doctrines so well propounded. Accordingly, they requested a prose commentary (*bhāṣyā*), which Vasubandhu wrote. But the Kashmiris soon realized, to their great disappointment, that the work in fact *refuted* many Sarvastivāda theories and upheld the doctrines of the Sautrāntika school. With the composition of the *Kośa*, however, Vasubandhu came to enjoy the patronage and favor of two Gupta rulers, Vikramāditya and his heir Bālāditya, who can be identified, respectively, as Skandagupta (r. about 455–467) and Narasiṃhagupta (r. about 467–473). Vasurāta, a grammarian and the husband of the younger sister of Bālāditya, challenged him to a debate but was defeated. Then Saṃghabhadra, a Sarvastivāda scholar from Kashmir,

appeared to dispute the *Kośa*. He composed two treatises, one consisting of 10,000 verses and another of 120,000 verses. (According to Xuanzang's report, it took twelve years for Saṃghabhadra to finish the two works.) He challenged Vasubandhu to a debate, but Vasubandhu refused, saying, "I am already old, so I will let you say what you wish. Long ago, this work of mine destroyed the Vaibhāṣika (i.e., the Sarvastivāda) doctrines. There is no need now of confronting you. . . . Wise men will know which of us is right and which is wrong."

The third section of the biography describes Vasubandhu's conversion to Mahāyāna Buddhism. According to this account, Vasubandhu, now proud of the fame he had acquired, clung faithfully to the Hīnayāna doctrine in which he was well versed and, having no faith in the Mahāyāna, denied that it was the teaching of the Buddha. His elder brother, Asaṅga, a Mahāyānist, feared that Vasubandhu would use his great intellectual gifts to undermine the Mahāyāna. By feigning illness he was able to summon his younger brother to Puruṣapura, where he lived. There Vasubandhu asked Asaṅga to explain the Mahāyāna teaching to him, whereupon he immediately realized the supremacy of Mahāyāna thought. After further study the depth of his realization came to equal that of his brother. Deeply ashamed of his former abuse of the Mahāyāna, Vasubandhu wished to cut out his tongue, but refrained from doing so when Asaṅga told him to use it for the cause of Mahāyāna. After Asaṅga's death, Vasubandhu composed commentaries on various Mahāyāna sūtras, including the *Avataṃsaka*, *Nirvāṇa*, *Saddharma-puṇḍarīka*, *Prajñāparamitā*, *Vimalakīrti*, and *Śrīmālādevī*. He himself composed a treatise (or treatises) on the "representation only" (*viññaptimātra*) theory and commented on the *Mahāyānasamgraha*, **Triratna-gotra*, **Amṛta-mukha*, and other Mahāyāna treatises. He died in Ayodhyā at the age of eighty.

The *Biography* contains legendary or even mythical elements; the time sequence of events is ambiguous and differs greatly in places from the accounts in Xuanzang's *Xiyu ji*. For example, the *Biography* has Vasubandhu composing the *Kośa* at Ayodhyā and states that his conversion takes place at Puruṣapura; the *Xiyu ji* places the composition of the *Kośa* in the suburbs of Puruṣapura, and the conversion at Ayodhyā. According to the *Biography*, Vasubandhu's teacher was called Buddhamitra, who, it relates, was defeated in a debate by Vindhyavāsīn. The *Xiyu ji*, however, never mentions Buddhamitra and names Manoratha as the teacher of Vasubandhu. In the *Biography*, Vasubandhu engages in his literary activity on behalf of the Mahāyāna after Asaṅga's death. Xuanzang, however, tells a strange story that suggests that Vasubandhu died before Asaṅga. Paramārtha and Xuanzang are the two most credible authorities for Vasubandhu's life, but serious discrepancies still exist between their accounts.

THE DATE OF VASUBANDHU. Vasubandhu's life has been variously dated at 900, 1,000, and 1,100 years after the Buddha's *nirvāṇa*. The figure 900 appears in the *Biography*, but

elsewhere Paramārtha is also said to have given another figure, 1,100. The figure 1,000 is found in Xuanzang's report, but the figure 900 seems also to have been adopted by his disciples. Various theories concerning the date have been offered by scholars. Noël Péri and Shiio Benkyō give as Vasubandhu's dates the years 270 to 350 CE. Ui Hakuju places him in the fourth century (320–400). Takakusu Junjirō and Kimura Taiken give 420 to 500, Wogihara Unrai gives 390 to 470, and Hikata Ryūshō gives 400 to 480, placing him in the fifth century.

In order to resolve these issues, Erich Frauwallner (1951) proposed a new theory whereby two Vasubandhus, Vasubandhu the elder and Vasubandhu the younger, are distinguished. The elder would be the younger brother of Asaṅga. It is his activity that, according to this theory, is described in the first and third sections of the *Biography* and may be dated at around 320 to 380. The younger would be the author of the *Kośa*. His activity constitutes the second section of the *Biography*. Since he was associated with the two Gupta rulers, he may be dated around 400 to 480. Frauwallner supposes that Paramārtha confused the two Vasubandhus and conflated them into a single person. This mistake, he maintains, was inherited by later historians, including Xuanzang.

Frauwallner's lucid and revolutionary theory has been endorsed by many scholars. But it does not seem to convince all. Especially doubtful is his treatment of early Chinese documents, many of which have been claimed by scholars to be spurious. Japanese scholars, who opposed the theory of dating in the fourth century by negating the evidence employed in its support, would reject Vasubandhu the elder for almost the same reasons. At any rate, Frauwallner's theory and the issues it raises remain a hypothesis.

LITERARY ACTIVITY. Vasubandhu is renowned as the author of one thousand works, five hundred in the Hīnayāna tradition and five hundred Mahāyāna treatises. However, only some forty-seven are extant, nine of which survive in the Sanskrit original, twenty-seven in Chinese translation, and thirty-three in Tibetan translation.

Among the independent expositions of Vasubandhu's own philosophy and doctrines, the *Abhidharmakośa* is the most voluminous. In the countries of "northern" Buddhism, including Tibet, it came to be regarded as a fundamental text to be studied by all students of the tradition. The *Karmasiddhi* (Demonstration of Karma) is a short, quasi-Hīnayāna treatise colored, as is the *Abhidharmakośa*, by Sautrāntika leanings. From the Yogācāra point of view the most important of Vasubandhu's works are the *Viṃśatikā* (Twenty verses), *Triṃśikā* (Thirty verses), and *Trisvabhāvanirdeśa* (Exposition on the three natures). Although these three texts are all very brief (and the last was totally unknown in China), they form a sort of trinity and represent Vasubandhu's final accomplishment as a Yogācāra-Vijñānavāda teacher. The *Triṃśikā* is especially important in that it became the basic text of the Faxiang (Jpn., Hossō) school. The *Foxing lun*

(Treatise on Buddha nature), although thought to be apocryphal by not a few scholars, exerted great influence on Sino-Japanese Buddhism by advocating the concept of *tathāgata-garbha*, or Buddha nature. Vasubandhu's works also include books on logic, polemics, and other sciences.

Vasubandhu's commentaries on sūtras and śāstras are by no means less important than the above-mentioned independent treatises. He wrote commentaries on three treatises: the *Madhyāntavibhāga* (Discrimination between the middle and the extremes), *Mahāyānasūtrālaṃkāra* (Ornament of the Mahāyāna Sūtras), and *Dharmadharmatāvibhāga* (also, *-vibhāga*; Discrimination between existence and essence). These three treatises are all ascribed to Asaṅga's teacher Maitreya and are therefore fundamental texts for the Yogācāra school. Vasubandhu also composed a commentary on Asaṅga's *Mahāyānasamgraha* (Compendium of Mahāyāna), the first systematic presentation of the Yogācāra-Vijñānavāda doctrines. His commentary (*upadeśa*) on the *Sukhāvatīvyūha Sūtra* is important in that it became a basic treatise of the Pure Land faith in China and Japan. The Indian Yogācāra-Vijñānavāda is represented in China by three schools, all of which developed around Vasubandhu's works. The first to appear, the Dilun school (established in the first half of the sixth century), took his commentary on the *Daśabhūmika Sūtra* as its central text. The second, the Shelun school, emerged in the second half of the same century organized around a Paramārtha's translation of the *Mahāyāna-samgraha*. The last to appear, the Faxiang school, founded by Xuanzang and his disciple Kuiji in the seventh century, took the *Triṃśikā* as its basic text.

With these works, Vasubandhu proved to be a highly influential Mahāyāna teacher. He is reverently called a *bodhi-sattva*, or even "the second Buddha," in various traditions from India to China. Vasubandhu brought to fruition doctrinal developments in the Mahāyāna, especially in the Yogācāra-Vijñānavāda tradition, that had been begun by Maitreya and Asaṅga and advanced by other unknown teachers. He thus marks a culmination in Buddhist history. Before him, his school concerned itself chiefly with Buddhist practice (hence the name *Yogācāra*); after him, it emphasized theoretical problems such as the analysis of consciousness (hence the name *Vijñānavāda*), so that various ontological, epistemological, and logical investigations became more and more conspicuous. Compared with Asaṅga, who was gifted as a religious leader, Vasubandhu seems more scholarly, abhidharmic, and theoretical.

BIBLIOGRAPHY

A bibliography appended to Erich Frauwallner's *On the Date of the Buddhist Master of the Law, Vasubandhu* (Rome, 1951) is highly helpful in that it exhausts almost all discussions, hence almost all evidences, relevant to Vasubandhu's date.

After Frauwallner, there is no independent biographical study on Vasubandhu, except a paper by Hikata Ryūshō, "A Reconsideration on the Date of Vasubandhu," *Bulletin of the Faculty of the Kyushu University* 4 (1956): 53–74, which does not refer to Frauwallner and a criticism of Frauwallner's theory by Padmanabh S. Jaini, "On the Theory of Two Vasubandhus," *Bulletin of the School of Oriental and African Studies* 21 (1958): 48–53.

Vasubandhu's thought is the subject of numerous studies. Among the most useful are Louis de La Vallée Poussin's *Vijñaptimātratāsiddhi, la siddhi de Hiuan-tsang*, 2 vols. (Paris, 1928–1929); Sylvain Lévi's *Un système de philosophie bouddhique: Matériaux pour l'étude du système Vijñaptimātra* (Paris, 1932); and Yuki Reimon's *Seshin Yuishiki no kenkyū* (Tokyo, 1955–1956).

There have been several publications of English translations of the French translations of Vasubandhu's work. Among these are *Abhidharmakośabbāsyam*, by Louis De La Vallée Poussin, English translation by Leo Pruden (Berkeley, Calif., 1988–1990), and *Karmasiddhiprakaraṇa: The Treatise on Action*, by E. Lamotte, English translation by Leo Pruden (Berkeley, Calif., 1988). Stefan Anacker's *Seven Works of Vasubandhu* (Delhi, 1984) includes translations of Vasubandhu's *Vādavidhī*, *Pañcaskandha-prakaraṇā*, *Karmasiddhi-prakaraṇa*, *Viṃśatika*, *Triṃśikā*, *Madhyāntavibhāgabhāṣya*, and *Trisvabhāvanirdeśa*; another important translation is Hermann Jacobi's *Triṃśikāvijñapti des Vasubandhu, mit bhāṣya des ācārya Sthiramati* (Stuttgart, 1932). Louis de La Vallée Poussin translated the most influential work of Abhidharma as *L'Abhidharmakośa de Vasubandhu*, 6 vols. (1923–1931; reprint, Brussels, 1971). My *Chūkan to yuishiki* (Tokyo, 1978) contains articles discussing some philosophical ideas of the Vijñānavāda; see also *Seshin ronshū* (Tokyo, 1976) by Kajiyama Yūichi, Aramaki Noritoshi, and me.

VATICAN COUNCILS: VATICAN I

When Pius IX decided to convoke an ecumenical council, his purpose, clarified by advice solicited from various bishops whom he regarded as trustworthy, was to complete the work of reacting against naturalism and rationalism. He had been pursuing this goal since the beginning of his pontificate by endeavoring to establish Catholic life and thought once again on the solid foundation of divine revelation. As a result of suggestions from the bishops he had consulted, he added to this purpose, first, defining the true nature of the relation between church and state while taking into account the new situation produced by the French Revolution and its consequences and, second, adapting church law in ways made necessary by the profound changes that had taken place during the three centuries since the last ecumenical council.

PRELIMINARY DISCUSSIONS. Despite the reservations of some in the Curia Romana, which caused him to delay for two years, Pius IX was encouraged by prominent members of the episcopate to announce his intention of convoking a council; on July 29, 1868, he officially summoned all the bishops of Christendom to come to Rome by December 8, 1869, along with others who had the right to attend (especially the superiors general of the major religious orders). During the preliminary consultations a number of bishops had suggested taking advantage of the council to try to renew contacts with separated Christians. Two apostolic letters, dated September 8 and 13, 1868, invited the Eastern prelates not in communion with Rome, the Protestants, and the Anglicans in order that they might be able to take part in the council. But this clumsy approach was considered very insulting by those addressed and may be regarded, from an ecumenical viewpoint, as one of the most distressing examples of a lost opportunity.

In the Catholic world the announcement of the council almost immediately intensified the opposition between currents of thought that had been in confrontation for several years: Neo-Gallicans and liberal Catholics, on the one hand, and ultramontanes and opponents of modern freedoms, on the other. The choice of the consultors who were to prepare the drafts of the conciliar decrees—the group included sixty Romans and thirty-six from abroad, almost all of them known for their ultramontane and antiliberal views—disturbed those who had been hoping that the council would provide an opportunity for bishops from the outer reaches of the church to open up the church somewhat to modern aspirations and who thought they could discern a strategy at work: namely, to prepare for the council in secret, with no challenges raised by debate and with the curial viewpoint alone represented, and then to have the fathers accept without discussion a series of ready-made propositions.

The unfortunate "Correspondence from France" that was published on February 6, 1869, in *La civiltà cattolica*, the organ of the Jesuits in Rome, seemed to confirm this expectation by predicting a definition of papal infallibility by proclamation and thus without any possibility of restatement or discussion by the fathers. The reaction was especially intense in the Germanic countries. In particular, Ignaz von Döllinger, the well-known professor at the University of Munich, whose hostility toward the Curia had been on the increase for a number of years, published under the pen name *Janus* a violent and one-sided polemic against the overemphasis on papal primacy and Roman centralization. Polemical articles, though more moderate in tone, were also published in the newspapers of France, where liberal Catholics regarded as inopportune the definition of papal infallibility for which the ultramontanes were calling. The question of papal infallibility, which had not come up in the initial program for the council, suddenly became a major issue during the months preceding the opening of the council. A number of prominent bishops, such as Victor Deschamps, archbish-

op of Malines, and Henry Edward Manning, archbishop of Westminster, asked insistently that advantage be taken of the council for a solemn definition of this truth, since it was now being publicly challenged. On the other side, at their annual meeting in Fulda (September 1869), the majority of the German bishops discreetly expressed clear-cut reservations with regard to such a definition.

Though unmoved by such theological discussions, a number of European governments did become apprehensive about possible conciliar decrees on civil marriage, the place of religion in public education, and the legitimacy of freedom of worship and the press. Such apprehensions could only be intensified by the desire that many bishops and some Catholic newspapers expressed, namely that the *Syllabus of Errors* (1864) be made the basis for the council's deliberations, a desire that seems to have been welcome in Rome. All those in the church who feared the triumph of the ultramontane party at the council did what they could to intensify this governmental mistrust in the hope of procuring diplomatic warnings and cautions. At one point, France considered appointing a special ambassador to the council, as it had at the time of the Council of Trent, while Prince von Hohenlohe, chancellor of Bavaria, attempted to have the European governments take joint steps. In the end, these governments chose to limit themselves to an attitude of distrustful expectation.

CONCILIAR DEBATES. The council opened on December 8, 1869, in the presence of about 700 bishops, about two-thirds of those with the right to attend. Among them were 70 prelates of the Eastern rite who were in union with Rome, most of these being from the Middle East, and almost 200 fathers from non-European countries: 121 from the Americas (49 from the United States), 41 from Southern Asia and the Far East, 11 from Oceania, and 9 from the African missions, which were then in their infancy. One must remember that while the prelates from other parts of the world made up a third of the gathering, many of them were actually from Europe (the missionaries in particular) and that there was as yet no native bishop in Asia or Africa. This predominantly European gathering was also predominantly Latin. There was indeed a sizable English-speaking group (in which those of Irish origin were predominant) and about 75 Germans and Austrians. Spaniards and Latin Americans numbered barely one hundred; the French made up 17 percent of the gathering (the majority of the missionaries of that time were from France), and the Italians over 35 percent. In addition, two-thirds of the consultors, or experts, and all of the secretaries of the commissions were Italians, as were the five presidents of the council; of the primary leadership offices, only that of secretary general was not occupied by an Italian, namely, the Austrian Joseph Fessler.

The first three sessions of the council were spent on the election of the commissions. The most important of these was the doctrinal commission (*Deputatio fidei*), from which all bishops suspected of being opposed to a definition of

papal infallibility were excluded by the maneuvering of a pressure group of which Archbishop Manning was one of the main leaders. This maneuver, which many wrongly believed was ordered by the Curia, was a serious mistake for two reasons: first, it gave the impression that the elections were only a front, with the result that fathers in various groups now began to have doubts about the freedom of the council; and, second, it prevented a possible dialogue that might have reconciled the two opposing viewpoints.

On December 28 the council began at last to examine the first drafted constitution, which was directed "against the numerous errors deriving from modern rationalism." This draft, which was the work of the Jesuits Johannes Baptist Franzelin and Clemens Schrader, drew strong criticism because of its substance, which some found to be out of touch with contemporary forms of rationalism and too apodictic on points freely discussed among theologians, and especially because of its form, which was judged to be overly polemical and insufficiently inspired by pastoral concerns. After six meetings for discussion, which had the advantage of showing that the council would be freer than some had feared, the presidents announced on January 10 that the draft would be sent back to the commission for recasting and that meanwhile the council would tackle the drafts on church discipline. In this area twenty-eight drafts had been prepared that were rather tame and showed hardly any pastoral openness to the future; to these were added eighteen others, much superior in character, on the adaptation of canon law to the new circumstances of the religious orders and congregations. The discussion of the first four drafts that were distributed quickly got bogged down in details, especially since the time available to the speakers was unlimited. As a result, in order to speed up the pace of the work (as the great majority of the fathers wanted), the pope, on February 20, 1870, amended the regulations that had been distributed at the opening of the council. By and large, the modifications were to the good, but some fathers, who had already resented having a set of regulations imposed on them from above, saw in these modifications a new threat to full freedom of discussion.

While the examination of texts that had little chance of proving explosive was advancing with prudent caution in the council hall, the attention of both the fathers and the public was increasingly focused on the question of infallibility. Raised again by a clumsy statement of Bishop Felix Dupanloup in November 1869, the question soon led the fathers, who had initially tended to group together along national and linguistic lines, to form new groups that were inspired by ideological considerations.

On the one side, many fathers who were very hostile to their contemporaries' infatuation with liberalism were not at all reluctant to have the council restate the principles according to which, in classical teaching, the relations between church and state should be ruled in an ideal Christian society. Many—often the same—wanted a solemn definition of the personal infallibility of the pope. Even though they did

not approve of all the centralizing steps taken by the Curia, they were convinced that the Gallican and Febronian theses, which tended to diminish the primacy of the pope in favor of the episcopate, were simply a departure from the ancient tradition to which, as they saw it, witness was given by certain scriptural texts (esp. *Mt.* 16:18), certain patristic formulas (e.g., the maxim “Rome has spoken, the question is closed”), and the whole body of great scholastic doctors from Thomas Aquinas to Roberto Bellarmino and Alphonsus Liguori. Those fathers met the historical difficulties of their adversaries with an appeal to the living faith of the church and were especially impressed by the almost universal acceptance, in the church of their time, of the thesis of the pope’s personal infallibility, a thesis repeated on a number of occasions during the preceding twenty years by many provincial or regional councils. Reasons of a nontheological kind strengthened many of these prelates in their conviction: their veneration of Pius IX; their belief that an increased emphasis on the monolithic character of the Roman church could only draw to this church various non-Catholics who were distressed by the hesitations and lack of resoluteness of the churches separated from Rome or by the contradictions of philosophical systems (Manning, a convert, laid great stress on this point); their concern to lend as much weight as possible to the principle of authority in a world weakened by aspirations toward democracy, a type of government they regarded as a mitigated form of revolutionary anarchy; and their desire, in the face of the religious crisis they saw growing before their eyes, to give an increasingly centralized form to the defensive and offensive strategy of the church.

A comparable mixture of doctrinal considerations and nontheological motives inspired other prelates to think that such projects would overthrow the traditional constitution of the church and might well threaten the most legitimate aspirations of civil society. Some bishops remained very attached to a conception of the ecclesiastical magisterium according to which the pope can never decide a point of doctrine independently from ratification by the body of bishops. More widespread seems to have been the concern to safeguard the second element in the divinely appointed structure of the hierarchy; to many of the fathers the proposed definition of papal infallibility seemed part of a program aimed at practically destroying the episcopate. In addition, the way in which the question of infallibility was presented in the most prominent ultramontane newspapers could only confirm in their views those who were convinced that “the intention was to declare the pope infallible in matters of faith in order thereby to make people think him infallible in other matters as well” (Leroy-Beaulieu), that is, in matters more or less related to the political order. But surely it was to be expected that the governments would not permit a development along these lines without reacting to it, to the great detriment of the local churches.

Over and above immediate tactical considerations there was a question of principle that greatly disturbed all those

who believed that the future in the political realm belonged to liberal institutions and that the church had everything to lose by standing forth as the champion of autocratic authoritarianism. There were also concerns of an ecumenical kind: the proposed definition would render even more difficult any rapprochement with Eastern Christians; it would intensify the militant hostility of some Protestant groups; it might even lead to a new schism in German intellectual circles, which had been deeply impressed by Döllinger’s campaign. Those who declared their opposition to the definition were less numerous than those in favor of it—thus the designation of them as the “minority”—but the most prominent among them enjoyed great authority by reason either of their theological competence or of the important sees they occupied: the entire Austro-Hungarian episcopate under the leadership of Cardinal Othmar Rauscher, a renowned patrologist and strong defender of the rights of the Holy See against Josephist, or liberal, claims; all the major sees of Germany; a sizable number of French prelates, including the archbishops of Paris and Lyons; several archbishops of North America; the archbishop of Milan, the most populous of the Italian dioceses; and three Eastern patriarchs.

The two groups had an opportunity to count heads as early as January. The infallibilist pressure group, again acting independently (but in close contact with the Jesuits of *La civiltà cattolica*), circulated a petition asking the pope to put on the assembly’s agenda a draft definition of papal infallibility, which the preparatory commission had preferred not to offer on its own initiative. The petition finally collected 450 signatures, and, despite a counterpetition signed by 140 bishops, Pius IX decided on March 1 to include the desired passage in the draft of the constitution on the church that had been distributed to the fathers some weeks earlier on January 21.

The minority, now deeply disturbed, busied itself organizing the resistance that had until then been scattered and unfocused. The real center of this opposition was a young layman, John Acton, who as a historian shared the prejudices of his master, Döllinger, against the dogma and who feared even more the indirect effects of the definition on the future chances of Catholicism in a society increasingly based on the idea of freedom. Conzemius’s publication of the Acton-Döllinger correspondence (3 vols., Munich, 1963–1971) has made fully clear the important role, unsuspected until now, that Acton played in organizing the conciliar minority.

The leaders of the minority did not limit themselves to making personal appeals to fathers they hoped they could win to their side. Convinced as they were of the deadly effects on the church of the definition now being readied and of the legitimacy of taking all effective means to stop it, a number of them thought it necessary to rouse public opinion and so bring outside pressure to bear on the authorities of the council. Several of these fathers even tried to win governmental support, especially at Paris, because they knew how influential any mediation by Napoleon III would be, since his mili-

tary and diplomatic support was indispensable in preserving what was left of the pope's temporal power.

CONCILIAR CONSTITUTIONS. Amid the growing restlessness outside the council in the salons, newspapers, and chancelleries, the assembly itself was going ahead with its work. The draft of the constitution against rationalism, which had been recast by bishops Martin, Deschamps, and Pie with the help of the Jesuit Joseph Kleutgen, came before the council again on March 18. The new version was favorably received by the fathers, and any discussion was now concerned only with individual points or improvements of details. On April 24 the council unanimously gave its solemn approval to its first dogmatic document, the constitution *Dei filius*, which responded to pantheism, materialism, and modern rationalism with a substantial exposition of Catholic teaching on God, revelation, and faith; this exposition was to be for almost a century the basis of the treatises which made up fundamental theology.

Chapter 1 condemns pantheist views and briefly sets forth Catholic teaching on providence. Chapter 2 defines, against atheism and traditionalism, the possibility of knowing the existence of God with certainty by the natural light of reason and, against deism, the absolute necessity of revelation if man is to have knowledge of the supernatural order. Chapter 3 defines the reasonableness of the act of faith as against the illuminism of some Protestants and against those who deny the value of the external motives of credibility, such as miracles. It states that faith is both a free assent and a gift of grace and reaffirms the obligation of believing all the truths the ordinary ecclesiastical magisterium proclaims to have been revealed. It asserts that the church, which proposes the truths to be believed, at the same time carries within itself the guarantee of its own divine origin and that with his grace God confirms believers in their faith. Chapter 4 explains the relations that should exist between faith and reason, science and revelation: there are mysteries that cannot be demonstrated by reason, but reason can legitimately reflect on supernatural truths. While claiming a proper freedom for science, the council warns against abuses of this freedom. Finally, it explains what true dogmatic development is and condemns systems according to which philosophy may give new and more perfect meanings to revealed dogmas.

It quickly became clear that, given the pace at which work was proceeding, the constitution on the church, the text of which had been distributed to the fathers on January 21, would not come up for discussion for several months; this was even more true of its eleventh chapter, which dealt with the special prerogatives of the pope. Consequently, as early as March, new petitions requested that this chapter, which made the council restive, be discussed out of its proper order as soon as the examination of the constitution against rationalism was concluded. Despite the reservations of three of the five presidents of the council, Pius IX, who was increasingly displeased at the opposition of the minority group, decided to alter the schedule. In order to avoid the anomaly

of treating this chapter before the others, it was expanded into a short, independent constitution devoted entirely to the pope.

The general debate on the text as a whole began on May 13 but was reduced from the outset to a discussion of the opportuneness of the definition; at times the discussion was impassioned. After some fifteen meetings, the fathers went on to examine the details of the texts; this discussion focused essentially on the chapter devoted to the definition of papal infallibility. The proposed text, although the commission had already improved it by comparison with the original draft, did not yet take sufficient account of the legitimate role that belonged to the episcopate, alongside and in collaboration with the pope, in the supreme teaching office of the church. Fifty-seven speakers took the floor, emphasizing theological arguments or historical difficulties, as well as the practical advantages or drawbacks of a definition in the circumstances of that time. These debates, though often tedious, at least gave an opportunity to qualify certain expressions and led to the elimination of some opposition.

Meanwhile, the behind-the-scenes lobbying intensified. For, apart from the zealots of the majority and the partisans of unyielding resistance, the great majority of the fathers were men of moderation who were deeply grieved and troubled by all the agitation. Far from desiring to see their opponents crushed, they wanted only to find a compromise formula that would keep the divisions within the assembly from becoming public. This was especially true of the Italians, as Michele Maccarrone has clearly shown. By reason of their numbers these men, who had played no part in the initial steps taken to introduce the famous question, were a decisive bulwark of the informal "third party" that had been taking shape since the beginning and was finally able to win the day against the neo-ultramontane and anticurialist extremists.

There is reason for thinking that a much larger section of the minority would have finally accepted the nuanced solution that was gradually worked out if Pius IX had not been so intransigent. For recent research has also shown, with the help of previously unstudied documents, that the pope several times directly intervened on the side of the majority extremists as the discussion became protracted. Whatever the personal responsibility of Pius IX may have been, it is a fact that last-minute efforts to rally the opponents through small concessions proved fruitless, despite the good impression made by the recapitulatory explanation given by Bishop Gasser in the name of the theological commission (this authoritative commentary is of key importance for a grasp of the nuances of the conciliar text). When a final appeal of the minority to Pius IX had no result, some sixty bishops decided to leave Rome before the final vote in order not to have to cast a negative vote in the presence of the pope on a question that directly concerned him. The other members of the minority judged that the successive improvements of the text as well as Bishop Gasser's commentary had removed the principal substantive objections and they decided therefore

to approve the final text. This text was solemnly accepted on July 18 by nearly everyone present.

Officially entitled First Constitution on the Church of Christ, the constitution *Pastor aeternus* expounds Catholic teaching on the privileges of the pope. After a lengthy introduction on the institution of the church by Christ and on the place therein of papal primacy as the foundation of the church's unity, chapter 1 asserts, against some Gallicans and Febronians, that Peter received directly from Christ, and not through the church, a primacy of jurisdiction over the entire church. Chapter 2 states that by Christ's will this primacy is to be continued perpetually in the successors of Peter, the bishops of Rome. Chapter 3 solemnly defines the nature of the pope's primacy: the pope has an ordinary, immediate, "episcopal" jurisdiction not only in questions of faith but also in matters of church discipline, and this authority, which does not depend on approval by an ecumenical council, is to be exercised over pastors as well as the faithful. The concern to provide explicit safeguards for the authority of the bishops is at the root of the third paragraph, the main point of which is that bishops govern their flocks as "true pastors" and are therefore not mere delegates of the pope.

The fourth chapter declares that authority as supreme teacher is included in the primacy and then recalls how over the course of time the popes had always exercised this function by drawing upon the faith of the universal church as expressed in particular by the teaching of the bishops. The chapter then goes on to define solemnly that this supreme teaching office has attached to it the prerogative of infallibility, provided the pope is speaking *ex cathedra*, that is, provided that "in exercising his office as teacher and shepherd of all Christians he defines, in virtue of his supreme apostolic authority" (that is, with the intention of unequivocally putting an end to all discussion) "that a doctrine concerning faith or morals must be held by the universal Church; such definitions are irreformable of themselves and do not require ratification by the episcopate (*ex sese non autem ex consensu Ecclesiae*)." This final formula is a bit ambiguous, for, according to the commentary given by Bishop Gasser in the name of the doctrinal commission, while the words reject the *consensus Ecclesiae* as the source of papal infallibility, they do not mean to deny that the pope, as spokesman for tradition, must remain in constant close contact with the "mind of the Church" (*sensus Ecclesiae*) in the exercise of his ministry.

After the vote taken on July 18 the council continued its work for two more months, but at a slower pace, since the majority of the fathers had left Rome for the summer. The occupation of Rome by the Italians on September 20 brought the work to a definitive end, and on October 20 the pope announced that the council was adjourned indefinitely.

The termination of the debates did not immediately bring a calm to all hearts. The agitation continued for some time, and there were sad apostasies, especially in the Germanic countries where the Old Catholic schism developed around some university professors who appealed to Döllinger's writings.

Among the bishops of the minority a few, Hefele and Strossmayer among them, wavered for several months, but in the end none of them refused to accept the new dogma.

When the immediate results of the council were compared with its ambitious program (fifty-one drafts had still to be voted on) and especially with the great hopes the convocation of the council had raised, the First Vatican Council seemed to many to have been a failure, its principal outcome having been to aggravate the disunity among Christians. With the passage of time, however, people became aware of important results flowing from the intense intellectual ferment the convocation of the council had produced. The work done by the commissions which dealt with the improvement of church law was not wasted, nor were the many suggestions sent in writing by those at a distance. Extensive use was to be made of these materials in the encyclicals of Leo XIII and especially in the revision of the Code of Canon Law under Pius X. The first dogmatic constitution that had been passed in April 1870 exercised a clarifying influence on subsequent theological teaching, especially in the burning question of the relations between reason and faith. On the other hand, it also strengthened the tendency to enlarge the role of authoritative doctrinal interventions in the development of Catholic thought; this tendency was strengthened even more by the definition of papal infallibility.

While the solemn approbation given to the ultramontane movement, which continued to develop for another half century, did not bring about the revolution in church government that some opponents had anticipated, it did nonetheless lead to more numerous direct interventions of the Holy See in the dioceses and to an emphasis on Roman centralization. At the same time, however, it must be recognized that by defining very strictly the rare cases in which the privilege of papal infallibility comes into play, the council ruled out the exaggerated ideas that were beginning to spread abroad before 1870 under the influence of bishops like Manning and journalists like Veuillot. In the final analysis, the nuanced character of the definition, which was the result of impassioned discussion and satisfied the legitimate demands of many minority bishops, was the best safeguard against the excesses of what has been called "neo-ultramontanism," a fashion of excessive devotion, more sentimental than theological, to the pope.

BIBLIOGRAPHY

The main documents that inform us of the preparation and course of the council have been published in volumes 49–53 of the *S. Conciliorum nova et amplissima collectio* (Arnhem, 1923–1927). The two most detailed histories of the council are tendentious: Johann Friedrich's *Geschichte des vatikanischen Konzils*, 3 vols. (Bonn, 1877–1887), is excessively critical from an Old Catholic point of view; Theodor Grandérath's

Geschichte des vatikanischen Konzils, 3 vols. (Freiburg, 1903–1906), is a systematic defense by a Jesuit who refuses to allow any legitimacy to the reservations of the minority. Good presentations are Edward Cuthbert Butler's *The Vatican Council*, 2d ed., 2 vols. (London, 1965), and Michele Maccarrone's *Il Concilio Vaticano I*, "Italia Sacra," vols. 7 and 8 (Padua, 1966). A shorter presentation is my *Vatican I* (Paris, 1964).

Worthy of special mention among the studies of the national episcopates are James Hennessey's *The First Council of the Vatican: The American Experience* (New York, 1963); Frederick J. Cwiekowski's *The English Bishops and the First Vatican Council* (Louvain, 1971); Klaus Schatz's *Kirchenbild und päpstliche Unfehlbarkeit bei den deutschsprachigen Minoritätsbischöfen auf dem I. Vatikanum* (Rome, 1975); and Constantin Patelos's *Vatican I et les évêques uniates* (Brussels, 1982). Doctrinal commentaries on the constitution *Dei filius* include Alfred Vacant's *Études théologiques sur les constitutions du Concile du Vatican d'après les actes du concile*, 2 vols. (Paris, 1895), and on the constitution *Pastor aeternus*, Gustave Thils's *La primauté pontificale* (Gembloux, France, 1972), and the same author's *L'infaillibilité pontificale* (Gembloux, France, 1969). August B. Hasler's *Pius IX (1846–1878), päpstliche Unfehlbarkeit und I. vatikanisches Konzil*, 2 vols. (Stuttgart, 1977), raises real questions but is spoiled by a lack of historical criticism. See also Giacomo Martina's "Pio IX e il Vaticano I, di A. B. Hasler, rilievi critici," in *Archivum historiae pontificiae* 16 (1978): 341–369, and Joseph Hoffmann's "Histoire et dogme: la définition de l'infaillibilité pontificale à Vatican I," in *Revue des sciences philosophiques et théologiques* 62 (1978): 543–557 and 63 (1979): 61–82. A very complete analytical and critical bibliography is J. Goñi Gastambide's "Estudios sobre el Vaticano I," *Salman-ticensia* 19 (1972): 145–203, 381–449.

VATICAN COUNCILS: VATICAN II [FIRST EDITION]

The idea of holding a church council, which can be attributed to Pius XI and Pius XII, four hundred years after the

Council of Trent and one hundred years after the First Vatican Council, as well as the realization of this idea, must be seen in historical perspective. The principal formative influence on the life of the Roman Catholic church until the Second Vatican Council, besides the impact of the institutional and doctrinal differentiation of Christian churches resulting from the Reformation, was the Council of Trent (1545–1563), especially through its decisions on faith and morals. Although the First Vatican Council, through its definition of the universal jurisdictional primacy and infallibility of the pope, had expanded to some extent the decisions made at Trent, it did so without addressing the question of the relationship of primacy and episcopacy. The problem of conformity between proclamation of the faith and pastoral care was not considered, nor were the altered circumstances resulting from industrialization. On the one hand, the French Revolution and secularization had shaken the foundations of radical episcopatism evidenced in such national movements as Gallicanism, Josephism, and Fabronianism, but on the other hand, an extreme papalism (or rather curialism) was no longer possible after the dissolution of the Papal States.

The way was clear, however, for new forms of thinking about and actualizing the church and its relationship to the world. Before discussing the conduct of the Second Vatican Council itself, we shall examine these tendencies briefly.

THE CHURCH BEFORE THE COUNCIL. The liturgical movement, whose roots go back to the time of the Reformation, reached a peak of activity in the twentieth century. The movement sought to revive liturgical forms in order to create the church anew by means of daily participation in the objective events of liturgy and the mysteries of the church. Connected with this was a new valuation of sacramentality and of the proclamation of the word (for example, in kerygmatic theology, that is, pastoral theology, culminating in the development of a new practical theology). The liturgical movement found magisterial support in the encyclical *Mediator Dei* (1947) of Pius XII.

Paralleling the liturgical movement was the biblical movement, which rediscovered the immediate religious meaning of holy scripture by means of new translations into vernacular languages and the formation of Catholic Bible associations. The Bible was studied according to the norms of modern scholarship and the canons of scientific exegesis. The epoch-making encyclical *Divino afflante Spiritu* (1943) of Pius XII removed the prevailing ecclesiastical obstacles to a truly critical study of the Bible.

The involvement of the laity in the ministry of the church also changed. Catholic Action was founded in 1923. Laypeople were becoming conscious of their responsibilities and rights in the church. Manuals on doctrine and moral theology written especially for laypeople appeared, culminating in Yves Congar's *Lay People in the Church* (rev. ed.; Westminster, Md., 1965).

The church's consciousness of itself changed. This was primarily a matter of the dissolution of the one-sided canon-

cal understanding of the church as juridical, an understanding that had been set forth in the late Middle Ages and was firmly established once and for all by the Code of Canon Law (1917). The change was signaled in 1922 by Romano Guardini, who declared the “awakening of the church in souls,” and was confirmed in 1943 by the understanding of the church as the mystical body of Christ set forth in Pius XII’s encyclical *Mystici corporis*, which, however, still identified the church with the official hierarchical Roman church. The change culminated in ecclesiological projects during and after World War II that engendered an understanding of the church as people of faith subject to the Word.

The ecumenical movements, which since the beginning of the twentieth century had brought together and united the non-Catholic Christian church communities through world church conferences and the founding of the World Council of Churches, stood distanced for a long time from the Roman Catholic church. The opening of the Roman offices for ecumenism by John XXIII was made possible by contacts and conversations between Protestant and Catholic theologians and church leaders that took place for mutual defense against anticlerical totalitarianism. These contacts were expanded after the founding of a Catholic ecumenical board in Fribourg, Switzerland, in 1951. The question of the reunification of all Christians appealed to parts of Catholic Christendom and exercised a great influence on theological reflection about the church’s unity in diversity and its understanding of ministry, eucharist, and primacy.

Another important tendency in the Roman Catholic church before the calling of the council involved changes in theology itself. Certain theological efforts and approaches went beyond basic or scholastic theology and carried on a dialogue with the consciousness of the times and with the theologians of the separated Christian churches. The most important stages were attempts to overcome through kerygmatic theology the objectivistic and unhistorical or superhistorical point of view of neoscholasticism; “nouvelle théologie,” which emphasized open thinking and opposed scholasticism; transcendental theology, which reflected on the conditions of the possibilities of man; the acquisition of a genuinely theological understanding of history in hermeneutical theology; and finally the inclusion of the societal dimension in political theology. These positions gained more and more significance with regard to the church’s self-understanding and its relationship to the world. It became a church that no longer defined itself in the triumphalist terms of the Counter-Reformation but understood itself as a pilgrim church waiting for its eschatological completion.

The inner transformation of the church corresponded to a new orientation in the relationship of the church to the world. Integralism, the world viewed simply as material for the activity and self-preservation of the church, and esotericism, the world as irrelevant for salvation, prompting flight from it, needed new alternatives. Here especially the theology of earthly realities (Gustave Thils), the theology of the

world, and the various projects in moral theology or ethics were preparatory for a new outlook. The true relationship of the Christian and of the church to the world lies between integralism and esotericism. And this middle ground must not be understood as a cheap compromise necessitated by circumstances, a compromise possible only because, unfortunately, the world cannot ever be integrated totally into the ecclesial-religious sphere or because the pious cannot avoid serving the profane reality of life. This is a middle that stands above the extremes as an original unity. Of itself, it actually constitutes the unity and difference between the explicitly Christian and churchly, on the one hand, and the world and worldly activity, on the other. And here there must be a clear distinction between the relationship of the official church to the world and that of the Christian to the world.

HISTORY AND THEMES OF THE COUNCIL. The Second Vatican Council was the twenty-first ecumenical council (according to the official count of the Roman Catholic church), held from 1962 to 1965 at Saint Peter’s Basilica in Rome. On May 17, 1959, after the first official announcement on January 25, 1959, John XXIII designated a commission that was to make preparations for the council under the direction of the cardinal secretary. All bishops, the Curia Romana, and the theological and canonical faculties voted on topics for discussion. On June 5, 1960 the pope ordered ten specialized commissions to work on the schemata (protocols). There were also two permanent secretariats (one for the mass media, another for Christian unity). A central preparatory committee was responsible for organizing the work of the council. The formal summoning of the council to Rome occurred on December 25, 1961. On January 2, 1962 the opening was set for October 11, 1962. According to the rules of procedure, ten cardinals were to head the ten council commissions assigned to work into the protocols the suggestions introduced in the general assembly. Two-thirds of the members of these commissions were to be chosen by the assembly; one-third were to be named by the pope. The council decisions required a two-thirds majority.

As so-called *periti* (expert advisers), about two hundred theologians (generally professors of theology) were called to Rome. Of the 2,908 legitimate delegates, 2,540 participated in the opening. Of the invited non-Catholic Christian churches and communities, seventeen were present through thirty-five representatives. In the end, twenty-eight non-Roman churches, including the Russian Orthodox church, were represented by ninety-three observers. There were eighty-six governments and international bodies represented at the opening.

The council met in four sessions: October 11 to December 8, 1962; September 29 to December 2, 1963; September 14 to November 21, 1964; and September 4 to December 8, 1965. Ten public sessions and 168 general assembly meetings were held.

From the time of its proclamation, the council was intended to have a double goal: reform within the church and

preparation for Christian and world unity. But already in the opening address this goal was expanded and deepened. The council was given the task of proclaiming the entire Christian truth “through a new effort” whereby it was of great consequence to distinguish between the truths and the “way in which they are proclaimed.” *Aggiornamento* (Ital., “coming together”) was to demonstrate the credibility of the church, and the church’s relationship to non-Christians was to be improved.

In the first session, which included the first thirty-six general assemblies, the commission members were not chosen according to the prepared list but rather, at the suggestion of Cardinal Achille Liénart (Lille), according to recommendations of the different groups of bishops. John XXIII died on June 3, 1963. His successor, Paul VI, continued the council. At the reopening of the second session (general assemblies 37–89) on September 29, 1963, Paul VI emphasized the pastoral orientation of the council. It was to deal with the nature of the church and the function of the bishops, to make efforts toward the unity of Christians, and to set in motion a dialogue with the contemporary world. From the presidency, which had been expanded to twelve members, four moderates were named (Cardinals G. P. Agagianian, Julius Döpfner, Jacobus Lercaro, and L. J. Suenens), who were alternately to direct the general assembly. The protocols were contracted to seventeen, and a press bureau was set up. In the third session (general assemblies 90–127), the pope, by way of the theological commission, had the so-called *nota explicativa praevia* (“previous explanatory note”) included in the Constitution on the Church as an authoritative explanation of the chapter on the collegiality of pope and bishops in their responsibility for the whole church. The decisions of the First Vatican Council were thereby once again maintained. At the opening of the fourth session (general assemblies 128–168), Paul VI announced the establishment of a synod of bishops to be convened regularly. This was to emphasize the idea of collegiality between the pope, the bishop of Rome, and the other bishops. All the decisions of the council were confirmed and proclaimed in public session. Paul VI solemnly closed the council on December 8, 1965. The task of carrying out the decisions of the council was assigned to the appropriate commissions. The Secretariat for Christian Unity continued in existence, and two new bodies were set up: a secretariat for relations with non-Christian religions and one for relations with unbelievers.

The Second Vatican Council was a council of the church about the church. In order to protect its freedom, John XXIII specifically avoided formulating a systematic plan of discussion. The council was to be pastorally oriented so that the church could ask itself all the questions about the contemporary situation that were being asked within it and in the world. Beyond that, however, nothing was really prescribed. That fact is demonstrated by the seventy preconciliar proposals for future council decrees, which had to do with almost everything with which the church could at all concern

itself. Although the selected topics, reflected in the sixteen documents accepted by the council, may appear to be haphazard, these four constitutions, nine decrees, and three declarations do form a unified network that makes the council a council about the church.

The subjects treated in the documents produced by the council can be summarized briefly. The basic self-understanding of the church is addressed in the Dogmatic Constitution on the Church. The inner life of the church is discussed in various documents: the work of salvation through liturgy (the Constitution on the Sacred Liturgy); the church’s function of oversight (the Decree on the Bishops’ Pastoral Office in the Church and the Decree on Eastern Catholic Churches); the teaching office (the Dogmatic Constitution on Divine Revelation, including discussions of scripture, tradition, and teaching office, and the Declaration on Christian Education); and vocations (the Decree on the Ministry and Life of Priests, the Decree on Priestly Formation, the Decree on the Appropriate Renewal of the Religious Life, and the Decree on the Apostolate of the Laity). The mission of the church to the world is likewise elaborated on in several documents: the church’s relationship to non-Catholic Christianity (the Decree on Ecumenism and the Decree on Eastern Catholic Churches); its relationship to non-Christians (the Declaration on the Relationship of the Church to non-Christian Religions, which makes special reference to the Jews, and the Decree on the Church’s Missionary Activity); its relationship to the contemporary secular situation of the world in general (the Pastoral Constitution on the Church in the Modern World and the Decree on the Instruments of Social Communications); and its relationship to the philosophical pluralism of the present age (especially in the Declaration on Religious Freedom).

The council’s understanding of the church. The church is the subject not only of the Dogmatic Constitution on the Church (*Lumen gentium*) but also of all the other documents. The Second Vatican Council, in contrast to Trent and to Vatican I, was oriented neither toward dogma nor toward theological controversy; rather it was pastorally oriented in that it set forth the meaning of the church, its message, and its missions for the world and for humanity. The church, it declared, wishes to encounter humanity through acceptance and solidarity, through dialogue and cooperation.

In *Lumen gentium* the council set aside juridical and controversial questions and defined the church first as a mystery, as a sacrament of unity between God and human beings and among human beings themselves. It presented the mystery of the church in the perspective of salvation history as people of God, body of Christ, and temple of the Spirit, and it articulated the mission of the church for faith and for service in word and sacrament. It made the designation of the church as people of God its central statement and thereby set aside a one-sided hierarchical understanding of the church. It emphasized the pilgrim character and historicity of the church as well as its instrumental quality and its non-

identity with the kingdom of God. The ministry of the church was characterized as gift and service. The council, in full support of Vatican I, dealt extensively with the college of bishops. It accentuated the principles of collegiality and synod as structural elements of the church and the meaning of the local church as representative of the whole church. With reference to the priesthood of all believers, the council stressed the dignity, role, and responsibility of the laity as well as the presence of the church in the world, which is often possible only through the laity.

Concerning the question of the identification of the Roman Catholic church with the church of Jesus Christ, the exclusive *est* ("is") was replaced by the more open *subsistit* ("subsists," *Lumen gentium* 8). The council characterized the church's relationship to the other churches and Christian confessions not through the instrumental definition of union with Rome but through the living realities in these communities that are constitutive of church. These realities make it legitimate, and also necessary, to address and recognize other churches as means of salvation. The relationship of these churches to the Roman church is defined by the formula "*coniunctum esse*" ("to be joined together"). This union is rooted in baptism, faith in God and Christ, and in other sacramental and spiritual realities. The call to Christian unity is understood not merely as a summons to the others but as an appeal to the church itself, a call for its own constant conversion. According to Vatican II, therefore, the unity of the church is not to be sought by imposing uniformity, that is, by an all-defining centralization, but in a legitimate plurality that strengthens unity and does not endanger it.

A council of the world church. The council seemed to be the first act in which the Catholic church began to realize itself as a truly worldwide community, but this does not dispute the importance of preceding events. In the nineteenth and twentieth centuries, the church slowly and tentatively developed from a potential world church to an actual world church, from a European, Western church with European settlements around the world, to a universal church present in the whole world, even if in very differing degrees of intensity, and no longer seen in terms of European-North American affiliates. Throughout the world the church was developing a native clergy that was conscious of its independence and responsibility for itself. This world church acted for the first time at the council with historical clarity concerning faith and morals. In spite of the undeniably powerful presence and influence of the European and North American regional churches, the members of this council, in contrast to all previous councils, were bishops from the whole world and not simply, as at Vatican I, European missionary bishops sent out to the whole world.

The council was also the cause of the abolition of Latin as the common cultic language. There will always be an ultimate liturgical unity among the regional liturgies because of the unity of the church and the sameness in theological essence of the Christian cult, but from the diversity of cultic

languages there will develop, in a necessary and irreversible process, a diversity of liturgies. The relationship between sameness and diversity of the regional liturgies cannot be certainly and precisely predicted. In the long run, the liturgy of the universal church will not be a mere translation of the liturgy of the Roman church but rather a liturgy formed from the unity in diversity of regional liturgies in which each has its own unique form that does not result from its language only but also from other cultural factors such as gesture and dance. If the essence of the church, and thereby the essence and character of a local church, derives essentially from the liturgy, which is one of its highest actualizations, then a truly independent local church is formed. Such a church is more than an administrative district of a uniform, centrally organized state.

Relationship to the world. In several decrees, to which belong primarily the Pastoral Constitution on the Church in the World (*Gaudium et spes*) and the Decree on Religious Freedom, the council attempted to describe its fundamental relationship to the secular world on the basis of its nature and not simply by the force of external circumstances. The council spoke about the renunciation of external means of force in matters of religion, the dignity even of an errant conscience, and the building of a legitimate secular world that was not to be judged by ecclesial standards alone. These may seem like statements forced upon the church against its most inner sensibilities by a secularized world rather than as objective expressions of the reality of Christianity itself. One must consider, however, that the church, even where it has or could have greater power in the secular realm, must support the renunciation of that power, as the council stated, because this is required of the church by virtue of its own nature (although in its history it has all too often disregarded this requirement). The temptation for the church to reassert a false superiority over the world continues to exist, but since the decisions of Vatican II the church in principle can no longer yield to this temptation, because the council formulated an irrevocable norm. No longer, since the decrees of the council, can the limitation of freedom in the name of goodness and justice be so easily rationalized by the church. For the sake of the common good, as the council says, there will always be force and power in the world. But with Vatican II the church renounced a share of that power, which it had previously claimed without inhibitions whenever it could. A border over which it was no longer possible to return, not even in small matters, had thus been crossed.

Theology of the council. The theological situation in which the council found itself was transitional and difficult to define. On the one hand, neoscholastic theology was self-evident; it was the dominant theological position represented in the proposals that had been prepared for the council by Roman commissions. Linked inextricably with the Latin language, this neoscholastic theology used the New Testament in the old style as a collection of proofs (*dicta probantia*). On the other hand, the theology of the council was more critical-

ly related to scripture than was neoscholasticism. It had opened itself to subject matter that did not originate in the repertory of neoscholasticism. It exercised a certain braking effect against theological excess (for example, in Mariology). It made an effort to be considerate of ecumenical needs. It also held that one could say something theologically important even if one did not proclaim it solemnly as dogma. The theology of the council was, then, a theology of transition. The question still remains whether, how, and how quickly this theology will be further developed now that it has received a certain official legitimation by the council. Although impulses from the conciliar theology can be felt in the work of the Sacred Congregation of the Doctrine of the Faith since the close of the council, that office remains too neoscholastic in its anxious defense against certain modern theological efforts and too fearful and not creative enough about the questions that engage contemporary theology.

Roman theology will not be able to lead the theology of the whole church back over the border crossed at the council. On the contrary, theology will almost of necessity become a world theology, in accord with the council. That is, it will no longer exist in the non-European and non-North American countries simply as a Western expression. Latin America and sub-Saharan Africa have already announced a claim to a theology of their own. Liberation theology does not have to remain the only watchword for such an independent Latin American theology. Perhaps East Asia will also soon develop a theology of its own in a creative dialogue with its own culture and history. These theologies will have to concern themselves with the questions that are foremost in the respective cultural arenas and are not the same everywhere. The undeniable diversity that emerges from this process will help shape and determine the character of the whole of theology. European and North American theology can actually contribute to the development of non-Western theologies, in spite of the hoped-for independence of the rest of the world, because the West, with its Enlightenment and technological rationality, is becoming in increasing measure a partner in the fate of the rest of the world practically and theologically.

Change in ecumenical attitude. The council signified a break in the history of the relationship of the Catholic church both with other Christian churches and communities and with the non-Christian religions of the world. Naturally there were always contained in the faith consciousness of the church convictions that in principle legitimized the newly emerging relationship of the Catholic church with other Christian churches and communities and the non-Christian religions. But in the past these convictions had no effective impact. The theological grounds that legitimized this new breakthrough were already present in the past: the conviction of God's will for universal salvation in Christ and the doctrines of the possibility of justification without sacraments, of the implicit desire to belong to the church, and of the validity of baptism even outside the Catholic church, among

others. This legacy, which is theologically self-evident and was always present, can give the impression that nothing has actually changed in the relationship between the church and the rest of humanity. But the Catholic theologian, in contrast to an all too naive nontheologian, cannot understand the new closeness and the positive relationship of the Christian confessions among themselves and the relationship of Christianity with the non-Christian religions as if serious differences, divisions, or tasks for unification do not exist. The Catholic theologian does not understand the Catholic church to be only a particular form of historical coincidence, which religious history or church history has produced among many other equally valid forms.

Christianity has always been convinced that there is a true history of revelation and faith in which the same thing does not just happen again and again but in which new and radical changes occur. Naturally, with the event of Jesus Christ there occurred an unsurpassable summit and irreversible stage of revelation history that should not be hidden or trivialized. Nonetheless, the council initiated a point of view that it ratified as truly Christian, namely, that Catholic Christianity had assumed a different and new position relative to other Christians and their churches and relative to the non-Christian religions of the world.

The crucial point in this ecumenical change of attitude, in the broadest sense, is that the extent and radicality of this change is hidden and rendered innocuous in our ordinary consciousness by a modern liberal and relativistic mentality that assumes *a priori* that such a new ecumenical openness and readiness to learn is banal and self-evident. It should not be denied that this modern liberal mentality was part of the climate in which the new ecumenical consciousness could grow for the first time. But this consciousness also and especially grew out of a genuinely Christian root; it is in itself Christian. It definitively leaves behind an older mentality that had been operative for a millennium and a half; moreover, it remains obligatory for the history of the church, like other great decisive moments of faith history.

Without denying the seeds of the future in the past, it is necessary to maintain that before the council the Catholic church considered the non-Roman Catholic churches and communities to be organizations and societies of people who differed with the old church only through errors and deficiencies and who ought to return to it in order to find in it the full truth and fullness of Christianity. From the point of view of the old attitude, the non-Christian religions were all forms of paganism, that is, religion that human beings, sinfully and without grace, produced on their own. (This was also the opinion of Martin Luther and Karl Barth.) It was not at all explicit in the actual consciousness of the church that the non-Catholic churches could bring with them in an ecumenical accord a positive legacy of Christian history into the one church of the future, or that the non-Christian religions could exercise in their institutionality a positive salvific function for non-Christian humanity. Those views were

changed by Vatican II, and since then a position of acceptance can no longer be excluded, because it is understood not as an aspect of the liberal modern mentality but rather as an integral element of Christian conviction.

Universal optimism about salvation. Given the multifaceted nature of Augustine's theology, the following characterization may not do him justice in every respect. One may also not ignore the fact that the history of the church's faith consciousness has progressed by many small steps from Augustine to the present. But if one considers these limitations and that many historical causes have functioned as catalysts in the above-mentioned change of faith consciousness of the church, one can still say that Augustine inaugurated and gave to Christianity a consideration of world history in which, because of the incomprehensibility of God's providence, world history remained the history of the damned, of whom in the end only a few were saved through a rarely given grace of election. The world was dark for Augustine and only dimly illuminated by the light of God's grace, the gratuitousness of which was manifested in its rarity. Even if Augustine knew that there were many in the church who seemed to be outside it, and vice versa, the circle of those who are to be saved was nearly the same as the group of those who believed explicitly in a Christian and ecclesiastical way. The rest, because of an incomprehensibly just judgment of God, were among the damned of humanity. On the whole, hell was the future of world history.

Augustine's pessimism about salvation was slowly reconstructed and transformed in the theoretical and existential consciousness of the church by an extremely painstaking process. The emerging optimism about salvation, consisting of insights acquired one by one, was viewed as limited only by the bad will of the individual, and even then it was hoped that the power of grace would once again transform this malice into free love for God. Until the council, however, the church had not yet actually ratified and taught these insights with dogmatic finality. It did teach, however, that even those who are convinced atheists are connected with the Easter mystery of Christ as long as they follow their consciences; moreover, all human beings who know God in some way are in touch with God's revelation and can, in the theological sense of a saving act, believe. The church through Vatican II declared that even those who search in shadows and images for the unknown God are not far from the true God who wills that all human beings be saved if only they make an effort to lead a righteous life. It was emphasized by the council that the church is not so much a society for those who are saved but the primary sacramental symbol and germination cell of salvation for the whole world.

One could say that the council's optimism about universal salvation remained hypothetical, that salvation could fail for individuals through unrepented guilt, and that, hypothetically, such optimism was the normal teaching of the church even before the council. It is true that the church, even after the council, does not proclaim universal reconcili-

ation. It is likewise true that before the council the church already taught belief in a universal salvific will. But this preconciliar teaching was thought of very abstractly and was equipped with not a few "ifs" and "buts" that could no longer be maintained after the council. The council courageously postulated a real revelation and therefore a real possibility of faith where the Christian proclamation does not yet reach. It did not even consider a profession of atheism to be unequivocal proof of the hopelessness of salvation, which certainly did not agree with the traditional doctrine previous to the council. With its rejection of a *theoretical* doctrine of universal salvation, the church, in the council and in its practical attitude, proceeded from the principle that the grace of God is offered to a person's free choice and that in this freedom it is also universally effective. This attitude has naturally had a long developmental history. In Vatican II, however, it became clear and irreversible because such a hope can certainly grow, but it cannot actually any longer diminish.

The world church made its appearance as such in the council, and it says to the world, at once incomprehensibly and self-evidently, that in all the abysses of its history and all the darkness of its future this world is surrounded by God and God's will. In boundless love this God is self-communicated to the world as its ground, power, and goal. Out of such love, God assures the effectiveness of this offer to the freedom of history. In the council the church became new because it became a world church. As such, it proclaims to the world a message that, although it certainly has always been the heart of the message of Jesus, is proclaimed today more unconditionally and more courageously than before—and thus it is new. In both respects, in the proclaimer and in the message, something new has happened that is irreversible.

VATICAN COUNCILS: VATICAN II [FURTHER CONSIDERATIONS]

Until Vatican II (1962–1965) pronouncements of the Catholic Church were deduced from objective truths expressed in essentialist, ahistorical language. In contrast, the sixteen documents of the Twentieth Ecumenical Council are marked by a sense of historicity. Analogously, before Vatican II, authority in the church was exercised in a monarchical manner. In the documents of Vatican II, collegiality and subsidiarity became hallmarks of authentic authority.

THE METHODOLOGICAL SHIFT. Neither the implications of historicity for morality and doctrine nor a more inclusive understanding of the exercise of authority have run a smooth course since the close of the council. Nothing, however, that has transpired during that time remains unaffected by these two characteristics that permeated the council's deliberations. Indeed one's attitude toward the work of the council is most frequently dictated by one's acceptance or nonacceptance of the paradigm shift in ecclesial self-understanding occasioned by the twin concepts of historicity and shared authority. Further, developments in liturgical practice, more than in any other area, illustrate the interplay of historicity and authority.

HISTORICITY. Common to modern philosophers of history and cultural anthropologists is the understanding that humans are shaped by the empirical, particular circumstances of their lives. Within these circumstances a set of meanings and values emerges that develops into particular cultures, which, because of their particularity, cannot claim absolute universality for their values. Cultures generate horizons in which participants of that culture live, think, ask questions and receive answers, seek meaning, perceive value, and create symbol systems. However, these cultures are not static. Due to various influences, they change and develop. Some would say cultures are open-ended and that the ever-receding horizon is God—a horizon, however, never reached. The Jesuit theologians Karl Rahner (1904–1984) and Bernard Lonergan (1904–1984) worked with this notion of horizon. If one adopts this position, one can speak of absolute truth only within a certain horizon. Human beings can know truth but never completely possess it. Indeed within this understanding truth is more a lure, urging individuals and communities

to a fuller self-appropriation, than it is an object to be possessed.

This understanding of human history and culture profoundly influenced the documents of Vatican II and the theology developed from these documents. Pius XII's landmark encyclical *Divine Afflante Spiritu* (1943) marked the beginning of a new era in Catholic biblical studies, one marked by an acknowledgement of the historicity of sacred texts. However, not until after Vatican II and the promulgation of *Dei Verbum* (1965) were nonscholars introduced to new ways of appropriating the Scriptures and modern biblical scholarship found its way into seminaries. Consequently whole areas of doctrine, such as original sin, which had been based on a literal understanding of Scripture, had to be rethought.

Besides applying the concept of historicity to Scripture, theologians applied it to theology. Whereas most theologians would agree that truth may be unchanging, they would also stipulate that it is expressed in historically conditioned categories and that, as history and culture change and develop, so do doctrines. This profoundly affected the study of Christology. As Elizabeth Johnson has pointed out, the emphasis on the historicity of Jesus, coupled with the fifteenth centenary anniversary of the Council of Chalcedon (451 CE), opened a whole new corpus of reflections on the humanity of Jesus and its relation to divinity. If Jesus was historically conditioned, so were his life choices and teachings and so was the founding of the church.

Once historicity has been accepted as a category or lens through which one looks at the dogmas of faith, the entire symbol system is open to reinterpretation. The hierarchy—those entrusted with the authentic passing on of the faith—often equates historicity with the danger of relativism. As philosophers and theologians have pointed out, historicity is not antithetical to truth, nor does it necessarily result in relativism. The relation between historicity and relativism remains, however, a principal focus of magisterial concern.

Of special concern to the hierarchy is the preservation of the teachings that Jesus is the universal savior of humankind and that Christianity is not simply one great religion among others. The Vatican II document on the church, *Lumen Gentium* (1964), spoke to both issues. Concerning the latter, it invited a renewed discussion of interfaith dialogue with its striking but somewhat ambiguous statement that truth subsisted (*subsistit*) in the Catholic Church while inviting the faithful to discover the truth in other religions. Pontiff John Paul II, following in the footsteps of John XXIII, has been particularly open to Christian-Jewish relations. He has, however, at the same time been extremely cautious in accepting any account of the salvific quality of religions, which would, in his opinion, relativize the absolute role of Christ. Various of his writings have addressed this issue. Notable among them are *Redemptor Homines* (1979) and *Ecclesia Asia* (1999), which was a response to the Synod

of Asian Bishops and their attempt to enter into dialogue with indigenous and world religions in their respective areas.

AUTHORITY. It is perhaps in the area of authority that the church reveals its deepest frustration. This is not unexpected and perhaps unavoidable. Although the council enunciated the principals of collegiality and subsidiarity, it retained as fundamental its hierarchical structure. For example, *Lumen Gentium* (21–23) specified that bishops receive their authority from Christ, not from the pope, and that the universal church results from the union of local churches. It further stated that the pope and bishops form a college of discourse. Yet bishops may not exercise their authority without the approbation of the pope, but there is no imperative that the pope consult the bishops. This situation represents a clash of concepts regarding the exercise of authority. What was intended as a complement to Vatican I's promulgation of papal infallibility remains a source of frustration because of its conceptual ambiguity.

Subsidiarity, the principal that decisions and actions should occur at the lowest possible level of authority and competence, is vexed by the same concern. The fathers of the council clearly had in mind a new model of leadership, but their trust that the ambiguities resulting from the document's conflicting models of authority would be resolved in the life of the church was overly optimistic.

Symbolic of this and bringing together the various issues relative to authority is the 1968 encyclical of Paul VI, *Humanae Vitae*. In this encyclical Paul VI restated the traditional prohibition of artificial birth control although the majority of members of a panel of experts constituted by him, consisting of scientists and theologians, clergy and laity, advised him to do otherwise. This event marked a crisis of papal authority because many laity and moral theologians dissented from this teaching, something nearly unthinkable before Vatican II. To stem the increasing occurrences of dissent on this and other issues, the Vatican commissioned *The Catechism of the Catholic Church*, which was published in 1994. This publication offers the official teaching of the Catholic Church in all areas of faith and morals.

Christus Dominus (1965), *The Decree on the Pastoral Office in the Church*, provided for regional synods of bishops to address particular questions of their cultures and jurisdictions. In 1968 the bishops of Latin America met in Medellín, Colombia, and from this meeting liberation theology was born. This must be ranked among the most far-reaching effects of the council. Liberation theology is based on the premise that the appropriation of the gospel's message of the Kingdom of God implies the responsibility of the church, actualized in local communities, to seek not only the spiritual but also the material welfare of its members.

Liberation theology recognized too the systemic nature of sin and advocated a more just distribution of the world's goods. Often a Marxist economical analysis (although not a Marxist ideology) was applied to an oppressive situation.

This use of Marxist economic categories raised the suspicions of ecclesial authorities. Although warnings were issued, liberation theology was never condemned by John Paul II. Born on Latin soil and addressing issues of the materially oppressed, liberation theology also gave impetus to the liberation movements of women, African Americans, and other marginalized groups. The fundamental option for the poor voiced by these liberation theologians has remained the motif of those movements throughout the world that strive for social justice.

LITURGY. Modifications in liturgical rites, especially the Eucharist, are the most notable results of the council and have affected the laity more than most other outcomes of the council. The changes in the liturgy also illustrate the ancient maxim, *Lex orandi, lex credendi* (as the church prays, so the church believes). Most conspicuous of these transformations are the celebration of Mass in the vernacular, the change from the celebrant facing the altar to facing the people, receiving the sacred host in one's hand rather than on the tongue, receiving the consecrated wine, and the incorporation of the laity into the ritual, including the introduction of lay lectors and lay ministers of the Eucharist into the celebration.

These changes bespeak a new ecclesiology that stresses the communion that exists among the members of the church and the fact that the priest leads the congregation rather than acts as a mediator between God and the assembly. These modifications also lessen the mystique that previously surrounded the celebrant as well as the emphasis on the distinction between the ordained and the laity. The architecture that characterized most churches constructed in the first few years after the council also emphasized these ecclesiological changes. Many of these were churches in the round, with the pews surrounding the altar. Except for statues of Mary and Joseph and perhaps the patron saint of the community, there was an absence of statues. This was to emphasize the centrality of Christ and direct the congregation's attention to the celebration of his mysteries in the Eucharistic observance. Consequent on this new emphasis, there was a great reduction in the number of private devotions such as novenas and the public recitation of the rosary.

It is in regard to the liturgy that the magisterium exercises the most caution and control. As lay persons become more involved in ministry, at times out of necessity, the Vatican has found it necessary to institute regulations that emphasize the difference in kind between clergy and laity. Any modifications initiated by the local church, including the use of inclusive language, must be approved by Rome, and that approval is difficult to obtain. Rahner had great hope that the Roman Church would finally become a world church. This, he said, would involve not only the celebration of the liturgy in the vernacular but the liturgy's being celebrated in the cultural idiom of a particular people. The Roman Church insists on the translation of the Roman liturgy into the vernacular. In the spirit of Rahner, one must ask if one

must put on the mind-set of a white European male to embrace Catholicism.

Lumen Gentium declared that all persons were called to the perfection of love. For the first time in centuries the vocations of married couples and single men and women were regarded as having the same potential for holiness as those called to priesthood and religious life. A perhaps unforeseen consequence partially accounted for by this teaching was a vast exodus of men and women from consecrated life. Coupled with a great decrease in the numbers of those embracing such a life, the church is facing a dilemma in how to provide the Eucharist for the faithful. Paul VI in his declaration *Inter Insigniores* (1976) declared that women could not be admitted to ministerial priesthood. This position has been even more forcefully stated by John Paul II. Both Paul VI and John Paul II have restated the dedication of the Roman Church to the discipline of mandatory celibacy. This issue of who may preside at the Eucharist remains a central point of contention among the magisterium, theologians, and laity, especially as the number of priests continues to decline. The same may be said for the issue of optional celibacy. Perhaps the questions of ordination and celibacy, more than many others, illustrate the crisis resulting from the clash of cognitive viewpoints and the tension that sometimes characterizes the relationships among the pope, theologians, and laity since Vatican Council II.

NANCY C. RING (2005)

VEDĀNGAS. Vedāngas (Sanskrit, “limbs of the Veda”) are subjects supplementary and subsidiary to the Vedas, the sacred texts of the pre-Hindu religion of ancient India. While the earliest sections of the Vedas date back to at least 1000 BCE, and probably earlier, the first works classified as Vedānga were composed not before the sixth or seventh centuries BCE, and the initial appearance of much of the classic literature of this genre is usually dated to no earlier than the fifth and fourth centuries BCE.

The Vedāngas are those subjects that were to be studied in order to correctly understand the Vedas and perform the rituals those texts enjoin. The texts categorized as Vedāngas are in the form of technical treatises written in the extremely condensed, aphoristic, and mnemonic style known as *sūtra* (literally “thread,” referring to the idea that each aphorism is woven together with the others into a whole rather than tied sequentially into a linear chain). Because of the brevity and concision of their prose style, these works require further explication on the part of a teacher or through written commentary.

Although clearly appendages to the sacred Vedas, the Vedāngas were among the earliest texts to be categorized as *smṛti*, that is, “remembered” or traditional texts passed on from teacher to pupil and ultimately traceable back to a human author. While thus differentiated from the absolutely authoritative Vedas (which were classified as “revealed” or *śruti*, and regarded as not being the product of human beings), the Vedāngas are nevertheless often treated as approximating, if not fully equaling, the status of the Vedas themselves. The Vedāngas are, as one scholar has said, “at the same time without and within the Veda.”

The Vedas and Vedāngas depict a religion entirely concerned with the performance, meaning, and implications of ritual and fire sacrifice. But as opposed to the often loosely structured hymns, myths, and speculative prose characteristic of the Vedas per se, the Vedāngas are precise, rationally and systematically organized, and highly technical.

The subjects covered in the six primary Vedāngas—ritual action (*kalpa*), grammar (*vyākaraṇa*), phonology or phonetics (*śikṣā*), prosody (*chandas*), etymology (*nirukta*), and astrology and astronomy (*jyotiṣa*)—all emerged out of necessities related to correct ritual perfor-

mance. In this sense it can be said that all the earliest sciences of ancient India spring from ritual (and not, as in ancient Greece, for example, from mathematics). The Kalpasūtras are directly concerned with the rules for the correct performance of the ritual acts. Grammar, phonology, prosody, and etymology originated in order to ensure the proper and exact preservation and recitation of the Vedic *mantras* (inherently powerful verbal spells) that were an essential part of the performance of the ritual. And the science of *jyotiṣa* came into being to guarantee precision in the calculations for accurately timing the occurrences of the various rituals.

The Vedāngas, then, are “limbs” of the Vedas in that they help one correctly preserve, understand, and apply the material in those sacred texts. It is said in later texts that grammar is the mouth of the Vedas, etymology is its ears, ritual procedure is its hands, phonetics is its nose, prosody its feet, and astronomy/astrology its eyes.

Of the six primary Vedāngas, phonetics or *Śikṣā* (literal meaning “the study” or “teaching”) is usually listed first and is regarded as the most important. Because the Vedas were preserved and transmitted orally, rules for precise pronunciation were crucial for maintaining the accuracy and integrity of the texts. Phonetics emerged as the first branch of linguistics, and its categories—*sound, accent, quantity, articulation, recital, and connection*—were fundamental for the subsequent development of linguistic studies. Important works on phonetics were composed by Pāṇini, Nārada, Vyāsa, and others.

Vyākaraṇa (“distinction,” “separation”) is so termed because grammar distinguishes roots, suffixes, and prefixes: it is the science that analyzes the parts and structure of a word and the method for such divisions. It also explains how correct words and sentences are formed from basic elements so that the intended meaning is clearly expressed, and is therefore also a crucial science for both the preservation and the understanding of the Vedas. Pāṇini’s *Aṣṭādhyāyī* (Eight chapters) is the foundational text on grammar, along with important commentaries by Kātyāyanīputra (Kātyāyana) and Patañjali.

Chandas, or prosody, is the Vedānga that gives rules for the various meters in which the Vedas are recited, and lays out their classification and characteristics. The meters are divided into fourteen types ranging from those with twenty-four letters (the *gāyatrī*) to those with seventy-six. The word *chandas* is sometimes used a synonym for Vedic speech itself, as opposed to common language (*bhāṣā*).

According to tradition, there were originally some fourteen works of etymology included in the Vedānga designated *Nirukta*. Only one of these survives. The sole extant representative of the Vedānga dealing with etymology is the *Nirukta* by Yāska (dated ca. 500 BCE), which is a commentary on an older work (called the *Nighantū*) consisting of lists, groupings, and synonyms of words from the *Rgveda*. Yāska provides etymologies for these words and explanations

of the stanzas from the *R̥gveda* in which they occur. In the *Nirukta*, Yāska says he composed his text to insure that the correct meaning of the Veda is preserved even as people's abilities decline the further removed they are from the time of the original seers, who "heard" the Veda with direct intuitive insight. Without the aid of etymology, Yāska claims, the meaning of the Veda cannot be properly determined.

Vedic rituals were performed regularly at the various "junctures" of time: sunrise and sunset, the advent of new and full moons, the turn of the seasons, and the beginning of the new year. The ancient Indian science of astronomy developed out of the need for exact computations of the proper times for performing those rituals. Additionally, works on this subject also address what we would label astrology: the casting of horoscopes and predictions made on the basis of the location of the planets and stars, which helped the specialist adduce the most auspicious times for important events.

Finally, the Vedāṅga called *Kalpa* (from the Sanskrit root meaning "to prepare, design, arrange, or accomplish") consists of the rules and procedures for the actual performance of rituals. Kalpasūtras were produced by different ritual schools attached to one or another of the Vedas and are named after their mythical or semi-mythical founders (e.g., Baudhāyana, Āpastamba, etc.). A full Kalpasūtra consists of four principal components. First, there is the Śrautasūtra, which deals with the rules for performing the most complex rituals of the Vedic repertoire. Next comes the Gṛhyasūtra, which lays out the injunctions governing performance of the simpler "domestic" or household rituals. Third is the Dharmasūtra, which extends the reach of ruled, ritualized behavior to ethics and purity as they pertain to nearly every sector of daily life. Finally, a complete Kalpasūtra will also contain a Śulbasūtra that gives the rules of measurement for the construction of ritual altars. From this last component developed the Indian sciences of geometry, trigonometry, and algebra.

In addition to these six primary Vedāṅgas, four secondary "limbs" (*upāṅgas*) to Vedic literature are also sometimes listed: history (*purāṇa*), logic (*nyāya*), ritual exegesis (*mīmamsa*), and teachings on religious duty (*dharmaśāstra*). To this list of four Vedas, six Vedāṅgas, and four Upāṅgas are added four so-called "secondary Vedas" (*upavedas*)—medicine (*āyurveda*), the science of archery (*dhanurveda*), musicology (*gandharvaveda*), and political science (*arthaśāstra*)—to complete the list of eighteen divisions of the literature of the "orthodox" tradition stemming from the Vedas.

BRIAN K. SMITH (2005)

VEDĀNTA. The word *vedānta* literally means "end [*anta*] of the Veda," that is to say, the concluding part of the *apauruṣeya*, or revealed Vedic literature, which is traditionally believed to comprise the Saṃhitās, the Brāhmaṇas, the Āraṇyakas, and the Upaniṣads. Vedānta thus primarily denotes the Upaniṣads and their teachings. Metaphorically, Vedānta is also understood to represent the consummation or culmination (*anta*) of the entire Vedic speculation, or indeed of all knowledge (*veda*). The Hindu philosophical tradition, however, generally recognizes three foundations (*prasthānas*, literally, "points of departure") of Vedānta, namely, the Upaniṣads, the *Bhagavadgītā*, and the *Brahma Sūtra*. Of these three, the *Bhagavadgītā*, which primarily deals with the problems of social ethics, and which attempts a kind of religio-philosophical synthesis, can hardly be characterized as a strictly Vedantic treatise. Historically, one may speak of three periods of Vedānta—the creative period represented by the Upaniṣads, the period of systematization and harmonization of the Upaniṣadic teachings represented by the *Brahma Sūtra*, and the period of exposition, elaboration, and diversification represented by the commentaries on the *Brahma Sūtra*, the commentaries on those commentaries, and many independent treatises. The traditional grounding of Vedānta is thus consistently emphasized, it being implied that Vedānta is largely an exercise in scriptural exegesis rather than an independent philosophical formulation.

UPANIṢADS. More than two hundred texts call themselves Upaniṣads, but they include even such recent works as the *Christopaniṣad* and the *Allopaniṣad*. The *Muktikopaniṣad* gives a traditional list of 108 Upaniṣads, but, even out of these, many texts seem to have been called Upaniṣads only by courtesy. Usually 13 Upaniṣads, namely, *Iśa*, *Kena*, *Kaṭha*, *Praśna*, *Munḍada*, *Māṇḍūkya*, *Taittirīya*, *Aitareya*, *Chāndogya*, *Bṛhadāranyaka*, *Svetāśvatara*, *Kauṣītaki*, and *Maitrāyaṇī*, are regarded as the principal Upaniṣads (eighth to fourth century BCE). They are traditionally connected with one Vedic school (*śākhā*) or another, and several of them actually form part of a larger literary complex.

The Upaniṣads do not, by any means, constitute a systematic philosophical treatise. They rather represent the fearless quest for truth by essentially uninhibited minds. They seek, among other things, to investigate the ultimate reality

“from which, verily, these beings are born, by which, when born, they live, and into which, when departing, they enter” (*Taittirīya Upaniṣad* 3.1.1), to delve into the mystery of the *ātman* “by whom one knows all this” but whom one cannot know by the usual means of knowledge (*Bṛhadāranyaka Upaniṣad* 4.5.15), and generally to promote “that instruction by which the unheard becomes heard, the unperceived becomes perceived, and the unknown becomes known” (*Chāndogya Upaniṣad* 6.1.3). It is true that the Upaniṣads arose out of a kind of intellectual and social revolt against the closed mechanical sacerdotalism sponsored by the Brāhmaṇas. But the Upaniṣadic teachers soon realized that the ultimate reality could not be comprehended through mere logical reasoning, for “words return [from it] along with the mind, not attaining it” (*Taittirīya Upaniṣad* 2.9.1). “Not by reasoning is this apprehension attainable,” they declared (*Kaṭha Upaniṣad* 1.2.4). It is accordingly seen that the Upaniṣads present only the results of their speculation without making much ado about the logical processes, if any, which lead to those results. For the Upaniṣads the true consummation of all knowledge lies in the direct experience of the ultimate reality.

The Upaniṣads, however, presuppose a certain development of thought. The origin of some of their doctrines can be traced back to the *R̥gveda*, or in certain cases, even to the pre-Vedic non-Aryan thought complex. It will also be seen that, from the methodological as well as from the conceptual point of view, the Upaniṣads owe not a little to the Brāhmaṇas, as a reaction against which they were largely brought into existence. The word *upaniṣad* is usually understood in the sense of esoteric teachings imparted by the teacher to his pupils who sit (*sad*) near (*upa*) him in a closed exclusive group (*ni*). But literally the word would rather seem to denote “placing side by side; equivalence, correlation,” and then, secondarily, doctrines taught through equivalences or correlations. In a sense, the Upaniṣads represent an extension of the tendency of the Brāhmaṇas toward *bandhutā*, that is, toward perpetually establishing equivalences between entities and powers apparently belonging to different levels and to different spheres. It is, of course, inevitable that there should be no uniformity of method and teaching in such composite and heterogeneous texts as the Upaniṣads, but there certainly is a definite uniformity of purpose and outlook in them.

The Upaniṣads clearly betray a trend toward inwardization and spiritualization, which presumably has its origin in their general aversion for the physical body and sensual experience (*Maitrī Upaniṣad* 1.3). The Upaniṣadic teachers have consistently emphasized the view that the essential or real self (*ātman*) has to be differentiated from the empirical or embodied self (*jīva*). Indeed, true philosophical knowledge consists in not confusing the one for the other. This teaching is very well brought out in the famous parable from the *Chāndogya Upaniṣad* (8.7–12), in which Prajāpati is seen leading Indra progressively on the path of true knowledge

and ending with the final instruction that the essential Self is different from and transcends the embodied self in its conditions of wakefulness, dream, and deep sleep. The essential Self is of the nature of pure self-consciousness. It is neither the knower nor the known nor the act of knowing, though this last necessarily presupposes the existence and direct awareness of the essential Self. The essential Self does exist—it is *sat* (existence)—but not in any particular form; it is pure *sat*, that is to say, it is of the nature of existence *as such*. It is also conscious, but not of any particular object, internal or external; it is pure *cit* (consciousness), that is to say, it is of the nature of consciousness *as such*.

In another significant analysis of the human personality (*Taittirīya Upaniṣad* 2.2.5), the Upaniṣadic teacher proceeds from the grosser to the subtler forms of the Self, it being implied that each succeeding subtler and more internal form is more real and essential than the preceding one. He there speaks of the physical form (*annamāyā*), the vital form (*prāṇamāyā*) which inheres within the physical form, the mental form (*manomāyā*) which inheres within the vital form, the form of consciousness (*vijñānamāyā*) which inheres within the mental form, and finally concludes by affirming that within the form of consciousness inheres the subtlest and the most internal, and, therefore, the most real and the most essential form, namely, the form of bliss (*ānandamāyā*). The essential Self is thus pure existence (*sat*), pure consciousness (*cit*), and pure bliss (*ānanda*).

Side by side with the analysis of the human personality, the Upaniṣadic thinker has attempted an analysis of the external world as well. The thinker has thereby arrived at the conclusion that at the basis of this gross, manifold, changing phenomenal world—which ultimately is a conglomeration of mere names and forms—there lies one single, uniform, eternal, immutable, sentient reality (see, e.g., *Chāndogya Upaniṣad* 6.1). The natural and logical next step is to identify the deepest level of the subjective person, namely, the essential Self (*ātman*), with the ultimate basis of the objective universe, namely, the cosmic reality (*brahman*, also called *sat*). The world appearance or the relation of the world to *brahman* are not major concerns in the Upaniṣads.

The Upaniṣads have not developed any epistemology. Nor have they enunciated any ethical system as such. They are more or less exclusively concerned with the ideal of *mokṣa*, or humanity’s release from its involvement in the phenomenal world and its realization of the identity of its essential self with the cosmic reality. Even the doctrine of *karman* has not been systematically elaborated in the early Upaniṣads. It is regarded as something not to be spoken of openly (*Bṛhadāranyaka Upaniṣad* 3.2.13). As for the doctrine of rebirth, its first clear indications are seen in a passage of the *Bṛhadāranyaka Upaniṣad* (6.2.15–16), where it is mentioned as one of three eschatological alternatives.

BRĀHMASŪTRAS. For various reasons, the period immediately following the major Upaniṣads marked a kind of break in the continuity of Brahmanic thought and tradition. But it

proved to be only an interregnum. Soon a vigorous and comprehensive cultural movement was set in motion that sought to resuscitate the Brahmanic way of life and thought by reorganizing, systematizing, simplifying, and popularizing it. The literary monuments of this movement were generally clothed in a practical literary form, namely, the *sūtras*, or aphorisms, that were defined as being at once brief but unambiguous and to the point. By their very nature, the Upaniṣadic teachings, which were often sheer flashes of spiritual radiance rather than coherent philosophical formulations, were characterized by inherent ambiguities, inconsistencies, and contradictions. In order that they should prove reasonably meaningful, it was necessary to systematize and, more particularly, to harmonize them. This is exactly what the *Brahma Sūtra* (also called *Vedānta Sūtra* or *Uttara-mīmāṃsā Sūtra*) of Bādarāyaṇa (third to second century BCE) attempted to do.

Apparently, the *Brahma Sūtra* was not the only work of this kind, for Bādarāyaṇa mentions several predecessors, as, for example, Ātreya, Āśmarathya, Kāśakṛtsna, and Jaimini. Little is known about the writings of these teachers except for Jaimini, who is believed to have been the author of the *Pūrva-mīmāṃsā Sūtra*. The literary form of the *Brahma Sūtra* no doubt eminently suited its original purpose; in the course of time, however, it inevitably rendered the *sūtras* multivocal. By themselves they could hardly be made to yield any cogent philosophical teaching. Yet it seems that the *Brahma Sūtra* favors a kind of *bhedābheda*, or doctrine of distinction-cum-nondistinction. The world is represented as a transformation of the potency of God, God himself remaining unaffected and transcendent in the process. Hardly any of Bādarāyaṇa's *sūtras* can be shown to be unequivocally nondualistic in purport. It also seems that the *Brahma Sūtra* is specifically disposed against Sāṃkhya dualism and Mīmāṃsā ritualism. But after all, the Vedānta of the *Brahma Sūtra* is what the different commentators have chosen to derive from them. Indeed, each commentator exploits Bādarāyaṇa's work to develop his own peculiar thesis with a relentless vertical consistency regardless of the consequences such a procedure may have on collateral issues.

GAUḌAPĀDA. The earliest complete extant commentary on the *Brahma Sūtra* is that of Śaṅkara (788–820 CE). But in his thinking Śaṅkara is more vitally influenced by Gauḍapāda (fifth to sixth century) than by Bādarāyaṇa. It is true that the doctrine of *bhedābheda* and, to a certain extent, the Yoga of Patañjali provide the technical framework for Śaṅkara's philosophy, but it is the uncompromising nondualism reclaimed by Gauḍapāda from the Upaniṣads that Śaṅkara strongly vindicates, though he never goes so far in the direction of phenomenalism as does Gauḍapāda.

Gauḍapāda is traditionally believed to have been the teacher of Śaṅkara's teacher Govinda, although there is clear evidence that he must have lived at least three centuries before Śaṅkara. True to the usual practice of Hindu thinkers, Gauḍapāda has set forth his philosophy in his commentary,

in the form of *kārikās* or memorial verses. The *Gauḍapādakārikā* constitutes the earliest treatise on absolute nondualism (*kevala advaita*). The very names of the four books that make up the work—namely, *Āgama* (Scripture), *Vaitathya* (Unreality of the World Experience), *Advaita* (Nondualism), and *Alātaśānti* (Extinction of the Revolving Firebrand)—bring out the entire teaching of Gauḍapāda in a nutshell. The first book the *Gauḍapādakārikā*, which alone is directly related to the *Māṇḍūkya Upaniṣad*, deals with the self in its four states: wakefulness, dream, deep sleep, and the “fourth” state (*turīya*), identified with *mokṣa*. In the second book, Gauḍapāda for the first time asserts that the world does not exist in reality, but that “the Self (*ātman*) apparently creates the self by the self” through its own *māyā* and cognizes various things (*Gauḍapādakārikā* 2.12). In other words, the world subsists in *ātman* through *māyā*. The third book teaches that duality does not exist in reality. Just as space (*ākāśa*), which is without duality, is manifested as portions of space, such as the space enclosed in a pot (*ghaṭākāśa*), so too is the Self manifested as *jīvas*. Similarly, just as when the pot is destroyed the space that it had enclosed merges into *ākāśa*, so too do *jīvas* merge into the Self. In reality no *jīva* is ever born. The fourth book speaks of the two standpoints—*saṃvṛti*, or the practical standpoint, and *paramārtha*, or the highest standpoint—and of the three stages in understanding, namely, *laukika* (“ordinary”), in which both objects and a subject are cognized as real; *śuddha laukika* (“purified ordinary”), in which perceiving itself, but not the objects of perception, is cognized as real; and *lokotara* (“supramundane”) in which neither objects nor perceiving is cognized. This section emphasizes that consciousness (*viññāna*) alone is real, though it may appear in various guises as objects with beginnings and ends, movements, and so on. It is analogous to a revolving firebrand that appears as a fiery hoop; in the same way *viññāna*, when it flickers, appears as both perceiver and perceived.

There can be hardly any doubt about the strong Buddhist influence on Gauḍapāda's thought. The Buddhist terminology used in books two to four is quite unmistakable. One may leave aside such questions as whether Gauḍapāda himself was a Buddhist, or whether the authorship of all four books belongs to him, yet the *Gauḍapādakārikā* creates an irresistible impression that the Buddhist Śūnyavāda and the Viññānavāda schools present philosophical positions that are in no small measure consistent with those presented by the major classical Upaniṣads.

ŚAṅKARA. Śaṅkara is by far the most outstanding and the most widely known exponent of Vedānta, particularly of the doctrine of absolute nonduality (Kevala Advaita). Many works pass as having been written by him, but among the philosophical works that can be ascribed to him with reasonable certainty are the commentaries on nine Upaniṣads; the commentaries on the *Brahma Sūtra*, the *Bhagavadgītā*, the *Gauḍapādakārikā*, the *Yogasūtra-bhāṣya*, and the *Adhyātmapaṭala* of the *Āpastamba Dharmasūtra*; and the *Upadeśasahāsrī* (with its nineteen verse tracts and three prose

tracts). Some scholars have suggested that Śaṅkara was originally an adherent of Pātañjala Yoga and only later became an Advaitin. His background of theism and a kind of doctrine of distinction-*cum*-nondistinction, though not directly discernible, may also be validly assumed. But it is clearly Gauḍapāda who influenced Śaṅkara's teachings the most. Many of Śaṅkara's doctrines, illustrations, and arguments are clearly anticipated by Gauḍapāda, though in rather extreme forms. Indeed, in his teachings Śaṅkara may be said to have represented Gauḍapāda's philosophy without its overtones of Buddhist Vijñānavāda and Śūnyavāda.

Śaṅkara's philosophy, like most Indian philosophy, is oriented toward the one practical aim of *mokṣa*, which implies liberation from suffering and regaining of the original state of bliss. It is based on *śruti* (scripture), especially the Upaniṣads, rather than on *tarka* (logical reasoning), which according to Śaṅkara belongs to the realm of *avidyā*. Śaṅkara takes for granted the validity of the Upaniṣads as an embodiment of the highest truth, and uses logic either to support his interpretation of the Upaniṣads or to refute other systems of thought. In his commentary on the *Brahma Sūtra* he seeks to harmonize the apparently contradictory teachings of the Upaniṣads through the assumption of two points of view, the ultimate (*pāramārthika*) and the contingent (*vyāvahārika*). He has obviously inherited this device of argumentation from Gauḍapāda. Indeed, it is in the many portions of his commentary that do not relate directly to the text of the *Sūtra* (that is, in the *utsūtra* discussions) that one gets glimpses of Śaṅkara's original philosophical contribution.

The main plank of Śaṅkara's philosophy is the belief in the unity of all being and the denial of the reality of the many particular entities in the universe. Reality is that which is one without a second, which is not determined by anything else, which is not sublated at any point of time, which transcends all distinctions, to which the familiar categories of thought are inapplicable, and which can be only intuitively realized. Such is *brahman* of Śaṅkara's Advaita. Śaṅkara's most distinctive contribution is the philosophical and dialectical development of the concept of *brahman* as without qualities (*nirguṇa*). *Nirguṇa brahman* is not to be understood as "void" or "blank"; it only signifies that nothing that the mind can think of can be attributed to it. *Sat* (pure, unqualified being), *cit* (pure consciousness), and *ānanda* (pure bliss), which are often affirmed of *brahman*, are not qualifying attributes of *brahman* but rather together constitute the essential nature of *brahman*.

Śaṅkara's main problem is how to reconcile the Upaniṣadic accounts of creation and the Upaniṣadic denial of plurality. He resolves it by pointing out that the world belongs to a level of being that is different from that of reality, namely, the level of appearance. The world (*jagat*) may be regarded as the imaginary translation of *brahman*—which is the only reality in the ultimate sense—to the space-time plane. The world is grounded in *brahman* as the illusory appearance of a serpent is grounded in a rope. The causal rela-

tionship between *brahman* and *jagat* is of the nature of *vivarta* ("manifestation, appearance"), which is to be clearly distinguished from *pariṇāma* ("evolution, transformation"). The ultimate reality that is one does not *become* many; it can only *appear* as many. *Jagat* is thus not absolutely real, for the experience of the world with its diversity of particular phenomena is sublated by realization of the one ultimate reality; but it is also not absolutely unreal, for until the world appearance is sublated by true knowledge it does possess empirical viability. Śaṅkara propounds a kind of phenomenalism without any suggestion of either nihilism or subjective idealism.

The world appearance, according to Śaṅkara's absolute nondualism, is the result of *avidyā* ("nescience"), which is a radical constitutive adjunct of the embodied self (*jīva*). *Avidyā* not only conceals (*avarāṇa*) the true nature of *brahman* but it also distorts (*vikṣepa*) it, so that *brahman*, for the time being, appears as the phenomenal world. The oneness of *brahman* experience is made to give way to the multiple experience of the world of names and forms. Viewed from yet another angle, the world is described as the result of *māyā*. If *avidyā* represents the weakness of *jīva*, *māyā* represents the potency imagined of *brahman* for cosmological purpose. It is by means of *māyā* that *brahman*, or rather the empirically posited creative aspect of *brahman* that is referred to as *saguṇa brahman* (God), produces the illusion of the world. It is emphasized, however, that *māyā* does not constitute a duality with *brahman*, that it does not affect *brahman*, and that it is not a permanent character of *brahman*, for when, as the result of true knowledge, the world appearance vanishes, *māyā* also vanishes and only pure *nirguṇa brahman* remains as the ultimate reality. In a sense, *māyā* and *avidyā* may be regarded as the two sides of the same coin.

The "why" of *avidyā* is, however, beyond comprehension. One, indeed, finds oneself in *avidyā*. For *jīva* is the Self (*ātman*), who, under the influence of *avidyā*, which is beginningless, has forgotten his essential identity with the one ultimate reality, namely, *brahman*. Like the world, *jīva* also is empirically real albeit transcendently unreal; but whereas with the dawn of true knowledge the world completely vanishes, *jīva* sheds its body and other appurtenances occasioned by *avidyā* and regains its essential nature, namely, identity with *brahman*.

Śaṅkara has not developed any significant epistemology. Nor has he specifically discussed any ethical issues. He seems to take the observance of *dharmā* in the phenomenal world for granted. For him the four prerequisites for *brahman* realization are discrimination between the eternal and the temporal, renunciation of nonspiritual desires, moral equipment, consisting of tranquility, self-control, and so forth, and an intense longing for *mokṣa*. Śaṅkara's personality is, in many respects, paradoxical. While strongly advocating the doctrine of Kevala Advaita, he is believed to have composed some very beautiful and moving hymns; while sponsoring a life of complete renunciation, he is himself known to have traveled almost the whole length and breadth of India as an

active religious missionary with a view to founding *maṭhas* (monasteries) for the propagation of his teachings.

POST-ŚAṄKARA TEACHERS OF KEVALA ADVAITA. The school of Śaṅkara's Kevala Advaita can boast of a long line of teachers and pupils who through their writings have brought tremendous popularity to that school. Some of them have reinforced Śaṅkara's teachings with keen dialectic, some others have elaborated certain specific aspects of those teachings, while still others have presented those teachings in the form of more practical compendia. Again, some of Śaṅkara's followers have given a significant twist to the original doctrines of the great master and are, therefore, credited with having founded more or less independent subschools of Advaita.

Maṇḍana Mīśra was a contemporary, perhaps a senior contemporary, of Śaṅkara. He was originally a Mīmāṃsaka and had written several treatises on Mīmāṃsā. But later he became an Advaitin. His *Brahmasiddhi* shows that he is directly influenced by Śaṅkara's philosophy. Indeed, there is a strong tradition—which is, however, equally strongly contested—that identifies Maṇḍana Mīśra with Śaṅkara's pupil Sureśvara. Maṇḍana Mīśra emphasizes that it is the *jīvas* who by their own individual *avidyā* create for themselves the world appearance on the changeless *brahman*; he discounts the theory that the world originates from the *māyā* of *brahman*. Tradition is unanimous in holding that Sureśvara was a direct pupil of Śaṅkara. Sureśvara's *vārttika* on Śaṅkara's commentary on the *Bṛhadāranyaka Upaniṣad* is one of the longest philosophical treatises extant in Sanskrit. Its introductory part, called *Sambandha-vārttika*, deals with the relationship between the two sections of the Veda, the ritualistic and the spiritualistic. Sureśvara is also the author of the *vārttika* on Śaṅkara's commentary on the *Taittirīya Upaniṣad* and of an independent Vedantic treatise called *Naiṣkarmyasiddhi*. Some of the important points made by Sureśvara are that ritual action is in no way helpful to attainment of *mokṣa*; that *māyā* is only an aperture (*dvāra*) through which the one *brahman* appears as many; that *avidyā* is based not upon *jīvas* but upon pure *cit* itself; and that there is no reason to characterize the world as unreal before realization of the oneness of *ātman*.

Padmapāda is believed to have been the first pupil of Śaṅkara, and was, according to a tradition, nominated by the master as the first pontiff of the *maṭha* at Puri. His only available work, though called *Pañcapādikā* ("gloss [or *ṭikā*] on five quarters"), actually consists only of the *ṭikā* on Śaṅkara's commentary on the first four *sūtras* of the *Brahmasūtras*. Padmapāda invests *māyā* with a sort of substantiality and also assigns to it cognitive as well as vibratory activity. *Brahman* in association with *māyā* as characterized by this twofold activity is, according to Padmapāda, the root cause of *jagat*, while *avidyā* manifests itself in *jīva*.

It is, however, Vācaspati (fl. 841), author of the *Bhāmatī*, a commentary on Śaṅkara's commentary on the *Brahmasūtras*, who may be said to have founded an independent subschool of Śaṅkara's Vedānta. Vācaspati has sought

to merge the teachings of Śaṅkara and Maṇḍana Mīśra into one system. He propounds the view that *avidyā* has *brahman* as its object (*viśaya*) and *jīva* as its support (*āśraya*). The *Śaṅkṣepaśārīraka* of Sarvajñātman (tenth century), a pupil of Sureśvara, is a popular treatise in verse on the main teachings of Śaṅkara. Sarvajñātman asserts that *brahman* is the ultimate cause of everything through the instrumentality of *avidyā*. Like the Bhāmatī subschool of Advaita, Prākaśātman (fl. 1200) inaugurated another independent subschool—the Vivaraṇa subschool—through his *Vivaraṇa* (exposition) of Padmapāda's *Pañcapādikā*. Prākaśātman endorses the view of Sarvajñātman that *brahman* is both the support and the object of *avidyā*. While in respect of *jīva* the Bhāmatī subschool puts forth the doctrine of limitation (*avaccheda*), the Vivaraṇa subschool puts forth the doctrine of reflection (*pratibimba*). The *Khaṇḍanakhaṇḍakhādyā* of Śrīharṣa (fl. 1190) is a Vedantic dialectic against Nyāya, while the *Vedāntaparibhāṣā* of Dharmarājadhvarīnda (sixteenth century) deals with, among other things, the epistemology of Vedānta. Among other writers belonging to the school of Śaṅkara are Vidyāranya (fourteenth century), author of the famous *Pañcadaśī*; Prakāśānanda (sixteenth century), who wrote the *Vedāntasiddhantamuktāvalī*; Madhusūdana Sarasvatī (sixteenth century), author of the *Advaitasiddhi* and the *Siddhāntabindu*; Appayya Dīkṣita (sixteenth century), who wrote the *Siddhāntalesamgraha* and the *Parimala*, a commentary on the *Kalpataru* of Amalānanda (thirteenth century); and Sadānanda Vyāsa (seventeenth century), who commented on the *Advaitasiddhi* of Madhusūdana Sarasvatī and also wrote a handy compendium called *Vedāntasāra*.

ŚABDĀDVAITA. Although there is generally evident a tendency to equate Vedānta with Śaṅkara's Kevala Advaita, one cannot afford to ignore the other schools of Vedānta that have been substantially influential. The doctrine of *śabdādvaita*, a monistic ontology presenting language as the basis of reality, was propounded by Bhartṛhari (d. 651) in his *Vākyapadīya*; this doctrine cannot be said to belong to Vedānta proper, since it is not derived from any of the three *prasthānas*. Still, according to Bhartṛhari the ideas that the ultimate reality, *brahman*, which is without beginning and end, is of the nature of the "word" and that the world proceeds from it can be traced back to the revelation of the Word *par excellence*, the Veda itself. This ultimate reality is one, but because of its many powers it manifests itself as many in the form of experiencer, the object of experience, and experience itself (the purpose of experience also being sometimes mentioned). This view of Bhartṛhari may be regarded as a precursor of Śaṅkara's theory of *vivarta*. The most important of the powers of *brahman*, according to Bhartṛhari, is time (*kāla*). The different kinds of actions and changes that bring about multiplicity in being all depend upon *kāla*. Bhartṛhari, however, adds that time itself is the first result of *avidyā*. In the state of true knowledge, there is no place for time.

BHĀSKARA. The proper post-Śaṅkara Vedānta begins with Bhāskara (fl. 850). Unlike the other post-Śaṅkara schools of Vedānta, Bhāskara's Vedānta does not seem to have gained wide currency, presumably because it was not linked up with any theistic sect. From his commentary on the *Brahma Sūtra* it becomes clear that Bhāskara knew Śaṅkara's commentary, for he follows Śaṅkara's arguments for refutation point by point. It further becomes clear that, for much of their interpretation, both Śaṅkara and Bhāskara must have drawn on a common traditional source. According to Bhāskara, *brahman* has a dual form: *brahman* as pure being and intelligence, formless, the causal principle, which is the object of one's highest knowledge; and *brahman* as the manifested effect or the world. Thus *brahman* represents unity (*abheda*) as well as distinction (*bheda*), both of which are real. *Jīva* is *brahman* characterized by the limitations of the mind substance. Thus, unlike the material world, *jīva* is not the effect of *brahman*. Bhāskara is at one with most of the post-Śaṅkara schools of Vedānta in rejecting outright Śaṅkara's view of the world appearance. Indeed, such rejection was the main obsession of those schools.

VIŚIṢṬĀDVAITA. To Rāmānuja (1017–1137) belongs the credit for successfully attempting to coordinate personal theism with absolutistic philosophy. Indeed, Rāmānuja may be said to have secured for Vaiṣṇavism the sanction of the Upaniṣads. In this, of course, he was heir to a fairly distinguished tradition of teachers such as Nāthamuni (fl. 950) and Yāmunācārya (fl. 1000), who is believed to have been Rāmānuja's teacher's teacher. Among the followers of Rāmānuja are Sudarśana Sūri (fl. 1300), Veṅkatanātha, more popularly known as Vedāntadeśika (fl. 1350), and Śrīnivāsācārya (fl. 1700). Rāmānuja's commentaries on two of the three *prasthānas*, namely, the *Brahma Sūtra* (called *Śrībhāṣya*) and the *Bhāgavadgītā*, have been preserved. Rāmānuja is also the author of an independent philosophical treatise called *Vedārthasaṃgraha*. According to Rāmānuja, God, who possesses supremely good qualities, is the only absolute reality and therefore the only object worthy of love and devotion. Matter (*acit*) and souls (*cit*), which are equally ultimate and real, are the qualities (*viśeṣaṇas*) of God, but, as qualities, they are entirely dependent on God in the same way as the body is dependent on the soul. They are directed and sustained by God and exist entirely for and within him. Rāmānuja's doctrine is therefore known as Viśiṣṭa Advaita or the doctrine of one God qualified by *cit* (souls) and *acit* (matter). These three factors (*tattva-traya*) form a complex (*viśiṣṭa*) organic unity (*advaita*). The omnipotent God creates the world of material objects out of himself, that is, out of *acit* (which is eternal in him), by an act of will. Rāmānuja emphasizes that creation is a fact, a real act of God. What the Upaniṣads deny is the independent existence of material objects and not their existence as such. *Jīva* is made up of the human body (which is related to *acit*) and the soul (which is related to *cit*), which become associated with each other on account of *karman*. Souls are eternal and atomic and are conscious and self-luminous by their very na-

ture. The liberated soul, which is completely dissociated from the body, becomes similar to, but not identical with, God.

In Rāmānuja's theory, God can be known only through scripture; besides the Veda, Rāmānuja recognizes the *Pañcarātra Āgama* also as revealed. For him, religious acts comprehend both Vedic ritual and the practices (*kriyāyoga*) prescribed by the Āgama. Rāmānuja recommends to all persons, irrespective of caste, rank, or sex, complete self-surrender to God (*prapatti* or *śaraṇāgati*) as the most efficacious means of attaining the *summum bonum*.

DVAITĀDVAITA. The philosophy of Nimbārka (fl. mid-fourteenth century?) is generally known as Svābhāvika Bhedābheda or Dvaitādvaita. It is set forth briefly, precisely, and without much polemic or digression in his commentary on the *Brahma Sūtra*, called *Vedāntapārijātasaurabha*, and which is elaborated in such works as the *Vedāntakaustaubha* of Śrīnivāsa (who is believed to have been a direct pupil of Nimbārka), the *Vedāntaratnamāñjūṣa* of Puruṣottama (a pupil of Śrīnivāsa), and the *Vedāntakaustubhaprabhā* of Keśava Kāśmīrin (fourteenth century). Presumably influenced by Rāmānuja, Nimbārka assumes the ultimate reality of the three entities, namely, Paramātman or Puruṣottama (God), *Jīva*, and Jagat. He does not accept *avidyā* as a cosmic principle producing the world appearance. Rather, according to him, God actually transforms himself into the world of material objects and individual souls, but does not lose himself in these. He is simultaneously one with (*abheda*) and distinct from (*bheda*) the world of *jīvas* and matter. This is so, not because of any imposition or supposition (*upādhi*), but because of the specific peculiarity of God's spiritual nature (*svabhāva*). God alone has independent existence, while individual souls and matter, which are but derivative parts of God, are entirely dependent on and controlled by him. Liberation in Nimbārka's theory implies realization of and participation in the true nature of Lord Śrī Kṛṣṇa (who is the ultimate *brahman*) and is possible only through Kṛṣṇa's grace.

ŚUDDHĀDVAITA. Tradition speaks of four main schools of what may be called Vaiṣṇava Vedānta, namely, the Śrī school of Rāmānuja, the Sanaka school of Nimbārka, the Brahma school of Madhva, and the Rudra school of Viṣṇusvāmin, which last is more commonly associated with its later exponent Vallabha (1479–1531). Many works, large and small, are ascribed to Vallabha, the most important among them being the *Aṇubhāṣya*, a commentary on the *Brahma Sūtra* (up to 3.2.34); the *Tattvārthadīpanibandha*, an independent philosophical treatise; and the *Subodhini*, a commentary on a major part of the *Bhāgavata*. Vallabha's son Viṭṭhalanātha (1516–1584) completed the unfinished *Aṇubhāṣya* and also composed independent works such as the *Vidvanmaṇḍana* and the *Śrīngārarasamaṇḍana*. The *Suddhādvaitamartanda* by Giridhara (1541–1621) and the *Prameyaranārṇava* by Bālakṛṣṇa Dīkṣita (seventeenth century) are other notable works of the Rudra school. *Suddha advaita* ("pure nondual-

ism”) and *puṣṭimārga* are the two fundamental tenets of Vallabha’s Vedānta. *Suddha advaita* implies that the one *brahman*, free from and untouched by *māyā*, is the cause of the individual souls and the world of material objects. *Jīvas* and the material world are, in reality, *brahman*, for they represent but partial manifestations of the essential attributes of *brahman*. *Brahman* (God) pervades the whole world. Vallabha’s doctrine is therefore also known as *brahmavāda*. While explaining the relation between *brahman* and the world, Vallabha propounds *avikṛtapariṇamavāda*, the theory that the world is a transformation of *brahman*, which latter itself, however, remains unchanged. It is like gold, which always remains itself no matter how it is formed into various ornaments or objects. God manifests his qualities of *sat* and *cit* in the form of *jīvas*, but the quality of bliss (*ānanda*) remains unmanifested. Vallabha teaches that it is through *puṣṭi* (literally, “nourishment, spiritual nourishment”), or the special grace of God, that *jīvas* attain *goloka* (“the world of cows”), the world of bliss, and participate in the eternal sport presided over by Lord Śrī Kṛṣṇa.

MADHVA. Among the Vedāntins, Madhva (1238–1317) is reputed to be a confirmed dualist (*dvaitin*). One wonders, however, whether the doctrine that Madhva advocates in his commentaries on the three *prasthānas* and in his other works—a doctrine endorsed by other teachers of his school, such as Jayatīrtha (fourteenth century) and Vyāsarāya (1478–1539)—can be designated strictly speaking as dualism in the sense in which the Sāṃkhya doctrine is designated as dualism. Madhva no doubt speaks of two mutually irreducible principles as constituting reality, but he regards only one of them, namely, God, as the one infinite independent principle, whereas the finite reality comprising matter, individual souls, and other entities is regarded as dependent. He emphasizes that Lord Śrī Hari, who is omnipresent, omniscient, omnipotent, and without beginning and end, is the highest independent reality. The ungodly traits that are sometimes imputed to his character in descriptions of his various incarnations are not native to him but are intended to delude the demons and similar evil beings. The material world is essentially real, for whatever is created by God by veridical volition cannot be unreal. Furthermore, on the strength of the evidence of direct perception, inference, and scripture (which Madhva considers to be the only valid sources of knowledge) it can be established that the distinction between God and *jīva* is real and beginningless. Indeed, Madhva asserts the verity of the fivefold distinction, namely, the distinction between God and *jīvas*, the distinction between God and insentient objects, the mutual distinction among *jīvas*, the distinction between *jīvas* and insentient objects, and the mutual distinction among insentient objects. *Jīvas*, which are infinite in number, are subject and subservient to God. There is a gradation of high and low among them in accordance with their *karman*, and this gradation persists even in the state of emancipation. *Mokṣa*, according to Madhva, implies the unblemished blissful experience of

one’s pure intrinsic nature as a servant of Lord Śrī Kṛṣṇa, and devotion to him is the chief means of attaining *mokṣa*.

VEDAS. Specifically, the Vedas are often understood to comprise four collections of hymns and sacrificial formulas. In a more general sense, however, the term *Veda* does not denote only these four books, or any single book, but a whole literary complex, including the Saṃhitās, the Brāhmaṇas, the Āraṇyakas, the Upaniṣads, the Sūtras, and the Vedāṅgas. The many texts, varied in form and content, that make up the Veda were composed over several centuries, in different localities, and by many generations of poets, priests, and philosophers. Tradition, however, will not admit the use of the word *compose* in this context, for the Veda is believed to be *apauruṣeya*, “not produced by human agency.” It is eternal. Its so-called authors have merely “seen” or discovered it, and they are thus appropriately called *ṛṣis*, or seers.

Vedic tradition notes that the *apauruṣeya* character of the Veda accords it ultimate validity in every respect. More-

over, the Veda is said to comprehend all knowledge (*veda*). Indeed, most of the later Brahmanic disciplines claim the Veda as their fountainhead. The Veda has been passed from generation to generation by oral transmission. This fact explains the name *śruti* (“what is heard”) by which the Veda is known. In order to preserve this extensive literature intact without the aid of writing, and to facilitate its precise memorizing, the Vedists devised various ways of reciting the Veda (*pāṭhas* or *vikṛtis*) that involve permutations and combinations of the words in *mantras* (versus) and prose formulas. The emergence of various schools (*sākhās*) and subschools (*caranās*) of Vedic study has also substantially helped the preservation of this large corpus of literature. At the same time, oral transmission may have resulted in the loss of a considerable portion of Vedic literature in the course of time.

EARLY HISTORY OF THE VEDA. The literary history of the Veda is usually divided into four periods: the Saṃhitā period (c. 2000–1100 BCE), the Brāhmaṇa-Āraṇyaka period (c. 1100–800 BCE), the Upaniṣadic period (c. 800–500 BCE), and the Sūtra-Vedāṅga period (c. 500 BCE onward). Broadly speaking, these four periods represent a chronological sequence, and a thread of logical development running through them invests them with a kind of unity. Yet only the literature of the first three periods is traditionally regarded as *apauruṣeya*. In particular, four collections of texts from the Saṃhitā period are commonly referred to as the four Vedas. These are the *Rgveda Saṃhitā* (the oldest collection), the *Atharvaveda Saṃhitā*, the *Sāmaveda Saṃhitā*, and the *Yajurveda Saṃhitā*.

Before the Vedic Aryans migrated into the northwestern region of India, then called Saptasindhu (“land of seven rivers”), their ancestors had lived together with the ancestors of the Iranian Aryans, presumably in Balkh and its environs, for a fairly long time (2200–2000 BCE). It was there that the Proto-Aryan language and religion acquired their specific characteristics. The religion of the Proto-Aryans consisted mainly of the concepts of cosmic law (Vedic, *ṛta*; Avestan, *aša*) and its administrator (Vedic, Asura Varuṇa; Avestan, Ahura Mazdā), a simple fire worship, and a cult centering on the sacred drink (Vedic, *soma*; Avestan, *haoma*). *Mantras* (magically potent verses) or hymns (groups of *mantras* usually involving a single theme) relating to this religion were composed by the ancestors of the Vedic Aryans in an earlier form of Vedic Sanskrit. In the course of time, the ancestors of the Vedic Aryans left their home in Balkh and proceeded toward the alluring “land of seven rivers,” while the ancestors of the Iranian Aryans migrated toward Iran. During their expedition to Saptasindhu and because of subsequent conflicts and colonization in that region, a significant strain was imposed on the old Vedic religion in the form of a hero cult with Indra as its chief divinity. The activity of composing *mantras* and hymns relating to the old (Proto-Aryan) as well as the new Vedic (Indra) religion continued unabated throughout this time. Side by side with this religion of the “classes” among the Vedic Aryans developed the religion of the “masses,” which was largely constituted of magic, sor-

cery, and witchcraft, and relating to which *mantras* were also being composed. When, soon after, the Vedic Aryans had settled down in their new home to a life of comparative peace, leisure, and prosperity, poet-priests collected all the scattered mantras, old and new and relating to both the Proto-Aryan and Vedic religions. They revised and edited them, grouped them together into suitable hymns (where they were not already so grouped), and arranged those hymns according to a certain plan. As a result, two primary “collections” (*saṃhitās*) were brought into existence: the *Rgveda Saṃhitā* and the *Atharvaveda Saṃhitā* (2000–1700 BCE).

RGVEDA SAMHITĀ. The *Rgveda Saṃhitā* has come down to the present according to the recension of the Sakala school. It consists of 1,028 *sūktas* (hymns) made up of varying numbers of metrical verses (*mantras*, more commonly called *ṛks*, which accounts for the name *Rgveda*). The hymns are assembled in ten different books or *maṇḍalas* whose formation is governed mainly by the criterion of authorship. Among the classes of the Vedic Aryans, a few families had already acquired some measure of socioreligious prestige. The *mantras* or hymns, which were traditionally believed to have been “seen” by the progenitor and other members of a particular family, were collected together to form the book of that family. The nucleus of the *Rgveda* is formed of six such family books, which are numbered from two to seven and which are ascribed respectively to the families of Gr̥tsamada, Viśvāmitra, Vāmadeva, Atri, Bharadvāja, and Vasiṣṭha. Within a family book, the hymns are grouped according to the divinities to whom they are related. These divinity groups are then arranged in a certain fixed order, the group of hymns relating to Agni being placed first. Within each divinity group, the hymns are arranged in descending order according to the number of stanzas. The majority of hymns in the eighth book belong to the Kaṇva family. The first book is a collection of miniature *maṇḍalas*. Book nine is ritualistically oriented, all the hymns included in it, irrespective of authorship, being related to *soma*. The tenth book, which contains the same number of hymns as the first book (191), is a collection of residual hymns. There is another, later mechanical arrangement of the *Rgveda* that is obviously directed to the purpose of memorizing the *Saṃhitā*. According to this system, the entire *Rgveda Saṃhitā* is divided into eight divisions (*aṣṭakas*), each division into eight chapters (*adhyayas*), and each chapter into about thirty-three sections (*vargas*) of about five stanzas each.

The bulk of the *Rgveda* consists of mythology and the panegyrics and prayers that are either dependent on or independent of that mythology. The exclusively naturalistic, or ritualistic, or mystic interpretation of Vedic mythology is now generally discountenanced, and an evolutionary approach is increasingly favored. One may speak of three main phases of the evolution of the Rgvedic mythology: the phase represented by Ṛta-Varuṇa, Agni, and Soma; the phase represented by Indra and other heroic gods; and the phase represented by the admission into the Vedic pantheon of popular Aryan divinities (e.g., Viṣṇu) and pre-Vedic non-Aryan di-

vinites (e.g., Rudra). Apart from mythology, the *Rgveda* also contains a few hymns of sociohistorical and philosophical purport.

ATHARVAVEDA SAMHITĀ. The *Atharvaveda*, which is aptly described as the Veda of the masses, is more heterogeneous and less inhibited than the *Rgveda*. The name *Atharvāngirasah*, often used in reference to this Veda, indicates the twofold character of its contents—the wholesome, auspicious “white” magic of Atharvan, and the terrible, sorcerous “black” magic of Aṅgiras. Another name of this Veda is *Brahmaveda*. The name has been explained by the fact that the *Atharvaveda* consists of *brahmans* (magically potent formulas), or by the fact that this Veda is the special concern of the brahman priest in the Vedic ritual. There is another explanation of the name. Because of the peculiar character of the contents of this Veda, it was for a long time not recognized as being as authoritative as the other three Vedas (*trayī*). In reaction against this exclusivism, the Atharvavedins went to the other extreme and stated that the *Rgveda*, the *Sāmaveda*, and the *Yajurveda* were essentially “limited,” for *brahman* alone was infinite, and this *brahman* was truly reflected only in the *Atharvaveda*. Thus, the *Atharvaveda* was called *Brahmaveda*. The *Atharvaveda* is also known by several other names, each of which emphasizes a specific trait of its character: It proves particularly efficacious in the performance of the duties of the *purohita* (royal priest), and is thus known as the *Purohitaveda*; it contains many hymns pertaining to the *kṣatriyas* (ruling or warrior class), and is thus called the *Kṣataveda*; and it is the guide for the performers of the practices described in the five (*pañca*) main ancillary texts (*kalpas*) of this Veda, and thus is known as the *Veda of the Pañcakalpins*.

The *Atharvaveda* is available in two recensions, the *Śaunaka* and the *Paippalāda* (which is only partially available). The *Śaunaka* recension consists of 730 hymns grouped into twenty books (*kāṇḍas*). About five-sixths of these hymns are metrical (*arhasūktas*), whereas the remaining ones (*paryāya-sūktas*) are made up of prose units (*avasānas*). The *Atharvaveda* is less sophisticated in its meter, accent, and grammar than the *Rgveda*. The contents of the *Atharvaveda* may be broadly classified under the following headings: charms to counteract diseases and possession by evil spirits; prayers for health and longevity and for happiness and prosperity; spells pertaining to various kinds of relationships with women; hymns concerning the affairs of the king, as well as those intended to secure harmony in domestic, social, and political fields; and formulas for sorcery and imprecation and for exorcism and counterexorcism. Finally, the *Atharvaveda* contains quite a few hymns embodying highly theosophic and philosophical speculations.

SĀMAVEDA AND YAJURVEDA SAMHITĀS. The *Sāmaveda* and the *Yajurveda* are essentially liturgical collections and conceptually mark the transition from the Saṃhitā period to the Brāhmaṇa period. The *Sāmaveda Saṃhitā* is a collection of *mantras* to be chanted at the various soma sacrifices by the

udgātṛ priest and/or his assistants. The name *Sāmaveda* is, however, a misnomer; it is not a collection of *sāmans*, or chants, but rather a collection of verses, mostly derived from the *Rgveda*, which are intended to form the basis of proper *sāmans* (*sāmāyoni mantras*). Out of the traditionally mentioned thirteen *sākhās* of the *Sāmaveda*, only three are known today: the *Kauthuma*, the *Rāṇāyanīya*, and the *Jaiminīya*, or *Talavakāra*. The *Kauthuma Saṃhitā* of the *Sāmaveda* is made up of two parts, the *Pūrvārcika* and the *Uttarārcika*. The *Pūrvārcika* consists of 585 *mantras* and the *Uttarārcika* of 1,225 *mantras*. However, the total number of *mantras* in the *Sāmaveda*, not counting those that are repeated, is 1,549—all but 78 of them having been taken from the *Rgveda*, mostly its eighth and ninth *maṇḍalas*. For their use in the *soma* ritual, the *sāmāyoni mantras* are transformed into chants or ritual melodies, called *gānas*, by means of such devices as the modification, prolongation, and repetition of the syllables in the *mantras* and the occasional insertion of additional syllables (*stobhas*). Such *gānas* are gathered in four books: the *Grāmageyagāna*, the *Aranyagāna*, the *Ūhagāna*, and the *Ūhyagāna*. Of course, these *gāna* collections are quite distinct from the *Sāmaveda*. Since one *sāmāyoni mantra* can be chanted in a variety of ways, it gives rise to several *gānas*. Consequently, the number of *gānas* is much larger than the number of *sāmāyoni mantras*. For instance, the number of *gānas* belonging to the Kauthuma school is 2,722.

Whereas the *Sāmaveda* concerns itself exclusively with just one feature of the *soma* sacrifice, the *Yajurveda* treats the entire sacrificial system. Indeed, the *Yajurveda* may be regarded as the first regular textbook on the Vedic ritual as a whole. It deals mainly with the duties of the *adhvaryu*, the priest responsible for the actual performance of the various sacrificial rites. There are two major recensions of the *Yajurveda*, the *Kṛṣṇa* (“black”) *Yajurveda* and the *Śukla* (“white”) *Yajurveda*. The difference between them lies not so much in their contents as in their arrangement. In the *Kṛṣṇa Yajurveda*, the *mantras* and the *yajus* (sacrificial formulas in prose) and their ritualistic explanation and discussion (called *brāhmaṇa*) are mixed together. Thus, in its form and content the Saṃhitā of the *Kṛṣṇa Yajurveda* is not particularly distinguishable from the Brāhmaṇa or the Āraṇyaka of that Veda. In contrast, the *Śukla Yajurveda* contains only the *mantras* and the *yajus*, the corresponding ritualistic explanation and discussion being reserved for the *Śatapatha Brāhmaṇa* that belongs to that Veda.

The Saṃhitās of four schools of the *Kṛṣṇa Yajurveda*—namely, the Taittirīya, the Kaṭha (or Kāthaka), the Maitrāyaṇī, and the Kapiṣṭhala Kaṭha—are available today either whole or in fragments. Incidentally, it may be noted that the Taittirīya school has preserved its literature perhaps most fully of all the Vedic schools, maintaining the continuity from the Saṃhitā period, through the Brāhmaṇa-Āraṇyaka-Upaniṣad periods, up to the Sūtra period. The *Taittirīya Saṃhitā* is divided into seven *kāṇḍas*, and, together with the *Taittirīya Brāhmaṇa* and the *Taittirīya Āraṇyaka*,

it covers almost the whole gamut of Vedic ritual. However, in these texts, the different sacrifices are not dealt with in any rational order.

A significant feature of the *Śukla Yajurveda* is that its entire literary corpus has come down in two distinct versions, the *Mādhyandina* and the *Kāṇva*. However, there is little essential difference between them in content and arrangement. The *Śukla Yajurveda Samhitā*, which is also known as the *Vājasaneyi Samhitā* in the *Mādhyandina* version, consists of forty chapters (*adhyaṅgas*). The first twenty-five *adhyaṅgas* contain *mantras* and formulas relating to the principal sacrifices; the next four *adhyaṅgas* include additions to these basic *mantras* and formulas; *adhyaṅgas* 30–39 deal with such sacrifices as the Puruṣamedha, the Sarvamedha, the Pitṛmedha, and the Pravargya; and the last *adhyaṅga* constitutes the well-known *Īśa Upaniṣad*.

VEDISM AND BRAHMANISM. The somewhat imprecise terms *Vedism* and *Brahmanism* refer to those forms of Hinduism that revolve primarily around the mythic vision and ritual ideologies presented by the Vedas. These terms are classifications that have been used by historians to categorize in a typological manner a variety of religious beliefs and practices in ancient and contemporary South Asia. Vedic and Brahmanic religious sensibilities are thereby distinguished from Agamic, Tantric, and sectarian forms of Hinduism, which look to a variety of non-Vedic texts as the source of religious authority. Vedism is older than Brahmanism, which developed from and remains true to the Vedic worldview but accommodated and remolded the religious ideas and practices of non-Vedic South Asian traditions.

Vedism applies more specifically to the religious ideas and expressions of the Indian branch of the Indo-Europeans who gradually entered the valley of the Indus River in successive waves in the second millennium BCE. These communities regard as sacred and authoritative texts only those orally transmitted collections of poetic hymns (*mantras*), ritual instructions (Brāhmaṇas), and some of the early philosophical speculations (Āraṇyakas and Upaniṣads) of the Vedic literary

corpus. Together, these works are said to constitute sacred “knowledge” (*veda*, hence *Vedism*) and are known as *śruti*, “revealed truth.”

Brahmanism developed as the Vedic Indians moved further into the subcontinent to settle in the regions drained by the Ganges River and then southward to the tip of India. It is loosely known as Brahmanism because of the religious and legal importance it places on the *brāhmaṇa* (priestly) class of society. Brahmanism takes as sacred truth, in addition to the Veda, various law books (the Dharmasāstras and Dharmasūtras), mythic epics (the *Mahābhārata* and *Rāmāyaṇa*), and a wide range of non-Vedic myths recounted in the Purāṇas. These texts, the earliest of which may date to the second part of the first millennium BCE and the latter-most of which to the medieval period, are known as *smṛti*, “remembered truth.”

Both Vedism and Brahmanism, then, accept the Veda as sacred. The difference between the two is that Brahmanism also includes doctrines and mythic themes that do not specifically derive from the Vedas and therefore is ideologically more inclusive than Vedism. Some of these ideas find expression in various ritual practices such as temple worship and the domestic ceremony known as *pūjā*, in the notion of a society arranged according to vocational function (*varṇa*) and stage of life (*āśrama*), in meditation and renunciatory practices, in vegetarianism and reverence for the cow, in the importance of the teacher (*guru*) for transmitting the tradition, and in other non-Vedic themes that play important parts in Hindu religious life and thought.

TEXTUAL CORPUS. The collection of metric and prose texts that form the Veda (or, taken individually, Vedas) is by far the largest single documentary source of archaic Indo-European religious thought. At the same time, however, this collection amply documents a particular line of intellectual development that went far beyond its archaic beginnings and gave the Veda its pivotal but never undisputed place in Indian religion and philosophy.

Though no definite dates can be assigned to the Veda or any of its parts, some of its materials, especially in the metrical texts, may be dated back to the twelfth century BCE, or even earlier, when the later Indo-Aryans were still in direct contact with the Iranian branch of the Indo-European peoples. This common Indo-Iranian period is attested by linguistic, lexical, formulaic, and cultic similarities between the Veda and the Avesta (e.g., the sacred beverage, *soma* in the Veda and *haoma* in the Avesta, and the use of these beverages in the cult; the Vedic *hotṛ* priest and his Avestan counterpart, *zaotar*). The formation of the Veda as currently known extended over the first half of the last millennium BCE, bearing witness to a gradual move from the northwest of the subcontinent, the upper Indus area, where the *Rgveda* had its original home, to the watershed between the Indus and Ganges basins and into the Ganges plain. This movement is epitomized in the story of the sacrificial fire, which was forced by means of a ritual formula to come out of the mouth of the

legendary sacrificer Videgha Māthava (whose name recalls Videha, present-day Bihar); the fire then relentlessly rolled eastward from the Sarasvatī River in the west to the Sadanira, the boundary river of Videha, in the east, and finally was established even beyond that boundary (*Śatapatha Brāhmaṇa* 1.4.1.10–19). Bengal (Vanga), however, remained, as far as the Veda is concerned, a “barbarian” country.

Apart from its antiquity, the most striking features of the Veda are its rigid codification and internal organization as well as its faithful oral transmission among specialized brahmins up to the present day. Although no decisive arguments can be adduced, the codification of the Veda may date from the middle of the first millennium BCE. (This is to be distinguished from partial compilations, which are generally assumed to have already been in existence at the rise of Buddhism in the sixth century BCE.) During the second half of that millennium further ancillary texts were added to the corpus.

Organization of the Veda. The primary principle of the internal organization of the Vedic corpus is strictly ritualistic, the texts being arranged according to their function with regard to the sacrificial ritual. The initial textual layer consists of formulas (*mantras*)—both metrical and in prose—to accompany the ritual acts (*karman*) and descriptions of the ritual (Brāhmaṇas). The latter are thus differentiated in rules regulating the ritual (*karmavidhāna*) and in explanation or discussion (*arthavāda*; *Āpastamba Śrautasūtra* 24.1.31–34). Though this primary division gives no special place to the Upaniṣads, the speculative extension of the Brāhmaṇa texts, it clearly illustrates the ritualistic divide between *karman*, or act, and *mantra*, or formula.

The repositories of the *mantras* are known as the Saṃhitās (named after the continuous mode of recitation involving *saṃdhi*, or changes taking place at the juncture of words succeeding each other), first collected in the *Rgveda* or “Veda of the Stanzas.” Though the time of its final compilation may not greatly differ from the period of the Brāhmaṇas, the *Rgveda* contains, generally speaking, the oldest materials. The exposition of the ritual (including the explanation of the *mantras* and their use) in the Brāhmaṇas provides the second layer. The third layer is formed by the Āraṇyakas (“forest books”) and the Upaniṣads. They are attached to the Brāhmaṇas and are composed in the same style. The Āraṇyakas, which derive their name from their having to be studied outdoors, in the wilderness (*araṇya*) because of their supposedly dangerous or secret nature, deal with particular parts of the ritual. The Upaniṣads start from and often refer to the ritual but their meta-ritualistic content goes beyond and even supersedes it.

To these three layers of texts, which form the *śruti* (lit., “hearing”), the “revealed” tradition in the strict sense, the Kalpasūtras (*kalpa*, “arrangement”; *sūtra*, “guideline”), concisely worded manuals, must be added. These comprise the Śrautasūtras—manuals for the *śrauta* (derived from the *śruti*), or “solemn” ritual based on the Brāhmaṇas—and

the Smārtasūtras, summarizing the *smṛti* (“remembrance”), the secular tradition. The latter are again divided into the Gṛhyasūtras, manuals for the domestic ritual (*gṛha*, “house”), which exhibit a ritual close to the *śrauta* pattern, and the Dharmasūtras, on religious law and custom, which are at a greater distance from the *śruti*, though they are supposedly authorized by it.

The Kalpasūtras belong to the six Vedāṅgas (“members of the Veda”), ancillary branches of knowledge meant to explain the Veda and to sustain its preservation. In addition to the Kalpa, the system of ritual rules, these branches of knowledge are Śikṣā (“phonetics”), Chandas (“meter”), Vyākaraṇa (“grammar”), Nirukta (“etymology”), and Jyotiṣa (“astronomy”). While the systematic elaboration and standardization of Kalpa has the rationalistic trappings that qualify it as a “prescientific” science, astronomy and especially grammar developed into full-fledged sciences independent of the Veda.

The partly chronological division in Saṃhitās, Brāhmaṇas, Āraṇyakas, Upaniṣads, and Kalpasūtras is joined by a second, equally ritualistic, principle of organization running vertically through the successive layers. This division corresponds to the four priestly functions in the performance of the *soma* sacrifice, that is, the functions of the *hotṛ* (“reciter”); the *udgātṛ* or *chandoga* (“cantor” or “chanter”); the *adhvaryu* (officiating priest), who is in charge of the ritual acts and so of the overall proceedings; and the *brahman*, who acts as a mainly silent overseer and corrects possible mistakes in the performance of the ritual. To each of these four functions a separate Veda is assigned, consisting of its own Saṃhitā, Brāhmaṇa, and Kalpasūtra. Thus the *hotṛ*’s Veda is the *Ṛgveda*, from which the invitatory and offering stanzas as well as the longer recitations (*śāstra*) are taken. The *Śāmaveda* cites the texts of the *Ṛgveda* and their “melodies” (*sāman*) that are to be chanted by the *udgātṛ*. The *adhvaryu* operates with the *Yajurveda* or “Veda of the Formulas” (*yajus*). These “formulas” are defined as non-ṛc (that is, non-Ṛgvedic), although the Saṃhitā contains many Ṛgvedic *mantras* as well. Finally, the *brahman* relies, at least in theory, on the *Atharvaveda*, but because of his overseeing function he should also be conversant with the other three Vedas.

There are, then, four Vedas. Tradition, however, emphasizes the “Triple Veda” (*trayī vidyā*, “threefold sacred knowledge”), that is, *Ṛgveda*, *Yajurveda*, and *Śāmaveda*. The *Atharvaveda* was added as a fourth according to a well-known pattern based on the numbers three and four: the three “twice-born” *varṇas* (social classes) of *brāhmaṇas* (Eng., brahmins), *kṣatriyas*, and *vaiśyas*—their second birth being their initiation to the Veda—joined by the fourth *varṇa* of the *śudras*. The pattern also represents the three aims or duties of life: *dharma* (religious law), *artha* (wealth), and *kāma* (sexuality)—to which *mokṣa* (liberation from mundane existence) is added as a fourth.

The position of the *Atharvaveda* as regards the other three Vedas is somewhat puzzling. The name of a legendary

priest and his descendants, *Atharvan* is related to the Old Iranian *āthravan*, or fire priest, but does not refer to a specific priestly function in Vedic ritual. The relationship of the *Atharvaveda* with the *śrauta* ritual is a slight one. The connection with the *brahman*’s function is made no earlier than in the comparatively late Brāhmaṇa of the *Atharvaveda* (*Gopatha Brāhmaṇa* 1.2.9). The contents of its Saṃhitā appear to be related to special rites for promoting well-being, for averting or undoing evil, for curing illness, and for harming enemies, which belong to the sphere of activity of the *purohita* (domestic priest or royal chaplain) rather than to the *brahman*’s function in the *śrauta* ritual. This seems also to be underlined by the fact that the *Atharvaveda*’s Gṛhyasūtra has priority over its Śrautasūtra in both age and importance. Although the *Atharvaveda*’s codification patterned after the “Triple Veda” is comparatively late, this does not mean that its contents are equally late in origin. Thus the so-called rice-dish sacrifice (Savayajña), though recast to parallel the *soma* sacrifice, may well have ancient roots. The Savayajña gives prominence to the sacrificial meal, which in the *śrauta* ritual is reduced to a minimum. Generally speaking, it would seem that the *Atharvaveda* became a repository of rites and incantations for which the fully developed *śrauta* system of ritual had no place anymore—such as, for instance, the exaltation of the *vrātya*, the warrior-sacrificer to whom the fifteenth book of the Saṃhitā is devoted.

Finally, there is still a third principle subdividing the Vedic texts, namely by “schools,” each having its own recension of one of the four Vedas. If such a “school” has its own version of the Saṃhitā it is known either as a *śākhā* (“branch”) or as a *carana* (liturgical observance). The most subdivided of the four Vedas is the *Yajurveda*. First, there is the division between the so-called *Kṛṣṇa* (“black”) *Yajurveda* and *Śukla* (“white”) *Yajurveda* schools. The older *Black Yajurveda* is characterized by alternating *mantra* and Brāhmaṇa portions in its Saṃhitās, while the younger *White Yajurveda* neatly separates the *mantras* from the Brāhmaṇa, the celebrated *Śatapatha Brāhmaṇa*. Whereas the *White Yajurveda* has two closely related *śākhās* (*Mādhyandina* and *Kanva*), the *Black Yajurveda* shows marked differentiation between *śākhās* and their subdivisions, or *caranas* (the *Maitrāyaṇī Saṃhitā* with the *Mānava* and *Vārāha Sūtras*; the closely related *Kāṭhaka*, whose *sūtra* has been lost; and the *Taittirīya Saṃhitā*, with the *Āpastamba*, *Hiranyakeśin*, *Bhāradvāja*, *Baudhāyana*, *Vaikhānasa*, and *Vādhūla Sūtras*).

The Saṃhitā of the *Ṛgveda* is known in only one recension but has two subdivisions, *Āsvalāyana* (with the *Aitareya Brāhmaṇa* and the *Āsvalāyana Sūtra*) and *Śāṅkhāyana* (with the *Śāṅkhāyana Brāhmaṇa*—also known as the *Kauṣītaki Brāhmaṇa*—and the *Śāṅkhāyana Sūtra*). The *Śāmaveda* boasts two *śākhās* that in fact differ only minimally, the *Kauthuma-Rānāyanīya* and the *Jaiminīya*; the Brāhmaṇa of the latter is called *Jaiminīya Brāhmaṇa*, and it is known for the richness of its mythical and legendary data. Finally, the *Atharvaveda* knows two *śākhās*, the *Saunaka* and the *Paippalāda*.

Though scholarly attention has mostly been directed toward the *Rgveda* and the problems raised by its language, stylistics, and mythological conceptions, from the strictly Indian point of view the main interest of Vedism is in the structure and development of ritual. This is evident in the internal organization of the Vedic corpus of texts, which, as has been seen, are arranged according to the needs of the *śrauta* system of ritual. The elaboration and standardization of this system are, however, a late Vedic development. The division of *mantra* and Brāhmaṇa is more than a technical-ritualistic one. It represents a caesura between, on the one hand, the older state of cult and belief that forms the background of the *Rgveda*'s stanzas, and on the other the standardized system of ritual that developed in the Brāhmaṇas and was perfected in the Sūtras. It is also to be observed that, although the standardized ritual draws liberally on the *Rgveda* as a source of metrical *mantras*, only part of it is actually used in the ritual. Only the ninth of the ten books (*maṇḍalas*) of the *Rgveda*, which contains the hymns (*sūkta*) addressed to the god Soma (in the form of the *soma* beverage), is directly related to the ritual, namely to the decanting and filtering of the *soma* (*soma pavamāna*). These hymns were assembled for the purpose of the ritual in a separate collection that was added at a later date to the *Rgveda* as the ninth of its ten *maṇḍalas*. Otherwise, the arrangement of the *Rgveda* is not related to the later ritual. In general, this text provides few, if any, clear indications about its cultic context or about the occasions at which or for which the hymns were composed.

The *Rgveda*, then, for all its size and suggestive contents, does not allow a clear view of Vedic religion, its cult, or its beliefs, nor do the Brāhmaṇas, with their single-minded concentration on ritual. Non-Vedic testimonies, such as the early Buddhist scriptures, may be put to use—regarding, for instance, the cult of spirits (*yaksas*)—but they will not suffice for a well-rounded picture. Nor does archaeology offer any reliable clues. It has not even been possible to find indubitable evidence linking the Vedic data with the preceding Indus civilization. The only source for Vedic religion is the Vedic corpus, but it can only give part of the spectrum. Moreover, one must take into account the sharp divide between the *Rgveda* and the Brāhmaṇas.

MYTHOLOGY. As regards mythology the *Rgveda* is a vast storehouse of mythic motifs that are partly taken up again and recast by the Brāhmaṇas in their explanation of the ritual. It would be a mistake, however, to expect a consistent mythology or a clearly structured pantheon. Individual outlines tend to be blurred and areas of activity indeterminate, whereas attributes and positions are to some extent interchangeable among the gods. The reason for the apparent indeterminateness of Rgvedic mythology is not to be found in the fluidity of archaic thought. In fact, the *Rgveda* bears witness to a highly developed state of verbal art. Though conventional and even formulaic, the mode of expression is characterized by great sophistication and flexibility, geared to interchangeability and conflation of images and formulations. The aim

is not to arrive at a precise delineation of the deity invoked and his power, but, on the contrary, to compress several associations and layers of meaning within the bounded, metrical compass of a stanza. In this respect Rgvedic mythology is essentially different from the mythological statements of the Brāhmaṇas. The *Rgveda* works by multi-interpretable suggestion and allusion rather than by explicit statement, leaving unexpressed the inner connection of the images and meanings that are suggested or alluded to. In this way a vast or even unbounded field of symbolic relationships is evoked to enhance (and exploit) the power of the deity. Hence the indeterminacy of Rgvedic mythology, which is a matter of principle rather than of pristine fluidity.

This feature has given rise to F. Max Müller's well-known but misleading term *henotheism*, or *kathenotheism*, to characterize Vedic religion. Insofar as it describes the apparent tendency to provide the invoked deity with a maximum of divine associations to enhance its power, the term may still be useful. It should, however, not be taken as an intermediary stage on the way to some form of strict monotheism, nor can it serve to define Rgvedic religious thought. It does no more than indicate a marked feature of Vedic hymnology.

The mythological statements of the Brāhmaṇas, by contrast, are directly and unequivocally linked to the ritual and its details, which they are meant to explain and justify. The tersely and concisely recounted mythical and legendary episodes lack the sophisticated associativeness and multi-interpretability that characterize the *Rgveda*. Their only—and explicit—association is with the ritual. The many layers of meaning are reduced and systematized in three tiers referring respectively to the ritual (*adhiyajña*), to the godhead (*adhidaiva*), and to the person of the sacrificer (*adhyaṭma*). Given the structure of the ritual as a collection of separate sacrifices and of each sacrifice as a lineal concatenation of clearly distinguishable acts and accompanying *mantras*, the mythological statements that refer to the separate sacrifices or to the successive acts of each of them cannot, by their nature, present a consistently structured mythology and cosmology. Moreover, there are clear traces of non-Aryan themes—often revealed by non-Aryan names—that raise the question of their whole or only partial integration. The search for an underlying unified pattern of mythic and cosmic conception will therefore to a large extent remain a matter of speculation.

Keeping in mind this caveat as well as the indeterminacy of the *Rgveda* and the ritualism of the Brāhmaṇas, one may now proceed to a brief survey of Vedic mythology. In accordance with the not specifically Vedic or Indian custom of expressing the idea of totality by a number, the *Rgveda* often speaks of thirty-three gods. The Brāhmaṇas break down this number as eight Vasus, eleven Rudras, and twelve Ādityas, leaving two open slots. Essentially such numbers are, however, not meant to be filled out by a complete list.

Ādityas. In the same way, the most important group among the gods, the Ādityas, is equally marked by a number,

namely seven or eight (although only six are named) and later, in the Brāhmaṇas, twelve. They are defined as the sons of the goddess Aditi, whose name means “boundlessness.” Her name has given rise to an opposite counterpart, the goddess Diti (dropping the privative *ā*), who later is considered the mother of the gods’ enemies, the demonic *daityas*, better known as *asuras*. The notion of a mother goddess or Magna Mater is, however, not very prominent in the Veda. The Ādityas are connected with light and with celestial phenomena. Āditya also occurs as the name of the sun (otherwise Sūrya), and it has been proposed that the seven Ādityas be equated with the sun, the moon, and the five planets. On the other hand they are thought to represent various aspects of rulership or sovereignty; the first three, Varuṇa, Mitra, and Aryaman, especially represent this capacity, whereas Bhaga (“dispenser”), Amśa (“share”), and Dakṣa (“capability”) are associated with social concepts. Some of these names, such as *Mitra*, *Aryaman*, and *Bhaga*, have direct correspondences in Old Iranian, but the functions associated with them differ considerably. Apart from that, the Ādityas as a group have been equated with the (somewhat different) Amesha Spentas in the Avesta.

The foremost among the Ādityas—and at the same time the most problematic—is Varuṇa. His name is, not without doubts, connected with the Greek Ouranos. He is a sovereign god, often characterized as *samvrāj*, establishing and maintaining universal order, punishing transgressions, and binding the sinner with his ties. In this perspective one can also place his connection with *ṛta* (cosmic truth) and guardianship of the oath as well as with the waters, which are the abode of *ṛta*. At the same time Varuṇa exhibits a sinister and dark side, especially in his opposition to the warrior god Indra, who appears to have robbed Varuṇa of his virility and dethroned him (*Rgveda* 4.42; 10.124). In this connection Varuṇa’s qualification as an *asura* should be mentioned. Being preeminently an *asura*, a lordly being, he can be considered as the Vedic counterpart to the Avestan Ahura Mazda, with whom he shares the connection with *ṛta* (Old Iran., *asha*). Varuṇa’s *asura* quality would seem to oppose him to the *devas*, or heavenly gods, even though the *deval asura* opposition is less pronounced in the *Rgveda* than it is in the Brāhmaṇas. The problem Varuṇa presents is his twosidedness. As the first among the Ādityas he is a *deva*, while at the same time he is prominent as an *asura*.

Varuṇa often occurs coupled with another Āditya, Mitra, who (in accordance with his name) represents contract and alliance. In the Veda he remains somewhat in the background. In the Avesta, however, he is more prominent and receives a fuller treatment; he is also a warrior and is associated with heaven and the sun. In contradistinction to the *Rgveda*, the Brāhmaṇas emphasize an opposition between Mitra and Varuṇa, the former being equated with the daylight, the latter with the night. The third Āditya, Aryaman, is concerned with marriage and hospitality.

Indra. The god most often encountered is the warrior god Indra, who receives the most elaborate mythological

treatment of all the Vedic gods. Although he does not belong to the Ādityas he is mentioned at least once as the fourth Āditya (*Rgveda* 8.52.7), so as to connect him with the three first, and sovereign, deities among the Ādityas. A few times in the *Rgveda* he is called an *asura*, as is Varuṇa. His appearance, strength, and liberality, and his prowess in battle, in drinking *soma* (sometimes obtained forcibly), and, later, in amorous ventures—as well as his chariot, his horses, and his weapon, the *vajra* (the thunderbolt)—receive ample attention. He is, however, not only a warrior and divine prototype of the *kṣatriya* or *rājanya*: He also exhibits priestly or Brahmanic traits and as such is related to Bṛhaspati, or Brāhmaṇaspati (lord of the greatness or of the *brahman*), who is credited with some of the heroic deeds usually ascribed to Indra. (Hanns-Peter Schmidt has even argued that *Bṛhaspati* may originally have been an epithet of Indra. Incidentally, this should warn against setting too early a date for the separation of the four *varṇas* as closed, mutually exclusive status groupings.)

Indra’s most vaunted deeds are the liberation of the waters by killing the monster Vṛtra (“obstruction”)—hence his epithet *Vṛtrahan*, which equates him with the Avestan Verethraghna—and the freeing of the cows (metaphorically, the heavenly lights) from the Vala cave or from the cave where the Paṇis hid their cattle. In the Vala episode he is associated with the priestly Angirasas, who assist him by their chanting in opening the cave or enclosure. Here, Indra’s relationship, or rather overlap, with Bṛhaspati/Brāhmaṇaspati is most clear.

Maruts and Vāyu. Indra’s usual companions and warband are the Maruts, the sons of Pṛṣṇi, the spotted cow. They are depicted as chariot fighters and support Indra in the Vṛtra battle, but they also have a priestly quality as bardic chanters. In a naturalistic perspective the Maruts are the violent storm gods, just as Indra’s weapon, the *vajra*, is the thunderbolt. As such, the Maruts are akin to Vāyu (“wind”). Equally a charioteer and associated with Indra, Vāyu is linked with the Maruts. His pneumatic character seems to connect him with ancient initiation rites as well as with the later, Upaniṣadic speculations on the life breath, or *prāṇa*.

Trita. As a dragon slayer Indra has a minor double in Trita (“the third”) Aptya (“the aquatic one” [?]), who is equally credited with slaying Vṛtra and Vala. These exploits, however, burden him, like Indra, with the guilt of manslaughter, which makes Trita into a kind of scapegoat. In the Brāhmaṇas he is identified with Agni, the fire, who hides from his cruel duty as the sacrificial fire. Trita is also known to the Avesta in a double form, as Thraetaona (Pers., Farīdūn) Āthwya, the slayer of the dragon Azhi Dahāka, and as Thrita, the father of Kereśāspa, equally a dragon slayer. Trita, and not Indra, may have been the original hero of the dragon fight.

Aśvins. The twin Aśvins (“possessing horses”), or, by their original name, the Nāsatyas, are chariot warriors—the chariot being typically manned by a pair, the driver and the

fighter—conveying Sūrya, the bride of the sun. Equally, they are associated with the goddess Uṣas, or Dawn. They obtain the secret of the cultic *surā* beverage (distilled from grain) from the demon Namuci and honey mead (*madhu*) from the horse-headed Dadhyañc. In this connection they are also known for their qualities as healers and miracle workers.

Rudra. A different type of warrior is the terrible archer Rudra (“the red one,” or “the howler”), who inhabits the mountains and the wilderness. He is identified with the destructive, uncontrolled aspect of Agni, the fire. Generally, Rudra is surrounded by fear and taboo. In the ritual he typically receives the remainder of the oblation, thus being set apart from the gods and “bought off.” The group of Rudras—their later standard number is eleven—are identified with the Maruts, Rudra being said to be their father. In post-Vedic religion Rudra developed into the transcendent god Śiva.

Viṣṇu. Another Vedic god who was destined for post-Vedic prominence is Viṣṇu, who in many ways became a counterpart to Śiva. In the Vedic hymns Viṣṇu is a minor figure, associated with Indra in the Vṛtra battle. In the Brāhmaṇas he is identified with the institution of sacrifice. His characteristic deed, however, is the feat of crossing, measuring out, or conquering the universe by his three steps. This feat may be linked with his solar (and, possibly, also phallic) character as also with his later association with the *axis mundi*. As against the fearsome Rudra-Śiva, who resides outside human society, the consistently benevolent Viṣṇu takes up his position in the center of the universe and in the middle of the settled world, encompassing and organizing the universe with his three steps.

Pūṣan. The pastoral Pūṣan is the guardian of the roads, a trait that should probably be viewed against the background of the movement of cattle. The furthering of prosperity to which his name (from *pus*, “prosper”) refers is primarily concerned with cattle (especially cows), the epitome of wealth. His guardianship of the roads easily connects Pūṣan with the path of the sun, which leads from heaven to earth. In this respect he may be viewed as a solar deity.

Agni. From the ritualistic point of view the most important deities are Agni, the fire, and Soma, the deified cultic beverage and draft of immortality (*amṛta*). In cosmic perspective they represent the fiery and watery elements. As the sacrificial fire, Agni is produced with the help of two special pieces of wood known as the “two *araṇīs*” that are manipulated in a way explicitly imitating the sexual act. The domestic fire, on the other hand, is the fire used in the marriage ritual and so is derived from the bride’s paternal home. This notion should be a warning to any misunderstandings regarding the “ancestral fire”; insofar as it is ancestral it is transmitted in the female line. Moreover, the upkeep of the actual domestic fire ends with the death of the householder, when it is used for the last time at his cremation. The fire—both domestic and sacrificial—is discontinuous, its transmission broken and its possession uncertain. The mythology of Agni

is replete with his fleeing and hiding in plants or trees but especially in the waters, illustrating the basic though paradoxical interrelationship between the watery and fiery elements. This paradox is further indicated by one of the names for Agni, Apāṃ Napāt (“son of the waters”).

Time and again Agni has to be retrieved from his hiding places, that is, the fire must be obtained from elsewhere, from other people. Even though the “two *araṇīs*” would, in principle, ensure the undisturbed possession of the fire, which then can be produced at will after a period of inactivity or hiding when it has been symbolically taken up in the sacrificer’s person, these drilling sticks are not an ancestral heirloom, but are obtained from the *adhvaryu* priest (fittingly, he is rewarded with a gift when fire is produced). Less ritualistically, the fire appears to be obtained by force or theft, as occasionally shown in the ritual texts. Conversely, the *śrauta* ritual for setting up the sacrificial fires (*agnyād-hāna*)—obviously meant to have only one performance, whose effects were permanent—can be repeated after some, not clearly specified, mishap. This seems to point in the same direction: The fire may have been robbed or lost as the result of a hostile encounter. Although the Vedic myth of Mātariśvan (“swelling in the mother”[?], probably a name of Agni), who brings the fire to the human world, does not mention agonistic proceedings, the ritual seems to recall the well-known Indo-European myth of the theft of the heavenly fire.

On the other hand the fire is identified with the person of its possessor in a way that suggests the notion of an “external soul.” It defines the household and its master; in the sacrificial ritual it leads the triumphant procession to the sacrificial hearth (*āhavanīya*), where it is to be installed. In this latter triumphal aspect Agni is a victorious warrior moving about on his chariot and bringing the gods to the sacrifice or conveying the offerings to them as well as receiving offerings himself. In short, he is the linchpin of the universe viewed as sacrificial process. Although the *śrauta* ritual identifies Agni with the *hotṛ* priest, it would seem that originally this functionary is no other than the sacrificer striving to prevail over other sacrificers and their fires, as is still noticeable in the rite of the Pravara, the “election” of the *hotṛ*, immediately preceding the burnt offerings.

Both mythologically and ritually, then, the relationship of humans with Agni, dispersed throughout many separate (and competing) fires as well as regularly disappearing, is critical and insecure. In his “terrible” (*ghora*) form, as Rudra, he may even endanger the sacrificer’s life.

Soma. *Soma* (Avestan, *haoma*) is predominantly the plant from which the cultic beverage is prepared as well as the beverage itself. Like the fire, Agni, it has to be won or obtained from elsewhere. “The one [Agni] Matarisvan brought from heaven, the other [Soma] the eagle [*śyena*] took by force from the mountain” (*Rgveda* 1.93.6). In the Brāhmaṇas this bird is identified with the *gāyatrī*, which, having three eight-syllable feet, is the shortest of the Sanskrit

meters and is emblematic of chant and recitation. The mountain where the *soma* plant grows is named Mūjavat. The main distinguishing feature of *soma* is that it is to be won or brought from the wilderness, far away from the settled world. In the ritual the stalks of the *soma* plant are bought from an outsider in exchange for a cow, after which the *soma* seller is beaten and chased. This latter feature, as well as other less explicit details, suggests that behind the trading lies a contest in which the seller represents the guardians of the *soma*, the heavenly Gandharvas.

Another way of winning the *soma*—or rather the *soma* draft—is by forcibly obtaining access to another’s *soma* sacrifice. Though the ritual does not account for this it is a well-known mythical theme. Thus Indra robs Tvaṣṭṛ and drinks the *soma* from his ritual vessels. In another myth Indra slays Tvaṣṭṛ’s son, the three-headed monster Viśvarūpa, at the sacrifice in order to obtain the *soma* draft. Or again, Indra obtains the *soma*—as well as Agni—by slaying Vṛtra, who is holding them within himself.

As a god, Soma rules over the waters and their cosmic circulation. As such he takes up a central position in the universe, parallel to that of Agni, with whom Soma is often coupled as a dual divinity in the ritual texts. Significantly the *R̥gveda* associates him with the sun, illustrating once more the solldarity of the fiery and the watery elements.

As in the case of Agni, Soma’s relationship with man (i. e., winning him or losing him) is of crucial importance. However, unlike Agni, he is not identified with the sacrificer, but remains external to him. He is “the king” *par excellence*, ceremonially received as such on the place of sacrifice and often referred to by this title alone in the ritual manuals. This may perhaps explain why, whereas the fire is simply brought from heaven and the evidence for force or stealth is reduced to scattered and fragmentary indications, conflict and violence are involved in winning the *soma*. If the fire, as the sacrificer’s “external soul,” were to be the subject of an equally open direct conflict, the consequences would be disastrous: Just how disastrous can be seen upon considering the position of Soma, “the king.” After his reception, he is pressed—that is, “killed.” Having been prepared, sacrificed, and consumed, Soma is, in short, immolated. Obviously, this rules out the direct identification with the sacrificer. Such an identification is, however, still discernible, but shrouded in mystery as a dark, undeclared truth. Thus, when the royal sacrificer of the R̥jasūya is proclaimed king, the priests inaudibly add “Soma is our king.”

The original mystery of the sacrificer’s immolation has been preserved in a different and innocuous form in the ritualistic mythology of the Br̥hmaṇas, where the sacrificer is stereotypically identified with Prajāpati, the “lord” (*pati*) of “beings” (*prajā*). One of the many *pati* gods, he makes a fleeting appearance in the late tenth book of the *R̥gveda* but reaches overall preeminence in the Br̥hmaṇas. This Prajāpati, then, is the epitome of sacrifice, being at once the sacrificer and sacrificial victim. By that time, however, the

ritual had developed into a closed, autonomous system that is ideally parallel to but not directly linked with the reality of the sacrificer’s actual life and death.

A particularly knotty problem is the original identity of the *soma* plant. From the texts it appears that it must be a plant, often thought to be a creeper, with juicy stalks delivering the *soma* juice when crushed. R. Gordon Wasson’s seductively argued theory of *soma* as the “divine mushroom of immortality,” specifically fly agaric, is not generally accepted. The main difficulty is that fly agaric is not indigenous to the geographical area of the *R̥gveda*. But if Wasson is right, this would mean that the elaborate imagery of the *soma* hymns would revolve around a substance no longer used or even known. Given the conventional nature of Vedic hymnology, this is certainly not impossible. The stalks actually used in the ritual appear anyway to be a substitute for the lost original.

As to the god Soma’s celestial nature and abode the question of whether he represents the sun or the moon was at one time hotly debated. Though regularly associated with the sun in the *R̥gveda*, Soma is usually identified with the moon in the Br̥hmaṇas. The waxing and waning of the moon easily lend themselves to serve as an expression of the cosmic processes of growth, death, and renewal over which Soma presides. This led Alf Hillebrandt to postulate a lunar origin and character for Soma, which he expanded into a mythology involving other gods as well. This interpretation has, however, not been generally accepted, nor has Hermann Lommel’s suggestion that Soma’s identification with the moon would have come about by a restructuring under external, non-Aryan influences found favor. When the naturalistic and celestial interpretation of Vedic mythology receded in favor of more sociologically, cosmogonically, or ritually oriented views, the question of the lunar as opposed to the solar interpretation slipped into the background. The naturalistic viewpoint has once again gained favor, and the debate may in some form or other be reopened. At any rate the central point of Soma’s mythology is the circulation of the cosmic waters holding the ambrosia (*amṛta*) and linked with the alternation of life and death.

Female deities. As mothers, sisters, wives, and lovers of the gods, female deities receive frequent mention, but, with the exception of Uṣas (Dawn), they remain diffuse, lacking in profile and to a high degree interchangeable with one another.

First there are the deified (primordial) waters, Āpaḥ (plural of *ap*, water), which hold the germ of life and are the abode or hiding place of Agni (Fire), the “son of the waters” (Apāṃ Napāt). As has been seen, they are also associated with Soma. Their most direct manifestation is formed by the rivers, especially those of the Punjab, such as the Sindhu (grammatically both masculine and feminine), also called Indus, and its tributaries. Mythologically the most important of them is the Sarasvatī, in the Br̥hmaṇas identified with the goddess Vāc (Speech), especially in connection with the

hymnic or ritual utterance. Aditi, the mother of the Ādityas, has already been mentioned. The Brāhmaṇas explain the latter's birth as the result of Aditi's eating the remainder of the rice mess (*odana*) prepared and offered by her to the gods. Other female deities are Śrī (Luster), Puraṃdhi (Bounty), and Idā, or Ilā (Food, both as offering and as sacrificial meal).

The most individualized of the goddesses is Uṣas (Dawn). She is depicted as a nubile, eternally young woman, wife or lover of the sun and companion of the Aśvins. Her most important feature is her bounty and her association with the gift, especially the *dakṣiṇā*, the gift to the priests at the sacrifice. The Brāhmaṇas transfer the incest motif of the otherwise featureless sky god, Dyaus, and his daughter to Prajāpati, father of all and epitome of sacrifice, and Uṣas. Prajāpati is then chastised by the archer Rudra who shoots an arrow at him; the wound is represented by a small piece from the offering cake, "Rudra's portion," which is, because of its potency, given to the *brahman* priest to eat. It is striking that Uṣas, notwithstanding her clear delineation and the hymns addressed to her, does not have a part in the sacrificial cult.

Ancestors. Finally, mention must be made of a separate class of divine beings, the Ancestors (*pitarah*, "the fathers"). To them belong the *ṛṣis*, the seers to whom the Rgvedic hymns are ascribed. Stereotypically the ancestors form a group of seven (such as the Ādityas) to which an eighth, Agastya, is added. They are the eponyms of the *gotras* (brahman lineages) systematically listed in the Pravara ("election") rite in the *śrauta* sacrifice where the names of the *ṛṣis* defining the sacrificer's *gotra* are mentioned.

Otherwise, the householder's lineage is defined by the last three ancestors—father, grandfather, great-grandfather—who receive offerings of water and rice balls (*pinḍas*) in both the domestic (*gṛhya*) and the solemn (*śrauta*) ritual. The feature distinguishing the cult of the ancestors from that of the gods is the use of the left hand; the right hand is used in the cult of the gods. Thus, though regularly associated with the gods and their deeds, the *pitarah* are sharply differentiated from them. Similarly, the "way of the fathers" (*pitṛyāna*) is distinguished from the "way of the gods" (*devayāna*), the first "way" being associated with the moon and the second with the sun.

Yama. Another set of ideas regarding the world of the dead focuses on Yama and his twin sister Yamī (*yama*, "twin"). Also known in Old Iranian mythology, they form the primordial pair. The *Rgveda* knows, but apparently rejects, their incest: In a dialogue hymn (*Rgveda* 10.10) Yama refuses to respond to Yamī's entreaties. Yama is the first mortal and, in ancient Iran, the first king. In India his kingship is reserved for his righteous rule over the world of the dead, which he is the first to enter. In the *Rgveda* he is the son of Vivasvat, a solar figure ("the wide-shining") whom the Brāhmaṇas make into an Āditya. Although it is only in later Hinduism that Yama is equated with Dharmaraja, the king

of the universal order, the idea underlying this notion does not seem to be alien to the Veda.

Interpretations of Vedic mythology. The interpretation of the Vedic mythological data has, in the last hundred years or so, variously emphasized naturalistic, ritualistic, and sociological approaches. Abel Henri Joseph Bergaigne's *La religion védique d'après les hymnes du Rgveda* was the first and, thus far, unequalled attempt at a unitary synthesis combining both the naturalistic and ritualistic viewpoints. The mythical motifs are classified on two levels: on the one hand the celestial processes of light and darkness, on the other the atmospheric phenomena (clouds, rain, lightning) parallel to the celestial level. Both levels are further characterized by the opposition and interaction of male and female elements. The natural processes structured in this way are then seen as reflected in the cult. Bergaigne has been criticized for his allegorical schematism and his tendency to view the *Rgveda* exclusively in terms of its rhetorics. But his lasting achievement is in his systematic textual approach, involving a rigorous attention to the phraseology and its formulaic aspects. On this basis, modified by Hermann Oldenberg, it has also been possible to obtain a clearer view of the formation of the *Rgveda*. In general, Bergaigne can be considered the founder of Vedic philology, which then is brought to full growth by Hermann Oldenberg.

The sociological approach has been forcefully represented by Georges Dumézil, who stresses the three functions of sovereignty, both spiritual and worldly (Varuṇa as against Mitra), physical force (exemplified by Indra), and fecundity or productivity (represented by the Aśvins and other groups of gods, such as the Vasus, in association with female divinities). The three functions or principles are at the same time seen as the (Indo-European) ideology governing a tripartite social organization exemplified by the three "Aryan" or "twiceborn" *varṇas* (classes): *brāhmaṇas*, *kṣatriyas*, and *vaiśyas*. The problem with the social and ideological tripartition is that the number three, which is indeed strikingly frequent, is usually associated with either the number two—the third forming a link or intermediary—or four, when the fourth is an indeterminate or opposite element rounding out the whole (thus the three *varṇas* are supplemented by a fourth, the *śudra varṇa*; compare also such configurations as seven or eight Ādityas). The theory of the three functions is, however, not primarily directed at the interpretation of Vedic (and later, epic) mythology as such, but at comparative Indo-European mythology—a field of study revived and stimulated by Dumézil's numerous and erudite publications.

Another approach, which is reminiscent of Bergaigne's cosmological comprehensiveness but is not dependent on naturalistic or ritualistic viewpoints, singles out cosmogony as the key to "the basic concept of Vedic religion." The cosmogonic approach, propounded by F. B. J. Kuiper, has been influenced by earlier work (in the 1930s) of Dutch structuralist scholars on Indonesian religion and society; it is an approach in which psychoanalytic insights also are heuristically

brought to bear on cosmogonic thought. In this perspective, the central feature of Vedic cosmogony and of the world it brought about is the sudden breakup of the undifferentiated primeval unity of the waters into a dualistic cosmos. The cause of this dramatic change was Indra's heroic deed. The *asuras*, who were associated with the primeval state of affairs, are defeated and replaced by the "younger" *devas*. Henceforth, the dualistic cosmos of upper and nether world—rent apart by Indra—is determined by the conflict of *devas* and *asuras*, which periodically breaks out again at the joints of the time cycle (as at the New Year) and is reenacted in verbal and other contests, particularly chariot races. In this scheme, the primordial unity is guaranteed by Viṣṇu, who, far from being a minor figure in the *Rgveda* as is usually assumed, transcends the conflict by his third step. The cosmogonic exegesis entails complex problems of textual analysis. Thus the opposition between *devas* and *asuras*, though clear and systematic in the Brāhmaṇas, is far from unambiguous in the *Rgveda*. The main problem is the nature of Varuṇa, an *asura* who belongs equally to the *devas*. In Kuiper's view Varuṇa went over to the victorious *devas* (keeping a hidden allegiance to the *asuras*), much as Agni and Soma left Vṛtra for Indra.

Whether cosmogony can deliver a basic or unitary concept underlying Vedic religion, or at least the Veda as known to the modern scholar, is of course debatable. One may even doubt whether such a concept did indeed exist. At any rate the metaphorical language of the hymns, with its tendency to pack various meanings and images in a single suggestive stanza while leaving the connecting idea or concept unexpressed, makes it particularly hard to isolate and define such a basic concept.

There can, however, be no doubt about the importance attached to Indra's cosmogonic battle, if the number of references both in the hymns and in the prose texts is taken as a criterion. More generally, competition, conflict, and combat appear to permeate the Vedic world. If the gods are bountiful or the human patrons munificent, the point is more often than not that the bounty and munificence should not go to the opponent. In the Brāhmaṇas conflict is stereotyped as the perennial struggle between *devas* and *asuras*, but conflict does not stop there. The *devas* are also competing (often by running chariot races) or fighting among themselves. The hostile tension between Indra and his followers, the Maruts, that is noticeable in some hymnic passages is crudely expressed in the Brāhmaṇas as Indra plundering the Maruts. In the ritual texts the *bhātrvya* (rival kinsman), or the *dviṣat* (the foe), is all but ubiquitous. There clearly is the idea of a stable unalterable order—often associated with the unforgiving rule of Varuṇa—but this order is destabilized from within by the dualism of conflict for the goods of life. These goods, known under various, mostly indeterminate, all-encompassing terms, are mythologically luminous and celestial in nature and are associated with the waters. Thus, for instance, Indra's freeing Agni and Soma, the fire and the waters, from Vṛtra.

The "real life" substratum of the goods of life is cattle, especially cows, which then are transformed into theriomorph divinities (as, for instance, Pṛṣṇi, the mother of the Maruts). In this connection the complex of female deities seems to be particularly important. Thus Uṣas is directly associated with the cow given as *dakṣiṇā* (gift to the priests), and the *soma* cow (the price for which the *soma* is traded) is addressed (among other names) as *Dakṣiṇā* (the deified gift cow), Aditi "facing both ways" (*ubhataḥśīrṣṇī*), Rudrā (feminine form of Rudra), and Ādityā (belonging to Aditi); her footprint is that of Iḍā. Especially suggestive is the double-headed Aditi: She is reminiscent of the Brāhmaṇa motif of the *dakṣiṇā* threateningly standing between the two parties of the Ādityas and the Aṅgirasas (a clan of ancient fire priests, especially associated with the *Atharvaveda* but here identified with the *asuras*); the two parties soothingly try to lure her, now identified with the goddess Vāc (Speech), each to his own side (*Śatapatha Brāhmaṇa* 3.5.1.18–22). The complex of female deities, then, are intimately connected with the cows (i. e., the goods of life) for which the conflicting parties contend.

This may explain the rather indeterminate nature of the female deities. They are the movable stakes in the ever-repeated contest. As such they have no fixed place or allegiance but keep shifting between the contending parties, dividing and connecting them. In this way it can perhaps also be understood that Uṣas (Dawn), though profusely eulogized, does not receive a sacrificial cult: Standing for the bounty spent, contended for, distributed, and consumed, she is—like Iḍā, the sacrificial meal—not a recipient but the gift itself.

As party to the conflict the *asuras* are originally not so much demoniacal opponents and spoilers but rather settled rulers and holders of the goods of life. They are being despoiled by the aggressive wandering *deva* warriors led by Indra, who aspire to the status of settled lords. As the *Śatapatha Brāhmaṇa* has it in a lapidary but probably ancient phrase: "The *devas* drove about on wheels, the *asuras* sat in their halls" (*Śatapatha Brāhmaṇa* 6.1.1.1). But eventually the *devas* prevail over the *asuras*, and that is why the "moving-about warrior" (*yāyāvara*) holds sway over the settled people (*kṣemyā*), as a parallel passage explains (*Taittirīya Saṃhitā* 5.2.1.7). Similarly, an isolated but telling rule recommends the would-be sacrificer who is going to set up his *śrauta* fires to take his cooking fire (*dakṣiṇāgni*, lit., "southern fire") from the house of a man of substance (*puṣṭa*) who is "like an *asura*" (*asura iva*; *Kāthaka Saṃhitā* 8.12; cf. *Āpastamba Śrautasūtra* 5.14.1).

This does not mean that the world of the gods is modeled after human society, but rather that there is no sharp dividing line separating them. The worlds of gods and humans smoothly blend into each other, forming a universe permeated by the divine and the sacral. If Indra's heroic warrior deed established the cosmic order, it is an order of peren-

nial conflict over the possession and the redistribution of the goods of life—a conflict in which gods and men equally take part—and the outcome is open to reversal at the next turn. This may explain the fact, usually considered a secondary extension, that Indra is in a few R̥gvedic passages called *asura*.

The arena where the conflict was fought out was the microcosm of the place of sacrifice. The central institution that regulated and contained conflict was sacrifice (*yajña*). Though the *śrauta* ritual has no place for the enemy it does contain many mock contests, prominent among them verbal contests (*brahmodya*) and chariot races. The Brāhmaṇas do not tire of referring to enemies, and the explanatory passages continually link the sacrificial ritual and its details with the fights of *devas* and *asuras*, while the place of sacrifice is made the battleground.

Though researchers are ill-informed about the cultic background of the hymns, which may have known a great variety of concepts and forms, sacrifice, especially the *soma* sacrifice, clearly must have been of overwhelming importance. As the *R̥gveda Samhitā* (1.164.50 and 10.90.16) says in an enigmatically involute statement: “With sacrifice the gods sacrificed sacrifice, these were the ‘first ordinances’ (*dharmāni prathamāni*).” The second passage concludes the hymn celebrating the sacrifice of the *puruṣa*, the cosmic man, out of whose immolated body the ordered universe, including the four *varṇas*, was created. Although this cosmogonic sacrifice recalls Indra’s Vṛtra-slaying, there is no reference to a fight or contest. Rather, it suggests the “monistic” form of the *śrauta* sacrifice propounded by the Brāhmaṇas, mythologically represented by Prajāpati, who creates the world by sacrificing himself. However, judging by the explanations in the Brāhmaṇas as well as by many features of the *śrauta* ritual itself, the form of the sacrifice preceding the one taught by them appears to have been characterized by a dualistic and agonistic structure.

The dualistic character is already implied in Paul Thieme’s fundamental observation that the *śrauta* sacrifice is in all its details characterized as a guest reception, the sacrificer being the host. The guests at the sacrificial feast are not only the gods but equally the priestly participants who drink the *soma* and partake of the sacrificial food and who are identified with gods. The dualism of hosts and guests is clearly marked by tension and competition. Thus the Ādityas and the Aṅgirasas—who have been seen already in their (verbal) contest over the *dakṣiṇā* bounty—competed over the honor of inviting the other party to their own sacrifice. First the Aṅgirasas invite the Ādityas, but the latter manage to be “one up.” Devising an equally important sacrificial ritual that can be performed on short term before the time set by the Aṅgirasas, the Ādityas invite the latter and win out (*Aitareya Brāhmaṇa* 6.34).

Apparently, being invited to a sacrifice is a challenge that one cannot honorably refuse. On the other hand, not being invited is a dishonor. And so uninvited guests force their way in to obtain or rather to contend for their share,

as did the Śyāparṇas at the sacrifice performed by Viśvantara Sauśademaṇa (*Aitareya Brāhmaṇa* 7.27), or as did Indra at Tvaṣṭṛ’s, where Indra even killed Viśvarūpa, Tvaṣṭṛ’s son. It is this dualistic and agonistic form of sacrifice that the ritualists of the Brāhmaṇas and the Sūtras reformed and turned into the rigidly “monistic” system of ritual that is the apogee of Vedism.

RITUAL. The most striking feature of Vedic ritual is the thoroughly systematic nature of its structure and textual presentation. Whereas the Brāhmaṇas still show in many ways, but especially in the *arthavāda* discussions, traces of the formative process and sometimes explicitly mention former practices as against the new rules, the Sūtras, or “guidelines,” are fully systematized to the extent of stating a set of “meta-rules” (*paribhāṣā*) for the proper interpretation and handling of the ritual prescripts. This systematic character, definitively clarified by Willem Caland, caused Oldenberg to speak of “prescientific science” and Sylvan Lévi of “doctrine.” Frits Staal has again called attention to what he considers to be the ancient Indian “science of ritual” as a system of “rule-governed activity” per se.

The ritual system. In the first place, there is the principle of the unity of act and formula. Unless stated otherwise each act is accompanied by a formula. The system is then built up in the way of nesting units, simpler acts being integrated to form ever more intricate complexes. The basic sacrificial unit is the pouring of a small portion of the oblatinal substance—milk, ghee (clarified butter), cake, gruel, meat, or *soma*—into the offering fire. This smallest unit, indicated by the verb *juhōti* (“he pours”), occurs as a separate act in all *yajñas*, but it is also an integral part of a more complex sacrificial act. The simple pouring is performed by only one person, usually the *adhvaryu*, but the more complicated form requires the cooperation of several priests. While standing at the offering fire the *adhvaryu* calls out to the *agnīdhra*, “*omśrāvaya*” (“let there be hearing”), and the latter answers with “*Astu śrauṣaṭ*” (“be it, one should hear”); then it is again the turn of the *adhvaryu*, who now calls on the *hotṛ* to recite the offering verse (*yājyā*). The verse begins with the name of the god to whom the oblation is addressed and is followed by the instruction to “worship” (*yaja*), that is, to recite the appropriate verse; the *hotṛ* complies, prefixing the words *ye yajāmahe* (“we who worship,” also known from Old Iranian) and ending with the word *vausaṭ*, at which the *adhvaryu* pours the oblation in the fire and the sacrificial patron (*yajamāna*) pronounces the *tyāga* (“abandonment”): “for [name of the god addressed], not for me.”

This scheme, indicated by the verb *yajati* (“he [i. e., the *hotṛ*] worships”), is the one used in the standard ghee libations preceding and following the main offering (*pradhāna*) in the vegetal sacrifices. In the case of the main offering the scheme is enlarged by a preceding invitatory verse (*anuvākya* or *puronuvākya*) to be recited by the *hotṛ*, who is called upon by the *adhvaryu* to do so. The same scheme is then further elaborated in the animal sacrifice by the participation of one

of the *hotṛ*'s assistants, the *maitrāvaruṇa*, who relays to the *hotṛ* the *adhvaryu*'s call for the *anuvākya* and *yājya* verse. In the *soma* sacrifice this complex is further enlarged by the chanting of the *stotra* ("laud," from the verb *stu*, "to praise"), which is the task of the *udgātṛ* and his assistants, and the *śastra* (recitation) of the *hotṛ*, which follows the libation and the drinking of the *soma* by the participants. In all this the basic sacrificial act remains the libation in the offering fire.

This summary description of the basic sacrificial act and its enlargement cannot do justice to the intricate detail of the rules that, apart from the sacrificial act itself, also cover the no less complicated preparatory acts—taking the vow, choosing the priests, collecting the ingredients and implements (*sambhāra*), arranging the place of sacrifice, readying the fires, preparing the oblatinal substance (*havis*), its consumption and disposal, the *dakṣiṇās*—as well as the concluding phase. But the brief summary adequately illustrates the systematic buildup of the ritual. Each sacrifice consists of a lineal succession of such standardized units of act and formula, primarily the basic sacrificial act with or without its extensions. The alignment of acts again shows the nesting principle by boxing in a unit on both sides by two other mutually connected or similar units, as for instance is the case of the main offering (*pradhāna*), which is preceded by the "fore-offerings" (*prayāja*), and followed by the "after-offerings" (*anuyāja*). In this way a complicated concatenation is achieved spanning the whole of the sacrifice, its beginning and conclusion, mirroring each other so as to enclose the whole.

The same nesting principle governs the hierarchical taxonomy of types of sacrifices, the simpler types being incorporated in the more complicated ones. The simplest type of sacrifice is the Agnihotra, the evening and morning offering of boiled milk. It is essentially the basic sacrificial act of the *juhoti* type, requiring only the service of the *adhvaryu*. More complicated is the *iṣṭi* (from the verb *yaj*, "to worship"), a vegetal sacrifice of one or more cakes (*purodāsa*), cereal boiled with butter and milk (*caru*), or a dish of coagulated milk (*sāmnāyya*). It involves the taking out, husking, and grinding of the grain, preparing the dough, baking the cake (on a specified number of potsherds heated on the embers), and dividing it into portions to be distributed to the deity and among the sacrificer and his priests. Moreover, before the main offerings are made, the sacrificial fire is fueled with pieces of wood (*samidh*). The *hotṛ* recites a verse (*sāmidhenī*) as the *adhvaryu* places each *samidh* as an offering into the fire.

This series of sacrificial acts is then followed by the *pravara* ("election") of *hotṛ* and *adhvaryu*, in which the sacrificer's ancestral names are mentioned, and finally the main offerings are made according to the *yajāti* scheme. Of course, separate *juhoti* offerings are equally part of the *iṣṭi* ritual. A more complicated version of this type of sacrifice requires four priests: apart from the *adhvaryu*, the *hotṛ*, the *agnīdhra* (counted with the *adhvaryu*, but as to his function associated with the *hotṛ*), and the *brahman*.

The next type, the *paśubandha* ("binding the animal victim"), or animal sacrifice, incorporates the *iṣṭi*. The acts concerned with the cake offering (*paśu-purodāsa*) are neatly intertwined with those of the animal sacrifice proper. Two more priests are added: the *maitravaruṇa*, who is associated with the *hotṛ*, and the *pratiprasthatr*, who assists the *adhvaryu*.

The most complicated type is the *soma* sacrifice, which incorporates both *iṣṭis* and *paśubandhas*. Its distinctive liturgical feature is the extensive use of the *Śāmaveda*, practically absent in the other sacrifices, for the chanted "lauds" (*stotra*), while the *soma* ritual proper is intertwined with an animal sacrifice. This involves the services of four specialized chanters (*chandoga*) led by the *udgātṛ*. Altogether the *soma* sacrifice needs sixteen or, according to some *sūtras*, seventeen priests, including the previously mentioned ones, divided into four groups according to the four Vedas: four *adhvaryu* priests (*Yajurveda*), four *hotrakas* (*Rgveda*), four *chandogas* (*Śāmaveda*), and four in the *brahman*'s group (*Atharvaveda*); the seventeenth, the *sadasya*, is assigned to the *brahman*. At the same time, however, seven, instead of only four, of these priests are counted as *hotrakas*, six of whom are actually charged with *śastra* recitations from the *Rgveda*.

In the *śrauta* system of ritual the *iṣṭi* in the form of the fortnightly New and Full Moon sacrifices (*Darśapūrṇamāsa*), the *paśubandha* and the one-day *soma* sacrifice known as Agniṣṭoma ("liturgy of Agni") form the basic paradigms, or *prakṛti*. These *prakṛtis* can then be modified mainly as to the sacrificial substance and the deity or deities addressed (such a modification is known as *vikṛti*). The modified part therefore is primarily the *pradhāna* offering(s) involving (apart from differences in the sacrificial substances used) different invitations and offering verses. The rest of the ritual, the *aṅgas* (members) or *tantra* ("the warp," the sacrifice regularly being said to be woven), remains, but for a few minor adaptations, essentially unchanged. Thus a particular sacrifice is said to be characterized by three criteria: *dravya* (sacrificial substance), *devatā* (deity, or deities, first addressed at the beginning when the sacrificial substance is taken out), and *tyāga* (the sacrificer's "abandonment" formula, again specifying the deity after the offering; cf. *Kātyāyana Śrautasūtra* 1.2.2).

Furthermore, sacrifices can be strung together either in a continuous series (*ayana*, "course") or in periodical clusters. The latter is the case, for instance, with the fortnightly New and Full Moon sacrifice (comprising two main offerings within the same *tantra*) or with the seasonal Four Month sacrifices, which are essentially clusters of *iṣṭi*-type offerings at the beginning of a four-month period. The *soma* sacrifice in particular has lent itself to such strings, which may stretch over a number of years (theoretically even a hundred years). Although a *prakṛti* form, the Agniṣṭoma lasts only one day (apart from the preparatory days) and as such is an *ekāha*; there are strings of up to twelve days known as *abīna*. A twelve-day series can be performed either as *anahīna* or a *sat-*

tra (“session”). The difference is that at a *sattra* there is not a sacrificer with his sixteen (or seventeen) priests but all the participants are homogenized into a single band of sacrificers who have put together their sacrificial fires, while at the same time each performs the task of a particular priest. Their leader is then called the *gṛhapati* (“master of the house”). The modifications that are needed make the twelve-day *sattra* into the *prakṛti* for all other, longer *sattras*, while the yearlong *sattra* or *gavām ayana* (“course of the cows”) is again the model for all other *sattras* within the duration of a year or longer.

The feature by which the *soma* sacrifices are usually distinguished, however, concerns the arrangements of the *stotras* and *śastras*. The *stotras* involve intricate rules regarding the formation of the different standardized numbers of chanted units (*stotriyā*), composed of a group of two or three R̥gvedic stanzas. These numerical arrangements are known as *stoma* (“liturgy”), which, like *stotra*, derives from the root *stu*.

Soma sacrifice. The *soma* sacrifice is the most important as well as the most intricate of the *śrauta* rituals. Its basic paradigm, the Agniṣtoma, consists of an elaborate concatenation of sacrifices spanning five days and involving a whole pantheon. The first day is marked by the consecratory bath (*dīkṣā*) of the sacrificer, who remains a *dīkṣita* (initiate) and as such subject to restrictions of diet and behavior until the concluding bath (*ava-bhṛtha*, “the carrying away,” i. e., of ritual matter by means of the waters). Special libations and an *iṣṭi* are connected with the *dīkṣā*. The next three days feature, in the morning and at midday, the ritual known as Pravargya and a ghee offering in the form of an *iṣṭi* called *upasad* (“sitting near” or “besieging”), after which these three days are called *upasad* days. The Pravargya (“to be removed,” referring to the implements after the last performance) centers on a special clay pot (called *mahāvīra*, “great hero,” or *gharma*, “heat”). Fresh milk is poured into this pot, which has been heated in the fire; of the milk boiled in this way a libation is made.

On the first *upasad* day the introductory (*prāyaṇīyā*) *iṣṭi* is performed. The *soma* stalks are bartered for the *soma* cow, and “King Soma” (in the form of the *soma* stalks) is given a ceremonial reception that takes the form of another *iṣṭi*. On the second *upasad* day the outline of the place of sacrifice (the *mahāvedī*) is traced and the earthen elevation for the offering fire is made. The third *upasad* day sees the construction of the other fire-places and of the various sheds on the *mahāvedī*; fire and *soma* stalks are brought forward in an elaborate procession and a *paśubandha* is performed. The *soma* sacrifice proper, entwined with another animal sacrifice, falls on the next, the fifth day, known as the *sutyā*, or pressing day.

The *soma* stalks are pressed three times, in the morning, at midday, and in the afternoon, providing for three “services” or *savanas* (“pressings”). The pressing is done by four of the priests, who crush the stalks, spread on a bull’s hide,

with the pressing stones (*grāvan*). The *soma* juice is mixed with water and poured through a woolen filter into the wooden *soma* tub (*dronakalaśa*). It is to this latter operation that the *pavamana* hymns of the *R̥gveda* refer. Apart from the *soma* pressing, the distinctive feature of the *sutyā* day is formed by the twelve rounds—five each during the morning and midday *savanas*, and two in the afternoon—of pouring the *soma* libation, drinking the *soma*, and conducting the liturgy of the variously arranged *stotra* chants and *śastra* recitations. The afternoon service is followed by the final bath (*avabhṛtha*, “carrying away” of ritual matter to the waters), which forms the counterpart of the *dīkṣā* bath. Next is performed the concluding (*udayaniyā*) *iṣṭi*, which corresponds to the introductory (*prāyaṇīyā*) *iṣṭi*. But this is not yet the end, for a last *paśubandha*—a cow for Mitra and Varuṇa—must still be conducted. Only then is the “breaking up” (*adavasānīyā*) *iṣṭi* performed, after which the sacrificer and the other participants return home (the *śrauta* sacrifice, and especially the *soma* sacrifice, take place outside the settled community, in the wilds).

This basic scheme allows for an unlimited but mostly unspectacular variation. Such variation concerns in the first place the numerical arrangement of the *stotras* and the melodies (*sāman*) to which they are sung. Second, as already mentioned, the number of *sutyā* days can be multiplied so as to form *ahīnas* and *sattras*. Third, special rites can be inserted, both regular sacrificial acts and rites that are, strictly speaking, external to the *śrauta* system. Prominent among the latter are consecratory baths (*abhiṣeka*, comparable to an elaborate *dīkṣā*), which have given rise to a special class of sacrifices called *sava* (“instigation”), as well as agonistic rites: chariot races, dice games, and verbal and other contests. Storytelling, singing (as different from the Śāma-vedic chanting), and dancing are occasionally prescribed. Such rites are mostly inserted in the middle of the *sutyā* day, during the midday service. A well-known case is provided by the *mahāvṛata* (“great vow”). Technically a *sutyā* day at the end of the yearlong *gavāmayana*, it offers an interesting array of popular, apparently ancient rites, including a chariot race, arrow shooting, and a tug-of-war between an *ārya* and a *śudra* for a hide (believed to represent the sun), as well as the copulation of a “man from Magadha” (possibly meaning a musician) and a courtesan, and, of course, singing and dancing.

Similarly, the royal sacrifices, Vājapeya, Rājasūya, and Aśvamedha (horse sacrifice), are marked by such insertions. The Vājapeya (“booty” or “victory draft”) follows the scheme of a one-day *soma* sacrifice which, however, combines the *soma* rites with those of the (popular) *surā* (grain liquor). Moreover, it features a race of seventeen chariots and a curious pole-climbing rite in which the sacrificer and his wife “ascend to heaven.” The Rājasūya (“royal consecration”) is essentially a series of five periodical *soma* sacrifices interconnected by *iṣṭi*-type sacrifices that stretch over two or three years. The important insertions are an elaborate *abhiṣeka* (water consecration), the enthronement, a game of dice, a

chariot drive or race, and the recitation of the interesting legend of Śunaḥśepa (a brahman boy bought by King Hariścandra as a substitute for his own son, whom he was bound to sacrifice to Varuṇa, the point of the story being how Śunaḥśepa liberated himself by “seeing” and reciting stanzas in praise of Varuṇa). These rites are inserted in the second *soma* sacrifice, the Abhiṣecanīya (connected with the *abhiṣeka*).

The prestigious horse sacrifice (Aśvamedha) is a three-day *soma* sacrifice. The horse, accompanied by warriors, is left to roam about for a year on a tour of “world conquest” and is immolated, together with other animals, on the second *sutyā* day (thus providing the animal sacrifice of the basic *soma* paradigm). The insertions concern first of all the treatment of the horse; the chief consort of the sacrificer has to go through a sham copulation with the immolated horse while exchanging prescribed obscene and enigmatic phrases with the other consorts. Further there is again a chariot race and a full-scale verbal contest (Brahmodya).

The Puruṣamedha, or human sacrifice, is modeled on the Aśvamedha. In this form it would seem to be no more than a theoretical possibility reflecting the Ṛgvedic *Puruṣa* hymn (*Rgveda* 10.90). It does, however, raise the question of human sacrifice in general, outside the strictly bounded realm of the *śrauta* ritual. Although the idea of such sacrifices appears to have been known to the ritualists, as witnessed by the Śunaḥśepa legend, the actual practice would go against the grain of the *śrauta* ritual. The Brāhmaṇas repeatedly indicate that the sacrificer offers himself in sacrifice—like his mythical prototype Prajāpati or the Ṛgvedic *Puruṣa*—but the ritualistic solution is to “buy oneself free” (*niṣkerīṇīte*) by substitution. Or rather, the sacrificial ritual effectively cancels the ultimate violence of self-sacrifice. In a comparable way the royal sacrificer is mysteriously identified with the sacrificed “King Soma,” a mystery that as such is not meant to be concretely realized but can only be hinted at. Nor is there a need for a *human* substitute. The *Puruṣamedha*, then, appears to be a theoretical construct that may reflect non-*śrauta* practices translated into the terms of the *śrauta* systems.

Separate mention should be made of the Sautrāmanī, named after Indra Sutrāman (“savior”). It is the sacrifice of *surā*, the grain liquor. In terms of the *śrauta* system it is an animal sacrifice in which three male animals are immolated for the Aśvins (who mythologically obtained the *surā* by force from Namuci), Sarasvatī, and Indra. The special feature is, however, the preparation, offering, and drinking of the *sura*. The way the animal sacrifice and the *surā* beverage are intertwined is patterned after the *soma* ritual (though without the *stotra-śastra* liturgy). The Sautrāmanī, though also given as an independent sacrifice, is to follow a *soma* sacrifice in which an *abhiṣeka* has been inserted (a *sava*, as in the Rājasūya). Apparently it is meant to remedy any unspecified bad effect of such sacrifices, as it is also said to cure the sacrificer from excessive *soma* drinking. In this connection, the function of the Aśvins as healers is relevant. It should be

observed, however, that the *sura* beverage is not favored by the ritualists, who concentrate on *soma* instead, and later, in the *dharma* texts, *surā* is even prohibited.

Place of sacrifice and fires. In contradistinction to the domestic (*grhya*) ritual, the *śrauta* ritual requires a place of sacrifice separate from the home. Of the *soma* sacrifice it is even said, “One undergoes the *dīkṣā* at home; in the wilderness one performs the sacrifice.” Although the *śrauta* ritual requires the presence of the sacrificer’s wife, it appears originally to have been linked with life outside the settled community. Accordingly, the place of sacrifice is a temporary structure that is left when the sacrifice has been complete.

Just as the *śrauta* sacrifices are ordered by degrees of complexity, so also the place of sacrifice goes from simpler to more complex, enlarged forms. The basic form is that used for Agnihotra and *iṣṭi*. An oblong shed, oriented to the east, with openings to the four directions, shelters the three fire hearths. The round *gārhapatya* (“householder’s”) hearth, where the vegetal or dairy oblations are prepared, is on the west side, the square *āhavanīya* (offering hearth) is on the east side, and the half-moon-shaped *dakṣiṇāgni* (“southern fire”), where the food given to the priestly guests is cooked, is to the southeast of the *gārhapatya*. Between the *gārhapatya* and the *āhavanīya*, the *vedi*, the altar on which the oblations are placed, is arranged in the form of a trapezium. The upper layer of earth is taken off and the dug-out space is covered with grass. With its base to the west, its upper side to the east, and its sides bent inward, it is meant to suggest the form of a woman, broad-hipped and narrow-shouldered, holding the bounty of sacrifice (that is, the oblations placed on the *vedi*). To add to the *vedi*’s symbolism, the two shoulder points encompass the sides of the *āhavanīya*. Furthermore, there is a small mound (*utkara*) formed by the earth taken from the place of the *vedi* and used for rubbish disposal on the northern side. North of the *āhavanīya* a vessel with water is put down. The sacrificer has his seat south of the *āhavanīya*, as does the *brahman*, whose place is to the east of the *yajamāna*’s seat; the *hotṛ* is seated at the northwestern “hip” of the *vedi* and the *āguīdhra*, north of the *vedi*; the *adhvaryu*, who mostly moves around on the place of sacrifice, has no fixed place.

For the *paśubandha* (animal sacrifice) the place of sacrifice is enlarged by adding an open space, the “great *vedi*” (*mahāvedi*), equally traced out in the form of a trapezium and covered with grass, immediately east of the fire shed. On the east side of the *mahāvedi* the new *āhavanīya* hearth (*uttaravedi*, “further *vedi*”) is arranged, and east of it the sacrificial pole (*yūpa*) is erected. The center of the action is shifted to the east: The fire is brought from the old *āhavanīya* hearth in the fire shed and the latter serves henceforth as the *gārhapatya*. Outside the *mahāvedi*, to the north of it, sits the *śamitra*, the shed where the *śamitr* (“appeaser”) kills the victim (by suffocation) after it has been taken from the *yūpa*. The same special arrangement with fire shed and trapezoid *mahāvedi* is used for the *soma* sacrifice. The *mahāvedi* is con-

siderably larger, as various sheds are built on it. West of the new *āhavanīya* is the *havirdhāna* shed, where the two *soma* carts (one of which was used to bring up the store of *soma* stalks) are kept, as well as the *soma* tub (*dronakalaśa*) and the other implements. On the western side, the north-south oriented *sadas* (seating hall) is erected. In the *sadas* six small fire hearths (*dhiṣṇīya*) are made, one for each of the six reciting *hotrakas*; further on are the seats of the four chanters who perform the *stotra*. The drinking of the *soma*, after the libation in the fire, takes place in the southern part of the *sadas*. The entrances of the *sadas* are on the east and the west sides. When the participants enter the *sadas* in procession, they do so in a peculiar way “as if stalking a deer” (*prasarpaṇa*, “creeping,” possibly the remnant of a hunting dance). Finally there are two more sheds, each with a small fire hearth, the *āgnīdhṛīya* (the *āgnīdhṛa*’s place) and the *mārjalīya* (“cleansing”), respectively on the north and south sides of the *mahāvedi*. Outside the *mahāvedi* is placed the *utkara*, as is the *cātvāla* (cesspit), from which the earth has been taken for the fire hearths.

Normally the hearths are made of earth mixed with other materials, such as gravel, earth from an anthill, mud from a dried-up pool, and so forth. In the case of the *soma* sacrifice it is also possible to enhance the prestige of the ceremony by using brick fire hearths. For the horse sacrifice this is obligatory. The focus of attention is the *āhavanīya*, which rests on the *mahāvedi*. The *āhavanīya* consists of a five-layered brick construction. This requires a full thousand bricks of various shapes and sizes so as to fit into the prescribed pattern—the form of a bird with spread-out wings representing Agni (the bricks, being fired, are intimately connected with Agni). At the same time the brick-built *āhavanīya* is equated with the immolated and reconstructed body of Prajāpati or of the cosmic man (Puruṣa). Various objects are buried in the ground beneath the brick construction, including the skulls of a man and of four animals (horse, bull, ram, he-goat) and a gold image of a man. This rather suggests a funerary tumulus (not unrelated to the Buddhist *stūpa*). The construction of the brick hearths (Agnicayana, “piling the fire”) is a complicated ritual of fetching the clay in a ceremonial procession (which can be shown to derive from a razzia or war expedition), firing the bricks, and finally building the hearths, especially the bird-shaped *āhavanīya*. The Agnicayana takes place during the *upasad* days, so as to be ready for the animal sacrifice on the last *upasad* day. After the sacrifice the brick-built fireplaces, like the place of sacrifice itself, are abandoned, not to be used again.

In this connection, mention should be made of the special ritual for the first installation of the *śrauta* fires, which forms the starting point of the *śrauta* sacrificer’s career. This ritual, called Agnyādhāna or Agnyādheya, concerns the transition of the domestic householder-sacrificer to the status of an *āhitāgni*, one who has set up the *śrauta* fires. Hence the first part of the ritual is still domestic in nature, namely the cooking of a rice dish (*odana*) on a fire taken from the do-

mestic hearth. This rice dish is offered to four brahmins (the number four characterizing the smallest possible community, as it does in the case of the Buddhist monks’ community). Over the dying embers the drilling sticks (the two *araṇīs*) are held and then given by the *adhvaryu* to the sacrificer. In the early morning of the next day the fire is drilled and put on the *gārhapatya* hearth. From the *gārhapatya* a burning piece of wood is taken and brought to the *āhavanīya* hearth, accompanied by a horse and a chariot wheel that is rolled in the same direction. This procedure for bringing over and setting up the *āhavanīya* fire, though easily interpreted as a solar charm, rather suggests a warlike expedition, especially when the accompanying *mantras* (referring to unnamed enemies) are taken into consideration. The *dakṣiṇāgni* is either drilled separately, is taken from elsewhere, or is taken from the remainder of the *odana*’s cooking fire.

The ritual involves the installation of two more fires: the *sabhya* (“of the assembly,” *sabhā*) and the *āvasathya* (“of the residence,” *āvasatha*, i. e., of the guests). Their installation involves a dice game for the portions of a cow, which may, however, be replaced by an *odana*. The total number of fires, then, is five, a number that is in later speculations connected with the five *prāṇas* (vital breaths). In the *śrauta* sacrifices these two additional fires are not used, but they may well represent an ancient tradition of communal sacrificial festivals—a tradition that may live on in the *Mahābhārata*’s description of the royal *sabhā* where the Rājasūya of the Pāṇḍava protagonists took place, as well as the fatal game of dice that set off the all-consuming war between the Pāṇḍavas and the Kauravas.

The Agnyādhāna is then rounded off by the first Agnihotra and *iṣṭi*. The main point of the Agnyādhāna is, however, the bridging of the gap between the *grhya* (domestic) and the *śrauta* spheres. The two sorts of fire, domestic (called *aupāsada* or *āmātya*) and *śrauta*, are discontinuous. They are to be linked to each other by the person of the sacrificer, who after the completion of the sacrifice symbolically takes the fires into himself to reproduce them for the next sacrifice with the help of his *araṇīs*.

Domestic ritual. The domestic (*grhya*) ritual requires only the domestic fire (*aupāsada* or *āmātya*). It is, in principle, performed by the master of the house with the help of a house priest (*purohita*, lit., “put forward,” apparently to ward off evil). The domestic sacrifices, including a domestic Agnihotra, cake and gruel offerings (*pākayajña*), and animal sacrifices, have undergone the influence of the *śrauta* system but are not directly derived from them. In many respects they may be nearer to the common source of both types of ritual, the material of this common source having been “recycled” and rigidly systematized in the *śrauta* ritual.

A prominent occasion for the animal sacrifice is the reception (*arghya*) of a prestigious guest to whom a cow is offered. The guest must then either order to kill and prepare the cow for a meal or release it. The burden for the killing falls on the guest, not on the host. This point is not without

importance in connection with later notions about *ahiṃsā* (nonviolence) and the prohibition of cow slaughter. It may also explain the Buddha's refusal to have meat prepared for him.

The main part of the domestic ritual concerns the life cycle rituals. The first of these is marriage, at which time the domestic fire, derived from the fire lit for the occasion in the bride's home, is established in the new home. Further rituals are the furthering of the birth of male progeny (Pūṣsavana), the birth rites (Janmakarma), first taking of solid food (Annaprāśana), first haircutting (Cūḍākaṛaṇa, "making the haircut," *cūḍā*).

Then follows the important initiation to the Veda (Upanayana, "leading up to" and acceptance of the boy by the teacher). This is said to be the "second birth" of the "twice born" *varṇas* of *brāhmaṇas*, *kṣatriyas*, and *vaiśyas*, which qualifies them for the use of Vedic *mantras* and for becoming, if they so wish, *śrauta* sacrificers. The period of pupilage or fosterage (*brahmacārin*, "walking in *brahman*") lasts, in theory at least, a varying number of years according to the *varṇa* of the pupil and is concluded by the Samāvartana, the "turning around" or return from the teacher. The former *brahmacārin* is now a *snātaka*, "one who has taken the bath" that ends his duties and restrictions as a pupil; the restrictions of the *brahmacārin* include chastity and are generally similar to those of the *dīkṣita*. Originally, the *brahmacārin* would seem to have been a young warrior who commends himself as a vassal to a magnate or warlord rather than a pupil peacefully devoted to learning by heart the Veda. His "return" as a *snātaka* is preferably by chariot and thereby recalls the *dīkṣita*, who, according to the older Śrautasūtras, also sets out on a chariot to the place of sacrifice. The term *samāvartana* seems, moreover, more appropriate to the warrior's art of turning around the horse-drawn chariot at high speed than to returning home. The long period of initiation to Vedic lore, then, appears to be largely a theoretical construct preserving the memory of an older situation rather than a generally applied rule. Accordingly, the Upanayana is the decisive rite that gives access to the Veda, whether or not there is an extended period of pupilage and a *samāvartana* rite.

To the domestic ritual also belong the funerary rites. These concern the cremation of the body, the Pitr̥medha ("ancestor sacrifice"), which, as the name indicates, is viewed as a (holocaust) sacrifice. The cremation fire is the household fire or, in the case of a *śrauta* sacrificer, his three sacrificial fires, which are placed around the pyre. The wife of the deceased lies down with the body of her husband on the pyre but is then ordered with a *mantra* to stand up again before the pyre is lit (the Veda apparently knows but rejects the burning of the widow). Then the parts of an immolated cow (or other female animal) are placed on corresponding parts of the body and burned with him. If the deceased was a *śrauta* sacrificer his sacrificial implements are also placed on his body. Afterward the ashes are gathered and at a later date interred under a tumulus (*loṣṭaciti*, "earth piling").

The period of mourning and impurity (*āśarca*) of the relatives at the death of a full-grown family member lasts for twelve days and is completed by a purificatory rite including a bath. The next stage is the incorporation of the deceased (who as a *preta*, or "one gone forth," is thought to roam about) into the ranks of the ancestors (*pitr̥*) to receive his part of the cult. The cult consists in the festive Śrāddha (from *śrāddha*, "faith"), a meal offered to brahmins. On this occasion three rice balls (*pinḍas*) are put on the ground for the three immediate ancestors, represented by three brahmins who silently wait till the rice balls are cooled and they emit no steam. The ancestors are supposed to be fed by the steam of the hot rice balls, which are set on the ground and left there. Apart from the Śrāddha, which is very much a social occasion and is performed periodically as well as at particular auspicious occasions (such as the birth of a son), there are also daily offerings of water and food to the ancestors.

The *pinḍa* offering to the ancestors has also found a place in the *śrauta* ritual, most notably on the preparatory day of the *īṣṭi*. Rice is cooked on the southern fire, offerings are made from it into the same fire, and three *pinḍas* are placed on a special *vedi* near the fire. An enlarged version of this *pinḍa-pitr̥-yajña* is incorporated as the "great ancestor sacrifice" (Mahāpitryajña) in the Sākamedha, the third of the seasonal four-month sacrifices.

As already mentioned, the cult of the ancestors is characterized by the use of the left side and the left hand as well as by uneven numbers.

Interpretations of Vedic ritual. Vedic ritual is usually interpreted in the sense of magic, the Veda being the means to bring about well-being and to avoid pain, as is stated by the fourteenth-century commentator Śāyaṇa. This interpretation is supported by the fact that the ritual texts dutifully declare which desire will be fulfilled by the performance of a particular sacrifice: health, wealth (especially in cattle), progeny, headmanship, or, less materialistically, (access to) heaven. More important, the ritual system as such is given in the Brāhmaṇas as a perfectly ordered mechanism to dominate and regulate the cosmic processes, both as regards the individual's life and the universe at large. In this context the gods are not free agents but, being themselves cosmic forces, they are compelled to do the sacrificer's bidding. The place of sacrifice is a microcosmos encompassing heaven and earth, and the ritual is identical with the cosmic order. When set in motion and correctly executed the ritual automatically controls the universe. Thus, for instance, it is said that the sun would not rise if the morning libation of the Agnihotra were not offered in the fire (*Śatapatha Brāhmaṇa* 2.3.1.5).

The Brāhmaṇas relate the ritual microcosmos to the macrocosmos and to the individual's life through the identification of ritual acts, objects, and implements with the elements of the macrocosmos and with parts of the sacrificer's body, the sacrificer being identified with Prajāpati, the mythical embodiment of sacrifice. Although these identifications, which form the central feature of the Brāhmaṇas, suggest a

rich and multilayered network of symbolic relations, they are not so much multi-interpretable symbolic statements as one-to-one equations of ritual items with human and macrocosmic ones. They are, each one separately, isolated identificatory statements. As they occur in the Brāhmaṇas they make a singularly atomized impression. Taken together they are no more than a collection lacking consistency. Whereas Vedic hymnology capitalizes on the associative ramification of symbolic connections, such connections (*nidāna*, *bandhu*) are, in the Brāhmaṇas, reduced to single, unmistakable identifications. The connection on which the identification is based is often a number characterizing both items, which are then said to “coincide” (*sampad*) or to exhibit the same count (*samkhyāna*): for instance, three fires, three worlds; 360 *stotriyās*, 360 days in the year. Such equivalences are, of course, known to the Vedic hymns, but they are not directly made explicit as they are in the Brāhmaṇas. The explicit use of equivalence appears to have been viewed by the ritualists as an innovative technique—indeed their premier intellectual tool—to identify the ritual with the universe and so to reduce the universe to a strict, ritually controlled order.

The significance of identification and of the ritual system it underwrites is clearly set out in a ritualistic myth given in explanation of the *mahāvratā soma* sacrifice. Its theme is the sacrificial contest of Prajāpati and his antagonist Mṛtyu (Death). In this contest Prajāpati’s “weapons” are the *stotra*, the *śāstra*, and the ritual act. The arsenal of Death consists of lute playing, singing, dancing, and improper acts. For many years the contest remains undecided. But the breakthrough comes when Prajāpati finally discovers (“sees”) the (numerical) equivalence, namely, of his own “weapons” with those of Death. Once the equivalence is established, Prajāpati effortlessly subjugates Death’s panoply to his own, cancels the rival sacrifice, and so defeats Mṛtyu (*Jaiminīya Brāhmaṇa* 2.69–70). It is to be noted that Prajāpati’s “weapons” are elements of the *śrauta* system of ritual, such as *stotra*, *śāstra*, and regular sacrificial acts. It is through their equivalences that Prajāpati overcomes and integrates the countervailing power of Death. The latter’s rival sacrifice, incorporating singing, dancing, and improper acts, is clearly non-*śrauta*.

Such acts are indeed part of the *mahāvratā*, which features a number of contest rites and even copulation. What the ritualistic myth relates, however, is that these rites are made harmless and are in fact superseded by Prajāpati’s victory. Indeed, the term *mahāvratā* generally means no more than a *sutyā* day characterized by a particular arrangement of its *stotras* and forming part of a *sattra* made up of similarly differentiated *soma*-pressing days. In the same way other non-*śrauta* rituals and sacrifices were remodeled and fitted into the *śrauta* system. For instance, the guest reception offered to King Soma is made into a vegetal *iṣṭi*, not essentially different from any other *iṣṭi*. A more complicated example is provided by the so-called *vrātyastomas*, which are related to the *mahāvratā*. The *vrātya* (from *vrāta*, “gang, band,” pos-

sibly derived from *vrata*, “vow”) is a consecrated warrior in many ways related to the *dīkṣita*. The *Atharvaveda* in a long hymn celebrates the *vrātya* as a sacral cosmic figure. However, his disturbingly aggressive habits, which still shine clearly through the Brāhmaṇas, ill suit the perfect order of the ritual. The ritualists solved the problem they presented by remodeling the sacrifice of the *vrātyas* into the regular *soma* sacrifices of the *abīna* type.

The Brāhmaṇa myth of Prajāpati’s and Mṛtyu’s sacrificial contest brings out the extent and depth of the reflection that went into the formulation of the ritual system. It also shows the aim of the ritualists’ work. This is made clear by the story’s conclusion: “Now there is no sacrificial contest (*samsava*) anymore; what was the other (rival) sacrifice, that came to nought; the sacrifice is only one; Prajāpati is the sacrifice.” That is: Conflict is canceled; the enemy, Death, has been subjected to the rule of ritual. Henceforth, the single sacrificer stands uncontested on his place of sacrifice where he establishes his own perfectly ordered universe governed by the ritual. The mythological battle of *devas* and *asuras* has been decided by the ritual system. Enemies, like the *asuras*, are still profusely mentioned in the Brāhmaṇas, but only as disembodied entities defeated in advance by the unailing means of the ritual. The only remaining uncertainty is the ritual mistake, which, however, can be repaired by ritual means (*prāyaścitta*, “removal of concern”).

The ritual system is an absolute, universal, and nonconflicting order: It is, in other words, transcendent. While the hymn’s world of the gods imperceptibly shaded over the world of men, the suprahuman (*apauruṣeya*) *śruti* and its ritual is now separated by a gap from the mundane world of conflict. The *śrauta* sacrifice has been individualized and desocialized. It is the exclusive affair of the single sacrificer. He and his priests should form one single body; otherwise, they are separate individuals within a group of priests, all of whom are at once sacrificers in the *sattra*. The situation in which more than one sacrificer would exist in addition to the priests on the place of sacrifice is explicitly ruled out. This may explain the striking lack of public religious ceremonies. Although the royal *śrauta* sacrifices such as the Rājasūya (consecration of the king) contain ample indications of a former public festival, the royal sacrificer is a single sacrificer, no different from any other *soma* sacrificer. The public rites have been remodeled in accordance with the standard paradigms of the individualized ritual, or else they are dismembered as separate acts inserted into the standard *soma* paradigm. The Rājasūya, formally speaking, does not make a sacrificer a king, for it is stated that “a king who wants to attain heaven should perform the Rājasūya” (*Āpastamba Śrautasūtra* 18.8.1). That is: He is already a king who for his own reasons performs the sacrifice. This is recognized in the later *dharma* texts, which do not prescribe it as the required consecration. Similarly, the Aśvamedha sacrificer should already have the status of a world ruler (*Āpastamba Śrautasūtra* 10.1.1).

The *śrauta* ritual, as many details of its rules and the Brāhmaṇa explanations make clear, has its origin in the hero-

ic and essentially tragic world of the warrior who like the gods must “move about on wheels” and contend for the goods of life with the *asura*-like settled magnate who “sits in his hall.” He can only hope that he may survive and eventually quit the life of the warrior (*kṣattravṛtti*) so as to become a settled householder and magnate himself. The warrior lives in the wilds (*araṇya*); hence the sacrificer’s setting out from home. The settled community (*grāma*) on the other hand is the sphere of the magnate. The two spheres, *grāma* and *araṇya*, are clearly hostile to each other but equally complementary. The point of contact that held both together was their conflict contained by the sacrificial contest that lived on in the hypertrophical imagination of the epic “sacrifice of battle” (*raṇayajña*). Both epics, the *Mahābhārata* as well as the *Rāmāyaṇa*, still show the alternation between the wandering warrior’s life in the wilds and the sphere of settled rulership.

The *śrauta* ritual indicated a clear break with the cyclical alternation of *grāma* and *araṇya* and with the sacrificial contest as the joint holding the two together. By the elimination of conflict from the desocialized and individualized sacrifice the two spheres were definitively broken apart. This is illustrated by the *aṅnyādhya*, which physically separates the domestic fire from the *śrauta* fires. The resulting gap must then be bridged by the single sacrificer who alternates between his life in the world and the transcendent rule of the *śruti*. Put differently, he must fuse the two opposite rules of a substantial householder and a wandering warrior. Hence, only a householder can be an *āhitāgni*, that is, one who has set up the *śrauta* fires permanently and thereby submits himself to the absolute order of the *śruti*. This gives him access to transcendence, but by the same token this does not change his social position. Whether king or commoner, under the rule of ritual all sacrificers are equal. Sacrifice can only impoverish the *āhitāgni*, since he has to go on spending his wealth in sacrifices and *dakṣiṇās* without a chance to recoup through reciprocity at the sacrifices of others. Accordingly, there is no obligation for the qualified householder to set up the fires and to submit to the strict discipline of *śrauta* sacrifice. If he does, he must be sure of himself and his fortune, or, as the texts put it, he must have absolute faith (*śraddhā*). It is true that the *śrauta* sacrifice promises him the fulfillment of his wishes. In the sacrificial contest the possibility of fulfilling one’s wishes was clear. The goods of life were concretely set out as the stakes and prizes of the contest. The *śrauta* ritual by contrast does not and cannot make clear how the desired results are to be brought about. It is *adr̥ṣṭārtha* (without visible object), that is, transcendent.

It is clear, then, that the *śrauta* ritual hinges on a paradox. It offers itself as an effective magical means for the gratification of the sacrificer’s worldly desires. On the other hand it withdraws from all worldly concerns from which desocialization and individualization have cut it free. It is a closed system of rationalistically devised rules, complete in itself and regardless of the uses and abuses to which it may be put. In

the last resort it rejects its own potential for magical and sacral meaning. Beyond magic and sacrality it stands by itself in sovereign transcendence.

BRAHMANISM. Though admittedly a vague term, *Brahmanism* is best defined in relation to Vedism. It does not primarily concern religious cults or institutions but rather propounds particular views, laid down in texts, about humanity and the universe. These views are, however, equally fundamental to Hinduism in general. Their specificity resides in the claim to be related to or directly derived from the Veda. Brahmanism is, therefore, usually considered to be the Veda-oriented form of Hinduism, immediately following Vedism. However, since the textual tenets of Brahmanism are generally authoritative also in later Hinduism, a three-tiered succession of Vedism, Brahmanism, and Hinduism tends to be misleading. Moreover, like Vedism, Brahmanism is not likely to cover the whole of early Hindu religious belief and practice. Brahmanism is characterized by its acknowledgment of the Veda as the ultimate source of transcendent authority. Thereby it is clearly marked off from the “heterodox” sects or movements such as Buddhism, Jainism, Ajīvakas, and the materialist schools (Lokāyata, Cārvāka), which reject the authority of the Veda.

In Indian terms, the relationship between Vedism and Brahmanism is that of *śruti* (“hearing”), the transcendent “revelation” as against the worldly or human tradition, called *smṛti* (“remembrance”). The word *śruti* does not refer to the mode of receiving the revelations: The standard term is “seeing,” not “hearing.” *Śruti* thus refers to the transmission of the fixed and systematized texts. In this sense it is not essentially different from the *smṛti*, except for the unique care and efforts spent on its preservation and transmission. But the differentiation marked by the two terms is significant. Although the *smṛti* equally tends to give itself as revelation, namely by the godhead, the transcendent authority of the *śruti* does not derive from any godhead. It stands by itself without the intermediary of a divine agency. Its authority being ultimate, it can have no other, higher source. It therefore functions as the unassailable basis of the fluid and adaptive worldly *smṛti*. Another word for *smṛti* is *dharma*, universal law, which then is said to be derived from or to be already contained in the *śruti*. At any rate the *dharma* should not go counter to the *śruti*. In fact, however, the relationship is more complex and indeed problematic.

Texts. In addition to the Vedas and Brāhmaṇas, the texts to which Brahmanism, or, to use the Indian term, the *smṛti*, refers are the Upaniṣads, the Dharmasūtras and Dharmasāstras, the epics (*Mahābhārata* and *Rāmāyaṇa*), and the Purāṇas. The Upaniṣads can be chronologically distinguished by their form: The older prose Upaniṣads are extensions of the ritualist Brāhmaṇas. Most of the younger ones, often of sectarian origin and with a wide variety of contents, are metrical. The latter genre has been productive over a long period reaching far beyond the late Vedic texts, until at least the sixteenth century CE. The Upaniṣads belong to the *śruti*,

and this title is a claim to ultimate authority. In the same way, the set of 108 Upaniṣads (listed in the *Muktikā Upaniṣad*) are ascribed to the Vedic *śākhās* (schools), but it is significant that a large proportion is ascribed to the *Atharvaveda*, in which have been collected many other materials that do not fit into the *śrauta* system.

The Dharmasūtras are in the same condensed style as the Vedic *sūtras* and are equally affiliated with Vedic “schools” (*carāṇa*). This affiliation becomes looser with the metrical Dharmasāstras. No less important as a storehouse of mythology, religious notions, and *dharma* are the wide-ranging *Mahābhārata* (especially its twelfth book, the *Śāntiparvan*, and its sixth book, which contains the celebrated *Bhagavadgītā*) and the *Rāmāyaṇa*, which has known a great number of reworkings. The encyclopedic Purāṇas (“ancient stories”) deal, in principle, with five topics (*pañcalakṣaṇa*, “five characteristics”): creation, periodical recreation, genealogy (of gods and holy men), the world periods (*yugas*), and the dynasties. But many other materials have been added at various unspecified times: *dharma* precepts, pilgrimage, hymns, and sectarian treatises. They have functioned over a long period as a storehouse receiving all manner of materials. The Purāṇas (the term occurs already in the *Atharvaveda*) continued the tradition of legends (*itihāsa*) that occasionally make an appearance in the *śrauta* ritual (e.g., the Śunahṣepa story in the Rājasūya). *Chandogya-Upaniṣad* 3.4.1. mentions *itihāsa-purāṇa* as the “fifth Veda,” which is later taken to comprise the epics as well.

Brahmanism, though primarily textual, does not have a fixed corpus of texts. Its tenets are recorded in a variety of texts stretching over a long and, in fact, indefinite period of time. Its impact has made itself felt in Hinduism, increasing and decreasing in various regions at different times. It would seem that rising regional dynasties have been instrumental in creating waves of “brahmanization.” This will also have been responsible for the incorporation in the texts of materials of regional and sectarian origin. But such brahmanization equally carried the *śruti* with it, which as the source of ultimate authority was of singular importance for the ruler’s legitimation.

Interiorization of the ritual. The crucial issue here is the relationship of Brahmanism with the Veda, that is, between *śruti* and *smṛti*. The *śruti* has exhausted itself in creating a closed system of ritual order. But the price that had to be paid for this achievement was the alienation from the worldly concerns of the mundane order. The *śruti* was—purposely—desocialized and individualized. This created the problem of reconnecting it again with the mundane order. Propounding an absolute and seamless order, the *śruti* rejects conflict and places the rival beyond the pale. It therefore cannot speak to man’s worldly concerns. Notwithstanding the proclaimed dependence of the *dharma* on the *śruti*, the latter’s contents do not provide specific guidelines for the tensions and conflicts of social life.

Once it was desocialized and individualized there was only one way open to the *śruti*: interiorization. What then takes priority is no longer the faithful execution of the ritual but knowledge of the ritual and of the identifications on which it rests. This is already prefigured in the recurrent Brāhmaṇa phrase that a particular ritual act is effective only for him “who knows thus,” that is, for him who knows the relevant identification. It is thus possible to perform the ritual in thought alone (*manasā*). The transcendent order of the ritual is realized internally in the way of discipline meditation.

An illustrative example is provided by the Agnihotra, offered in five breaths that are equated with the five sacrificial fires (*prāṇāgnihotra*). In mundane terms it is simply eating one’s meal embellished with mouth rinsings and simple *mantras*. But the same pattern enables the brahman to participate in a festive meal to which he is invited (a Śrāddha, for instance). He is thus not just a guest obliged to his munificent host but an individual sacrificer who performs the sacrificial ritual independent of his host and the surrounding society. In other words, it enables the brahman to square the circle of living in society and of transcending it at the same time.

World renunciation. From the individualized sacrificer and his internalized sacrifice there runs a straight line leading to the extramundane world renouncer (*saṃnyāsīn*), who gives up the three aims of mundane life—the socioreligious duties of the householder (*dharma*), the acquisition and management of wealth (*artha*), and sensual gratification (*kāma*)—to devote himself single-mindedly to a strict inner discipline that results in his liberation from earthly life (*mokṣa*). Though there is a wide variety of such inner disciplines they all share the ritualistic strictness of an internalized transcendent order. The renouncer’s discipline obviously goes beyond, and in many if not most cases even rejects, Vedic ritualism. But it is the desocialization and individualization of Vedic ritual that has prepared the ground for the institution of *saṃnyāsa*, or renunciation.

In this connection two sets of ideas, both deriving from ritualistic thought, are fundamental. The first such notion is the Upaniṣadic identification of *ātman*, the individual “soul,” with *brahman*. In the Vedic hymns *brahman* is the multilayered and multi-interpretable, often paradoxical or enigmatic formulation. The unexpressed inner connection is the essence of the *brahman*. The Brāhmaṇa ritualists reduce the *brahman* to the explicit identification. In both cases, however, it is this fundamental force that makes the poetic statement as well as the rite effective. In this way the *brahman* came to be seen as the transcendent principle of universal order. The *saṃnyāsīn*’s discipline, as already announced in the Upaniṣads, means the internal realization of the *brahman* as the principle of transcendent order through its identification with the *ātman*. It is the ultimate identification tying together and thereby canceling the dispersed identifications of the Brāhmaṇas in the single person of the renouncer, as was in fact already the case with the individualized *śrauta* sacrificer who was identified with Prajāpati or the *puruṣa*.

The other set of ideas, equally ritualistic in origin, is the concept of *karman*, or work. In the Brāhmanas *karman* is the sacrifice. Originally this sacrificial “work” had a social context. It rested on the competitive reciprocity of hosts and guests, the latter having to redeem themselves by acting in their turn as hosts. The individualization of the *śrauta* sacrifice, however, put an abrupt stop to all exchange and reciprocity. This meant that now the sacrificer had to exchange his *karman* with himself alone, one’s *karman* inexorably bringing the next *karman* in its wake. This, combined with the not exclusively Indian notion of an unending alternation of birth, death, and rebirth (*saṃsāra*), created the urge to terminate the endless chain of ever-renewed *karman* that could no longer be transferred to the rival. The only way open was then to renounce all *karman*, all activity, by realizing internally the stasis of absolute order. Obviously, this signifies rejection of the external sacrifice as well. Even though it cancels Vedic ritualism, the ideal of terminating all *karman* can be seen as the consequence of ritualistic thought.

The crucial importance of the institution of world renunciation in Brahmanism and in Hinduism in general is that it created two opposite and incompatible spheres: the transcendent sphere of the renouncer’s individualistic rejection of society as against the social world and its requirements. At the same time, however, the renouncer paradoxically needs society, which must provide for his upkeep so as to enable him to preserve his discipline. On the other hand society wants to draw him into its web again as the holder of transcendent authority. That is: The *saṃnyāsin* will gather a following. He is therefore especially known as the founder of a sect. The Indian sect typically has a *saṃnyāsin* as founder, who will be succeeded by one of his pupils to lead the worldly lay followers.

Varṇa and āśrama. The *dharma* or world order, being universal, must regulate both worldly and renunciatory life. This is the subject of *varṇāśramadharmā*, the order of caste (*varṇa*) and life stages (*āśrama*, “place of exertion,” hence also dwelling place of ascetics). While caste orders worldly society, the life stages give a place to its opposite, renunciation. As regards caste, it is to be noted that the *smṛti* knows two terms, *jāti* (genus) and *varṇa* (shape, color). The two terms are to some extent interchangeable, but there is a marked difference. Although there are only four *varṇas*—*brāhmanas* (Eng., brahmins), *kṣatriyas* (warriors), *vaiśyas* (producers), and *śūdras*, who serve the three “twice-born” *varṇas* (that is, those who have been initiated to the Vedic *mantras*)—the number of *jātis* is unlimited. The latter are said to have arisen in the first instance from mixed unions of the four *varṇas*. However, the scriptural order of the *varṇas* is based on their strict separation, that is, neither intermarriage nor commensality is allowed. As no society can exist on the basis of the single principle of separation, the *jātis* make society function. But this equally means that *jāti* society is based on a serious transgression, namely *varṇasaṃkara*, or “mixing of the *varṇas*.”

The principle of separation can be seen as deriving from the individualization of the Vedic sacrificer that resulted from the exclusion of conflict and competition. In fact, individualization did not stop at the boundary of the *varṇa*. The scriptural rules forbid marriages among even distant relatives, and so are directed against the formation of extended marriage networks. As in the case of the sacrificer’s individualization, the separation of the *varṇa* aims at a static, conflictless order through the exclusion of social relations. The scriptural order of the separate *varṇas* is in the last resort incompatible with the reality of the associative and conflictive *jātis*.

Although it is not stressed in the texts, the religious principle of the *jāti* order appears to be the asymmetric interdependence of pure and impure, the impure being the “fall-out” of life processes, including death and decay. Their hierarchy as well as their obvious complementarity led the French sociologist Louis Dumont to his impressive analysis of the Indian caste order as based on and encompassed by the religious principle of the pure-impure hierarchy. Although this analysis holds for the *jāti* order, it is undermined by the scriptural *varṇa*, which rejects relations of complementarity and interdependence in favor of separation and independence.

This problem is particularly clear in the case of the brahman. As the ideal repository and upholder of the transcendent *śruti* the brahman should be immaculately pure. But this requirement threatens to make him dependent on the impure—such as the sweeper or the washerman—and such relations of dependence would fatally impair his purity. Purity, then, is the absence of relations. Strictly speaking he should not be a priest, because this would involve him in social relations of a particularly dangerous—because sacral—nature. Ideally, the brahman should stand outside of society, the highest brahman being the one who has no power or wealth or even provisions for the next day, and who performs the ritual in and for himself alone. Thus he bears the brunt of the incompatibility between *jāti* interdependence and *varṇa* separation. In other words, the ideal brahman should be a renouncer. The tension between *jāti* and *varṇa* is akin to the one between society and renunciation, and derives from the same source.

The scriptural theory of the four stages of life (*āśrama*) brings social and renunciatory life together in a single scheme. These four stages are those of the pupil memorizing the Veda (*brahmacārin*); the married householder (*grhastha*); the cenobitic forest dweller (*vānaprastha*), who still keeps up his domestic fire; and the individualized renouncer (*saṃnyāsin*), who has interiorized the fire and consequently the ritual. Of these four it is only the *grhastha* who is fully a member of society and as such must perform the scriptural duties toward the Vedic seers by upholding the *śruti*, toward the ancestors by progeny, and toward the gods by sacrifice. Only after these duties, especially the continuation of the lineage, have been fulfilled, is the householder free to withdraw from the world and strive for final liberation (*mokṣa*). It

would seem that the basic principle is again the opposition of social and renunciatory life. Originally, the two opposites were given their due in a pattern of the cyclical alternation of life in the established community, setting out into the wilderness and returning again. When this alternating cycle was broken, the opposite and now-incompatible phases were given their due by placing them in the linear succession of the four *āśramas*, spanning the individual's life.

Ahimsā, vegetarianism, and the cow. *Ahimsā* (nonviolence) brings out the problematic character of the relationship between *śruti* and *smṛti*. It categorically forbids the killing of animals. Yet the *śruti* prescribes animal sacrifice and the consumption of the victim's meat, albeit only an insignificant part of it (the *idā*). Ludwig Alsdorf has distinguished three stages. First, there is no question of a general rule against meat consumption, but only against particular kinds of animals. Next, meat-eating is forbidden, except in the isolated context of the animal sacrifice. The third and last stage brings the absolute prohibition of meat (together with intoxicating drinks, such as *surā*). This does not, however, explain the reason for the rise of *ahimsā*. Non-Hindu influences, such as Buddhism and Jainism, have often been assumed to be important factors. Alsdorf suggests the pre-Aryan Indian civilization as the source of the prohibition. Hanns-Peter Schmidt, however, has pointed out that the Vedic ritual itself evinces a strong aversion to the violence of immolation. Part of the ritual is concerned with undoing the harm of the sacrificial killing. In Schmidt's view it was the internalization of the ritual that brought about *ahimsā*. Internalization canceled the external acts needed to undo the evil of killing, which is still involved, even in the internal food sacrifice (of the *prāṇāgnihotra* type). From then on the only way open was the absolute prohibition of meat.

The problem is further complicated by the sacrosanctity of the cow and the consequent prohibition—equally alien to the *śruti*—of cow's meat. Nevertheless, both *ahimsā* and the prohibition of cow's meat can be seen as deriving from the *śrauta* ritual, though in a different way from the one proposed by Schmidt. Originally it may have been a matter of alternating phases, namely the phase of the trekking consecrated warrior (the *dīkṣita*), who should preserve and, if possible, increase his cow herd (and consequently should not eat meat) as against the homecoming celebrated by a sacrificial festival that lifts the prohibition of meat-eating. The trekking phase of the warrior was decidedly violent, but vegetarian; the settled phase reversed the situation: Meat-eating is allowed, even prescribed, but social relations should be marked by nonviolence. In this way vegetarianism and the cow taboo can be seen as different in origin and even opposite to each other, deriving from opposite phases. With the collapse of their cyclical alternation, both the trekking warrior and the peaceful householder had to be homogenized into the single householder-sacrificer. As such he was required not only to be both nonviolent and to abstain from the cow, but at the same time to perform the sacrifice, which, even if vegetal, still

involved the killing (grinding and pressing being explicitly considered as "killing") of the sacrificial substances.

Although this may explain the origin of vegetarianism based on *ahimsā* and of the sacrosanctity of the cow, the fact remains that there is an unresolved conflict between the *śruti* and the *smṛti*. This conflict is formulated in terms of the two opposite spheres of social life and renunciation. Eating meat is the ongoing way of the world (*pravṛtti*), but abstention (*nivṛtti*, the term for the cessation of worldly processes) brings ultimate spiritual rewards (*Mānava Dharmasāstra* 5.56).

Cultic institutions. Separate from—but not wholly dissociated from—the impersonal cosmic principle there lies in the texts a profuse mythology. The Vedic ritual itself came to overshadow the gods as the central cosmic force and reduced them to mere names whose only place was in the *mantras*. Accordingly, the Veda is fundamentally aniconic. Brahmanism by contrast gives way to a rich stream of theistic beliefs and practices (which may never have been absent but were simply ignored by the Vedic scriptures). The *Svetāśvatara Upaniṣad*, considered as the gate to theistic Hinduism, places the "Lord" (*īśa* or *īśvara*) in the center. Being intimately connected with the impersonal *brahman* he is both transcendent and, in his relation to humans, immanent. Such transcendent and immanent gods, who as such are to be distinguished from the great many divinities, are Śiva (Rudra), to whom the title *īśa* or *īśvara* primarily refers, and Viṣṇu. Together with the personified Brahma (who hardly receives a cult) they are often represented iconographically as the *trimurti*, the "triple body" or trinity.

Theism opened the way to cultic institutions, the first of which may be considered the temple, which developed from a simple open-air sanctuary to ever more elaborate complexes with a central cella and deity (*mūrti*) in an awe-inspiring towerlike and massive structure surrounded by smaller sanctuaries and niches for other gods, the whole of which was marked off by an outer wall. Second is the *pūjā* as the fundamental cult form, both in the household and more elaborately in the temple. Though the *pūjā* had existed before, its textual canonization by Brahmanism was a new development. Its basic pattern is the hospitable reception of an honored guest who is offered a bath, clothes, food, and a resting place. In the great temples of Śiva and Viṣṇu the *pūjā* is elaborated into a full and regal ceremony involving also the god's consorts and divine retainers. In the sense of a hospitable reception offered to the guest the *pūjā* is closely related to the Vedic ritual, which, as Thieme has shown (see above), derives from the same pattern. This does not mean that the *pūjā* evolved out of the Vedic ritual. Rather, the two are different realizations of the same basic pattern.

The individualization achieved by Vedic ritualism is also a characteristic of Brahmanism. This is clearly noticeable in the *pūjā*. The domestic *pūjā*, like the Vedic *grhya* ritual, is strictly a family affair. The individualistic tendency is displayed most clearly in the temple. Although great crowds are

usually present at the temple during particular festivals, they do not participate in the actual *pūjā*. To pay their obeisance and to obtain a view (*darśana*) of the deity, the devotees pass, one by one, before the opening of the cella. Like Vedism, Brahmanism is devoid of regular *sacra publica*. Public and royal festivals, such as the raising of the “Indra pole” (*Indradhvaja*, a sort of Maypole), are described in the epics and Purāṇas but are not in any way prescribed. In this respect it is significant that although the Śrāddha in honor of the ancestors can be celebrated as a social gathering with a large number of guests, the *dharma* texts explicitly prefer the patron to invite no more than three brahmins, or even only one (*Mānava Dharmaśāstra* 3.125, 126, 129). Whereas Hinduism involves large public festivals, Brahmanism holds on to the individualism of Vedism.

The most important cultic notion to pervade Indian religiosity as a whole is *bhakti* (“participation”), the single-minded loving devotion to the godhead (in this context usually known as the *bhagavat*, the “felicitous one”), in whose being the devotee (*bhakta*) strives to share. Though at the opposite end from Vedic ritualism and Upaniṣadic thought, *bhakti* appears to be ancient. Its attitude of loving devotion is already commended in relatively early Upaniṣads (especially the *Katha Upaniṣad*). The term makes its first entry in the *Śvetāśvatara Upaniṣad*, which is generally known for its theistic stance. It is, however, in the *Bhagavadgītā* (*Mahābhārata* 6.25–42) that *bhakti* is canonized as the third “way” (*mārga*), next to (Upaniṣadic) knowledge (*jñāna*, that is, “knowledge” of *brahman*) and ritualism (*karman*). There *bhakti* is connected with the concept of disinterested worldly action (*karmayoga*, “harnessing oneself to action”). This means that the devotee should perform all actions that his station in life requires of him (even if this means that the warrior Arjuna must kill his relatives), but without any self-interest. It is a renunciatory attitude: The devotee renounces the result, the “fruit” (*phala*) of his actions. This attitude is the answer to the gap that divides life in the world from world renunciation. But the fusion of worldly and renunciatory life can only be achieved at the price of a paradox: The devotee fully engages in worldly activity, including violent conflict, but does not engage himself.

The Bhagavat (or Bhagavan), the god of the *bhakta*, is most commonly a form of Viṣṇu. His connection with the cosmic pillar and his *avatars* or “descents” in the world to restore the *dharma* and save humankind made him the ideal mediator between humans and transcendence. The devotee’s *bhakti* is especially directed toward two of his forms of *avatars*, namely Kṛṣṇa and Rāma. Kṛṣṇa is worshiped as the divine child or as the cowherd (*gopāla*), the beloved of the *gopīs*, the cowherd girls. As a charioteer and bard (*sūta*: the combination of the two functions is a standard one) he proclaims the *Bhagavadgītā* to the warrior Arjuna. His story is told in the tenth book of the *Bhāgavata Purāṇa*, a fundamental text for the *bhakti* cult and for religious art, especially miniatures. King Rāma is the protagonist of the epic

Rāmāyaṇa. The basic text of Rāma devotionalism is the Old Hindi *Rāmacaritamānasa* of Tulsīdās (fifteenth century), one of the many reworkings of the classical epic.

Concentrating on the inner life and attitude of the devotee, *bhakti* as a cult form does not need specific installations or institutions. It does know, however, a “congregational,” though informal, form of worship: the singing of devotional hymns (*bhajan*). Both in its individual interiorized and in its “congregational” forms *bhakti* easily associates itself with temples and with organized sects. In fact, *bhakti* imbues all Hindu religiosity. As such it translates the Western concept of religion better than the word *dharma*, which has come into use in this sense only in the last century, and misleadingly stresses religious law and doctrine.

In the marked absence of a well-defined clergy, the most important figure in Brahmanism, as well as in Hinduism in general, is the *guru*, the spiritual teacher and guide. Ideally, he is a world renouncer or at least is known for his lack of self-interest. Although not a priest in the sense of an officiant or dispenser of sacraments, he holds an all but absolute authority—even in matters not necessarily of a spiritual nature—in the personal affairs of his devotees. Even in the context of *bhakti*, which emphasizes the direct personal relationship of the devotee to his god, the *guru* is the indispensable mediator. He can be seen as the actual recipient of the cult. Indian religiosity would be able to dispense with its gods on the condition that there is a *guru*.

Itself not a cult or a sect, Brahmanism is receptive to a great variety of beliefs, practices, and institutions. Its characteristic as well as its specific contribution to Hinduism is the faithful acknowledgement of the authority of the *śruti*. More importantly, Brahmanism carries on the individualistic tradition of interiorization that resulted from Vedic thought.

Smārtas. Brahmanism is still represented to the present day by the Smārtas (adherents of the *smṛti*). Characteristically, they are not a sect in an institutional or doctrinal sense but a loose category of (South Indian) brahmins who uphold nonsectarian orthodoxy. Their cultic practices are primarily private in character and reserve an important place for the Vedic *grhya* ritual. Smārtas will frequent particular temples, especially Śaiva ones, but they have no specific temples of their own. Worship takes place in the house, where a special room is kept for the *pūjā*. Smārta worship is especially concerned with the five gods Śiva, Viṣṇu, Durgā (consort of Śiva), Sūrya, and the elephant-headed Ganeśa, who are placed in the corners of a square with the preferred deity in the middle.

The Smārtas derive their tradition from Śāṅkara, the eighth-century founder of Advaita (monistic) Vedānta. Accordingly, they recognize the head of the monastic establishment (*maṭha*) and center of the Śāṅkara tradition at Śṛṅgeri (in present-day Karnataka) as their spiritual leader. Another tradition connects the Smārtas with Kumārila, the eighth-century teacher of Mimāṃsā (the interpretation of the Vedic

ritual rules and so of the *dharmā*). In this way the Smārta tradition claims to derive from both aspects of the *śruti*, the ritualistic and the Upaniṣadic (and thus the knowledge of *karman* and that of *brahman*, respectively), represented by the Vedānta tradition of Sankara and the Mīmāṃsā tradition of ritualism.

The Brahmanic Smārta tradition lacks the colorful drama and institutions often and not without justification associated with Hinduism. It does not propound an enchanted world of magic and numinous power. Instead, it focuses on the central problem of *karman* and *brahman* already pre-figured in later Vedism. It therefore holds on to the *śruti* as the ultimate truth and source of *dharmā*. Tolerant of sectarian doctrines and practices, which it tends to harmonize, the Smārta tradition is not a sharply outlined orthodoxy. But it does represent the central concerns of Hinduism, past and present.

BIBLIOGRAPHY

General

The classic work is still Hermann Oldenberg's *Die Religion des Veda* (1894; 2d ed., Stuttgart, 1917). Arthur Berriedale Keith's *The Religion and Philosophy of the Veda and Upaniṣads*, 2 vols. (1925; 2d ed., Westport, Conn., 1971), is a useful and detailed survey. Arthur Berriedale Keith and A. A. Macdonell's *Vedic Index of Names and Subjects*, 2 vols. (Varanasi, 1958), is outdated but still useful, especially for its text references. An up-to-date survey is provided in Jan Gonda's *Die Religionen Indiens*, vol. 1, *Veda und alterer Hinduismus* (1960; 2d rev. ed., Stuttgart, 1978). The nature, style, and composition of the text corpus are extensively dealt with in Jan Gonda's *A History of Indian Literature*, vol. 1, *Vedic Literature* (Wiesbaden, 1975).

Mythology

A. A. Macdonell's *Vedic Mythology* (1897; reprint, New York, 1974) gives a comprehensive survey. Full-scale studies are Abel Henri Joseph Bergaigne's *La Religion védique d'après les hymnes du Rig-veda*, 4 vols. (1878–1897; reprint, Paris, 1963), known for its systematic cosmological approach, and Alfred Hillebrandt's *Vedische Mythologie*, 2 vols. (1927–1929; reprint, Hildesheim, 1965), which also brings in the ritual prose texts. Important specialized, although wide-

ranging, studies are Heinrich Lüders's *Varuṇa*, 2 vols., edited by Ludwig Alsdorf (Göttingen, 1951–1952), Hanns-Peter Schmidt's *Brhaspati und Indra: Untersuchungen zur vedischen Mythologie und Kulturgeschichte* (Wiesbaden, 1968), and F. B. J. Kuiper's *Ancient Indian Cosmogony*, essays selected and introduced by John Irwin (New Delhi, 1983). Georges Dumézil has argued his sociological and comparative Indo-Europeanist view in many publications; a useful analysis is given by C. Scott Littleton in *The New Comparative Mythology: An Anthropological Assessment of the Theories of Georges Dumézil*, 3d ed. (Berkeley, Calif., 1980). Leading scholars in the field are Louis Renou, some of whose significant contributions have been reprinted in *L'Inde fondamentale*, edited by Charles Malamoud (Paris, 1978), and Paul Thieme, whose work is among other things concerned with the Ādityas: see, for example, his *Mitra and Āryaman* (New Haven, Conn., 1957) and *Kleine Schriften*, 2 vols. (1971). In his fine ethnomycological study, *Soma: Divine Mushroom of Immortality* (New York, 1968), R. Gordon Wasson has forcefully argued that the *soma* plant originally was fly agaric; his thesis is, however, not generally accepted.

Ritual

Alfred Hillebrandt's *Ritual-Litterature: Vedische Opfer und Zauber*, "Grundriss der Indo-Arischen Philologie und Altertumskunde," no. 3.2 (Strassburg, 1897), still offers the best comprehensive survey. The foremost authority on Vedic ritual was—and still is—Willem Caland, whose translations definitely clarified the intricacies of the Vedic system of ritual. Special mention should be made of his *Das Śrautasūtra des Āpastamba*, 3 vols. (Göttingen and Amsterdam, 1921–1928). For the role of the *Śamaveda* in the ritual, his translation of the *Pañcaviṃśa Brāhmaṇa* (Calcutta, 1931) should be consulted. Caland also initiated the study of the Jaiminīya School of the *Śamaveda*: see his *Das Jaiminīya-Brāhmaṇa im Auswahl* (Amsterdam, 1919). Julius Eggeling's five-volume translation of the *Śatapatha Brāhmaṇa* in "Sacred Books of the East," vols. 12, 26, 41, 43, and 44 (1882–1900; reprint, Delhi, 1963) still stands as a masterly achievement. *The Veda of the Black Yajus School Entitled Taittirīya-Saṅhitā*, 2 vols., has been translated by Arthur Berriedale Keith (1914; reprint, Delhi, 1967); it should be checked with Caland's translation of the *Āpastamba Śrautasūtra*. Keith also translated the Ṛgveda Brāhmaṇas: *The Aitareya and Kauṣītaki Brāhmaṇas* (1920; reprint, Delhi, 1971). For the domestic ritual *The Gṛhya-sūtras*, translated by Hermann Oldenberg, "Sacred Books of the East," vols. 29 and 30 (1886–1892; reprint, Delhi, 1964), should be mentioned. For the "solemn" (*śrauta*) ritual there is now the compendium of texts and English translation edited by C. G. Kashikar, *Śrautakosa* (Poona, 1958–1982).

The basic paradigms of the vegetal, the animal, and the *soma* sacrifices have been described in Alfred Hillebrandt's *Das altindische Neu- und Vollmondsopfer in seiner einfachsten Form* (Jena, 1879); Julius Schwab's *Das altindische Thieropfer* (Erlangen, 1886); and Willem Caland and Victor Henry's *L'Agnistoma: Description complète de la forme normale du sacrifice de Soma dans le culte védique*, 2 vols. (Paris, 1906–1907). The *sūtras* for the Agnihotra have been translated by Paul-Émile Dumont as *L'Agnihotra* (Baltimore, 1939) and the relevant Brāhmaṇa passages in H. W. Bodewitz's *The Daily Evening and Morning Offering according to the Brāhmaṇas* (Leiden,

1976). The Agnyādheya has been extensively studied by Herta Krick and Gerhard Oberhammer in *Das Ritual der Feuergründung (Agniyādheya)* (Vienna, 1982), giving full translations of the Brāhmaṇa portions. While Krick's interpretation is oriented toward Indo-European comparison, Timothy Moody's treatment in "The Agnyādheya" (Ph.D. diss., McMaster University, 1980) is more factual. The royal rituals of the horse sacrifice and the Rājasūya have been analyzed by Paul-Émile Dumont in *L'Āsvamedha* (Paris, 1927) and by me in *The Ancient Indian Royal Consecration* (The Hague, 1957). The Agnicayana has been described from the texts and from Frits Staal's 1975 observations of the ritual as executed by Nambudiri brahmins in *Agni: The Vedic Ritual of the Fire Altar*, 2 vols., edited by Staal, with cassette recordings of chants and recitation (Berkeley, Calif., 1983).

The worldview of the Brāhmaṇas and especially their identification by modern scholars as the "prescientific" intellectual tool for ritual control of the universe have been dealt with by Sylvain Lévi in his *La doctrine du sacrifice dans les Brāhmaṇas* (1898), 2d ed., with a preface by Louis Renou (Paris, 1966), and by Hermann Oldenberg in *Die Weltanschauung der Brāhmaṇa-Texte* (Göttingen, 1919). Frits Staal has argued against the magico-cosmic meaning of ritual in general and, in particular, of Vedic ritual in "The Meaninglessness of Ritual," *Numen* 26 (June 1979): 2–23; Hans H. Penner's "Language, Ritual and Meaning," *Numen* 32 (July 1985): 1–16, emphasizes structure per se as against meaning. The continuity of the Vedic concept of sacrifice in Hinduism is the subject of Madeleine Biardeau and Charles Malamoud's *Le sacrifice dans l'Inde ancienne* (Paris, 1976). For the view of Vedic sacrificial ritual as originating in the conscious reform of a previous agonistic sacrifice, see my *The Inner Conflict of Tradition: Essays in Indian Ritual, Kingship, and Society* (Chicago, 1985). A detailed bibliography is provided by Louis Renou's *Bibliographie védique* (Paris, 1931). It has been continued by R. N. Dandekar's *Vedic Bibliography*, vol. 1 (Bombay, 1946) and vols. 2–4 (Poona, 1961–1985).

Brahmanism

As a singular topic, Brahmanism has not been the subject of special monographs. Its definition fluctuates between a particular period of post-Vedic religious development (older Hinduism) and mainstream orthodoxy. Louis Renou and Jean Filliozat's *L'Inde classique: Manuel des études indiennes*, 2 vols. (Paris, 1947–1953), brings together the whole of the written records of Hinduism, including those in the regional languages, under the heading "Brahmanism" (vol. 1, chap. 6). Among older works may be mentioned Auguste Barth's *The Religions of India*, translated by J. Wood, 6th ed. (Delhi, 1969), chap. 2.

Central to Brahmanism is *dharma*. The best introduction is provided by Robert Lingat's *The Classical Law of India*, translated with additions by J. D. M. Derrett (Berkeley, Calif., 1973). P. V. Kane's *History of Dharmaśāstra*, 5 vols. in 7 (1930–1962; 2d ed., rev. & enl., Poona, 1968–1975) is an exhaustive survey of the topics that traditionally come under the heading of *dharma*. The institution of world renunciation has been analyzed from a sociological point of view by Louis Dumont in "World Renunciation in Indian Religions," *Contributions to Indian Sociology* 4 (April 1960): 53–62. The same author has dealt with caste and *varṇa* in

his influential *Homo Hierarchicus: An Essay on the Caste System*, rev. ed., translated by Mark Sainsbury (Chicago, 1980). He argues that Indian caste society (and even Indian civilization as a whole) is encompassed and held together by the religious principle of hierarchy. This view, however, is debatable because of the textual concept of *varṇa*, which refers not so much to hierarchic encompassment as to strict separation, while the religious institution of renunciation tends to break up society.

The vexing matter of *ahimsā* is discussed in Ludwig Alsdorf's *Beiträge zur Geschichte von Vegetarismus und Rinderverehrung in Indien* (Wiesbaden, 1962) and in Hanns-Peter Schmidt's "The Origin of *Ahimsā*," in *Mélanges d'indianisme à la mémoire de Louis Renou*, edited by Jacques Robert (Paris, 1968), pp. 625–655. Like Schmidt, I argue for the ritualistic origin of *ahimsā* in "Nonviolence and Sacrifice," in *Indologica Taurinensia* (forthcoming).

As regards mythology, E. Washburn Hopkins's *Epic Mythology*, "Grundriss der indo-arischen Philologie und Altertumskunde," no. 3.1.13 (Strassburg, 1915), gives a useful survey. *Classical Hindu Mythology: A Reader in the Sanskrit Purāṇas* (Philadelphia, 1978), edited and translated by Cornelia Dimmitt and J. A. B. van Buitenen, offers an illustrative selection. Wendy Doniger O'Flaherty's discussions of Puranic mythology, such as *The Origin of Evil in Hindu Mythology* (Berkeley, Calif., 1978), are of considerable interest.

VEGETARIANISM SEE AHIMSĀ; GREEK RELIGION; VEGETATION

VEGETATION. The world's mythology and folklore offer one example after another of sacred plants, both wild

and cultivated, as well as stories about the divine origins of plants, their magic or medicinal properties, and heroic quests to obtain them. These stories reflect a dual tendency, shared by humanity's forebears in history and by its contemporaries in the so-called nonliterate societies: On the one hand there has been the tendency to "humanize" nature with sacred narratives whose purpose is to explain how the world and humankind came to be the way they are; on the other hand analogies have been consistently drawn from the physical world—in this case, plants or perhaps the tools and techniques for cultivating them—to express those things about human living that can never be fully expressed, especially the perennial anxieties, fervent hopes, and nostalgias that expose immediately the limits of one's situation in the world.

For example, the Warao Indians of the Orinoco Delta in South America have endowed basket making with a quite explicit religious meaning derived ultimately from their experience with a certain plant. Besides calabashes and makeshift containers put together by folding leaves or palm stipules, the Warao have only baskets for storage and carrying. The raw material used in the manufacture of baskets is the cortex of the stem of the *itiriti* plant, which grows in most parts of the delta. The Warao say that they owe the existence of the plant to the selfless sacrifice of an ancestor in primordial times who, seeing that his people were in need of baskets to survive, transformed himself into the first *itiriti* plant and enjoined his descendants to employ his body in the manufacture of many useful things.

The plant itself has a number of magico-religious properties, the most important being its effect on the craftsman's hands. A Warao basket maker observes that over the course of his career his palms whiten as the pithy interior of the *itiriti* passes through his hands. He believes that eventually a small hole that only he can see will appear in each palm. Often, when the craftsman splits open an *itiriti* stem to get at the pith, he can see that a small snake has tunneled up from the roots of the plant, and he understands then by analogy what the Itiriti Spirit, conceived of as a snake, is accomplishing in his body. The spirit, he believes, is boring a tunnel from his chest, where the tutelary spirits reside, through both arms to the openings in his palms. When the craftsman finally observes the exit holes in his palms, he knows he has undergone a transformation from an ordinary human to a shamanic craftsman with the same healing powers and social status as the other religious specialists in his tribe.

At least two points deserve mention. First, when the Warao craftsman produces baskets, he complies with his divine ancestor's original intention that many useful things be made of his serpentine body. He validates the Spirit's sacrificial deed through the knowledge and practice of his craft, and by having the body of the god pass continually through his hands, he effectively reconstitutes the sacrality of the primordium. In other words, he "humanizes" nature, here not so much by narrating what took place in the beginning as by acting it out.

Second, thanks to the analogies he draws from the plant, the snake, and the physical effect of his contact with the sacred fiber, the basket maker possesses a language suitable for expressing—as well as a technique suitable for achieving—the transformation from ordinary status to that of shamanic craftsman, by means of which he gains a place for himself after death in the presence of the Creator Bird of Dawn. Such is the spiritual achievement to which he dedicates the better part of his life. Just as he masters his craft by understanding the nature of the material he employs and the secret of the manufacturing process, so, by analogy, does he achieve spiritual mastery over himself and the world. The Warao example thus illustrates an important function of religious symbols generally: By making it possible for the human situation to be translated into cosmological terms and vice versa, religious symbols reveal a fundamental oneness between human life and the structure of the world, drawing human beings out of their isolation in subjectivity and allowing them to take a stance vis à vis their own lives and the world that one could easily describe as a kind of transcendence.

Warao basket making describes only one of the ways that plants have entered and shaped religious life. The effectiveness of medicinal plants is often ascribed to the spirit or power they embody. For example, the Apinagé of South America believe that for each species of edible animal there is a corresponding wild plant that can be used should a person undergo the harm of ingesting the animal's soul.

Poisons have played extremely important roles in human affairs, especially in the hands of sorcerers and priest-physicians charged with knowing how to treat their toxic effects and who are themselves capable of using the poison against an enemy. The Canelos Quichua and the Jivaroan people in Ecuador say that forest demons reside in plants from which the poisonous curare is prepared, and it is they who kill the victim when a poisoned arrow penetrates the body.

The beer that the Chaco Indians brew from algaroba or other fruits is said to derive its intoxicating powers from the spirit present in the tree and especially in its fruits. As the beverage ferments, the indwelling spirit approaches the height of its powers. The mysterious process of fermentation can be hurried along by various ceremonies, the beating of drums, or the shaking of rattles.

Any plant that somehow bears or manifests the vital forces at work in the world, spontaneous growth and renewal, may host divine or magic powers; contact with such a plant will commonly transfer those powers for the benefit of one who understands its secret. An endless variety of agricultural rites and beliefs entail the recognition of a force manifested in the harvest. The Indochinese have a rice spirit that makes their crops grow and bear fruit. They treat the rice in flower as they would a pregnant woman, taking care to capture the spirit in a basket and store it carefully in the granary where rice is kept. When barley starts to germinate, the Ewe of West Africa ensure the fertility of the fields by consecrat-

ing a number of young girls to the python god. As the god's representatives, priests consummate a sacred marriage, and the girls or women thus consecrated engage in ritual prostitution for a period of time in the enclosure of the sanctuary. Elsewhere the presence of the sacred tree at wedding celebrations underscores the link between vegetation and human sexuality. In Java, when rice blossomed it was customary for the husband and wife to mate in the field.

These examples all express not only a certain solidarity between plants and human beings but also an ambiguous vulnerability or susceptibility to the spirits of plant life that causes humans to wish to coordinate their activities with the mysterious rhythms and circulating energies of vegetation.

It should also be clear that the sacrality of vegetation differs in marked ways from, for example, the sacred as it is revealed through the sky and its symbols. Whereas the latter communicates distance, overarching sovereignty, and "spirituality" in the sense of being elevated, not physical, and timeless, human relations with the plant world are characteristically close, physical, and time-bound (owing especially to the cyclic nature of plant life).

It is exceedingly difficult to account for the distance between ours and a properly religious world in which the spiritual powers of vegetation are a self-evident truth, at least not without demeaning the intelligence of religious people by repeating arguments akin to the Greek polemics against Egyptian religion or the Israelite polemics against the worship of idols. The Greek writer Plutarch, for example, insisted that the Egyptians worshiped plants, and they did so, he said, because of a verbal misapprehension. According to Plutarch, primitive peoples had once believed that the food plants they consumed were gifts from the gods, but later the habit of associating the gods' names with various plants caused their descendants to forget, that is, people of later times began to confuse the plant with the divinity who made it. Scarcely more helpful were writers in the twentieth century who, influenced by Darwin, simply reversed the order of Plutarch's hypothetical "devolution" of religion into superstition. Their claim was that theism came late not early in human history and that the known nonliterate peoples, like the earliest peoples on record, are as yet incapable of consistent, complex religious thought and self-understanding.

By contrast, a historian of religions would choose to say that even an expression such as "plant worship" is something of a misnomer, for it is usually not the plant itself that is worshiped but the sacred power present or embodied in the plant or symbolized by the plant; and that wherever the sacred is revealed, whether in vegetation, animal life, stones, or sky, it engages the whole human person—meaning his or her emotional, imaginative, and intellectual faculties taken together—in a vital relationship. There is no reason to assume that the earliest human forebears were any less intelligent than those of the present. In fact, if one compares the mythopoetic thought of nonliterate or "primitive" peoples with modern scientific thought, the differences—and in this

most scholars would now agree—turn out to be due to emotional attitude and intention rather than to any disparity of intellect.

In what follows this article has tried to simplify things as much as possible by reducing the topic of vegetation to its two most important and revealing elements: the symbolism of the tree and the ideas and practices made possible by the discovery of agriculture. These two are in any case the models without which further discussion of vegetation as a religious phenomenon would prove difficult.

TREE SYMBOLISM. In myth and ritual, trees serve as symbols of orientation, knowledge, and life.

The cosmic tree. One of the most widely disseminated motifs in mythology and religious iconography is that of the sacred tree as both *imago mundi* and *axis mundi*. There seems no way to reconstruct with certainty the process whereby the tree came to represent both the cosmos as a whole and its cardinal axis, joining the three domains (heaven, earth, and underworld) together and making communication among them possible.

It is known that the earliest sacred places were small-scale reproductions of the world in toto achieved by forming a landscape of stones, water, and trees. Australian totem centers were often located in a sacred group of trees and stones, and the tree-altar-stone pattern characterized sacred places throughout India and East Asia. Often a vertical post or pillar was added, presumably as a stylized tree meant to enhance the sacred power already present in this microcosmic landscape. Finally, it would seem that over the course of time the elements of such a landscape were reduced to the single most important element: the tree or sacred pillar.

One does not have to go far in the history of religions to find examples of the cosmic tree as an image of the world. The ancient Babylonians knew the black Kiskanu Tree that grows at Eridu, the center of the world. It shines like lapis lazuli—meaning that it shines like the night sky—and spreads its branches out toward the cosmic ocean that surrounds and supports the world. The Upaniṣads speak of the universe as an inverted tree that buries its roots in the sky and spreads its branches over the whole earth. A Scandinavian creation story in the *Völuspá* tells of a cosmic tree called Yggdrasill with branches that reach to heaven and cover the whole world and roots that run under the earth and support it. At the base of the tree lies the cosmic serpent Niðhoggr, gnawing at its roots, and at the top is an eagle who battles daily with the serpent. Yggdrasill thus mirrors the precarious fate of the cosmos; though it may be bruised and shaken, the tree's ultimate renewal will mark the beginning of a new age and a new earth.

Furthermore, the cosmic tree also expresses one of the most profound nostalgias of religious people, namely, the desire to orient themselves to the center of the world. Like other symbols for the center, the tree image calls attention to the vertical plane of the universe, and that means to the

underworld as well. Chinese mythology tells of a miraculous tree that grows at the center of the universe and that unites the Nine Springs and the Nine Heavens. In other words, it marks the point at which the various cosmic levels intersect. The Abakan Tatars describe an iron mountain on which grows a birch tree with seven branches symbolizing the seven levels of heaven. A shaman is said to climb this tree in his ecstatic ascent. The Qurʾān refers in several places to the tree Zaqqūm, which has its roots in the lowest reaches of Hell. Its leaves are small, and its fruits bitter. It reverses the image of the heavenly Tuba Tree that is situated at the celestial Kaʿbah directly above the earthly Kaʿbah and linking the two.

The Tree of Knowledge. Perhaps partly because of its role in the cosmos as the cardinal axis and partly because of its connections with certain deities, the sacred tree sometimes has oracular functions, making it a tree of knowledge. Two of the roots of Yggdrasil reached to the sources of divine wisdom: one to the Spring of Mímir (“meditation” or “memory”), the other to the Fountain of Urðr (“fate”). Similarly, the Oak of Zeus at Dodona was said to have oracular powers on account of the extreme depth to which its roots extended. Whether in the creation story of the *Book of Genesis* the Tree of Life and the Tree of Knowledge are in fact one tree or two has been open to dispute, but some have argued persuasively that only by eating first of the Tree of the Knowledge of Good and Evil could the hidden tree that conferred immortality be found.

The Tree of Life. When historians speak of the cosmic tree, they have in mind those meanings conveyed through the symbolism of the tree that refer specifically to the structure and organization of the cosmos. But the tree, quite simply because of its other vegetative qualities—those related to its growth cycle and regenerative capacities—also conveys to religious people another set of ideas, expressive of the world’s inexhaustible fertility. Most scholars, when they consider tree symbols with an eye to this latter array of meanings, refer to the tree of life as opposed to the cosmic tree; and it is true that in specific instances one or the other tends to be more fully expressed. Still, in some myths they are the same tree or at least are located near one another at the center of the world. For example, the second chapter of *Genesis* states that immediately after the Lord God breathed into Adam’s nostrils, he

planted a garden in Eden, in the east; and there he put the man whom he had formed. And out of the ground the Lord God made to grow every tree that is pleasant to the sight and good for food, and the tree of life also in the midst of the garden, and the tree of the knowledge of good and evil. (*Gen.* 2:8–10)

The garden stands, then, at the center of the world, and the tree at its center.

Numerous myths and iconographic motifs connect the tree of life (or its equivalent) with the Great Goddess and water and so confirm the basic meaning conveyed through

the symbol: that is, a common concern for, and perhaps a deep anxiety over, life’s changing cycles of fruitfulness and decay, youth and old age, poverty and abundance, sickness and health.

One of the most common themes associated with the tree of life describes how the cosmos itself and the various deities came into being. According to the Egyptian Pyramid Texts, Atum first emerged from a lotus drifting over the primordial watery abyss, but the rest of the gods originated from trees, including Hathor, the Great Mother, from the sycamore.

Excavations in the Indus Valley have unearthed artifacts picturing goddesses of the *yakṣinī* type beside a *Ficus religiosa* or plants emerging from a goddess’s genital organs. In a pictorial theme found over a wide expanse of Africa and Asia, the goddess rises between two branches of a tree in the center of a circle.

The lotus, while not a tree, shares the same connection with the Great Goddess and cosmic fertility. The lotus is already a sacred flower in the Brāhmaṇas, where it represents the female generative organ, and that is its root meaning whether it becomes the female goddess, the cosmic lotus of Viṣṇu’s navel and hence the womb of all creation, or the seat of divinity and spiritual power. It tells the story of being issuing forth pure and bright from the dark possibilities of watery chaos.

The legendary soma plant also has a connection with water, for the *Rgveda* describes it both as a spring or stream and as a paradisiacal plant that promises life, fertility, and regeneration. The *Book of Revelation* makes even clearer the cosmological and redemptive significance of water and the tree together:

Then he showed me the river of the water of life, bright as a crystal, flowing from the throne of God and of the lamb through the middle of the streets of the city; also, on either side of the river, the tree of life with its twelve kinds of fruit, yielding its fruit each month; and the leaves of the trees were for the healing of the nations. (*Rv.* 12:1–2)

One last theme deserves mention. Often a hero goes off in search of the tree of life (or some other divine plant for which the tree is a model) and the immortality it will bring. The quest usually entails great dangers and trials, for the tree of life is hidden (as the Tree of Life in the Garden of Eden may have been) or guarded by monsters, like the golden apples in the Garden of Hesperides, and therefore difficult if not impossible to reach. For example, in the Babylonian variant of the theme, Gilgamesh seeks a thorny herb of life that the sage Utanapishtim tells him is at the bottom of the sea. A serpent thwarts his attempt and gains immortality for itself instead.

Similarly, Iranian tradition has an earthly tree of life with a heavenly counterpart. Like soma, earthly *haoma* is sometimes thought of as a plant and sometimes as a spring.

The heavenly variety gives immortality to all who eat of it and grows where Ahura Mazda first planted it, among the thousands of other medicinal herbs at the source of the waters of Ardisura, on an island in the great sea Vourukasha. Angra Mainyu counters Ahura Mazda's creation with a creation of his own in the shape of a lizard that swims through the waters to attack the miraculous *haoma* tree.

THE DISCOVERY OF AGRICULTURE. The term *Neolithic Revolution*, its second component notwithstanding, denotes a period of gradual technological, economic, and religious innovation that took place roughly between 9000 and 7000 BCE, during which time many societies drifted away from their hunting and gathering economies toward an economy based on the domestication of animals and plants. Domestication resulted in the appearance of agriculture as a special form of animal and plant production and put human beings in the position of being, in a sense, creators of their food.

This new food-producing role brought with it many changes. For one thing, agriculture altered the division of labor, as women began to assume the better part of the responsibility for subsistence. It meant that early cultivators had to develop more accurate techniques for reckoning time, inasmuch as the complex activities in which they were now engaged had to be planned months in advance and coordinated both with the yearly cycles and with the different cycles of plant life.

Agriculture also enriched the meaning of work. To be sure, farming is a profane skill, but for religious people it has always been first and foremost a ritual. It deals, for example, with the mysterious forces of growth somehow at work in the seed and furrow. It is carried out on the body of Mother Earth herself. It requires the planter to integrate his movements with beneficent and dangerous periods of time; and it forces him to contend with the spirits of vegetation, particularly those, like the tree and forest spirits, who grow angry when the land is cleared. It requires ceremonial action to assist the growth of crops and renew the earth's life-giving energies, and it draws the farmer into contact with the dead, for the earth is their abode.

Above all, agriculture provided for a vast store of analogies that made it possible for human beings to see the necessary links that joined plant life, women and sexuality, earth, moon, water, death, initiation, and resurrection in a single, integrated view of life. In effect it allowed the whole world to be apprehended as a living organism, governed by rhythmic cycles in which death and life belong necessarily to one another, and in which rebirth is all the more miraculous for the astonishing increase of new life that accompanies it. Long and intimate dealings with the soil and its seasons fostered the great hope that, like the seed hidden in the earth, the dead can hope to return to life in a new form: that is, death might be no more than a provisional change in the human mode of being. On the other hand, it also pointed to life's essential transitoriness and fragility.

Simply put, the discovery of agriculture created an opportunity for the human mind to grasp certain truths that had been much harder to grasp before. A primitive hunter, for example, would have understood the rhythm of the seasons perfectly well, but for agriculturalists that rhythm was the basis for a theoretical construction that gave meaning to life, and they experienced this rhythmic quality of life amplified many times over in patterns of activity and rest or of scarcity and plenty; in rituals meant to drive out the old season; in rites of sowing and harvest; and even in orgies, whose aim was to reproduce on the human level what was taking place in the ground and what did take place in the beginning—like seeds that lose their shape, disintegrate, and become something different, human beings lose their identities and try to enter a state of chaotic formlessness analogous to the formless state prior to the creation of the world.

Agriculture had certain tragic implications as well. As producers of their food, early humans learned to take responsibility for the vegetable kingdom, for its perennality, even if that meant, as in the case of human sacrifice or cannibalism, the killing of their own kind so that life could be renewed. For example, an important Aztec festival dedicated to the maize goddess Chicomecoatl began every year just as the maize plant attained its full growth. A young female slave or captive, painted red and yellow to represent the colors of the plant, performed a ritual dance nightly for the duration of the festival. On the last night all the women in the community danced with her and chanted the deeds of Chicomecoatl. At daybreak, the men joined them in a solemn dance of death that brought the exhausted victim to the top of the pyramid of sacrifice. There the woman was finally offered up in a gruesome rite to the goddess. In this way the maize goddess, herself exhausted by her season's labors, was thought to be restored. For precisely the same reasons, the Khonds, a Dravidian tribe of Bengal, practiced human sacrifice at least until the middle of the nineteenth century, consecrating their victims to the earth goddess, Tari Pennu or Bera Pennu.

These examples give some hint of the essential, underlying ambivalence toward farming and vegetable life that has found expression in almost every known myth concerning the origins of agriculture and the introduction of food plants. The German scholar Adolf E. Jensen divides these myths into two categories. One group of myths he attributes to cultivators of tuberous plants. Perhaps the most famous story comes from the Ceramese Islanders in Indonesia and tells how a young maiden, Hainuwele, was killed and buried on the ninth night of the Maro festival. Her father dug up the corpse, cut it in pieces, and buried the pieces around the sacred dancing ground. Then from the various parts of her body food plants sprang forth. This primordial murder radically changed the human condition. On the one hand, it was a creative death that permits the goddess to be continually present in the lives of her descendants, for every time one of them consumes a plant that sprang from her divine body, he or she partakes of the actual substance of the goddess. On

the other hand, the story reveals how death and sexuality first entered the world and attributes all the religious and social institutions that are still in place to a criminal act at the beginning of time.

Myths belonging to Jensen's second category he attributes to cereal growers, and they recall a primordial theft of the food plant in question from heaven. The Dogon, for example, tell of a primordial blacksmith who stole cereal grains from the sky god and brought them back to earth hidden in his hammer. The Gula and Kulfa of the central Sudan say that a female spirit pressed beeswax to the soles of her feet so that the grain that the sky god had spread out would adhere. The Chané in the western Gran Chaco believe that the fox god hid the small seeds of the algaroba fruit in a hollow tooth.

While there are differences between the two types of myths, a rigid distinction between them would be difficult to defend, partly because the origin of cereals is often attributed to a primordial murder as well; but it would also distract attention from the variety of origin myths and the different themes they choose to emphasize. For example, one could construct another category of myths that tell of a benevolent woman who secretly provides food for human beings until she is discovered in the act of producing plants asexually from her body. According to one variant of the story, food plants (tubers and cereals both) came originally from the sweat or excreta of the goddess. Members of the tribe learn about the revolting source of their food and kill her; but following the advice she gives just before her death, they also bury the pieces of her dismembered body, whereupon food plants and other elements of culture (agricultural implements, for example) spring from the corpse.

All of the foregoing myths have one thing in common: They present the introduction of agriculture as an ambiguous event caused by a crime or mistake that took place during primordial times and fraught with difficult consequences. It would seem, in fact, that myths that account for the origins of agriculture also have things to say about the highly ambiguous achievement of civilization itself, and to the degree that *civilized* is the equivalent of *human*, they address those ambiguities that define humanity's common lot.

Many of those ambiguities can be seen played out in the myth of Prometheus and in that story's profound effects on the religious life of the ancient Greeks. It is a story that recounts much more than just the origins of agriculture. In the myth from Hesiod, gods and humans lived together and shared food in the primordial Golden Age. On the day he distributed the share from the first sacrificial animal, Prometheus established the diet that differentiates humans and the gods. Through Prometheus's deceit, humans received the edible portions, leaving the gods with only the bones and fat. Zeus took his revenge by hiding fire so that it was impossible for humans to cook their meat. Prometheus then stole the seed of fire, hiding it in the hollow stalk of a fennel plant, and presented it as a gift to humankind. Feeling cheated,

Zeus hid the seed of wheat, burying it in the earth, with the result that henceforth men would have to labor in the fields for food. At the same time, he created the first woman, whom Hephaistos modeled out of clay, and thus sexuality entered the world too.

The myth of Prometheus was commemorated in ancient Greece as the passing of the Golden Age and the beginning of human time. For the Greeks, Prometheus had fulfilled the will of Zeus, who condemned human beings to the experience of hunger and death, but he had also provided the food needed to survive. Moreover, in leaving nothing for the gods except, significantly enough, the smells rising from the sacrifice, he validated the gods' supremacy, for in a sense the need to consume food is inversely proportional to the vital energy that makes gods different from humans in the first place.

The state sacrifice, though it was the cornerstone of Greek religion in the cities, reflected the ambivalence of the myth that served as its model or charter: On the one hand it brought gods and humans together to commemorate the start of human life, but it also underscored the distance separating people from the gods they worshiped. Various religious groups opposed the sacrifice out of a desire for a religious experience that was unlike that offered by official religion and that promised the devotee closer contact with the divine. Among the most important of these groups were the followers of Pythagoras, who embraced vegetarianism as a way of rejecting wholesale the type of communion with the gods that animal sacrifice had established as the norm. The foods they valued were cereals such as wheat and barley and plants such as mallow and asphodel, for in the Golden Age those plants—even though the first two are cultivated grains—were said to have sprung spontaneously from the earth and were the foods that men and gods had once eaten together. In other words, through rediscovering this lost commensality, the Pythagoreans hoped to achieve a return to the Golden Age. Like other forms of vegetarianism, the Pythagorean type is an example of ascetic practice that aims to purify and transform human life and, in a way, to undo the effects of civilization. Recalling the equivalence of the terms *civilized* and *human*, one might interpret Pythagorean vegetarianism as an example of one of the many different ways that people living in a world shaped by the ideas and values of agriculture have expressed their lives and imagined ways of transcending their all-too-human circumstances.

BIBLIOGRAPHY

The single most important source on vegetation and the religious significance of agriculture is Mircea Eliade's *Patterns in Comparative Religion* (New York, 1958), chap. 8, "Vegetation: Rites and Symbols of Regeneration," and chap. 9, "Agriculture and Fertility Cults." Both chapters include extensive bibliographies. In addition, James G. Frazer's *The Golden*

Bough: A Study in Magic and Religion, 3d ed., rev. & enl., 12 vols. (London, 1911–1915), remains a valuable sourcebook.

On the sacred tree, a useful study is E. O. James's *The Tree of Life: An Archaeological Study* (Leiden, 1966), but see also the illuminating insights of Gerardus van der Leeuw in his *Religion in Essence and Manifestation*, translated by J. E. Turner (London, 1938), pp. 55ff.

On the origins of agriculture in the Neolithic period, see Mircea Eliade's *A History of Religious Ideas*, vol. 1, *From the Stone Age to the Eleusinian Mysteries* (Chicago, 1978), esp. chap. 2, "The Longest Revolution: The Discovery of Agriculture—Mesolithic and Neolithic." For the prehistoric worship of vegetation goddesses, see Marija Gimbutas's *The Goddesses and Gods of Old Europe, 6500 to 3500 B.C.: Myths and Cult Images* (Berkeley, Calif., 1982). Another important study of the religious life of the early cultivators is Vittorio Lanternari's *La Grande Festa: Storia del Capodanno nelle civiltà primitive* (Milan, 1959).

Adolf E. Jensen has written extensively about myths of the Hainuwele type and other myths of the origins of agriculture. See his *Myth and Cult among Primitive Peoples*, translated by Marianna Tax Choldin and Wolfgang Weissleder (Chicago, 1963). Note that Ileana Chirassi has identified themes of the Hainuwele type in Greek mythology. An excellent bibliography is appended to her *Elementi di Culture Precereali nei miti e riti Greci* (Rome, 1968).

PETER C. CHERMERY (1987)
Revised Bibliography

VELES-VOLOS. The alternative names *Veles* and *Volos* denote different aspects of a deity of the pre-Christian Slavs, the god of death and of cattle. The bifurcation in meaning must have taken place in the East Slavic area, since *Volos* is confined to East Slavic; in South and West Slavic, the only known form is *Veles*. *Volos* very likely derives from the older **Velsu*. Some scholars (e.g., Michael Shapiro) consider *Veles-Volos* not as a composite figure but as distinct twin gods. It is true that the names *Veles* and *Volos* never occur together; however, both are associated with death and evil and with pastureland and cattle, as linguistic analysis suggests. Furthermore, the two aspects of *Veles-Volos* have close parallels in individual gods of other Indo-European pantheons, such as the Baltic *Vels* and *Velinas*, the Germanic *Odin*, the Indic *Varuna*, and the Iranian *Ahura Mazda*.

Downgraded to a demon in the Christian era, *Veles* is known in Czech demonology of the fourteenth to sixteenth century as well as in the toponymy of the South Slavic area.

The medieval Czech phrase *k Velesu za more*, used to denote "beyond the sea (or water)," literally means "to *Veles* in the otherworld."

The character and function of *Veles-Volos* can, to some degree, be reconstructed by linguistic analysis, especially of names of parallel deities in other Indo-European pantheons. The Lithuanian name **Velinas* (now *Velnias*, "devil") and the Latvian name *Vels* or *Velis*, for example, identify a Baltic god of death and the underworld (recorded as a god at the end of the eighteenth century and later described as a devil, an adversary of *Perkūnas*, the Lithuanian god of thunder. The Lithuanian term *vėlė* or *velė* means "shade of the dead." Other related terms include the Latvian *Velu laiks* and Lithuanian *velinės* ("days of the dead"), the Tocharian *wäl* ("to die") and *walu* ("dead"), and a host of Germanic relatives: Old Icelandic *valr* ("dead on the field of battle") and *Valhöll* (abode of warriors fallen on the field of battle), Old English *wæl* ("corpse left on the battlefield"), and Old Norse *vollr* ("meadow," i.e., "the pastureland of the departed"), a term paralleled in meaning by the Hittite *wellu-* (**wel-nu*).

The Indo-European root **wel-* ("sight, insight, foresight") underlies the name of the Baltic deity *Velinas* or *Velis*, whose clairvoyance (by means of a single eye) is one of his chief attributes. The Old Russian "*Velesov vnuk*" ("grandson of *Veles*") is an epithet for the musician and prophetic poet *Boian* of the epic *Slovo o polku Igoreve*, and the Old Russian word *v'lehu* means "sorcerer, magician, poet."

Another name for *Veles* is *Chernobog*, signifying the "black god" known to all Slavs. This name is still preserved in Slavic toponymy, and a curse invoking *Chernobog* is still used in the Ukraine: "May the black god kill you."

Volos is first mentioned in the Russian *Primary Chronicle* (c. 1111 CE), and in two tenth-century treaties with the Greeks, as *skot'i' bog* ("god of cattle"). The etymology of the phrase reveals connections with theriomorphism, disease, and evil spirits. The Russian word *volos* ("hair, fur") also refers to a parasite that lodges under the skin of human beings and animals; the disease it causes is variously called *volos*, *volost'*, or *vo-losti*. The carrier of the disease, a worm, is also called *volosets* or *zmeevik*, from *zmei* ("serpent"). The related Russian words *volosen* and *volosatik* mean "evil spirit" or "devil." *Medved'* ("fierce beast"), a term meaning "bear" in Russian dialect, is known from literary texts of the eighteenth and nineteenth centuries and is used as an epithet to describe the adversary of the prophet *Elijah*, the Christian successor of the Slavic thunder god, *Perun*.

The importance of *Volos* is indicated in various references to his idols. The eighteenth-century Russian collection *Skazanii o postroenii grada Iaroslavlia* (Legends about the Founding of Yaroslavl), first published in 1876, mentions a place where a statue of *Volos* once stood: "The sounds of heavy breathing, of the psaltery, and of singing could often be heard from there, and dancing could be seen." Another text in the *Skazanii* mentions that cattle were driven around

the idol of Volos. Of great interest also is a description of how a priest, Volkhv, first offered by fire a sacrificial victim, prophesied in the name of Volos, and was then himself sacrificed to the god, a parallel of the Germanic deity Odin's sacrifice to himself.

Etymologies, historical records, and comparative studies of Indo-European mythologies allow us to reconstruct the ancient Veles-Volos as a multifaceted god who was, on the one hand, a frightening god of death and, on the other, a divine seer: a god who ruled over the magic art and over cattle, who was a steadfast protector of peaceful settlements and a stern chastiser of their violation, and who was an adversary of the thunder god.

In the Christian era, Volos became identified with the saints Blasius (Vlasii) and Nicholas (Nikola), the patrons of flocks and crops. The connection between Volos and Blasius may be based on actual and functional similarity, considering that Blasius was "the guardian of the flocks" to the Byzantines. Northern Russian icons portray Vlasii seated on a horse or on a stone, surrounded by cows, sheep, and horses. In central and northern Russia, particularly in the Yaroslavl and Novgorod districts, the cult of Vlasii was popular up to the end of the nineteenth century. On February 11, his name day, peasants did not work, thereby appealing to the god to preserve their village against epidemics of plague or cholera. Icons depicting Vlasii were placed in stables, and there was a custom of carrying the icon around each sheep, horse, and cow. In springtime, when the animals were driven out to pasture, special prayers were said: "Let the smooth lambs, the fat oxen go out playing, and let them come back hopping." The saying "Those who celebrate Saint Vlasii will always be in plenty" points to his ancient role as god of wealth.

VENIAMINOV, INNOKENTII SEE INNOKENTII VENIAMINOV

VENUS is perhaps the most singular example from among the divinized abstractions that make up the Roman pantheon. The word *venus*, in its origin, is a neuter noun of the same kind as *genus* or *opus*. It is discernible in the derived verb *venerari* (**venes-ari*), which is confined to religious usage by all the authors of the republican period, especially Plautus. The Plautinian construction (not maintained by classic use) is of particular interest: *veneror . . . ut*, which can be translated, "I work a charm [upon such-and-such a divinity] in order to [obtain a result]." This notion of charm or seduction that defines the word *venus* is represented in Hittite (*wenzi*) and in the language of the Veneti (*wontar*). Yet the root *ven-* did not produce a divinity anywhere except in Latin. It is significant that, in the Oscan region (where is recorded a form that is probably borrowed from Latin), the homologue of the Latin *Venus* is *Herentas*, formed from another root: *her-*, "to will."

The neuter *venus* is part of a remarkable semantic series of the same kind as *genus/Genius/generare*, except that here the first term and not the second was divinized, passing from the neuter to the feminine: *Venus/venia/venerari* (sometimes *venerare* in Plautus). To the persuasive charm that the goddess embodies and that the *venerans* ("he who venerates") practices upon the gods, there corresponds the symmetric notion of *venia* in the sense of "grace" or "favor"—a notion that belongs to the technical vocabulary of the pontiffs (Servius, *Ad Aeneidem* 1.519).

This metamorphosis of a neuter noun into a goddess (in contrast, it is the shift from feminine to masculine that marks the divinization of Cupido) was very likely furthered by the encounter of this divinity with the Trojan legend. This legend must have facilitated the relation drawn between a Venus embodying charm in its religious meaning and an Aphrodite personifying seduction in the profane sense. The notion of Aphrodite as mother of the Trojan hero Aeneas, the legendary founder of the Roman race, allowed for the application of a Greek legend to Roman benefit. The myth illustrated the rite. It made explicit in plain language the ritual employed by a Roman *venerans* when soliciting the *venia deum*, the favor of the gods. Set forth as their ancestor, the "pious" Aeneas conferred upon the Romans a privileged status in the eyes of the gods. Was it not therefore their lot as his descendants, the Aeneads, to be assured of obtaining the *pax veniaque deum* (the peace and grace of God), as frequently expressed by Livy, thanks to the mediation of Venus, the

preferred daughter of Jupiter? This, to be sure, was on the condition that they fulfill the duties of *pietas* (“piety”). This explains the famous declarations whereby the Romans claimed the title of “the most religious people in the world” (Cicero, *De natura deorum* 2.3.8, *De haruspicum responsis* 9.19).

The divinization of the notion of *venus* had to take place in a syncretic environment, Lavinium, which lent to Venus the smile of Aphrodite. According to tradition, Aeneas established at Lavinium, in Latium, a cult of Venus Frutis (the appellation *Frutis* is very likely connected etymologically to *Aphrodite*), and in the same place a federal temple of Venus, common to all Latins, was set up. Archaeology has uncovered at that site a *hērōion*, the shrine of a hero, which the discoverer identifies as the mausoleum of Aeneas mentioned by Dionysius of Halicarnassus (1.64.1–5).

The Trojan interpretation of Venus explains the development of her cult. Thanks to the enlightenment afforded by the association with the Trojan legend, the Romans were able to recognize their national Venus in the Aphrodite of Mount Eryx in Sicily at the time of the First Punic War and so erected a temple to her later on the Capitoline. On the basis of this same enlightenment, the goddess was associated with Jupiter in the cult of the Vinalia, the wine festival thought to have been instituted by Aeneas. The first temple erected in the goddess’s honor had been dedicated to Venus Obsequens (“propitious Venus”). It had been vowed in 295 BCE by Q. Fabius Gurgus while battle raged against the Samnites. Its dedication day, August 19, coincided with the Vinalia Rustica. The Trojan interpretation was imposed in definitive and official fashion in the first century BCE: Julius Caesar offered a temple in the middle of the forum to Venus Genetrix as the grandmother of the Julian gens and the mother of the Aeneades. Lucretius’s literary expression *Aeneadum genetrix* thus was awarded liturgical consecration.

Translated from French by Paul C. Duggan
Revised Bibliography

VERGIL (also spelled Virgil; Publius Vergilius Maro; 70–19 BCE) was born in Andes, near Mantua, and educated in Cremona and Milan before coming to Rome. His youthful poems include *Catalepton* 5 and 8. After publication of the *Eclogues* in about 39 to 38 BCE, he joined the literary circle of Maecenas, the close friend and ally of Octavian (the future Augustus).

Vergil’s early poems reflect his Epicurean orientation, and evidence of his participation in the Epicurean community at Naples is found in a papyrus from Herculaneum, where he is mentioned by name (Gigante, 1983). The *Eclogues* reflect the turbulence during the civil wars following the death of Julius Caesar, the defeat of the tyrannicides, and the narrow avoidance of war between Octavian and Antony by the signing of the Treaty of Brundisium. In *Eclogue* 4, Vergil celebrates this treaty, proclaiming that an unnamed child is about to be born, and his birth will usher in a new Golden Age. Vergil’s Golden Age in the fourth *Eclogue* resembles that of Hesiod, where little human effort is required, but Hesiod’s negative connotation of decline is reversed by Vergil’s proclamation that the Golden Age is about to return. The idea that it can recur is linked with a Sibylline prophecy of the “final age” before a new cycle of ages begins again. The role of Dikē (Justice) and agriculture derives from Aratus’s version (*Phaenomena* 96–136); that Apollo will rule this age is consistent with Augustus’s coming religious renewal. The theme of the Golden Age appears again in the *Georgics*, where Vergil says that Jupiter deliberately brought an end to the inertia characteristic of the Hesiodic Golden Age and imposed *labor* (toil) on mortals so that they could develop skills and intelligence. Vergil here develops the idea that a new Golden Age will be based on agriculture rather than leisure. In the *Aeneid* he says that Saturnus brought a Golden Age to Italy, where it was enjoyed by the Latin people but was lost through war. Jupiter prophesies it will recur under the rule of Augustus (Johnston, 1980).

Scholars have tried in vain to identify the child with whose birth the new Golden Age will begin. Candidates have included a child of Mark Antony, of Augustus, or of Pollio (for identifications, see Coleman, 1977; and Clausen, 1994). Christians associated it with *Isaiah* 7:14 and 9:6–7, a theme supported by the Jewish associations of Pollio, the poem’s dedicatee. References to Sibylline oracles, the return of Virgo

(Justice), and other references in the poem were given biblical interpretations. Lactantius interpreted the poem as a prophecy of the birth of the Christ child, and Vergil was thus viewed as a “pre-Christian” and “a vehicle of divine inspiration” (Tarrant, 1997). The emperor Constantine, who had been associated earlier with the reference to Apollo in *Ecclesiastes* 4:10, accepted this reading, although saints Jerome and Augustine rejected it (Clausen, 1994, pp. 119–129). The messianic or Christian interpretation reigned through the nineteenth century despite scholars such as Christian Gottlob Heyne, who rejected it (1767). Eduard Norden (1924) connected the poem with Egyptian and Middle Eastern theology and rituals of Helios (December 25; which H. J. Rose associated with Apollo) and of Aion (January 6, formerly the winter solstice). Günther Jachmann (1952) argued that the child was meant to be a symbol of the new age.

At the end of the Republic, a prevailing attitude of neglect toward the gods caused great concern among intellectuals and leaders. Julius Caesar, and then Augustus, engaged in a series of religious reforms. Augustus was concerned with maintaining the traditional values of an agricultural society in the new Rome; he did not return to such republican practices as auguries and prodigies, which had been abused, but focused on reforms in Roman private religion, such as developing the priesthood of the *Fratres Arvales* (Arval brothers), and restoring neglected rites as well as the temples of the gods. Particularly important is the cult of Apollo, who, before the time of Augustus, was worshiped outside the *pomerium* with other foreign gods; under Augustus his temple was placed in the heart of the city on the Palatine Hill. Vergil's *Georgics* (completed in 29 BCE and read by Vergil to Augustus), a poem on the art of agriculture, invokes the gods of the countryside as well as the deities whom Augustus elevates.

VERGIL'S AENEID. The *Aeneid* (published by Varius after Vergil's death in 19 BCE) tells of the fall of Troy and the search by the surviving Trojans, led by Aeneas, to found a new homeland. The poem embodies the religious motifs of Vergil's earlier works: the struggles (*labores*) necessary to build a new society, embodied in the suffering of Aeneas, who was later depicted on the Ara Pacis as a heroic founder figure, like Romulus. In the poem Aeneas, whose regular epithet is *pious* (pious), is the embodiment of *pietas* (piety, which many medieval readers interpreted as “pity” and hence interpreted his killing of Turnus as a lack of *pietas*). Aeneas's piety is reflected in his religious attitude, in his patriotic mission, and in his relations with his father, son, and companions as he labors selflessly to fulfill the commands of the gods and to found a new home for his people and his family. The motifs of the loss and promised return of a Golden Age are prominent, particularly in the second half of the poem, in the prophecies of the gods that such an age will recur under Augustus, and in the revelation that the Latin race, which once enjoyed such an age, lost it through the madness of war.

In the *Aeneid* fate and the gods provide divine machinery that advances the plot: Aeneas is driven by his destiny or

fate to found a new civilization, and the anthropomorphized gods aid him in his pursuit of that destiny. Although his destiny is fixed, Aeneas's mortal failings threaten to undermine his pursuit of that goal, as when he is motivated to die in battle in Book 2 or when he is tempted to remain at Carthage with Dido in Book 4. Jupiter, who to some degree is the personification of fate, serves throughout the poem as the final power who resolves conflicts between other gods who oppose what fate has ordained. Venus, mother of Aeneas, supports his quest, and Juno, for a variety of reasons, opposes it. The deities participating in the action include Greco-Roman gods, particularly Apollo (who is closely associated with Augustus and Actium) and Herakles (who serves as a model for Aeneas and for Augustus), as well as Eastern deities (Cybele) and indigenous deities (Faunus, Tiber-god, and Portunus). For Aeneas, as representative of the Trojans, prayer and ritual are constant concerns. This is reflected throughout the poem, as when the Trojans arrive at or depart from Thrace, Delos, Actium, and Castrum Minervae; after visions of the Penates, Anchises's ghost, and the Tiber-god; at signs from Venus; when Aeneas's ships are converted into nymphs; and in the honors he pays to the dead.

The underworld in Book 6 of the *Aeneid*. Aeneas enters the underworld at Lake Avernus in Cumae, guided by the Cumaean Sibyl, after performing funeral rites for Misenus and obtaining the Golden Bough, required for passage into the underworld. His descent to the underworld to consult with his deceased father, Anchises, is the main theme of Book 6. Vergil's underworld is more complex than previous accounts. Whereas Homer's Odysseus goes only to the entrance, Aeneas descends through each level until the road diverges, one leading to Tartaros, the lowest level, which he is not permitted to enter (the sinners and their punishments are described by the Sibyl), and one leading to Elysium, a *locus amoenus* (a pleasant place), thus providing the first distinction in destinies according to the manner in which one has lived one's life.

Vergil describes the levels of the underworld, beginning with the evil shapes and spirits at the entrance, which are harmless. On one side of the River Acheron huddle the dead who have not been properly buried. After crossing the river, they confront the dog Kerberos, then those who have died prematurely, including Dido. Next he sees Trojans and Greeks who died at Troy, and finally he comes to the parting of the ways, which leads him to Elysium, where he meets with Anchises and beholds the future heroes of Rome. His departure from the underworld, through the gates of ivory, is mysterious because Vergil says that *falsa insomnia* (false dreams) pass through these gates (6.896), as opposed to the “true dreams,” which pass through the alternate gates of horn.

VERGIL AS A SUITABLE MODEL FOR CHRISTIAN SPECULATIONS UNTIL DANTE. By the fourth century CE Vergil had become the common property of pagans and Christians. Not only were his works central to literary education, but the

themes of his works—the miraculous child of the fourth *Eclogue* as a prophecy of the birth of Christ, the reading of the first half of the *Aeneid* as an allegory for the progress of the soul to maturity, and Vergil's description of the underworld in Book 6—were seen as suitable models for Christians. Like the Cumaean Sibyl guiding Aeneas through the underworld, Vergil guides Dante Alighieri to the brink of *Paradiso*, which he is not permitted to enter because, having lived before the time of Christ, he cannot be a Christian. Vergil leads the way to a Christian era and represents the imperial values that a Christian must leave behind.

VERIFICATION SEE LOGICAL POSITIVISM

VESTA. The name *Vesta*, with the archaic suffix *-ta*, is derived from the root **a1eu*, "to burn." It encompasses two stems: stem 1, **a1eu-s*, is found in the Greek *heuo* and the Latin *uro*, "I burn"; stem 2, **a1u-es*, lies at the base of the Latin *Vesta* and most probably also of the Greek *Hestia*. The intrinsic bond between the goddess and fire, *ignis Vestae* ("fire of Vesta"; Paulus-Festus, ed. W. M. Lindsay, 1913, p. 94 L.), was understood perfectly by the ancients, even though they were sometimes tempted to propose fanciful etymologies; Festus, for example, in order to explain Vesta's round sanctuary identifies her with the round earth (Paulus-Festus, ed. W. M. Lindsay, 1913, p. 320 L.). The semantic connection between the Latin goddess and the Greek goddess was conceded by Cicero (*De natura deorum* 2.67), who also believed that Vesta had been borrowed from the Greeks.

Although the cult of Vesta was known throughout the Italic regions, evidence of it comes above all from Latium.

The cult of Vesta was established at Lavinium, so that it is possible that her worship with colleges of virgins in attendance was at one time more widespread throughout Latium. The goddess is clearly listed in the famous catalogue of Sabin divinities introduced in Rome in archaic times (Varro, *De lingua Latina*, 5.74). The tradition that the *virgines Vestae*, like most other Roman religious institutions, were instituted by king Numa is given by Livy (1. 20.3), Gellius (1.12.10) and Ovid (*Fasti* 6.259) but may be no more than a reconstruction from the established connexion between Numa and the nymph Egeria who inspired him: the Vestals drew water from the well of the Camenae, where Numa and Egeria met (Plutarch, *Numa* 13). Another origin, Romulean or Alban, may be inferred: according to Livy (1.3.11), Ovid (*Fasti* 3.11–52), and Plutarch (*Romulus* 3), Rhea Silvia, daughter of Numitor and mother of the twins Romulus and Remus, was consecrated to the cult of Vesta by King Amulius, who wanted to deprive her of descendants. Tarpeia, who betrayed the Romans during the war between Romulus and Titus Tatius, was also perhaps a Vestal Virgin (Livy 1.3.11).

Since the cult of Vesta goes back to the origins of the Latin city, it escaped the anthropomorphism of the Etruscan and Greek environments, as evidenced by Ovid, who writes that even in his time the *ignis Vestae* was sufficient by itself and had no cultic statue (*Fasti* 6.295–298). When Cicero (*De natura deorum* 3.80) tells of the episode in which the *pontifex maximus* Q. Mucius Scaevola was slain in 82 BCE in front of “the statue of Vesta” he must be referring to an honorific statue located in the vestibule or outside the sanctuary.

Situated near the *via Sacra* in the Forum, in front of the *Regia* and linked with the *Atrium Vestae* (“house” of the Vestals), the goddess’s round sanctuary (*rotunda aedes*; Paulus-Festus, ed. Lindsay, 1913, p. 321 L.; Ovid, *Fasti* 6.267) was differentiated from a four-sided temple oriented to the four cardinal points. This contrast, which the ancients attempted to explain by gratuitously comparing the goddess with the earth, becomes clear in the light of comparative studies. Vedic religion distinguished “the fire of the master of the house,” which is “this world and, as such, is round,” from “the fire of offerings,” the smoke of which “carries men’s gifts to the gods: this is oriented to the four cardinal points and is thus four-sided” (Dumézil, 1974, p. 320).

Vesta’s influence was upon the altars and hearths (Cicero, *De natura deorum* 2.67). The recommendation that Cato (*De agricultura* 143) made to the farmwife (*vilica*), who held the same place in the country as did the mistress of the house (*domina*) in the city, was appropriate for anyone responsible for the hearth: “Let the hearth be maintained by being swept each day before bedtime.”

Since the goddess also watched, “as it were, over the hearth of the city” (Cicero, *De legibus* 2.29), she was designated *Vesta publica populi Romani Quiritium* in the official religion. At her service there were the six Vestal Virgins, whose principal task was to maintain the fire (Cicero, *De legibus* 2.29). This fire was renewed once a year on March 1, the

beginning of the ancient year (Ovid, *Fasti* 3.135–144). “If by chance this fire were extinguished, the virgins would be flogged by the pontiff. Custom then obliged them to rub on a piece of ‘fertile’ wood [*felix materia*] until the fire thus produced could be carried by a Vestal in a bronze sieve to the sanctuary” (Paulus-Festus, ed. W. M. Lindsay, 1913, p. 94 L.). Although the Vestals were directed by a superior, the *virgo Vestalis maxima*, they were placed under the authority of the *pontifex maximus*, who was to flog them in case of carelessness. They had to maintain absolute chastity for the entire duration of their service (Ovid, *Fasti* 6.283ff.). The loss of virginity meant capital punishment: the guilty Vestal was buried alive in the *Campus Sceleratus* (“field of crime”) near the *Porta Collina*. Cicero (*De legibus* 2.8.20) gives two reasons for the virginity of the priestesses. The first is a practical one: married women have others duties. The second is inspired by Roman morality, and Cicero imagines the Vestals as setting a public example for all women. The preparation of the various items needed for sacrifices was also entrusted to the Vestals. The *muries*, a brine produced by adding water to oven-cooked coarse salt (Festus, p. 152 L.), and the *mola salsa*, baked wheat flour sprinkled with salt (p. 124 L.), which was spread over the heads of the victims (*immolare*) before they were slain (*mactare*), were both prepared by the Vestals (Paulus-Festus, ed. W. M. Lindsay, 1913, p. 97 L.). Scholars have defined the duties of the Vestals as a kind of housekeeping at the state hearth, and there is a debate as to whether they represent, in the cult, the king’s daughters or the king’s wife.

The girls chosen to be “priestesses” of Vesta were said to be “seized” (*capere*) by the *pontifex maximus*, and this “capture” had important juridical consequences: from that moment, the girl was no longer subordinate to the *patria potestas* (Gellius, *Noctes Atticae* 1.12.9; Gaius, *Institutiones* 1.130), nor to a tutor (Gaius, *Institutiones* 1.145); she may, of her free will, dispose of her fortune, and she also may appear in court as a witness (Gellius 7.7.2). So the Vestals Virgins enjoyed a number of civil rights that originally a Roman woman did not possess. From the beginning, this female priesthood was endowed with outstanding rights (civil rights and not only cultic honors), which led some scholars to regard the Vestal Virgins as forerunners of the “emancipation” of Roman women (Guizzi, 1968, p. 200). Some scholars pretend that there was cooperation and solidarity between Vestal Virgins and Roman women (Gagé, 1963). But only “presence” is attested and there is no proof for an act of solidarity (Cancik-Lindemaier, 1990, 1996).

The goddess’s feast, the *Vestalia*, was held on June 9. From June 7 to 15, her sanctuary was open exclusively to women, who were allowed to enter only with bare feet. On the last day it was cleaned. The end of this operation was noted in the calendars by the letters *Q(uando) ST(ercus) D(-elatum) F(as)* (literally, “Once the dung is removed, the day is profane”). This archaic notion, which marks the specific moment at which the day changes from being a *dies nefastus*

("forbidden or holy day," a day on which no public business could be transacted) to being *fastus* ("profane"), recalls the time "when a pastoral society in camp had to clean away the *stercus* [dung] of its flocks from the site of its sacred fire" (Dumézil, 1974, p. 320).

The sanctuary also contained some talismans that served as pledges of Rome's perpetuity. Among these was the Palladium, the statue of Pallas Athena, reputedly of Trojan origin (Servius, *Ad Aeneiden* 7.188; Livy, 27.27.14; Cicero, *Pro Scauro* 48). In contrast to the sacrificial ingredients preserved in the anterior part of the sanctuary (*penus exterior*), these "pledges of destiny" (*pignora fatalia*; Ovid, *Fasti* 6.445) were kept in the "holy of holies" (*penus interior*) that was closed off by a tapestry (Festus, p. 296 L.) and accessible only to the Vestals. This gave rise to the anecdote about the *pontifex maximus* L. Caecilius Metellus, who in 241 BCE, after having saved the Palladium from a fire, penetrated to the forbidden place and was struck blind (Pliny, *Natural History* 7.141). Thus, the symbolism of the "eternal fires" of Vesta (Ovid, *Fasti* 3.421) was reinforced by the presence of these "pledges of destiny."

The importance of Vesta is evident in the liturgy. The goddess was invoked at the end of every prayer and sacrifice (Cicero, *De natura deorum* 2.67), paralleling the opening invocation of Janus, who led the sequence of divinities. (This liturgical rule was the opposite of the Greek practice, which prescribed "beginning with Hestia."). Esteem for the Vestals followed naturally. Once a year they appeared before the *rex sacrorum* ("king of sacrifices") and said to him, "Vigilansne rex? Vigila!" ("Are you watchful, king? Be watchful!"); Servius, *Ad Aeneidem* 10.228). In a solemn ceremony at the Capitol, the *pontifex maximus* officiated along with the chief Vestal (Horace, *Odes* 3.30.8). One can thus understand Cicero's statement (*Pro Fonteio* 48): "If the gods were to scorn the Vestal's prayers, it would be the end of our power."

In the third century BCE Vesta did not entirely escape a syncretism that made her the homologue of Hestia: during the *lectisternium* of 217 BCE she was coupled with Vulcan/Hephaistos. Thus the beneficial fire, kept inside the city, was uncustomarily associated with the harmful fire, relegated to outside the *pomerium*, the religious and ritual boundary of the city (Vitruvius, 1.7.1). Another innovation started with Augustus, who upon becoming *pontifex maximus* in 12 BCE, even while respecting the old sanctuary of the Forum, had a chapel of Vesta (Aedicula Vestae) built on the Palatine near his palace and adorned it with a cultic statue (*Corpus inscriptionum Latinarum*, Berlin, 1863, vol. 1, no. 317).

VESTMENTS SEE CLOTHING

VIA NEGATIVA is a technical term for the negative way of theology, which refuses to identify God with any human concept or knowledge, for God transcends all that can be known of him. Yet the term points to the possibility of union with God and the experience of his presence.

Via negativa was described by Dionysius the Areopagite (c. 500 CE) in his treatises *Divine Names* and *Mystical Theology*. He developed further the ideas of the fourth-century Cappadocian fathers, particularly that of Gregory of Nyssa, but the term derives originally from the writings of the Neoplatonic philosopher Proclus (411–485). The writings of Dionysius were translated by John Scottus Eriugena (c. 810–880), who made *via negativa* the basis of his theology, arguing that it was more effective than the affirmative path. Since

Eriugena the term *via negativa* has been used by other theologians of mystical contemplation, particularly by Meister Eckhart (1260–1327) and Nicholas of Cusa (1401–1464).

The affirmative way of theology, *theologia kataphatika*, uses terms from one's own experience to describe God and his qualities. According to the affirmative theology, every term that refers to the good and the beautiful in this world can be applied analogously to God: "God is good," "God is love," "God is light," "God is truth." Yet the seeker after God becomes aware that God transcends all qualities or attributes that are applied to the creator by his creatures. God is good, but he is beyond and above any concept of goodness that one may imagine. What humans affirm about God does not express his reality. Whatever one may say of God one can also deny. People call him "Person," but, at the same time, they know that he transcends personal categories and empirical existence. God dwells in light that none can approach (*1 Tm.* 6:16), or he dwells in darkness, in which all names disappear. He transcends any concept that may be applied to him. This *via negativa* is the basis of "negative theology" (*theologia apophatika*), which presents God as ineffable and a mystery.

Via negativa is both a way to the knowledge of God and a way of union with him. God is known by *via negativa* when upon removal from the names, definitions, and statements used about God all that he is not. God cannot be named or defined. Any name or definition imposes limits, and God is above (*hyper*) them. Incommensurable and incomprehensible, he cannot be reached by discursive reasoning; he is not an object of knowledge, for he is above knowledge. *Via negativa* means radical denial of all definitions, transcending reason while not abandoning it. The person following *via negativa* in order to know God engages in a paradoxical search. On the one hand, he or she denies that God can be identified with anything or that God can be expressed in words or concepts; on the other hand, the seeker must follow the road of *via negativa* to be united with the ultimate reality. The life of those who seek union with God is one of purification of soul and overcoming of passion as an approach to that union. God is nearer to people than they are to themselves, yet he is inconceivable. Hence, those who experience union with God speak in negative rather than positive terms; God is even more incomprehensible than he is at the beginning of the religious quest. Worship, expressed in prayers and hymns, reflects *via negativa*. God, who transcends reason and thought, is honored in silence as well. Negative theology conveys the purest form of devotion and the experience of God's ineffable presence.

Dionysus the Areopagite thought of God as a being beyond any conception or name, who "transcends all affirmation by being the perfect and unique cause of all things, and all negation by plenitude of his simple and absolute nature." Any concept that can be applied to the world cannot be used regarding God. He is present in the world by providence, but not in his essence. Yet one can know God in the silence of unknowing. "Unknowing" (*agnosia*), a key word in the mys-

tical theology of Dionysius, means much more than absence of knowledge. To know God by unknowing is to surrender one's mind to him. God is not an object of knowledge. As the soul is saved by losing itself, so the mind knows God by unknowing. The mind is abandoned to be found and saved, for it is the mind itself that sees God at the last stage of union and contemplation. Knowledge of God is not simply knowledge but union with him. Still, God is incomprehensible even when this union is realized. To attain "superessential darkness" is the goal of *via negativa*.

The Christian experience of God must be distinguished from that of Neoplatonic mysticism. Although Dionysius the Areopagite was a devoted disciple of Proclus, the last great Neoplatonist, his description of the experience of God is not Neoplatonic. The Neoplatonists would say that God is incomprehensible to the human soul, but that this is because of the soul's union with the body. The "unbodying" of humans leads to liberation: When the soul, free from the body or from finitude, returns to the One, it attains perfect unity with it. The One is no longer incomprehensible. The apophatic, negative way is transformed into a cataphatic, positive one. This Neoplatonic outlook is far from the views of Dionysius.

Via negativa was important in later Christian theology as well, as in the work of the fifteenth-century German Catholic cardinal Nicholas of Cusa, who built upon and developed some ideas of Dionysius and Eriugena. With his conception of "learned ignorance," Nicholas teaches that God is ineffable, infinitely greater than anything that words or concepts can express, and that by the process of elimination and the use of negative propositions one comes nearer to the truth about Him. Negative propositions are true, whereas affirmative ones are inadequate, Nicholas asserts. He emphasizes that negative theology "is so indispensable to affirmative theology that without it God would be adored, not as the Infinite but rather as a creature, which is idolatry."

Via negativa is present in the Eastern religious traditions as well. The Hindu seeker's goal is union with *brahman*, the ineffable, the nonconceptual. The Upaniṣads contain innumerable statements expressing or reflecting the unknowability and intangibility of ultimate reality. *Brahman* is "without beginning, without end, eternal, immutable, beyond nature, is the Self" (*Kaṭha Upaniṣad*). The Self is to be described as *neti, neti* ("not this, not this"). The ignorant do not know *brahman*, for *brahman* remains hidden behind names and forms. To know *brahman* is to know what is beyond knowledge, and one who knows *brahman* becomes one with *brahman* (*Mundaka Upaniṣad*). Having attained the ultimate reality, the sage declares: "I am life" (*Taittirīya Upaniṣad*). Meditation as practiced in Eastern religions reflects *via negativa* more strongly than is the case in modern Western religions.

The Dao of Daoism, like *brahman* of Hinduism, is ineffable, indescribable, indefinable, ungraspable. The Dao is actionless, yet active. The Dao, the way of all life, is "beyond

the power of words to define.” The terms applied to the Dao are all relative, “none of them absolute” (Bynner, 1944, p. 25). The Dao gives life to everything, yet it is humble and lowly: “Existence, by nothing bred, breeds everything” (Bynner, p. 27).

Via negativa also permeates the Buddhist view of *nirvāṇa*. According to the Theravāda teaching, *nirvāṇa* is a state into which one enters by achieving victory over craving through the extinction of desire. The nature of *nirvāṇa* is beyond ordinary human existence; no images or concepts derived from the world of human experience are adequate for describing or analyzing it. By using only negative terms, such as “unborn, not become, not made, uncompounded,” the Buddha pointed to the nature of *nirvāṇa*. Something very positive is conveyed in this negative way, for these negative terms overcome limitations that are implicit in positive terms.

The Mahāyāna conception of *nirvāṇa* dispenses with the image of entering *nirvāṇa* and emphasizes the state of ultimate perfection. The *arahant*, the saint of the Theravāda, is interested in “entering” *nirvāṇa*; but the *bodhisattva*, the saint of the Mahāyāna, when he reaches the state of perfection, does not “stay” in *nirvāṇa* but brings perfection back into *samsāra*, the flux of events in this world. How is this state of perfection of the *bodhisattva* described? Again, only a negative approach is found to be adequate. The experience of the *bodhisattva* does not fit ordinary experience. The perfection of the *bodhisattva* is experienced as “compassionate oneness with others,” when any thought of the self as separate is transcended, when *nirvāṇa* and *samsara* are known to be not two different realms of existence but one. To refuse to “enter” *nirvāṇa*, to remain in the world for the sake of others, is in fact to be in *nirvāṇa*. This state of perfection can be adequately expressed only in negative terms: “*nirvāṇa* is the annihilation of ego conception,” or, “*nirvāṇa* is bliss unspeakable,” that is, perfect, timeless bliss. A notion common to these and similar statements is that human language is inadequate for the expression of *nirvāṇa*, which is “the recognition of the oneness of existence.” The Buddha said, “I will teach you the truth and the path of the truth.” The truth is *nirvāṇa*, but *nirvāṇa*, the experienced eternal in Buddhism, is ineffable. *Brahman* is ineffable. Dao is ineffable. God is ineffable.

What positive theology affirms about God is not false, but it is inadequate. Negative theology affirms that God excels in everything. Yet the apophatic way alone, without the cataphatic, may lead anywhere. Cataphatic theology, without an apophatic dimension, may build a system of concepts without an underlying experience of God. The absolute terms of negation that are common to the mystical traditions (*emptiness, void, darkness, nothingness*) are paradoxically positive in content. They are the product of the experience of the divine, the numinous. They are symbols that point to God, who is the “Wholly Other,” with whom nothing in this world can be compared. *Via negativa* indicates and expresses his unconditional existence.

VESELIN KESICH (1987)
Revised Bibliography

VICO, GIOVANNI BATTISTA (1668–1744), Neapolitan philosopher of history and culture. Vico was born and lived his life in Naples except for nine years (1686–1695) spent as tutor to the Rocca family at Vatolla. He received a degree in law from the University of Naples (Salerno) in 1694. Vico was professor of Latin Eloquence, that is, rhetoric, at the University of Naples from 1699 to his retirement in 1741. Because of the low salary of his position, Vico provided for his family by working as a private tutor and by writing on commission.

As part of the duties of his professorship, Vico presented a series of inaugural orations marking the beginning of each

university year. The last of these, *De nostri temporis studiorum ratione* (On the Study Methods of Our Time), published in 1709, contains the first statement of Vico's original philosophical position. This was followed by an attack on Descartes, *De antiquissima Italorum sapientia* (On the Ancient Wisdom of the Italians) in 1710, in which Vico states his famous principle of *verum et factum convertuntur*—the convertibility of the true and the made. Between 1720 and 1722 Vico wrote two works and a series of annotations that comprise a large study known as *Il diritto universale* (Universal Law), in one chapter of which Vico gives a first sketch of his concept of a new science of nations. The first version of his major work, now known as the *Scienza nuova prima* (First New Science), was published in 1725. The two parts of his autobiography were completed between 1725 and 1728. The definitive version of his major work, entitled *Principi di scienza nuova di Giambattista Vico d'intorno alla comune natura delle nazioni* (Principles of New Science of Giambattista Vico Concerning the Common Nature of Nations), was published in 1730 and revised in the year of his death. This version has come to be known as Vico's *Scienza nuova seconda* or simply as Vico's *New Science*. Vico's work was very little known in his time. It was revived in the nineteenth century by Jules Michelet and early in the twentieth century by Benedetto Croce and Fausto Nicolini. More recently Vico's thought has been given a further revival in works by a number of European and Anglo-American scholars.

In the *New Science* Vico claims that religion, marriage, and burial are the three “principles” (*principi*) at the basis of all human society. Vico intends to emphasize the genetic and etymological meaning of the word *principi* as “beginnings.” The institutions of religion, marriage, and burial are the necessary and sufficient conditions required for a minimal human society, one that can generate and transmit culture. Vico's emphasis is on religion, the first term in this list of principles or institutions; through its beginning, marriage and burial begin.

In Vico's view, religion arises from a primordial fear of the actions of a divine being and from the attempt to establish a relationship to this being through auspices. The primordial phenomenon through which the divine appears is thunder and humankind's fear of it. In Vico's account, the first humans, who have grown to gigantic size and who are living in the great forests of the earth since the biblical flood, produce the first act of human speech by calling the thunderous sky Jove. Every people, or nation, has its Jove. Human speech and the culture of any nation begin at the sudden transformation of the physical states of the thunderous sky and humankind's fear of it into a spiritual meaning, the presence of a god. Jove is the first name forged in human consciousness. This is done not through an act of reasoning but through an act of imagination, or what Vico calls *fantasia*. *Fantasia* is not the passive formation of images from sensation, but an active power to form or make something true in human experience. Vico calls Jove an “imaginative univer-

sal” (*universale fantastico*), which is the term he uses for the form of thought that characterizes the primordial religious-mythic or poetic mind.

In Vico's view, the nations of humanity begin at various times and places independent of each other, but all share a common nature. They all have structurally similar beginnings in the Jove experience and they all undergo the same course (*corso*) of historical development that passes through three ages, that of gods, heroes, and men. Within a *corso* various organized religions evolve from the impetus of the original religious mentality and life. The world of nations is a panorama of *corsi* and *ricorsi*. That all nations have a common nature—that they begin in an act of naming the divine and develop according to the pattern of three ages—is in Vico's view evidence of providence in history.

Providence, for Vico, is evident in this three-stage life of any nation. In the age of gods men see all of nature and social institutions in terms of the presence of gods. Social order exists through fathers who found cities and take auspices of the divine. In the age of heroes *fantasia* is directed to form not gods but certain human figures, such as Achilles, as imaginative universals. In the age of men all life and thought becomes secularized: abstract thought rather than *fantasia* dominates; natural piety fades; the forms of social life become dissolute. When this occurs a given *corso* comes to an end and a civilization falls. At this point God reestablishes the providential structure of history by a *ricorso* in which a new beginning is made by a return of the survivors to the original severe conditions of life and primordial religious experience.

BIBLIOGRAPHY

Works by Vico

The standard edition of Vico's writings is by Fausto Nicolini, *Opere di G. B. Vico*, 8 vols. in 11 (Bari, 1911–1941). The standard English translation of Vico's major work is *The New Science of Giambattista Vico* (Ithaca, N. Y., 1961; rev. trans. 1968). Complementary to this is *The Autobiography of Giambattista Vico* (Ithaca, N. Y., 1944). Both of these works are translated by Thomas G. Bergin and Max H. Fisch and are admirable in their style and accuracy. Both contain prefaces and notes that are indispensable. Vico's *De nostri temporis studiorum ratione* (1709) has been translated by Elio Gian-turco as *On the Study Methods of Our Time* (Indianapolis, 1965). Partial translations of Vico's works, including *De antiquissima Italorum sapientia* and *La scienza nuova prima*, are available in *Vico: Selected Writings*, edited and translated by Leon Pompa (Cambridge, 1982). For a comprehensive description of the Italian and English editions of Vico's works, see Michael J. Mooney's “Vico's Writings” in *Giambattista Vico's Science of Humanity*, edited by Giorgio Tagliacozzo and me (Baltimore, 1976).

Works about Vico

The classic bibliography is Benedetto Croce's *Bibliografia vichiana*, revised and enlarged by Fausto Nicolini (Naples, 1947–1948). Also useful is *A Bibliography of Vico in English, 1884–1984*, edited by Giorgio Tagliacozzo et al. (Bowling Green,

Ohio, 1986), and its supplements published by the Institute for Vico Studies in New York. For a full, paragraph-by-paragraph commentary on Vico's *Scienza nuova*, see Fausto Nicolini's *Commento storico alla seconda Scienza nuova*, 2 vols. (Rome, 1949–1950). For the classic interpretation of Vico's thought from the standpoint of Hegelian idealism, see Croce's *The Philosophy of Giambattista Vico*, translated by R. G. Collingwood (London, 1913). Three recent interpretations of Vico in English are Leon Pompa's *Vico: A Study of the 'New Science'* (Cambridge, 1975), which examines Vico's ideas as they constitute a science of society and history; Isaiah Berlin's *Vico and Herder* (New York, 1976), which considers Vico from the perspective of the history of ideas; and my own *Vico's Science of Imagination* (Ithaca, N.Y., 1981), which examines Vico's conception of "imaginative universals" as the basis of his thought. Several volumes of essays by European and American scholars have been edited by Giorgio Tagliacozzo, director of the Institute for Vico Studies, and others. Many of these essays show the connection of Vico with other thinkers; one of the most recent volumes is *Vico: Past and Present* (Atlantic Highlands, N.J., 1981). See also the yearbook, *New Vico Studies* (1983–), edited by Tagliacozzo and me.

DONALD PHILLIP VERENE (1987)

VICTORINES SEE HUGH OF SAINT-VICTOR

VIERKANDT, ALFRED (1867–1953), was a German sociologist. His early work focused on anthropology and social psychology. Born in Hamburg, Vierkandt studied at the University of Leipzig, where he was awarded the Ph.D. degree in 1892. He began teaching at the University of Berlin in 1900. In 1921 he was given the newly founded chair in sociology at Berlin, and he was awarded an honorary doctorate in 1932 by the University of Würzburg. Forbidden by the Nazis to lecture and give examinations, he was forced into retirement in 1934. After 1945 he took over the leadership of the Kant Society, and in 1946 he resumed teaching at the University of Berlin. He died in Berlin in 1953.

The influence of his teacher at Leipzig, Wilhelm Wundt, can be seen in Vierkandt's first major anthropological work, *Naturvölker und Kulturvölker* (1896), in which his differentiation between "primitive" and "civilized" peoples reflects Wundt's distinction between association and apperception. In his lectures Vierkandt dealt with the psychology, religion, art, and social conditions of "primitive people" with special attention to ethics and the philosophy of religion. Vierkandt focused upon the impact of a culture upon the individual through language, myth, and custom in his idea of the determining influence of the group on the individual's character development. In *Die Stetigkeit im Kulturwandel* (1908) Vierkandt not only presented a theory of cultural continuity and cultural change but also attacked the mechanical theories of diffusionism then prevalent.

After World War I Vierkandt shifted his focus and sought to outline the contents and methodology for the discipline of sociology. In *Gesellschaftslehre: Hauptprobleme der philosophischen Soziologie* (1923; 2d ed., 1928), he described sociology as the study of the "ultimate facts" of society, which, for him, were manifested in the specific properties of the group and in the characteristics of group life, the group being the carrier of interaction between its members. He further proposed a phenomenological method for this study. Vierkandt also acted as editor for a comprehensive dictionary, the *Handwörterbuch der Soziologie* (1931; reprint, 1959), to which most of the leading German sociologists of his day contributed. His study *Familie, Volk, und Staat in ihren gesellschaftlichen Lebensvorgängen* (1936) received little attention during the Nazi period but was republished in 1949 under the title *Kleine Gesellschaftslehre*.

Vierkandt's focus on the group as having an identity in itself instead of just being the sum of its individual members suggested a new approach to understanding the phenomena of religious life. Although his attempt to introduce phenomenology as a methodology for sociology has been rejected as not acceptable if sociology is to be a science, his view of religion as a distinctive phenomenon to be studied has been taken up and developed by historians of religions. Vierkandt understood culture as a historical phenomenon, something that gradually develops with its own inherent dynamism, and thus he advocated a nonreductive approach that does not seek to explain the phenomenon by some outside "key" but rather looks at the inner essence of the thing itself. This has been the basis for most approaches to the study of religions.

BIBLIOGRAPHY

The most recent appraisal of Vierkandt's work in English is Paul Hochstim's *Alfred Vierkandt: A Sociological Critique* (New York, 1966). Hochstim's work focuses primarily on a critical evaluation of Vierkandt's significance in the history and development of sociological thought, but it is more comprehensive and moves beyond the negative criticism of Vierkandt's phenomenological methodology found in Theodore Abel's *Systematic Sociology in Germany* (1929; reprint, New York, 1965). A brief treatment of Vierkandt's contributions to cultural sociology is found in *Social Thought from Lore to Science*, 3d ed., vol. 3, by Howard S. Becker and Harry Elmer Barnes (New York, 1961). A more philosophical appraisal of Vierkandt's contributions is Dora Peyser's "The Sociological Outlook of Vierkandt," *Australasian Journal of Psychology and Philosophy* 15 (1937): 118–136. Finally, more biographical details on Vierkandt's life and work can be found in the *Handwörterbuch der Sozialwissenschaften*, edited by Erwin von Beckerath et al., vol. 11 (Stuttgart, 1961).

WALLACE B. CLIFT (1987)

VIETNAMESE RELIGION. Like the whole complex of Vietnamese culture, Vietnamese religion has long been presented as a pure copy of the Chinese model. Trained for the most part in the discipline of Chinese studies and as-

sociating mostly with the literati class and the townspeople, scholars have been constantly confronted by their interlocutors with the Chinese ideal, notably in the domains of moral and aesthetic norms, and they have gauged the value of a rite or particular behavior according to its degree of conformity with the rules laid down by the Han Chinese texts.

Historically, the Red River Delta, cradle of Vietnamese civilization, was occupied by the Han for more than a thousand years. Moreover, the Middle Kingdom, as highly centralizing as the Roman Empire, had an especially effective organization wherein each parcel of conquered territory was put under absolute control and strict surveillance militarily, administratively, and ideologically. Chinese writing served as a unifying and assimilating instrument of the first order. Nonetheless, Dongsonian civilization, which flourished in this region before its destruction by the Han invasions, must have possessed a certain vigor, for despite the very long coercive occupation that followed it, the Vietnamese preserved their language and a part of their culture, finally succeeding in the tenth century of the common era after numerous revolts in liberating themselves from their deeply implanted Chinese occupants. Paradoxically, the consolidation for independence reinforced the prestige of the Chinese model among the literati. Their influence in this regard even resulted in the promulgation in 1812 by Emperor Gia Long, who had recently reunified the country, of a new code that was nothing more than a translation of a Manchu dynasty treaty, despite the fact that for more than three centuries, the Vietnamese had a set of original laws known as the Lê Code.

Yet, in a population that was more than 90 percent rural, ideology directly concerned only a relatively small number of people, those who wielded power and prestige. The ideals and beliefs they held touched but superficially the great masses, who remained bound to a set of rules transmitted orally and put to the test through daily observance. That the Vietnamese spoke a language belonging to a different family (Austroasiatic rather than Sino-Tibetan) was a considerable asset for the preservation of these rules. In addition, the development in the tenth century of the *chu nô*m, a demotic system of writing based on Chinese graphs, allowed for a closer contact between this popular culture and the literati class. This open attitude toward national beliefs and practices was reinforced with the extension of the *quốc ngữ*, the romanized system of writing introduced in the seventeenth century by Alexandre de Rhodes. This system acquired its full acceptance, however, only in the nineteenth century and did not become universal until the twentieth century.

In the religious sphere, this situation created a coexistence, on the one hand, of a Chinese model followed strictly by the most erudite or those instructed in the faith, and on the other, of popular cults observed by the great mass of people. Between the two there evolved a phenomenon of osmosis leading to a syncretism with multiple nuances.

The expansion southward along the entire length of the Vietnamese territory added further to this diversification of the religion by the absorption, on the small coastal plains, of the Chams, whose religious affiliation was divided between Brahmanism and Islam, and on the Mekong Delta, of the Khmer adherents to Theravāda Buddhism. These three religions, with that of the Proto-Indo-Chinese on which they were grafted, effected a syncretism probably more intimately overlapping than was the Triple Religion (Buddhism, Confucianism, and Daoism) of the Vietnamese with these same Proto-Indo-Chinese foundations. Even at its source, at the edge of the Red River Delta, mention must be made, albeit in passing, of the Tai influence on the beliefs and practices not only of the Muong, who speak archaic Vietnamese, but also on those of the Vietnamese, properly speaking, who inhabit the villages of the foothills.

The twenty-year separation between the northern and southern halves of the country introduced further variations in the religions. A great number of Catholics from the North took refuge in the South in 1954, where their political weight allowed them to extend their influence. It should not be forgotten that outside of the Philippines, where the majority of the population is Catholic, Vietnam has the strongest Christian minority in Asia.

Whatever the case may be, this article examines Vietnamese religion before the entry of the country into its Marxist period, focusing not on the Chinese model, already treated elsewhere, but rather on those aspects that touch directly on Vietnamese religion.

On the level of the individual, a fundamental concept is that of souls or vital principles. This concept governs as many aspects of daily conduct as it does basic rituals such as funeral rites or ancestor worship. In this domain, Chinese influence predominates. One encounters the scholarly Han tradition of the three souls and the seven corporeal souls. They too carry Sino-Vietnamese names: *hôn* (Chin., *hun*) and *phách* (Chin., *po*). However, if one follows Leopold Cadière, to whom we owe the most profound study on the subject, notable variations appear between the system of the literati and the vocabulary and conceptions of the common people. For example, with regard to *phách*, the inferior vital principles, its Vietnamese equivalent, *voc*, remained confined to the physical aspect of the body (especially the external appearance of the body). Moreover, the most current term used is in fact Vietnamese: *via*, which is in the same semantic range as *phách* (from form of the body to animal soul). Qualities of these *via* vary according to individuals as well as within the same individual. A person endowed with heavy *via* exercises a harmful influence on others, while light *via* brings beneficial influence.

Appropriate funeral rites are absolutely essential for the benefit of the departed. There is fear of two categories of malevolent spirits, the *ma* (Chin., *ma*) and the *gui* (Chin., *gui*), souls of the dead without sepulchers. In contrast, one can benefit from the aid of the *thần* (Chin., *shen*), souls of ances-

tors, understood in a noble sense. These three entities, expressed in Sino-Vietnamese words, testify to the survival of the *hon*.

From words of the same family comes the Vietnamese *hoi*, with its Sino-Vietnamese doublet *khi* (Chin., *qi*), whose meaning ranges from breath, inhalation, emanations from living or dead bodies, to supernatural influence over a person's life and destiny. This influence can emanate not only from a human but also from an animal, the ground, stones, plants, and so forth. The concept provides the essential basis of popular cults as well.

The Chinese model reposes on the complex called *tam giao* (Chin., *sanjiao*, triple teaching or triple religion), that is, Buddhism (Phật giáo; Chin., Fojiao), Confucianism (Không giáo; Chin., Kongjiao), and Daoism (Lao giáo; Chin., Daojiao), or the teachings of the Buddha, Confucius, and Laozi, respectively. Prior to 1975, when asked his religion, an educated Vietnamese generally would have answered that he was a Buddhist. On the civic or family level, however, he followed Confucian precepts; on the affective level or in the face of destiny, he turned to Daoist conceptions. Even if Mahāyāna Buddhism had an effect on his relationship with the otherworld, his personal behavior would have remained impregnated with Daoism. This fact was evident in his concern to conform with cosmic harmony, to pay careful attention to sources and currents of energy traversing the universe, and to parallel equivalents between these and the human body. These concerns were manifested in his desire to withdraw into nature as well as in his recourse to geomancy and diverse divinatory procedures, even to magic. It was primarily Confucianism and Buddhism, however, that affected his moral conduct.

It goes without saying that, as in China, each of the elements composing the Triple Religion in no way presented itself as impervious to the other two. Mutual borrowings throughout the course of centuries increased to the point that it was sometimes difficult to know with certainty which rite or belief to attribute to which element. During the twelfth and thirteenth centuries, disputes, sometimes very intense, pitted Buddhists against Daoists and caused them to accuse each other of plagiarism on a number of points. Recourse to divination in its multiple forms was not a monopoly of Daoists; Confucians also employed this means of decoding destiny.

This mixture was more deeply rooted among the common people, where features of each of the Three Ways were known only very superficially. Nevertheless, their respective dosages seem to have been in inverse proportion to that predominating among the literati. There was among the common people much less preoccupation with correct rules of government and with mandates from Heaven than with recourse to aid of supernatural beings to resolve the grievous problems of the here and now or to assure for oneself a decent future, both here and in the otherworld. It is true that the observance of ancestor worship attested to the ascendant

cy of Confucianism, but the different Buddhas and *bodhisattvas* tended to join the ranks of the multiple divinities and deities of the Daoist pantheon. Daoism itself was immeasurably enriched with popular autochthonous beliefs and practices, to which it lent a certain respectability by a tint of sinicization; furthermore, magic played a proportionally more important role in activities of a religious type.

The geographical situation of Chinese-occupied Vietnam placed it in a privileged position on the route of Indian merchants and missionaries traveling from India to China and of Han and Vietnamese pilgrims taking the reverse route. From the first centuries CE, Indian monks were personally active in spreading Buddhist doctrine throughout the Middle Kingdom, including South China. It is thus that some Vietnamese participated in the first translations of canonical texts. From the sixth century, and especially the seventh century, Theravāda Buddhism in Vietnam gave way to Mahāyāna, which was also prevalent in China. And in the pagodas, the three Buddhas (*tam thê phât*; Chin., *sanshi fô*) of the present, the past, and the future occupied the principal altar, other altars being invaded by statues of numerous *bodhisattvas*. Distinctly autochthonous *dhyāna* (*thiên*; Chin., *chan*) sects sprang up in the course of the centuries, and Vietnamese, in ever-increasing numbers, went on pilgrimage to India. The assistance given by eminent Buddhist monks to those who liberated the country from the Chinese accorded to Buddhism a considerable hold over the first dynasties. One was even to see kings abdicating to end their days in monasteries.

Confucianism, which regulated the examinations for the recruitment of the literati (in other words, the mandarin cadres), was from the time of the Ly (1009–1225) the dominant official ideology. Moreover, beginning with the reigns of the Lê, Confucianism provided the state and family moral code and rituals of a once-again independent Vietnam that subsequently was to behave as a southern replica of the Celestial Empire. Before the image of the Son of Heaven, its suzerain, the emperor of Dai-Viet, was responsible for his acts before the all-powerful God. If he did not observe the rules correctly, the mandate to govern that he received from Heaven would be withdrawn from him by different means: war, revolution, lack of a male heir, and so forth.

In matters of cult ministry, the eminent positions occupied by Heaven and earth found expression through the sacrifices offered to them by the sovereign, who officiated in person. These ceremonies, said to belong to the *nam giao* (Chin., *nanjiao*, sacrificial mound), appanage of imperial power, had always been vested with exceptional majesty and pomp. The *lê tích điền* (Chin., *jitian*, opening ceremony of the rice fields) also belonged to this cult complex. Here, too, the sovereign himself officiated—although he soon came to delegate the performance of this ceremony to a high-ranking mandarin. By tracing nine furrows on the royal field, the sovereign or his representative would open the plowing season.

Ancestor worship occupied a central place in the family cult. It represented the ritual expression of a cardinal virtue, filial piety (*hiêu*; Chin., *xiao*), the pivot of interpersonal relationships. The Vietnamese followed with devotion the precept of Mengzi, “duty toward parents is the foundation of all others,” that permeated all rules of conduct. The necessity of perfecting oneself morally and intellectually, loyalty to one’s friends, respect for one’s superiors, fidelity to the sovereign—all these were believed to arise from the domain of filial piety.

The extent of the economic impact of ancestor worship on a family depended on the wealth of that family. Reserved exclusively for the maintenance of such worship and for the performance of its ceremonies were revenues from property (rice fields, houses, etc.) that constituted the *huong-hoa* (Chin., *xianghuo*), the portion of the incense and the fire transmitted by inheritance from the father to his eldest son. It should be noted that Confucianism did not succeed in lowering the Vietnamese woman to the inferior rank occupied by her Chinese counterpart. Even in wealthy families the wife had the same status as her husband in family ceremonies, including those pertaining to ancestor worship in its strict sense. As the ideology of the mandarin type of government, Confucianism, by its very nature, became a target of Marxist-Leninist regimes. In Vietnam the offensive has been less virulent and of shorter duration than in the People’s Republic of China; it is true that Vietnam has not experienced any extremist phenomenon comparable to that of the Cultural Revolution in China.

Responsive as the literati were to the abstract universal order proposed by Confucianism, the idealized transposition of the bureaucratic hierarchy, they were equally responsive to the concrete universal order conceived by Daoist doctrine, with its correspondences (the human body, the microcosmic replica of the macrocosm) and its complementary contradictions (*âm* and *duong*, the Vietnamese equivalents of *yin* and *yang*). The peasant, on the other hand, retained of Daoism principally the imagery presented in the temples (*đền*) in various forms. Dominating the whole ensemble was the August Jade Emperor, Ngọc-Hoang (Chin., Yuhuang), assisted by his two chief ministers, Nam-Tao (Chin., Nancao, the Southern Constellation) and Bac-Đầu (Chin., Beidou, the Northern Constellation), who were charged respectively with keeping account of the birth and death of human beings and of governing a multitude of deities ranked according to an organization duplicating the imperial bureaucracy. Among these deities a special place must be assigned to Tao-quân (Chin., Zaojun), the hearth deity, who at the end of each year reports on the acts and deeds of humans; the days surrounding this event are a period of transition that provides an occasion for the Vietnamese to celebrate their most spectacular collective feast, the Tết Nguyên Đán (Chin., Yuan-dan), the celebration of the New Year. In popular Vietnamese consciousness Tao-quân is actually a composite of three personages, a woman and her two husbands, whose unhappy

marriages were the subject of legends. The other important category in Vietnamese practice is represented by the immortals, whose Chinese nucleus of eight personalities has been enlarged by the addition of native deities.

The recourse to mediums and ritual decorative features representing the pantheon dominated by the Jade Emperor made possible the assimilation of Daoist elements into a certain number of Vietnamese popular cults. The one that came closest in form to a Daoist cult was that attributed to Trần Hưng Đạo, a spirit served by a male medium (*ông đồng*). Trần Hưng Đạo is a Vietnamese national hero from the thirteenth century, conqueror of the Han armies of the Mongol dynasty. The medium would perform a violent ritual in the course of which he inflicted on himself bloody ordeals and healed the sick by exorcising them of the traitor or vanquished general who possessed them.

The cult of the *chu vi*, dignitaries served by female mediums (*ba đồng*), borrowed from Daoism some elements of the decor, and at least in the north, the possession of the mediums by some immortals (whereas in the south it was spirits rather than immortals who descended). Here the medium (a *ba đồng* in this case) is mounted not by one god but successively, in the course of the same séance, by different spirits of both sexes and of different ages.

At the collective level, the cult of the tutelary deity (*thanh-hoang*; Chin., *shenghuang*), the protector of the commune, held an eminent place in Vietnamese popular religion. Indeed, the most important public building in a village was the *đình*, both a communal house and a place of worship; it sheltered the altar of the tutelary deity and served as a meeting place of the notables for the settlement of questions of administration and internal justice. The *đình* was the center of collective life on the social as well as the religious level. It constituted the core of the system of peasant relations with the world beyond (through the intervention of the *thanh-hoang*) as well as with the state (the tutelary deity was confirmed by an imperial warrant obtained at the request of the notables).

The *thanh-hoang* could be a celestial deity, a deified legendary or historical personage, or even a disreputable person, such as a thief or a scavenger, whose violent death at a sacred hour endowed him with occult powers. It even would happen, although quite rarely, that an influential mandarin who had rendered an important service to the village became a guardian spirit during his lifetime. A deity who failed to protect the village at a critical moment or whose perfidy was denounced by a mystical revelation would be chased away and replaced by another deity.

A maintenance service for the fire and the incense was celebrated throughout the year, and ceremonies were held at the *đình* on the first and fifteenth day of each month and on certain calendar feasts. The most important feast of the year was the Vao Đám, or Vao Hội (to be in festivities), which took place in spring or autumn, or on the anniversary

of the birth or death of the tutelary deity. This feast lasted for two weeks, during which time it was forbidden to hold any funeral ceremonies. It was celebrated in great pomp with a series of processions, offerings, and prayers. Many villages undertook the organization of various entertainments: theater, cockfights, bullfights, and chess games with the people themselves acting as the chess pieces. Particular to this feast was a rite called Hem, often held secretly, recalling the salient features of the deity's life. It was celebrated at night when commemorating a dishonorable act: a scene of robbery for a thief deity, an enactment of excrement collection (with the excrement replaced by peeled bananas) for a scavenger deity, and so forth.

Certain trees, rocks, and natural boundaries were objects of cults that could lead to the construction of small altars. This veneration, very often fearful, could have varied origins. The tree, for example, could influence by the simple force of its being. It could also shelter a malevolent spirit, such as a *ma*, the soul of an unburied dead person, or of a *con tinh*, the soul of a young girl or woman who died before having experienced the joys of marriage. The man she succeeded in seducing would lose his reason and die unless exorcised in time. Sometimes, however, the tree or stone was not simply the habitat of a spirit but was in itself a deity: a deity-tree or deity-stone, such as one finds among the Proto-Indo-Chinese of the hinterlands.

The dominant features of Vietnamese religion were its openness to all forms of spirituality and its profusive character that resulted from this openness. These features were manifested on the level of the literati, whose most erudite members sought to abide by the texts of the Triple Religion or at least of one of the religions, as well as on the popular level, where the cult of the tutelary deity was observed and that was above all responsive to the different spirits peopling the environment as well as to the counsels of specialists. A village might possess a temple of one or another of the Three Ways, peopled with saints of the other two. There might at the same time be a temple by the seaside dedicated to the whale deity washed up and stranded on the shore. It should be noted that the intransigence of Christianity would eliminate from the territory of a converted village all monuments consecrated to another cult. This did not, however, prevent the majority of Christian peasants from having at least a minimum of respect for the spirits haunting the premises.

This general tendency toward syncretism made possible a strong implantation of Catholicism (but not of Islam) and encouraged Vietnamese, when emigrating in large numbers to foreign countries, to worship local deities until these were assimilated. This tendency has resulted, likewise, in the rise of new forms of syncretisms such as the Hoa-hao or Cao Dai, the first grafted on a Buddhist core, the other on a Daoist one.

Revised Bibliography

VIJÑĀNABHIKṢU (c. sixteenth century CE) was an Indian philosopher and exponent of a syncretic Sāṃkhya-Yoga and Vedānta system. Nothing is known of the birthplace of Vijñānabhikṣu, but some scholars have suggested that he was a native of Bengal. His direct disciple was Bhāvāgaṇeśa, who may be the same as Gaṇeśa Dīkṣita, the author of a commentary on the *Tarkabhāṣā*.

Vijñānabhikṣu holds a significant position in the history of Indian philosophy. A Sāṃkhya-Yoga thinker, he is nonetheless recognized as having developed a distinct philosophical position all his own. He was the author of as many as sixteen or eighteen works, four or five of which are available as printed texts. The most notable are *Yogavārttika*, *Sāṃkhya-pravacana-sūtrabhāṣya*, and *Sāṃkhyasārah*. He also wrote commentaries on the *Brahma Sūtra* and on many Upaniṣads, including the *Kaṭha*, *Kaivalya*, and *Taittirīya*.

Although Vijñānabhikṣu was undoubtedly an original thinker, his originality was strongly tempered by his syncretic tendencies, as seen in his combining of Sāṃkhya-Yoga with Vedānta thought. One of his unique views was that the individual's ultimate goal is not the cessation of sorrow (*duḥkha*), but the cessation of the *experience* of sorrow. He maintained that the state of *mokṣa* ("liberation") is not blissful and that when the scriptures talk about the blissful state of the self (*ānandamaya*), what they really mean is the absence of sorrow.

Vijñānabhikṣu was primarily a yogin, both in theory and practice. In his *Yogavārttika*, he claimed that Yoga (as taught by Patañjali) is the best path to liberation. He believed that it was necessary to reconcile Vedānta philosophy with Yoga philosophy in order to combine knowledge and praxis. He was critical of Advaita Vedānta and charged that the Advaitins were crypto-Buddhists.

For Vijñānabhikṣu, sentient beings (*jīvas*) are not identical with *brahman* (Īśvara or Parameśvara) but are just parts of *brahman*. The relationship is one of the-part-and-the-whole, not total identity; the *jīvas* are the sparks of the fire that is *brahman*. *Brahman* creates the world, often referred to as *māyā* ("illusion"). However, according to Vijñānabhikṣu, the world is not illusory, because *prakṛti* ("matter, nature"), being part of *brahman*, is eternal and real. The creation is a real, not an illusory, transformation (*pariṇāma*), as in the Sāṃkhya view.

Bhikṣu's interpretation of the *Yoga Sūtra* differed from that of either Vācaspati Miśra or Bhoja. His interpretation of *vikalpa* ("mental discrimination") indicates a Buddhist in-

fluence. The Yoga school regards *suṣupti* ("dreamless sleep") as a *vr̥tti* ("transformation") of consciousness, while the Vedānta school argues that it is not a *vr̥tti* at all. Bhikṣu reconciles these viewpoints by saying that there are two states of dreamless sleep: *ardha* ("half") and *samagra* ("full"). The Yoga school talks about the first, while the Upaniṣads talk about the second.

God, the creator, is not simply an agent (as the Nyāya-Vaiśeṣikas hold) who creates the universe as a potter produces a pot. The causality of God is said to be very different from the three types of causality mentioned by Nyāya-Vaiśeṣika: *samavāyin* ("inherent"), *asamavāyin* ("non-inherent"), and *nimitta* ("efficient cause"). Rather, Vijñānabhikṣu refers to *adhiṣṭhāna kāraṇa* ("ground cause, container"). For Śaṅkara too, *brahman* is the ground for all changes and causation. But while Śaṅkara believes that all changing phenomena are unreal and the ground cause is real, Bhikṣu asserts that all changes are real and that the unchangeable ground cause, *brahman*, sustains this principle of change within its individual unity. By rejecting nondualism, Bhikṣu also fostered the *bhakti* movement. He interpreted *bhakti* as true devotion in the service of God, and referred to the Bhāgavata description of *bhakti* as "the emotion that melts the heart and brings tears to the eyes."

VIOLENCE. Humans, as individuals and as groups, have the potential to be violent. Physical violence is disruptive and damaging to other individuals and groups because it conflicts with some of their basic rights. Individuals try to protect themselves from injury, and societies try to channel and curb violence both through symbolic action and through concrete counterviolence. Individuals and groups, on the other hand, may feel the necessity to resort to physical violence, while ritualization and symbolism may make violent acts easier to perform.

Religion is the most powerful symbolic system humans have developed. Throughout history, religion and violence have been in close contact. The detailed history of this contact still has to be written, although there is no lack of research on individual epochs and episodes, often stimulated by contemporary events. Recent examples include the surge in religiously motivated violence during the 1990s, reflected in the destruction of Yugoslavia or the conflict between Israelis and Palestinians. Both the actors on the ground and commentators from the outside understood these conflicts as religious confrontations, at least in part. During the same period, the rapid spread of religious fundamentalism, Christian as well as Islamic, led to further reflection on the relationship between religion and violence. The trauma of the attacks on the World Trade Center in New York and the Pentagon in Washington, D.C., which were quickly interpreted as religious as well as political phenomena, provoked yet another body of studies. On the other hand, general studies of the relationship between religion and violence are rare, and they often appear to be somewhat one-sided. Religion is usually perceived either from the perspective of those institutionalized monotheist religions that dominate the contemporary world, or from a secular position. Since even general research has grown out of actual necessities in most cases, relatively little attention has been given to the place of violence within polytheistic religious systems.

INTRODUCTION. Earlier philosophical reflection treated violence within the wider context of ethics or anthropology. Ethological research, in which Konrad Lorenz's investigation of aggression as a basic biological drive was the perhaps most influential theory in the mid-twentieth century (Lorenz, 1959), was a later field for the study of violence. In the early twenty-first century, however, research on societal and political violence has been carried out primarily in the area of conflict and peace studies. These disciplines evolved as a response to World War II—the Stockholm International Peace Research Institute (SIPRI) being founded in 1959 and the *Journal for Peace Research* in 1961—and gained momentum during the Vietnam War. The origin of these fields of study in actual political events accounts for their perspective. Researchers in these areas are interested in the political and social conditions under which collective violence originates as well as finding ways to counteract collective violence. They challenge Lorenz's assumption that violence is a biological given of the human condition. Most of these researchers, however, regard religion as relevant only as a social or political variable, and often overlook the consequences of the possibility that it might be an anthropological constant (Burkert, 1996).

As a heuristic approach—that is, one intended to stimulate exploration—the topic of religion and violence can be subdivided into three different questions: (1) religion can be used to legitimate and condone or even to stimulate and incite to violence—this is the most common view, and examples range from the role of priests in warfare to religious riots and wars; (2) violence, both direct and symbolic, through rit-

uals, narrations and images, can be seen as inherent to religion; (3) religion can be a healing force after violence has been committed, as part of its function to create or restore social cohesion.

DEFINITIONS. In current research, violence is understood in several different ways. In common speech, violence usually refers to physical force directed against another human being in order to inflict bodily harm or, in extreme cases, death. This narrow use of the term is easily extended to include physical violence against other living beings and material objects. Violence may be a spontaneous emotional reaction to a provocation; premeditated; or institutionalized and ritualized, as in the violence associated with warfare, torture, or punishment. In conflict research, the term tends to be used in an even wider sense. Johan Galtung, the founder of peace studies, introduced the concept of *structural violence* as a supplement to *direct* (physical) *violence*. Structural violence refers to the coercion inherent in societal structures that is used without the agreement of the victims and against their interests, such as the exploitation of workers in capitalistic economies or the exclusion of foreigners from a state. Its effectiveness relies on the threat and plausibility of direct violence (Galtung, 1969).

A third type of violence is *cultural violence*, which is structural violence of such long duration that it is embedded in and protected by cultural institutions. Religious violence, or the violence inherent in the three institutionalized monotheistic religions of the West, is the most obvious example of cultural violence (Galtung, 1990). The contrast between direct and structural violence is useful because it demonstrates that direct violence is not necessarily an aberration but a direct consequence of structural violence, and thus of social developments and institutions. This connection has consequences for those who wish to combat violence. Cultural violence, on the other hand, might appear as a simple extension of structural violence to a specific content; it might be seen as inherent in such cultural institutions as those associated with religions. The consequences for the question of religion and violence, however, have to be explored in considerably greater depth than has been done hitherto (Galtung, 1997–1998). As to the social conditions under which direct collective violence is likely to develop, studies converge to show that such violence is likely to occur when “political power is centralized, non-democratic, and highly dependent on one's group membership, be it race, ethnicity, religion, or some cultural division” (Rummel, 1997, p. 170). This summary suggests that religion, not only in its monotheistic variants, is one among several possible triggers for violence, but fails to explore the question as to whether there is a privileged connection between the two.

RELIGION IN THE SERVICE OF VIOLENCE. Every society is committed to the use of direct violence, if only to defend itself against outside and inside enemies. In developed societies, however, the state usually claims a monopoly on the use of violence. Violence inside the state is regulated by its laws

and structured by its justice system, violence against other states by concepts of warfare, among which the Roman notion of the *bellum iustum*, or just war, had the most important transhistorical consequences. In polytheistic systems, both law and warfare are protected by such specific deities as the Greek Zeus, the guardian of justice inside society, and Athena, the goddess of properly conducted defensive wars of the city-state of Athens. Monotheist systems place both areas under the tutelage and protection of their respective gods. This divine protection finds expression in the rituals surrounding both the performance of justice and warfare. War often was constructed as a time outside of society's normal order and taking place outside civic space; rituals opened and ended this period, such as the Spartan sacrifices to Artemis Agrotera, "Wild Artemis," before a battle, or the many rituals of integration performed for returning warriors (Parker, 2000). Religion thus marks the borders of war's confined territory. This role of religion was rarely contested in the name of a nonviolent and pacifist theology, as in the Buddhist concept of *ahimsā*. As long as early Christianity remained at the margins of the state, it was mostly a pacifist faith, following the nonviolent teachings of the New Testament (Swift, 1979). This attitude changed, however, when the Roman Empire adopted Christianity as its official faith. Christian leaders were then confronted with the necessity of violence related to warfare. The prosecution of war was left to the laity but was legitimated from Scripture, albeit under very clearly stated conditions (e.g., Augustine of Hippo [354–430], *Letter* 189). Unlike Christianity, Judaism and Islam never had a tradition of nonviolence; war thus presented many fewer theological problems. Nevertheless, in these religions too war needed sanction and regulation. Islam in particular developed the concept of *jihād* (literally, "the exercise of faith"), the just defense of the faith (Colpe, 1994; Lewis, 2003).

Despite these restrictions on open violence, Christian and to a lesser extent Muslim history is full of religious wars, most conspicuously the crusades that also turned against Orthodox Christian Byzantium and the European wars of religion that followed the Reformation, such as the Thirty Years' War of 1618–1648. The development of explicitly religious wars changes the relationship between religion and violence: religion now is the very source of violence, at least in the reading of the actors themselves. It has always been easy to find political and economical motives for these religious wars, in contrast to the indigenous understanding of them. The key problem then has been to assess the extent and sincerity of the combatants' religious motivations. To some extent, the answer has always been determined by axiomatic choices.

In the past, historiography tended to emphasize "rational" political and economical motives. More recently, however, indigenous insistence on religious motives has been taken more seriously: religion has come to be seen as more than just a thin veil hiding more important motivations (Holt, 1993). This reevaluation of motives is true also for the

riots that accompanied religious practice before the rise of monotheist systems. When two neighboring villages in Roman Egypt fought each other over the killing of a sacred animal (Plutarch, *On Isis* 72; Dio Cassius 42.34; Juvenal, *Satire* 15), or when the killing of a sacred cat by a Roman soldier triggered riots (Diodorus Siculus 1.83.8), later scholars often pointed to rival political and economic ambitions, tensions created by the presence of foreign armies in Egypt, or popular impressions that local traditions were threatened. But in all cases, the native discourse as well as the discourse of the Roman administrators and commentators was religious. The same was true of the riots against the early Christians that triggered such major persecutions as the one in Lyons in 177 CE. The objections against the Christians were usually couched in the language of sacrifice and perverted sexuality; economic problems entered only marginally, as when Paul threatened the prosperous business of the Ephesian silversmiths (*Acts* 19).

But it was not until Natalie Zemon Davis published a seminal paper in 1973 on religious riots in early modern France that historians were compelled to take religion seriously as a motive for violence. With the establishment of the secularized state, matters became more complicated. Research on religious violence in nineteenth-century France has shown that as a consequence of the French Revolution, "the boundary between religious, social and political violence was extremely porous" (Ford, 1998, p. 105). Anticlerical riots in the name of a secularized state against the Catholic Church confused the distinction between political and religious violence more than the riots against Roman occupiers that were triggered by the killing of a sacred animal. In the latter case, violence was used against foreigners who were seen to violate the norms of the indigenous religion. In the former case, violence resulted from the political desire to curb the influence of a religious institution.

VIOLENCE AS INTRINSIC TO RELIGION. The key question in this debate is whether religion as such contains violence or whether it is only associated with it. The answers given by various scholars range from agreement to fierce denial, but the question may be too simplistic. Many religions contain rituals, stories, and representations that are directly violent. The pantheon of a polytheistic religion usually contains one or several *violent divinities*; these are often connected with the irrational violence of warfare, such as Ares in Greece or Erra in Mesopotamia. But these gods represent a violence kept at a distance and with which humans are uncomfortable. Civic cults of Ares are extremely rare, and gods as well as humans are said to hate him (*Iliad* 5.889). The myth of Erra describes his rule as only short-lived and characterized by senseless destruction that necessitates the reconstruction of Babylon (Maschinist and Sasson, 1985). These divinities define a world in which war is a bitter necessity that should be as infrequent as possible.

Other stories, however, place violence at the foundation of the present-day cosmic order. Marduk, the god of Baby-

lon, creates the world from the body of his opponent Tiamat and human beings from the blood of her closest ally, while in Greek mythology Zeus fights the Titans and the monster Typhon before he can establish his rule (Trumpf, 1959). In one possible reading of the New Testament, the Christian God must let his son die as a victim of human violence in order to found the new messianic world order. Order can be created only through the destruction of its antecedents and its enemies. This order is also precarious because these hostile forces are still active and must be kept at bay. Thus protective violence is always necessary; for example, the Indian goddess Durgā is a powerful demon killer who protects the world “every time when demons create danger” (*Devīmāhātmya* 11.55).

Animal and human sacrifice. The notion of protective violence leads to the practice of *animal sacrifice*, a rite that is widespread in agricultural cultures. The victims are usually domesticated animals. The performers often regard the killing of animals as unproblematic because it prepares them for a common meal with the gods. Moreover, meat is a staple food in these cultures. Ritualization and mythologization explain and legitimate the public slaughter of animals, as does the ritualization of hunting and warfare. The very fact of ritualization, however, might point to the existence of a latent problem, in that the ritual and the discourse about it must give some kind of meaning to the killing. Sometimes, the indigenous discourse about animal sacrifice and its practice point to the awareness of the problem. In some Polynesian cultures, the victim—a pig—is never killed and sometimes never eaten by its owner because it is considered “a brother of humans.” The complex ritual behavior allows the owner of a pig, however, to also eat pork (Lanternari, 1976, pp. 298–303).

In Indo-European sacrificial ideology, the stories talk about the killing of a human being (Lincoln, 1991, pp. 167–175). Thus the problem of killing interferes with the necessity of eating to the point that animal sacrifice is altogether abolished. This abolition leads to vegetarianism, as with the Pythagoreans in Greece or the Buddhists and Jains in India. In these instances, animals are regarded as too closely related to humans to be killed. But with the exception of Buddhism, the rejection of animal sacrifice remained an option only for individuals, and could be given up again (e.g., Findley, 1987).

Human sacrifice as the ultimate form of sacrificial violence exists at least in the discourse about sacrifice, even in societies in which actual human sacrifice is unattested. Greek and Roman myths, for example, establish some violent rituals on a past history of human sacrifice that the present and less cruel rite replaced. Stories that legitimate direct violence against others (Christians, Jews, Gnostics, religious reformers, political rebels) typically accuse them of practicing child sacrifice and even cannibalism. Accusations of Satanism in the 1980s and 1990s adopted the same strategy to trigger (and, presumably, legitimate) judicial violence in private re-

lationships (Frankfurter, 2005). In other societies (Celts, Aztecs), human sacrifice is attested with varying explanations of the practice. In some cases, the foundational violence is taken more seriously and avoided by exchanging an animal for a human victim (Lincoln, 1991, pp. 176–207).

Not all modern theories of animal sacrifice pay attention to its inherent violence. The two best-known theories that address the problem, Burkert’s and Girard’s, were both published in 1972; their connection with the wider cultural interest in violence seems obvious. Although their theories assume different origins for animal sacrifice (hunting rituals in Burkert’s case, scapegoat rituals in Girard’s), they both arrive at similar conclusions regarding the function of sacrificial violence—namely that the ritualized killing of a living being channels the group’s innate violence and renders it harmless. Violence is inherent in the religious act because violence as a threat is innate in humans, and religion offers a symbolized way to domesticate and defuse it. In the meantime, other scholars have challenged some of the premises of these constructions (Hamerton-Kelly, 1987), and the debate continues. The main thrust of this group of theories is that religion does not contain or breed violence, but is rather a powerful instrument to counteract it.

The problems surrounding questions of violence in the major monotheistic religions, Judaism, Christianity, and Islam, are more intricate and more controversial. Contemporary critics underscore the fact that the two main characteristics of monotheistic faiths, revelation and universalism, make them by their very nature potentially violent. Revelation can lead to conflicts with those who contest this revealed truth, and universalism can lead to missionary expansion (Galtung, 1997; Assmann, 2002). These consequences, however, are not inevitable; the certainty of revealed truth generates conflicts only when the claim of another truth becomes threatening to one or both parties. Early Christianity collided with the Roman religious system when its refusal of sacrifice to the emperor was seen as a threat to the divine protection of the empire (Fox, 1986, pp. 452–455). The Roman Catholic Church came into conflict with such other Christian groups as the Montanists, or with pagan diviners (Fögen, 1993) whose rituals or beliefs challenged its monopoly of truth.

In all cases, the situation is more complex than a simple conflict between religious systems. Modern analysts perceive political and economical reasons for outbreaks of violence as well as a conflict of personalities; the Montanist claim of charismatic prophecy, for example, challenged the established hierarchy of the church (Trevett, 1996). But again, when indigenous actors give religious motivations for violent behavior, they should be taken at their word. The religious motivations of the Islamic terrorists who attacked the United States on September 11, 2001, were intended to be taken seriously, as were the claims of Mormon fundamentalists who killed “recalcitrant” wives (Krakauer, 2003). Although Islam has a tradition of avoiding religious conflicts with non-Muslims, Islamic fundamentalism as it developed in early

twentieth-century Egypt expressed its resistance to Western values in a religious key (Ali, 2002), as did Western fundamentalism with respect to the modernization of society.

Religious imagery and violence. A key role is often attributed to the *religious imaginary* of narrations and images. All societies possess traditional (or even sacred) stories about the violent acts of their gods, demons, heroes, or ancestors. Many of these tales value these acts positively and regard them as a necessity, as in foundation myths or stories about defense against spiritual or human enemies. Even when violence is perpetrated by others against members of one's own group, the result can be turned into a positive statement, as in the narratives of Christ's crucifixion or the deaths of Christian, Jewish, or Muslim martyrs. Another type of positive narrative of violence is found in apocalyptic visions from the Jewish-Christian *Book of Enoch*, which was composed in the second century BCE, to the contemporary series of "Left Behind" novels that are popular among American Christian fundamentalists in the early twenty-first century. In apocalyptic visions, violence serves as a deterrent from sin or as a tool of mission and conversion. In martyrologies, the stories (whose recitation was part of the liturgy of the early Church) encouraged their audiences to withstand the violence of persecution in order to preserve the faith. Stories, however, can always be reenacted; violent stories can, under certain circumstances, generate real violence (Lüdemann, 1997; Ellens, 2004, vol. 1). The texts do not always function as directly as they did during the French wars of religion, however, when executions and mutilations reproduced the details related in apocalyptic narratives (Crouzet, 1990).

The early Christians sometimes provoked the Roman authorities in order to suffer martyrdom in a sort of passive violence. In a theologically highly contested move, contemporary Palestinian suicide bombers turned active violence against their enemies and themselves in order to become martyrs. The investigators of persons suspected of witchcraft in early modern Europe projected their own concepts of demonic behavior on their victims in order to legitimate their own punitive violence (Frankfurter, 2005). The reasons for this "dark side" of religion are complex, but a major factor appears to be the tradition of reading sacred books in order to find models for religiously (and thus ethically) correct action. This pattern of reading is central to Christian, Muslim and Jewish religious education. To deny that some of the stories taken as models encourage violence, or even to point out that the sacred books contain at least as many stories that inculcate nonviolence, compassion, and love, serves only an apologetic function. The researcher seeks to analyze why certain epochs, circumstances and charismatic personalities preferred one type of story or the other, and why certain epochs and circumstances actualized the dormant potential of the religious imaginary. It is instructive to see how one of the most violent symbolic systems, Tantrism, is serving in its Himalayan version as the most powerful spiritual guide to total ascetic calm (Huntington and Bangdel, 2003), while Bengali

Tantrism served as an ideological source for political violence during the struggle for Indian independence, its goddess Kalī coming to represent Mother India as a violent rebel (Urban, 2003, pp. 73–133).

RELIGION AND THE END OF VIOLENCE. Religion plays a vital but relatively unexplored role in the aftermath of violence. On one level, rituals mark the end of such periods of violence as warfare. Cathartic rituals and rituals of thanksgiving reintegrate the returning warriors into the fabric of peaceful society; the ringing of church bells and modern peace celebration liturgies also preserve this religious symbolism.

On another level, religion is used to heal the wounds caused by a violent conflict. In early nineteenth-century France, Catholic missionaries kept the memory of the horrors of the reign of terror alive by staging processions that retraced the way to the guillotine of prominent victims. The declared aim of these ritual processions was to remember the violent acts and, through confession, to expiate them. According to Catholic teaching, forgiveness and expiation are possible only after penitence, and penitence presupposes memory of the sinful deed, even if this remembrance contradicted the official policy of *oubli*, forgetting, as practiced by the Restoration monarchy (Kroen, 1998). After the violent civil wars in Zimbabwe in the 1980s, both the official Catholic Church and the country's indigenous religions were concerned with healing; because, in an indigenous reading, the violence had unleashed the demons of the murdered, Catholic exorcists and traditional diviners and spirit mediums stepped in (Ranger, 1992, pp. 705–706). The extraordinary situations that prevailed in both nineteenth-century France and twentieth-century Zimbabwe after a period of unusually high levels of violence generated new rituals within the matrix of traditional ritualism. The same dynamics are visible elsewhere; for example, Andean peasant communities readapted "new discourses and practices . . . according to community memory about ancient practices" after the violence of the *Sendero Luminoso* (Shining Path) insurrection (Gamarra, 2000, p. 286). It appears that most communities can deal with "ordinary" levels and forms of violence with the help of their traditional symbolic systems. On the other hand, extraordinary violence, especially the violence generated by prolonged periods of intensive or brutal civil war, demands adaptations of the symbolic language that gives meaning to violence.

FRITZ GRAF (2005)

VIRACOCHA is the name or title in the Quechua language of the Inca creator god at the time of the Spanish conquest of Peru in the sixteenth century. According to Inca beliefs, Viracocha (also called Ticciviracocha) made earth and sky, then fashioned from stone a race of giants. Displeased with them, he turned some giants back into stone and destroyed the rest in a flood. He then caused the sun and the moon to rise from Lake Titicaca, and created, at nearby Tiahuanaco, human beings and animals from clay. He painted clothing on the people, then dispersed them so that they would later emerge from caves, hills, trees, and bodies of water. He gave the people social customs, food, and other aspects of civilization. Appearing as a bearded old man with staff and long garment, Viracocha journeyed from the mountainous east toward the northwest, traversing the Inca state, teaching as he went. At Manta, on the coast of Ecuador, he spread his cloak and set out over the waters of the Pacific Ocean.

Viracocha is described by early Spanish chroniclers as the most important Inca god, invisible, living nowhere, yet ever-present. Texts of hymns to Viracocha exist, and prayers to him usually began with the invocation "O Creator." A temple in Cuzco, the Inca capital, was dedicated to him. He also appeared as a gold figure inside Cuzco's Temple of the Sun. Near this temple, a *huaca* (sacred stone) was consecrated to Viracocha; sacrifices were made there, particularly of brown llamas. At the festival of Camay, in January, offerings were cast into a river to be carried by the waters to Viracocha.

Viracocha may have been identified with the Milky Way, which was believed to be a heavenly river. His throne

was said to be in the sky. The sun, the moon, and the star deities were subservient to him. Inti, the sun, was the imperial god, the one whose cult was served by the Inca priesthood; prayers to the sun were presumably transmitted by Inti to Viracocha, his creator.

Because there are no written records of Inca culture before the Spanish conquest, the antecedents of Viracocha are unknown, but the idea of a creator god was surely ancient and widespread in the Andes. Viracocha—who was related to Illapa (“thunder,” or “weather”)—may have been derived from Thunupa, the creator god (also the god of thunder and weather) of the Inca’s Aymara-speaking neighbors in the highlands of Bolivia, or from the creator god of earlier inhabitants of the Cuzco Valley. The god’s antiquity is suggested by his various connotations, by his imprecise fit into the structured Inca cult of the solar god, and by pre-Inca depictions of a deity very similar to Inca images of Viracocha. Viracocha is sometimes confused with Pachacámac, the creator god of adjacent coastal regions; they probably had a common ancestor.

The eighth king in a quasi-historical list of Inca rulers was named for Viracocha. The god appeared in a dream or vision to his son, a young prince, who (with the help of the god, according to legend) raised an army to defend Cuzco successfully when it was beleaguered by the rival Chanca people. This prince became the ninth Inca ruler, Pachacuti Inca Yupanqui (r. 1438?–1470?), the great man of Inca history, who glorified architecturally the Temple of Viracocha and the Temple of the Sun and began the great expansion of the Inca empire. According to some authors, he was called Yupanqui as a prince and later took the name *Pachacuti* (“transformer”). He is usually referred to simply as Pachacuti (Pachacutic or Pachacutec), although some records refer to him more fully as Pachacuti Inca Yupanqui. It was he who provided the list of Inca rulers.

BIBLIOGRAPHY

The relative importance of Viracocha and Inti, the sun god, is discussed in Burr C. Brundage’s *Empire of the Inca* (Norman, Okla., 1963); Arthur A. Demarest’s *Viracocha* (Cambridge, Mass., 1981); Alfred Métraux’s *The History of the Incas* (New York, 1969); and R. Tom Zuidema’s *The Ceque System of Cuzco* (Leiden, 1964). Gary Urton’s *At the Crossroads of the Earth and Sky: An Andean Cosmology* (Austin, 1981) interprets Viracocha in the light of present-day Quechua-speaking sources.

ELIZABETH P. BENSON (1987)

VIRGIN GODDESS is a nonhomogeneous, highly problematic concept for scholarly use, for it was partly made up by the religious politics of Greek city-states in order to further their patriarchal aims, and for the other part has been popularized by a certain kind of feminist interest promoted

by followers of the contemporary goddess religion. Goddess worshipers in Western postmodern societies promote a biologicistic understanding of femaleness that is focused on the procreative capacity of the female body, and therefore venerate one or several goddesses as givers and takers of life. In relating all possible functions of goddesses from all times and religions to sexuality and fertility, the goddess movement(s) reveal an outlook on the essence of femaleness that resembles that of ancient Greek gender ideology, even though it arrives at a different evaluation of it.

HISTORY AND CRITICAL REEVALUATION OF THE NOTION OF THE VIRGIN GODDESS. The use of the term *virgin goddess* is grounded in the assumption that prehistoric societies in Europe and elsewhere worshiped a goddess who could appear in three forms: as maiden (often used synonymously with *virgin*), mother, and aged wise woman. A dyad of the goddess as mother and maiden had already been introduced by Jane Harrison (1903), and then taken up by the Jungian scholar Mary Esther Harding (1935), but the idea of a female divine trinity was for the first time formulated by the poet and essayist Robert von Ranke-Graves in his work *The Greek Myths* (1955). The origin of this construction is unclear, but it was very probably influenced by the trinitarian structure of God according to Christian dogma. Ranke Graves connected the threefold manifestation of the divine matriarch to the phases of the moon (waxing moon, full moon, waning moon) and to the three cosmic spheres: the “upper air” for the maiden, earth and sea for the mother, and the underworld for the old woman. Admittedly owing this construction mainly to his intuition, Graves also may have been inspired by the popular ideas of Johann Jakob Bachofen (1861) about the religion of a matriarchal age in early human history. Bachofen claimed that the relations of the sexes always found a cosmic expression in the relations between sun and moon, and according to his hypothesis the *gynaiokratia*, the Greek term for matriarchy, a social order that is dominated by assumingly female values, was characterized by the reign of the moon (and the night) over the sun (and the day). More recently, these kinds of ideas have been taken up by Heide Göttner-Abendroth (1993) and Marija Gimbutas (1989; 1991). Gimbutas, who used a great deal of nineteenth-century theory (Hegel, Bachofen, and James George Frazer) in her interpretations of Stone Age artifacts, promoted the idea of a parthenogenetic primal goddess that might have emerged in the Paleolithic era. According to her hypothesis, the primal goddess, who was avirgin in the sense that she did not have sexual intercourse with a male, was equated with nature as a whole and therefore did not have a particular shape. The earliest goddess images, the so-called Paleolithic Venuses (dated before 10,000 BCE), are images of the awesome creative power associated with woman and nature. The goddess could be represented by triangular stones or by stone or bone carvings emphasizing her vulva, buttocks, and breasts. In the Neolithic or early agricultural era (which began c. 9000 BCE in the Near East), goddess images symbolized the cosmic energy of birth, growth, death, and regeneration, on which

farming, and indeed all life, depends. She was often depicted in zoomorphic shape or with animals as her companions (these figures are known as Ladies of the Animals). The anthropomorphic goddess images, according to Gimbutas, gradually became differentiated into two functions, one as “the giver and taker of all,” and the other as rebirth and regeneration. Eventually these two images were characterized as the Mother and the Maiden. The Mother was the sustaining power, represented especially by the enduring earth, the bedrock that underpins all life. The Maiden, related to the forces of renewal and regeneration, was represented especially by new life, plant and animal, that emerges in spring. The Mother, the eternal, and the Maiden, the ephemeral power of nature, were understood to be two aspects of the same whole. Gimbutas’s theories are very popular among people interested in female spirituality, but they have provoked criticism from professional historians and archaeologists, who argue that hardly anything can be said with any certainty about Neolithic female figurines because of the lack of written information about them.

But some adherents of contemporary goddess religions have taken up Gimbutas’s conception and believe that farming societies of the Neolithic venerated a threefold goddess as maiden, mother, and old woman. Moreover, they argue that this pattern is still recognizable in religions of the ancient world. Within the context of a constructed female monotheism, all astral, war, and hunting goddesses venerated in ancient cultures are viewed as expressions of the Maiden, and as a particular focus of interest, this maiden goddess is interpreted as an antecedent of the virginal goddesses of Olympic religion in Classical Greece. Thus, the concept of the Virgin Goddess emerged, although so-called virgin goddesses share no other feature than their youthful virginity, and even this is interpreted in peculiar and inconsistent ways. In various contexts, virginity can mean maidenhood in the sense of prematurity, it can mean temporary or constant willful abstinence from sexual activity, and it can denote a struggle for independence from male domination. By their divine functions, so-called virgin goddesses do not form a coherent group at all, and they have no automatic connection to the category of mother goddesses. The assumption that mother and daughter (maiden) are two aspects of the same deity was taken from certain images in Minoan religion, where a woman figure appears with one or two maidens. The interpretation of these groups is uncertain, and their occurrence is by no means universal, but culturally restricted to the Minoan and early Cycladic sphere. Generally, ancient polytheistic religions possessed a great number of highly differentiated female and male deities, and the accessible evidence does not allow for interpretations along the lines of monotheism.

In sum, ideas about the Virgin Goddess are based on several shortcomings and conflation. The monotheistic character of a Neolithic goddess cannot be proven. It remains a hypothesis that may be of some relevance in the interpretation of prehistoric religions, but the evidence from those

early civilizations that can inform their modern interpreters through written testimonies reveals a different picture. There is every reason to assume that the idea of the Goddess as one whose mythology focuses on the theme of fertility and procreation is a rather late concept which appeared no earlier than in Hellenistic times (from about 300 BCE). Divine oneness as the source for the multiplicity of goddesses and gods is an outcome of philosophical speculations undertaken to systematize and rationalize mythological traditions. Early panthea and also the figurines and statuettes of the Stone Age show a great variety. In Mesopotamia and Egypt there was a vast number of female and male deities with most diverse powers and responsibilities. It seems unlikely that the prehistoric figurines and statuettes that may represent female godheads—even that is uncertain—should indicate a uniform concept of the female divine. Nothing suggests that the numerous sky goddesses, patronesses of war, and Ladies of the Animals and Hunting, as well as several female astral deities, were to be subsumed under anything like the concept of the Maiden or Virgin Goddess.

Moreover, chastity and virginity only became a feature of Olympic goddesses in Greek and then particularly in Hellenistic cults; in other ancient religions, particular sexual or antisexual attitudes of goddesses were not addressed. Instead, it seems that sexuality was considered an integral part of godheads as well as of humans. Thus, linking later virginal goddesses to earlier figures who were supposedly parthenogenetic (i.e., able to create life exclusively out of themselves) is problematic. The assumption of a Virgin Goddess with a history beginning earlier than in Classical Greece lumps together phenomenologically and historically different qualities. It must be concluded that a pre-Greek concept of virgin goddesses did not exist, and that even from the Classical Greek period onwards, virgin goddesses were never categorized as a group. If anything, it could be stated that goddesses of the ancient Mediterranean with virginal features are peculiar developments of archaic mistresses of the animals and the goddesses of the early city-states in Mesopotamia (Inanna-Ishtar) and Asia Minor (Cybele), whose power over natural forces was also called upon for the protection of the urban sphere, but great caution is required to avoid generalizations inapplicable to highly differentiated divine figures.

GREEK VIRGINITY AND ITS IMPACT ON GODDESSES. Nevertheless, it is interesting to see on which types of goddesses the Greeks imposed virginity and in which ways they thereby influenced their appearances and their spheres of action. But first, the implications of virginity, and specifically of Greek virginity, need to be clarified. Ideas about the interrelatedness of female sexuality and threat become apparent as ancient iconographic motifs, which are known from northern Mesopotamian representations on seals and also in evidence during the orientaling period in Greece (eighth century BCE), but in the Classical era they became a generally recognizable cultural feature.

Two issues are important when considering the meanings of Greek virginity. The first regards the status and repu-

tation of women in the urban milieus of Classical Greece, both of which were formed and dominated by patrilineal and patriarchal order. Greek societies were structured by the *oikoi* (households), and each *oikos* was ruled by a male head of the family. Girls were born and raised in one household, but later, through marriage, they passed into another domain of living, bringing a dowry as their share of the patrimonial inheritance into another man's household. Thus, a daughter was a threat to men's possessions and to their wishes for a stable existence. In order to guarantee the procreation of the society of the *poleis*, it was naturally necessary to have women crossing the borders between the *oikoi*. As a consequence, the female sex was associated with all things hated and abhorred: with changeability, unboundedness, pollutedness, formlessness, uncontrolledness, and natural chaos—all oppositions to cultural order represented by men. According to patriarchal ideology, femininity stood for the ability or rather the fate to cross boundaries. The means to control this necessary but dangerous inclination of women was first and foremost a control of their sexuality through the institution of legitimate marriage. In this context the polarity between virgin and wife developed. This polarity is expressed in Greek in the opposition between *gunē*, which means both "woman" and "wife" and is used to refer to married women, and *parthenos*, which means "maiden, girl, or virgin" and "virgin" and is used to refer to unmarried girls. Only by a rigid control of women's sexuality could a man be certain that his children were his. Therefore, it was decreed that a woman must be a virgin at marriage and refrain from sexual intercourse with any man but her husband. Since marriage meant subjection of the female and her control by the male-defined cultural order, virginity made her an outsider and a potential threat. In other words, for the Greeks, virginity became a means to express what was to their standards a paradox—a female who is independent from and even capable of exercising power over men.

For those Greek goddesses who were perceived according to the virgin pattern, this meant that they never became fully subordinated. Consequently, virgin goddesses do not always necessarily abstain from sexuality; they may be virgins in the sense of being unmarried, or even in the sense of not being confined through marriage to a male god. The complex nature of the virgin goddesses is further explicated by the fact that the unmarried girl or woman poses a threat to patriarchal social order because her sexuality is not under the control of man. They carry the connotation of being wild or untamed. This wildness can manifest itself in at least three forms: as a connection to wild places and wild animals not tamed or under control of the city; as passion for the ritual shedding of blood, which draws hunters and warriors away from the city and the family; and as untamed sexuality, by which men are seduced and can be endangered.

A second issue that is important for the rise of Greek virgin goddesses has to do with intellectual currents towards more transcendental conceptualizations of the divine. This

move took place in a number of ancient civilizations which are known as the cultures of the Axial Age, according to a theory by the German existentialist philosopher Karl Jaspers (1883–1969). The gender-specific implications of this theory have not yet been analyzed, but it can be said that in the majority of the civilizations of Jaspers's Axial Age the transcendental is ascribed to male godheads, whilst female deities were linked to nature and the material world. The emergence of the idea of transcendence and the transcendental in the intellectual history of humankind thus supported the polarization of the genders, that is, the belief in fundamental differences in female versus male nature. One way of mediating between the two became the construction of virginity as a "male femaleness," and thus with a kind of physical femaleness that was not acted out and lived as such.

Greek goddesses in general, and the Greek virgin goddesses in particular, combine protective and transgressive qualities in their relation to the cultural standards of the *poleis*. This results from the ability to overcome boundaries, which in Classical Greek culture was ascribed to women and goddesses alike. Virginity could underline as well as constrain this trait. It allowed for a kind of freedom, independence, and power that was usually refused to females, but it also ensured that married women, who represented by definition the kind of femininity that was demanded by their society, remained securely cut off from these privileges. Goddesses, however, unlike ordinary women, could make exceptions here.

INDIVIDUAL VIRGIN GODDESSES AND HEROINES. It is helpful to consider in more detail the expression of virginity by, or the impact of the virginity concept on, some mythological figures.

Kore. Strangely, the Greek goddess Kore, whose very name translates as "maiden," has so far attracted comparatively little attention by propagators of the threefold goddess. Kore was closely related to death, which corresponds with general Greek ideas about human *parthenoi*. Their state of being was regarded as very similar to being condemned to death. In rites that should prepare them for marriage, girls from aristocratic families underwent rites connected with the cults of either Artemis or Athena, initiating them to the theme of sexuality by exposing them to a death-like experience. In Kore's myth this is symbolized by her abduction by Hades, the god of the underworld. The sixth century BCE saw a very rich production of Kore statues, mainly, apparently, for a grave cult. On the Athenian Parthenon there were six Korai, who probably functioned as grave-servants for Erechtheus, the legendary first king of Athens.

Hestia, Artemis and Iphigeneia, and Athena. Greek goddesses virgin in the sense of sexual abstinence by an adult woman were Hestia, Artemis, and Athena.

Hestia, the personification of the hearth and the sacrificial fire, transcends the boundary between humankind and the goddesses and gods. She had a major role in female rites

of passage such as marriage and childbirth. Because the mythology as well as the iconography of the goddess Hestia are poorly developed, further implications of her virginity are not traceable.

Artemis was the goddess of wild places, flocks, and the hunt; she was named Potnia Theron (“lady of the wild animals”) in the *Iliad*, and “slayer of wild beasts” in the Homeric hymns. She had particularly close ties to deer, as indicated by the legend that pregnant does swam to her island in order to give birth, and to bears. Bears play a significant role in the rites and roles of a cult dedicated to Artemis Brauronia, which were performed by young girls. The stages of the ritual are not clear, but it included libations and spinning and weaving, and it was finalized with a goat sacrifice. In Artemis’s mythology, even human—and particularly maiden—sacrifices are significant. According to a study by Ken Dowden (1989), such plots can be interpreted as literary encodings of girls’ initiation rites performed in the service of this goddess. Near the temple of Artemis Brauroneia there was a shrine for Iphigeneia, the daughter of Agamemnon and Klytaimnestra, who on her way to her wedding with Achilles was almost sacrificed to Artemis. A deer was then slaughtered instead of the girl, and Iphigeneia was whisked away by the goddess herself in order to serve her on the Tauris Peninsular. Artemis was there venerated under the name *Parthenos*, or as Iphigeneia, which confirms the closeness of the two figures. Artemis was a virgin herself and shunned men except for her brother Apollo, and she insisted ruthlessly on the chastity of her mythical attendants, the nymphs. Yet, the goddess as well as the nymphs were intimately familiar with sexuality, the female cycle, and childbirth. The sexual appeal of nymphs is apparent in, for example, the story of Odysseus and Kalypso, in which Artemis was explicitly invoked as Elei-theia and Locheia, goddess of childbirth. She was one of the most powerful patronesses of life and death and all passages between them.

The Greek Artemis is clearly the heiress of the Mistress of the Animals, but her wildness was acceptable in a patriarchal culture only if it was understood that she was not like other women. Thus she was superficially bereft of her female sexuality, and although she always remained the goddess of women and female affairs, she was often portrayed as a masculinized huntress, clad in a short tunic, slaying wild animals with arrows from her quiver. However, the image of the Ephesian Artemis, which stressed her nurturing qualities by depicting her as a mature female with many breasts, proves that the Homeric shape of the goddess was not authoritative.

Worshiped in her temple, the Parthenon, Athena Parthenos was a very different expression of a virgin goddess than Artemis, for she was very much identified with the city and its distinct, male-defined culture. Athena was said to have been born from the head of her father Zeus, and in the *Eumenides* of Aeschylus she was said to have declared that she sided with her father against her mother in all things except marriage, which she shunned. She was born fully armed as

a warrior and was usually depicted wearing a helmet and holding a spear and shield. Her title *polias* indicated that the city was her home; her titles *promachos* and *nike* named her victorious against its enemies. She avoided the company of women but nurtured such heroes as Odysseus, Theseus, Herakles, Perseus, and Erichthonius. Her virginity meant that she could consort with men as an equal and engage in the masculine pursuit of war. However, she also figured in important initiation rites for girls, the *Arrhephoria*, the theme of which seems to have been an encounter with overpowering and frightening aspects of male sexuality. Moreover, she was patroness not only of the masculine art of warfare but also of the arts and crafts associated with women, including pottery, weaving, and healing. One of the rituals performed in her honor involved the weaving and presentation of a new robe (*peplos*) for her ancient wooden statue; girls and women played important roles in these rites.

Hera and Aphrodite. If the designation *virgin goddess* is interpreted in the sense of a refusal to be submissive to a male partner, two other Olympians deserve mention here, although both are sexual and, according to Olympian mythology, sexually active.

Hera, known as wife of Zeus and as mother of Hebe, Eleithea, Ares, and Hephaistos, was also known as an independent goddess. Before Zeus entered Greece, Hera was the indigenous goddess of the island of Samos, which was once called Parthenia, and of Argos; even at Olympus, her temple is older than that of Zeus. Her union with Zeus as presented in the *Iliad* was a sacred marriage that brought fertility to the earth. However, another legend reports that every year she renewed her virginity at a sacred spring called Canathus in Nauplia.

Aphrodite, too, although fully and joyously sexual, can be viewed as virginal in the sense of self-determined. Her sexuality is unbridled, untamed, and her own. She is married to Hephaistos, according to Olympian mythology, but she is neither submissive nor faithful to him. Although she is a mother, her child Eros (“love, desire”) is but a reflection of her sexuality. Aphrodite is related to the Lady of the Animals, as indicated in the Homeric *Hymn to Aphrodite*, where she is portrayed as followed by wolves, lions, bears, and leopards, in whom she awakens the spark of desire, and she is also connected to the Near Eastern goddesses of sexuality and of warfare such as Anat, Ishtar, and Astarte. Like Inanna-Ishtar and Astarte, she is identified with the morning and evening stars, which mark the transition between night and day. Aphrodite is an island goddess who entered Greece through Phoenician ports in Cythera and Cyprus; her temples were often found in the marshy ground where sea transforms into land, or on the cliffs where the sea rises as mist to the land. Thus, the nature of her sacred places underlines her transcending capacities as they are also expressed through her irresistible sexual appeal.

Sophia. Although in the classical culture of Greece the meaning of virginity was not necessarily confined to sexual

abstemiousness, certain currents in Hellenism and particularly in Hellenistic Judaism became obsessed with the religious benefits of chastity. This development applied to men and women alike, but in the context of virgin goddesses only the implications for female virginity are relevant.

Due to the “ascetic tension” (Fraade, 1989) in Judaism in the Hellenistic age, the feminine aspect of the Old Testament God acquired an independent identity, with a huge impact also on Gnosticism and emerging Christianity. In several Jewish texts of that period (e.g., *Proverbs*, Ben Sira, c. 200 BCE, *Wisdom of Solomon*, c. 150 BCE), Sophia as a personification of divine wisdom figures prominently, and chastity is described as one of her important traits. Another female figure in a number of writings (e.g., *Proverbs* 9; fragment from cave four in Qumran) is clearly recognizable as Sophia’s counterpart: the “strange woman,” one of whose most obvious marks is her lasciviousness, as opposed to the wise woman’s purity. Thus, a discourse developed in which virginity was regarded as a means to, and even as a code for, salvation. According to Gnostic mythology, the origination of the lower worlds of psychic and material quality (as opposed to the upper world of spiritual substance) results from the fall of a female soul—later replaced by the Jewish Sophia—and her involvement in passion and sexual activity. In the end, the soul is restored by union with a male salvational figure in a “virginal” bridal chamber. In Sethian Gnostic texts, the original, purely spiritual creation of the *pleroma*, or fullness, is ascribed to the goddess Barbelo, who is characterized as a “male virgin.” The *Apocryphon of John*, the *Gospel of the Egyptians*, and *The Three Tablets of Seth* know of her as the “thrice male” and the “masculine female virgin.”

The Virgin Mary. Many features of ancient virginal goddesses survive to the present day in the Virgin Mary. Throughout the Near East, Europe, and Latin America, churches to the Virgin Mary were built at the holy places of the goddesses. Even though she is not prominent in the New Testament, Mary eventually became the repository for all the lingering images of the goddesses. To the Greeks she is *panaghia*, which means simply “the all-holy.” In the *Gospel of Matthew*, a prophecy from Isaiah that reads “Behold, a virgin shall conceive and bear a son” (*Mt.* 1:23) is applied to the birth of Jesus. Although the Hebrew word *almanah* in the original prophecy might be translated “young woman” without the necessary imputation of *virgin*, both the Greek translation of the Hebrew Bible, the Septuagint, and the *Gospel of Matthew* use *parthenos*. Lest there be any ambiguity as to its interpretation, the author of *Matthew* clarifies, Joseph “knew her not until she had borne a son” (1:25). The theme of Mary’s continual virginity despite of Jesus’ birth emerged already in second-century theological discourse, there. The church agreed at the Council of Ephesus in 431 that Mary would be called *theotokos* (“God bearer”), and confirmed this title at the Council of Chalcedon in 451.

The dogmatic establishment of Mary’s virginity is a continuation of the Greek strategies to mark particular and

powerful women as virgins, but it also needs to be understood as a confirmation and even superlevation of the most important function of Greek goddesses: the mediation between different spheres of existence, which in Mary’s case is the mediation between humans and the divine.

Kumari. A different kind of virgin goddess, which is completely detached from the specific cultural conditions of the eastern Mediterranean, can be found in Nepal. Here, the goddess Taleju, an aspect of Durga, inhabits a human virgin who is correspondingly worshiped as the goddess herself. The custom of having an immature girl residing in Taleju’s temple in Kathmandu is said to go back to a legend from the late sixteenth century about the king Jaya Prakash Malla, who used to play dice with the goddess when she regularly visited him in his palace. On one occasion he developed “unholy thoughts” about his companion; she recognized this and then disappeared. When the remorseful king begged forgiveness, Taleju said she would return only in the form of a virginal little girl who would have to live next to the royal palace. Since then, the living Kumari is chosen from the Sakya community in the Kathmandu valley. Although Taleju is a Hindu goddess, the living Kumari comes from a Buddhist family (the Sakyas are descendants from the Buddha’s clan) and is selected by high-level Vajracharya priests. Apart from her virginity, further criteria are an unblemished body and a fearless mind. When the girl approaches puberty, she ceases to be Kumari and in theory can live a normal life. However, she does not receive school education or any other training that would prepare her for such a life, and moreover she is unlikely to get married because she is still believed to be possessed by supernatural powers.

Possible meanings of virginity in Indian and Himalayan religions are less well researched than for Greek and Hellenistic antiquity, and particularly the political aspect of it—as it is suggested by the close bond with the Nepalese royals—has so far been neglected. Interpretations given agree on the assumption that the phenomenon should be explained in the context of shaktism. According to this branch of tantrism, the goddess is understood as creative energy. This energy remains untouched and therefore complete, as long as the goddess is virgin.

BIBLIOGRAPHY

The concept of Virgin Goddess was developed by the works cited above, including Johann Jakob Bachofen, *Das Mutterrecht: Eine Untersuchung über die Gynaikokratie der alten Welt nach ihrer religiösen und rechtlichen Natur* (Stuttgart, Germany, 1861); Jane Harrison, *Prolegomena to the Study of Greek Religion* (Cambridge, U.K., 1903); Mary Esther Harding, *Women’s Mysteries, Ancient and Modern* (New York, 1935); Karl Jaspers, *Vom Ursprung und Ziel der Geschichte (About the Origin and Aim of History)*, Zurich, 1949); Robert von Ranke-Graves, *The Greek Myths* (New York, 1955); Ken Dowden, *Death and the Maiden: Girls’ Initiation Rites in*

Greek Mythology (New York, 1989); and Heide Göttner-Abendroth, *Die Göttin und ihr Heros*, 10th edition (Munich, 1993). Most influential were the popular books by Marija Gimbutas, *The Language of the Goddess* (San Francisco, Calif., 1989) and *The Civilization of the Goddess* (San Francisco, Calif., 1991). Positive assessments of Gimbutas's views can be found in several articles in issue 12 (1996) of the *Journal of Feminist Studies in Religion*, pp. 33–119.

A critical reconsideration of the threefold Goddess in general and the Virgin Goddess as one of her forms has not yet been written. Thorough reexaminations about the Goddess in prehistoric religions can be found in the collection *Ancient Goddess*, edited by Lucy Goodison and Christine Morris (London, 1998). Very insightful on the broader context of interpreting goddesses is the volume *Engendering Archaeology. Women and Prehistory*, edited by Joan M. Gero and Margaret W. Coney (Oxford, 1991). For the Near Eastern context see Tikva Frymer-Kensky, *In the Wake of the Goddesses* (New York, 1992).

The standard work on understandings of Greek virginity is Giulia Sissa, *Greek Virginity*, translated from the French by Arthur Goldhammer (Cambridge, Mass., 1990). For several thorough analyses of Greek interpretations of the female body—including its state as a virginal body—and female roles in Greek culture and religion consult Helen King, *Hippocrates' Women: Reading the Female Body in Ancient Greece* (London, 1998).

Julia Iwersen, *Die Frau im alten Griechenland. Religion, Kultur, Gesellschaft* (Düsseldorf, Germany, 2002) deals with virgin goddesses, virginity, and maidenhood in various contexts of Greek religion. Several important articles on the meaning of virginity and maidenhood in Greek religion can be found in the volume *The Sacred and the Feminine in Ancient Greece*, edited by Sue Blundell and Margaret Williamson (London and New York, 1998); see particularly the contribution of Susan Guettel Cole, "Domesticating Artemis," pp. 27–43. Nannó Marinatos, *The Goddess and the Warrior. The Naked Goddess and Mistress of Animals in Early Greek Religion* (London and New York, 2000) is interesting about functions of Artemis in male-dominated Greek society and also about how the image of this goddess was changed and adapted to Greek gender ideology. As for the maiden Kore, see Katerina Karakasi, *Archaische Koren* (Munich, 2001) and Andreas Scholl, *Die Korenhalle des Erechtheion auf der Akropolis. Frauen für den Staat* (Frankfurt am Main, Germany, 1998). For a classical interpretation of the virginity of a Greek goddess see Karl Kerényi, *Sie Jungfrau und Mutter der griechischen Religion* (Zurich, 1952), translated as *Athene: Virgin and Mother in Greek Religion* (Zurich, 1978).

Wolfgang Beinert and Heinrich Petri, eds., *Handbuch der Marienkunde* (Regensburg, Germany, 1984), and Marina Warner, *Alone of All Her Sex* (New York, 1976) compile a vast amount of material on the Virgin Mary. For a comprehensive phenomenology of the type in the ancient Mediterranean milieu (from Isis and Cybele to Mary the Virgin and Mother of God) see Stephen Benko, *The Virgin Goddess: Studies in the Pagan and Christian Roots of Mariology* (Leiden, Netherlands, 1993).

The Nepalese Kumari is examined and interpreted in terms of cultural anthropology by Michael Allen, *The Cult of Kumari*.

Virgin Worship in Nepal (Kathmandu, 1975, with several reprints), and for a more descriptive approach, see Siddhi B. Ranjitkar, *Kumari. The Virgin Goddess* (New Delhi, 2002).

Discussion of ascetic tension in Judaism in the Hellenistic age can be found in Steven D. Fraade, "Ascetical Aspects of Ancient Judaism" in *Jewish Spirituality from the Bible through the Middle Ages*, vol. 1, edited by Arthur Green, pp. 253–288 (New York, 1989).

JULIA IWERSEN (2005)

VIRGINITY is the condition of young male and female persons who have not had sexual intercourse and have preserved their sexual innocence. This state is partly biologically determined, in that children do not yet have sexual potency; but that condition can be voluntarily or obligatorily extended until marriage, so that virginal status becomes a social fact. The significance of virginity, therefore, has to be understood in a wider social context, in which it bears specific symbolic meanings. A basic fact in every society is the organization of the relationship of men and women into various kinship systems to guarantee the reproduction of the human species. Being a complete man or woman presupposes sexual potency and activity. A virgin boy or girl has not yet reached the condition of full maturity, and therefore retains a purity that makes him or her more suited for certain religious functions or specific activities.

In Classical Greece and Rome, virgin children of living parents often assisted with religious ceremonies. In Greece, they had the task of cutting the olive branches with which the victors at Delphi and at the Olympic games were crowned. They also had a ceremonial role at weddings comparable to that of bridesmaids and pages, who are supposed to be unmarried and consequently virgins. In Christianity, virgin children or eunuchs (i. e., artificial virgins) often functioned as singers in the choir, because their pure status made them more appropriate for contact with the divine world.

Virginity is also believed to bring a man or woman into closer contact with nature, because he or she is still unspoiled by sexuality. In the Babylonian *Epic of Gilgamesh* Enkidu, who was created by the gods as Gilgamesh's opponent, lived among the animals until he was seduced by a prostitute. After that the animals left Enkidu, who was forced to join human society. For the same reason the Kaluli, a tribe of Papua New Guinea, believe that virgin youths are the most effective hunters, and the belief is endorsed by a Kaluli myth featuring Dosali, the mythical model of perfect manhood, and Newelesu, his clownish, violent, and uncivilized antithesis. Both stay a night with the Mother of the Animals. Dosali behaves like a decent guest and gets a lot of game. Newelesu forces the old woman to have intercourse with him, and all the animals flee the house. A virginal man still has close rapport with the animal world, because he is less entangled in the social world of marriage, exchange of property, alliance, and all other issues linked with the world of settled married people.

The virginity of an unmarried girl is likewise temporary, a transitory biological condition with a strong social value. The virginity of young women often acts as a symbol of the social purity of the whole group to which the women belong. In some societies, therefore, the chastity of the young women is a matter of concern for the whole group. In India, the purity of the social group, the caste, is dependent on the purity of the women, who transmit caste membership. Therefore the whole group scrupulously guards the chastity of the young girls until their marriage, and often kills them if they break the interdiction of sexual intercourse. In other societies, for example, in Samoa, a group of islands in the Pacific Ocean close to the equator, the virginity of the daughter of the chief was a symbol of the integrity of the whole society, whereas other girls were permitted to have sexual relationships as they pleased.

In all societies where men exchange women, as is the case in almost all Mediterranean and Arab countries, and where virginity is expected at marriage, the virginity of the woman is an essential part of the marriage contract between the families and the chastity of the young woman is of direct family concern. A bride who is not a virgin breaks the contract and is often severely punished, even with death.

Virginity, however, has yet another aspect, in addition to sexual purity as a link to nature or as a symbol of social purity. Because of their lack or renunciation of sexual experience, virgins are not completely male or female, and consequently defy in a sense gender specificity. In a state of ambiguity, they have aspects of both genders, as sometimes becomes clear in mythology. Persephone, the corn maiden of Greek mythology, lives half the year with her mother Demeter and the other half with Hades, god of the underworld. As a virgin she belongs to both the female and the male world; she is a typically intermediary figure, a go-between. This mediating function of virgins makes them particularly appropriate for contact with the supernatural and implies their sacredness.

In imitation of this quality, chastity or temporary sexual renunciation is often a prerequisite for a visit to a temple or for the performance of religious rites. The participants in the Eleusinian mysteries were obliged to observe a period of chastity, just as in the Middle Ages lay people who wanted to take the Holy Communion had to remain chaste for some days before and after. The priests in Israel had to live apart from their wives during the period of their service in the Jerusalem Temple, and the priests of the Dea Syria, the Syrian mother goddess of fertility, were the so-called Galli, men who had emasculated themselves in the service of the goddess and had in this way made themselves into artificial virgins.

Priestesses of various cults in Greco-Roman antiquity had to be virgins. The Vestal Virgins are a good example of how an intermediary position implies sacredness and contact with the divine world. The Vestals were virgins, but they also had the main characteristics of married women: Their dress was similar and they had some legal rights. They were also

treated as brides. For example, they wore permanently the hairstyle typical of a bride on her wedding day. They even showed some male characteristics: Like male magistrates they had the right to be escorted by a lictor. They were in every respect ambiguous, and so especially fit to mediate between human society and the powers that watched over it.

As brides the Vestal Virgins were permanently on the brink between the unmarried and married status. Their anomalous sacred position also entailed living outside a normal household: They lived together in a special house separated from common society. The same ambiguity is symbolized by the sacred fire that the Vestals guarded. Fire is life-giving and life-destroying; it is pure and sterile and a symbol of fertility, and thus a sacred symbol linking two spheres. The Vestals were not an isolated case. The priestess at the Delphic oracle, the Pythia, was required to be an elderly woman of over fifty who might have been married but had to dress as a young virgin. In this way she acted as an intermediary between divine decisions and human affairs.

All these examples of virginity refer to a temporary status—even the Vestals were allowed to leave their service after thirty years and to marry if they wished. The symbolic aspect of virginity was often a motive for a permanent virginity, or what is often called celibacy. A permanent status of virginity, for instance, occurs in Buddhism as a requisite for monks and in the Roman Catholic Church. Virginity was a widespread phenomenon in the early Christian church and was based upon specific concepts of human status and salvation. In view of the impending end of the world the apostle Paul considered the status of unmarried virgin as the most desirable (*1 Cor.* 7), in accordance with certain ascetical trends in the New Testament. Baptism in Christ represents the reunification of male and female, “being one in Christ Jesus” according to *Galatians* 3:28, and implies the abolition of sexual differentiation.

In particular during the second and third centuries CE, the ideal of following Christ as a virgin became a dominant element in the nascent Christian church. This development required broadening the idea of virginity to include those who had been sexually active but now chose to abstain. Just as Christ was unmarried and single, so his followers too should be virgins. But *imitatio Christi* means more than just an ascetic life of sexual renunciation. It is actually a reversion of the fateful division of humankind into sexually active males and females after the Fall, which started with the creation of Eve from Adam as described in *Genesis* 2:21f. According to an apocryphal logion of Christ quoted in *2 Clement*, a treatise dating back to the middle of the second century CE, the kingdom of God will come “when the two will be one, and the outer like the inner, and the male will be united with the female, so that there will be neither male nor female, but the two will be one.”

The same language occurs in logion 22 of the *Gospel of Thomas*, an apocryphal gospel that originated in the Syriac-speaking East and dates from about 200 CE. The reunifica-

tion of male and female is explained as the transformation of women into men. When Simon Peter said to Jesus and the disciples, "Let Mary go out from among us, because women are not worthy of the Life," Jesus said, "See, I shall lead her, so that I will make her male, that she too may become a living spirit, resembling you males. For every woman who makes herself male will enter the kingdom of Heaven" (logion 114).

This transcendence of sexuality is also described as becoming like children who do not yet know sexual shame. In the same *Gospel of Thomas* the disciples ask Jesus, "When wilt Thou be revealed to us and when will we see Thee?" And Jesus said, "When you take off your clothing without being ashamed, and take your clothes and put them under your feet as the little children and tread on them, then shall you behold the Son of the Living One and you shall not fear" (logion 37). When the apostle Thomas converted a royal bridal couple from "filthy intercourse" to a pure virginal life, as is related in the apocryphal *Acts of Thomas*, written in the Syrian East around 225 CE, the bride took off her veil, because "the veil of corruption is taken away from her, and the deed of shame has been removed." According to her own words, she is "betrothed to the true Husband," a situation recalling *Genesis 2:24f.*: ". . . and they shall be one flesh. And they were both naked, the man and his wife, and were not ashamed."

The union between the virgin and Christ the true bridegroom was often celebrated in the ritual of the Bridal Chamber that is attested in nascent Syrian Christianity as well as in sectarian gnostic groups. It represented the union with Christ the Second Adam that restored the asexual androgynous condition of humankind in paradise before the Fall. Where there is no longer male or female, a new world has come that is paradise regained. The life of the virgins is, therefore, often characterized as angelical life (*bios aggelikos*), referring to *Luke 20:27–40*.

The Christian virgins who had overcome gender differentiation demonstrated their paradisiacal state in different ways. They sometimes lived chastely together in one house or community, to show how they could live without passions. Often they lived singly outside common human society in isolation, for example, in the desert, because neutralization of sexuality implies a renunciation of all ties that link a person with society, since marriage and procreation are linked with its survival. Sexually and socially the virgins were ambiguous: They were neither male nor female, and they lived an angelical eternal paradisiacal life among or on the outskirts of human mortal society. They even demonstrated the new life in their dress: The virgin Thecla in the apocryphal *Acts of Paul and Thecla* dressed like a man and had her hair cut short. She is reminiscent of Joan of Arc, the virgin of Orléans, who also dressed like a man and played an intermediate role.

The virginal life meant perpetual struggle with bodily passions, the manifestations of Satan. Like Christ, Christian

virgins could win that struggle and undo the inheritance of Adam's fate of sexuality and death. Their life is, therefore, often depicted as a permanent war or struggle, a motif that had its roots in the antique world and exercised a deep influence on Christian tradition. The virgins became saints who mediated between this world and God because they kept an intermediate, ambiguous position. Their symbolic behavior pointed to their mediating function, as did that of the stylytes, early Christian ascetics who lived on the tops of pillars representing the link between heaven and earth.

But the most anomalous phenomenon connected with virginity is virgin birth. A virgin mother is a powerful symbol of the relationship between the natural (human) and supernatural (divine) world. Through the Virgin Mary, Christ became the mediator *par excellence*, being God and human at the same time. Thus virginity is also a sign of the power to cross the boundary of biological existence, to mediate between body and socioreligious ideals, between what is and what ought to be. In this way people can order their biological existence and social world through the most powerful symbols they have, the sexual bodies that are their only way of survival and their eternal fate.

BIBLIOGRAPHY

A comprehensive study of virginity does not exist. For understanding the religious significance of the ambiguous status of virgins, modern cultural anthropology is useful, particularly the works of Mary Douglas: *Purity and Danger: An Analysis of Concepts of Pollution and Taboo* (New York, 1966), *Natural Symbols: Explorations in Cosmology* (New York, 1970), and *Implicit Meanings: Essays in Anthropology* (Boston, 1975). Kirsten Hastrup's article "The Semantics of Biology: Virginity," in *Defining Females: The Nature of Women in Society*, edited by Shirley Ardener (London, 1978), uses Douglas's theoretical insights with great profit, as does Mary Beard's "The Sexual Status of Vestal Virgins," *Journal of Roman Studies* 70 (1980): 12–27. A bit out of date but a useful collection of material and sources is Eugen Fehrle's *Die kultische Keuschheit im Altertum*, "Religionsgeschichtliche Versuche und Vorarbeiten," vol. 6 (Giessen, 1910). Aline Rousselle's *Porneia: De la maîtrise du corps à la privation sensorielle deuxième-quatrième siècles de l'ère chrétienne* (Paris, 1983) is excellent for the social and medical background of virginity and asceticism in general in the antique and early Christian world. For a good survey of the topic, see Peter Nagel's *Die Motivierung der Askese in der alten Kirche und der Ursprung des Mönchtums*, "Texte und Untersuchungen," vol. 95 (Berlin, 1966), and Bernhard Lohse's *Askese und Mönchtum in der Antike und in der alten Kirche* (Munich, 1969). Peter Brown's *The Making of Late Antiquity* (Cambridge, Mass., 1978) is quite interesting.

VISION QUEST. The personal vision is a fundamental feature of American Indian cultures across the continent and across all linguistic boundaries. While there are always people who have visions of a quality that sets them apart from others, people in all American Indian communities treasure their own visions and respect those of others. Whether wake-state or sleep-state, the vision in American Indian cultural contexts is always a communication between a human person and one or more nonhuman spirit persons.

While these vision experiences sometimes occur spontaneously, they occur most frequently in the context of intentional seeking done in a carefully arranged ceremonial manner in what is called in English the *vision quest* or *rite of vigil*. The details are always dependent on the particular purpose for the quest and the particularities of community custom. The general structures, however, tend to be similar across the continent. Adolescents might undertake the rite of vigil for one or two days and nights; adults might extend the ritual, which includes fasting, from four to seven days, and occasionally even longer. These occasions typically were, and are yet today, life-altering experiences for Native women and men. Fletcher and La Flesche report that a young man's vision became his personal connection with the "vast universe" of the immaterial spirit world, "by which he could strengthen his spirit and his physical powers" (p. 131).

The vision quest is a common American Indian ceremonial tradition that is or was practiced in nearly every tribal community. Indeed, Ruth Benedict, an early ethnographer, could claim that the vision was the single unifying factor in all North American Indian religious experience. While the ceremony varied from community to community and according to the particularity of the occasion, Benedict is essentially correct in claiming that it was, and is, structurally and functionally similar across all these communities, even as she distinguishes characteristics unique to the Plains. In every case, these were intense occasions of personal retreat from human community, of intentional self-deprivation, and of prayer.

A number of consistent factors tie these phenomena together. In almost every case the faster is separated from the

human community and isolated in places remote from the civic center of the village. Lakota peoples sometimes refer to it as "going on the hill." A total abstinence from food and water is fundamental to the ceremonial exercise. The ceremony is one of constant prayer. The duration of the ceremony—usually dependent on the prior commitment of the faster—varies from one day and night (for an adolescent) up to four to seven days and sometimes longer (for an adult).

Finally, the American Indian vision phenomenon is always predicated on an understanding of the world as peopled by both material and immaterial beings, with the visionary moment as that which allows a human person to communicate with, and especially to receive communication from, immaterial spirit beings. Thus, the occasion always includes the possibility of receiving some sort of personal power as a gift from a spirit.

Much of the literature concerning the vision quest is somewhat unsatisfactory, either because of its great superficiality or because it attempts to impose colonial structures of meaning on indigenous phenomena. For instance, the majority of professional literature on the vision quest presumes the accuracy of nineteenth-century ethnographic collections of vision recitations as if the whole of the recitation is accurately represented in the brief paragraph typically recorded by the ethnographer; and as if the typically language-deficient ethnographer has also accurately translated the native language in which the vision would have been recited.

These anthropological renditions are typically rather short and cannot have been the whole of the vision experienced by the informant. In fact, it is a universal Native American characteristic that the vision, as an intensely personal experience, is never shared fully but is kept throughout life as a private revelation. Thus, the ethnographer was almost always not privy to the whole of the vision encounter. Moreover, few ethnographers, most of whom were Native Americans themselves, were fluent in the languages of those they presumed to study, meaning that almost all translations relied on others whose English may have been only nominally better than the ethnographer's understanding of the native language. The most egregious example of this is John Neihard's poetic and romanticized interpretation of Lakota elder Nicholas Black Elk's words in *Black Elk Speaks*. The work is based on Neihard's daughter's stenographic notes of Ben Black Elk's relatively naive boarding-school English translation of his father Nicholas's sophisticated and abstract Lakota spoken narrative, a sophistication that is inexorably stripped away on its path toward the English printed version.

Perhaps the most significant shortcoming of the professional literature is its proclivity, from the late nineteenth century to the present, to treat all Native American cultural phenomena, including the vision quest, as historical artifacts that have no place in contemporary American Indian societies. The more recent academic treatments almost universally base their interpretations on these older nineteenth- and early-twentieth-century ethnographic texts, treating them as if

they actually represented a “textus receptus,” an absolutely authoritative text, with regard to Native religious traditions.
